CPS135B-1500D

Digital Barometer

Overview

The CPS135B-1500D SIP (System-in-a-Package) solution comprises of a resistive bridge type pressure sensor and a 24-bit ADC for high resolution and accurate pressure measurements. The fully calibrated pressure and temperature compensated digital output makes the CPS135B-1500D solution simple to use. The CPS135B-1500D comprises of an internal calibration logic that provides accurate pressure and temperature measurements to the application via I²C interface. There is no need to separately download internal calibration coefficients and have the host micro-controller conduct complicated compensation calculations.

Applications

- Altimeters
- Portable and Stationary Barometers
- Weather Stations
- GPS Applications
- Hard Disk Drives(HDD)
- Industrial Equipment
- Air Control Systems
- Vacuum Systems

Benefits

- Low Power Consumption. Excellent for Battery and Other Low-Power Applications
- External Clock not Required
- High Resistance to Sensing Media

Features

- Factory Calibrated Pressure and Temperature Sensor
- Supply Voltage: 2V to 5.5V(3V @typical)
- Current Consumption: <5uA(One Measurement)
- Sleep State Current: <200nA (25°C)
- Operating Temperature Range: -20°C to +85°C
- Pressure Accuracy: ±2kPa (±20.0mbar) @ 25°C
- Temperature Accuracy: ±1.0°C

Interfaces

- I²C™* Compatible (≤400kHz)

Physical Characteristics

- Small Form Factor, 4.5 x 4.5 x 3.5mm (w x l x h)
- SMD, 6 Lead
- Ceramic Substrate

*I²C™ is a registered trademark of NXP

1 OPERATING CHARACTERISTICS

1.1 ABSOLUTE RATINGS

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Over Pressure					2X FS	kPa (bar)
Supply Voltage (with respect to GND)	V_{DD}		-0.3		6.5	V
Voltages at Analog and Digital I/O Pins	V_{A_IO} V_{D_IO}		-0.3		$V_{DD} + 0.3$	V
Storage Temperature	T_{STOR}		-60		150	°C

1.2 OPERATING CONDITIONS

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
PRESSURE SENSOR						
Range			50 (500)		1500 (15000)	kPa (mbar)
Resolution ¹				0.01 (0.1)		kPa (mbar)
Accuracy		50 to 1500kPa (-20°C to 0°C)	-3 (-30)	±2.5 (±25)	+3 (+30)	kPa (mbar)
		50 to 1500kPa (0°C to 65°C)	-2.5 (-25)	±2 (±20)	+2.5 (+25)	kPa (mbar)
Solder Drifts				±3		kPa
Long-term stability				±2		kPa/yr
TEMPERATURE SENSOR						
Range			-20		85	°C
Resolution				0.003		°C
Accuracy		-20°C to 85°C	-1	±0.75	+1	°C
OPERATION						
Supply Voltage to GND ²	V_{SUPPLY}		2	3.0	5.5	V
Operating Temperature Range			-20		85	°C
I ² C Pull-Up Resistors	R_{PU}		1	2.2		kΩ

¹Guaranteed by design of 24bits ADC, and calculated according to the range in application.

² Factory calibrated for Pressure and Temperature at 3.0V±10%. Output accuracy will be affected if used outside this range. Other ranges available upon request.

Digital Barometer

1.3 ELECTRICAL PARAMETERS

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
SUPPLY CURRENT						
Supply Current, average(1) during conversion(2) standby(no conversion)	I _{avg} I _{sc} I _{ss}	VDD=3V		3.95 1.5	0.2	μA mA uA
ANALOG TO DIGITAL CONVERTER						
Resolution	r _{ADC}				24	Bit
I ² C Clock Frequency	F _{C,I2C}				400	kHz

Notes

- 1) Under the assumption of one conversion every second. Conversion means either a pressure or a temperature measurement
- 2) During conversion, the sensor will be switched on to VDD, and after conversion ended, the sensor will automatically be switched off from VDD.

2 OPERATION MODES

The CPS135B-1500D is factory programmed to Sleep Mode. In this mode, the CPS135B-1500D remains asleep until the master/host sends a measurement request (MR) before taking sensor measurements. After the CPS135B-1500D receives an MR command, it wakes up, runs a full measurement cycle, stores the measurement data in internal registers and then returns to sleep mode again.

3 OUTPUT MODES

3.1 I²C Slave

Two-wire I²C is available for reading sensor measurement data from the CPS135B-1500D.

The factory setting for the I²C slave address is 0x6D and the communication is restricted to this address only.

- I²C Address = 0x6D

CPS135B-1500D

Digital Barometer

3.2 I²C COMMANDS

Table 2 details the commands to interface with the device in the I²C mode.

TABLE 2: I²C COMMANDS

TYPE	DESCRIPTION
Get Data (GD)	Retrieves the sensor measurement data from the internal CPS135B-1500D registers*.
Measurement Request (MR)	Wakes up the CPS135B-1500D, performs a sensor measurement, stores the sensor measurement data in internal registers and returns to sleep

**Note: GD does not initiate a new measurement. Repeated GD commands will return the same (or stale) sensor measurement data. An MR is required to perform a full sensor measurement cycle to refresh the sensor register data.*

The Get Data (GD) command is used to read out data from the CPS135B-1500D. With the start of communication (for I²C after reading the slave address) the entire sensor measurement output packet will be loaded in a serial output register. The register will be updated after the communication is finished. The output is always scaled to 24-bits.

The ordering of the bits is “big-endian”.

3.2.1 I²C GET DATA

An I²C Get Data command starts with the 7-bit slave address and the 8th bit = 1 (READ). The device then sends acknowledge (ACK), indicating I²C communication success. The number of data bytes returned by the device is determined by the master, which controls NACK and stop conditions.

Figure 1 displays an example for sending three bytes followed by reading five bytes. The first byte contains the I²C address followed by internal register address (0x06). Then the I²C address is repeated, followed by the slave sending out three pressure bytes and two temperature bytes.

The GD command is used to retrieve the pressure and temperature sensor data after an MR command has been executed.

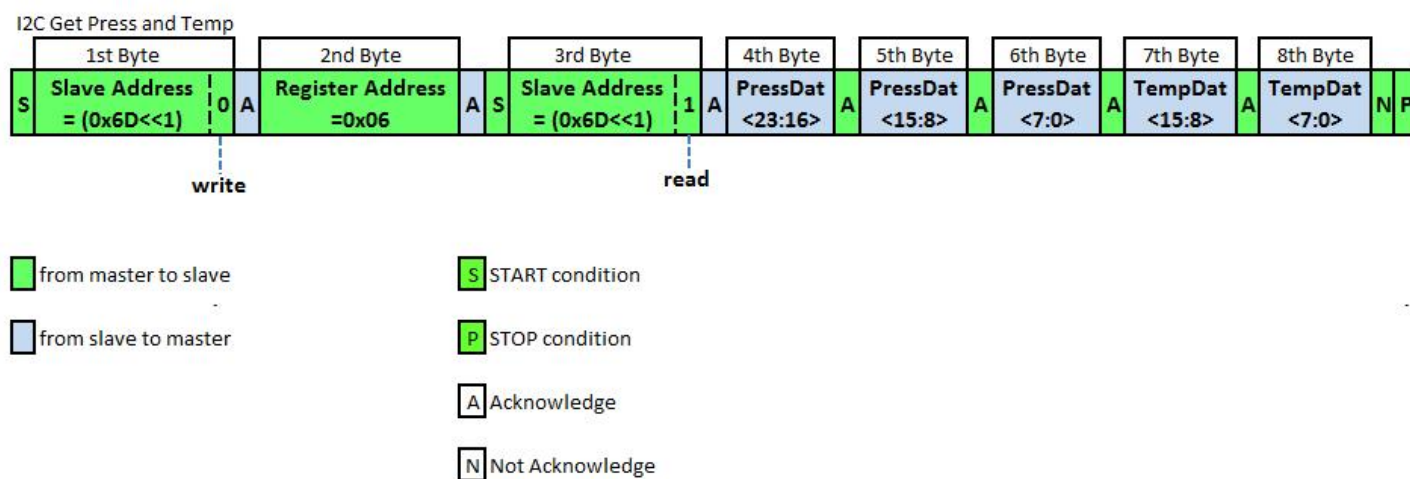

CPS135B-1500D

Digital Barometer

FIGURE 1: 7-BIT SLAVE ADDRESS FOLLOWED BY THREE PRESSURE AND TWO TEMPERATURE BYTES

Note that the two temperature byte codes are formatted in 2's complement.

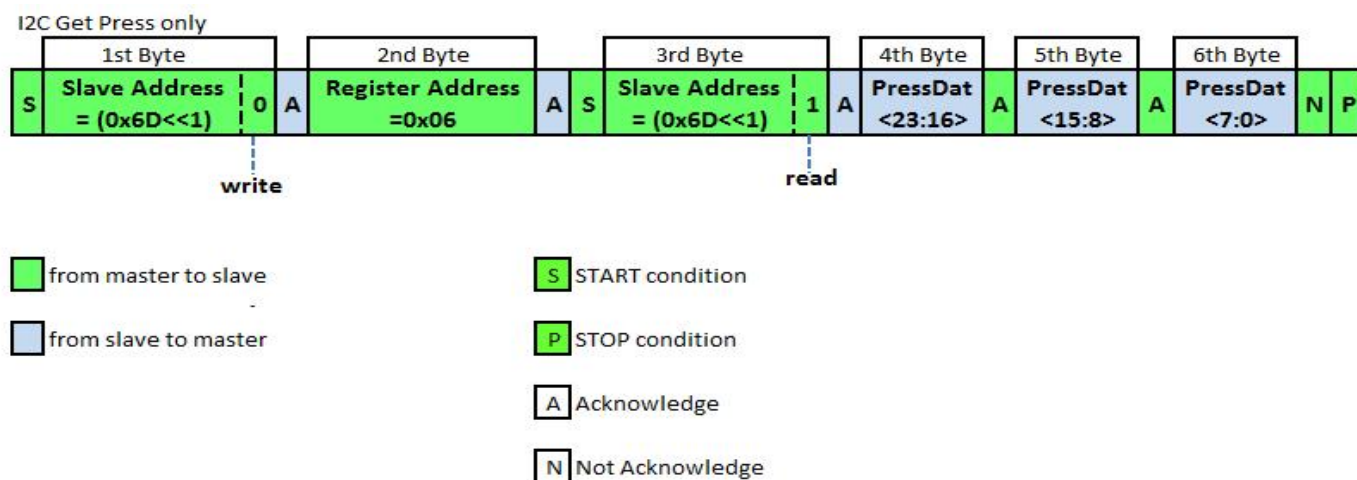

CPS135B-1500D

Digital Barometer

FIGURE 2: 7-BIT SLAVE ADDRESS FOLLOWED BY THREE PRESSURE BYTES

For Pressure data only, the data stream can be terminated after the sixth pressure byte. See Figure 2 below.

3.2.2 I²C MEASUREMENT REQUEST

The I²C MR is used to wake up the device from Sleep Mode and start a complete sensor measurement cycle, before the device returns to Sleep Mode again. The measurement cycles starts with a pressure measurement followed by a temperature measurement. The sensor measurements are digitized and run through an onboard compensation algorithm before the final measurement values are written to the digital output register. As shown in Figure 3, the communication requires the slave address (0x6D) and a WRITE bit (0) to initiate the MR. This is followed by two bytes; register address (0x30) and measurement (0xA). After the CPS135B-1500D responds with the slave ACK, the master terminates the communication with a stop condition.

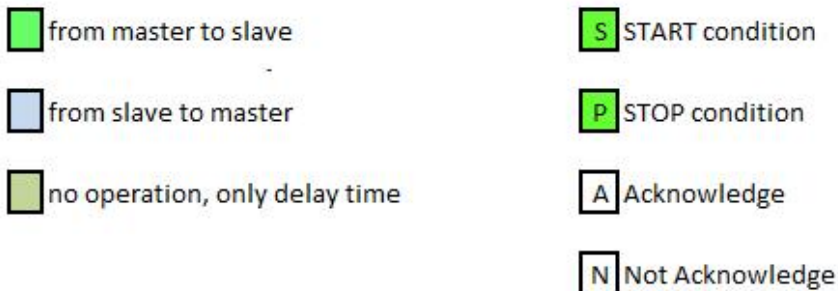

Sensor measurement conversion time takes approximately 5ms, so MRs should not be sent faster than every 5ms.

CPS135B-1500D

Digital Barometer

FIGURE 3: I²C MEASUREMENT REQUEST COMMAND (0xA)

4 CALCULATING OUTPUT

After retrieving the data, the compensated output can be scaled to real world values by following the equations below.

4.1 PRESSURE OUTPUT

An example of the 24-bit compensated pressure with a full scale range of 50 to 1500kPa can be calculated as follows:

$$\text{Pressure [kPa]} = (\text{Pressure 3rd Byte [23:16]} \times 65536 + \text{Pressure 2nd Byte [15:8]} \times 256 + \text{Pressure 1st Byte [7:0]}) / 2^{12} / 1000$$

4.2 TEMPERATURE OUTPUT

The 16-bit compensated temperature can be calculated as follows:

$$\text{Positive Temperature [}^{\circ}\text{C]} = (\text{Temperature High Byte [15:8]} \times 256 + \text{Temperature Low Byte [7:0]}) / 2^8$$

$$\text{Negative Temperature [}^{\circ}\text{C]} = (\text{Temperature High Byte [15:8]} \times 256 + \text{Temperature Low Byte [7:0]} - 65536) / 2^8$$
