

## General Description

EZ-PD™ CCG3PA2 is Cypress' highly integrated USB Type-C port controller that complies with the latest USB Type-C and PD standards and is targeted for cable and power adapters applications. In such applications, CCG3PA2 provides additional functionalities and BOM integration advantages. CCG3PA2 uses Cypress' proprietary M0S8 technology with a 32-bit Arm® Cortex®-M0 processor, 2×64-KB flash, a complete Type-C USB-PD transceiver, all termination resistors required for a Type-C port, an integrated feedback control circuitry for voltage (VBUS) regulation, and system-level ESD protection in 32-pin QFN and 30-ball CSP packages.

## Features

### Type-C Support and USB-PD Support

- Supports USB PD3.0 Version 1.1 Spec including Programmable Power Supply Mode
- Configurable resistors  $R_P$ ,  $R_D$ , and  $R_A$
- Supports one USB Type-C port and one Type-A port
- Firmware control to electrically disconnect  $R_A$  when not required in order to save source power

### 2× Legacy/Proprietary Charging Blocks

- Supports QC 4.0, Apple charging 2.4A, AFC, BC 1.2
- Integrates all required terminations on DP/DM lines

### Integrated Voltage (VBUS) Regulation and Current Sense Amplifier

- Analog regulation of secondary side feedback node (direct feedback or opto coupler)
- Integrated shunt regulator function for VBUS control
- Constant current or constant voltage mode
- Supports low-side current sensing for constant current control

### System-Level Fault Protection

- On-chip OVP, OCP, UVP, and SCP
- Supports OTP through integrated ADC circuit
- Short to VBUS protection for CC, SBU, and VCONN pins up to 24.5VDC

### 32-bit MCU Subsystem

- Arm Cortex-M0 CPU
- 2×64-KB Flash
- 8-KB SRAM

### Clocks and Oscillators

- Integrated oscillator eliminating the need for external clock

### Power

- 3.0 V to 24.5 V operation (using on-chip 30VAC tolerant LDO)
- Deep Sleep: 15  $\mu$ A, Sleep: 3 mA
- Integrated 24.5VDC, 30VAC tolerant regulator and VBUS control signals

### System-Level ESD Protection

- On CC, VCONN, VBUS\_C\_MON\_DISCHARGE, SBU, and DP0/DM0 pins
- $\pm$ 8-kV Contact Discharge and  $\pm$ 15-kV Air Gap Discharge based on IEC61000-4-2 level 4C

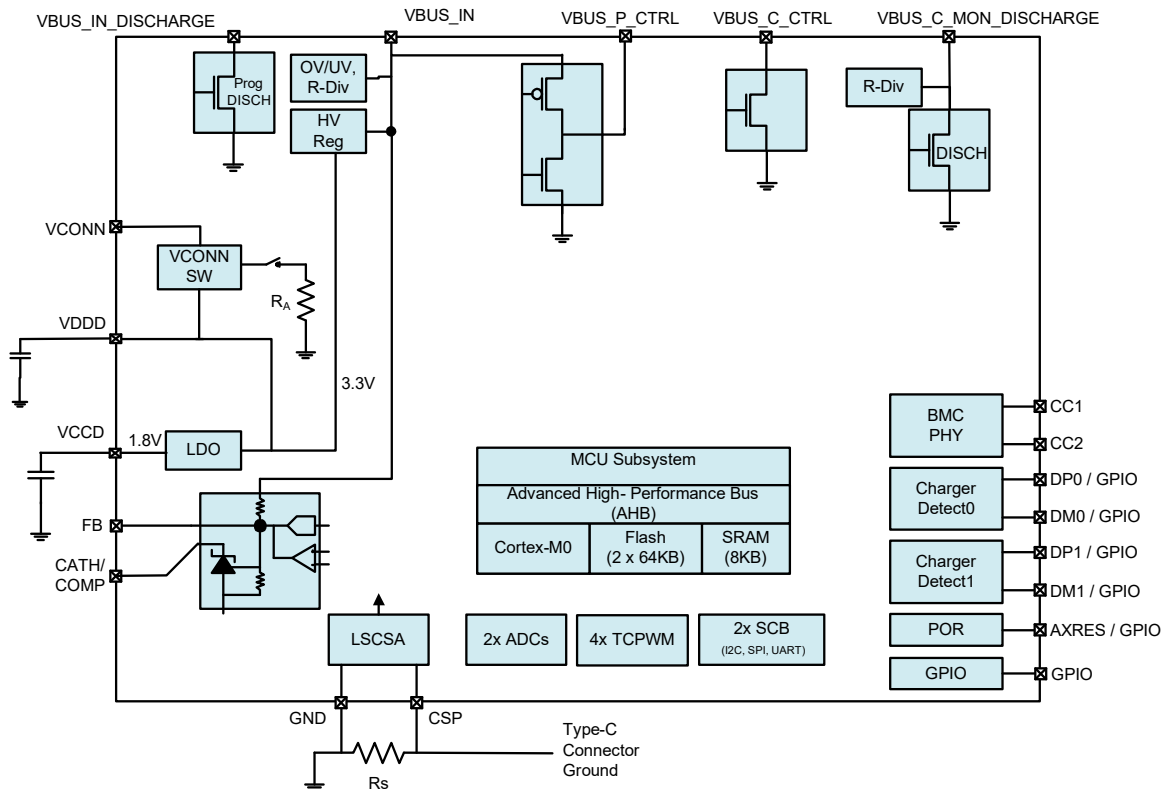

### Packages

- 32-pin QFN
- 30-Ball WLCSP
- Supports extended industrial temperature range (−40 °C to +105 °C)

## Functional Overview

### MCU Subsystem

#### CPU

The Cortex-M0 CPU in EZ-PD CCG3PA2 is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating.

The CPU also includes a serial wire debug (SWD) interface, which is a 2-wire form of JTAG. The debug configuration used for EZ-PD CCG3PA2 has four break-point (address) comparators and two watchpoint (data) comparators.

#### Flash

The EZ-PD CCG3PA2 device has a flash module with two banks of 64-KB flash, a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block.

#### SROM

A supervisory ROM that contains boot and configuration routines is provided.

### USB-PD Subsystem (SS)

The USB-PD subsystem provides the interface to the Type-C USB port. This subsystem comprises a current sense amplifier, a high-voltage regulator, OVP, OCP, and supply switch blocks. This subsystem also includes all ESD required and supported on the Type-C port.

#### USB-PD Physical Layer

The USB-PD Physical Layer consists of a transmitter and receiver that communicate BMC-encoded data over the CC channel based on the PD 3.0 standard. All communication is half-duplex. The Physical Layer or PHY practices collision avoidance to minimize communication errors on the channel.

The USB-PD block includes all termination resistors ( $R_P$  and  $R_D$ ) and their switches as required by the USB-PD spec.  $R_P$  and  $R_D$  resistors are required to implement connection detection, plug orientation detection, and for establishing USB DFP/UFP roles. The  $R_P$  resistor is implemented as a current source.

#### ADC

The ADC is a low-footprint 8-bit SAR ADC that is available for general-purpose A-D conversion applications in the chip. This ADC can be accessed from all GPIOs and the DP/DM pins through an on-chip analog mux. CCG3PA2 contains two instances of the ADC. The voltage reference for the ADCs is generated either from the VDDD supply or from internal bandgap. When sensing the GPIO pin voltage with an ADC, the pin voltage cannot exceed the VDDIO supply value.

#### Charger Detection

The two charger detection blocks connected to the two pairs of DP/DM pins allow CCG3PA2 to detect conventional battery chargers conforming to BC 1.2, and the following proprietary charger specifications: Apple, Qualcomm's QuickCharge 4.0, and Samsung AFC.

#### VBUS Overcurrent and Overvoltage Protection

The CCG3PA2 chip has an integrated hardware block for VBUS overvoltage protection (OVP)/overcurrent protection (OCP) with configurable thresholds and response times on the Type C port.

#### VBUS Short Protection

CCG3PA2 provides four VBUS short protection pins: CC1, CC2, P2.2, and P2.3. These pins are protected from accidental shorts to high-voltage VBUS. Accidental shorts may occur because the CC1 and CC2 pins are placed next to the VBUS pins in the USB Type-C connector. A Power Delivery controller without the high-voltage VBUS short protection will be damaged in the event of accidental shorts. When the protection circuit is triggered, CCG3PA2 can handle up to 17 V forever and between 17 V to 22 VDC for 1000 hours on the OVT pins. When a VBUS short event occurs on the CC pins, a temporary high-ringing voltage is observed due to the RLC elements in the USB Type-C cable. Without CCG3PA2 connected, this ringing voltage can be twice (44 V) the maximum VBUS voltage (21.5 V). However, when CCG3PA2 is connected, it is capable of clamping temporary high-ringing voltage and protecting the CC pin using IEC ESD protection diodes.

#### Low-side Current Sense Amplifier (CSA)

The CCG3PA2 chip also has an integrated low-side current sense amplifier that is capable of detecting current in the order of 100 mA across a 5-m $\Omega$  external resistor. It also supports constant current mode of operation in power adapter application as a provider.

#### PFET Gate Drivers on VBUS Path

CCG3PA2 has two integrated PFET gate drivers to drive external PFETs on the VBUS provider and consumer path. The VBUS\_P\_CTRL gate driver has an active pull-up, and thus can drive high, low or High-Z.

The VBUS\_C\_CTRL gate driver can drive only low or high-Z, thus requiring an external pull-up. These pins are VBUS voltage-tolerant.

#### VBUS Discharge FETs

CCG3PA2 also has two integrated VBUS discharge FETs used to discharge VBUS to meet the USB-PD specification timing on a detach condition. VBUS Discharge FET on the provider side can be used to accelerate the ramp down of VBUS to the default 5 V on the secondary side.

#### Voltage (VBUS) Regulation

CCG3PA2 contains an integrated feedback control circuitry (for AC/DC applications) for secondary side control with analog regulation of the feedback/cathode pins to achieve the appropriate voltage on VBUS pin as per the negotiated contract with the peer device over Type-C.

## Integrated Digital Blocks

### Serial Communication Blocks (SCB)

EZ-PD CCG3PA2 has two SCBs, which can be configured to implement an I<sup>2</sup>C, SPI, or UART interface. The hardware I<sup>2</sup>C blocks implement full multi-master and slave interfaces capable of multimaster arbitration. In the SPI mode, the SCB blocks can be configured to act as master or slave.

In the I<sup>2</sup>C mode, the SCB blocks are capable of operating at speeds of up to 1 Mbps (Fast Mode Plus) and have flexible buffering options to reduce interrupt overhead and latency for the CPU. These blocks also support I<sup>2</sup>C that creates a mailbox address range in the memory of EZ-PD CCG3PA2 and effectively reduce I<sup>2</sup>C communication to reading from and writing to an array in memory. In addition, the blocks support 8-deep FIFOs for receive and transmit which, by increasing the time given for the CPU to read data, greatly reduce the need for clock stretching caused by the CPU not having read data on time.

The I<sup>2</sup>C peripherals are compatible with the I<sup>2</sup>C Standard-mode, Fast-mode, and Fast-mode Plus devices as defined in the NXP I<sup>2</sup>C-bus specification and user manual (UM10204). The I<sup>2</sup>C bus I/Os are implemented with GPIO in open-drain modes.

The I<sup>2</sup>C port on the SCB blocks of EZ-PD CCG3PA2 are not completely compliant with the I<sup>2</sup>C spec in the following aspects:

- The GPIO cells for SCB 1's I<sup>2</sup>C port are not overvoltage-tolerant and, therefore, cannot be hot-swapped or powered up independently of the rest of the I<sup>2</sup>C system.
- Fast-mode Plus has an I<sub>OL</sub> specification of 20 mA at a V<sub>OL</sub> of 0.4 V. The GPIO cells can sink a maximum of 8-mA I<sub>OL</sub> with a V<sub>OL</sub> maximum of 0.6 V.
- Fast-mode and Fast-mode Plus specify minimum Fall times, which are not met with the GPIO cell; Slow strong mode can help meet this spec depending on the bus load.

### Timer/Counter/PWM Block (TCPWM)

EZ-PD CCG3PA2 has four TCPWM blocks. Each implements a 16-bit timer, counter, pulse-width modulator (PWM), and quadrature decoder functionality. The block can be used to measure the period and pulse width of an input signal (timer), find the number of times a particular event occurs (counter), generate PWM signals, or decode quadrature signals.

## I/O Subsystem

EZ-PD CCG3PA2 has up to 17 GPIOs of which, some of them can be re-purposed to support functions of SCB (I<sup>2</sup>C, UART, SPI). GPIO pins P0.0 and P0.1 are overvoltage-tolerant (OVT) (up to 7V).

The GPIO block implements the following:

- Seven drive strength modes:
  - Input only
  - Weak pull-up with strong pull-down
  - Strong pull-up with weak pull-down
  - Open drain with strong pull-down
  - Open drain with strong pull-up
  - Strong pull-up with strong pull-down
  - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTTL)
- Individual control of input and output buffer enabling/disabling in addition to the drive strength modes
- Hold mode for latching previous state (used for retaining I/O state in Deep Sleep mode)
- Selectable slew rates for dV/dt related noise control to improve EMI

During power-on and reset, the I/O pins are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix is used to multiplex between various signals that may connect to an I/O pin.

Port pins P1.0 and P1.1 can be configured to indicate Fault for OCP/SCP/OVP/UVLP conditions. Any two fault conditions can be mapped to two GPIOs or all the four faults can be OR'ed to indicate over one GPIO.

**Power Systems Overview**

CCG3PA2 can operate from three possible external supply sources: VBUS\_IN (2.7 V–24.5 V), VDDD (2.7 V–5.5 V) or VCONN (3.0 V–5.5 V). When powered through VBUS\_IN, the internal regulator generates VDDD of 3.3 V for chip operation. The regulated supply, VDDD, is either used directly inside some analog blocks or further regulated down to VCCD (1.8 V), which powers majority of the core using the regulators. VCONN is chosen as a power source for EMCA cable applications only, as it offers the necessary termination resistance (Ra). Figure 1 and

Figure 2 show the power sources supported by specific revisions of the silicon.

CCG3PA2 has three different power modes: Active, Sleep, and Deep Sleep. Transitions between these power modes are managed by the power system. When powered through the VBUS\_IN pin, VDDD cannot be used to power external devices and should be connected to a 1-μF capacitor for the regulator stability only. These pins are not supported as power supplies. Refer to the application diagrams for capacitor connections.

**Table 1. CCG3PA2 Power Modes**

Mode	Description
Power-On Reset (POR)	Power is valid and an internal reset source is asserted or Sleep Controller is sequencing the system out of reset.
ACTIVE	Power is valid and CPU is executing instructions.
SLEEP	Power is valid and CPU is not executing instructions. All logic that is not operating is clock gated to save power.
DEEP SLEEP	Main regulator and most blocks are shut off. Deep-Sleep regulator powers logic, but only low-frequency clock is available.

Note: CCG3PA2 devices cannot be used in single -chip based passive cable applications. Pin E5 (P1.0) to be connected to GND for passive cable applications with two chips per cable.

Figure 8 shows the application diagram of CCG3PA2-based power adapter with Direct Feedback control. The default value of VBUS upon power-up (which is usually at 5 V) is set up by choosing the appropriate resistor divider that will set the FB node at a voltage expected by the secondary controller.

The feedback node is regulated using internal IDACs. Whenever a change in VBUS voltage is needed, CCG3PA2 will either source or sink a proportional current at feedback node, based on the amount of voltage change needed.

**Ordering Code Definitions**

- T = Tape and Reel
- ES (Optional Field): Pre-production Engineering Samples only. Not orderable.
- Temperature Grade: I = Industrial (–40 °C to 85 °C);
- Q = Extended Industrial (–40 °C - 105 °C)
- Lead: X = Pb-free
- Package Type: FN = CSP, LQ = QFN; SX = SOIC
- Number of pins in the package
- Si Rev (Optional Field) = B1 or B2
- Application and Feature Combination Designation
- Number of Type-C Ports: 1 = 1 Port, 2 = 2 Port
- Product Type: C1 = Custom design IC #1 per customer specific requirements
- Marketing Code: PD = Power Delivery product family
- Company ID: CY = Cypress

NOTES

- ALL DIMENSIONS ARE IN MILLIMETERS.
  - DIMENSIONS AND TOLERANCES METHODS PER ASME Y14.5-2009. THIS OUTLINE CONFORMS TO JEP95, SECTION 4.5.
  - BALL POSITION DESIGNATION PER JEP95, SECTION 3, SPP-010.
  - "e" REPRESENTS THE SOLDER BALL GRID PITCH.
  - SYMBOL "MD" IS THE BALL MATRIX SIZE IN THE "D" DIRECTION. SYMBOL "ME" IS THE BALL MATRIX SIZE IN THE "E" DIRECTION. n IS THE NUMBER OF POPULATED SOLDER BALL POSITIONS FOR MATRIX SIZE MD X ME.
- ⚠ DIMENSION "b" IS MEASURED AT THE MAXIMUM BALL DIAMETER IN A PLANE PARALLEL TO DATUM C.
- ⚠ "SD" AND "SE" ARE MEASURED WITH RESPECT TO DATUMS A AND B AND DEFINE THE POSITION OF THE CENTER SOLDER BALL IN THE OUTER ROW. WHEN THERE IS AN ODD NUMBER OF SOLDER BALLS IN THE OUTER ROW "SD" OR "SE" = 0. WHEN THERE IS AN EVEN NUMBER OF SOLDER BALLS IN THE OUTER ROW, "SD" = eD/2 AND "SE" = eE/2.
- ⚠ A1 CORNER TO BE IDENTIFIED BY CHAMFER, LASER OR INK MARK, METALLIZED MARK INDENTATION OR OTHER MEANS.
9. "\*" INDICATES THE THEORETICAL CENTER OF DEPOPULATED BALLS.
10. JEDEC SPECIFICATION NO. REF: N/A.

## Acronyms

**Table 47. Acronyms Used in this Document**

Acronym	Description
ADC	analog-to-digital converter
ARM®	advanced RISC machine, a CPU architecture
CCG3	Cable Controller Generation 3
CPU	central processing unit
CS	current sense
DIO	digital input/output, GPIO with only digital capabilities, no analog. See GPIO.
EMCA	electronically marked cable assembly, a USB cable that includes an IC that reports cable characteristics (e.g., current rating) to the Type-C ports
ESD	electrostatic discharge
FS	full-speed
GPIO	general-purpose input/output
I <sup>2</sup> C, or IIC	Inter-Integrated Circuit, a communications protocol
I/O	input/output, see also GPIO
MCU	microcontroller unit
OCP	overcurrent protection
OTP	over temperature protection
OVP	overvoltage protection
PHY	physical layer
PRES	precise power-on reset
PWM	pulse-width modulator
RAM	random-access memory
RX	receive
SAR	successive approximation register
SCL	I <sup>2</sup> C serial clock
SCP	short circuit protection

**Table 47. Acronyms Used in this Document (continued)**

Acronym	Description
SDA	I <sup>2</sup> C serial data
SPI	Serial Peripheral Interface, a communications protocol
SRAM	static random access memory
SWD	serial wire debug, a test protocol
TX	transmit
Type-C	a new standard with a slimmer USB connector and a reversible cable, capable of sourcing up to 100 W of power
UART	Universal Asynchronous Transmitter Receiver, a communications protocol
USB	Universal Serial Bus
UVP	undervoltage protection
XRES	external reset I/O pin

Document Title: EZ-PD™ CCG3PA2 Datasheet USB Type-C Port Controller Document Number: 002-18400				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
*E (cont.)	6093653	VGT	03/23/2018	Updated <a href="#">Analog to Digital Converter</a> : Updated <a href="#">Table 40</a> : Added INL parameter (Spec ID SID.ADC.2A) and its details. Added DNL parameter (Spec ID SID.ADC.3A) and its details. Removed V <sub>REF_ADC1</sub> parameter and its details. Updated details in "Description" column corresponding to V <sub>REF_ADC2</sub> parameter.
*F	6161548	VGT	04/30/2018	Added I <sub>DD_XR</sub> parameter in <a href="#">Table 5</a> . Updated <a href="#">Table 28</a> .
*G	6261344	VGT	07/25/2018	Added Packaging Characteristics in <a href="#">Table 44</a> , <a href="#">Table 45</a> , <a href="#">Table 46</a> . Updated title of figure: <a href="#">Internal Block Diagram (Silicon Rev = B1)</a> and updated <a href="#">Figure 5</a> and <a href="#">Figure 7</a> . Added <a href="#">Internal Block Diagram (Silicon Rev = B2)</a> , <a href="#">Figure 2</a> and <a href="#">Figure 6</a> . Updated <a href="#">Table 2</a> , <a href="#">Table 37</a> , <a href="#">Table 39</a> and <a href="#">Table 43</a> . Updated <a href="#">Ordering Code Definitions</a> . Updated <a href="#">Power Systems Overview</a> section.

Notice regarding compliance with Universal Serial Bus specification. Cypress offers firmware and hardware solutions that are certified to comply with the Universal Serial Bus specification, USB Type-C™ Cable and Connector Specification, and other specifications of USB Implementers Forum, Inc (USB-IF). You may use Cypress or third party software tools, including sample code, to modify the firmware for Cypress USB products. Modification of such firmware could cause the firmware/hardware combination to no longer comply with the relevant USB-IF specification. You are solely responsible ensuring the compliance of any modifications you make, and you must follow the compliance requirements of USB-IF before using any USB-IF trademarks or logos in connection with any modifications you make. In addition, if Cypress modifies firmware based on your specifications, then you are responsible for ensuring compliance with any desired standard or specifications as if you had made the modification. CYPRESS IS NOT RESPONSIBLE IN THE EVENT THAT YOU MODIFY OR HAVE MODIFIED A CERTIFIED CYPRESS PRODUCT AND SUCH MODIFIED PRODUCT NO LONGER COMPLIES WITH THE RELEVANT USB-IF SPECIFICATIONS.

Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage ("Unintended Uses"). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from or related to all Unintended Uses of Cypress products. You shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.
