32V;1.5μA I$_Q$,150mA Low Dropout Voltage Regulator

Features

- Low Quiescent Current：1.5μA
- High Input Voltage： Up to 32V
- High Output Current：≥150mA
- Dropout Voltage：
  300mV@100mA（3.3V）
- VT7133B ±2 % Output Accuracy
  VT7133A ±1 % Output Accuracy
- High-accuracy Output Voltage

- Good Transient Response
- Integrated Short-Circuit Protection
- Integrated Thermal Protection
- Over-Temperature Protection
- Support Fixed Output Voltage：
  1.8, 2.5, 3.0, 3.3, 3.6，4.0，4.2 and 5.0V
- Available Package:
 SOT23-3L、SOT89-3L

Applications

- Portable, Battery Powered Equipment
- Battery-powered equipment
- Smoke detector and sensor

- Audio/Video Equipment
- Weighting Scales
- Home Automation

General Description

The VT7133 series is a high voltage，ultralow-power，low dropout voltage regulator. The device can deliver 100mA output current with a dropout voltage of 300mV and allows an input voltage as high as 32V. The typical quiescent current is only 1.5μA.

The device is available in fixed output voltages of 1.8, 2.5, 3.0, 3.3, 3.6, 4.0, 4.2 and 5.0V.The device features integrated short-circuit and thermal shutdown protection.Although designed primarily as fixed voltage regulators, the device can be used with external components to obtain variable voltages.

Application Guideline

Input Capacitor

A 1µF ceramic capacitor is recommended to connect between V$_{DD}$ and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both VIN and GND.

Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended output capacitance is 10µF, ceramic capacitor is recommended, and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot/overshoot. Place output capacitor as close as possible to VOUT and GND pins.

Dropout Voltage

The dropout voltage refers to the voltage difference between the VIN and VOUT pins while operating at specific output current. The dropout voltage VDROP also can be expressed as the voltage drop on the pass-FET at specific output current (IRATED) while the pass-FET is fully operating at ohmic region and the pass-FET can be characterized asan resistance RDS(ON). Thus the dropout voltage can bedefined as $(V_{DROP} = V_{IN} - V_{OUT} = R_{DS(ON)} \times I_{RATED})$. Fornormal operation, the suggested LDO operating range is $(V_{IN} > V_{OUT} + V_{DROP})$ for good transient response and PSRR ability. Vice versa, while operating at the ohmic region will degrade the performance severely.

Thermal Application

For continuous operation, do not exceed the absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated as below: TA=25°C, PCB,
Power dissipation (PD) is equal to the product of the output current and the voltage drop across the output pass element, as shown in the equation below:

PD = (VIN – VOUT) × IOUT
