

Description

The F2971 is a high reliability, low insertion loss, 75Ω absorptive SP2T RF switch designed for a multitude of cable systems and RF applications. This device covers a broad frequency range from 5MHz to 3000MHz. In addition to providing low insertion loss, the F2971 also delivers excellent linearity and isolation performance while providing a 75Ω termination for the unselected port.

The F2971 uses a single positive supply voltage and supports 3.3V logic.

Competitive Advantage

The F2971 provides broadband RF performance to support the CATV market along with high power handling and high isolation.

- Low insertion loss
- High isolation
- Excellent linearity
- Extended temperature: -40°C to +105°C

Typical Applications

- CATV/Broadband applications
 - Headend
 - Fiber/HFC distribution nodes
 - Distribution amplifiers
 - Switch matrix
 - DTV tuner input select
 - DVR/PVR/Set-top box
- CATV test equipment

Features

- Low insertion loss: 0.31dB at 1200MHz
- High Isolation: 71dB at 1200MHz (RF1/RF2 to RFC)
- High IIP3: 67dBm at 5MHz
- Operating Temperature: -40°C to +105°C
- 4mm x 4mm, 20-pin LQFN package

Pin Descriptions

Table 1. Pin Descriptions

Number	Name	Description
1, 2, 4, 5, 6, 7, 9, 10, 11, 12, 14, 15, 18, 19	GND	Internally grounded. Connect pin directly to paddle ground or as close as possible to the pin with thru-hole vias.
3	RF1	RF1 Port. Matched to 75Ω. If this pin is not 0V DC, then an external coupling capacitor must be used.
8	RFC	RFC Port. Matched to 75Ω. If this pin is not 0V DC, then an external coupling capacitor must be used.
13	RF2	RF2 Port. Matched to 75Ω. If this pin is not 0V DC, then an external coupling capacitor must be used.
16	C2	Control pin to set switch state. See Table 8.
17	C1	Control pin to set switch state. See Table 8.
20	V _{DD}	Power Supply. Bypass to GND with capacitors shown in the Typical Application Circuit (see Figure 34) as close as possible to pin.
	EP	Exposed Paddle. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

Absolute Maximum Ratings

Stresses beyond those listed below may cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Application Information

Default Start-up

Control pins do not include internal pull-down resistors to logic LOW or pull-up resistors to logic HIGH.

Power Supplies

A common V_{cc} power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade the noise figure, and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than $1V / 20\mu s$. In addition, all control pins should remain at 0V ($\pm 0.3V$) while the supply voltage ramps or while it returns to zero.

Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of each control pin is recommended. This applies to control pins 16 and 17 as shown below.

Figure 35. Control Pin Interface Schematic

Evaluation Kit (EVKit) Operation

External Supply Setup

Set up a V_{CC} power supply in the voltage range of 2.7V to 3.6V with the power supply output disabled.

Logic Control Setup

External logic control is applied to J8 CTL1 (pins 5 and 7) and CTL2 (pins 9 and 11). See Table 8 for the logic truth table.

Turn On Procedure

Setup the supplies and EVKIT as noted in the “External Supply Setup” and “Logic Control Setup” sections above.

Enable the V_{CC} supply.

Set the desired logic setting to achieve the desired configuration (see Table 8). Note that external control logic should not be applied without V_{CC} being present.

Turn Off Procedure

Set the logic control to 0V.

Disable the V_{CC} supply.
