

3.5Ω/7Ω Quad SPST Switches with Over-Rail Signal Handling

General Description

The MAX4851/MAX4851H/MAX4853/MAX4853H family of quad single-pole/single-throw (SPST) switches operates from a single +2V to +5.5V supply and can handle signals greater than the supply rail. These switches feature low 3.5Ω on-resistance with 40pF on-capacitance or 7Ω on-resistance with 30pF on-capacitance, making them ideal for switching audio and data signals.

The MAX4851/MAX4851H are configured with four SPST switches and feature a comparator for headphone detection or mute/send key functions. The MAX4853/MAX4853H have four SPST switches but do not include a comparator.

For over-rail applications, these devices offer either the pass-through or high-impedance option. For the MAX4851/ MAX4853, signals greater than the positive supply (up to 5.5V) pass through the switch without distortion. For the MAX4851H/MAX4853H, the switch input becomes high impedance when the input signal exceeds the supply rail.

The MAX4851/MAX4851H/MAX4853/MAX4853H are available in the space-saving, 16-pin, 3mm x 3mm thin QFN package and operate over the -40°C to +85°C extended temperature range.

Applications

- USB Switching
- Audio Signal Routing
- Cellular Phones
- Notebook Computers
- PDAs and Other Handheld Devices

Pin Configurations and Typical Operating Circuit appear at end of data sheet

Features

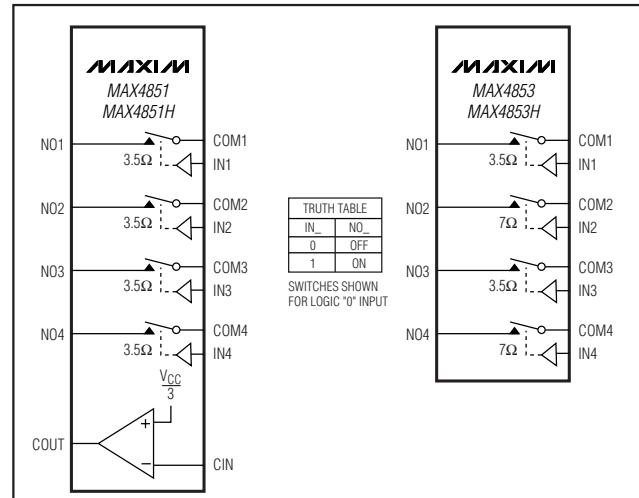

- ◆ USB 2.0 Full Speed (12Mbps) and USB 1.1 Signal Switching
- ◆ Switch Signals Greater than Vcc
- ◆ +2V to +5.5V Supply Range
- ◆ 3.5Ω/7Ω On-Resistance
- ◆ 30pF On-Capacitance (7Ω Switch)
- ◆ 150MHz -3dB Bandwidth
- ◆ 1.8V Logic Compatibility
- ◆ Low Supply Current
 - 0.01µA (MAX4853)
 - 5µA (MAX4851)
 - 10µA (MAX4851H/MAX4853H)
- ◆ Low 0.01nA Leakage Current
- ◆ Available in a Space-Saving 3mm x 3mm, 16-Pin TQFN Package

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	TOP MARK
MAX4851ETE	-40°C to +85°C	16 TQFN-EP*	ABW
MAX4851HETE	-40°C to +85°C	16 TQFN-EP*	ABX
MAX4853ETE	-40°C to +85°C	16 TQFN-EP*	ACB
MAX4853HETE	-40°C to +85°C	16 TQFN-EP*	ACC

*EP = Exposed paddle.

Continuous Power Dissipation (T _A = +70°C)	
16-Pin Thin QFN (derate 20.8mW/°C above +70°C) ...	1667mW
Operating Temperature Range	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C

Note 1: Signals on IN_{_}, NO_{_}, or COM_{_} below GND are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = +2.7V to +5.5V, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at V_{CC} = +3.0V, T_A = +25°C, unless otherwise noted.) (Note 2)

Pin Description

PIN		NAME	FUNCTION
MAX4851	MAX4853		
MAX4851H	MAX4853H		
1	1	NO1	Normally Open Terminal for Analog Switch 1
2	—	CIN	Inverting Input for Comparator
3	3	IN2	Digital Control Input for Analog Switch 2. A logic-low on IN2 disconnects COM2 from NO2 and a logic-high connects COM2 to NO2.
4	4	COM2	Common Terminal for Analog Switch 2
5	5	NO2	Normally Open Terminal for Analog Switch 2
6	6	GND	Ground
7	7	NO3	Normally Open Terminal for Analog Switch 3
8	8	COM3	Common Terminal for Analog Switch 3
9	9	IN3	Digital Control Input for Analog Switch 3. A logic-low on IN3 disconnects COM3 from NO3 and a logic-high connects COM3 to NO3.
10	10	NO4	Normally Open Terminal for Analog Switch 4
11	—	COUT	Output for Comparator
12	12	COM4	Common Terminal for Analog Switch 4
13	13	IN4	Digital Control Input for Analog Switch 4. A logic-low on IN4 disconnects COM4 from NO4 and a logic-high connects COM4 to NO4.
14	14	VCC	Supply Voltage. Bypass to GND with a 0.01µF capacitor as close to the pin as possible.
15	15	IN1	Digital Control Input for Analog Switch 1. A logic-low on IN1 disconnects COM1 from NO1 and a logic-high connects COM1 to NO1.
16	16	COM1	Common Terminal for Analog Switch 1
—	2, 11	N.C.	No Connection. Not internally connected.
EP	EP	GND	Exposed Pad. Connect to ground.

Detailed Description

The MAX4851/MAX4851H/MAX4853/MAX4853H are low on-resistance, low-voltage, analog switches that operate from a +2V to +5.5V single supply and are fully specified for nominal 3.0V applications. The MAX4851/MAX4853 devices feature over-rail signal capability that allows signals up to 5.5V with supply voltages down to 2.0V to pass through without distortion. The MAX4851H/MAX4853H enter high-impedance mode when the signal voltage exceeds V_{CC} and return to normal operation when the signal voltage drops below V_{CC}.

These quad SPST switches have low on-channel capacitance, which allows switching of the data signals for USB 2.0/1.1 applications (12Mbps). They are designed to switch D+ and D- USB signals with a guaranteed skew of less than 1ns (see Figure 2), as measured from 50% of the input signal to 50% of the output signal.

The MAX4851_ features a comparator that can be used for headphone or mute detection. The comparator threshold is internally generated to be approximately 1/3 of V_{CC}.

Applications Information

Digital Control Inputs

The logic inputs (IN_{_}) accept up to +5.5V even if the supply voltages are below this level. For example, with a +3.3V V_{CC} supply, IN_{_} can be driven low to GND and high to +5.5V, allowing for mixing of logic levels in a system. Driving IN_{_} rail-to-rail minimizes power consumption. For a +2V supply voltage, the logic thresholds are 0.5V (low) and 1.4V (high). For a +5V supply voltage, the logic thresholds are 0.8V (low) and 1.8V (high).

Analog Signal Levels

The on-resistance of these switches changes very little for analog input signals across the entire supply voltage range (see *Typical Operating Characteristics*). The switches are bidirectional; therefore, NO_{_} and COM_{_} can be either inputs or outputs.

Comparator

The positive terminal of the comparator is internally set to V_{CC} / 3. When the negative comparator terminal (CIN_{_}) is below the threshold (V_{CC} / 3), the comparator output (COUT_{_}) goes high. When CIN_{_} rises above V_{CC} / 3, COUT_{_} goes low.

The comparator threshold allows for detection of headphones since headphone audio signals are typically biased to V_{CC} / 2.

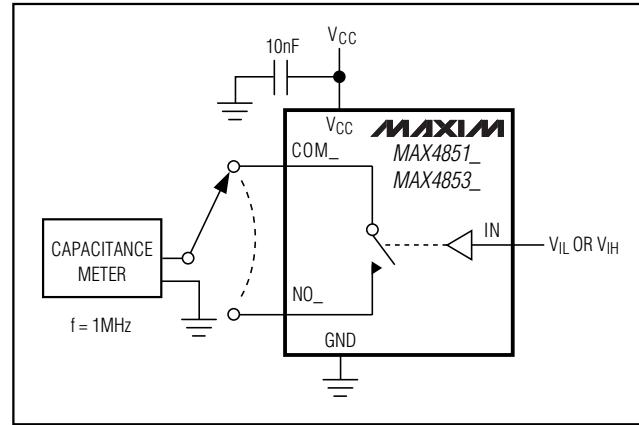

Figure 5. Channel Off-/On-Capacitance

Power-Supply Sequencing

Caution: Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the device.

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V_{CC} before applying analog signals, especially if the analog signal is not current limited.

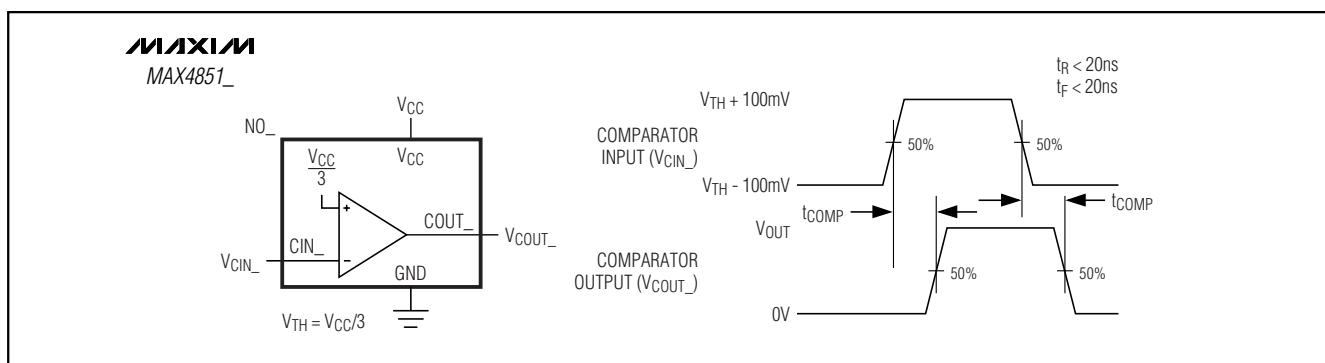

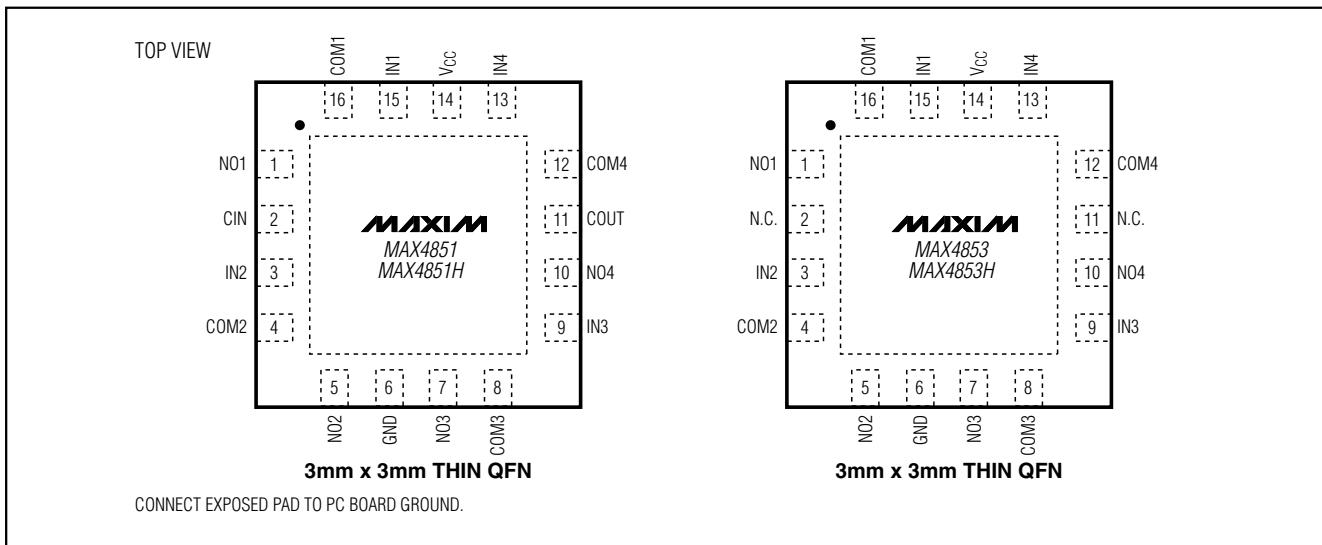

Figure 6. Comparator Switching Time
