4. Soldering Recommendations

4-1 Soldering profile

4-1-1 Pb free solder paste

4-1-2 Repair soldering

- Allowable time and temperature for making correction with a soldering iron : 350 \pm 10 $^\circ$ C, 3 sec.
- Optimum solder amount when corrections are made using a soldering iron

4-2 Soldering guidelines

- Our chip varistors are designed for reflow soldering only. Do not use flow soldering
- Use non-activated flux (CI content 0.2% max.)
- Follow the recommended soldering conditions to avoid varistor damage.

4-3 Solder pad layout

5. Storage condition

- Storage environment must be at an ambient temperature of 25~35 $\,^\circ\!\!\mathbb{C}\,$ and an ambient humidity of 40~60 % RH
- Chip varistors can experience degradation of termination solderability when subjected to high temperature of humidity, or if exposed to sulfur or chlorine gases.
- Avoid mechanical shock (ex. Falling) to the chip varistor to prevent mechanical cracking inside of the ceramic dielectric due to its own weight.
- Use chips within 6 months.

If 6 months of more have elapsed, check solderability before use.-
