

LM27762 集成低噪声正负输出的电荷泵和 LDO

1 特性

- 可生成低噪声、可调节的 1.5V 至 5V 的正电源电压和 -5V 至 -1.5V 的负电源电压
- 输入电压范围为 2.7V 至 5.5V
- $\pm 250\text{mA}$ 输出电流
- 反向电荷泵紧接一个负电压低压降稳压器 (LDO)
- 2MHz 固定频率、低噪声运行
- 2.5Ω 逆变器输出阻抗, $V_{\text{IN}} = 5\text{V}$
- 电流为 100mA 时的负电压 LDO 压降电压为 30mV, $V_{\text{OUT}} = -5\text{V}$
- 电流为 100mA 时的正电压 LDO 压降电压为 45mV, $V_{\text{OUT}} = 5\text{V}$
- $390\mu\text{A}$ 静态电流 (典型值)
- 关断时的静态电流降至 $0.5\mu\text{A}$ (典型值)
- 电流限制和热保护
- 电源正常引脚 (低电平有效)
- 使用 LM27762 并借助 **WEBENCH®** 电源设计器创建定制设计

2 应用

- 高保真 (Hi-Fi) 音频耳机放大器
- 运算放大器电源偏置
- 为数据转换器供电
- 无线通信系统
- 接口电源
- 手持式仪表

3 说明

LM27762 提供 $\pm 1.5\text{V}$ 至 $\pm 5\text{V}$ 可调节、超低噪声正负输出。输入电压范围为 2.7V 至 5.5V, 输出电流高达 $\pm 250\text{mA}$ 。LM27762 的工作电流仅为 $390\mu\text{A}$ 并且关断电流的典型值为 $0.5\mu\text{A}$, 因此可为功率放大器、数模转换器 (DAC) 偏置以及其他大电流、低噪声、负电压应用提供理想性能。该器件采用小型解决方案尺寸, 所需外部组件很少。

负电压由经过稳压的反相电荷泵生成, 该电荷泵紧接一个低噪声、负电压 LDO。LM27762 器件的反相电荷泵在 2MHz (典型值) 开关频率下运行, 可减少输出阻抗和电压纹波。正电压由低噪声正电压 LDO 的输入生成。

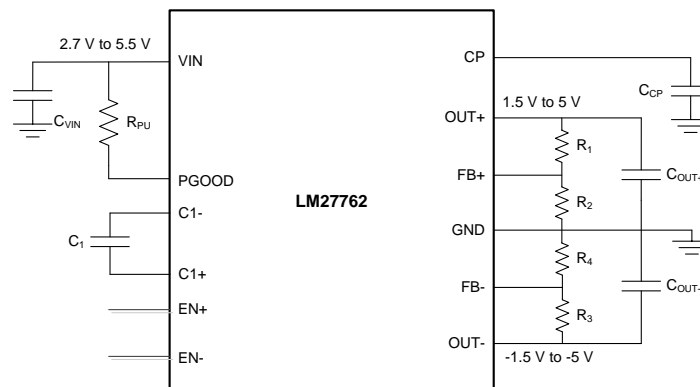

LM27762 的正负电压输出配有专用使能输入。为满足特定的系统电源排序需要, 这些输出支持独立的正负电源轨时序。使能输入也可短接在一起并与输入电压相连。LM27762 具有可选的电源正常功能。

6 Specifications

6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
V _{IN} to GND or GND to V _{OUT}		5.8	V
EN+, EN-	GND – 0.3	V _{IN}	V
C _{POUT} , OUT+ and OUT- , continuous output current		300	mA
OUT+, OUT- short-circuit duration to GND ⁽³⁾		1	s
Continuous power dissipation ⁽⁴⁾	Internally limited		
T _{JMAX} ⁽⁴⁾		150	°C
Operating input voltage, V _{IN}	2.7	5.5	V
Operating output current, I _{OUT}	0	250	mA
Operating ambient temperature, T _A	–40	85	°C
Operating junction temperature, T _J	–40	125	°C
Storage temperature, T _{stg}	–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, contact the TI Sales Office/Distributors for availability and specifications.
- (3) OUT may be shorted to GND for one second without damage. However, shorting OUT to V_{IN} may damage the device and must be avoided. Also, for temperatures above T_A = 85°C, V_{OUT} must not be shorted to GND or V_{IN} or device may be damaged.
- (4) Internal thermal shutdown circuitry protects the device from damage.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Operating ambient temperature, T _A	–40	85	°C
Operating junction temperature, T _J	–40	125	°C

V_{FB+}	Feedback pin reference voltage		1.182	1.2	1.218	V
V_{OUT+}	Adjustable output voltage	$5.5\text{ V} \geq V_{IN} \geq 2.7\text{ V}$	1.5		5	V
	Load regulation	0 to 250 mA, $V_{OUT+} = 1.8\text{ V}$		11		$\mu\text{V}/\text{mA}$
	Line regulation	$5\text{ V} \geq V_{IN} \geq 2.7\text{ V}$, $I_L = 50\text{ mA}$		1.9		mV/V
V_{IH}	Enable pin input voltage high	$5.5\text{ V} \geq V_{IN} \geq 2.7\text{ V}$	1.2			V
V_{IL}	Enable pin input voltage low	$5.5\text{ V} \geq V_{IN} \geq 2.7\text{ V}$			0.4	V

(1) When $V_{IN} = 5.5\text{ V}$ charge pump may enter PWM mode in hot conditions.

6.6 Typical Characteristics

Typical Characteristics (接下页)

7 Detailed Description

7.1 Overview

The LM27762 low-noise inverting charge pump with both positive and negative LDOs delivers very low-noise adjustable positive and negative outputs between ± 1.5 V and ± 5 V. The output voltage levels of the positive and negative LDO are independently controllable with external resistors. Input voltage range of LM27762 is from 2.7 V to 5.5 V. Five low-cost capacitors are used in this circuit to provide up to ± 250 mA of output current. The LM27762 operates at 2-MHz (typical) switching frequency to reduce output resistance and voltage ripple. With an typical operating current of only 390 μ A and 0.5- μ A typical shutdown current, the LM27762 provides ideal performance for power amplifiers and DAC bias and other high-current, low-noise negative voltage needs.

The LM27762 device has an enable input (EN+) for the positive LDO and another enable input (EN-) for the negative charge pump and LDO. This supports independent timing for the positive and negative rails in system power sequence. Enable inputs can be also shorted together and connected to VIN. When LDO is disabled, output of the positive LDO has 50-k Ω pulldown to ground, and output of the negative LDO has 50-k Ω pullup to ground. The LM27762 has power good monitoring for OUT+ and OUT- outputs. The PGOOD pin is an open-drain output and requires an external pullup resistor. When Power Good feature is not used, PGOOD pin can be connected to ground.

7.3 Feature Description

7.3.1 Undervoltage Lockout

The LM27762 has an internal comparator that monitors the voltage at V_{IN} and forces the device into shutdown if the input voltage drops to 2.4 V. If the input voltage rises above 2.6 V, the LM27762 resumes normal operation.

7.3.2 Input Current Limit

The LM27762 contains current limit circuitry that protects the device in the event of excessive input current and/or output shorts to ground. The charge pump and positive LDO both have 500 mA (typical) input current limit when the output is shorted directly to ground. When the LM27762 is current limiting, power dissipation in the device is likely to be quite high. In this event, thermal cycling is expected.

7.3.3 PFM Operation

To minimize quiescent current during light load operation, the LM27762 allows PFM or pulse-skipping operation. By allowing the charge pump to switch less when the output current is low, the quiescent current drawn from the power source is minimized. The frequency of pulsed operation is not limited and can drop into the sub-2-kHz range when unloaded. As the load increases, the frequency of pulsing increases until it transitions to constant frequency. The fundamental switching frequency in the LM27762 is 2 MHz.

7.3.4 Output Discharge

In shutdown, the LM27762 actively pulls down on the outputs (OUT+, OUT–) of the device until the output voltage reaches GND.

7.3.5 Power Good Output (PGOOD)

The LM27762 has monitoring for the OUT+ and OUT– output voltage levels and open-drain PGOOD output.

表 1. PGOOD (Active Low) Operation

EN+	EN–	OUT+	OUT–	PGOOD
Low	Low	Don't care	Don't care	High
High	Low	< 95% of target value	Don't care	High
High	Low	> 95% of target value	Don't care	Low
Low	High	Don't care	< 95% of target value	High
Low	High	Don't care	> 95% of target value	Low
High	High	< 95% of target value	Don't care	High
High	High	Don't care	< 95% of target value	High
High	High	> 95% of target value	> 95% of target value	Low

7.3.6 Thermal Shutdown

The LM27762 implements a thermal shutdown mechanism to protect the device from damage due to overheating. When the junction temperature rises to 150°C (typical), the device switches into shutdown mode. The LM27762 releases thermal shutdown when the junction temperature is reduced to 130°C (typical).

Thermal shutdown is most often triggered by self-heating, which occurs when there is excessive power dissipation in the device and/or insufficient thermal dissipation. The LM27762 device power dissipation increases with increased output current and input voltage. When self-heating brings on thermal shutdown, thermal cycling is the typical result. Thermal cycling is the repeating process where the part self-heats, enters thermal shutdown (where internal power dissipation is practically zero), cools, turns on, and then heats up again to the thermal shutdown threshold. Thermal cycling is recognized by a pulsing output voltage and can be stopped by reducing the internal power dissipation (reduce input voltage and/or output current) or the ambient temperature. If thermal cycling occurs under desired operating conditions, thermal dissipation performance must be improved to accommodate the power dissipation of the device.

7.4 Device Functional Modes

7.4.1 Shutdown Mode

When enable pins (EN+, EN–) are low, both positive and negative outputs of LM27762 are disabled, and the device is in shutdown mode reducing the quiescent current to minimum level. In shutdown, the outputs of the LM27762 are pulled to ground (internal 50 k Ω between each OUT pin and ground).

7.4.2 Enable Mode

Applying a voltage greater than 1.2 V to the EN+ pin enables the positive LDO. Applying a voltage greater than 1.2 V to the EN– pin enables the negative CP and LDO. When enabled, the positive and negative output voltages are equal to levels set by external resistors. Care must be taken to both the positive LDO and the inverting charge pump followed by negative LDO have enough headroom. Power Good output PGOOD indicates the status of OUT+ and OUT– voltage levels.

8 Application and Implementation

注

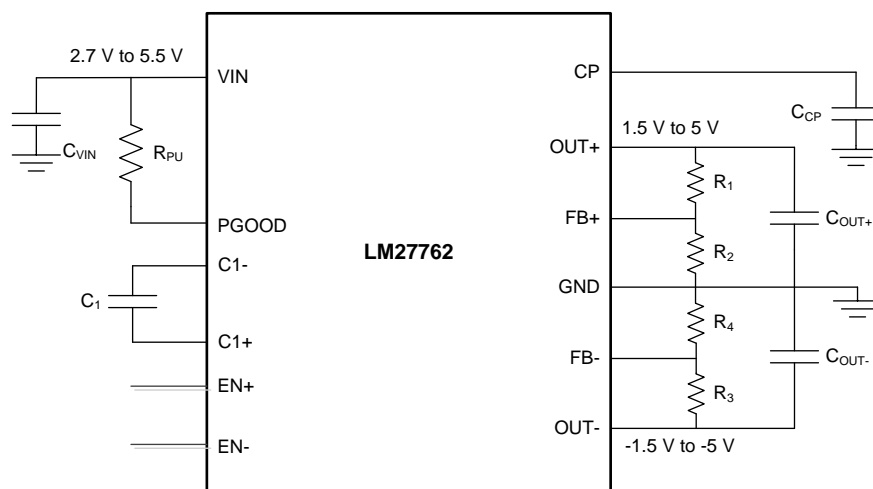

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LM27762 input voltage range is from 2.7 V to 5.5 V. The positive LDO provides a positive voltage configurable with external gain setting resistors R_1 , R_2 . The low-noise charge-pump voltage converter inverts the input voltage V to a negative output voltage. Charge pump is followed by the negative LDO which regulates a negative output voltage configurable with external gain setting resistors R_3 , R_4 . Output voltage range is ± 1.5 V to ± 5 V. When selecting input (VIN) and output (OUT+, OUT-) voltages ranges, headroom required by the charge pump and LDOs must be considered. Charge-pump minimum headroom can be estimated based on the maximum load current and charge pump output resistance.

The device uses five low-cost capacitors to provide up to 250 mA of output current. The LM27762 operates at a 2-MHz oscillator frequency to reduce charge-pump output resistance and voltage ripple under heavy loads. When using the optional open-drain PGOOD feature, connect a 10-k Ω pullup resistor (R_{PU}) to VIN. Connect pin to ground if PGOOD is not used.

8.2 Typical Application

图 12. LM27762 Typical Application

Typical Application (接下页)

8.2.1 Design Requirements

The following example describes powering an amplifier driving high impedance headphones. Input voltage is from a smart-phone battery. Amplifier is driving 2- V_{RMS} to 600- Ω stereo headphones.

表 2. Application Example Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	3.3 V to 4.2 V
Output voltage	± 3 V
Output current	10 mA (LM27762 capability 250 mA maximum)
C_{VIN} , C_{OUT+} , C_{OUT-}	2.2 μ F
C_{CP}	4.7 μ F
R_{PU}	10 k Ω (optional, connect PGOOD pin to ground if feature is not used)

8.2.2 Detailed Design Procedure

8.2.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the LM27762 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance.
- Run thermal simulations to understand board thermal performance.
- Export customized schematic and layout into popular CAD formats.
- Print PDF reports for the design, and share the design with colleagues.

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.2.2 Positive Low-Dropout Linear Regulator and OUT+ Voltage Setting

LM27762 features a low-dropout, linear positive voltage regulator (LDO). The LDO output is rated for a current of 250 mA. This LDO allows the device to provide a very low noise output, low output voltage ripple, high PSRR, and low line or load transient response.

The positive output voltage of the LM27762 is externally configurable. The value of R_1 and R_2 determines the output voltage setting. The output voltage can be calculated using [公式 1](#):

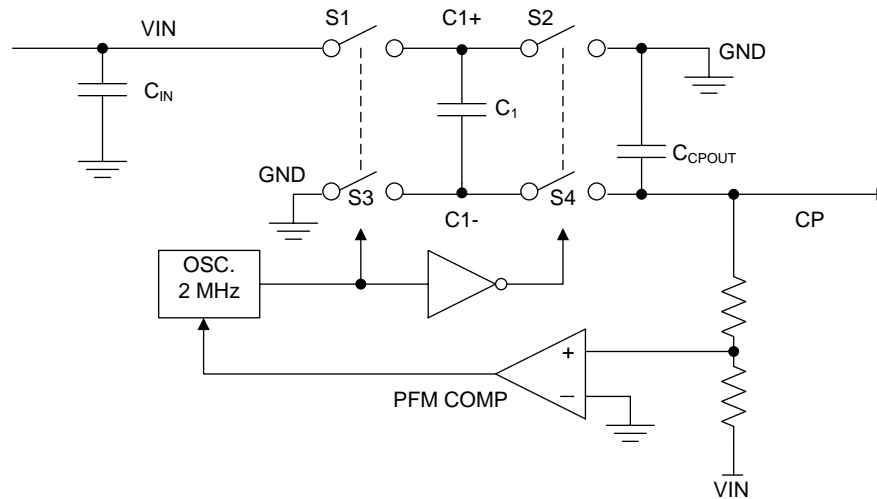

$$V_{OUT} = 1.2 \text{ V} \times (R_1 + R_2) / R_2 \quad (1)$$

The value for R_2 must be no less than 50 k Ω .

8.2.2.3 Charge-Pump Voltage Inverter

The main application of the LM27762 is to generate a regulated negative supply voltage. The voltage inverter circuit uses only three external capacitors, and the LDO regulator circuit uses one additional output capacitor.

The voltage inverter portion of the LM27761 contains four large CMOS switches which are switched in sequence to invert the input supply voltage. Energy transfer and storage are provided by external capacitors. [图 13](#) shows the voltage switches S2 and S4 are open. In the second time interval, S1 and S3 are open; at the same time, S2 and S4 are closed, and C_1 is charging C_{CP} . After a number of cycles, the voltage across C_{CP} is pumped into V_{IN} . Because the anode of C_{CP} is connected to ground, the output at the cathode of C_{CP} equals $-(V_{IN})$ when there is no load current. When a load is added, the output voltage drop is determined by the parasitic resistance (R_{DSON} of the MOSFET switches and the equivalent series resistance (ESR) of the capacitors) and the charge transfer loss between the capacitors.

Copyright © 2016, Texas Instruments Incorporated

图 13. Voltage Inverting Principle

The output characteristic of this circuit can be approximated by an ideal voltage source in series with a resistance. The voltage source equals $-(V_{IN})$. The output resistance R_{OUT} is a function of the ON resistance of the internal MOSFET switches, the oscillator frequency, the capacitance, and the ESR of C_1 and C_{CP} . Because the switching current charging and discharging C_1 is approximately twice as the output current, the effect of the ESR of the pumping capacitor C_1 is multiplied by four in the output resistance. The charge-pump output capacitor C_{CP} is charging and discharging at a current approximately equal to the output current; therefore, its ESR only counts once in the output resistance. A good approximation of charge-pump R_{OUT} is shown in [公式 2](#):

$$R_{OUT} = (2 \times R_{SW}) + [1 / (f_{SW} \times C_1)] + (4 \times ESR_{C1}) + ESR_{CCP}$$

where

- R_{SW} is the sum of the ON resistance of the internal MOSFET switches shown in [图 13](#). (2)

High capacitance and low-ESR ceramic capacitors reduce the output resistance.

8.2.2.4 Negative Low-Dropout Linear Regulator and OUT– Voltage Setting

At the output of the inverting charge-pump the LM27762 features a low-dropout, linear negative voltage regulator (LDO). The LDO output is rated for a current of 250 mA. This negative LDO allows the device to provide a very low noise output, low output voltage ripple, high PSRR, and low line or load transient response.

The negative output voltage of the LM27762 is externally configurable. The value of R_3 and R_4 determines the output voltage setting. The output voltage can be calculated using [公式 1](#):

$$V_{OUT} = -1.22 \text{ V} \times (R_3 + R_4) / R_4 \tag{3}$$

The value for R_4 must be no less than 50 k Ω .

8.2.2.5 External Capacitor Selection

The LM27762 requires 5 external capacitors for proper operation. Surface-mount multi-layer ceramic capacitors are recommended. These capacitors are small, inexpensive, and have very low ESR ($\leq 15 \text{ m}\Omega$ typical). Tantalum capacitors, OS-CON capacitors, and aluminum electrolytic capacitors generally are not recommended for use with the LM27762 due to their high ESR compared to ceramic capacitors.

For most applications, ceramic capacitors with an X7R or X5R temperature characteristic are preferable for use with the LM27762. These capacitors have tight capacitance tolerances (as good as $\pm 10\%$) and hold their value over temperature (X7R: $\pm 15\%$ over -55°C to $+125^\circ\text{C}$; X5R $\pm 15\%$ over -55°C to $+85^\circ\text{C}$).

Using capacitors with a Y5V or Z5U temperature characteristic is generally not recommended for the LM27762. These capacitors typically have wide capacitance tolerance (80%, ...20%) and vary significantly over temperature (Y5V: 22%, –82% over –30°C to +85°C range; Z5U: 22%, –56% over 10°C to 85°C range). Under some conditions a 1- μF -rated Y5V or Z5U capacitor could have a capacitance as low as 0.1 μF . Such detrimental deviation is likely to cause Y5V and Z5U capacitors to fail to meet the minimum capacitance requirements of the LM27762.

Net capacitance of a ceramic capacitor decreases with increased DC bias. This degradation can result in lower-than-expected capacitance on the input and/or output, resulting in higher ripple voltages and currents. Using capacitors at DC bias voltages significantly below the capacitor voltage rating usually minimizes DC bias effects. Consult capacitor manufacturers for information on capacitor DC bias characteristics.

Capacitance characteristics can vary quite dramatically with different application conditions, capacitor types, and capacitor manufacturers. TI strongly recommends that the LM27762 circuit be evaluated thoroughly early in the design-in process with the mass-production capacitor of choice. This helps ensure that any such variability in capacitance does not negatively impact circuit performance.

8.2.2.5.1 Charge-Pump Output Capacitor

In typical applications, Texas Instruments recommends a 4.7- μF low-ESR ceramic charge-pump output capacitor (C_{CP}). Different output capacitance values can be used to reduce charge pump ripple, shrink the solution size, and/or cut the cost of the solution. However, changing the output capacitor may also require changing the flying capacitor or input capacitor to maintain good overall circuit performance.

In higher-current applications, a 10- μF , 10-V low-ESR ceramic output capacitor is recommended. If a small output capacitor is used, the output ripple can become large during the transition between PFM mode and constant switching. To prevent toggling, a 2- μF capacitance is recommended. For example, 10- μF , 10-V output capacitor in a 0402 case size typically has only 2- μF capacitance when biased to 5 V.

8.2.2.5.2 Input Capacitor

The input capacitor (C_2) is a reservoir of charge that aids in a quick transfer of charge from the supply to the flying capacitors during the charge phase of operation. The input capacitor helps to keep the input voltage from drooping at the start of the charge phase when the flying capacitors are connected to the input. It also filters noise on the input pin, keeping this noise out of the sensitive internal analog circuitry that is biased off the input line.

Input capacitance has a dominant and first-order effect on the input ripple magnitude. Increasing (decreasing) the input capacitance results in a proportional decrease (increase) in input voltage ripple. Input voltage, output current, and flying capacitance also affects input ripple levels to some degree.

In typical applications, a 4.7- μF low-ESR ceramic capacitor is recommended on the input. When operating near the maximum load of 250 mA, after taking into the DC bias derating, a minimum recommended input capacitance is 2 μF or larger. Different input capacitance values can be used to reduce ripple, shrink the solution size, and/or cut the cost of the solution.

8.2.2.5.3 Flying Capacitor

The flying capacitor (C_1) transfers charge from the input to the output. Flying capacitance can impact both output current capability and ripple magnitudes. If flying capacitance is too small, the LM27762 may not be able to regulate the output voltage when load currents are high. On the other hand, if the flying capacitance is too large, the flying capacitor might overwhelm the input and charge pump output capacitors, resulting in increased input and output ripple.

In typical high-current applications, 0.47- μF or 1- μF 10-V low-ESR ceramic capacitors are recommended for the flying capacitors. Polarized capacitors (tantalum, aluminum, electrolytic, etc.) must not be used for the flying capacitor, as they could become reverse-biased during LM27762 operation.

8.2.2.5.4 LDO Output Capacitor

The LDO output capacitor (C_{OUT+} , C_{OUT-}) value and the ESR affect stability, output ripple, output noise, PSRR and transient response. The LM27762 only requires the use of a 2.2- μF ceramic output capacitor for stable operation. For typical applications, a 2.2- μF ceramic output capacitor located close to the output is sufficient.

8.2.2.6 Power Dissipation

The allowed power dissipation for any package is a measure of the ability of the device to pass heat from the junctions of the device to the heatsink and the ambient environment. Thus, the power dissipation is dependent on the ambient temperature and the thermal resistance across the various interfaces between the die junction and ambient air.

The maximum allowable power dissipation can be calculated by [公式 4](#):

$$P_{D-MAX} = (T_{J-MAX} - T_A) / R_{\theta JA} \tag{4}$$

The actual power being dissipated in the device can be represented by [公式 5](#):

$$P_D = P_{IN} - P_{OUT} = V_{IN} \times (-I_{OUT-} + I_{OUT+} + I_Q) - (V_{OUT+} \times I_{OUT+} + V_{OUT-} \times I_{OUT-}) \tag{5}$$

[公式 4](#) 和 [公式 5](#) establish the relationship between the maximum power dissipation allowed due to thermal consideration, the voltage drop across the device, and the continuous current capability of the device. These equations must be used to determine the optimum operating conditions for the device in a given application.

In lower power dissipation applications the maximum ambient temperature (T_{A-MAX}) may be increased. In higher power dissipation applications the maximum ambient temperature (T_{A-MAX}) may have to be derated. T_{A-MAX} can be calculated using [公式 6](#):

$$T_{A-MAX} = T_{J-MAX-OP} - (R_{\theta JA} \times P_{D-MAX})$$

where

- $T_{J-MAX-OP}$ = maximum operating junction temperature (125°C)
 - P_{D-MAX} = the maximum allowable power dissipation
 - $R_{\theta JA}$ = junction-to-ambient thermal resistance of the package
- (6)

Alternately, if T_{A-MAX} cannot be derated, the power dissipation value must be reduced. This can be accomplished by reducing the input voltage as long as the minimum V_{IN} is not violated, or by reducing the output current, or some combination of the two.

8.2.3 Application Curves

Refer also to [Typical Characteristics](#)

9 Power Supply Recommendations

The LM27762 is designed to operate from an input voltage supply range between 2.7 V and 5.5 V. This input supply must be well regulated and capable of supplying the required input current. If the input supply is located far from the LM27762, additional bulk capacitance may be required in addition to the ceramic bypass capacitors.

10 Layout

10.1 Layout Guidelines

The high switching frequency and large switching currents of the LM27762 make the choice of layout important. Use the following steps as a reference to ensure the device is stable and maintains proper LED current regulation across its intended operating voltage and current range:

- Place C_{IN} on the top layer (same layer as the LM27762) and as close as possible to the device. Connecting the input capacitor through short, wide traces to both the VIN and GND pins reduces the inductive voltage spikes that occur during switching, which can corrupt the VIN line.
- Place C_{CPOUT} on the top layer (same layer as the LM27762) and as close as possible to the VOUT and GND pins. The returns for both C_{IN} and C_{CPOUT} must come together at one point, as close as possible to the GND pin. Connecting C_{CPOUT} through short, wide traces reduces the series inductance on the VCPOUT and GND pins that can corrupt the VCPOUT and GND lines and cause excessive noise in the device and surrounding circuitry.
- Place C_1 on top layer (same layer as the LM27762) and as close as possible to the device. Connect the flying capacitor through short, wide traces to both the C1+ and C1– pins.
- Place C_{OUT+} , C_{OUT-} on the top layer (same layer as the LM27762) and as close to the respective OUT pin as possible. For best performance the ground connection for C_{OUT} must connect back to the GND connection at the thermal pad of the device.
- Place R_1 to R_4 on the top layer (same layer as LM27762) and as close as possible to the respective FB pin. For best performance the ground connection of R_2 , R_4 must connect back to the GND connection at the thermal pad of the device.

Connections using long trace lengths, narrow trace widths, or connections through vias must be avoided. These add parasitic inductance and resistance that results in inferior performance, especially during transient conditions.

10.2 Layout Example

(Note: Pullup resistor for PGOOD not shown in example.)

11 器件和文档支持

11.1 器件支持

- 《使用 [LM27762EVM 评估模块](#)》

11.1.1 开发支持

11.1.1.1 使用 **WEBENCH®** 工具创建定制设计

请单击[此处](#)，使用 LM27762 器件并借助 WEBENCH® 电源设计器创建定制设计。

1. 在开始阶段键入输出电压 (V_{IN})、输出电压 (V_{OUT}) 和输出电流 (I_{OUT}) 要求。
2. 使用优化器拨盘优化关键设计参数，如效率、封装和成本。
3. 将生成的设计与德州仪器 (TI) 的其他解决方案进行比较。

WEBENCH Power Designer 提供一份定制原理图以及罗列实时价格和组件可用性的物料清单。

在多数情况下，可执行以下操作：

- 运行电气仿真，观察重要波形以及电路性能
- 运行热性能仿真，了解电路板热性能
- 将定制原理图和布局方案导出至常用 CAD 格式
- 打印设计方案的 PDF 报告并与同事共享

有关 WEBENCH 工具的详细信息，请访问 www.ti.com/WEBENCH。

11.2 接收文档更新通知

要接收文档更新通知，请导航至德州仪器 TI.com.cn 上的器件产品文件夹。请单击右上角的[通知我](#)进行注册，即可收到任意产品信息更改每周摘要。有关更改的详细信息，请查看任意已修订文档中包含的修订历史记录。

11.3 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [《使用条款》](#)。

TI E2E™ 在线社区 *TI 的工程师对工程师 (E2E) 社区*。此社区的创建目的在于促进工程师之间的协作。在 e2e.ti.com 中，您可以咨询问题、分享知识、拓展思路并与同行工程师一道帮助解决问题。

设计支持 *TI 参考设计支持* 可帮助您快速查找有帮助的 E2E 论坛、设计支持工具以及技术支持的联系信息。

11.4 商标

E2E is a trademark of Texas Instruments.

WEBENCH is a registered trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

11.5 静电放电警告

这些装置包含有限的内置 ESD 保护。存储或装卸时，应将导线一起截短或将装置放置于导电泡棉中，以防止 MOS 门极遭受静电损伤。

11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 机械、封装和可订购信息

以下页面包括机械、封装和可订购信息。这些信息是指定器件的最新可用数据。这些数据发生变化时，我们可能不会另行通知或修订此文档。如欲获取此产品说明书的浏览器版本，请参阅左侧的导航栏。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM27762DSSR	ACTIVE	WSON	DSS	12	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	L27762	Samples
LM27762DSST	ACTIVE	WSON	DSS	12	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	L27762	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (<http://www.ti.com/sc/docs/stdterms.htm>) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和该等应用中所用 TI 产品的功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关 TI 资源。但并未依据禁止反言原则或其他法理授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或与美国 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
