|---------------|----------------|----------------|---------------|
| 24 | 2400 | 2500 | 1450 |
| 30 | 3000 | 3100 | 1750 |

2.0 Extension of Voltage Grades

This report is applicable to other voltage grades when supply has been agreed by Sales/Production.

3.0 De-rating Factor

A blocking voltage de-rating factor of 0.13%/°C is applicable to this device for T_j below 25°C.

4.0 Snubber Components

When selecting snubber components, care must be taken not to use excessively large values of snubber capacitor or excessively small values of snubber resistor. Such excessive component values may lead to device damage due to the large resultant values of snubber discharge current. If required, please consult the factory for assistance.

5.0 Computer Modelling Parameters

5.1 Device Dissipation Calculations

$$I_{AV} = \frac{-V_{T0} + \sqrt{V_{T0}^2 + 4 \cdot ff^2 \cdot r_T \cdot W_{AV}}}{2 \cdot ff^2 \cdot r_T}$$

$$\text{and: } W_{AV} = \frac{\Delta T}{R_{th}}$$

$$\Delta T = T_{j\max} - T_K$$

Where $V_{T0}=0.97V$, $r_T=0.064m\Omega$,

R_{th} = Supplementary thermal impedance, see table below and

ff = Form factor, see table below.

5.2 Calculating V_F using ABCD Coefficients

The forward characteristic I_F vs. V_F , on page 8 is represented in two ways;

- (i) the well established V_{T0} and r_T tangent used for rating purposes and
- (ii) a set of constants A, B, C, D, forming the coefficients of the representative equation for V_F in terms of I_F given below:

$$V_F = A + B \cdot \ln(I_F) + C \cdot I_F + D \cdot \sqrt{I_F}$$

The constants, derived by curve fitting software, are given below for both hot and cold characteristics. The resulting values for V_F agree with the true device characteristic over a current range, which is limited to that plotted.

| 160°C Coefficients | |
|--------------------|-----------------------------|
| A | 0.4889186 |
| B | 0.08510914 |
| C | $0.07490114 \times 10^{-3}$ |
| D | -4.150444×10^{-3} |

5.3 D.C. Thermal Impedance Calculation

$$r_t = \sum_{p=1}^{p=n} r_p \cdot \left(1 - e^{-\frac{t}{\tau_p}} \right)$$

Where $p = 1$ to n , n is the number of terms in the series and:

t = Duration of heating pulse in seconds.

r_t = Thermal resistance at time t .

r_p = Amplitude of p th term.

τ_p = Time Constant of r th term.

The coefficients for this device are shown in the tables below:

| D.C. Double Side Cooled | | | | |
|-------------------------|----------|-------------------------|-------------------------|-------------------------|
