

## GENERAL DESCRIPTION

The PT5110 is a low-dropout voltage regulator designed for portable applications that require both low noise performance and board space. The PT5110's is ideal for battery powered systems for delivering low dropout voltage and low quiescent current.

The device can be used for mobile phones and similar battery powered wireless applications. It provides up to 400mA, from a 2.5V to 8V input. The PT5110 consumes less than 0.1 $\mu$ A in shutdown mode. The PT5110 is available in SOT23-3 and SOT89-3 packages. Selected performances are specified for -40°C to +85°C temperature range. Nine output voltage levels are available from 1.5V through 5.0V.

## FEATURES

- 400mA maximum output current
- 2.5V to 8V operating range
- < 1 $\mu$ A quiescent current at shutdown mode
- Thermal shutdown and short-circuit current limit
- SOT23-3 and SOT89-3 packages

## APPLICATIONS

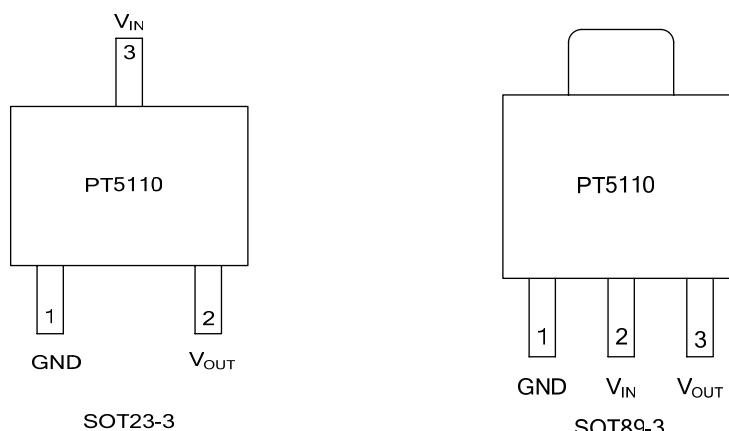

- Battery powered devices
- Cordless telephones
- WLAN and bluetooth appliances
- PDAs/MP3

**Note 1:** The Absolute Maximum power dissipation depends on the ambient temperature and can be calculated using the formula:  $P_D = (T_J - T_A)/\theta_{JA}$ , where  $T_J$  is the junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance.

**Note 2:** Additional information on lead temperature and pad temperature may be obtained by contacting CR PowTech

**Note 3:** Like the Absolute Maximum power dissipation, the maximum power dissipation for operation depends on the ambient temperature.

**Note 4:** The target output voltage, which is labeled  $V_{OUT(nom)}$ , is the desired voltage option.

**Note 5:** All limits are guaranteed. All electrical characteristics having room-temperature limits are tested during production with  $T_J = 25^{\circ}C$  or correlated using Statistical Quality Control (SQC) methods. All hot and cold limits are guaranteed by correlating the electrical characteristics to process and temperature variations and applying statistical process control.

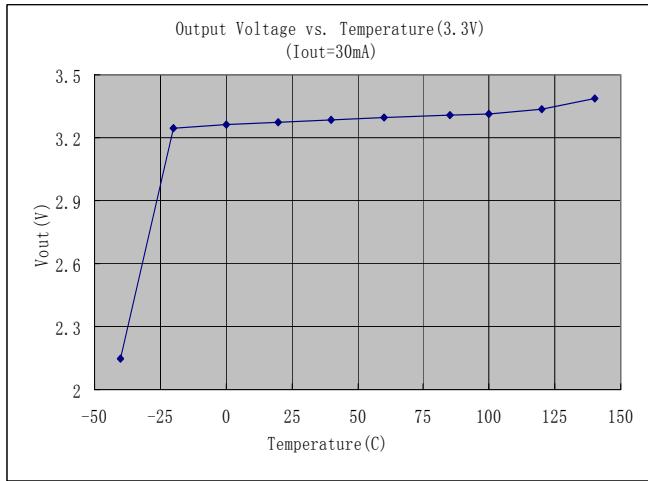

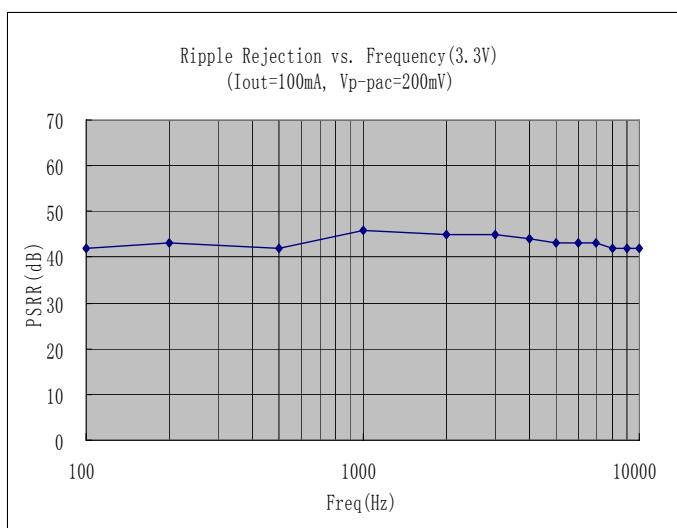

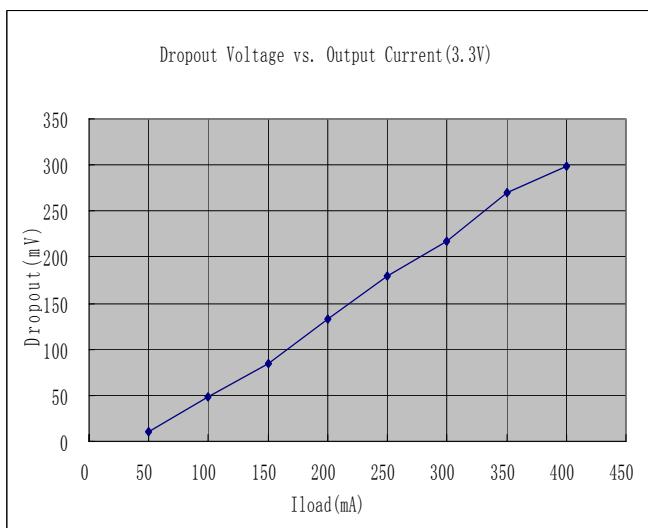

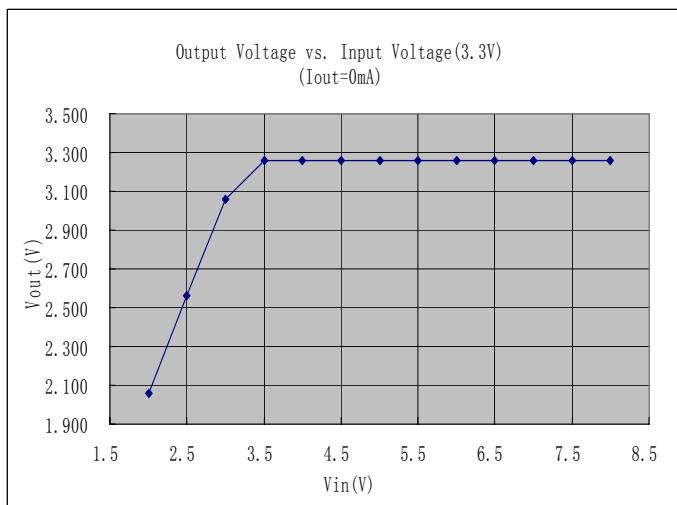

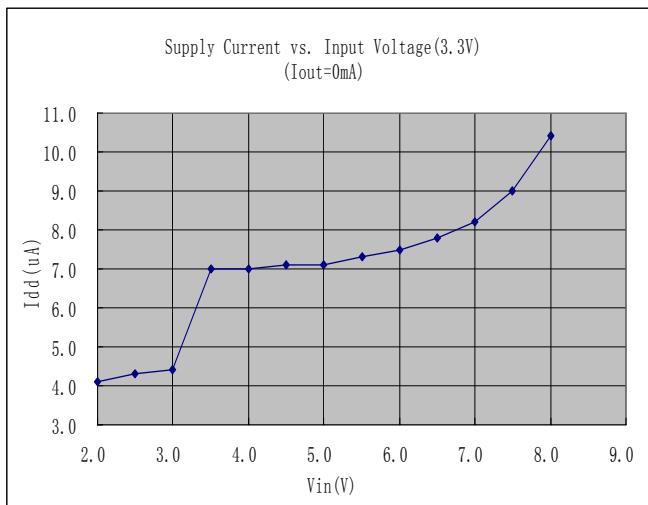

**SIMPLIFIED BLOCK DIAGRAM**

**Figure1. Graph the PT5110 major functional blocks**

In Figure 1, the block of Bandgap Reference provides the reference voltage of the LDO. The op amp block is used as the error amplifier of the LDO by compare the reference with the output feedback voltages. Its output controls the gate of a large PMOS driver and hereby adjusts the output voltage. The resistor  $R_1$  and  $R_2$  form a voltage divider to provide the feedback voltage. The Current Sense & Limit block senses the LDO output current and limits the output current from being too high. This is mostly a short circuit protection feature.
