

AMS1117(文件编号: S&CIC0539)

800mA Adjustable & Fixed Voltage LDO Linear Regulator

General description

The AMS1117 is a low-dropout linear regulator that operates in the input voltage range from +2.5V to +12.0V and delivers 800mA output current.

The AMS1117 is available in two types, fixed output voltage type or adjustable output voltage type. The fixed output voltage type is preset at an internally trimmed voltage 1.8V, 2.5V, or 3.3V. Other options 1.5V, 2.85V, 3.0V and 3.6V are available by special order only. The output voltage range of the adjustable type is from 1.25V to 5V.

The AMS1117 consists of a 1.25V bandgap reference, an error amplifier, and a P-channel pass transistor. Other features include short-circuit protection and thermal shutdown protection. The AMS1117 devices are available in SOT-223 and TO-252 packages.

Features

- Low dropout voltage 1300mV at 800mA typ.
- Adjustable output voltage (AMS1117-Cx) or fixed output voltage (AMS1117-xxCx) preset at 1.8V, 2.5V, or 3.3V
- High output voltage accuracy
- Fixed output voltage: $V_{out} \pm 2\%mV$
- Adjustable output voltage: $\pm 50mV$
- Small output capacitor
- Output current limit
- Thermal overload shutdown protection
- SOT-223 and TO-252 packages

Applications

- Active SCSI terminators
- High efficiency linear regulators
- Monitor microprocessors
- Low voltage micro-controllers
- Post regulator for switching power

Ordering information

AMS1117-- XX

Output Voltage

(For fixed voltage types Inly. for adjustable voltage types, these two digits are eliminated.)

15:1.5V 18:1.8V 25:2.5V
29:2.85V 30:3.0V 33:3.3V
36:3.6V

Default: Adjustable Output

Note: The output voltages other than the preset values are available by order only.

800mA Adjustable & Fixed Voltage LDO Linear Regulator

Pin configurations

PartNo.	Pin1	Pin2	Pin3
AMS1117-XX	GND/ADJ	OUT (TAP)	IN

Pin description

Part No	Symbol	Description
AMS1117-xx	GND/ADJ	Ground pin or adjust terminal pin
	IN	Regulator input pin
	OUT	Regulator output pin

IN is the regulator input pin. Supply voltage can range from 2.5V to 12.0V. Bypass with a 10uF capacitor to GND.

OUT is the output voltage pin. Sources up to 800mA. Bypass with a 10uF capacitor to GND.

GND provides the reference for all voltages.

ADJ provides $V_{REF}=1.25V$ (TYP.) for adjustable output voltage.

800mA Adjustable & Fixed Voltage LDO Linear Regulator

Detail description

The AMS1117 is a low-dropout linear regulator. The device provides preset 1.8V, 2.5V and 3.3V output voltages for output current up to 800mA. adjustable output voltage and other mask options for special output voltages are also available. As illustrated in function block diagram, it consists of a 1.25V bandgap reference, an error amplifier, a P-channel pass transistor and an internal feedback voltage divider (fixed voltage types).

The 1.25V bandgap reference is connected to the error amplifier, which compares this reference with the feedback voltage and amplifies the voltage difference. If the feedback voltage is lower than the reference voltage, the pass-transistor gate is pulled lower, which allows more current to pass to the output pin and increases the output voltage. If the feedback voltage is too high, the pass-transistor gate is pulled up to decrease the output voltage.

The output voltage is feed back through an internal resistive divider (or external resistive divider for adjustable output voltage type) connected to OUT pin. Additional blocks include an output current limiter, thermal sensor, and shutdown logic.

Internal P-channel pass transistor

The AMS1117 features a P-channel MOSFET pass transistor. Unlike similar designs using PNP pass transistors, P-channel MOSEFTS require no base drive, which reduces ground pin current. PNP-based regulators also waste considerable current in dropout when the pass transistor saturates, and use high base-drive currents under large loads. The AMS1117 does not suffer from these problems and consumes only 65uA(Typ) of fround pin current under heavy loads as well as in dropout conditions.

Output voltage selection

For fixed voltage type of AMS1117, the output voltage is preset at an internally trimmed voltage. The first two digits of part number suffix identify the output voltage (see [Ordering Information](#)). For example, the AMS1117-33CJ has a preset 3.3V output voltage.

For adjustable voltage type of AMS1117, the output voltage is set by comparing the feedback voltage at adjust terminal to the internal bandgap reference voltage. The reference voltage V_{REF} is 1.25V. The output voltage is given by the equation:

$$V_{OUT}=V_{REF}*(1+R2/R1)+I_{ADJ}*R2$$

(see [Typical Application Schematic](#))

Current limit

The AMS1117 also includes a fold back current limiter. It monitors and controls the pass transistor's gate voltage, estimates the output current, and limits the output current within 800mA.

Thermal overload protection

Thermal overload protection limits total power dissipation is the AMS1117. When the junction temperature exceeds

AMS1117(文件编号: S&CIC0539)

800mA Adjustable & Fixed Voltage LDO Linear Regulator

$T_J=+155^{\circ}\text{C}$, a thermal sensor turns off the pass transistor, allowing the IC to cool down. The thermal sensor turns the pass transistor on again after the junction temperature cools down by 20°C , resulting in a pulsed output during continuous thermal overload conditions.

Operating region and power dissipation

Maximum power dissipation of the AMS1117 depends on the thermal resistance of the case and circuit board, the temperature difference between the die junction and ambient air, and the rate of airflow. The power dissipation across the devices is $P=I_{\text{OUT}}\times(V_{\text{IN}}-V_{\text{OUT}})$. The resulting maximum power dissipation is:

$$P_{\text{MAX}}=(T_J-T_A)/(\theta_{\text{JC}}+\theta_{\text{CA}})=(T_J-T_A)/\theta_{\text{JA}}$$

Where (T_J-T_A) is the temperature difference between the AMS1117 die junction and the surrounding air, θ_{JC} is the thermal resistance of the package chosen, and θ_{CA} is the thermal resistance through the printed circuit board, copper traces and other materials to the surrounding air. For better heat-sinking, the copper area should be equally shared between the IN, OUT, and GND pins.

If the AMS1117 uses a SOT-223 package and this package is mounted on a double sided printed circuit board with two square inches of copper allocated for “heat spreading”, the resulting θ_{JA} is $80^{\circ}\text{C}/\text{W}$.

Based on the maximum operating junction temperature 125°C with an ambient of 25°C , the maximum power dissipation will be:

$$P_{\text{MAX}}=(T_J-T_A)/(\theta_{\text{JC}}+\theta_{\text{CA}})=(125-25)/80=1.25\text{W}$$

Thermal characteristics were measured using a double-sided board with $1''\times 2''$ square inches of copper area connected to the GND pin for “heat spreading”.

Input-output voltage

A regulator’s minimum input-output voltage differential, or dropout voltage, determines the lowest usable supply voltage. In battery-powered systems, this will determine the useful end-of-life battery voltage. The AMS1117 uses a P-channel MOSEFT pass transistor, its dropout voltage is a function of drain-to-source on-resistance ($R_{\text{DS(ON)}}$) multiplied by the output current.

$$V_{\text{DROPOUT}}=V_{\text{IN}}-V_{\text{OUT}}=R_{\text{DS(ON)}}\times I_{\text{OUT}}$$
