3 说明

ULN2003LV 是一款针对 TI 生产的广受欢迎的 ULN2003 系列 7 通道达灵顿 (Darlington) 复合晶体管阵列的低压和低功耗升级产品。ULN2003LV 下沉式驱动器特有 7 个低输出阻抗驱动器以支持低压中继和电感线圈应用。低阻抗驱动器大大降低了片上功耗；对于典型 3V 中继，功率耗散低了多达 5 倍。

ULN2003LV 驱动器与相似封装内的 ULN2003 系列器件引脚到引脚兼容。

ULN2003LV 支持 3.3V 至 5V CMOS 逻辑输入接口，从而使得此器件与大范围的微控制器和其它逻辑接口兼容。ULN2003LV 特有一个改进的输入接口，此接口可以大大降低取自外部驱动器的输入 DC 电流。

ULN2003LV 特有一个输入 RC 缓冲器，此缓冲器能够极大地改进此器件在嘈杂运行条件下的性能。

ULN2003LV 通道输入特有一个内部输入下拉电阻器从而可实现三态输入逻辑。ULN2003LV 也可以支持其他逻辑输入电平，例如 TTL 和 1.8V，相关详细信息请参见 [Application Information](#) 部分。

ULN2003LV 通过将几条相邻的并联通道相组合来提供增加电流吸收能力的灵活性。在通常情况下，当所有 7 个通道并联时，ULN2003LV 能够支持高达 1.0A 的负载电流。此外，ULN2003LV 还可用于各类需要灌电流驱动器的应用，例如驱动 LED 和逻辑电平转换。

7 Detailed Description

7.1 Overview

ULN2003LV device is a seven-channel, low-side NMOS driver capable of driving 100-mA load with 3-V input drive voltage through each channel. This device can drive low voltage can drive low-voltage relays, LEDs or resistive loads. The ULN2003LV supports 3.3-V to 5-V CMOS logic input interface thus making it compatible to a wide range of micro-controllers and other logic interfaces. The ULN2003LV features an improved input interface that minimizes the input DC current drawn from the external drivers. The ULN2003LV features an input RC snubber that greatly improves its performance in noisy operating conditions. The ULN2003LV channel inputs feature an internal input pulldown resistor thus allowing input logic to be tri-stated. The ULN2003LV may also support other logic input levels, for example, TTL and 1.8 V.

7.2 Functional Block Diagram

Figure 6. Channel Block Diagram

7.3 Feature Description

7.3.1 TTL and Other Logic Inputs

ULN2003LV input interface is specified for standard 3-V and 5-V CMOS logic interface. However, ULN2003LV input interface may support other logic input levels as well. Refer to [Figure 1](#) and [Figure 2](#) to establish VOL and the corresponding typical load current levels for various input voltage ranges. The [Application Information](#) section shows an implementation to drive 1.8-V relays using ULN2003LV.

7.3.2 Input RC Snubber

ULN2003LV features an input RC snubber that helps prevent spurious switching in noisy environment. Connect an external 1-kΩ to 5-kΩ resistor in series with the input to further enhance the noise tolerance of the ULN2003LV.

Feature Description (continued)

7.3.3 High-Impedance Input Drivers

ULN2003LV features a 300-k Ω input pulldown resistor. The presence of this resistor allows the input drivers to be tri-stated. When a high-impedance driver is connected to a channel input the ULN2003LV detects the channel input as a low-level input and remains in the OFF position. The input RC snubber helps improve noise tolerance when input drivers are in the high-impedance state.

7.4 Device Functional Modes

As shown in [Figure 6](#), each output of the ULN2003LV features an internal free-wheeling diode connected in a common-cathode configuration at the COM pin. The ULN2003LV provides flexibility of increasing current sink capability through combining several adjacent channels in parallel. Under typical conditions the ULN2003LV can support up to 1.0 A of load current when all 7-channels are connected in parallel. The ULN2003LV can also be used in a variety of other applications requiring a sink drivers.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The typical application of the ULN2003LV is a sink driver. The ULN2003LV provides a low-impedance path to GND for driving external peripherals or open-drain signals. If all 7 channels are tied together, the ULN2003 can sink up to 1 A of current in these applications

8.2 Typical Application

To use ULN2003LV as an open-collector or an open-drain inverting logic level shifter configure the device as shown in Figure 7. The ULN2003LV's each channel input and output logic levels can also be set independently. When using different channel input and output logic voltages connect the ULN2003LV COM pin to the maximum voltage.

Figure 7. ULN2003LV as Inverting Logic Level Shifter

8.2.1 Design Requirements

ULN2003LV can be used in digital application requiring logic level shifting up to 8 V at the output side. Applications requiring a level shift operation from 1.8 V to 8 V. Since device pulls the output transistor low when input is high, this configuration is useful for applications requiring inverting logic with the level shifting operation.

8.2.2 Detailed Design Procedure

To operate in level shifting operation certain time aspects should be kept in mind. Depending on the pull up resistors at the output ULN2003LV exhibits different propagation delays. The choice of pull up resistor is dependent on the drive required at the output. The device can pull output to ground with the output transistor but to transition from low to high output resistor plays a critical role. If high drive at output is required a lower resistance can be calculated using Equation 1.

$$R_{\text{Pullup}} = \text{OUT1_VSUP} / I_{\text{Drive}} \quad (1)$$

Typical Application (continued)

For example, a drive of 5 mA is required at the output for 1.8-V to 5-V translation application.

$$R_{\text{Pullup}} = \text{OUT1_VSUP} / I_{\text{Drive}} = 5/0.005 = 1 \text{ K} \tag{2}$$

8.2.3 Application Curve

Figure 8. ULN2003LV Iref vs VOUTx

8.3 System Examples

8.3.1 Max Supply Selector

The [Figure 9](#) implements a max supply selector along with a 4-channel logic level shifter using a single ULN2003LV. This setup configures ULN2003LV's channel clamp diodes OUT5 – OUT7 in a diode-OR configuration and thus the maximum supply among VSUP1, VSUP2 and VSUP3 becomes available at the COM pin. The maximum supply is then used as a pull-up voltage for level shifters. Limit the net GND pin current to less than 100mA DC to ensure reliability of the conducting diode. The unconnected inputs IN5-IN7 are pulled to GND potential through 300kΩ internal pull-down resistor.

Figure 9. ULN2003LV as Max Supply Selector

System Examples (continued)

8.3.2 Constant Current Generation

When configured as per Figure 10 the ULN2003LV outputs OUT1-OUT6 act as independent constant current sources. The current flowing through the resistor R1 is copied on all other channels. To increase the current sourcing connect several output channels in parallel. To ensure best current copying set voltage drop across connected load such that VOUTx matches to VOUT7.

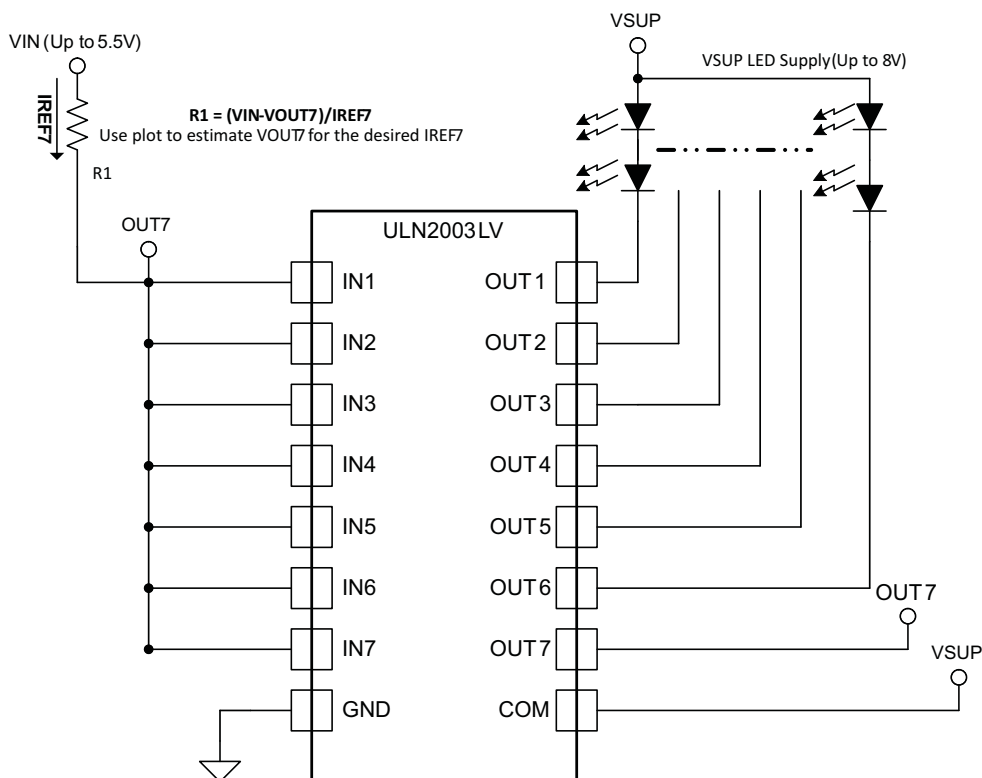

Figure 10. ULN2003LV as a Constant Current Driver

System Examples (continued)

8.3.3 Unipolar Stepper Motor Driver

The [Figure 11](#) shows an implementation of ULN2003LV for driving a unipolar stepper motor. The unconnected input channels can be used for other functions. When an input pin is left open the internal 300kΩ pull down resistor pulls the respective input pin to GND potential. For higher noise immunity use an external short across an unconnected input and GND pins.

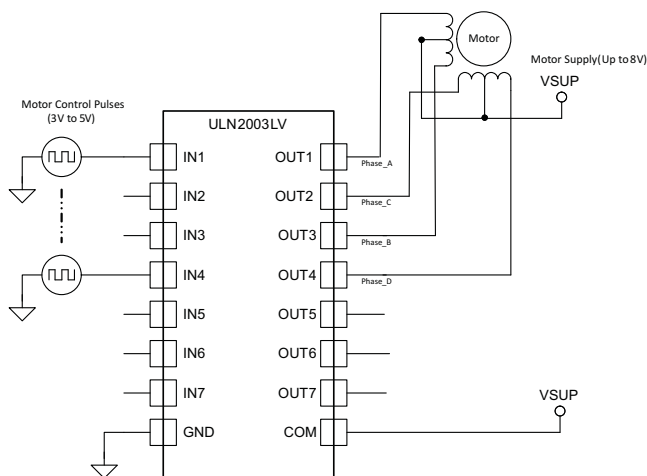

Figure 11. ULN2003LV as a Stepper Motor Driver

8.3.4 NOR Logic Driver

[Figure 12](#) shows a NOR Logic driver implementation using ULN2003LV. The output channels sharing a common pull-up resistor implement a logic NOR of the respective channel inputs. The LEDs connected to outputs OUT5-OUT7 light up when any of the inputs IN5-IN7 is logic-high ($> V_{IH}$).

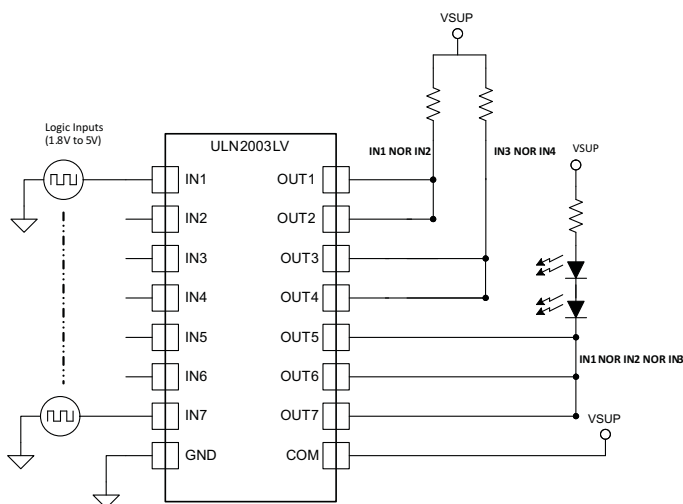

Figure 12. ULN2003LV as a NOR driver

System Examples (continued)

8.3.5 1.8-V Relay Driver

To drive lower voltage relays, like 1.8V, connect two or more adjacent channels in parallel as shown in [Figure 13](#). Connecting several channels in parallel lowers the channel output resistance and thus minimizes VOL for a fixed current.

Figure 13. ULN2003LV Driving 1.8V Relays

9 Power Supply Recommendations

The COM pin is the power supply pin of this device to power the gate drive circuitry. Although not required but depending on the power supply, TI recommends to put a bypass capacitor of 100 nF across the Vcom pin and Gnd.

10 Layout

10.1 Layout Guidelines

Thin traces can be used on the input due to the low current logic that is typically used to drive ULN2003LV. Take care to separate the input channels as much as possible, as to eliminate cross-talk. Thick traces are recommended for the output, in order to drive high currents that may be needed. Wire thickness can be determined by the trace material's current density and desired drive current. Since all of the channels currents return to a common ground, it is best to size that trace width to be very wide. Some applications require up to 1 A.

10.2 Layout Example

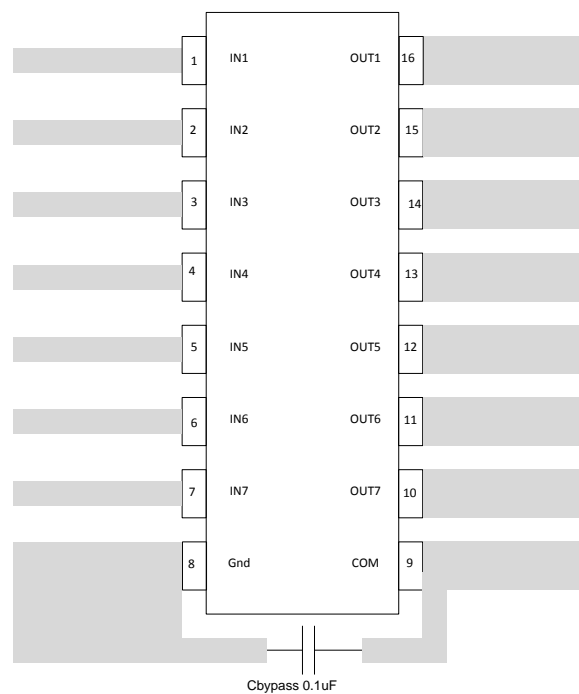

Figure 14. Layout Example Recommendation

10.3 On-Chip Power Dissipation

Use [Equation 3](#) to calculate ULN2003LV on-chip power dissipation P_D :

$$P_D = \sum_{i=1}^N V_{OLi} \times I_{Li}$$

where

- N is the number of channels active together.
- V_{OLi} is the OUT_i pin voltage for the load current I_{Li} .

(3)

10.4 Thermal Considerations

TI recommends to limit ULN2003LV IC's die junction temperature to less than 125°C. The IC junction temperature is directly proportional to the on-chip power dissipation. Use the following equation to calculate the maximum allowable on-chip power dissipation for a target IC junction temperature:

$$PD_{(MAX)} = \frac{(T_{J(MAX)} - T_A)}{\theta_{JA}}$$

where

- $T_{J(MAX)}$ is the target maximum junction temperature.
- T_A is the operating ambient temperature.
- $R_{\theta JA}$ is the package junction to ambient thermal resistance. (4)

10.4.1 Improving Package Thermal Performance

The package $R_{\theta JA}$ value under standard conditions on a High-K board is listed in the [Dissipation Ratings](#). $R_{\theta JA}$ value depends on the PCB layout. An external heat sink and/or a cooling mechanism, like a cold air fan, can help reduce $R_{\theta JA}$ and thus improve device thermal capabilities. Refer to TI's design support web page at www.ti.com/thermal for a general guidance on improving device thermal performance.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
