

TPD3S0x4 针对 USB 主机端口的限流开关和 D+/D- ESD 保护

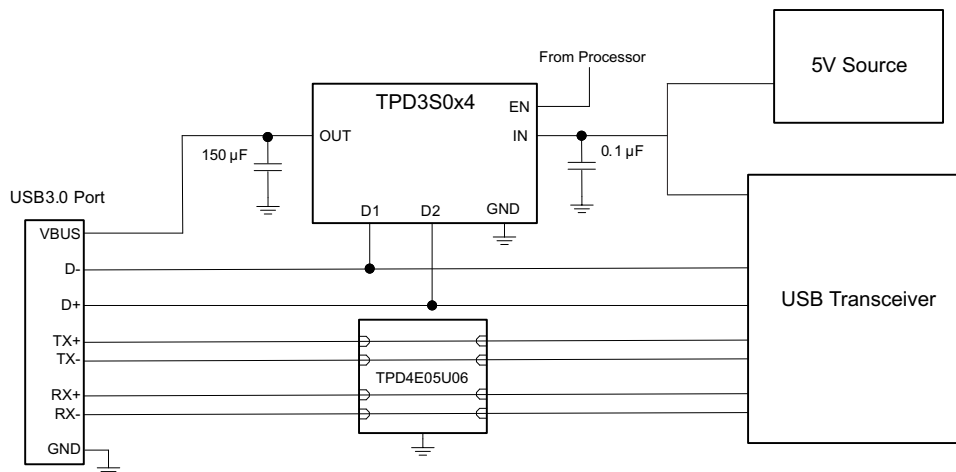

1 特性

- 连续额定电流为 0.5A 和 1.5A
- 恒定电流限制固定为 0.85A 和 2.15A（典型值）
- 快速过流响应 – 2 μ s
- 集成输出放电
- 反向电流阻断
- 短路保护功能
- 过热保护，支持自动重启
- 内置软启动
- 环境温度范围：-40°C 至 85°C
- 产品遵从规范
 - UL 认证元件（UL 2367, 固态过流保护器标准）
 - CB 文件号 E169910 至 IEC 60950-1，信息技术设备
- IEC 61000-4-2 4 级静电放电 (ESD) 保护（外部引脚）
 - \pm 12kV 接触放电 (IEC 61000-4-2)
 - \pm 15kV 空气间隙放电 (IEC 61000-4-2)

2 应用

- USB 端口/集线器
- 便携式计算机，台式机
- 高清数字电视
- 机顶盒

4 简化电路原理图

3 说明

TPD3S0x4 集成器件配有一个限流负载开关和一个基于双通道瞬态电压抑制器 (TVS) 的静电放电 (ESD) 保护二极管阵列，适用于 USB 接口。

TPD3S0x4 器件适用于可能出现大电容负载和短路的应用（如 USB 接口）；TPD3S0x4 可提供短路保护和过流保护。当输出负载超过电流限制阈值时，TPD3S0x4 通过在恒定电流模式下运行即可将输出电流限制到安全水平。快速过载响应特性有助于减轻 5V 主电源的负担，当输出短路时可以快速调节电源。电流限制开关的上升和下降此时受到控制，力求尽量减小器件开关过程中的浪涌电流。

TPD3S014 和 TPD3S044 的连续电流分别为 0.5A 和 1.5A。TVS 二极管阵列的额定 ESD 冲击消散值高于 IEC 61000-4-2 国际标准中规定的最高水平。此器件高度集成，并且采用易于布线的 DBV 封装，可对便携式计算机、高清数字 TV 和机顶盒等应用中的 USB 接口提供强力的电路保护。

器件信息(1)

器件型号	封装	封装尺寸 (标称值)
TPD3S0x4	DBV (6)	2.90mm x 2.80mm

(1) 要了解所有可用封装，请见数据表末尾的可订购产品附录。

7 Pin Configuration and Functions

Pin Functions

PIN		DESCRIPTION
NAME	NO.	
D1	5	USB data+ or USB data-
D2	6	
EN	1	Enable input, logic high turns on power switch
GND	2	Ground
IN	3	Input voltage and power-switch drain; Connect a 0.1 μF or greater ceramic capacitor from IN to GND close to the IC
OUT	4	Power-switch output, connect to load

8 Specifications

8.1 Absolute Maximum Ratings

 over operating free-air temperature (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
Input voltage ⁽³⁾	V _{IN}	-0.3	6	V
	V _{OUT}	-0.3	6	
	EN	-0.3	6	
	D1	-0.3	6	
	D2	-0.3	6	
Voltage range from V _{IN} to V _{OUT}		-6	6	V
Junction temperature, T _J		Internally limited		
Storage temperature range, T _{stg}		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Voltages are with respect to GND unless otherwise noted.
- (3) See the *Input and Output Capacitance* section.

8.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	All pins	±2000
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	All pins	±500
		IEC 61000-4-2 Contact Discharge ⁽³⁾	V _{OUT} , Dx pins	±12000
		IEC 61000-4-2 Air-Gap Discharge ⁽³⁾	V _{OUT} , Dx pins	±15000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±2000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±500 V may actually have higher performance.
- (3) V_{OUT} was tested on a PCB with input and output bypassing capacitors of 0.1 μF and 120 μF, respectively.

8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage	4.5		5.5	V
V _{EN}	Input voltage, EN	0		5.5	V
V _{IH}	High-level Input voltage, EN	2			V
V _{IL}	Low-level Input voltage, EN			0.7	V
C _{IN}	Input de-coupling capacitance, IN to GND	0.1			μF
I _{OUT} ⁽¹⁾	Continuous output current (TPD3S014)			0.5	A
	Continuous output current (TPD3S044)			1.5	
T _J	Operating junction temperature	-40		125	°C

- (1) Package and current ratings may require an ambient temperature derating of 85°C

9 Detailed Description

9.1 Overview

The TPD3S0x4 are highly integrated devices that feature a current limited load switch and a two channel Transient Voltage Suppressor (TVS) based Electrostatic Discharge (ESD) protection diode array for USB interfaces. The TPD3S014 and TPD3S044 provide 0.5 A and 1.5 A, respectively, of continuous load current in 5-V circuits. These parts use N-channel MOSFETs for low resistance, maintaining voltage regulation to the load. It is designed for applications where short circuits or heavy capacitive loads will be encountered. Device features include enable, reverse blocking when disabled, output discharge pull-down, over-current protection, and over-temperature protection. Finally, with two channels of TVS ESD protection diodes integrated, TPD3S0x4s provide system level ESD protection to all the pins of the USB port.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Undervoltage Lockout (UVLO)

The UVLO circuit disables the power switch until the input voltage reaches the UVLO turn-on threshold. Built-in hysteresis prevents unwanted on/off cycling due to input voltage drop from large current surges.

9.3.2 Enable

The logic enable input (EN) controls the power switch, bias for the charge pump, driver, and other circuits. The supply current is reduced to less than 1 μA when the TPD3S0x4s are disabled. The enable input is compatible with both TTL and CMOS logic levels.

The turn on and turn off times (t_{ON} , t_{OFF}) are composed of a delay and a rise or fall time (t_{R} , t_{F}). The delay times are internally controlled. The rise time is controlled by both the TPD3S0x4s and the external loading (especially capacitance). TPD3S0x4s fall time is controlled by the loading (R and C), and the output discharge (R_{PD}). An output load consisting of only a resistor will experience a fall time set by the TPD3S0x4s. An output load with parallel R and C elements will experience a fall time determined by the ($R \times C$) time constant if it is longer than the TPD3S0x4's t_{F} . Please see [Figure 25](#) and [Figure 26](#) for a pictorial description of t_{R} , t_{F} , t_{ON} , and t_{OFF} . The enable should not be left open; it may be tied to VIN.

Feature Description (continued)

Figure 25. Power-On and Power-Off Timing

Figure 26. Enable Timing, Active-High Enable

9.3.3 Internal Charge Pump

The device incorporates an internal charge pump and gate drive circuitry necessary to drive the N-channel MOSFET. The charge pump supplies power to the gate driver circuit and provides the necessary voltage to pull the gate of the MOSFET above the source. The driver incorporates circuitry that controls the rise and fall times of the output voltage to limit large current and voltage surges on the input supply, and provides built-in soft-start functionality. The MOSFET power switch will block current from OUT to IN when turned off by the UVLO or disabled.

9.3.4 Current Limit

The TPD3S0x4s respond to overloads by limiting output current to the static current-limit (IOS) levels shown in the *Electrical Characteristics: T_J = T_A = 25°C* table. When an overload condition is present, the device maintains a constant output current, with the output voltage determined by (I_{OS} × R_{LOAD}). Two possible overload conditions can occur.

The first overload condition occurs when either:

1. The input voltage is first applied, enable is true, and a short circuit is present (load which draws I_{OUT} > I_{OS}) or
2. The input voltage is present and the TPD3S0x4s are enabled into a short circuit.

The output voltage is held near zero potential with respect to ground and the TPD3S0x4s ramp the output current to I_{OS}. The TPD3S0x4s will limit the current to I_{OS} until the overload condition is removed or the device begins to thermal cycle. The device subsequently cycles current off and on as the thermal protection engages.

The second condition is when an overload occurs while the device is enabled and fully turned on. The device responds to the overload condition within t_{IOS} (Figure 27 and Figure 28) when the specified overload (per Electrical Characteristics table) is applied. The response speed and shape will vary with the overload level, input circuit, and rate of application. The current-limit response will vary between simply settling to I_{OS}, or turnoff and controlled return to I_{OS}. Similar to the previous case, the TPD3S0x4s will limit the current to I_{OS} until the overload condition is removed or the device begins to thermal cycle.

Figure 27. Output Short Circuit Parameters

Figure 28. Output Characteristic Showing Current Limit

Feature Description (continued)

The TPD3S0x4s thermal cycle if an overload condition is present long enough to activate thermal limiting in any of the above cases. This is due to the relatively large power dissipation $[(V_{IN} - V_{OUT}) \times I_{OS}]$ driving the junction temperature up. The devices turn off when the junction temperature exceeds 135°C (min) while in current limit. The devices remains off until the junction temperature cools 20°C and then restarts.

There are two kinds of current limit profiles typically available in TI switch products similar to the TPD3S0x4s. Many older designs have an output I vs V characteristic similar to the plot labeled "Current Limit with Peaking" in Figure 29. This type of limiting can be characterized by two parameters, the current limit corner (I_{OC}), and the short circuit current (I_{OS}). I_{OC} is often specified as a maximum value. The TPD3S0x4 parts do not present noticeable peaking in the current limit, corresponding to the characteristic labeled "Flat Current Limit" in Figure 29. This is why the I_{OC} parameter is not present in the *Electrical Characteristics* tables.

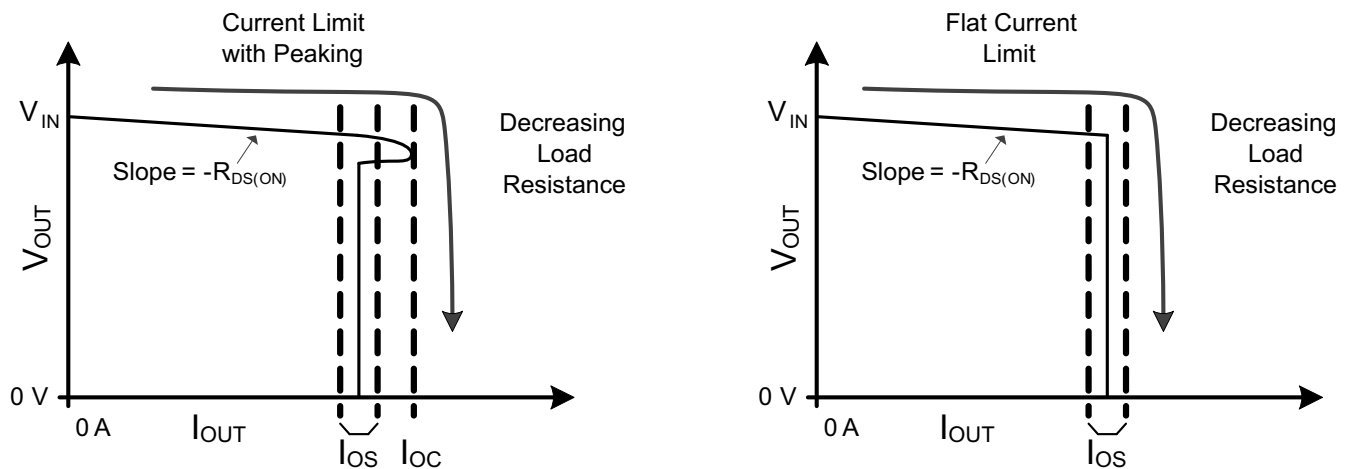

Figure 29. Current Limit Profiles

9.3.5 Output Discharge

A 470-Ω (typical) output discharge resistance will dissipate stored charge and leakage current on OUT when the TPD3S0x4s are in UVLO or disabled. The pull-down circuit will lose bias gradually as V_{IN} decreases, causing a rise in the discharge resistance as V_{IN} falls towards 0 V.

9.3.6 Input and Output Capacitance

Input and output capacitance improves the performance of the device; the actual capacitance should be optimized for the particular application. For all applications, a 0.1 μF or greater ceramic bypass capacitor between IN and GND is recommended as close to the device as possible for local noise decoupling.

All protection circuits such as the TPD3S0x4s will have the potential for input voltage overshoots and output voltage undershoots.

Input voltage overshoots can be caused by either of two effects. The first cause is an abrupt application of input voltage in conjunction with input power bus inductance and input capacitance when the IN terminal is high impedance (before turn on). Theoretically, the peak voltage is 2 times the applied. The second cause is due to the abrupt reduction of output short circuit current when the TPD3S0x4s turn off and energy stored in the input inductance drives the input voltage high. Input voltage droops may also occur with large load steps and as the TPD3S0x4s outputs are shorted. Applications with large input inductance (for example, connecting the evaluation board to the bench power-supply through long cables) may require large input capacitance reduce the voltage overshoot from exceeding the absolute maximum voltage of the device. The fast current-limit speed of the TPD3S0x4s to hard output short circuits isolates the input bus from faults. However, ceramic input capacitance in the range of 1 to 22 μF adjacent to the TPD3S0x4s inputs aids in both speeding the response time and limiting the transient seen on the input power bus. Momentary input transients to 6.5 V are permitted.

Feature Description (continued)

Output voltage undershoot is caused by the inductance of the output power bus just after a short has occurred and the TPD3S0x4s have abruptly reduced OUT current. Energy stored in the inductance will drive the OUT voltage down and potentially negative as it discharges. Applications with large output inductance (such as from a cable) benefit from use of a high-value output capacitor to control the voltage undershoot. When implementing USB standard applications, a 120 μF minimum output capacitance is required. Typically a 150- μF electrolytic capacitor is used, which is sufficient to control voltage undershoots. However, if the application does not require 120 μF of capacitance, and there is potential to drive the output negative, a minimum of 10- μF ceramic capacitance on the output is recommended. The voltage undershoot should be controlled to less than 1.5 V for 10 μs .

9.3.7 Power Dissipation and Junction Temperature

It is good design practice to estimate power dissipation and maximum expected junction temperature of the TPD3S0x4s. The system designer can control choices of the devices proximity to other power dissipating devices and printed circuit board (PCB) design based on these calculations. These have a direct influence on maximum junction temperature. Other factors, such as airflow and maximum ambient temperature, are often determined by system considerations. It is important to remember that these calculations do not include the effects of adjacent heat sources, and enhanced or restricted air flow. Addition of extra PCB copper area around these devices is recommended to reduce the thermal impedance and maintain the junction temperature as low as practical. In particular, connect the GND pin to a large ground plane for the best thermal dissipation. The following PCB layout example [Figure 30](#) was used to determine the $R_{\theta\text{JA}}$. Custom thermal impedances noted in the [Thermal Information](#) table. It is based on the use of the JEDEC high-k circuit board construction with 4, 1 oz. copper weight layers (2 signal and 2 plane).

Figure 30. PCB Layout Example

The following procedure requires iteration because power loss is due to the internal MOSFET $I^2 \times R_{\text{DS(ON)}}$, and $R_{\text{DS(ON)}}$ is a function of the junction temperature. As an initial estimate, use the $R_{\text{DS(ON)}}$ at 125°C from the [Typical Characteristics](#), and the preferred package thermal resistance for the preferred board construction from the [Thermal Information](#) table.

$$T_J = T_A + [(I_{\text{OUT}}^2 \times R_{\text{DS(ON)}}) \times R_{\theta\text{JA}}]$$

where

- I_{OUT} = rated OUT pin current (A)
- $R_{\text{DS(ON)}}$ = Power switch on-resistance at an assumed T_J (Ω)
- T_A = Maximum ambient temperature ($^{\circ}\text{C}$)
- T_J = Maximum junction temperature ($^{\circ}\text{C}$)
- $R_{\theta\text{JA}}$ = Thermal resistance ($^{\circ}\text{C}/\text{W}$)

(1)

Feature Description (continued)

If the calculated T_J is substantially different from the original assumption, estimate a new value of $R_{DS(ON)}$ using the typical characteristic plot and recalculate.

If the resulting T_J is not less than 125°C, try a PCB construction with a lower $R_{\theta JA}$. Please find the junction temperature derating curve based on the TI standard reliability duration in [Figure 31](#).

Figure 31. Junction Temperature Derating Curve

9.4 Device Functional Modes

9.4.1 Operation with $V_{IN} < 4$ V (Minimum V_{IN})

These devices operate with input voltages above 4V. The maximum UVLO voltage on IN is 4V and the devices will operate at input voltages above 4 V. Any voltage below 4 V may not work with these devices. The minimum UVLO is 3.5 V, so some devices may work between 3.5 V and 4 V. At input voltages below the actual UVLO voltage, these devices will not operate.

9.4.2 Operation With EN Control

The enable rising edge threshold voltage is 1.45 V typical and 2 V maximum. With EN held below that voltage the device is disabled and the load switch will be open. The IC quiescent current is reduced in this state. When the EN pin is above its rising edge threshold and the input voltage on the IN pin is above its UVLO threshold, the device becomes active. The load switch is closed, and the current limit feature is enabled. The output voltage on OUT will ramp up with the soft start value T_{ON} in order to prevent large inrush current surges on V_{BUS} due to a heavy capacitive load. When EN voltage is lowered below its falling edge threshold, the device output voltage will also ramp down with soft turn off value T_{OFF} to prevent large inductive voltages being presented to the system in the case a large load current is following through the device.

9.4.3 Operation of Level 4 IEC61000-4-2 ESD Protection

Regardless of which functional mode the devices are in, TPD3S0x4 will provide Level 4 IEC61000-4-2 ESD Protection on the pins of the USB connector.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

TPD3S0x4 are devices that feature a current limited load switch and a two channel Transient Voltage Suppressor (TVS) based Electrostatic Discharge (ESD) protection diode array. They are typically used to provide a complete protection solution for USB host ports. USB host ports are required by the USB specification to provide a current limit on the VBUS path in order to protect the system from over-current conditions on the port that could lead to system damage and user injury. Additionally, USB ports typically require system level IEC ESD protection due to direct end-user interaction. The following design procedure can be used to determine how to properly implement TPD3S0x4s in your systems to provide a complete, one-chip solution for your USB ports.

10.2 Typical Application

10.2.1 USB2.0 Application

Figure 32. USB2.0 Application Schematic

10.2.1.1 Design Requirements

For this design example, use the following as the system parameters.

DESIGN PARAMETER	VALUE
USB Port Type	Standard Downstream Port
Signal Voltage Range on V _{BUS}	0 V to 5.25 V
Current Range on V _{BUS}	0 mA to 500 mA
Maximum Voltage Droop Allowed on Adjacent USB Port	330 mV
Maximum Data Rate	480 Mbps

10.2.1.2 Detailed Design Procedure

To properly implement your USB port with TPD3S0x4s, the first step is to determine what type of USB port you are implementing in your system, whether it be a Standard Downstream Port (SDP), Charging Downstream Port (CDP), or Dedicated Charging Port (DCP); this will inform you what your maximum continuous operating current will be on VBUS. In our example, we are implementing an SDP port, so the maximum continuous current allowed to be pulled by a device is 500mA. Therefore, we need to choose a current limit switch that is 5.25V tolerant, can handle 500mA continuous DC current, and has a current limit point is above 500 mA so it will not current limit during normal operation. TPD3S014 is therefore the best choice for this application, as it has these features, and in fact was specifically designed for this application.

The next decision point is choosing your input and output capacitors for your current limit switch. A minimum of 0.1 μF is always recommended on the IN pin. For the OUT pin on VBUS, USB standard requires a minimum of 120 μF ; typically a 150 μF capacitor is used. The purpose of the capacitance requirement on the VBUS line in the USB specification is to prevent the adjacent USB port's VBUS voltage from dropping more than 330 mV during a hot-plug or fault occurrence on the VBUS pin of one USB port. Hot-plugs and fault conditions on one USB port should not disturb the normal operation of an adjacent USB port; therefore, it is possible to use an output capacitance lower than 120 μF if your system is able to keep voltage droops on adjacent USB ports less than or equal to 330 mV. For example, if the DC/DC powering VBUS has a fast transient response, 120 μF may not be required.

If your USB port is powered from a shared system 5V rail, a system designer may desire to use large than 0.1 μF for the input capacitor on the IN pin. This is largely dependent on your PCB layout and parasitics, as well as your maximum tolerated voltage droop on the shared rail during transients. For more information on choosing input and output capacitors, please see [Input and Output Capacitance](#) in the Detailed Description section.

The EN pin controls the on and off state of the device, and typically is connected to the system processor for power sequencing. However, the EN pin can also be shorted to the IN pin to always have the TPD3S014 on when 5V power supply on; this also saves a GPIO pin on your processor.

For a USB port with High-Speed 480Mbps operation, low capacitance TVS ESD protection diodes are required to protect the D+ and D- lines in the event of system level ESD event. TPD3S014 has 2-channels of low capacitance TVS ESD protection diodes integrated. When placed near the USB connector, TPD3S014 offers little or no signal distortion during normal operation. TPD3S014 also ensures that the core system circuitry is protected in the event of an ESD strike. PCB Layout is critical when implementing TVS ESD protection diodes in your system; please read the [Layout](#) section for proper guidelines on routing your USB lines with TPD3S014.

10.2.1.3 Application Curves

Figure 33. Eye-Diagram Without EVM

Figure 34. Eye-Diagram With EVM, Without TPD3S0x4

Figure 35. Eye-Diagram of TPD3S0x4 on EVM

10.2.2 USB3.0 Application

Figure 36. USB3.0 Application Schematic

10.2.2.1 Design Requirements

For this design example, use the following as the system parameters.

DESIGN PARAMETER	VALUE
USB Port Type	Standard Downstream Port
Signal Voltage Range on V_{BUS}	0 V to 5.25 V
Current Range on V_{BUS}	0 mA to 900 mA
Maximum Voltage Droop Allowed on Adjacent USB Port	330 mV
Maximum Data Rate D+, D- Lines	480 Mbps
Maximum Data Rate TX+/-, RX+/- Lines	5 Gbps

10.2.2.2 Detailed Design Procedure

The implementation of the USB3.0 port with TPD3S0x4s is identical to the USB2.0 port, except that in this use case we must use TPD3S044 because USB3.0 SDP has a maximum V_{BUS} current 900 mA. TPD3S014 current limit level is too low for USB3.0 operation. In addition to using TPD3S044, USB3.0 has four more Super-Speed Lines for transferring data 5 Gbps, and these lines also typically require Level 4 IEC61000-4-2 ESD Protection. With a data rate of 5 Gbps, ultra-low capacitance TVS ESD protection diodes are required to protect the TX+/- and RX+/- lines in the event of system level ESD event. TPD4E05U06 provides 4-channels of ultra-low capacitance TVS ESD protection diodes for USB3.0 Super-Speed lines, and can be coupled with TPD3S044 to provide a two-chip total protection solution for the USB3.0 Host Port. Please refer to the [Layout](#) section of the datasheet for guidelines on the PCB Layout of this two-chip solution.

The rest of the design procedure is identical to the [USB2.0 Application](#) section, so please refer to it for the rest of the design procedure.

10.2.2.3 Application Curves

See [Application Curves](#) for TPD3S0x4 Eye-Diagram performance. Please refer to the [TPD4E05U06](#) datasheet on ti.com to see its specifications and Eye-Diagram performance.

11 Power Supply Recommendations

These devices are designed to operate from a 5 V input voltage supply. This input should be well regulated. If the input supply is located more than a few inches away from the TPD3S0x4, additional bulk capacitance may be required in addition to the recommended minimum 0.1 μF bypass capacitor on the IN pin to keep the input rail stable during fault events.

12 Layout

12.1 Layout Guidelines

- The optimum placement is as close to the connector as possible.
 - EMI during an ESD event can couple from the trace being struck to other nearby unprotected traces, resulting in early system failures.
 - The PCB designer needs to minimize the possibility of EMI coupling by keeping any unprotected traces away from the protected traces which are between the TVS and the connector.
- Route the protected traces as straight as possible.
- Eliminate any sharp corners on the protected traces between the TVS and the connector by using rounded corners with the largest radii possible.
 - Electric fields tend to build up on corners, increasing EMI coupling.

14 机械封装和可订购信息

以下页中包括机械封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

重要声明

德州仪器(TI)及其下属子公司有权根据 JESD46 最新标准,对所提供的产品和服务进行更正、修改、增强、改进或其它更改,并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息,并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内,且 TI 认为有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定,否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应用相关的风险,客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予的直接或隐含权限作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息,不能构成从 TI 获得使用这些产品或服务的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可,或是 TI 的专利权或其它知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分,仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时,如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分,则会失去相关 TI 组件或服务的所有明示或暗示授权,且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意,尽管任何应用相关信息或支持仍可能由 TI 提供,但他们将独立负责满足与其产品及其在应用中使用的 TI 产品相关的所有法律、法规和安全相关要求。客户声明并同意,他们具备制定与实施安全措施所需的全部专业技术和知识,可预见故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中,为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特有的可满足适用的功能安全性标准和要求的终端产品解决方案。尽管如此,此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III (或类似的生命攸关医疗设备)的授权许可,除非各方授权官员已经达成了专门管控此类使用的特别协议。

只有那些 TI 特别注明属于军用等级或“增强型塑料”的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同意,对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用,其风险由客户单独承担,并且由客户独立负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品,这些产品主要用于汽车。在任何情况下,因使用非指定产品而无法达到 ISO/TS16949 要求, TI 不承担任何责任。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPD3S014DBVR	ACTIVE	SOT-23	DBV	6	3000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	SII	Samples
TPD3S044DBVR	ACTIVE	SOT-23	DBV	6	3000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	SIJ	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties.
