

### ■ Description

The WD78L05 series are three terminal positive regulators. These regulators can provide local on card regulation, eliminating the distribution problems associated with single point regulation. The WD78L05 can be used in logic systems, instrumentation, HiFi, and other solid state electronic equipment. When used as a Zener diode/resistor combination replacement, the WD78L05 usually results in an effective output impedance improvement of two orders of magnitude, and lower quiescent current. With adequate heat sinking, the WD78L05 can deliver 100mA output current. Current limiting is included to limit the peak output current to a safe value. Thermal protection is also provided. If internal power dissipation becomes too high for the heat sinking provided, the thermal shutdown circuit takes over, preventing the IC from overheating.

The WD78L05 are available in the plastic TO-92, SOIC-8, SOT-223 and SOT-89 packages.

### ■ Features and Benefits

- Output Current up to 100mA
- Output Voltage Tolerances of  $\pm 5\%$  over the Full Temperature Range
- Internal Short Circuit Current-limiting
- Internal Thermal Overload Protection
- No External Components

### ■ Applications

- High Efficiency Linear Regulator
- Post Regulation for Switching Supply
- Microprocessor Power Supply
- Mother Board I/O Power Supply

Note 1: Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “Recommended Operating Conditions” is not implied. Exposure to “Absolute Maximum Ratings” for extended periods may affect device reliability.
