### Description

The Microchip Technology Inc. MCP6L01/1R/1U/2/4 family of operational amplifiers (op amps) supports general-purpose applications. The combination of rail-to-rail input and output, low quiescent current and bandwidth fit into many applications.

This family has a 1 MHz Gain Bandwidth Product (GBWP) and a low 85  $\mu\text{A}$  per amplifier quiescent current. These op amps operate on supply voltages between 1.8V and 6.0V, with rail-to-rail input and output swing. They are available in the extended temperature range.

## 1.3 Test Circuit

The circuit used for most DC and AC tests is shown in Figure 1-1. This circuit can independently set  $V_{CM}$  and  $V_{OUT}$ ; see Equation 1-1. Note that  $V_{CM}$  is not the circuit's common mode voltage ( $(V_P + V_M)/2$ ), and that  $V_{OST}$  includes  $V_{OS}$  plus the effects (on the input offset error,  $V_{OST}$ ) of temperature, CMRR, PSRR and  $A_{OL}$ .

**EQUATION 1-1:**

$$G_{DM} = R_F/R_G$$

$$V_{CM} = (V_P + V_{DD}/2)/2$$

$$V_{OST} = V_{IN-} - V_{IN+}$$

$$V_{OUT} = (V_{DD}/2) + (V_P - V_M) + V_{OST}(1 + G_{DM})$$

Where:

$G_{DM}$	= Differential Mode Gain	(V/V)
$V_{CM}$	= Op Amp's Common Mode Input Voltage	(V)
$V_{OST}$	= Op Amp's Total Input Offset Voltage	(mV)

### 3.1 Analog Outputs

The analog output pins ( $V_{OUT}$ ) are low-impedance voltage sources.

### 3.2 Analog Inputs

The non-inverting and inverting inputs ( $V_{IN+}, V_{IN-}, \dots$ ) are high-impedance CMOS inputs with low bias currents.

### 3.3 Power Supply Pins

The positive power supply ( $V_{DD}$ ) is 1.8V to 6.0V higher than the negative power supply ( $V_{SS}$ ). For normal operation, the other pins are between  $V_{SS}$  and  $V_{DD}$ .

Typically, these parts are used in a single (positive) supply configuration. In this case,  $V_{SS}$  is connected to ground and  $V_{DD}$  is connected to the supply.  $V_{DD}$  will need bypass capacitors.

NOTES:

## 4.0 APPLICATION INFORMATION

The MCP6L01/1R/1U/2/4 family of op amps is manufactured using Microchip's state of the art CMOS process. It is designed for low cost, low power and general purpose applications. The low supply voltage, low quiescent current and wide bandwidth makes the MCP6L01/1R/1U/2/4 ideal for battery-powered applications. This device has high phase margin, which makes it stable for larger capacitive load applications.

### 4.1 Rail-to-Rail Inputs

#### 4.1.1 PHASE REVERSAL

The MCP6L01/1R/1U/2/4 op amps are designed to prevent phase inversion when the input pins exceed the supply voltages. Figure 2-10 shows an input voltage exceeding both supplies without any phase reversal.

#### 4.1.2 INPUT VOLTAGE AND CURRENT LIMITS

In order to prevent damage and/or improper operation of these amplifiers, the circuit they are in must limit the currents (and voltages) at the input pins (see Section 1.1 "Absolute Maximum Ratings †"). Figure 4-1 shows the recommended approach to protecting these inputs. The internal ESD diodes prevent the input pins ( $V_{IN+}$  and  $V_{IN-}$ ) from going too far below ground, and the resistors  $R_1$  and  $R_2$  limit the possible current drawn out of the input pins. Diodes  $D_1$  and  $D_2$  prevent the input pins ( $V_{IN+}$  and  $V_{IN-}$ ) from going too far above  $V_{DD}$ , and dump any currents onto  $V_{DD}$ .

**FIGURE 4-1:** Protecting the Analog Inputs.

A significant amount of current can flow out of the inputs (through the ESD diodes) when the common mode voltage ( $V_{CM}$ ) is below ground ( $V_{SS}$ ); see Figure 2-7. Applications that are high impedance may need to limit the usable voltage range.

#### 4.1.3 NORMAL OPERATION

The input stage of the MCP6L01/1R/1U/2/4 op amps use two differential CMOS input stages in parallel. One operates at low common mode input voltage ( $V_{CM}$ ), while the other operates at high  $V_{CM}$ . With this topology, and at room temperature, the device operates with  $V_{CM}$  up to 0.3V above  $V_{DD}$  and 0.3V below  $V_{SS}$  (typically at +25°C).

The transition between the two input stages occurs when  $V_{CM} = V_{DD} - 1.1V$ . For the best distortion and gain linearity, with non-inverting gains, avoid this region of operation.

### 4.2 Rail-to-Rail Output

The output voltage range of the MCP6L01/1R/1U/2/4 op amps is  $V_{DD} - 35 \text{ mV}$  (minimum) and  $V_{SS} + 35 \text{ mV}$  (maximum) when  $R_L = 10 \text{ k}\Omega$  is connected to  $V_{DD}/2$  and  $V_{DD} = 5.0V$ . Refer to Figure 2-13 for more information.

### 4.3 Capacitive Loads

Driving large capacitive loads can cause stability problems for voltage feedback op amps. As the load capacitance increases, the feedback loop's phase margin decreases and the closed-loop bandwidth is reduced. This produces gain peaking in the frequency response, with overshoot and ringing in the step response.

When driving large capacitive loads with these op amps (e.g., > 100 pF when  $G = +1$ ), a small series resistor at the output ( $R_{ISO}$  in Figure 4-2) improves the feedback loop's stability by making the output load resistive at higher frequencies; the bandwidth will usually be decreased.

**FIGURE 4-2:** Output Resistor,  $R_{ISO}$  stabilizes large capacitive loads.

Bench measurements are helpful in choosing  $R_{ISO}$ . Adjust  $R_{ISO}$  so that a small signal step response (see Figure 2-14) has reasonable overshoot (e.g., 4%).

# MCP6L01/1R/1U/2/4

## 4.4 Supply Bypass

With this family of operational amplifiers, the power supply pin ( $V_{DD}$  for single supply) should have a local bypass capacitor (i.e., 0.01  $\mu\text{F}$  to 0.1  $\mu\text{F}$ ) within 2 mm for good high frequency performance. It also needs a bulk capacitor (i.e., 1  $\mu\text{F}$  or larger) within 100 mm to provide large, slow currents. This bulk capacitor can be shared with other nearby analog parts.

## 4.5 Unused Op Amps

An unused op amp in a quad package (e.g., MCP6L04) should be configured as shown in Figure 4-3. These circuits prevent the output from toggling and causing crosstalk. Circuit A sets the op amp at its minimum noise gain. The resistor divider produces any desired reference voltage within the output voltage range of the op amp; the op amp buffers that reference voltage. Circuit B uses the minimum number of components and operates as a comparator, but it may draw more current.

FIGURE 4-3: Unused Op Amps.

## 4.6 PCB Surface Leakage

In applications where low input bias current is critical, PCB (printed circuit board) surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low humidity conditions, a typical resistance between nearby traces is  $10^{12}\Omega$ . A 5V difference would cause 5 pA of current to flow; this is greater than this family's bias current at +25°C (1 pA, typical).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. Figure 4-4 shows an example of this type of layout.

FIGURE 4-4: Example Guard Ring Layout.

1. Inverting Amplifiers (Figure 4-4) and Transimpedance Gain Amplifiers (convert current to voltage, such as photo detectors).
  - a) Connect the guard ring to the non-inverting input pin ( $V_{IN+}$ ); this biases the guard ring to the same reference voltage as the op amp's input (e.g.,  $V_{DD}/2$  or ground).
  - b) Connect the inverting pin ( $V_{IN-}$ ) to the input with a wire that does not touch the PCB surface.
2. Non-inverting Gain and Unity-Gain Buffer.
  - a) Connect the guard ring to the inverting input pin ( $V_{IN-}$ ); this biases the guard ring to the common mode input voltage.
  - b) Connect the non-inverting pin ( $V_{IN+}$ ) to the input with a wire that does not touch the PCB surface.

## 4.7 Application Circuit

### 4.7.1 ACTIVE LOW-PASS FILTER

The MCP6L01/1R/1U/2/4 op amp's low input bias current makes it possible for the designer to use larger resistors and smaller capacitors for active low-pass filter applications. However, as the resistance increases, the noise generated also increases. Parasitic capacitances and the large value resistors could also modify the frequency response. These trade-offs need to be considered when selecting circuit elements.

Figure 4-5 shows a second-order Bessel filter with 100 Hz cutoff frequency and a gain of +1 V/V. The component values were selected using Microchip's FilterLab<sup>®</sup> software; the capacitor values were reduced to a more common range.

NOTES:

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
