

Features

- Single-Supply Operation from +1.8V ~ +5.5V
 - Rail-to-Rail Input / Output
 - Gain-Bandwidth Product: 350KHz (Typ. @25°C)
 - Low Input Bias Current: 20pA (Typ. @25°C)
 - Low Offset Voltage: 30uV (Max. @25°C)
 - Quiescent Current: 25μA per Amplifier (Typ.)
 - Operating Temperature: -45°C ~ +125°C
 - Zero Drift: 0.03μV/°C (Max.)
 - Embedded RF Anti-EMI Filter
 - Small Package:
- GS8333 Available in SOT23-5 and SC70-5 Packages

General Description

The GS8333 amplifier is single/dual supply, micro-power, zero-drift CMOS operational amplifiers, the amplifiers offer bandwidth of 350 kHz, rail-to-rail inputs and outputs, and single-supply operation from 1.8V to 5.5V. GS8333 uses chopper stabilized technique to provide very low offset voltage (less than 30μV maximum) and near zero drift over temperature. Low quiescent supply current of 25μA per amplifier and very low input bias current of 20pA make the devices an ideal choice for low offset, low power consumption and high impedance applications. The GS8333 offers excellent CMRR without the crossover associated with traditional complementary input stages. This design results in superior performance for driving analog-to-digital converters (ADCs) without degradation of differential linearity.

The GS8333 is available in SOT23-5 and SC70-5 packages. The extended temperature range of -45°C to +125°C over all supply voltages offers additional design flexibility.

Applications

- Transducer Application
- Temperature Measurements
- Electronics Scales
- Handheld Test Equipment
- Battery-Powered Instrumentation

Pin Configuration

Figure 1. Pin Assignment Diagram

Absolute Maximum Ratings

Condition	Min	Max
Power Supply Voltage (V _{DD} to V _{ss})	-0.5V	+7.5V
Analog Input Voltage (IN+ or IN-)	V _{ss} -0.5V	V _{DD} +0.5V
PDB Input Voltage	V _{ss} -0.5V	+7V
Operating Temperature Range	-45°C	+125°C
Junction Temperature	+160°C	
Storage Temperature Range	-55°C	+150°C
Lead Temperature (soldering, 10sec)	+260°C	
Package Thermal Resistance (T _A =+25°C)		
SOT23-5, θ _{JA}	190°C/W	
ESD Susceptibility		
HBM	6KV	
MM	400V	

Note: Stress greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Package/Ordering Information

MODEL	CHANNEL	ORDER NUMBER	PACKAGE DESCRIPTION	PACKAGE OPTION	MARKING INFORMATION
GS8333	Single	GS8333-TR	SOT23-5	Tape and Reel,3000	333
		GS8333-CR	SC70-5	Tape and Reel,3000	333

Electrical Characteristics

(At $V_S=5V$, $T_A = +25^{\circ}C$, $V_{CM} = V_S/2$, $R_L = 10k\Omega$, unless otherwise noted.)

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
INPUT CHARACTERISTICS					
Input Offset Voltage (V_{OS})			± 2	± 30	μV
Input Bias Current (I_B)			20		pA
Input Offset Current (I_{OS})			10		pA
Common-Mode Rejection Ratio (CMRR)	$V_{CM} = 0V$ to $5V$		110		dB
Large Signal Voltage Gain (A_{VO})	$R_L = 10k\Omega$, $V_O = 0.3V$ to $4.7V$		145		dB
Input Offset Voltage Drift ($\Delta V_{OS}/\Delta T$)			50		nV/ $^{\circ}C$
OUTPUT CHARACTERISTICS					
Output Voltage High (V_{OH})	$R_L = 100k\Omega$ to $-V_S$		4.998		V
	$R_L = 10k\Omega$ to $-V_S$		4.994		V
Output Voltage Low (V_{OL})	$R_L = 100k\Omega$ to $+V_S$		5		mV
	$R_L = 10k\Omega$ to $+V_S$		20		mV
Short Circuit Limit (I_{SC})	$R_L = 10\Omega$ to $-V_S$		20		mA
Output Current (I_O)			30		mA
POWER SUPPLY					
Power Supply Rejection Ratio (PSRR)	$V_S = 2.5V$ to $5.5V$		115		dB
Quiescent Current (I_Q)	$V_O = 0V$, $R_L = 0\Omega$		25		μA
DYNAMIC PERFORMANCE					
Gain-Bandwidth Product (GBP)	$G = +100$		350		KHz
Slew Rate (SR)	$R_L = 10k\Omega$		0.2		V/ μs
NOISE PERFORMANCE					
Voltage Noise (e_n p-p)	0Hz to 10Hz		1.1		μV_{P-P}
Voltage Noise Density (e_n)	$f = 1kHz$		70		nV/ $\sqrt{Hz}$

Typical Performance characteristics

($T_A = +25^\circ\text{C}$, $V_S = 5\text{V}$, $R_L = 10\text{ k}\Omega$ connected to $V_S/2$ and $V_{OUT} = V_S/2$, unless otherwise noted.)

Application Note

Size

GS8333 series op amps are unity-gain stable and suitable for a wide range of general-purpose applications. The small footprints of the GS8333 series packages save space on printed circuit boards and enable the design of smaller electronic products.

Power Supply Bypassing and Board Layout

GS8333 series operates from a single 1.8V to 5.5V supply or dual $\pm 0.9V$ to $\pm 2.75V$ supplies. For best performance, a $0.1\mu F$ ceramic capacitor should be placed close to the V_{DD} pin in single supply operation. For dual supply operation, both V_{DD} and V_{SS} supplies should be bypassed to ground with separate $0.1\mu F$ ceramic capacitors.

Low Supply Current

The low supply current (typical $25\mu A$ per channel) of GS8333 series will help to maximize battery life. They are ideal for battery powered systems

Operating Voltage

GS8333 series operate under wide input supply voltage (1.8V to 5.5V). In addition, all temperature specifications apply from $-45^{\circ}C$ to $+125^{\circ}C$. Most behavior remains unchanged throughout the full operating voltage range. These guarantees ensure operation throughout the single Li-Ion battery lifetime

Rail-to-Rail Input

The input common-mode range of GS8333 series extends $100mV$ beyond the supply rails ($V_{SS}-0.1V$ to $V_{DD}+0.1V$). This is achieved by using complementary input stage. For normal operation, inputs should be limited to this range.

Rail-to-Rail Output

Rail-to-Rail output swing provides maximum possible dynamic range at the output. This is particularly important when operating in low supply voltages. The output voltage of GS8333 series can typically swing to less than $5mV$ from supply rail in light resistive loads ($>100k\Omega$), and $100mV$ of supply rail in moderate resistive loads ($10k\Omega$).

Capacitive Load Tolerance

The GS8333 family is optimized for bandwidth and speed, not for driving capacitive loads. Output capacitance will create a pole in the amplifier's feedback path, leading to excessive peaking and potential oscillation. If dealing with load capacitance is a requirement of the application, the two strategies to consider are (1) using a small resistor in series with the amplifier's output and the load capacitance and (2) reducing the bandwidth of the amplifier's feedback loop by increasing the overall noise gain. Figure 2. shows a unity gain follower using the series resistor strategy. The resistor isolates the output from the capacitance and, more importantly, creates a zero in the feedback path that compensates for the pole created by the output capacitance.

Figure 2. Indirectly Driving a Capacitive Load Using Isolation Resistor

The bigger the R_{ISO} resistor value, the more stable V_{OUT} will be. However, if there is a resistive load R_L in parallel with the capacitive load, a voltage divider (proportional to R_{ISO}/R_L) is formed, this will result in a gain error.

The circuit in Figure 3 is an improvement to the one in Figure 2. R_F provides the DC accuracy by feed-forward the V_{IN} to R_L . C_F

and R_{ISO} serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving the phase margin in the overall feedback loop. Capacitive drive can be increased by increasing the value of C_F . This in turn will slow down the pulse response.

Figure 3. Indirectly Driving a Capacitive Load with DC Accuracy

Typical Application Circuits

Differential amplifier

The differential amplifier allows the subtraction of two input voltages or cancellation of a signal common to the two inputs. It is useful as a computational amplifier in making a differential to single-end conversion or in rejecting a common mode signal. Figure 4. shows the differential amplifier using GS8333.

Figure 4. Differential Amplifier

$$V_{OUT} = \left(\frac{R_1 + R_2}{R_3 + R_4} \right) \frac{R_4}{R_1} V_{IN} - \frac{R_2}{R_1} V_{IP} + \left(\frac{R_1 + R_2}{R_3 + R_4} \right) \frac{R_3}{R_1} V_{REF}$$

If the resistor ratios are equal (i.e. $R_1 = R_3$ and $R_2 = R_4$), then

$$V_{OUT} = \frac{R_2}{R_1} (V_{IP} - V_{IN}) + V_{REF}$$

Low Pass Active Filter

The low pass active filter is shown in Figure 5. The DC gain is defined by $-R_2/R_1$. The filter has a -20dB/decade roll-off after its corner frequency $f_c = 1/(2\pi R_3 C_1)$.

Figure 5. Low Pass Active Filter

Instrumentation Amplifier

The triple GS8333 can be used to build a three-op-amp instrumentation amplifier as shown in Figure 6. The amplifier in Figure 6 is a high input impedance differential amplifier with gain of R_2/R_1 . The two differential voltage followers assure the high input impedance of the amplifier.
