### GENERAL DESCRIPTION

The TMI6809 series device are low  $I_q$  supply voltage supervisory that monitors a single voltage used in microprocessor and digital control system. The TMI6809 provide an active low reset signal while the VCC supply voltage drops below the reset threshold voltage. When the VCC supply voltage rises above the threshold voltage plus hysteresis the reset output goes high after 240ms (typical) reset delay time.

TMI6809 series are available suitable for monitoring 3V, 3.3V and 5V supply voltages. The low supply current of typical 5 $\mu$ A makes TMI6809 series devices ideal for using in portable, battery powered system applications, and they are available in 3-pin SOT23-3 package.
