

Digital Green-Mode Synchronous Rectifier Controller

1 Description

The iW673 is a high performance synchronous rectifier controller with an integrated MOSFET driver for flyback converters operating at discontinuous conduction mode. Combined with the MOSFET, the iW673 can emulate the diode rectifier at the secondary side of the flyback to reduce conduction loss. The iW673 determines the timing of the driver by sensing the voltage across the $R_{DS(ON)}$ to achieve lossless sensing. The iW673 uses proprietary digital adaptive turn-off control technology to minimize the turn-off deadtime of the synchronous rectifier so that the parallel Schottky diode required by conventional synchronous rectifiers can be eliminated. The integrated driver has strong driving capability for high efficiency. The operating power consumption of the controller excluding the driver is less than 4mW at no load to achieve the ultra-low no-load power consumption at 5V output. The iW673 integrates a pulse linear regulator to maintain the operation of the synchronous rectifier at low system output voltage when the system is operating in constant current (CC) mode.

2 Features

- Digital adaptive turn-off control minimizes dead-time and eliminates the parallel Schottky diode
- Integrated pulse linear regulator (PLR) enables SR operation at down to 2.4V system output when system is in constant current (CC) mode with iW673-00, iW673-01, or iW673-20
- Wide V_{IN} pin operating voltage up to 25V (16V for iW673-00)
- Optimized 5V MOSFET gate driver Intelligent low power management achieves ultra-low no-load operating current
- Lossless MOSFET V_{DS} sensing for SR timing control
- 6-pin SOT23 package

3 Applications

4 Pinout Description

Figure 4.1 : 6-Pin SOT23 Package

Pin No.	Pin Name	Type	Pin Description
1	DRAIN	Analog Input	Synchronous rectifier MOSFET drain voltage sensing and the Pulse Linear Regulator (PLR) input.
2	SOURCE	Analog input	Synchrnous rectifier MOSFET source voltage sensing input.
3	OUT	Output	Synchronous rectifier MOSFET driver.
4	GND	Ground	Ground.
5	V_{CC}	Power Input	Output of internal LDO and PLR. It provides bias voltage for the internal logic circuit and the MOSFET driver. Connect this pin to a capacitor.
6	V_{IN}	Analog Input	Input of internal LDO and system output voltage sensing circuit. Connect to adapter/charger output for bias voltage. The internal LDO clamps the V_{CC} voltage at 5V when $V_{IN} > 5V$. The V_{IN} is also the input for the PLR enable comparator and the SR enable comparator.
