# 1A, 正固定电压、低压降稳压器

### 特性

• 精度: 1.5% (典型值)

低 lo: 100µA(最大值)

- 比标准 1117 器件低 500 倍

• V<sub>IN</sub>: 2.0V 至 5.5V

- V<sub>IN</sub>: 绝对最大值为 6.0V

输出电流 0mA 时保持稳定

低压降: V<sub>OUT</sub> = 3.3V, 1A 时为 455mV

高电源抑制比 (PSRR): 频率 1kHz 时为 65dB

最低保证限流: 1.1A

与低成本陶瓷电容器一起工作时保持稳定性:

- 具有 0Ω 等效串联电阻 (ESR)

温度范围: -40°C 至 +125°C

具有热关断及过流保护功能

提供的封装类型: 小外形尺寸晶体管 (SOT)223 封

- 可提供的电压选项的完整列表请参阅此文档末尾 的封装选项附录。

### 应用范围

- 机顶盒
- 电视与监视器
- PC 外设、笔记本电脑、和主板
- 调制解调器与其它通信产品
- 开关电源后级稳压

### 说明

TLV1171 低压降 (LDO) 线性稳压器是普及型 1117 稳 压器的低输入电压版本。

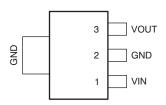

TLV1171 是一款极低功耗器件,其消耗的静态电流为 传统 1117 稳压器的五百分之一,这使得 TLV1171非 常适合于需要极低待机电流的应用。 TLV1171 LDO 还可在 0 mA 负载电流下保持稳定;没有最低负载要 求,这使得此器件非常适合于需要在待机时为极小负载 供电、同时又可在正常工作期间提供大约 1A 大电流的 应用。 TLV1171 可提供出色的线路与负载瞬态性能, 从而可在负载电流要求从不足 1 mA 变为超过 500 mA 时实现极低的下冲与过冲输出电压。

高精度带隙与误差放大器支持 1.5% 的精度。 极高的 电源抑制比使该器件能够在开关稳压器之后用于后稳 压。 其它重要特性还包括低输出噪声与低压降电压

该器件可通过内部补偿,在使用 0 Ω ESR 电容器时保 持稳定。 这些重要优势可实现对低成本小型陶瓷电容 器的使用。 此外,在必要时还可使用具有较高偏置电 压和温度降额的低成本电容器。

TPS1171 采用 SOT223 封装方式。 对于此器件的替 代插脚引线,请参考TLV1171LV。

### TLV1171xxDCY

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet. All trademarks are the property of their respective owners.

ZHCS849 – APRIL 2012 www.ti.com.cn

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### ORDERING INFORMATION(1)

PRODUCT	V <sub>OUT</sub>
TLV1171 <b>vvyyyz</b>	<b>VV</b> is the nominal output voltage (for example, 33 = 3.3 V). <b>YYY</b> is the package designator. <b>Z</b> is the package quantity. Use <i>R</i> for reel (2500 pieces), and <i>T</i> for tape (250 pieces).

<sup>(1)</sup> For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

## **ABSOLUTE MAXIMUM RATINGS**(1)

At  $T_J = +25$ °C, unless otherwise noted. All voltages are with respect to GND.

		VALUE	VALUE			
		MIN	MAX	UNIT		
Voltogo	Input voltage range, V <sub>IN</sub>	-0.3	+6.0	V		
Voltage	Output voltage range, V <sub>OUT</sub>	-0.3	+6.0	V		
Current	Maximum output current, I <sub>OUT</sub> Internally limited					
Output short-circuit duration		Ir	definite			
Continuous total power dissipation	P <sub>DISS</sub>	See Therma	l Information	Table		
Tananauatiun	Operating junction, T <sub>J</sub>	-55	+150	°C		
Temperature	Storage, T <sub>stg</sub>	-55	+150	°C		
Electrostatic discharge (ESD)	Human body model (HBM) QSS 009-105 (JESD22-A114A)		2	kV		
ratings	Charged device model (CDM) QSS 009-147 (JESD22-C101B.01)		500	V		

<sup>(1)</sup> Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods my affect device reliability.

#### THERMAL INFORMATION

		TLV1171		
	THERMAL METRIC(1)	DCY (SOT223)	UNITS	
		3 PINS		
$\theta_{JA}$	Junction-to-ambient thermal resistance	62.9		
$\theta_{JCtop}$	Junction-to-case (top) thermal resistance	47.2		
$\theta_{JB}$	Junction-to-board thermal resistance	12.0	°C/W	
ΨЈТ	Junction-to-top characterization parameter	6.1	-C/vv	
ΨЈВ	Junction-to-board characterization parameter	11.9		
$\theta_{JCbot}$	Junction-to-case (bottom) thermal resistance	N/A		

(1) For more information about traditional and new thermal metrics, see the IC Package Thermal Metrics application report, SPRA953A.

## **ELECTRICAL CHARACTERISTICS**

At  $T_A$  = +25°C,  $V_{IN}$  =  $V_{OUT(TYP)}$  + 1.5 V,  $I_{OUT}$  = 10 mA, and  $C_{OUT}$  = 1.0  $\mu$ F, unless otherwise noted.

			TLV1171					
	PARAMETER	Т	MIN	TYP	MAX	UNIT		
V <sub>IN</sub>	Input voltage range		2.0		5.5	V		
		V <sub>OUT</sub> > 2 V	-1.5		+1.5	%		
$V_{OUT}$	DC output accuracy	1.5 V ≤ V <sub>OUT</sub> < 2 V			-2		+2	%
		1.2 V ≤ V <sub>OUT</sub> < 1.5 V			-40		+40	mV
$\Delta V_{O}/\Delta V_{IN}$	Line regulation	$V_{OUT(NOM)} + 0.5 V \le V_{IN} \le$	5.5 V, I <sub>OUT</sub> = 10 r	nA		1	5	mV
$\Delta V_O/\Delta I_{OUT}$	Load regulation	0 mA ≤ I <sub>OUT</sub> ≤ 1 A				1	35	mV
				I <sub>OUT</sub> = 200 mA		115		mV
	Dropout voltage <sup>(1)</sup>	$V_{IN} = 0.98 \times V_{OUT(NOM)}$	.,	I <sub>OUT</sub> = 500 mA		285		mV
			V <sub>OUT</sub> < 3.3 V	I <sub>OUT</sub> = 800 mA		455		mV
M				I <sub>OUT</sub> = 1 A		570	800	mV
$V_{DO}$			V <sub>OUT</sub> ≥ 3.3 V	I <sub>OUT</sub> = 200 mA		90		mV
				I <sub>OUT</sub> = 500 mA		230		mV
				I <sub>OUT</sub> = 800 mA		365		mV
				I <sub>OUT</sub> = 1 A		455	700	mV
I <sub>CL</sub>	Output current limit	$V_{OUT} = 0.9 \times V_{OUT(NOM)}$	1.1			Α		
IQ	Quiescent current	I <sub>OUT</sub> = 0 mA				50	100	μA
PSRR	Power-supply rejection ratio	$V_{IN} = 3.3 \text{ V}, V_{OUT} = 1.8 \text{ V}$		65		dB		
V <sub>N</sub>	Output noise voltage	BW = 10 Hz to 100 kHz, V <sub>IN</sub> = 2.8 V, V <sub>OUT</sub> = 1.8 V, I <sub>OUT</sub> = 500 mA				60		$\mu V_{RMS}$
t <sub>STR</sub>	Startup time <sup>(2)</sup>	$C_{OUT} = 1.0 \mu F, I_{OUT} = 1 A$	C <sub>OUT</sub> = 1.0 μF, I <sub>OUT</sub> = 1 A			100		μs
UVLO	Undervoltage lockout	V <sub>IN</sub> rising		1.95		V		
T <sub>SD</sub>	Thermal shutdown	Shutdown, temperature in		+165		°C		
	temperature	Reset, temperature decre		+145		°C		
T <sub>J</sub>	Operating junction temperature		-40		+125	°C		

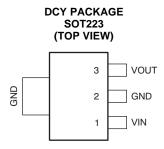

<sup>(1)</sup>  $V_{DO}$  is measured for devices with  $V_{OUT(NOM)} = 2.5 \text{ V}$  so that  $V_{IN} = 2.45 \text{ V}$ . (2) Startup time is the time from when  $V_{IN}$  asserts to when output is sustained at a value greater than or equal to  $0.98 \times V_{OUT(NOM)}$ .

ZHCS849 – APRIL 2012 www.ti.com.cn

#### APPLICATION INFORMATION

The TLV1171 is a low quiescent current linear regulator designed for high-current applications. Unlike typical high-current linear regulators, the TLV1171 consumes significantly less quiescent current. The device delivers excellent line and load transient performance. The TLV1171 is low noise, and exhibits a very good power-supply rejection ratio (PSRR). As a result, the device is ideal for high-current applications that require very sensitive power-supply rails.

The TLV1171 regulator offers both current limit and thermal protection. The device operating junction temperature range is -40°C to +125°C.

#### INPUT AND OUTPUT CAPACITOR REQUIREMENTS

For stability, 1.0-µF ceramic capacitors are required at the output. Higher-valued capacitors improve transient performance. X5R- and X7R-type ceramic capacitors are recommended because these capacitors have minimal variation in value and equivalent series resistance (ESR) over temperature. Unlike traditional linear regulators that need a minimum ESR for stability, the TLV1171 is ensured to be stable with no ESR. Therefore, cost-effective ceramic capacitors can be used with this device. Effective output capacitance that takes bias, temperature, and aging effects into consideration must be greater than 0.5 µF to ensure device stability.

Although an input capacitor is not required for stability, it is good analog design practice to connect a 0.1- $\mu$ F to 1.0- $\mu$ F, low-ESR capacitor across the IN and GND pins of the regulator. This capacitor counteracts reactive input sources and improves transient response, noise rejection, and ripple rejection. A higher-value capacitor may be necessary if large, fast, rise-time load transients are anticipated, or if the device is not located physically close to the power source. If source impedance is greater than 2  $\Omega$ , a 0.1- $\mu$ F input capacitor may also be necessary to ensure stability.

### BOARD LAYOUT RECOMMENDATIONS TO IMPROVE PSRR AND NOISE PERFORMANCE

Input and output capacitors should be placed as close to the device pins as possible. To improve characteristic ac performance such as PSRR, output noise, and transient response, it is recommended that the board be designed with separate ground planes for  $V_{IN}$  and  $V_{OUT}$ , with the ground plane connected only at the GND pin of the device. In addition, the output capacitor ground connection should be connected directly to the device GND pin. Higher-value ESR capacitors may degrade PSRR performance.

### **INTERNAL CURRENT LIMIT**

The TLV1171 internal current limit helps to protect the regulator during fault conditions. During current limit, the output sources a fixed amount of current that is largely independent of the output voltage. In such a case, the output voltage is not regulated and can be calculated by Equation 1:

$$V_{OUT} = I_{LIMIT} \times R_{LOAD}$$
 (1)

The PMOS pass transistor dissipates  $[(V_{IN} - V_{OUT}) \times I_{LIMIT}]$  until thermal shutdown is triggered and the device turns off. As the device cools down, it is turned on by the internal thermal shutdown circuit. If the fault condition continues, the device cycles between current limit and thermal shutdown. See the *Thermal Information* section for more details.

The PMOS pass element in the TLV1171 has a built-in body diode that conducts current when the voltage at OUT exceeds the voltage at IN. This current is not limited; if extended reverse voltage operation is anticipated, external limiting to 5% of the rated output current is recommended.

#### **DROPOUT VOLTAGE**

The TLV1171 uses a PMOS pass transistor to achieve low dropout. When  $(V_{IN}-V_{OUT})$  is less than the dropout voltage  $(V_{DO})$ , the PMOS pass device is in the linear region of operation and the input-to-output resistance is the  $R_{DS(ON)}$  of the PMOS pass element.  $V_{DO}$  scales approximately with output current because the PMOS device behaves like a resistor in dropout.

As with any linear regulator, PSRR and transient response are degraded as (V<sub>IN</sub> - V<sub>OUT</sub>) approaches dropout.

#### TRANSIENT RESPONSE

As with any regulator, increasing the size of the output capacitor reduces over- and undershoot magnitude.

### **UNDERVOLTAGE LOCKOUT (UVLO)**

The TLV1171 uses an undervoltage lockout circuit to keep the output shut off until the internal circuitry operates properly.

#### THERMAL INFORMATION

Thermal protection disables the output when the junction temperature rises to approximately +165°C, thus allowing the device to cool. When the junction temperature cools to approximately +145°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits dissipation of the regulator, protecting it from damage as a result of overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature should be limited to +125°C (max). To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions.

The TLV1171 internal protection circuitry has been designed to protect against overload conditions. It is not intended to replace proper heatsinking. Continuously running the TLV1171 into thermal shutdown degrades device reliability.

#### POWER DISSIPATION

The ability to remove heat from the die is different for each package type and presents different considerations in the printed circuit board (PCB) layout. The PCB area around the device that is free of other components moves heat from the device to ambient air. Performance data for JEDEC low and high-K boards are given in the *Thermal Information* table. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves heatsink effectiveness.

Power dissipation depends on input voltage and load conditions. Power dissipation (P<sub>D</sub>) is equal to the product of the output current and voltage drop across the output pass element, as shown in Equation 2:

$$P_{D} = (V_{IN} - V_{OUT}) I_{OUT}$$
(2)

<sup>&</sup>lt;sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

TBD: The Pb-Free/Green conversion plan has not been defined.

**Pb-Free** (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. **Pb-Free** (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between

the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

### PACKAGE OPTION ADDENDUM

19-Nov-2014

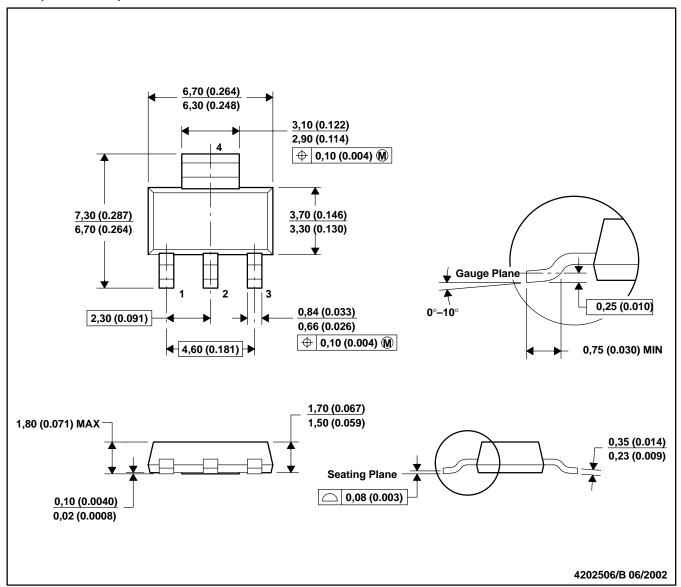

- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
