## 1 General description

The GD32E232xx device belongs to the value line of GD32 MCU family. It is a new 32-bit general-purpose microcontroller based on the ARM® Cortex®-M23 core. The Cortex-M23 processor is an energy-efficient processor with a very low gate count. It is intended to be used for microcontroller and deeply embedded applications that require an area-optimized processor. The processor delivers high energy efficiency through a small but powerful instruction set and extensively optimized design, providing high-end processing hardware including a single-cycle multiplier and a 17-cycle divider.

The GD32E232xx device incorporates the ARM® Cortex®-M23 32-bit processor core operating at up to 72 MHz frequency with flash accesses 0~2 wait states to obtain maximum efficiency. It provides up to 64 KB embedded flash memory and up to 8 KB SRAM memory. An extensive range of enhanced I/Os and peripherals connected to two APB buses. The devices offer one 12-bit ADC, two DACs, four CLAs and one comparator, up to five general 16-bit timers, one general 32-bit timer, two basic timers, a PWM advanced timer, as well as standard and advanced communication interfaces: two I2Cs, two USARTs, up to two SPIs, and an I2S.

The device operates from a 1.8 to 3.6 V power supply and available in –40 to +105 °C temperature range. Several power saving modes provide the flexibility for maximum optimization between wakeup latency and power consumption, an especially important consideration in low power applications.

The above features make the GD32E232xx devices suitable for a wide range of applications, especially in areas such as industrial control, motor drives, user interface, power monitor and alarm systems, consumer and handheld equipment, gaming and GPS, E-bike, optical module and so on.

**Note:**

If the APB prescaler is 1, the timer clock frequencies are set to AHB frequency divide by 1. Otherwise, they are set to the AHB frequency divide by half of APB prescaler.

- (2) I/O Level: 5VT = 5 V tolerant.
- (3) When power reset, this pin must be used as BOOT0. When system reset and PIN\_RSTMD bit in SYSCFG\_CFG2 is set to 0, this pin must be used as BOOT0. At other times, this pin can be used as BOOT0 or PB9 according to BOOT0\_PB9\_RMP bit in SYSCFG\_CFG0. Specially, when PIN\_RSTMD bit and BOOT0\_PB9\_RMP bit are both set, the boot0 function is tied to 0 by hardware after system reset. In this case, the system will boot from main flash without regard to the input value from the BOOT0 pin.

## 3 Functional description

### 3.1 ARM® Cortex®-M23 core

The Cortex-M23 processor is an energy-efficient processor with a very low gate count. It is intended to be used for microcontroller and deeply embedded applications that require an area-optimized processor. The processor is highly configurable enabling a wide range of implementations from those requiring memory protection and powerful trace technology to cost sensitive devices requiring minimal area, while delivering outstanding computational performance and an advanced system response to interrupts.

32-bit ARM® Cortex®-M23 processor core

- Up to 72 MHz operation frequency
- Single-cycle multiplication and hardware divider
- Ultra-low power, energy-efficient operation
- Excellent code density
- Integrated Nested Vectored Interrupt Controller (NVIC)
- 24-bit SysTick timer

The Cortex®-M23 processor is based on the ARMv8-M architecture and supports both Thumb and Thumb-2 instruction sets. Some system peripherals listed below are also provided by Cortex®-M23:

- Internal Bus Matrix connected with AHB master, Serial Wire Debug Port and Single-cycle IO port
- Nested Vectored Interrupt Controller (NVIC)
- Breakpoint Unit(BPU)
- Data Watchpoint and Trace (DWT)
- Serial Wire Debug Port

### 3.2 Embedded memory

- Up to 64 Kbytes of flash memory
- Up to 8 Kbytes of SRAM with hardware parity checking

64 Kbytes of inner flash and 8 Kbytes of inner SRAM at most is available for storing programs and data, both accessed (R/W) at CPU clock speed with 0~2 wait states. [Table 2-2. GD32E232xx memory map](#) shows the memory map of the GD32E232xx series of devices, including code, SRAM, peripheral, and other pre-defined regions.

### 3.3 Clock, reset and supply management

- Internal 8 MHz factory-trimmed RC and external 4 to 32 MHz crystal oscillator

- Internal 28 MHz RC oscillator
- Internal 40 kHz RC calibrated oscillator
- Integrated system clock PLL
- 1.8 to 3.6 V application supply and I/Os
- Supply Supervisor: POR (Power On Reset), PDR (Power Down Reset), and low voltage detector (LVD)

The Clock Control Unit (CCU) provides a range of oscillator and clock functions. These include speed internal RC oscillator and external crystal oscillator, high speed and low speed two types. Several prescalers allow the frequency configuration of the AHB and two APB domains. The maximum frequency of the AHB, APB2 and APB1 domains is 72 MHz/72 MHz/72 MHz. See [Figure 2-4. GD32E232xx clock tree](#) for details on the clock tree.

The Reset Control Unit (RCU) controls three kinds of reset: system reset resets the processor core and peripheral IP components. Power-on reset (POR) and power-down reset (PDR) are always active, and ensures proper operation starting from 1.71 V and down to 1.67V. The device remains in reset mode when  $V_{DD}$  is below a specified threshold. The embedded low voltage detector (LVD) monitors the power supply, compares it to the voltage threshold and generates an interrupt as a warning message for leading the MCU into security.

Power supply schemes:

- $V_{DD}$  range: 1.8 to 3.6 V, external power supply for I/Os and the internal regulator. Provided externally through  $V_{DD}$  pins.
- $V_{SSA}$ ,  $V_{DDA}$  range: 1.8 to 3.6 V, external analog power supplies for ADC, reset blocks, RCs and PLL.

### 3.4 Boot modes

At startup, boot pins are used to select one of three boot options:

- Boot from main flash memory (default)
- Boot from system memory
- Boot from on-chip SRAM

In default condition, boot from main flash memory is selected. The boot loader is located in the internal boot ROM memory (system memory). It is used to reprogram the flash memory by using I2C0 (PB6 and PB7 for GD32E232Kx or PA9 and PA10 for GD32E232Ex).

### 3.5 Power saving modes

The MCU supports three kinds of power saving modes to achieve even lower power consumption. They are sleep mode, deep-sleep mode, and standby mode. These operating modes reduce the power consumption and allow the application to achieve the best balance between the CPU operating time, speed and power consumption.

- **Sleep mode**

In sleep mode, only the clock of CPU core is off. All peripherals continue to operate and any interrupt/event can wake up the system.

- **Deep-sleep mode**

In deep-sleep mode, all clocks in the 1.2 V domain are off, and all of the high speed crystal oscillator (IRC8M, HXTAL) and PLL are disabled. Only the contents of SRAM and registers are retained. Any interrupt or wakeup event from EXTI lines can wake up the system from the deep-sleep mode including the up to 16 external lines, the RTC alarm, RTC tamper, CMP output, LVD output and USART wakeup. When exiting the deep-sleep mode, the IRC8M is selected as the system clock.

- **Standby mode**

In standby mode, the whole 1.2 V domain is power off, the LDO is shut down, and all of IRC8M, HXTAL and PLL are disabled. The contents of SRAM and registers (except backup registers) are lost. There are four wakeup sources for the standby mode, including the external reset from NRST pin, the RTC alarm, the FWDGT reset, and the rising edge on WKUP pin.

### 3.6 Analog to digital converter (ADC)

- 12-bit SAR ADC's conversion rate is up to 2 MSPS
- 12-bit, 10-bit, 8-bit or 6-bit configurable resolution
- Hardware oversampling ratio adjustable from 2 to 256x improves resolution to 16-bit
- Support references from internal 2.5 V precision reference or external  $V_{REF}$  pin.
- Input voltage range: 0 to  $V_{REF}$
- Temperature sensor

One 12-bit 2 MSPS multi-channel ADC is integrated in the device. It has a total of 18 multiplexed channels: up to 16 external channels, 1 channel for internal temperature sensor ( $V_{SENSE}$ ) and 1 channel for internal reference voltage ( $V_{REFINT}$ ). The input voltage range is between 0 and  $V_{REF}$ . An on-chip hardware oversampling scheme improves performance while off-loading the related computational burden from the CPU. An analog watchdog block can be used to detect the channels, which are required to remain within a specific threshold window. A configurable channel management block can be used to perform conversions in single, continuous, scan or discontinuous mode to support more advanced use.

The ADC can be triggered from the events generated by the general level 0 timers (TIMERx) and the advanced timer (TIMER0) with internal connection. The temperature sensor can be used to generate a voltage that varies linearly with temperature. It is internally connected to the ADC\_IN16 input channel which is used to convert the sensor output voltage in a digital value.

### 3.7 Digital to analog converter (DAC)

- Two 12-bit DACs with four independent output channels

- 8-bit or 12-bit mode in conjunction with the DMA controller
- DACs output can be configured to retention when system reset
- Support references from internal 2.5 V precision reference or external  $V_{REF}$  pin.

The 12-bit buffered DAC is used to generate variable analog outputs. The DAC channels can be triggered by the timer or EXTI with DMA support. In dual DAC channel operation, conversions could be done independently or simultaneously. The maximum output value of the DAC is  $V_{REF}$ .

### 3.8 DMA

- 7 channels DMA controller
- Peripherals supported: Timers, ADC, DACs, SPIs, I2Cs, USARTs and I2S

The flexible general-purpose DMA controllers provide a hardware method of transferring data between peripherals and/or memory without intervention from the CPU, thereby freeing up bandwidth for other system functions. Three types of access method are supported: peripheral to memory, memory to peripheral, memory to memory.

Each channel is connected to fixed hardware DMA requests. The priorities of DMA channel requests are determined by software configuration and hardware channel number. Transfer size of source and destination are independent and configurable.

### 3.9 General-purpose inputs/outputs (GPIOs)

- Up to 28 fast GPIOs, all mappable on 16 external interrupt lines
- Analog input/output configurable
- Alternate function input/output configurable
- GPIO state retention when system reset

There are up to 28 general purpose I/O pins (GPIO) in GD32E232xx, named PA0 ~ PA15 and PB0 ~ PB9, PF0 ~ PF1 to implement logic input/output functions. Each of the GPIO ports has related control and configuration registers to satisfy the requirements of specific applications. The external interrupts on the GPIO pins of the device have related control and configuration registers in the Interrupt/event controller (EXTI). The GPIO ports are pin-shared with other alternative functions (AFs) to obtain maximum flexibility on the package pins. Each of the GPIO pins can be configured by software as output (push-pull open-drain or analog), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high-current capable except for analog inputs.

### 3.10 Timers and PWM generation

- One 16-bit advanced timer (TIMER0), one 32-bit general timer (TIMER1), up to five 16-

bit general timers (TIMER2, TIMER13 ~ TIMER16), and two 16-bit basic timer (TIMER5, TIMER6)

- Up to 4 independent channels of PWM, output compare or input capture for each general timer and external trigger input
- 16-bit, motor control PWM advanced timer with programmable dead-time generation for output match
- Encoder interface controller with two inputs using quadrature decoder
- 24-bit SysTick timer down counter
- 2 watchdog timers (free watchdog timer and window watchdog timer)

The advanced timer (TIMER0) can be used as a three-phase PWM multiplexed on 6 channels. It has complementary PWM outputs with programmable dead-time generation. It can also be used as a complete general timer. The 4 independent channels can be used for input capture, output compare, PWM generation (edge- or center- aligned counting modes) and single pulse mode output. If configured as a general 16-bit timer, it has the same functions as the TIMEx timer. It can be synchronized with external signals or to interconnect with other general timers together which have the same architecture and features.

The general timer can be used for a variety of purposes including general time, input signal pulse width measurement or output waveform generation such as a single pulse generation or PWM output, up to 4 independent channels for input capture/output compare. TIMER1 is based on a 32-bit auto-reload up/down counter and a 16-bit prescaler. TIMER2 is based on a 16-bit auto-reload up/down counter and a 16-bit prescaler. TIMER13 ~ TIMER16 is based on a 16-bit auto-reload up counter and a 16-bit prescaler. The general timer also supports an encoder interface with two inputs using quadrature decoder.

The basic timer, known as TIMER5 &TIMER6, are mainly used for DAC trigger generation. They can also be used as a simple 16-bit time base.

The GD32E232xx have two watchdog peripherals, free watchdog and window watchdog. They offer a combination of high safety level, flexibility of use and timing accuracy.

The free watchdog timer includes a 12-bit down-counting counter and an 8-bit prescaler. It is clocked from an independent 40 kHz internal RC and as it operates independently of the main clock, it can operate in deep-sleep and standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management.

The window watchdog is based on a 7-bit down counter that can be set as free-running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early wakeup interrupt capability and the counter can be frozen in debug mode.

The SysTick timer is dedicated for OS, but could also be used as a standard down counter. The features are shown below:

- A 24-bit down counter
- Auto reload capability

- Maskable system interrupt generation when the counter reaches 0
- Programmable clock source

### 3.11 Real time clock (RTC)

- Independent binary-coded decimal (BCD) format timer/counter with five 32-bit backup registers.
- Calendar with subsecond, second, minute, hour, week day, date, year and month automatically correction
- Alarm function with wake up from deep-sleep and standby mode capability
- On-the-fly correction for synchronization with master clock. Digital calibration with 0.954 ppm resolution for compensation of quartz crystal inaccuracy.

The real time clock is an independent timer which provides a set of continuously running counters in backup registers to provide a real calendar function, and provides an alarm interrupt or an expected interrupt. It is not reset by a system or power reset, or when the device wakes up from standby mode. In the RTC unit, there are two prescalers used for implementing the calendar and other functions. One prescaler is a 7-bit asynchronous prescaler and the other is a 15-bit synchronous prescaler.

### 3.12 Inter-integrated circuit (I2C)

- Two I2C bus interfaces can support both master and slave mode with a frequency up to 1 MHz (Fast mode plus)
- Provide arbitration function, optional PEC (packet error checking) generation and checking
- Support 7-bit and 10-bit addressing mode and general call addressing mode
- Support SAM\_V mode

The I2C interface is an internal circuit allowing communication with an external I2C interface which is an industry standard two line serial interface used for connection to external hardware. These two serial lines are known as a serial data line (SDA) and a serial clock line (SCL). The I2C module provides different data transfer rates: up to 100 kHz in standard mode, up to 400 kHz in the fast mode and up to 1 MHz in the fast mode plus. The I2C module also has an arbitration detect function to prevent the situation where more than one master attempts to transmit data to the I2C bus at the same time. A CRC-8 calculator is also provided in I2C interface to perform packet error checking for I2C data.

### 3.13 Serial peripheral interface (SPI)

- Up to two SPI interfaces with a frequency of up to 18 MHz
- Support both master and slave mode
- Hardware CRC calculation and transmit automatic CRC error checking

- Separate transmit and receive 32-bit FIFO with DMA capability (only in SPI1)
- Data frame size can be 4 to 16 bits (only in SPI1)
- Quad-SPI configuration available in master mode (only in SPI1)

The SPI interface uses 4 pins, among which are the serial data input and output lines (MISO & MOSI), the clock line (SCK) and the slave select line (NSS). Both SPIs can be served by the DMA controller. The SPI interface may be used for a variety of purposes, including simplex synchronous transfers on two lines with a possible bidirectional data line or reliable communication using CRC checking. Specially, SPI1 has separate transmit and receive 32-bit FIFO with DMA capability and its data frame size can be 4 to 16 bits. Quad-SPI master mode is also supported in SPI1.

### 3.14 Universal synchronous asynchronous receiver transmitter (USART)

- Two USARTs with operating frequency up to 4.5 Mbits/s
- Supports both asynchronous and clocked synchronous serial communication modes
- IrDA SIR encoder and decoder support
- LIN break generation and detection
- ISO 7816-3 compliant smart card interface

The USART (USART0, USART1) are used to translate data between parallel and serial interfaces, provides a flexible full duplex data exchange using synchronous or asynchronous transfer. It is also commonly used for RS-232 standard communication. The USART includes a programmable baud rate generator which is capable of dividing the system clock to produce a dedicated clock for the USART transmitter and receiver. The USART also supports DMA function for high speed data communication.

### 3.15 Inter-IC sound (I2S)

- One I2S bus Interfaces with sampling frequency from 8 kHz to 192 kHz, multiplexed with SPI0
- Support either master or slave mode

The Inter-IC sound (I2S) bus provides a standard communication interface for digital audio applications by 3-wire serial lines. GD32E232xx contain an I2S-bus interface that can be operated with 16/32 bit resolution in master or slave mode, pin multiplexed with SPI0. The audio sampling frequency from 8 kHz to 192 kHz is supported with less than 0.5% accuracy error.

### 3.16 Comparators (CMP)

- One fast rail-to-rail low-power comparators with software configurable
- Programmable reference voltage (internal or external I/O)

One comparator (CMP) is implemented within the devices. It can wake up from deep-sleep mode to generate interrupts and breaks for the timers and also can be combined as a window comparator. The internal voltage reference is also connected to ADC\_IN17 input channel of the ADC.

### 3.17 Configurable logic array (CLA)

- Four independent CLA units, with two input multiplexers, supporting 16 input signals, including external pins, timer channels, ADC, and CLA asynchronous outputs
- A Look-up table(LUT) providing 256 programmable digital logic functions is implemented in each CLA units
- Programmable asynchronous and synchronous output
- CLA output can be configured to synchronize with external pins and timers
- Four CLA units can be combined and support complicated logic operations

The configurable logic array provides 256 programmable digital logic operations for external pins, ADC and timers without intervention from the CPU. Four independent CLA units are implemented in this module. Each CLA unit supports configurable asynchronous and synchronous output for GPIO pins.

### 3.18 Debug mode

- Serial wire debug port

Debug capabilities can be accessed by a debug tool via Serial Wire (SW - Debug Port).

### 3.19 Package and operation temperature

- QFN32 (GD32E232KxQ7) and QFN24 (GD32E232ExU7).
- Operation temperature range: -40°C to +105°C (industrial level)

## 4 Electrical characteristics

### 4.1 Absolute maximum ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device. Note that the device is not guaranteed to operate properly at the maximum ratings. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

**Table 4-1. Absolute maximum ratings<sup>(1) (4)</sup>**

Symbol	Parameter	Min	Max	Unit
$V_{DD}$	External voltage range <sup>(2)</sup>	$V_{SS} - 0.3$	$V_{SS} + 3.6$	V
$V_{DDA}$	External analog supply voltage	$V_{SSA} - 0.3$	$V_{SSA} + 3.6$	V
$V_{IN}$	Input voltage on 5V tolerant pin <sup>(3)</sup>	$V_{SS} - 0.3$	$V_{DD} + 3.6$	V
	Input voltage on other I/O	$V_{SS} - 0.3$	3.6	V
$ \Delta V_{DDx} $	Variations between different $V_{DD}$ power pins	—	50	mV
$ V_{SSx} - V_{SS} $	Variations between different ground pins	—	50	mV
$I_{IO}$	Maximum current for GPIO pin	—	$\pm 25$	mA
$T_A$	Operating temperature range	-40	+105	°C
$T_{STG}$	Storage temperature range	-55	+150	°C
$T_J$	Maximum junction temperature	—	125	°C

(1). Guaranteed by design, not tested in production.

(2). All main power and ground pins should be connected to an external power source within the allowable range.

(3).  $V_{IN}$  maximum value cannot exceed 6.5 V.

(4). It is recommended that  $V_{DD}$  and  $V_{DDA}$  are powered by the same source. The maximum difference between  $V_{DD}$  and  $V_{DDA}$  does not exceed 300 mV during power-up and operation.

	Wakeup from Deep-sleep mode (LDO in low power mode)	16.3	
$t_{\text{Standby}}$	Wakeup from Standby mode	70.9	

(1). Based on characterization, not tested in production.

(2). The wakeup time is measured from the wakeup event to the point at which the application code reads the first

instruction under the below conditions:  $V_{DD} = V_{DDA} = 3.3\text{ V}$ , IRC8M = System clock = 8 MHz.

### 4.3 Power consumption

(1). Based on characterization, not tested in production.

(2). Unless otherwise specified, all values given for T<sub>A</sub> condition and test result is mean value.

(3). When System Clock is less than 4 MHz, an external source is used, and the HXTAL bypass function is needed, no PLL.

(4). When System Clock is greater than 8 MHz, a crystal 8 MHz is used, and the HXTAL bypass function is closed, using PLL.

(5). When analog peripheral blocks such as ADCs, DACs, HXTAL, IRC8M, or IRC40K are ON, an additional power consumption should be considered.
