Application Information

Output Voltage Setting

The EA8103 output voltage can be set via a resistor divider (R1, R2). The output voltage is calculated by following equation:

$$V_{OUT} = 1.13 \times \frac{R1}{R2} + 1.13 \text{ V}$$

The following table lists common output voltage and the corresponding R1, R2 resistance value for reference.

Output Voltage	R1 Resistance	R2 Resistance	Tolerance
3.3V	965KΩ	499KΩ	1%
1.8V	300KΩ	499KΩ	1%
1.5V	332KΩ	1MΩ	1%
1.2V	61.9KΩ	1MΩ	1%

Input / Output Capacitors Selection

The input capacitors are used to suppress the noise amplitude of the input voltage and provide a stable and clean DC input to the device. Because the ceramic capacitor has low ESR characteristic, so it is suitable for input capacitor use. It is recommended to use X5R or X7R MLCC capacitors in order to have better temperature performance and smaller capacitance tolerance. In order to suppress the output voltage ripple, the MLCC capacitor is also the best choice. The suggested part numbers of input / output capacitors are as follows:

Vendor	Part Number	Capacitance	Edc	Parameter	Size
TDK	C2012X5R1A106K	10uF	10V	X5R	0805
TDK	C3216X7R1A106K	10uF	10V	X7R	1206

Output Inductor Selection

The output inductor selection mainly depends on the amount of ripple current through the inductor ΔI_L . Large ΔI_L will cause larger output voltage ripple and loss, but the user can use a smaller inductor to save cost and space. On the contrary, the larger inductance can get smaller ΔI_L and thus the smaller output voltage ripple and loss. But it will increase the space and the cost. The inductor value can be calculated as:

$$L = \frac{V_{PWR} - V_{OUT}}{\Delta I_L \times F_{SW}} \times \frac{V_{OUT}}{V_{PWR}}$$

For most applications, 1uH to 4.7uH inductors are suitable for EA8103.

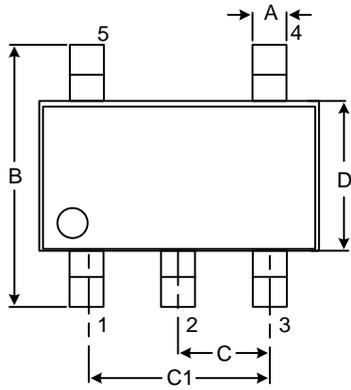

PCB Layout Recommendations

For EA8103 PCB layout considerations, please refer to the following suggestions in order to get good performance.

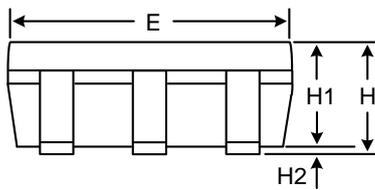

- ▶ High current path traces need to be widened.
- ▶ Place the input capacitors as close as possible to the PWR pin to reduce noise interference.
- ▶ Keep the feedback path (from V_{OUT} to FBK) away from the noise node (ex. SWITCH). SWITCH is a high current noise node. Complete the layout by using short and wide traces.
