3 说明

LM60 器件是一种精密集成电路温度传感器，可由 2.7V 单电源供电，并可检测 -40°C 至 +125°C 的温度范围。此器件的输出电压与摄氏温度成正比 (6.25mV/°C)，并具有 424mV 的

直流失调电压。凭借此失调电压，在无需负电源的情况下即可读取负温度值。对于 -40°C 至 +125°C 的温度范围，此器件的标称输出电压范围介于 174mV 至 1205mV 之间。此器件经校准后可在室温下提供 $\pm 2^\circ\text{C}$ 的精度，而在 -25°C 至 +125°C 的完整温度范围内提供 $\pm 3^\circ\text{C}$ 的精度。

此器件的线性输出、+424mV 失调电压和出厂校准简化了要求读取负温度值的单电源环境中所需要的外部电路。因为此器件的静态电流小于 110 μA ，所以在 SOT-23 封装中的静止空气中，自热限制在非常低的 0.1°C。此器件本身便具备关断功能，这是因为其自身功耗低，因此可直接通过许多逻辑门的输出供电。

Electrical Characteristics (continued)

Unless otherwise noted, these specifications apply for $+V_S = 3 V_{DC}$ and $I_{LOAD} = 1 \mu A$. All limits $T_A = T_J = 25^\circ C$ unless otherwise noted.

- (5) Regulation is measured at constant junction temperature, using pulse testing with a low duty cycle. Changes in output due to heating effects can be computed by multiplying the internal dissipation by the thermal resistance.
- (6) For best long-term stability, any precision circuit will give best results if the unit is aged at a warm temperature, temperature cycled for at least 46 hours before long-term life test begins for both temperatures. This is especially true when a small (surface-mount) part is wave-soldered; allow time for stress relaxation to occur. The majority of the drift will occur in the first 1000 hours at elevated temperatures. The drift after 1000 hours will not continue at the first 1000 hour rate.

8 Detailed Description

8.1 Overview

The LM60 devices are precision analog bipolar temperature sensors that can sense a -40°C to $+125^{\circ}\text{C}$ temperature range while operating from a single 2.7-V supply. The output voltage of the LM60 is linearly proportional to Celsius (Centigrade) temperature ($6.25\text{ mV}/^{\circ}\text{C}$) and has a DC offset of 424 mV. The offset allows reading negative temperatures with a single positive supply. The nominal output voltage of the device ranges from 174 mV to 1205 mV for a -40°C to $+125^{\circ}\text{C}$ temperature range. The device is calibrated to provide accuracies of $\pm 2.0^{\circ}\text{C}$ at room temperature and $\pm 3^{\circ}\text{C}$ over the full -25°C to $+125^{\circ}\text{C}$ temperature range.

With a quiescent current of the device is less than $110\text{ }\mu\text{A}$, self-heating is limited to a very low 0.1°C in still air in the SOT-23 package. Shutdown capability for the device is intrinsic because its inherent low power consumption allows it to be powered directly from the output of many logic gates.

The output of the LM60 is a Class A base emitter follower, thus the LM60 can source quite a bit of current while sinking less than $1\text{ }\mu\text{A}$. In any event load current should be minimized in order to limit its contribution to the total temperature error. The temperature-sensing element is based on a delta V_{BE} topology of two transistors (Q1 and Q2 in [Functional Block Diagram](#)) that are sized with a 10:1 area ratio.

8.3 Feature Description

8.3.1 LM60 Transfer Function

The LM60 follows a simple linear transfer function to achieve the accuracy as listed in [Electrical Characteristics](#) as given:

$$V_O = (6.25\text{ mV}/^{\circ}\text{C} \times T\text{ }^{\circ}\text{C}) + 424\text{ mV}$$

where

- T is the temperature
- V_O is the LM60 output voltage

8.4 Device Functional Modes

The only functional mode for this device is an analog output directly proportional to temperature.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The device has a low supply current and a wide supply range, therefore it can easily be driven by a battery.

9.1.1 Capacitive Loads

The device handles capacitive loading well. Without any special precautions, the device can drive any capacitive load as shown in Figure 12. Over the specified temperature range the device has a maximum output impedance of 800 Ω. In an extremely noisy environment, adding some filtering to minimize noise pick-up may be required. TI recommends that 0.1 μF be added from +V_S to GND to bypass the power supply voltage, as shown in Figure 13. In a noisy environment, adding a capacitor from the output to ground may be required. A 1-μF output capacitor with the 800-Ω output impedance forms a 199-Hz, low-pass filter. Because the thermal time constant of the device is much slower than the 6.3-ms time constant formed by the RC, the overall response time of the device is not be significantly affected. For much larger capacitors, this additional time lag increases the overall response time of the device.

9.2 Typical Applications

9.2.1 Full-Range Centigrade Temperature Sensor

Because the LM60 is a simple temperature sensor that provides an analog output, design requirements related to the layout are also important. Refer to [Layout](#) for details.

9.2.1.2 Detailed Design Procedure

Selection of the LM60 is based on the output voltage transfer function being able to meet the needs of the rest of the system.

$$V_{T1} = \frac{(4.1)R2}{R2 + R1 || R3} \tag{2}$$

9.3 System Examples

9.3.1 Conserving Power Dissipation With Shutdown

The LM60 draws very little power, therefore it can simply be shutdown by driving the LM60 supply pin with the output of a logic gate as shown in [Figure 18](#).

10 Power Supply Recommendations

In an extremely noisy environment, add some filtering to minimize noise pick-up. Adding 0.1 μF from $+V_S$ to GND is recommended to bypass the power supply voltage, as shown in [Figure 13](#). In a noisy environment, add a capacitor from the output to ground.

11 Layout

11.1 Layout Guidelines

The LM60 can be applied easily in the same way as other integrated-circuit temperature sensors. It can be glued or cemented to a surface. The temperature that the LM60 is sensing will be within about $+0.1^{\circ}\text{C}$ of the surface temperature that the leads of the LM60 are attached to.

This presumes that the ambient air temperature is almost the same as the surface temperature. If the air temperature were much higher or lower than the surface temperature, the actual temperature of the device die would be at an intermediate temperature between the surface temperature and the air temperature.

To ensure good thermal conductivity the backside of the device die is directly attached to the GND pin. The lands and traces to the device will, of course, be part of the printed-circuit board, which is the object whose temperature is being measured. These printed-circuit board lands and traces do not cause the temperature of the device to deviate from the desired temperature.

Alternatively, the device can be mounted inside a sealed-end metal tube, and can then be dipped into a bath or screwed into a threaded hole in a tank. As with any IC, the device and accompanying wiring and circuits must be kept insulated and dry to avoid leakage and corrosion. Specifically when the device operates at cold temperatures where condensation can occur. Printed-circuit coatings and varnishes such as a conformal coating and epoxy paints or dips are often used to ensure that moisture cannot corrode the device or connections.

11.3 Thermal Considerations

The thermal resistance junction to ambient ($R_{\theta JA}$) is the parameter used to calculate the rise of a device junction temperature due to the device power dissipation. Use [Equation 4](#) to calculate the rise in the die temperature of the device.

$$T_J = T_A + R_{\theta JA} [(+V_S I_Q) + (+V_S - V_O) I_L]$$

where

- I_Q is the quiescent current
- I_L is the load current on the output

(4)

Thermal Considerations (continued)

Table 2 summarizes the rise in die temperature of the LM60 without any loading, and the thermal resistance for different conditions. The values in Table 2 were actually measured where as the values shown in Thermal Information were calculated using modeling methods as described in the *Semiconductor and IC Package Thermal Metrics* (SPRA953) application report.
