

## 超低功率、轨到轨输出、完全差分放大器

 查询样品: **THS4531**

### 特性

- 超低功耗
  - 电压: **2.5V 至 5.5V**
  - 电流: **250µA**
  - 断电模式 **0.5µA** (典型值)
- 完全差分架构
- 带宽: **36MHz**
- 转换速率: **200V/µs**
- 总谐波失真: **1kHz (1V<sub>RMS</sub>, R<sub>L</sub> = 2kΩ) 时为-120dBc**
- 输入电压噪声: **10nV/√Hz (f=1 kHz)**
- 高 DC 精度
  - V<sub>OS</sub> 偏移 = **±4µV/°C (-40°C 至 +125°C)**
  - A<sub>OL</sub>: **114 dB**
- **RRO** - 轨至轨输出
- **NRI** - 负电源轨输入
- 输出共模控制

### 应用范围

- 低功耗逐次逼近式 (**SAR**)、三角积分模数转换器 (**ΔΣ ADC**) 驱动器
- 低功耗、高性能
  - 差分到差分放大器
  - 单端至差分放大器
- 低功耗、宽带宽差分驱动器
- 低功耗、宽带宽差分信号调节
- 高通道数量和功率密集系统

### 说明

THS4531 是一款低功耗、完全差分运算放大器，此放大器具有 低于负电源轨和轨到轨输出的输入共模范围。此器件设计用于能耗和功率耗散都十分关键的低功率数据采集系统和高密度应用。

此器件特有精确输出共模控制，此控制可实现驱动 ADC 时的 dc 耦合。与低于负电源轨和轨到轨输出的输入共模范围相耦合可轻松实现来自单端接地基准信号源的接口与 SAR 的连接，并允许 ΔΣ ADC 只使用 2.5V 至 5V 的单一电源。它也是一个针对通用低功耗差分信号调节应用的有用的工具。

THS4531 可在介于 -40°C 至 +125°C 的扩展温度范围内运行。可提供下列封装选项：

- 8 引脚小尺寸集成电路 (SOIC) / 超小型小尺寸封装 (VSSOP) (微型小尺寸封装 (MSOP)) (D/DGK)
- 10 引脚方形扁平无引脚封装 (WQFN) (RUN) 封装

THS4520	570	15.3	-114	2	输出
THS4121	100	16	-79	5.4	输入/输出
THS4131	150	16	-107	1.3	否

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

<b>INPUT</b>						
Common-mode input: low	$T_A = +25^\circ\text{C}$ , CMRR > 87 dB		$V_{S-} - 0.2$	$V_{S-}$	V	A
	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$ , CMRR > 87 dB		$V_{S-} - 0.2$	$V_{S-}$		B
Common-mode input: high	$T_A = +25^\circ\text{C}$ , CMRR > 87 dB	$V_{S+} - 1.2$	$V_{S+} - 1.1$		V	A
	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$ , CMRR > 87 dB	$V_{S+} - 1.2$	$V_{S+} - 1.1$			B
Common-mode rejection ratio		90	116		dB	A
Input impedance common-mode			$200 \parallel 1.2$		k $\Omega$    pF	C
Input impedance differential mode			$200 \parallel 1$			C
<b>OUTPUT</b>						
Linear output voltage: low	$T_A = +25^\circ\text{C}$		$V_{S-} + 0.1$	$V_{S-} + 0.2$	V	A
	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$		$V_{S-} + 0.1$	$V_{S-} + 0.2$		B
Linear output voltage: high	$T_A = +25^\circ\text{C}$	$V_{S+} - 0.25$	$V_{S+} - 0.12$		V	A
	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	$V_{S+} - 0.25$	$V_{S+} - 0.12$			B
Output saturation voltage: high/low			120/100		mV	C
Linear output current drive	$T_A = +25^\circ\text{C}$	$\pm 15$	$\pm 25$		mA	A
	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	$\pm 15$				B

(2) Input offset voltage drift, input bias current drift, and input offset current drift are average values calculated by taking data at the end points, computing the difference, and dividing by the temperature range.

**ELECTRICAL CHARACTERISTICS:  $V_S = 5\text{ V}$  (continued)**

Test conditions at  $T_A = +25^\circ\text{C}$ ,  $V_{S+} = 5\text{ V}$ ,  $V_{S-} = 0\text{ V}$ ,  $V_{OCM} = \text{open}$ ,  $V_{OUT} = 2\text{ V}_{PP}$ ,  $R_F = 2\text{ k}\Omega$ ,  $R_L = 2\text{ k}\Omega$  differential,  $G = 1\text{ V/V}$ , single-ended input, differential output, and input and output referenced to mid-supply, unless otherwise noted.

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS	TEST LEVEL <sup>(1)</sup>
<b>POWER SUPPLY</b>						
Specified operating voltage		2.5		5.5	V	B

## APPLICATION INFORMATION

### TYPICAL CHARACTERISTICS TEST CIRCUITS

Figure 68 shows the general test circuit built on the EVM that was used for testing the THS4531. For simplicity, power supply decoupling is not shown – please see layout in the applications section for recommendations. Depending on the test conditions, component values are changed per Table 2 and Table 3, or as otherwise noted. Some of the signal generators used are ac coupled 50Ω sources and a 0.22μF cap and 49.9Ω resistor to ground are inserted across  $R_{IT}$  on the un-driven or alternate input as shown to balance the circuit. Split-power supply is used to ease the interface to common lab test equipment, but if properly biased, the amplifier can be operated single-supply as described in the applications section with no impact on performance. For most of the tests, the devices are tested with single ended input and a transformer on the output to convert the differential output to single ended because common lab test equipment have single ended inputs and outputs. Performance is the same or better with differential input and differential output.

Figure 68. General Test Circuit

Table 2. Gain Component Values for Single-Ended Input<sup>(1)</sup>

GAIN	$R_F$	$R_G$	$R_{IT}$
1 V/V	2kΩ	2kΩ	51.1Ω
2 V/V	2kΩ	1kΩ	52.3Ω
5 V/V	2kΩ	392Ω	53.6Ω
10 V/V	2kΩ	187kΩ	57.6Ω

(1) Note components are chosen to achieve gain and 50Ω input termination. Resistor values shown are closest standard values so gains are approximate.

Table 3. Load Component Values For 1:1 Differential to Single-Ended Output Transformer<sup>(1)</sup>

$R_L$	$R_O$	$R_{OT}$	ATTEN
100Ω	25Ω	open	6
200Ω	86.6Ω	69.8Ω	16.8
499Ω	237Ω	56.2Ω	25.5
1kΩ	487Ω	52.3Ω	31.8
2kΩ	976Ω	51.1Ω	37.9

(1) Note the total load includes 50Ω termination by the test equipment. Components are chosen to achieve load and 50Ω line termination through a 1:1 transformer. Resistor values shown are closest standard values so loads are approximate.

Due to the voltage divider on the output formed by the load component values, the amplifier's output is attenuated. The column "Atten" in [Table 3](#) shows the attenuation expected from the resistor divider. When using a transformer at the output as shown in [Figure 68](#), the signal will see slightly more loss due to transformer and line loss, and these numbers will be approximate. The standard output load used for most tests is 2k $\Omega$  with associated 37.9dB of loss.

### Frequency Response, and Output Impedance

The circuit shown in [Figure 68](#) is used to measure the frequency response of the amplifier.

A network analyzer is used as the signal source and the measurement device. The output impedance of the network analyzer is 50 $\Omega$  and is DC coupled.  $R_{IT}$  and  $R_G$  are chosen to impedance match to 50 $\Omega$  and maintain the proper gain. To balance the amplifier, a 49.9 $\Omega$  resistor to ground is inserted across  $R_{IT}$  on the alternate input.

The output is routed to the input of the network analyzer via 50 $\Omega$  coax. For 2k load, 37.9dB is added to the measurement to refer back to the amplifier's output per [Table 3](#).

For output impedance, the signal is injected at  $V_{OUT}$  with  $V_{IN}$  left open. The voltage drop across the 2x  $R_O$  resistors is measured with a high impedance differential probe and used to calculate the impedance seen looking into the amplifier's output.

### Distortion

At 1MHz and above, the circuit shown in [Figure 68](#) is used to measure harmonic, intermodulation distortion, and output impedance of the amplifier.

A signal generator is used as the signal source and the output is measured with a spectrum analyzer. The output impedance of the signal generator is 50 $\Omega$  and is AC coupled.  $R_{IT}$  and  $R_G$  are chosen to impedance match to 50 $\Omega$  and maintain the proper gain. To balance the amplifier, a 0.22 $\mu$ F cap and 49.9 $\Omega$  resistor to ground is inserted across  $R_{IT}$  on the alternate input. A low-pass filter is inserted in series with the input to reduce harmonics generated at the signal source. The level of the fundamental is measured and then a high-pass filter is inserted at the output to reduce the fundamental so it does not generate distortion in the input of the spectrum analyzer.

Distortion in the audio band is measured using an audio analyzer. Refer to audio measurement section for detail.

### Slew Rate, Transient Response, Settling Time, Overdrive, Output Voltage, and Turn-On/Off Time

The circuit shown in [Figure 69](#) is used to measure slew rate, transient response, settling time, overdrive recovery, and output voltage swing. Turn on and turn off times are measured with 50 $\Omega$  input termination on the  $\overline{PD}$  input, by replacing the 0.22 $\mu$ F capacitor with 49.9 $\Omega$  resistor.

**Figure 69. Slew Rate, Transient Response, Settling Time,  $Z_O$ , Overdrive Recovery,  $V_{OUT}$  Swing, and Turn-on/off Test Circuit**

**Common-Mode and Power Supply Rejection**

The circuit shown in [Figure 70](#) is used to measure the CMRR. The signal from the network analyzer is applied common-mode to the input.

**Figure 70. CMRR Test Circuit**

[Figure 71](#) is used to measure the PSRR of  $V_{S+}$  and  $V_{S-}$ . The power supply is applied to the network analyzer's DC offset input. For both CMRR and PSRR, the output is probed using a high impedance differential probe across  $R_{OT}$ .

Figure 71. PSRR Test Circuit

**V<sub>OCM</sub> Input**

The circuit shown in Figure 72 is used to measure the transient response, frequency response and input impedance of the V<sub>OCM</sub> input. For these tests, the cal point is across the 49.9Ω V<sub>OCM</sub> termination resistor. Transient response and frequency response are measured with R<sub>CM</sub> = 0Ω and using a high impedance differential probe at the summing junction of the two R<sub>O</sub> resistors, with respect to ground. The input impedance is measured using a high impedance differential probe at the V<sub>OCM</sub> pin and the drop across R<sub>CM</sub> is used to calculate the impedance seen looking into the amplifier's V<sub>OCM</sub> input.

Figure 72. V<sub>OCM</sub> Input Test Circuit

**Balance Error**

The circuit shown in Figure 73 is used to measure the balance error of the main differential amplifier. A network analyzer is used as the signal source and the measurement device. The output impedance of the network analyzer is  $50\Omega$  and is DC coupled.  $R_{IT}$  and  $R_G$  are chosen to impedance match to  $50\Omega$  and maintain the proper gain. To balance the amplifier, a  $49.9\Omega$  resistor to ground is inserted across  $R_{IT}$  on the alternate input. The output is measured using a high impedance differential probe at the summing junction of the two  $R_O$  resistors, with respect to ground.

**Figure 73. Balance Error Test Circuit**

**APPLICATION CIRCUITS**

The following circuits show application information for the THS4531. For simplicity, power supply decoupling capacitors are not shown in these diagrams – please see the EVM and Layout Recommendations section for recommendations. For more detail on the use and operation of fully differential op amps refer to application report “Fully-Differential Amplifiers” [SLOA054D](#).

**Differential Input to Differential Output Amplifier**

The THS4531 is a fully differential op amp and can be used to amplify differential input signals to differential output signals. A basic block diagram of the circuit is shown in [Figure 74](#) ( $V_{OCM}$  and PD inputs not shown). The gain of the circuit is set by  $R_F$  divided by  $R_G$ .

**Figure 74. Differential Input to Differential Output Amplifier**

**Single-Ended Input to Differential Output Amplifier**

The THS4531 can also be used to amplify and convert single-ended input signals to differential output signals. A basic block diagram of the circuit is shown in [Figure 75](#) ( $V_{OCM}$  and PD inputs not shown). The gain of the circuit is again set by  $R_F$  divided by  $R_G$ .

**Figure 75. Single-Ended Input to Differential Output Amplifier**

**Differential Input to Single-Ended Output Amplifier**

Fully differential op amps like the THS4531 are not recommended for differential to single-ended conversion. This application is best performed with an instrumentation amplifier or with a standard op amp configured as a classic differential amplifier. See application section of the OPA835 data sheet ([SLOS713](#)).

### Input Common-Mode Voltage Range

The input common-mode voltage of a fully differential op amp is the voltage at the “+ and –” input pins of the op amp.

It is important to not violate the input common-mode voltage range ( $V_{ICR}$ ) of the op amp. Assuming the op amp is in linear operation the voltage across the input pins is only a few millivolts at most. So finding the voltage at one input pin will determine the input common-mode voltage of the op amp.

Treating the negative input as a summing node, the voltage is given by:

$$\left( V_{OUT+} \times \frac{R_G}{R_G + R_F} \right) + \left( V_{IN-} \times \frac{R_F}{R_G + R_F} \right) \quad (1)$$

To determine the  $V_{ICR}$  of the op amp, the voltage at the negative input is evaluated at the extremes of  $V_{OUT+}$ .

As the gain of the op amp increases, the input common-mode voltage becomes closer and closer to the input common-mode voltage of the source.

### Setting the Output Common-Mode Voltage

The output common-mode voltage is set by the voltage at the  $V_{OCM}$  pin and the internal circuit works to maintain the output common-mode voltage as close as possible to this voltage. If left unconnected, the output common-mode is set to mid-supply by internal circuitry, which may be over-driven from an external source. Figure 76 is representative of the  $V_{OCM}$  input. The internal  $V_{OCM}$  circuit has about 24MHz of -3dB bandwidth, which is required for best performance, but it is intended to be a DC bias input pin. Bypass capacitors are recommended on this pin to reduce noise. The external current required to overdrive the internal resistor divider is given approximately by the formula:

$$I_{EXT} = \frac{2V_{OCM} - (V_{S+} - V_{S-})}{60k\Omega} \quad (2)$$

where  $V_{OCM}$  is the voltage applied to the  $V_{OCM}$  pin.

Figure 76. Simplified  $V_{OCM}$  Input Circuit

### Single-Supply Operation

To facilitate testing with common lab equipment, the THS4531 EVM is built to allow for split-supply operation and most of the data presented in this data sheet was taken with split-supply power inputs. But the device is designed for use with single-supply power operation and can easily be used with single-supply power without degrading the performance. The only requirement is to bias the device properly and the specifications in this data sheet are given for single supply operation.

## Low Power Applications and the Effects of Resistor Values on Bandwidth

The THS4531 is designed for the nominal value of  $R_F$  to be 2 k $\Omega$ . This gives excellent distortion performance, maximum bandwidth, best flatness, and best pulse response. It also loads the amplifier. For example; in gain of 1 with  $R_F = R_G = 2$  k $\Omega$ ,  $R_G$  to ground, and  $V_{OUT+} = 4V$ , 1mA of current will flow through the feedback path to ground. In low power applications, it is desirable to reduce this current by increasing the gain setting resistors values. Using larger value gain resistors has two primary side effects (other than lower power) due to their interaction with the device and PCB parasitic capacitance:

1. Lowers the bandwidth.
2. Lowers the phase margin
  - (a) This will cause peaking in the frequency response.
  - (b) And will cause over shoot and ringing in the pulse response.

Figure 77 shows the small signal frequency response for gain of 1 with  $R_F$  and  $R_G$  equal to 2k $\Omega$ , 10k $\Omega$ , and 100k $\Omega$ . The test was done with  $R_L = 2$  k $\Omega$ . Due to loading effects of  $R_L$ , lower values may reduce the peaking, but higher values will not have a significant effect.

As expected, larger value gain resistors cause lower bandwidth and peaking in the response (peaking in frequency response is synonymous with overshoot and ringing in pulse response).

Figure 77. THS4531 Frequency Response with Various Gain Setting Resistor Values

## Driving Capacitive Loads

The THS4531 is designed for a nominal capacitive load of 2pF (differentially). When driving capacitive loads greater than this, it is recommended to use small resistors ( $R_O$ ) in series with the output as close to the device as possible. Without  $R_O$ , capacitance on the output will interact with the output impedance of the amplifier causing phase shift in the loop gain of the amplifier that will reduce the phase margin resulting in:

1. Peaking in the frequency response.
2. Overshoot, undershoot, and ringing in the time domain response with a pulse or square-wave signal.
3. May lead to instability or oscillation.

Inserting  $R_O$  will compensate the phase shift and restore the phase margin, but it will also limit bandwidth. The circuit shown in Figure 69 is used to test for best  $R_O$  versus capacitive loads,  $C_L$ , with a capacitance placed differential across the  $V_{OUT+}$  and  $V_{OUT-}$  along with 2k $\Omega$  load resistor, and the output is measure with a differential probe. Figure 78 shows the optimum values of  $R_O$  versus capacitive loads,  $C_L$ , and Figure 79 shows the frequency response with various values. Performance is the same on both 2.7V and 5V supply.

Figure 78. Recommended Series Output Resistor vs Capacitive Load for Flat Frequency Response

Figure 79. Frequency Response for Various  $R_O$  and  $C_L$  Values

**Audio Performance**

The THS4531 provides excellent audio performance with very low quiescent power. To show performance in the audio band, the device was tested with an audio analyzer. THD+N and FFT tests were run at 1V<sub>rms</sub> output voltage. Performance is the same on both 2.7V and 5V supply. Figure 80 is the test circuit used, and Figure 81 and Figure 82 show performance of the analyzer. In the FFT plot the harmonic spurs are at the testing limit of the analyzer, which means the THS4531 is actually much better than can be directly measured. Because the THS4531 distortion performance cannot be directly measured in the audio band it is estimated from measurement in high noise gain configuration correlated with simulation.

Figure 80. THS4531 Audio Analyzer Test Circuit

Figure 81. THD+N on Audio Analyzer, 10 Hz to 24 kHz

Figure 82. 1kHz FFT Plot on Audio Analyzer

### Audio On/Off Pop Performance

The THS4531 is tested to show on and off pop performance by connecting a speaker between the differential outputs and switching on and off the power supply, and also by using the power down function of the THS4531. Testing was done with and without tones. During these tests no audible pop could be heard.

With no input tone, Figure 83 shows the voltage waveforms when switching power on to the THS4531 and Figure 84 shows voltage waveforms when turning power off. The transients during power on and off show no audible pop should be heard.

Figure 83. Power Supply Turn On Pop Performance

Figure 84. Power Supply Turn Off Pop Performance

With no input tone, Figure 85 shows the voltage waveforms using the  $\overline{\text{PD}}$  pin to enable and disable the THS4531. The transients during power on and off show no audible pop should be heard.

Figure 85. PD Enable Pop Performance

**AUDIO ADC DRIVER PERFORMANCE: THS4531 AND PCM4204 COMBINED PERFORMANCE**

To show achievable performance with a high performance audio ADC, the THS4531 is tested as the drive amplifier for the PCM4204. The PCM4204 is a high-performance, four-channel analog-to-digital (A/D) converter designed for professional and broadcast audio applications. The PCM4204 architecture utilizes a 1-bit delta-sigma modulator per channel incorporating an advanced dither scheme for improved dynamic performance, and supports PCM output data. The PCM4204 provides flexible serial port interface and many other advanced features. Please refer to its data sheet for more information.

The PCM4204 EVM is used to test the audio performance of the THS4531 as a drive amplifier. The standard PCM4204 EVM is provided with 4x OPA1632 fully differential amplifiers, which use the same pin out as the THS4531. For testing, one of these amplifiers is replaced with a THS4531 device in same package (MSOP), gain changed to 1V/V, and power supply changed to single supply +5V. Figure 86 shows the circuit. With single supply +5V supply the output common-mode of the THS4531 defaults to +2.5V as required at the input of the PCM4204. So the resistor connecting the V<sub>OCM</sub> input of the THS4531 to the input common-mode drive from the PCM4204 is optional and no performance change was noted with it connected or removed. The EVM power connections were modified by connecting positive supply inputs, +15V, +5VA and +5VD, to a +5V external power supply (EXT +3.3 was not used) and connecting -15V and all ground inputs to ground on the external power supply so only one external +5V supply was needed to power all devices on the EVM.

Figure 86. THS4531 and PCM4204 Test Circuit

An audio analyzer is used to provide an analog audio input to the EVM and the PCM formatted digital output is read by the digital input on the analyzer. Data was taken at  $f_s = 96\text{kHz}$ , and audio output uses PCM format. Other data rates and formats are expected to show similar performance in line with that shown in the data sheet.

Figure 87 shows the THD+N vs Frequency with no weighting and Figure 88 shows an FFT with 1kHz input tone. Input signal to the PCM4204 for these tests is  $-0.5\text{dBFS}$ . Table 4 summarizes results of testing using the THS4531 + PCM4204 versus typical Data Sheet performance, and show it make an excellent drive amplifier for this ADC.

Figure 87. THS4531 + PCM4204 THD+N vs Frequency with No Weighting

Figure 88. THS4531 + PCM4204 1kHz FFT

Table 4. 1kHz AC Analysis: Test Circuit versus PCM4204 Data Sheet Typical Specifications ( $f_s = 96\text{kSPS}$ )

CONFIGURATION	TONE	THD + N

PCM4204 Data Sheet (typ)	1kHz	-103 dB

## SAR ADC PERFORMANCE

### THS4531 and ADS8321 Combined Performance

To show achievable performance with a high performance SAR ADC, the THS4531 is tested as the drive amplifier for the ADS8321. The ADS8321 is a 16-bit, SAR ADC that offers excellent AC and DC performance, with ultra-low power and small size. The circuit shown in Figure 89 is used to test the performance. Data was taken using the ADS8321 at  $100\text{kSPS}$  with input frequency of  $10\text{kHz}$  and signal levels  $0.5\text{dB}$  below full scale. The FFT plot of the spectral performance is in Figure 90. A summary of the FFT analysis results are in Table 5 along with ADS8321 typical data sheet performance at  $f_s = 100\text{kSPS}$ . Please refer to its data sheet for more information.

The standard ADS8321 EVM and THS4531 EVM are modified to implement the schematic in Figure 89 and used to test the performance of the THS4531 as a drive amplifier. With single supply +5V supply the output common-mode of the THS4531 defaults to +2.5V as required at the input of the ADS8321 so the  $V_{OCM}$  input of the THS4531 simply bypassed to GND with 0.22 $\mu$ F capacitor. The summary of results of the FFT analysis versus typical data sheet performance shown in Table 5 show the THS4531 will make an excellent drive amplifier for this ADC.

Table 5. 10kHz FFT Analysis Summary

CONFIGURATION	TONE	SIGNAL	SNR	THD	SINAD	SFDR
THS4531 + ADS8321	10kHz	-0.5 dBFS	87 dBc	-96 dBc	87 dBc	100 dBc
ADS8321 Data Sheet (typ)	10kHz	-0.5 dBFS	87 dBc	-86 dBc	84 dBc	86 dBc

**THS4531 and ADS7945 Combined Performance**

To show achievable performance with a high performance SAR ADC, the THS4531 is tested as the drive amplifier for the ADS7945. The ADS7945 is a 14-bit, SAR ADC that offers excellent AC and DC performance, with low power and small size. The circuit shown in Figure 91 is used to test the performance. Data was taken using the ADS7945 at 2MSPS with input frequency of 10 kHz and signal level 0.5 dB below full scale. The FFT plot of the spectral performance is in Figure 92. A summary of the FFT analysis results are in Table 6 along with ADS7945 typical data sheet performance at  $f_s = 2$ MSPS. Please refer to its data sheet for more information.

The standard ADS7945 EVM and THS4531 EVM are modified to implement the schematic in Figure 91 and used to test the performance of the THS4531 as a drive amplifier. With single supply +5V supply the output common-mode of the THS4531 defaults to +2.5V as required at the input of the ADS7945 so the  $V_{OCM}$  input of the THS4531 simply bypassed to GND with 0.22 $\mu$ F capacitor. The summary of results of the FFT analysis versus typical data sheet performance shown in Table 6 show the THS4531 will make an excellent drive amplifier for this ADC.

Figure 92. THS4531 and ADS7945 Test Circuit

Table 6. 10kHz FFT Analysis Summary

CONFIGURATION	TONE	SIGNAL	SNR	THD	SFDR
THS4531 + ADS7945	10kHz	-0.5 dBFS	83 dBc	-93 dBc	96 dBc
ADS7945 Data Sheet (typ)	10kHz	-0.5 dBFS	84 dBc	-92 dBc	94 dBc

## EVM AND LAYOUT RECOMMENDATIONS

The THS4531 EVM ([SLOU334](#)) should be used as a reference when designing the circuit board. It is recommended to follow the EVM layout of the external components near to the amplifier, ground plane construction, and power routing as closely as possible. General guidelines are:

1. Signal routing should be direct and as short as possible into and out of the op amp.
2. The feedback path should be short and direct avoiding vias if possible.
3. Ground or power planes should be removed from directly under the amplifier's input and output pins.
4. A series output resistor is recommended to be placed as near to the output pin as possible. See [Figure 78](#) "Recommended Series Output Resistor vs. Capacitive Load" for recommended values given expected capacitive load of design.
5. A 2.2 $\mu$ F power supply decoupling capacitor should be placed within 2 inches of the device and can be shared with other op amps. For split supply, a capacitor is required for both supplies.
6. A 0.1 $\mu$ F power supply decoupling capacitor should be placed as near to the power supply pins as possible. Preferably within 0.1 inch. For split supply, a capacitor is required for both supplies.
7. The  $\overline{\text{PD}}$  pin uses TTL logic levels referenced to the negative supply voltage ( $V_{\text{S}}$ ). When not used it should be tied to the positive supply to enable the amplifier. When used, it must be actively driven high or low and should not be left in an indeterminate logic state. A bypass capacitor is not required, but can be used for robustness in noisy environments.

## REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision A (January 2012) to Revision B</b>	<b>Page</b>
• Deleted DC Performance, <i>Input-referred offset voltage</i> parameter typical specifications for $T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$ , $-40^\circ\text{C}$ to $+85^\circ\text{C}$ , and $-40^\circ\text{C}$ to $+125^\circ\text{C}$ in 2.7 V Electrical Characteristics table .....	4
• Changed DC Performance, <i>Input-referred offset voltage</i> parameter maximum specifications for $T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$ , $-40^\circ\text{C}$ to $+85^\circ\text{C}$ , and $-40^\circ\text{C}$ to $+125^\circ\text{C}$ in 2.7 V Electrical Characteristics table .....	4

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

  - E. Falls within JEDEC MO-153

RUN (S-PWQFN-N10)

PLASTIC QUAD FLATPACK NO-LEAD

4209107/B 11/10

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-Leads (QFN) package configuration.

RUN (S-PWQFN-N10)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

D (R-PDSO-G8)

PLASTIC SMALL OUTLINE

4040047-3/M 06/11

D (R-PDSO-G8)

PLASTIC SMALL OUTLINE

4211283-2/E 08/12

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## 重要声明

德州仪器(TI) 及其下属子公司有权根据 JESD46 最新标准, 对所提供的产品和服务进行更正、修改、增强、改进或其它更改, 并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息, 并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内, 且 TI 认为有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定, 否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应用相关的风险, 客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予的直接或隐含权作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息, 不能构成从 TI 获得使用这些产品或服务的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可, 或是 TI 的专利权或其它知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分, 仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时, 如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分, 则会失去相关 TI 组件或服务的所有明示或暗示授权, 且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意, 尽管任何应用相关信息或支持仍可能由 TI 提供, 但他们将独力负责满足与其产品及其应用中使用的 TI 产品相关的所有法律、法规和安全相关要求。客户声明并同意, 他们具备制定与实施安全措施所需的全部专业技术和知识, 可预见故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中, 为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特有的可满足适用的功能安全性标准和要求的终端产品解决方案。尽管如此, 此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III (或类似的生命攸关医疗设备) 的授权许可, 除非各方授权官员已经达成了专门管控此类使用的特别协议。

只有那些 TI 特别注明属于军用等级或“增强型塑料”的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同意, 对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用, 其风险由客户单独承担, 并且由客户独力负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品, 这些产品主要用于汽车。在任何情况下, 因使用非指定产品而无法达到 ISO/TS16949 要求, TI 不承担任何责任。
