

## TPS25925x, TPS25926x Simple 5-V/12-V eFuse Protection Switches

### 1 Features

- 12-V eFuse – TPS25926x
- 5-V eFuse – TPS25925x
- Integrated 30-mΩ Pass MOSFET
- Fixed Over-Voltage Clamp:
  - 6.1-V Clamp - TPS25925x
  - 15-V Clamp - TPS25926x
- 2-A to 5-A Adjustable  $I_{LIMIT}$  ( $\pm 15\%$  Accuracy)
- Programmable  $V_{OUT}$  Slew Rate, UVLO
- Built-in Thermal Shutdown
- UL 2367 Recognized – File No. E339631\*
  - $*R_{ILIM} \leq 130 \text{ k}\Omega$  (5 A maximum)
- Safe During Single Point Failure Test (UL60950)
- Small Foot Print – 10L (3 mm x 3 mm) VSON

### 2 Applications

- HDD and SSD Drives
- Set Top Boxes
- Servers and AUX Supplies
- PCI and PCIe Cards
- Adapter Powered Devices

### 3 Description

The TPS25925x/6x family of eFuses is a highly integrated circuit protection and power management solution in a tiny package. The devices use few external components and provide multiple protection modes. They are a robust defense against overloads, shorts circuits, voltage surges, excessive inrush current. Current limit level can be set with a single external resistor and current limit set has a typical accuracy of  $\pm 15\%$ . Over voltage events are limited by internal clamping circuits to a safe fixed maximum, with no external components required. TPS25926x devices provide over voltage protection (OVP) for 12-V systems and TPS25925x devices for 5-V systems. In cases with particular voltage ramp requirements, a dV/dT pin is provided that can be programmed with a single capacitor to ensure proper output ramp rates.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS259250, TPS259251	VSON (10)	3.00 mm x 3.00 mm
TPS259260, TPS259261		

(1) For all available packages, see the orderable addendum at the end of the data sheet.

PART NUMBER	UV	OV CLAMP	FAULT RESPONSE	STATUS
TPS259250	4.3 V	6.1 V	Latched	Active
TPS259251	4.3 V	6.1 V	Auto Retry	Active
TPS259260	4.3 V	15 V	Latched	Active
TPS259261	4.3 V	15 V	Auto Retry	Active

## 6 Pin Configuration and Functions

### Pin Functions

PIN		TYPE	DESCRIPTION
No.	NAME		
1	dV/dT	O	Connect a capacitor from this pin to GND to control the ramp rate of OUT voltage at device turnon
2	EN/UVLO	I	This is a dual function control pin. When used as an ENABLE pin and pulled down, it shuts off the internal pass MOSFET. When pulled high, it enables the device As an UVLO pin, it can be used to program different UVLO trip point via external resistor divider
3	VIN	I	Input supply voltage
4			
5			
6	OUT	O	Output of the device
7			
8			
9	NC	NC	Not Connected Internally. Can be left floating or grounded
10	ILIM	O	A resistor from this pin to GND sets the overload and short circuit limit
Thermal Pad	GND	Ground	GND

## 7 Specifications

### 7.1 Absolute Maximum Ratings

 over operating temperature range (unless otherwise noted) <sup>(1)</sup> <sup>(2)</sup>

		MIN	MAX	UNIT
Supply voltage <sup>(2)</sup>	VIN	-0.3	20	V
	VIN (transient < 1 ms)		22	
Output voltage	OUT	-0.3	VIN + 0.3	V
	OUT (transient < 1 μs)		-1.2	
Voltage	ILIM	-0.3	7	V
Continuous output current			6.25 <sup>(3)</sup>	A
Voltage	EN/UVLO	-0.3	7	V
Voltage	dV/dT	-0.3	7	V
Storage temperature	T <sub>stg</sub>	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values, except differential voltages, are with respect to network ground terminal.
- (3) Device supports high peak current during short circuit conditions until current is internally limited.

### 7.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	TYP	MAX	UNIT
Input voltage	VIN (TPS25926x)	4.5	12	13.8	V
	VIN (TPS25925x)	4.5	5	5.5	
	dV/dT, EN/UVLO	0		6	
	ILIM	0		3	
Continuous output current	I <sub>OUT</sub>	0		5	A
Resistance	ILIM	10	100	162	kΩ
External capacitance	OUT	0.1	1	1000	μF
	dV/dT		1	1000	nF
Operating junction temperature	T <sub>J</sub>	-40	25	125	°C
Operating ambient temperature	T <sub>A</sub>	-40	25	85	°C

## 7.4 Thermal Information<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

THERMAL METRIC		TPS25925x/6x	UNIT
		DRC (VSON)	
		10 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	45.9	°C/W
R <sub>θJctop</sub>	Junction-to-case (top) thermal resistance	53	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	21.2	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	1.2	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	21.4	°C/W
R <sub>θJcbot</sub>	Junction-to-case (bottom) thermal resistance	5.9	°C/W

## 8 Detailed Description

### 8.1 Overview

The TPS25925x/6x is an e-fuse with integrated power switch that is used to manage current, voltage and start-up voltage ramp to a connected load. The device starts its operation by monitoring the VIN bus. When VIN exceeds the undervoltage-lockout threshold ( $V_{UVR}$ ), the device samples the EN/UVLO pin. A high level on this pin enables the internal MOSFET. As VIN rises, the internal MOSFET of the device starts conducting and allow current to flow from VIN to OUT. When EN/UVLO is held low (below  $V_{ENF}$ ), internal MOSFET is turned off. User also has the ability to modify the output voltage ramp time by connecting a capacitor between dV/dT pin and GND.

After a successful start-up sequence, the device now actively monitors its load current and input voltage, ensuring that the adjustable overload current limit IOL is not exceeded and input voltage spikes are safely clamped to VOVC level at the output. This keeps the output device safe from harmful voltage and current transients. The device also has built-in thermal sensor. In the event device temperature ( $T_J$ ) exceeds TSHDN, typically 150°C, the thermal shutdown circuitry shuts down the internal MOSFET thereby disconnecting the load from the supply. In TPS259250/60, the output remains disconnected (MOSFET open) until power to device is recycled or EN/UVLO is toggled (pulled low and then high). The TPS259251/61 device remains off and commences an auto-retry cycle of 145 ms after device temperature falls below  $T_{SHDN} - 10^\circ\text{C}$ . This auto-retry cycle continues until the fault is cleared.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 GND

This is the most negative voltage in the circuit and is used as a reference for all voltage measurements unless otherwise specified.

## Feature Description (continued)

### 8.3.2 VIN

Input voltage to the TPS25925x/6x. A ceramic bypass capacitor close to the device from VIN to GND is recommended to alleviate bus transients. The recommended operating voltage range is 4.5 V – 13.8 V for TPS25926x and 4.5 V – 5.5 V for TPS25925x. The device can continuously sustain a voltage of 20 V on VIN pin. However, above the recommended maximum bus voltage, the device is in over-voltage protection (OVP) mode, limiting the output voltage to  $V_{OVC}$ . The power dissipation in OVP mode is  $P_{D\_OVP} = (V_{VIN} - V_{OVC}) \times I_{OUT}$ , which can potentially heat up the device and cause thermal shutdown.

### 8.3.3 dV/dT

Connect a capacitor from this pin to GND to control the slew rate of the output voltage at power-on. This pin can be left floating to obtain a predetermined slew rate (minimum  $T_{dVdT}$ ) on the output. Governing slew rate at start-up is shown in [Equation 1](#).

$$\frac{dV_{OUT}}{dt} = \frac{I_{dVdT} \times GAIN_{dVdT}}{C_{dVdT} + C_{INT}} \quad (1)$$

Where:

$$I_{dVdT} = 220 \text{ nA (TYPICAL)}$$

$$C_{INT} = 70 \text{ pF (TYPICAL)}$$

$$GAIN_{dVdT} = 4.85$$

$$\frac{dV_{OUT}}{dT} = \text{Desired output slew rate}$$

The total ramp time ( $T_{dVdT}$ ) for 0 to VIN can be calculated using [Equation 2](#).

$$T_{dVdT} = 10^6 \times V_{IN} \times (C_{dVdT} + 70 \text{ pF}) \quad (2)$$

For details on how to select an appropriate charging time/rate, see the applications section [Setting Output Voltage Ramp Time \( \$T\_{dVdT}\$ \)](#).

### 8.3.4 EN/UVLO

As an input pin, it controls both the ON and OFF state of the internal MOSFET. In its high state, the internal MOSFET is enabled and allows current to flow from VIN to OUT. A low on this pin turns off the internal MOSFET. High and Low levels are specified in the parametric table of the datasheet. The EN/UVLO pin is also used to clear a thermal shutdown latch in the TPS259250/60 by toggling this pin (H→L).

The internal de-glitch delay on EN/UVLO falling edge is intentionally kept low (1  $\mu$ s typical) for quick detection of power failure. For applications where a higher de-glitch delay on EN/UVLO is desired, or when the supply is particularly noisy, it is recommended to use an external bypass capacitor from EN/UVLO to GND.

### 8.3.5 ILIM

The device continuously monitors the load current and keeps it limited to the value programmed by  $R_{ILIM}$ . After start-up event and during normal operation, current limit is set to  $I_{OL}$  (over-load current limit). See [Equation 3](#).

$$I_{OL} = (0.7 + 3 \times 10^{-5} \times R_{ILIM}) \quad (3)$$

When power dissipation in the internal MOSFET [ $P_D = (V_{VIN} - V_{OUT}) \times I_{OUT}$ ] exceeds 10 W, there is a 2% to 12% thermal foldback in the current limit value so that  $I_{OL}$  drops to  $I_{SC}$ . In each of the two modes, MOSFET gate voltage is regulated to throttle short-circuit and overload current flowing to the load. Eventually, the device shuts down due to over temperature. See [Figure 39](#).

Feature Description (continued)

Figure 39. Thermal Foldback in Current Limit

During a transient short circuit event, the current through the device increases very rapidly. The current-limit amplifier cannot respond to this event because of its limited bandwidth. Therefore, the TPS25925/6 incorporates a fast-trip comparator, which shuts down the pass device when  $I_{OUT} > I_{FASTRIP}$ , and terminates the rapid short-circuit peak current. The trip threshold is set to 60% higher than the programmed over-load current limit ( $I_{FASTRIP} = 1.6 \times I_{OL}$ ). After the transient short-circuit peak current has been terminated by the fast-trip comparator, the current limit amplifier smoothly regulates the output current to  $I_{OL}$ . See Figure 40 and Figure 41.

Figure 40. Fast-Trip Current

Figure 41. Fast-Trip and Current Limit Amplifier Response for Short Circuit

## 8.4 Device Functional Modes

The TPS25925x/6x is a hot-swap controller with integrated power switch that is used to manage current, voltage and start-up voltage ramp to a connected load. The device starts its operation by monitoring the VIN bus. When  $V_{VIN}$  exceeds the undervoltage-lockout threshold ( $V_{UVL}$ ), the device samples the EN/UVLO pin. A high level on this pin enables the internal MOSFET. As VIN rises, the internal MOSFET of the device starts conducting and allows current to flow from VIN to OUT. When EN/UVLO is held low (that is, below  $V_{ENF}$ ), the internal MOSFET is turned off; thereby, blocking the flow of current from VIN to OUT. The user can modify the output voltage ramp time by connecting a capacitor between dV/dT pin and GND.

Having successfully completed its start-up sequence, the device now actively monitors the load current and input voltage, ensuring that the adjustable overload current limit  $I_{OL}$  is not exceeded and input voltage spikes are safely clamped to  $V_{OVC}$  level at the output. This keeps the output device safe from harmful voltage and current transients. The device also has built-in thermal sensor. If the device temperature ( $T_J$ ) exceeds  $T_{SHDN}$ , typically 150°C, the thermal shutdown circuitry shuts down the internal MOSFET; thereby, disconnecting the load from the supply. In the TPS259250/60, the output remains disconnected (MOSFET open) until power to device is recycled or EN/UVLO is toggled (pulled low and then high). The TPS259251/61 device remains off and commences an auto-retry cycle of 145 ms after device temperature falls below  $T_{SHDN} - 10^\circ\text{C}$ . This auto-retry cycle continues until the fault is cleared.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The TPA25925x/6x is a smart eFuse. It is typically used for Hot-Swap and Power rail protection applications. It operates from 4.5 V to 18 V with programmable current limit and undervoltage protection. The device aids in controlling the in-rush current and provides precise current limiting during overload conditions for systems such as Set-Top-Box, DTVs, Gaming Consoles, SSDs, HDDs and Smart Meters. The device also provides robust protection for multiple faults on the sub-system rail.

The following can be used to select component values for the device.

Alternatively, the WEBENCH® software may be used to generate a complete design. The WEBENCH® software uses an iterative design procedure and accesses a comprehensive database of components when generating a design. Additionally, a spreadsheet design tool *TPS2592xx Design Calculator* ([SLUC570](#)) is available on web folder.

### 9.2 Typical Application

\*  $C_{IN}$  is optional and 0.1  $\mu\text{F}$  is recommended to suppress transients due to the inductance of PCB routing or from input wiring.

**Figure 42. Typical Application Schematic: Simple e-Fuse for Set Top Boxes**

#### 9.2.1 Design Requirements

Table 1 lists the TPA25925x/6x design requirements.

**Table 1. Design Parameters**

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage, $V_{IN}$	12 V
Undervoltage lockout set point, $V_{(UV)}$	Default: $V_{UVR} = 4.3 \text{ V}$
Overvoltage protection set point, $V_{(OV)}$	Default: $V_{OVC} = 15 \text{ V}$
Load at start-up, $R_{L(SU)}$	4 $\Omega$

## Typical Application (continued)

**Table 1. Design Parameters (continued)**

DESIGN PARAMETER	EXAMPLE VALUE
Current limit, $I_{OL}$	3.7 A
Load capacitance, $C_{OUT}$	1 $\mu$ F
Maximum ambient temperatures, $T_A$	85°C

### 9.2.2 Detailed Design Procedure

To begin the design process a few parameters must be decided upon. The designer needs to know the following:

- Normal input operation voltage
- Maximum output capacitance
- Maximum current Limit
- Load during start-up
- Maximum ambient temperature of operation

This design procedure below seeks to control the junction temperature of device under both static and transient conditions by proper selection of output ramp-up time and associated support components. The designer can adjust this procedure to fit the application and design criteria.

#### 9.2.2.1 Programming the Current-Limit Threshold: $R_{ILIM}$ Selection

The  $R_{ILIM}$  resistor at the ILIM pin sets the over load current limit, this can be set using [Equation 4](#).

$$R_{ILIM} = \frac{I_{ILIM} - 0.7}{3 \times 10^{-5}} \quad (4)$$

For  $I_{ILIM} = 3.7$  A, from [Equation 4](#),  $R_{ILIM}$  is 100 k $\Omega$ , choose closest standard value resistor with 1% tolerance.

#### 9.2.2.2 Undervoltage Lockout Set Point

The undervoltage lockout (UVLO) trip point is adjusted using the external voltage divider network of  $R_1$  and  $R_2$  as connected between IN, EN/UVLO and GND pins of the device. The values required for setting the undervoltage are calculated solving [Equation 5](#).

$$V_{(UV)} = \frac{R_1 + R_2}{R_2} \times V_{ENR} \quad (5)$$

Where  $V_{ENR}$  is enable voltage rising threshold (1.4 V). Because  $R_1$  and  $R_2$  leak the current from input supply ( $V_{in}$ ), these resistors must be selected based on the acceptable leakage current from input power supply ( $V_{in}$ ).

The current drawn by  $R_1$  and  $R_2$  from the power supply  $\{I_{(R12)} = V_{(IN)}/(R_1 + R_2)\}$ .

However, leakage currents due to external active components connected to the resistor string can add error to these calculations. So, the resistor string current,  $I_{(R12)}$  must be chosen to be 20x greater than the leakage current expected.

For default UVLO of  $V_{UVR} = 4.3$  V, select  $R_2 = OPEN$ , and  $R_1 = 1$  M $\Omega$ . Because EN/UVLO pin is rated only to 7 V, it cannot be connected directly to  $V_{IN} = 12$  V. It has to be connected through  $R_1 = 1$  M $\Omega$  only, so that the pull-up current for EN/UVLO pin is limited to < 20  $\mu$ A.

The power failure threshold is detected on the falling edge of supply. This threshold voltage is 4% lower than the rising threshold,  $V_{UVR}$ . This is calculated using [Equation 6](#).

$$V_{(PFAIL)} = 0.96 \times V_{UVR} \quad (6)$$

Where  $V_{UVR}$  is 4.3 V, Power fail threshold set is : 4.1 V.

#### 9.2.2.3 Setting Output Voltage Ramp Time ( $T_{dVdT}$ )

For a successful design, the junction temperature of device must be kept below the absolute-maximum rating during both dynamic (start-up) and steady state conditions. Dynamic power stresses often are an order of magnitude greater than the static stresses, so it is important to determine the right start-up time and in-rush current limit required with system capacitance to avoid thermal shutdown during start-up with and without load.

The ramp-up capacitor  $C_{dVdT}$  needed is calculated considering the two possible cases.

### 9.2.2.3.1 Case 1: Start-Up without Load: Only Output Capacitance $C_{OUT}$ Draws Current During Start-Up

During start-up, as the output capacitor charges, the voltage difference as well as the power dissipated across the internal FET decreases. The average power dissipated in the device during start-up is calculated using Equation 8.

For TPS25926x device, the inrush current is determined as shown in Equation 7.

$$I_{(INRUSH)} = C_{(OUT)} \times \frac{V_{(IN)}}{T_{dVdT}} \quad (7)$$

Power dissipation during start-up is:

$$P_{D(INRUSH)} = 0.5 \times V_{(IN)} \times I_{(INRUSH)} \quad (8)$$

Equation 8 assumes that load does not draw any current until the output voltage has reached its final value.

### 9.2.2.3.2 Case 2: Start-Up with Load: Output Capacitance $C_{OUT}$ and Load Draws Current During Start-Up

When load draws current during the turn-on sequence, there is additional power dissipated. Considering a resistive load during start-up ( $R_{L(SU)}$ ), load current ramps up proportionally with increase in output voltage during  $T_{dVdT}$  time. Equation 9 to Equation 12 show the average power dissipation in the internal FET during charging time due to resistive load.

$$P_{D(LOAD)} = \left(\frac{1}{6}\right) \times \frac{V_{(IN)}^2}{R_{L(SU)}} \quad (9)$$

Total power dissipated in the device during startup is:

$$P_{D(STARTUP)} = P_{D(INRUSH)} + P_{D(LOAD)} \quad (10)$$

Total current during startup is given by:

$$I_{(STARTUP)} = I_{(INRUSH)} + I_L(t) \quad (11)$$

If  $I_{(STARTUP)} > I_{OL}$ , the device limits the current to  $I_{OL}$  and the current limited charging time is determined by:

$$T_{dVdT(\text{Current-Limited})} = C_{OUT} \times R_{L(SU)} \times \left[ \frac{I_{OL}}{I_{(INRUSH)}} - 1 + \text{LN} \left( \frac{I_{(INRUSH)}}{I_{OL} - \frac{V_{(IN)}}{R_{L(SU)}}} \right) \right] \quad (12)$$

The power dissipation, with and without load, for selected start-up time must not exceed the shutdown limits as shown in Figure 43.

**Figure 43. Thermal Shutdown Limit Plot**

For the design example under discussion, select ramp-up capacitor  $C_{dVdT} = \text{OPEN}$ . Then, using Equation 2.

$$T_{dVdT} = 10^6 \times 12 \times (0 + 70 \text{ pF}) = 840 \text{ } \mu\text{s} \quad (13)$$

The inrush current drawn by the load capacitance ( $C_{OUT}$ ) during ramp-up using [Equation 14](#).

$$I_{(INRUSH)} = 1 \text{ } \mu\text{F} \times \frac{12}{840 \text{ } \mu\text{s}} = 15 \text{ mA} \quad (14)$$

The inrush power dissipation is calculated using [Equation 15](#).

$$P_{D(INRUSH)} = 0.5 \times 12 \times 15 \text{ m} = 90 \text{ mW} \quad (15)$$

For 90 mW of power loss, the thermal shut down time of the device must not be less than the ramp-up time  $T_{dVdT}$  to avoid the false trip at maximum operating temperature. From thermal shutdown limit graph [Figure 43](#) at  $T_A = 85^\circ\text{C}$ , for 90 mW of power, the shutdown time is infinite. So it is safe to use 0.79 ms as start-up time without any load on output.

Considering the start-up with load 4  $\Omega$ , the additional power dissipation, when load is present during start up is calculated using [Equation 9](#).

$$P_{D(LOAD)} = \frac{12 \times 12}{6 \times 4} = 6 \text{ W} \quad (16)$$

The total device power dissipation during start up is given in [Equation 17](#).

$$P_{D(STARTUP)} = 6 + 90 \text{ m} = 6.09 \text{ W} \quad (17)$$

From thermal shutdown limit graph at  $T_A = 85^\circ\text{C}$ , the thermal shutdown time for 6.09 W is more than 10 ms. So it is well within acceptable limits to use no external capacitor ( $C_{dV/dT}$ ) with start-up load of 4  $\Omega$ .

If, due to large  $C_{OUT}$ , there is a need to decrease the power loss during start-up, it can be done with increase of  $C_{dVdT}$  capacitor.

#### 9.2.2.4 Support Component Selection— $C_{VIN}$

$C_{VIN}$  is a bypass capacitor to help control transient voltages, unit emissions, and local supply noise. Where acceptable, a value in the range of 0.001  $\mu\text{F}$  to 0.1  $\mu\text{F}$  is recommended for  $C_{VIN}$ .

### 9.2.3 Application Curves

## 10 Power Supply Recommendations

The device is designed for supply voltage range of  $4.5\text{ V} \leq V_{IN} \leq 18\text{ V}$ . If the input supply is located more than a few inches from the device an input ceramic bypass capacitor higher than  $0.1\text{ }\mu\text{F}$  is recommended. Power supply must be rated higher than the current limit set to avoid voltage droops during over current and short-circuit conditions.

### 10.1 Transient Protection

In case of short circuit and over load current limit, when the device interrupts current flow, input inductance generates a positive voltage spike on the input and output inductance generates a negative voltage spike on the output. The peak amplitude of voltage spikes (transients) is dependent on value of inductance in series to the input or output of the device. Such transients can exceed the *Absolute Maximum Ratings* of the device if steps are not taken to address the issue.

Typical methods for addressing transients include:

- Minimizing lead length and inductance into and out of the device
- Using large PCB GND plane
- Schottky diode across the output to absorb negative spikes
- A low value ceramic capacitor ( $C_{(IN)} = 0.001\text{ }\mu\text{F}$  to  $0.1\text{ }\mu\text{F}$ ) to absorb the energy and dampen the transients. The approximate value of input capacitance can be estimated with [Equation 18](#).

$$V_{\text{SPIKE(Absolute)}} = V_{(IN)} + I_{(LOAD)} \times \sqrt{\frac{L_{(IN)}}{C_{(IN)}}} \quad (18)$$

Where:

- $V_{(IN)}$  is the nominal supply voltage
- $I_{(LOAD)}$  is the load current
- $L_{(IN)}$  equals the effective inductance seen looking into the source
- $C_{(IN)}$  is the capacitance present at the input

Some applications may require the addition of a Transient Voltage Suppressor (TVS) to prevent transients from exceeding the *Absolute Maximum Ratings* of the device.

The circuit implementation with optional protection components (a ceramic capacitor, TVS and schottky diode) is shown in [Figure 46](#).

(1) Optional components needed for suppression of transients

**Figure 46. Circuit Implementation with Optional Protection Components**

## 10.2 Output Short-Circuit Measurements

It is difficult to obtain repeatable and similar short-circuit testing results. Source bypassing, input leads, circuit layout and component selection, output shorting method, relative location of the short, and instrumentation all contribute to variation in results. The actual short itself exhibits a certain degree of randomness as it microscopically bounces and arcs. Care in configuration and methods must be used to obtain realistic results. Do not expect to see waveforms exactly like those in the data sheet; every setup differs.

## 11 Layout

### 11.1 Layout Guidelines

- For all applications, a 0.01- $\mu$ F or greater ceramic decoupling capacitor is recommended between IN terminal and GND. For hot-plug applications, where input power path inductance is negligible, this capacitor can be eliminated/minimized.
- The optimum placement of decoupling capacitor is closest to the IN and GND terminals of the device. Care must be taken to minimize the loop area formed by the bypass-capacitor connection, the IN terminal, and the GND terminal of the IC. See [Figure 47](#) for a PCB layout example.
- High current carrying power path connections must be as short as possible and must be sized to carry at least twice the full-load current.
- The GND terminal must be tied to the PCB ground plane at the terminal of the IC. The PCB ground must be a copper plane or island on the board.
- Locate all TPS25925x/6x support components:  $R_{ILIM}$ ,  $C_{dVdT}$  and resistors for ENUV, close to their connection pin. Connect the other end of the component to the GND pin of the device with shortest trace length. The trace routing for the  $R_{ILIM}$  and  $C_{dVdT}$  components to the device must be as short as possible to reduce parasitic effects on the current limit and soft start timing. These traces must not have any coupling to switching signals on the board.
- Protection devices such as TVS, snubbers, capacitors, or diodes must be placed physically close to the device they are intended to protect, and routed with short traces to reduce inductance. For example, a protection Schottky diode is recommended to address negative transients due to switching of inductive loads, and it must be physically close to the OUT pins.
- Obtaining acceptable performance with alternate layout schemes is possible; however this layout has been shown to produce good results and is intended as a guideline.

## 11.2 Layout Example

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. DRC (S-PVSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - Small Outline No-Lead (SON) package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance, if present.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions, if present

# THERMAL PAD MECHANICAL DATA

DRC (S-PVSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: A. All linear dimensions are in millimeters

DRC (S-PVSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
