Current PWM Controller with Integrated Protections

Features

- Current Mode Control
- Standby Power below 75mW
- Under-Voltage Lockout (UVLO)
- Non-Audible-Noise Green-Mode Control
- 65KHz Switching Frequency
- 8ms Soft-start
- Over Current Protection (OCP)
- Short circuit protection (SCP)
- Adjustment OVP on ZCD Pin
- Over Voltage Protection on VCC Pin
- Output diode Short circuit protection
- On Chip OTP Protection
- External OTP

GR1281 series is a highly-integrated, low startup current, current mode PWM controller with green-mode function. It could turn standby mode to green mode for high switching efficiency. It provides functions of low startup current, Over Current Protection Over Voltage Protection, Short circuit protection Output diode Short circuit protection and internal OTP to prevent the circuit being damaged.

Application

- Switching AC/DC power adapter
- SMPS Power Supply

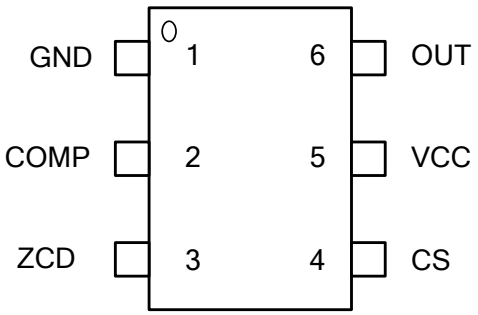
Pin Configuration

SOT-26 (TOP VIEW)



Pin Description

Pin No.	Name	Function
1	GND	Ground reference pin
2	COMP	Voltage feedback pin, by connecting a photo-coupler to control the duty cycle
3	ZCD	This pin is function of Brown in/out and OVP
4	CS	Current sense pin, connected to sense resistor for sensing the MOSFET current signal
5	VCC	Power supply pin
6	OUT	he output driver for driving the external MOSFET

Absolute Maximum Ratings

Supply voltage VCC ---------- 30V

COMP, CS, ZCD---------- -0.3~6.0V

OUT ---------- -0.3~Vcc+0.3V

Junction temperature ---------- 150℃

Storage temperature range ---------- -65℃ ~ 150 ℃

SOT-26 package thermal resistance ---------- 250℃/W

Power dissipation (SOT-26, at ambient temperature = 85℃) ---------- 250mW

Lead temperature (SOT-26,soldering, 10 sec) ---------- 230℃

Lead temperature (All Pb free packages, soldering, 10 sec) ---------- 260℃

ESD, human body model ---------- 2.5KV

ESD, machine model ---------- 250V

Caution: The “Absolute Maximum Ratings” are those values beyond which the safety of the device cannot be guaranteed and may cause permanent damage to the IC. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the Electrical Characteristics section of the specification is not implied. The “Electrical Characteristics” table defines the conditions for actual device operation. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

Recommended Operating Conditions

Item	Min.	Max.	Unit
Operating Junction temperature	-40	125	℃
Operating ambient temperature	-40	85	℃
Start Up Resistor (AC Half side)	540k	2.2M	Ω
Supply voltage VCC	9.5	26.5	V
VCC Capacitor	2.2	10	μF
COMP pin paralleling capacitor	1	33	nF
CS pin paralleling capacitor	100	1000	pF

Note:

- Not to exceed the maximum junction temperature of the IC, this relates to the operating power of the IC and the thermal resistance of the IC-package as above.
- The small signal components should be placed to IC pin as possible.
- A chemical capacitor and 1206 SMD ceramic capacitor are recommend for VCC to avoid noise of Resonance
- It’s essential to connect VCC pin with a SMD ceramic capacitor (0.1μF~0.47μF) to filter out the undesired switching noise for stable operation.
- Connecting a capacitor to COMP pin is also essential to filter out the undesired switching noise for stable operation.

Application Information

Overview

GR1281 series is a highly-integrated, low startup current, current mode PWM controller with green-mode function. This results in a low-cost solution for low power AC/DC adapters. It integrated more functions to reduce the external components counts and the size. Its major features are described as below.

Start-up Current

The typical start-up current is 2uA. Very low start-up current allows the PWM controller to increase the value of start-up resistor and then reduce the power dissipation on it.

Under-voltage Lockout (UVLO)

A hysteresis UVLO comparator is implemented in GR1281 series, then the turn-on and turn-off thresholds level are fixed at 16V and 8V respectively. This hysteresis ensures that the start-up capacitor will be adequate to supply the chip during start-up. The hysteresis is show in Fig. 7

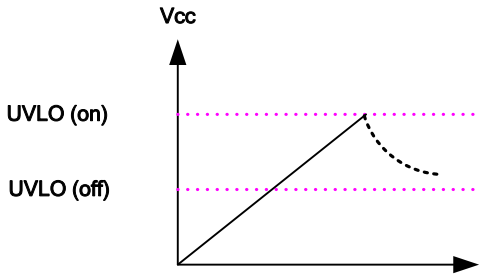

Fig.7

Leading-edge Blanking (LEB)

Each time the power MOSFET is switched on, a turn-on spike will inevitably occur at the sense resistor. To avoid fault trigger, a leading-edge blanking time is built in. During this blanking period, the current-limit comparator is disabled and cannot switch off the gate driver.

Over-voltage Protection (OVP) on VCC Auto Recovery mode

Over-voltage Protection is implemented in GR1281 series for being damaged from abnormal condition. When VCC voltage is higher than OVP level, the Output of Gate driver will be shut down.VCC OVP is auto-recovery. Once the condition of over voltage happened, the Gate driver will be shut down until the next turn-ON. This operation is an Hiccup mode. (Fig.8)

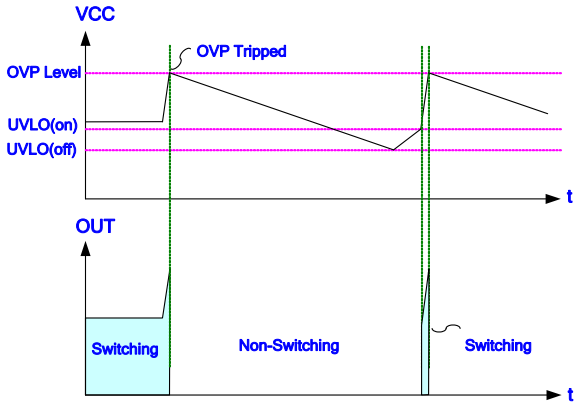

Fig.8

Output OVP on ZCD - Auto Recovery mode

An output overvoltage protection is implemented in GR1281 series, as shown in Fig. 9. It senses the auxiliary voltage via the resistors. The overvoltage protection works by sampling Izcd after a delay time. The sampling current level is compared with internal Iovp. If Izcd= (Nvcc-4.6)/R1 is large than 150uA ZCD OVP circuit switches the power MOSFET off. ZCD OVP function is an auto-recovery type protection.

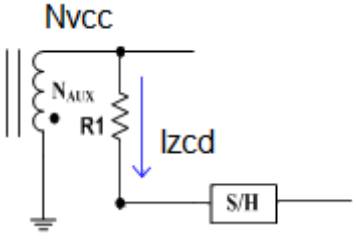

Fig 9

Output Under-voltage Protection (UVP) on ZCD – Auto Recovery mode

To protect the circuit from damage due to output short condition, an auto-recovery type of UVP protection is implemented for it. If the QRD voltage declines below 0.8V for over 4cycle, the protection will be activated to turn off the gate until the next UVLO-ON.

Adjustable H/L Line compensation

The circuit auxiliary winding R1 and connecting ZCD pin for keeping in VIN voltage consistency. The relation of IZCD and IOCP is IOCP=0.5*IZCD. The CS OCP source current, which via the resistors of R and Rcs, could compensates Voltage (△Vcs) because input voltage in H line makes Voltage Offset, as shown in Fig.11.

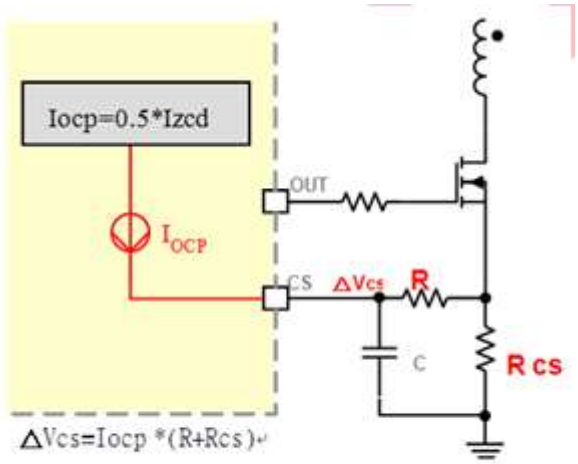

Fig.11

Gate Clamp/Soft Driving

Driver output is clamped by an internal 12.5V clamping circuit to prevent from undesired over-voltage gate signals. And under the conditions listed below, the gate output will turn off immediately to protect the power circuit. GR1281 series also has soft driving function to minimize EMI.

VCC Mode

In order to avoid the output voltage shut down by load changing from full to no load, GR1281 series is built-in the VCC mode function. When the load from full changes to no load, the output voltage will overshoot and pull low the COMP pin by feedback loop (Into burst mode). Thus the duty will disappear and no power delivers to the secondary. If there is without any mechanism to prevent this situation, the VCC pin voltage will down to UVLO off and the IC will re-start again.

The VCC mode function is used to prevent the output re-start again when load changes. So never let the system operate on the VCC mode at no load. The system should operate on burst mode, otherwise the input power maybe become larger.
