

## Low Input Voltage 3A LDO Regulator

NO.EA-203-201216

### OUTLINE

The RP108J is a CMOS-based voltage regulator IC featuring 3A output with low ON-resistance.

The RP108J consists of a voltage reference unit, an error amplifier, resistor-net for voltage setting, a fold-back protection circuit, and a thermal shutdown circuit. The RP108J features both low supply current and high output current, and the dropout voltage is much smaller than bi-polar's. The minimum input voltage is as low as 1.6V and the output voltage can be set from 0.8V, therefore it can be connected with the DC/DC converter as the latter power supply for high density LSI that is operated by low output voltage.

The output voltage of RP108J081x is externally adjustable by using external divide resistors. The CE pin of the RP108J can switch the regulator to standby mode. In addition to a fold-back protection circuit, which is already built in the conventional regulators, The RP108J contains a thermal shutdown circuit, a constant slope circuit as a soft-start function and a reverse current protection circuit. Ceramic capacitors can be used.

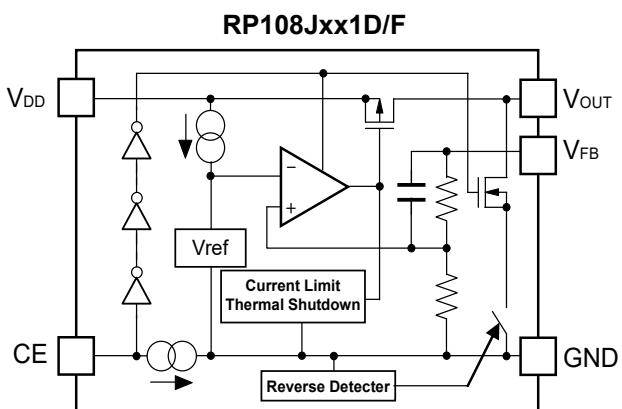

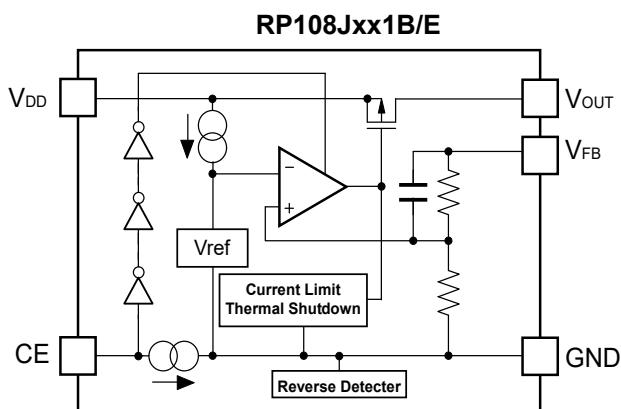

### FEATURES

- Output Current ..... Min. 3A
- Supply Current ..... Typ. 350 $\mu$ A
- Standby Current ..... Typ. 2 $\mu$ A
- Input Voltage Range ..... 1.6V to 5.25V
- Output Voltage Range ..... Fixed Output Voltage Type: 0.8V to 4.2V (0.1V steps)
  - \* Refer to *MARK INFORMATIONS* for other voltages.
  - Adjustable Output Voltage Type: 0.8V to 4.2V
- Output Voltage Accuracy .....  $\pm 1.0\%$  ( $\pm 15mV$  accuracy, When  $V_{SET} \leq 1.5V$ )
- Output Voltage Temperature-drift Coefficient ..... Typ.  $\pm 100ppm/^{\circ}C$
- Ripple Rejection ..... Typ. 65dB ( $f = 1kHz$ ,  $V_{SET} = 2.8V$ )
- Dropout Voltage ..... Typ. 0.51V ( $V_{SET}=2.8V$ )
- Line Regulation ..... Typ. 0.1%/V
- Package ..... TO-252-5-P2
- Built-in Fold-back Protection Circuit ..... Typ. 220mA
- Built-in Thermal Shutdown Circuit ..... Stops at 165 $^{\circ}C$
- Built-in Constant Slope Circuit
- Built-in Reverse Current Protection Circuit
- Ceramic capacitors are recommended to be used with this IC .... 10 $\mu$ F or more

### APPLICATIONS

- Power source for battery-powered equipments.
- Power source for portable communication equipments such as cameras and VCRs.
- Power source for electrical home appliances.

## BLOCK DIAGRAMS

## SELECTION GUIDE

The output voltage, auto discharge function, and the soft-start time for the ICs can be selected at the user's request.

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
RP108Jxx1*(y) -T1-FE	TO-252-5-P2	3,000 pcs	Yes	Yes

xx: The set output voltage ( $V_{SET}$ ) can be designated in the range of 0.8V(08) to 4.2V(42) in 0.1V steps.  
y: If the output voltage includes the 3rd digit, indicate the digit of 0.01V.  
(1.25V, 1.85V, 2.85V)  
Ex. If the output voltage is 1.25V, RP108J121\*5-T1-FE.  
If the output voltage is 1.85V, RP108J181\*5-T1-FE.  
If the output voltage is 2.85V, RP108J281\*5-T1-FE.

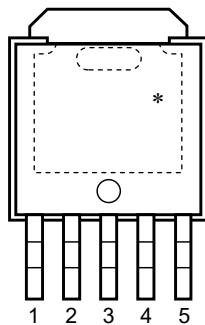

\*: Designation of auto-discharge function at off state and the soft-start time  
(B) No auto-discharge function, soft start time typ. 180  $\mu$ s  
(D) Auto-discharge function, soft start time typ. 180  $\mu$ s  
(E) No auto-discharge function, soft start time typ. 570  $\mu$ s  
(F) Auto-discharge function, soft start time typ. 570  $\mu$ s

Auto-discharge function quickly lowers the output voltage to 0V, when the chip enable signal is switched from the active mode to the standby mode, by releasing the electrical charge accumulated in the external capacitor.

Refer to *CONSTANT SLOPE CIRCUIT* for detailed information on the difference of soft-start time and its effect.

## PIN DESCRIPTIONS

TO-252-5-P2

TO-252-5-P2

Pin No.	Symbol	Description
1	CE	Chip Enable Pin ("H" Active)
2	V <sub>DD</sub>	Input Pin
3	GND	Ground Pin
4	V <sub>OUT</sub>	Output Pin
5	V <sub>FB</sub>	Feedback Pin

\*<sup>1</sup> The tab on the bottom of the package enhances thermal performance and is electrically connected to GND (substrate level). It is recommended that the tab be connected to the ground plane on the board, or otherwise be left floating.

The V<sub>OUT</sub> pin should be connected to the V<sub>FB</sub> pin when using RP108J as an internal fixed output voltage type. In case of using RP108J as an external adjustable type, please refer to "Adjustable Output Voltage Type Settings".

**ABSOLUTE MAXIMUM RATINGS**

Symbol	Item		Rating	Unit
$V_{IN}$	Input Voltage		6.0	V
$V_{CE}$	Input Voltage (CE Input Pin)		-0.3 to 6.0	V
$V_{FB}$	Input Voltage ( $V_{FB}$ Pin)		-0.3 to 6.0	V
$V_{OUT}$	Output Voltage		-0.3 to $V_{IN}+0.3$	V
$P_D$	Power Dissipation (TO-252-5-P2) <sup>*1</sup>	High Wattage Land Pattern	3800	mV
		Standard Land Pattern	1900	
Ta	Operating Temperature		-40 to 85	°C
Tstg	Storage Temperature		-55 to 125	°C

\*1 For Power Dissipation, please refer to *PACKAGE INFORMATION*.

**ABSOLUTE MAXIMUM RATINGS**

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings are not assured.

## ELECTRICAL CHARACTERISTICS

$V_{IN} = V_{SET} + 1.0V$ ,  $I_{OUT} = 1mA$ ,  $C_{IN} = C_{OUT} = 10\mu F$ , unless otherwise noted.

The specifications surrounded by   are guaranteed by design engineering at  $-40^{\circ}C \leq Ta \leq 85^{\circ}C$ .

RP108Jxx1B/D/E/F

(Ta=25°C)

Symbol	Item	Conditions		Min.	Typ.	Max.	Unit
$V_{OUT}$	Output Voltage	$Ta = 25^{\circ}C$	$V_{SET} > 1.5V$	x0.99		x1.01	V

1.0 ≤ V <sub>SET</sub> < 1.1		0.810	0.950
1.1 ≤ V <sub>SET</sub> < 1.2		0.755	0.895
1.2 ≤ V <sub>SET</sub> < 1.5		0.720	0.840
1.5 ≤ V <sub>SET</sub> < 2.5		0.630	0.760
2.5 ≤ V <sub>SET</sub> < 3.3		0.510	0.600
3.3 ≤ V <sub>SET</sub> ≤ 4.2		0.480	0.560

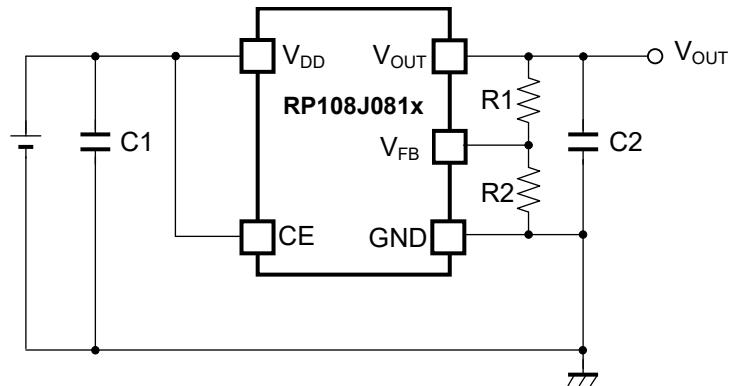

**RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)**

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

## TYPICAL APPLICATIONS

Typical Application

Typical application for adjustable output voltage type

### External Components :

Symbol	Descriptions
C1, C2	10μF (Ceramic), CM21X7R106M06AB, KYOCERA

## TECHNICAL NOTES

When using the RP108J as an internally fixed output voltage type, please connect the  $V_{out}$  pin to the  $V_{FB}$  pin. However, when using it as the Adjustable Output Voltage Type, The output voltage of the externally adjustable output voltage type should be set to 4.2V or less. Also, total resistors value of R1 and R2 should be  $20k\Omega$  or less.

### Phase Compensation

In the IC, phase compensation is made for securing stable operation even if the load current is varied. For this purpose, use a  $10\mu F$  or more capacitor C2.

In case of using a tantalum capacitor and its ESR is large, the output may be unstable. Therefore, select C2 carefully considering its frequency characteristics.

The recommended temperature characteristics for C1 and C2 capacitors are the followings.

- B Characteristics: Temperature range from  $-25^{\circ}C$  to  $85^{\circ}C$ , Capacitance change of  $\pm 10\%$
- X5R Characteristics: Temperature range from  $-55^{\circ}C$  to  $85^{\circ}C$ , Capacitance change of  $\pm 15\%$
- X7R Characteristics: Temperature range from  $-55^{\circ}C$  to  $125^{\circ}C$ , Capacitance change of  $\pm 15\%$

The recommended capacitor's tolerable voltage is twice as large as the voltage of use (C1: Input voltage, C2: Output voltage). The upper limit of the capacitance value for C2 is  $100\mu F$ .

However, the increase of C2 leads to the increase of inrush current. Refer to *CONSTANT SLOPE CIRCUIT* for detailed information.

### PCB Layout

Make  $V_{DD}$  and GND lines sufficient. If their impedance is high, noise pickup or unstable operation may result.

Connect a capacitor C1 with a capacitance value as much as  $10\mu F$  or more between  $V_{DD}$  and GND pin, and as close as possible to the pins.

Set external components, especially the output capacitor C2, as close as possible to the ICs and make wiring as short as possible.

### Transient Response

When using the Adjustable Output Voltage Type, the transient response could be affected by the external resistors. Evaluate the circuit taking the actual conditions of use into account.

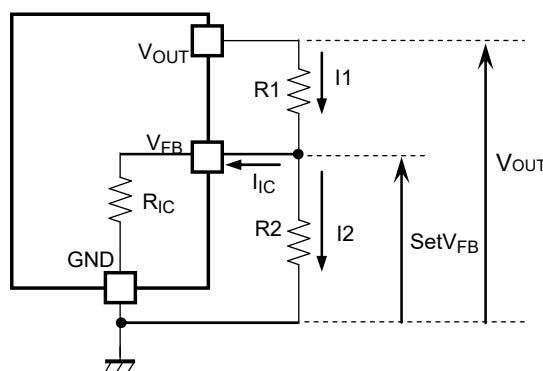

## **ADJUSTABLE OUTPUT VOLTAGE TYPE SETTINGS**

- **Output Voltage Setting Method**

RP108J081x can be adjusted the output voltage by using the external divider resistors.

If the  $V_{FB}$  voltage fixed into the IC is described as  $\text{Set}V_{FB}$ , the output voltage can be set by using the following equations

Set  $V_{FB}$  is equal to 0.8V. The  $V_{OUT}$  pin of RP108J081x should be connected to the  $V_{FB}$  pin.

$$I_1 = I_{IC} + I_2 \dots \quad (1)$$

$$I_2 = \text{SetV}_{FB} / R_2 \quad \dots \quad (2)$$

Thus,

$$I_1 = I_{IC} + \text{Set}V_{FB}/R_2 \dots \quad (3)$$

Therefore,

$$V_{\text{OUT}} = \text{Set} V_{\text{FB}} \times R_1 \times I_1 \quad \dots \quad (4)$$

Put Equation (3) into Equation (4), then

$$V_{\text{OUT}} = \text{SetV}_{\text{FB}} + R_1(I_{\text{IC}} + \frac{\text{SetV}_{\text{FB}}}{R_2})$$

In Equation (5),  $R_{1x} I_{IC}$  is the error-causing factor in  $V_{OUT}$ .

As for Inc.

$$|I_{IC}| = \text{SetV}_{FB} / R_{IC} \quad (6)$$

Therefore, the error-causing factor  $R1x|_{IC}$  can be described as follows.

$$R_{1 \times I_{IC}} = R1 \times \frac{SetV_{FB}}{R_{IC}} = R1 \times SetV_{FB} / R_{IC} \quad (7)$$

For better accuracy, choosing  $R_1$  ( $\ll R_{IC}$ ) reduces this error.

Without the error-causing factor  $R_{1x} \text{ inc}$ , the output voltage can be calculated by the following equation

$$V_{\text{OUT}} = \text{Set} V_{\text{FB}} \times ((R_1 + R_2) / R_2) \quad (8)$$

$R_{IC}$  of RP108J is approximately  $1.6\text{M}\Omega$  ( $T_a=25^\circ\text{C}$ , this value is guaranteed by design.).

The value could be affected by the temperature, therefore evaluate the circuit taking the actual conditions of use into account.

## REVERSE CURRENT PROTECTION CIRCUIT

The RP108J includes a Reverse Current Protection Circuit, which stops the reverse current from  $V_{OUT}$  pin to  $V_{DD}$  pin or to GND pin when  $V_{OUT}$  becomes higher than  $V_{IN}$ .

Usually, the LDO using Pch output transistor contains a parasitic diode between  $V_{DD}$  pin and  $V_{OUT}$  pin. Therefore, if  $V_{OUT}$  is higher than  $V_{IN}$ , the parasitic diode becomes forward direction. As a result, the current flows from  $V_{OUT}$  pin to  $V_{DD}$  pin.

The RP108J switches the mode to the reverse current protection mode before  $V_{IN}$  becomes lower than  $V_{OUT}$  by connecting the parasitic diode of Pch output transistor to the backward direction, and connecting the gate to  $V_{OUT}$  pin. As a result, the Pch output transistor is turned off and the all the current pathways from  $V_{OUT}$  pin to GND pin are shut down to maintain the reverse current lower than  $10\mu A$ .

Switching to either the normal mode or to the reverse current protection mode is determined by the magnitude of  $V_{IN}$  voltage and  $V_{OUT}$  voltage. For the stable operation, offset and hysteresis are set as the threshold. Offset is set to  $30mV$  (Typ.25°C) and hysteresis is set to  $5mV$  (Typ.25°C).

Therefore, the minimum dropout voltage under the small load current condition is restricted by the value of  $35mV$  (Typ.25°C).

Fig.1 and Fig.2 show the diagrams of each mode, and Fig.3 shows the load characteristics of each mode. When giving the  $V_{OUT}$  pin a constant-voltage and decreasing the  $V_{IN}$  voltage, the dropout voltage will become lower than  $30mV$  (Typ.25°C). As a result, the reverse current protection starts to function to stop the load current. By increasing the dropout voltage higher than  $35mV$  (Typ.25°C), the protection mode will be released to let the load current to flow. If the dropout voltage to be used is lower than  $30mV$  (Typ.25°C), the detection and the release may be repeated.

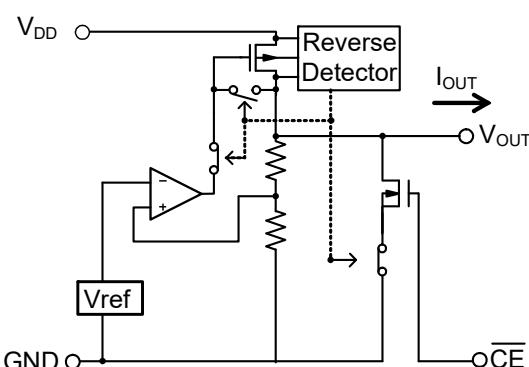

Fig.1 Normal Mode

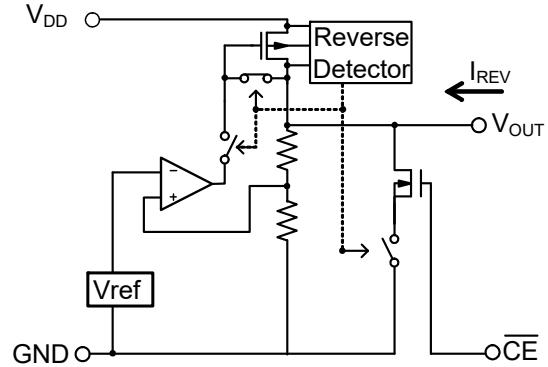

Fig.2 Reverse Current Protection Mode

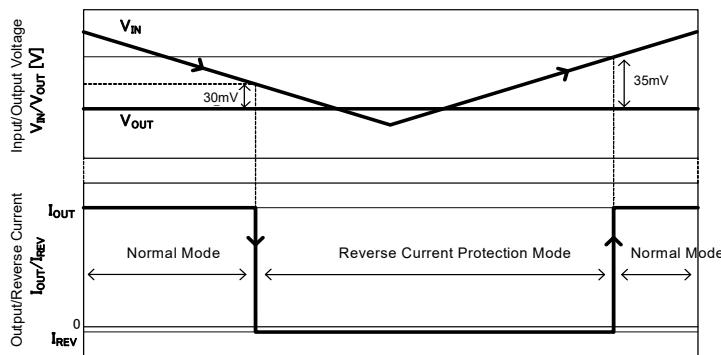

Fig. 3 Reverse Current Protection Mode Detection/ Release & Reverse Current/ Output Current Characteristics

## CONSTANT SLOPE CIRCUIT (RP108Jxx1B/xx1D)

RP108Jxx1B/xx1D has a Constant Slope Circuit (soft-start circuit) which allows the output voltage to start-up gradually. The capacitor to create the start-up slope is built-in the IC so that it does not require any external components. The upper limit of inrush current during the start-up is controlled by the short current ISC and the output current limit ILIM.

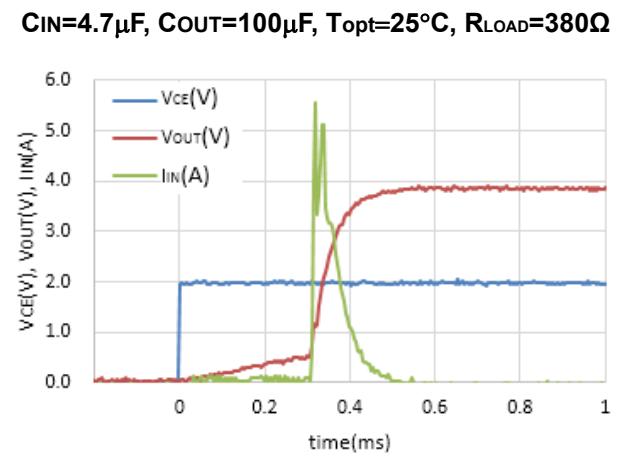

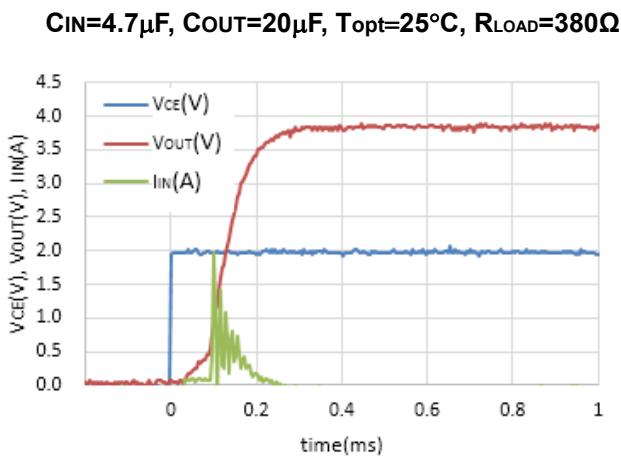

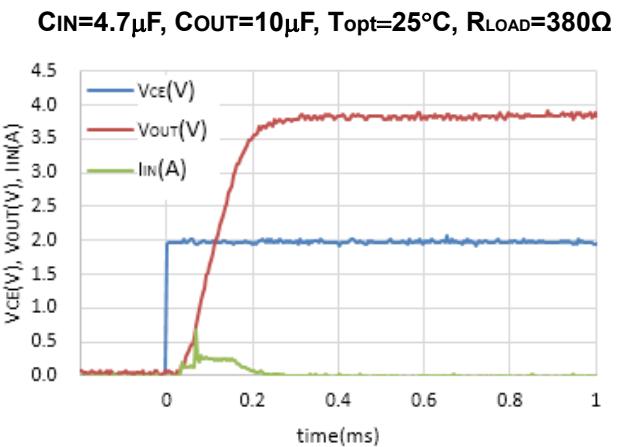

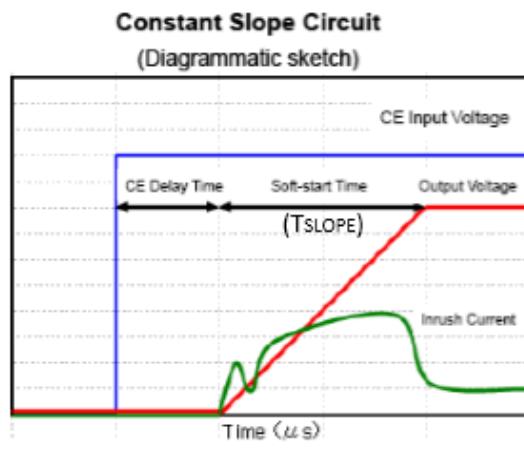

In the following characteristics  $C_{OUT} = 10 \mu F$  ( $R_{LOAD} = 380\Omega$ ), the inrush current  $I_{RUSH}$  is not controlled by the short current ISC and the output current limit ILIM. Therefore the output voltage rises with the soft-start time ( $T_{SLOPE}$ ) set inside IC, and it enables to control the overshoot of the output voltage and the inrush current.  $T_{SLOPE}$  is typ. 180  $\mu s$ .

In the characteristics  $C_{OUT} = 20 \mu F$ ,  $I_{RUSH}$  at the low output voltage is controlled by the short current ISC. After the current is released from ISC, the output voltage rises with the soft-start time ( $T_{SLOPE}$ ).

In the characteristics  $C_{OUT} = 100 \mu F$ ,  $I_{RUSH}$  at the low output voltage is controlled by the short current ISC. After the current is released from ISC, it is controlled by the output current limit. The output voltage rises with the soft-start time ( $T_{SLOPE}$ ) or longer.

The relation of the inrush current and the constant slope depends on the output voltage since the inrush current is a sum of the charge current of  $C_{OUT}$  and the load current. Use RP108Jxx1E/xx1F to avoid an influence on peripheral components due to the inrush current generated in the use environment conditions ( $C_{OUT}$  and output voltage).

### RP108J381B/D Inrush current characteristics

## CONSTANT SLOPE CIRCUIT (RP108Jxx1E/xx1F)

RP108Jxx1E/xx1F has a constant slope circuit (soft-start circuit) which allows the output voltage to start-up gradually. The capacitor to create the start-up slope is built-in the IC so that it does not require any external components. The upper limit of inrush current during the start-up is controlled by the output current limit ILIM.

As shown in the following Foldback Characteristics, the inrush current is not controlled by the short current ISC during the soft-start time at the start-up. Therefore the output voltage rises with the soft-start time ( $T_{SLOPE}$ ) set inside IC, and it enables to control the overshoot of the output voltage and the inrush current.  $T_{SLOPE}$  is typ. 570  $\mu$ s (max. 900  $\mu$ s/85°C). Use RP108Jxx1B/xx1D to avoid an influence on peripheral components due to the output start-up time is slow in the system.

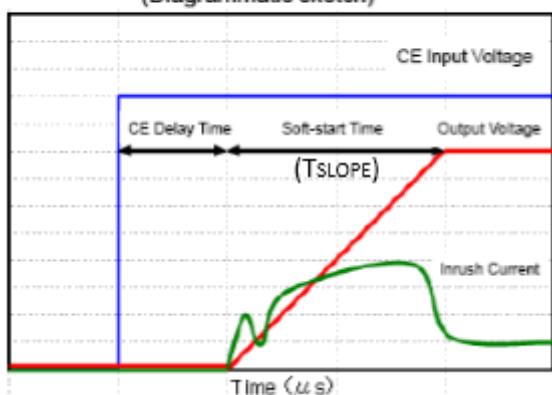

In the characteristics  $C_{OUT} = 20 \mu F$ , the inrush current is lower or equal to the output current limit ILIM. The output voltage rises with the soft-start time ( $T_{SLOPE}$ ).

Similarly in the characteristics  $C_{OUT} = 100 \mu F$ , the inrush current is lower or equal to the output current limit ILIM. The output voltage rises with the soft-start time ( $T_{SLOPE}$ ).

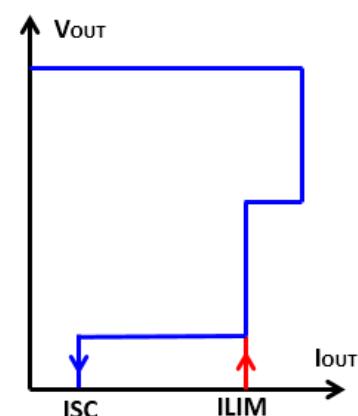

The relation of the inrush current and the constant slope depends on the output voltage since the inrush current is a sum of the charge current of  $C_{OUT}$  and the load current.

$C_{IN}=4.7\mu F$ ,  $C_{OUT}=100\mu F$ ,  $T_{opt}=25^{\circ}C$ ,  $R_{LOAD}=380\Omega$

## PACKAGE INFORMATION

### Power Dissipation (TO-252-5-P2)

Power Dissipation ( $P_D$ ) depends on conditions of mounting on board. This specification is based on the Measurement Conditions below.

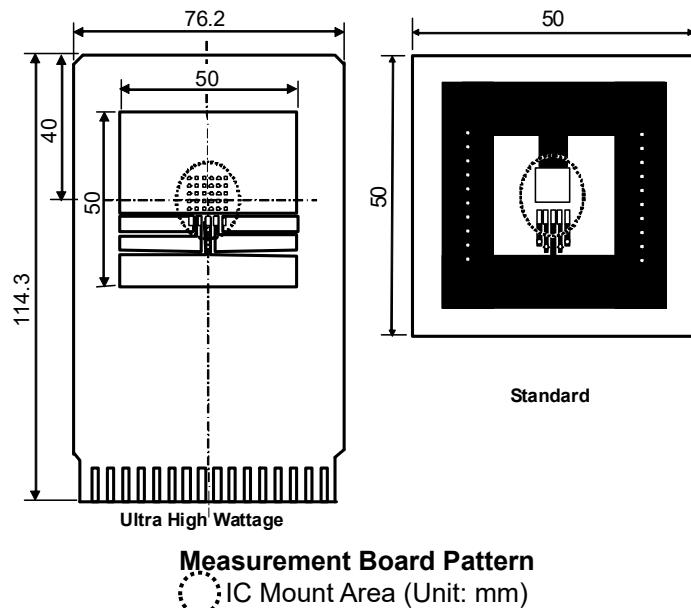

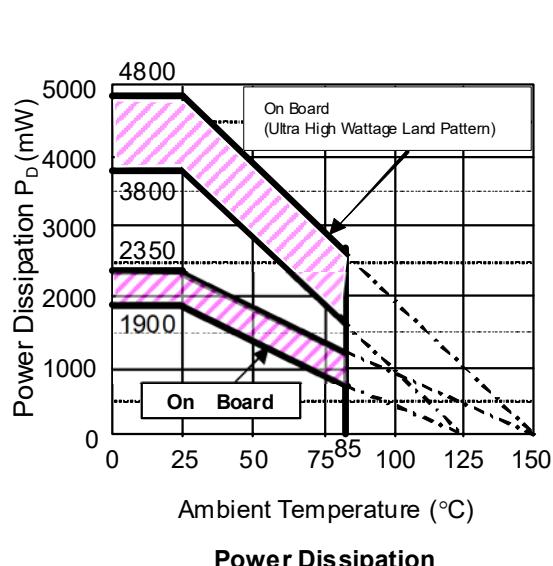

#### Measurement conditions

	Ultra High Wattage Land Pattern	Standard Land Pattern
Environment	Mounting on board (Wind velocity 0m/s)	
Board Material	Glass cloth epoxy plastic (Four-layers)	Glass cloth epoxy plastic (Double layers)
Board Dimensions	76.2mm x 114.3mm x 0.8mm	50mm x 50mm x 1.6mm
Copper Ratio	Top, Back side: 50mm Square, Approx.96%, 2 <sup>nd</sup> , 3 <sup>rd</sup> Layer: 50mm Square, Approx.100%	Top side: Approx. 50%, Back side: Approx. 50%
Through - Hole	φ 0.4mm x 30pcs	φ 0.5mm x 24pcs

#### Measurement Results

( $T_a=25^{\circ}\text{C}$ ,  $T_{jmax}=125^{\circ}\text{C}$ )

	Ultra High Wattage Land Pattern	Standard Land Pattern
Power Dissipation	3800mW	1900mW
Thermal Resistance	$\theta_{ja} = (125-25^{\circ}\text{C})/3.8\text{W} = 26^{\circ}\text{C/W}$	$\theta_{ja} = (125-25^{\circ}\text{C})/1.9\text{W} = 53^{\circ}\text{C/W}$
	$\theta_{jc} = 7^{\circ}\text{C/W}$	$\theta_{jc} = 17^{\circ}\text{C/W}$

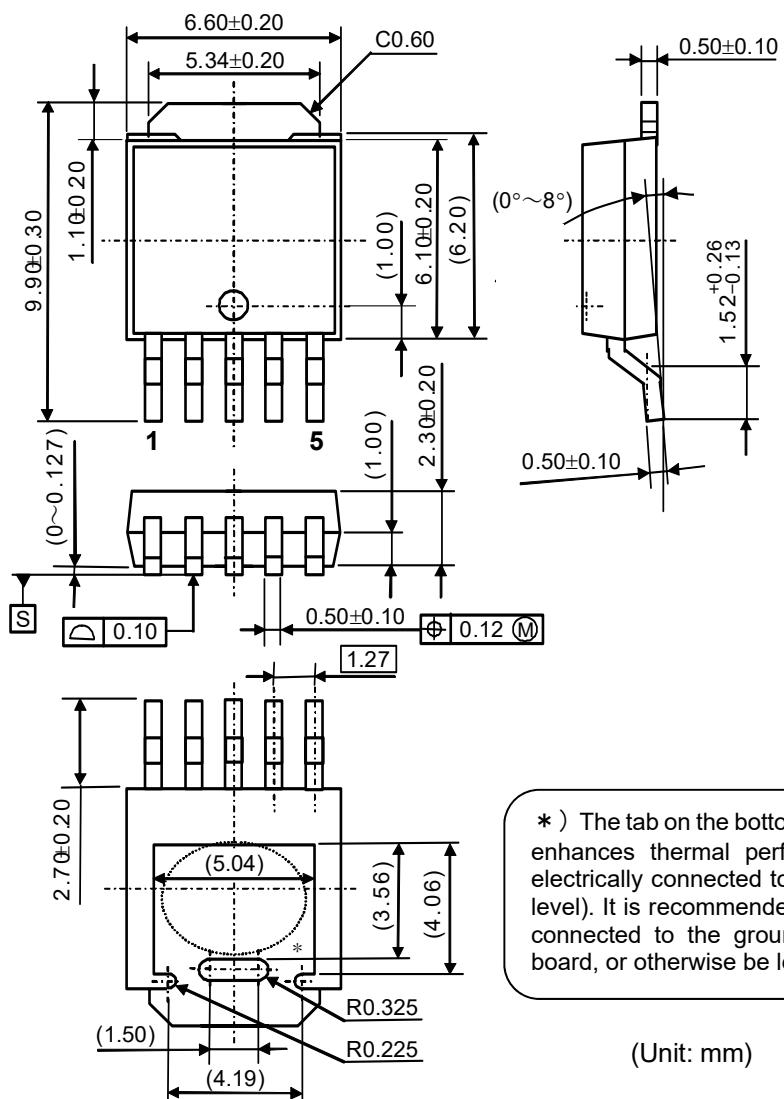

The above graph shows the Power Dissipation of the package based on  $T_{jmax}=125^{\circ}\text{C}$  and  $T_{jmax}=150^{\circ}\text{C}$ . Operating the IC in the shaded area in the graph might have an influence its lifetime.

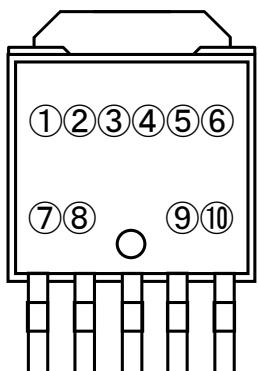

Operating time must be within the time limit described in the table below, in case of operating in the shaded area.

Operating Time	Estimated years (Operating 4 hours/day)
13,000 hours	9 years

## TEST CIRCUITS

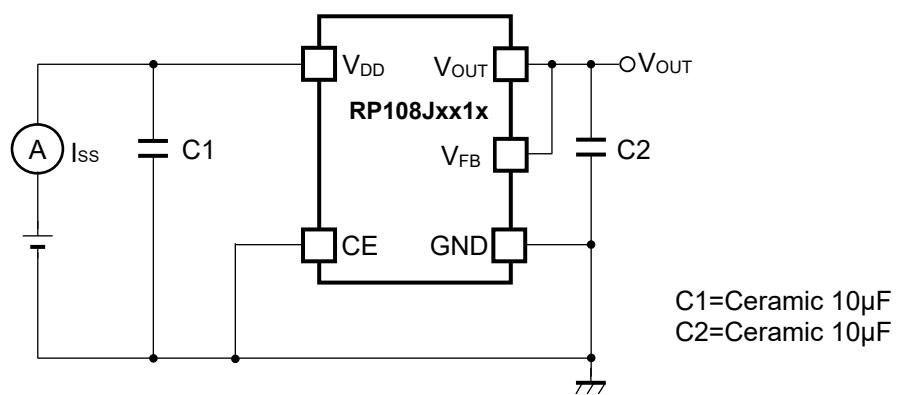

### Fixed Output Voltage Type (RP108Jxx1x)

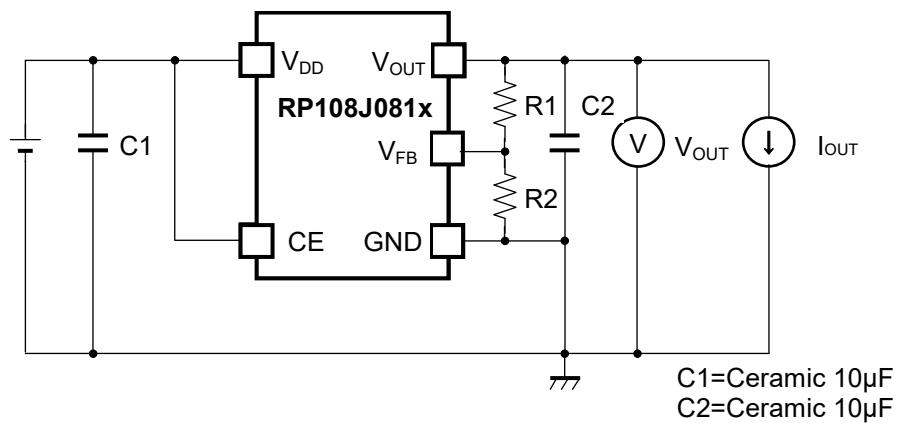

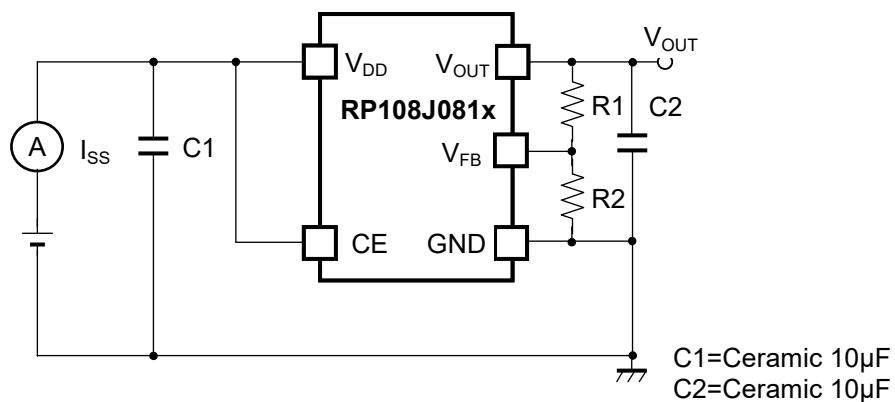

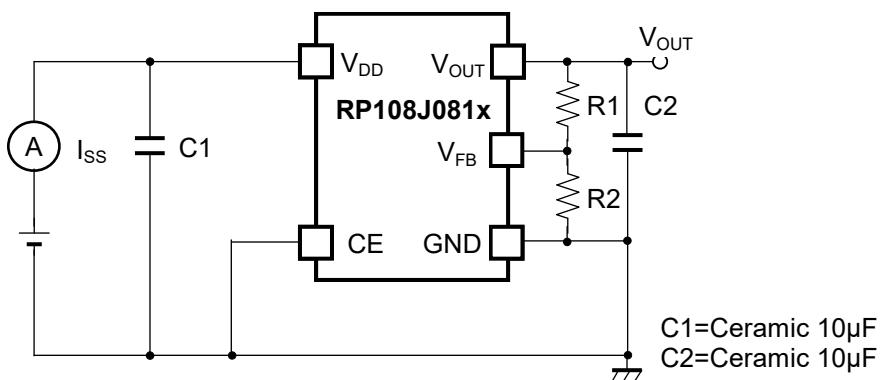

**Basic Test Circuit**

**Test Circuit for Supply Current**

**Test Circuit for Standby Current**

**Adjustable Output Voltage Setting Type (RP108J081x)****Basic Test Circuit****Test Circuit for Supply Current****Test Circuit for Standby Current**

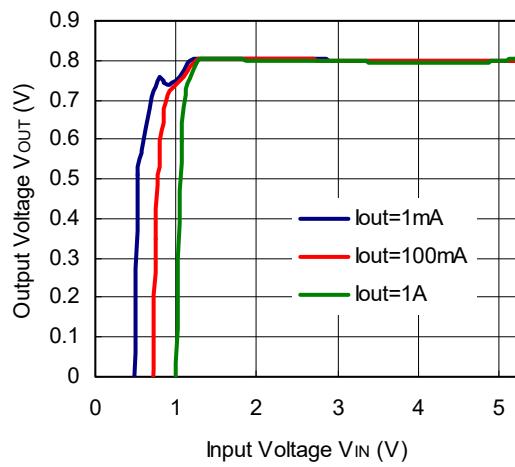

**Note :** Refer to *Adjustable Output Voltage Type Settings* for R1 and R2.

## TYPICAL CHARACTERISTICS

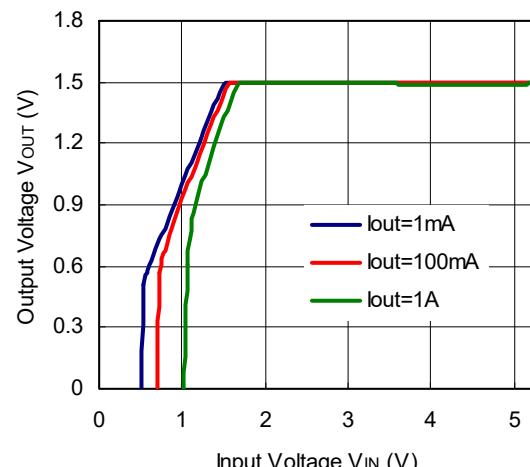

Note: Typical Characteristics are intended to be used as reference data; they are not guaranteed.

### 1) Output Voltage vs. Input Voltage ( $C_1=C_2=\text{Ceramic}10\mu\text{F}$ , $T_a=25^\circ\text{C}$ )

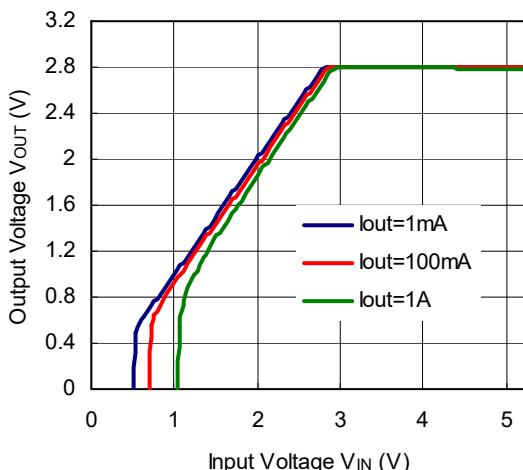

RP108J081x

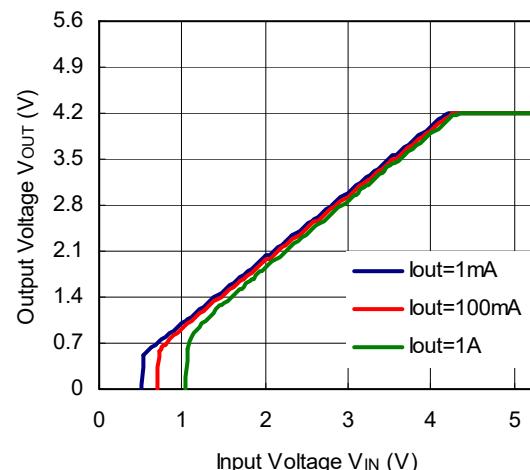

RP108J151x

RP108J281x

RP108J081x      RP108J151x

RP108J281x

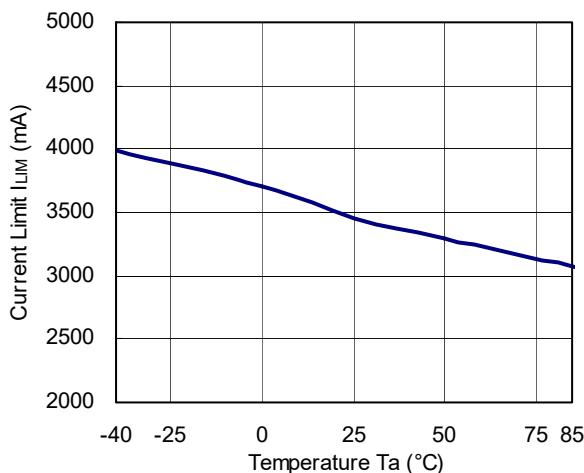

RP108J421x

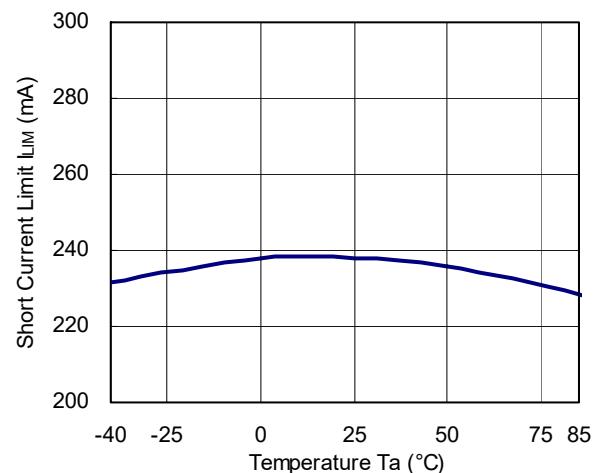

#### 4) Short Current Limit vs. Temperature/ Current Limit vs. Temperature

RP108J includes a Fold-back Protection Circuit. Under conditions during a Fold-back Protection Circuit works, Thermal Shutdown Circuit starts to operate in order to prevent the self-heat generation. Therefore, RP108J isn't able to test "Output voltage vs. Output Current".

**14) Inrush Current**

## ESR vs. Output Current

When using the IC, consider the following points: The relations between  $I_{OUT}$  (Output Current) and ESR of an output capacitor are shown below. The conditions when the white noise level is under  $40\mu V$  (Avg.) are marked as the hatched area in the graph.

### Measurement Conditions

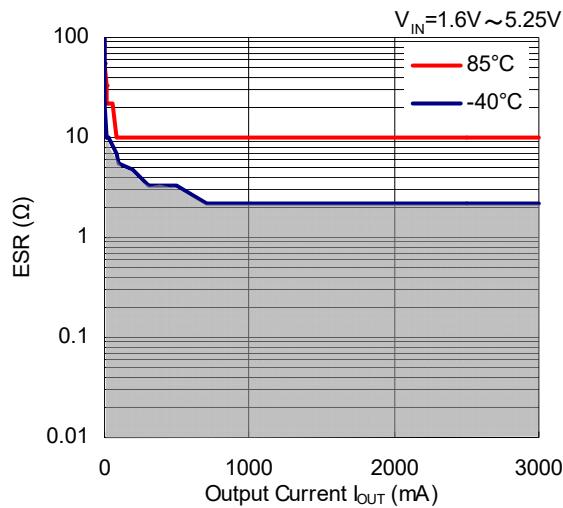

Frequency Band : 10Hz to 2MHz

Temperature :  $-40^{\circ}C$  to  $85^{\circ}C$

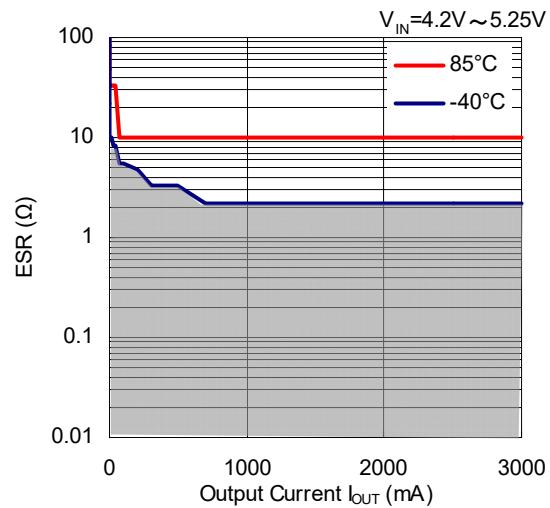

Hatched area : Noise level is under  $40\mu V$

$C_1, C_2$  :  $10.0\mu F$  or more

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to our sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of our company.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under our company's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact our sales or our distributor before attempting to use AOI.
11. Please contact our sales representatives should you have any questions or comments concerning the products or the technical information.
