1. Overview

1.1 Product Description

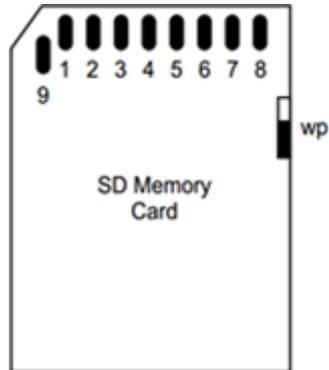

The SD3.0 Cards are fully compatible with Physical Layer Specification, Version 3.0 (this specification is available from the SDA), support Ultra High Speed(UHS), provides high write/read speed and high IOPS, It was designed to meet the security, high capacity, high performance and environmental requirements inherent in next generation consumer electronic devices.

The SD card system is a new mass-storage system based on innovations in semiconductor technology. It has been developed to provide an inexpensive, mechanically robust storage medium in card form for multimedia consumer applications. SD card allows the design of inexpensive players and drivers without moving parts. A low power consumption and a wide supply voltage range favors consumer electronic devices.

1.2 Features Summary

- Capacity: 4GB/8GB
- Complies to SD specifications version 3.0
- Voltage operating: 2.7~3.6V.
- Targeted for portable and stationary applications
- Greater Performance Choices
- Bus Speed Mode:
 - DS-Default Speed mode: 3.3V signaling, frequency up to 25MHz, up to 12.5MB/sec
 - HS-High Speed mode: 3.3V signaling, frequency up to 50MHz, up to 25MB/sec
 - SDR12-1.8V signaling, frequency up to 25MHz, up to 12.5MB/sec
 - SDR25-1.8V signaling, frequency up to 50MHz, up to 25MB/sec
 - SDR50-1.8V signaling, frequency up to 100MHz, up to 50MB/sec
 - SDR104-1.8V signaling, frequency up to 208MHz, up to 104MB/sec
 - DDR50-1.8V signaling, frequency up to 50MHz, sampled on both clock edges, up to 50MB/s
- Switch function command supports Bus Speed Mode, Command System, Drive Strength, and future functions.
- password protection (CMD42-LOCK_UNLOCK)
- Sophisticated system for error recovery including a powerful ECC
- Global Wear Leveling
- Power management for low power operation

**Maximum speed differs from the bus I/F speed. It varies depending upon the card performance. The average speed that a device writes to an SD memory card may vary depending upon the device and the operation it is performing. Normal and high-speed cards can also be used with UHS-I host devices, but the high performance enabled by a UHS-I host device can only be achieved with a UHS- I memory card.*

4. Current Consumption

Standby current: 500uA (Maximum value)

Standby current: 250uA (average value)

Operating current: 250mA (Maximum value)

Operating current: 150mA (average value)

6. SD Card Registers

6.1 Card Identification Register (CID)

The Card Identification (CID) register is 128 bit wide. It contains the card identification information used during the card identification phase. Every individual flash card shall have a unique identification number.

The structure of the CID register is defined in the following table.

| CID Bit | Width | Name | Field |
|----------------|--------------|-----------------------|--------------|
| [127:120] | 8 | Manufacture ID | MID |
| [119:104] | 16 | OEM/Application ID | OID |

Table 4: SD Card CID Table

- All contents in the CID table are programmable; Manufacturers can update the CID data through utility.
- Manufacturers should license MID and OID field form the SD Card Association(SDA)

6.2 Card Specific Data Register (CSD)

The Card-Specific Data register provides information regarding access to the card contents. The CSD defines the data format, error correction type, maximum data access time, whether the DSR register can be used, etc. The programmable part of the register (entries marked by W or E, see below) can be changed by CMD27. The CSD Table Version 2.0(as shown below) is applied to SDHC and SDXC Cards. Note that bits [15:0] are programmable by the host side. Refer to the SD specification for detailed information
