

## TMP103 采用 WCSP 封装、具备双线制接口的低功耗数字温度传感器

### 1 特性

- 多器件访问 (MDA):
  - 全局读/写操作
- 兼容 I<sup>2</sup>C™ 和 SMBus™ 的接口
- 分辨率: 8 位
- 精度:  $\pm 1^{\circ}\text{C}$  ( $-10^{\circ}\text{C}$  至  $100^{\circ}\text{C}$  范围内的典型值)
- 低静态电流:
  - 0.25Hz 频率下的工作 I<sub>Q</sub> 为 3 $\mu\text{A}$
  - 关断电流为 1 $\mu\text{A}$
- 电源范围: 1.4V 至 3.6V
- 数字输出
- 4 焊球晶圆级芯片 (WCSP) (DSBGA) 封装

### 2 应用

- 手持终端
- 笔记本电脑
- 固态硬盘 (SSD)
- 服务器
- 电信
- 机顶盒
- 低功耗环境
- 传感器

### 3 说明

TMP103 是一款采用 4 焊球晶圆级芯片规模封装 (WCSP) 的数字输出温度传感器。TMP103 读取温度的分辨率可达 1 $^{\circ}\text{C}$ 。

TMP103 特有一个兼容 I<sup>2</sup>C 和 SMBus 接口的双线制接口。此外, 该接口还支持多器件存取 (MDA) 命令, 允许主控器与总线上的多个器件同时进行通信, 从而不必向总线上的每个 TMP103 单独发送命令。

最多可并联 8 个 TMP103 并由主机轻松进行读取。TMP103 尤其适合 必须 监视多个温度测量区域的空间受限类功率敏感型应用。

TMP103 的额定运行温度范围为  $-40^{\circ}\text{C}$  至  $+125^{\circ}\text{C}$  (中)

## 5 Pin Configurations and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
A1	V <sup>+</sup>	I	Supply voltage
A2	GND	I	Ground
B1	SDA	I/O	Input/output data pin
B2	SCL	I	Input clock pin

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
V <sup>+</sup>	Supply voltage		3.6	V
	Input voltage <sup>(2)</sup>	-0.3	(V <sup>+</sup> ) + 0.3	V
	Operating temperature	-55	150	°C
T <sub>J</sub>	Junction temperature		150	°C
T <sub>stg</sub>	Storage temperature	-60	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input voltage rating applies to all TMP103 input voltages.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±1000
		Machine model (MM)	±200

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V <sup>+</sup>	Supply voltage	1.4	3.6	V
T <sub>A</sub>	Operating free-air temperature	-40	125	°C

(1) Values based on a statistical analysis of a one-time sample of devices. Minimum and maximum values are not guaranteed and not production tested.

The TMP103 is two-wire and SMBus compatible. [Figure 1](#) to [Figure 5](#) describe the various operations on the TMP103. Parameters for [Figure 1](#) are defined in [Timing Requirements](#). Bus definitions are:

**Bus Idle:** Both SDA and SCL lines remain high.

**Start Data Transfer:** A change in the state of the SDA line, from high to low, while the SCL line is high, defines a START condition. Each data transfer is initiated with a START condition.

**Stop Data Transfer:** A change in the state of the SDA line from low to high while the SCL line is high defines a STOP condition. Each data transfer is terminated with a repeated START or STOP condition.

**Data Transfer:** The number of data bytes transferred between a START and a STOP condition is not limited and is determined by the master device.

**Acknowledge:** Each receiving device, when addressed, is obliged to generate an Acknowledge bit. A device that acknowledges must pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable low during the high period of the Acknowledge clock pulse. Setup and hold times must be taken into account. On a master receive, the termination of the data transfer can be signaled by the master generating a *Not-Acknowledge* (1) on the last byte transmitted by the slave.

## 7 Detailed Description

### 7.1 Overview

The TMP103 is a digital output temperature sensor in a wafer chip-scale package (WCSP) that is optimal for thermal management and thermal profiling. The TMP103 includes a two-wire interface that is compatible with both I<sup>2</sup>C and SMBus interfaces. In addition, the TMP103 has the capability of executing multiple device access (MDA) commands that allow multiple TMP103 devices to respond to a single global bus command. MDA commands reduce communication time and power in a bus that contains multiple TMP103 devices. The TMP103 is specified over a temperature range of  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

The TMP103 serial interface is designed to support up to eight TMP103 devices on a single bus. The TMP103 is offered with eight internal interface addresses. Each unique address option can be used as a location or temperature zone designator. The TMP103 responds to standard I<sup>2</sup>C and SMBus slave protocols that allow the internal registers to be written to or read from on an individual basis. The TMP103 also responds to MDA commands that allow all the devices on the bus to be written to or read from, without having to send the individual address and commands to each device.

Pullup resistors are required on SCL and SDA. TI also recommends a 0.01- $\mu\text{F}$  bypass capacitor, as shown in Figure 11.

NOTE: SCL and SDA pins require pullup resistors.

Figure 11. Typical Connections

The temperature sensor in the TMP103 is the chip itself. Thermal paths run through the package bumps as well as the package. The lower thermal resistance of metal causes the bumps to provide the primary thermal path.

To maintain accuracy in applications that require air or surface temperature measurement, take care to isolate the package from ambient air temperature.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

The TMP103 is a 1°C resolution digital output temperature sensor offered in a four-ball wafer chip-scale package (WCSP). The TMP103 features a two-wire interface that is compatible with both I<sup>2</sup>C and SMBus interfaces.

The serial interface supports multiple device access (MDA) commands that allow the master to communicate with multiple devices on the bus simultaneously, eliminating the need to send individual commands to each TMP103 device on the bus. Up to eight TMP103 devices can be tied together in parallel and easily read by the host.

The TMP103 is an ideal choice for space-constrained and power-sensitive applications with multiple temperature measurement zones to be monitored.

## 7.4 Device Functional Modes

### 7.4.1 Shutdown Mode

Shutdown mode saves maximum power by shutting down all device circuitry other than the serial interface, reducing current consumption to typically less than 0.5  $\mu$ A. For details on how to enter shutdown mode, see [Shutdown Mode \( \$M1 = 0, M0 = 0\$ \)](#) in [Programming](#).

### 7.4.2 One-Shot Mode

The TMP103 features a One-Shot Temperature Measurement mode. When the device is in Shutdown mode, the device can be instructed to complete a one-time temperature measurement before returning to the shutdown state. This feature is useful for reducing power consumption in the TMP103 when continuous temperature monitoring is not required.

As a result of the short conversion time, the TMP103 can achieve a higher conversion rate. A single conversion typically takes 26 ms and a read can take place in less than 20  $\mu$ s. When using One-Shot mode, 30 or more conversions per second are possible.

For details on how to enter One-Shot mode, see [One-Shot \( \$M1 = 0, M0 = 1\$ \)](#) in [Programming](#).

### 7.4.3 Continuous Conversion Mode

In Continuous Conversion mode, the TMP103 performs temperature conversion at a rate determined by the conversion rate bits (CR1 and CR0) set in the configuration register. Because the actual temperature conversion takes only 26 mS, the TMP103 powers down in between conversions and waits for the appropriate delay. For details on how to enter One-Shot mode, see [Continuous Conversion Mode \( \$M1 = 1\$ \)](#) and [Conversion Rate](#) in [Programming](#).

## 7.5 Programming

### 7.5.1 Temperature Watchdog Function

The TMP103 contains a watchdog function that monitors device temperature and compares the result to the values stored in the temperature limit registers ( $T_{HIGH}$  and  $T_{LOW}$ ) to determine if the device temperature is within these set limits. If the temperature of the TMP103 becomes greater than the value in the  $T_{HIGH}$  register, then the flag-high bit (FH) in the configuration register is set to 1. If the temperature falls below the value in the  $T_{LOW}$  register, then the flag-low bit (FL) is set to 1. If both flag bits remain 0, then the temperature is within the temperature *window* set by the temperature limit registers, as shown in [Figure 12](#).

**Programming (continued)**

**Figure 12. Temperature Flag Functional Diagram**

The latch bit (LC) in the configuration register is used to latch the value of the flag bits (FH and FL) until the master issues a read command to the configuration register. The flag bits are set to 0 if a read command is received by the TMP103, or if  $LC = 0$  and the temperature is within the temperature limits. The power-on default values for these bits are  $FH = 0$ ,  $FL = 0$ , and  $LC = 0$ .

**7.5.2 Conversion Rate**

The conversion rate bits, CR1 and CR0 located in the Configuration Register, configure the TMP103 for conversion rates of 8 Hz, 4 Hz, 1 Hz, or 0.25 Hz (default). The TMP103 has a typical conversion time of 26 ms. To achieve different conversion rates, the TMP103 performs a single conversion and then powers down and waits for the appropriate delay set by CR1 and CR0. [Table 1](#) lists the settings for CR1 and CR0.

**Table 1. Conversion Rate Settings**

CR1	CR0	CONVERSION RATE
0	0	0.25 Hz (default)
0	1	1 Hz
1	0	4 Hz
1	1	8 Hz

After power up or general-call reset, the TMP103 immediately starts a conversion, as shown in [Figure 13](#). The first result is available after 26 ms (typical). The active quiescent current during conversion is 40  $\mu\text{A}$  (typical at 27°C,  $V^+ = 1.8\text{ V}$ ). The quiescent current during delay is 1  $\mu\text{A}$  (typical at 27°C,  $V^+ = 1.8\text{ V}$ ).

(1) Delay is set by CR1 and CR0.

**Figure 13. Conversion Start**

### 7.5.3 Shutdown Mode (M1 = 0, M0 = 0)

Shutdown mode saves maximum power by shutting down all device circuitry other than the serial interface, reducing current consumption to typically less than 0.5  $\mu\text{A}$ . Shutdown mode is enabled when bits M1 and M0 (in the Configuration Register) = 00. The device shuts down when the current conversion is completed.

### 7.5.4 One-Shot (M1 = 0, M0 = 1)

The TMP103 features a One-Shot Temperature Measurement mode. When the device is in Shutdown mode, writing a 01 to bits M1 and M0 starts a single temperature conversion. During the conversion, bits M1 and M0 read 01. The device returns to the shutdown state at the completion of the single conversion. After the conversion, bits M1 and M0 read 00. This feature is useful for reducing power consumption in the TMP103 when continuous temperature monitoring is not required.

As a result of the short conversion time, the TMP103 can achieve a higher conversion rate. A single conversion typically takes 26 ms and a read can take place in less than 20  $\mu\text{s}$ . When using One-Shot mode, 30 or more conversions per second are possible.

### 7.5.5 Continuous Conversion Mode (M1 = 1)

When the TMP103 is in Continuous Conversion mode (M1 = 1), a single conversion is performed at a rate determined by the conversion rate bits, CR1 and CR0 (in the Configuration Register). The TMP103 performs a single conversion and then powers down and waits for the appropriate delay set by CR1 and CR0. See [Table 1](#) for CR1 and CR0 settings.

### 7.5.6 Bus Overview

The device that initiates the transfer is called a *master*, and the devices controlled by the master are *slaves*. The bus must be controlled by a master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions.

To address a specific device, a START condition is initiated, indicated by pulling the data line (SDA) from a high to low logic level while SCL is high. All slaves on the bus shift in the slave address byte on the rising edge of the clock, with the last bit indicating whether a read or write operation is intended. During the ninth clock pulse, the slave being addressed responds to the master by generating an Acknowledge and pulling SDA low.

Data transfer is then initiated and sent over eight clock pulses followed by an Acknowledge Bit. During data transfer, SDA must remain stable while SCL is high, because any change in SDA while SCL is high is interpreted as a START or STOP signal.

Once all data have been transferred, the master generates a STOP condition indicated by pulling SDA from low to high, while SCL is high.

### 7.5.7 Serial Interface

The TMP103 operates as a slave device only on the two-wire bus and SMBus. Connections to the bus are made through the open-drain I/O lines SDA and SCL. The SDA and SCL pins feature integrated spike suppression filters and Schmitt triggers to minimize the effects of input spikes and bus noise. The TMP103 supports the transmission protocol for both fast (1 kHz to 400 kHz) and high-speed (1 kHz to 3.4 MHz) modes. All data bytes are transmitted MSB first.

### 7.5.8 Serial Bus Address

To communicate with the TMP103, the master must first address slave devices through a slave address byte. The slave address byte consists of seven address bits, and a direction bit that indicates the intent of executing a read or write operation.

The TMP103 is available in eight versions, each with a different slave address, as shown in [Table 2](#). These addresses can be used as either a location or a temperature zone designator.

**Table 2. Device Slave Addresses**

PRODUCT	TWO-WIRE ADDRESS	TEMPERATURE ZONE
TMP103A	1110000	Zone1
TMP103B	1110001	Zone2
TMP103C	1110010	Zone3
TMP103D	1110011	Zone4
TMP103E	1110100	Zone5
TMP103F	1110101	Zone6
TMP103G	1110110	Zone7
TMP103H	1110111	Zone8

### 7.5.9 Writing and Reading Operation

Accessing a particular register on the TMP103 is accomplished by writing the appropriate value to the Pointer Register. The value for the Pointer Register is the first byte transferred after the slave address byte with the R/W bit low. Every write operation to the TMP103 requires a value for the Pointer Register (see [Figure 2](#)).

When reading from the TMP103, the last value stored in the Pointer Register by a write operation is used to determine which register is read by a read operation. To change the register pointer for a read operation, a new value must be written to the Pointer Register. This action is accomplished by issuing a slave address byte with the R/W bit low, followed by the Pointer Register byte. No additional data are required. The master can then generate a START condition and send the slave address byte with the R/W bit high to initiate the read command. See [Figure 3](#) for details of this sequence. If repeated reads from the same register are desired, it is not necessary to continually send the Pointer Register bytes; the TMP103 remembers the Pointer Register value until it is changed by the next write operation, or the TMP103 is reset.

### 7.5.10 Slave Mode Operations

The TMP103 can operate as a slave receiver or slave transmitter. As a slave device, the TMP103 never drives the SCL line.

#### 7.5.10.1 Slave Receiver Mode

The first byte transmitted by the master is the slave address, with the  $\overline{R/W}$  bit low. The TMP103 then acknowledges reception of a valid address. The next byte transmitted by the master is the Pointer Register. The TMP103 then acknowledges reception of the Pointer Register byte. The next byte is written to the register addressed by the Pointer Register. The TMP103 acknowledges reception of the data byte. The master can terminate data transfer by generating a START or STOP condition.

### 7.5.10.2 Slave Transmitter Mode

The first byte transmitted by the master is the slave address, with the  $R/\overline{W}$  bit high. The slave acknowledges reception of a valid slave address. The next byte is transmitted by the slave of the register indicated by the Pointer Register. The master acknowledges reception of the data byte. The master can terminate data transfer by generating a *Not-Acknowledge* on reception of the data byte, or generating a START or STOP condition.

### 7.5.11 General Call

The TMP103 responds to a two-wire General Call address (0000000) if the eighth bit is 0. The device acknowledges the General Call address and responds to commands in the second byte. If the second byte is 00000110, the TMP103 internal registers are reset to power-up values. The TMP103 does not support the General Address acquire command.

### 7.5.12 High-Speed (Hs) Mode

For the two-wire bus to operate at frequencies greater than 400 kHz, the master device must issue an Hs-mode master code (00001xxx) as the first byte after a START condition to switch the bus to high-speed operation. The TMP103 does not acknowledge this byte, but switches its input filters on SDA and SCL and its output filters on SDA to operate in Hs-mode, allowing transfers at up to 3.4 MHz. After the Hs-mode master code has been issued, the master transmits a START condition followed by a two-wire slave address to initiate a data transfer operation. The bus continues to operate in Hs-mode until a STOP condition occurs on the bus. Upon receiving the STOP condition, the TMP103 switches the input and output filters back to the default fast-mode operation.

### 7.5.13 Timeout Function

The TMP103 resets the serial interface if SCL is held low for 30 ms (typical). The TMP103 releases the bus if it is pulled low and waits for a START condition. To avoid activating the timeout function, it is necessary to maintain a communication speed of at least 1 kHz for SCL operating frequency.

### 7.5.14 Multiple Device Access

The TMP103 supports Multiple Device Access (MDA), which allows the master to communicate with multiple TMP103 devices on the same bus interface with one interface transaction. MDA commands consist of an MDA read address (00000001) and an MDA write address (00000000). The device acknowledges the MDA address and responds to the command accordingly. For the MDA to function correctly, different product versions of the TMP103 must be used in the system; see [Table 2](#).

#### 7.5.14.1 Multiple Device Access Write

The master transmits an MDA write address followed by the pointer address of the register to be accessed; see [Table 4](#). Following the pointer, all of the TMP103 devices on the bus acknowledge and wait for the next byte of data to be written to the addressed registers. When the data byte is received by the TMP103 devices, they store and acknowledge the transmitted byte. The TMP103 devices store the same data on all devices on the bus in one transaction; see [Figure 4](#).

#### 7.5.14.2 Multiple Device Access Read

Before an MDA read transaction can begin, the master must first send an MDA write transaction to set the appropriate pointer address of the register to be accessed, as stated in the previous section. The master can then transmit an MDA read address followed by a read byte for each TMP103 used on the bus. For example, if a TMP103A and TMP103B are used on the same bus and an MDA read address is sent, the address must be followed by two bytes of data and two master acknowledges. The TMP103A sends data on the first byte and the TMP103B sends data on the second byte. The master must issue an acknowledge for each byte read to read all of the TMP103 devices on the bus; see [Figure 5](#). If the master does not acknowledge each byte of data, the TMP103s stop sending subsequent data for any remaining devices.

Up to eight TMP103 devices can be on the same bus and respond to MDA commands; see [Table 2](#).

**NOTE**

If the bus contains an incomplete sequence of TMP103 device addresses, the master must transmit all required dummy bytes for the missing device address to allow for normal MDA read operation. For example, if the TMP103A, TMP103B, and TMP103D devices are on the bus, the master must transmit an MDA read address followed by four bytes and four acknowledges to complete the MDA read transaction.

**7.5.15 NOISE**

The TMP103 is a very low-power device and generates very low noise on the supply bus. Applying an RC filter to the V<sup>+</sup> pin of the TMP103 can further reduce any noise the TMP103 might propagate to other components. R<sub>F</sub> in Figure 14 should be less than 5 kΩ and C<sub>F</sub> should be greater than 10 nF.

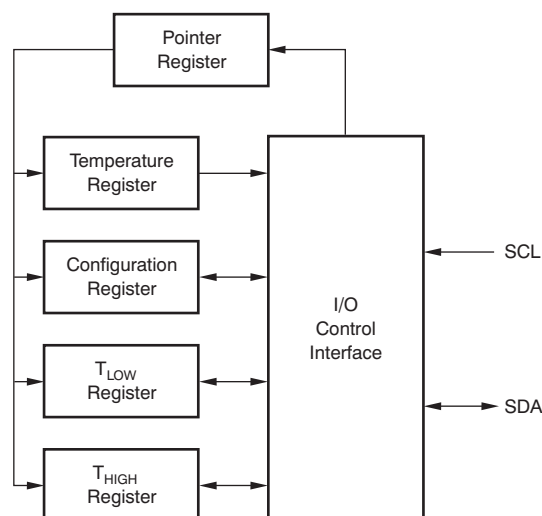

**Figure 14. Noise Reduction**
**7.6 Register Maps**
**7.6.1 Pointer Register**

Figure 15 shows the internal register structure of the TMP103. The 8-bit Pointer Register of the device is used to address a given data register. The Pointer Register uses the two LSBs to identify which of the data registers should respond to a read or write command. Table 3 identifies the bits of the Pointer Register byte. During a write command, P2 through P7 must always be 0. Table 4 describes the pointer address of the registers available in the TMP103. Power-up reset value of P1/P0 is 00. By default, the TMP103 reads the temperature on power up.

**Figure 15. Internal Register Structure**

**Register Maps (continued)**
**Table 3. Pointer Register Byte**

P7	P6	P5	P4	P3	P2	P1	P0
0	0	0	0	0	0	Register Bits	

**Table 4. Pointer Addresses**

P1	P0	REGISTER
0	0	Temperature Register (Read Only)
0	1	Configuration Register (Read/Write)
1	0	T <sub>LOW</sub> Register (Read/Write)
1	1	T <sub>HIGH</sub> Register (Read/Write)

**7.6.2 Temperature Register**

The Temperature Register of the TMP103 device is configured as an eight-bit, read-only register that stores the output of the most recent conversion. A single byte must be read to obtain data, and is described in [Table 5](#). The data format for temperature is summarized in [Table 6](#). One LSB equals 1°C.

**Table 5. Temperature Register**

D7	D6	D5	D4	D3	D2	D1	D0
T7	T6	T5	T4	T3	T2	T1	T0

Negative numbers are represented in binary twos complement format. Following power up or reset, the Temperature Register reads 0°C until the first conversion is complete.

**Table 6. 8-Bit Temperature Data Format<sup>(1)</sup>**

TEMPERATURE (°C)	DIGITAL OUTPUT (BINARY)	HEX
128	0111 1111	7F
127	0111 1111	7F
100	0110 0100	64
80	0101 0000	50
75	0100 1011	4B
50	0011 0010	32
25	0001 1001	19
0	0000 0000	00
-1	1111 1111	FF
-25	1110 0111	E7
-55	1100 1001	C9

(1) The resolution for the ADC is 1°C/count, where *count* is equal to the digital output of the ADC.

For positive temperatures (for example, 50°C):

Twos complement is not performed on positive numbers. Therefore, simply convert the number to binary code, left-justified format. Denote a positive number with MSB = 0.

Example: (50°C)/(1°C/count) = 50 = 32h = 0011 0010

For negative temperatures (for example, -25°C):

Generate the twos complement of a negative number by complementing the absolute value binary number and adding 1. Denote a negative number with MSB = 1.

Example: (|-25°C|)/(1°C/count) = 25 = 19h = 0001 1001

Twos complement format: 1110 0110 + 1 = 1110 0111

### 7.6.3 Configuration Register

The Configuration Register is an eight-bit read/write register used to store bits that control the operational modes of the temperature sensor. Read/write operations are performed MSB first. The format and power-up and reset value of the Configuration Register is shown in [Table 7](#). All registers are updated at the end of the data byte.

**Table 7. Configuration and Power-Up and Reset Format**

D7	D6	D5	D4	D3	D2	D1	D0
ID	CR1	CR0	FH	FL	LC	M1	M0
0	0	0	0	0	0	1	0

### 7.6.4 Temperature Limit Registers

The  $T_{HIGH}$  and  $T_{LOW}$  registers are used to store the temperature limit thresholds for the TMP103 watchdog function. At the end of each temperature measurement, the TMP103 compares the temperature results to each of these limits. If the temperature result is greater than the  $T_{HIGH}$  limit, then the FH bit in the configuration register is set to 1. If the temperature result is less than the  $T_{LOW}$  limit, then the FL bit in the configuration register is set to 1; see [Figure 12](#).

[Table 8](#) and [Table 9](#) describe the format for the  $T_{HIGH}$  and  $T_{LOW}$  registers. Power-up reset values for  $T_{HIGH}$  and  $T_{LOW}$  are:  $T_{HIGH} = 60^{\circ}\text{C}$  and  $T_{LOW} = -10^{\circ}\text{C}$ . The format of the data for  $T_{HIGH}$  and  $T_{LOW}$  is the same as for the Temperature Register.

**Table 8.  $T_{HIGH}$  Register**

D7	D6	D5	D4	D3	D2	D1	D0
H7	H6	H5	H4	H3	H2	H1	H0

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TMP103 is a digital output temperature sensor in a DSBGA package that is optimal for thermal management and thermal profiling. The TMP103 includes a two-wire interface that is compatible with both I<sup>2</sup>C and SMBus interfaces. In addition, the TMP103 has the capability of executing multiple device access (MDA) commands that allows multiple TMP103 devices to respond to a single global bus command. MDA commands reduce communication time and power in a bus that contains multiple TMP103 devices. The TMP103 is specified over a temperature range of –40°C to 125°C.

The TMP103 serial interface is designed to support up to eight TMP103 devices on a single bus. The TMP103 is offered with eight internal interface addresses. Each unique address option can be used as a location or temperature zone designator. The TMP103 responds to standard I<sup>2</sup>C and SMBus slave protocols that allow the internal registers to be written to or read from on an individual basis. The TMP103 also responds to MDA commands that allow all the devices on the bus to be written to or read from, without having to send the individual address and commands to each device.

### 8.2 Typical Application

Figure 16. Typical Application Diagram

#### 8.2.1 Design Requirements

The TMP103 device requires pullup resistors on the SCL and SDA pins. The pullup resistor values must be selected such that the maximum current sinking capability of I/O pins is not violated. TI recommends a 0.01-μF bypass capacitor on the supply.

#### 8.2.2 Detailed Design Procedure

The TMP103 devices must be placed in close proximity to the heat source that must be monitored, with a proper layout for good thermal coupling. This placement ensures that temperature changes are captured within the shortest possible time interval. To maintain accuracy in applications that require air or surface temperature measurement, take care to isolate the package and leads from ambient air temperature. The TMP103 device is a very low-power device and generates very low noise on the supply bus. Applying an RC filter to the V<sup>+</sup> pin of the TMP103 device can further reduce any noise that the TMP103 device might propagate to other components.

Typical Application (continued)

8.2.3 Application Curve

Table 9 shows the step response of the TMP103 device to a submersion in an oil bath of 100°C from room temperature (25°C). The time-constant, or the time for the output to reach 63% of the input step, is 1.4 s. The time-constant result depends on the printed-circuit-board (PCB) that the TMP103 device is mounted. For this test, there are eight TMP103 devices soldered to a two-layer PCB that measured 2 in x 2 in, and the PCB thickness is 64 mils.

Figure 17. Temperature vs Time

## 9 Power Supply Recommendations

The TMP103 device operates with power supply in the range of 1.4 V to 3.6 V. The device is optimized for operation at 3.3-V supply but can measure temperature accurately in the full supply range. A power-supply bypass capacitor is required for proper operation. Place this capacitor as close as possible to the supply and ground pins of the device. A typical value for this supply bypass capacitor is 0.01  $\mu\text{F}$ . Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise.

## 10 Layout

### 10.1 Layout Guidelines

Place the power-supply bypass capacitor as close as possible to the supply pin. The recommended value of this bypass capacitor is 0.01  $\mu\text{F}$ . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies. Pull up the SDA and SCL pins through 5-k $\Omega$  pullup resistors.

### 10.2 Layout Example

(1) The marketing status values are defined as follows:  
**ACTIVE:** Product device recommended for new designs.

---

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. ### NOTES:

NanoFree Is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. NanoFree™ package configuration.

# EXAMPLE BOARD LAYOUT

YFF0004

DSBGA - 0.625 mm max height

DIE SIZE BALL GRID ARRAY

LAND PATTERN EXAMPLE  
SCALE:50X

SOLDER MASK DETAILS  
NOT TO SCALE

4219460/A 02/2014

NOTES: (continued)

- Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. For more information, see Texas Instruments literature number SBVA017 ([www.ti.com/lit/sbva017](http://www.ti.com/lit/sbva017)).

# EXAMPLE STENCIL DESIGN

YFF0004

DSBGA - 0.625 mm max height

DIE SIZE BALL GRID ARRAY

SOLDER PASTE EXAMPLE  
BASED ON 0.1 mm THICK STENCIL  
SCALE:50X

4219460/A 02/2014

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

## 重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (<http://www.ti.com/sc/docs/stdterms.htm>) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和和该等应用所用 TI 产品的功能而设计。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关单项 TI 资源。但并未依据禁止反言原则或其他法律授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或与应用 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负任何责任，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有 任何安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准而设计。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
