

Product Overview

The NST20 is a high precision CMOS analog output temperature sensor. The device offers a maximum accuracy of ± 1.5°C at 25°C and a maximum of ±2.5°C over the full temperature range. The device is specified at the full temperature range of -55°C to 130°C and the power supply operating range is 2.7V to 5.5V, however, the minimum operating voltage can be as low as 2.4V when the temperature range is -30°C to 130°C.

The NST20 device provides a negative slope output of -11.77mV/°C over -30°C to 100°C. It is highly linear and does not require complex calculations or lookup tables to derive temperature.

The NST20 is a low power device, and the typical operating current is 20µA. Therefore, self-heating is negligible. The NST20 is available in a SC70(5) package, making it suitable for on-board and off-line applications in the industrial, and consumer markets applications in the IoT.

Key Features

- Operating Voltage Range: 2.4V to 5.5V
- Operating Temperature Range: -55°C to 130°C
- Accuracy at 25°C: ±1.5°C (Maximum)
- Accuracy at -55°C to 130°C: ±2.5°C (Maximum)
- Average Sensor Gain: -11.77mV/°C
- Output Impedance: 1 Ω (Typical)
- Operating Current: 20µA (Typical)
- Push-Pull Output Current Drain: 500µA (Maximum)
- Predictable Curvature Error
- Output Short Protection
- Suitable for Remote Applications
- Package: SC70(5)

Applications

- Smartphones
- Portable Medical Instruments
- Notebook Computers
- Industrial Internet of Things (IoT)
- Power Supply Modules
- Power-system Monitors
- Thermal Protection
- Environmental Monitoring and HVAC
- Disk Drives

3 Function Description

3.1 Overview

The NST20 is a high precision CMOS analog output temperature sensor. The device offers a maximum accuracy of $\pm 1.5^{\circ}\text{C}$ at 25°C and a maximum of $\pm 2.5^{\circ}\text{C}$ over the full temperature range. The device is specified at the full temperature range of -55°C to 130°C and the power supply operating range is 2.7V to 5.5V, however, the minimum operating voltage can be as low as 2.4V when the temperature range is -30°C to 130°C .

The NST20 device provides a negative slope output of $-11.77\text{mV}/^{\circ}\text{C}$ over -30°C to 100°C . It is highly linear and does not require complex calculations or lookup tables to derive temperature.

The NST20 is a low power device, and the typical operating current is $20\mu\text{A}$. Therefore, self-heating is negligible. The NST20 is available in a SC70(5) package, making it suitable for on-board and off-line applications in the industrial, and consumer markets applications in the IoT.

The NST20 Functional Block Diagram as shown in [Figure 3.1](#).

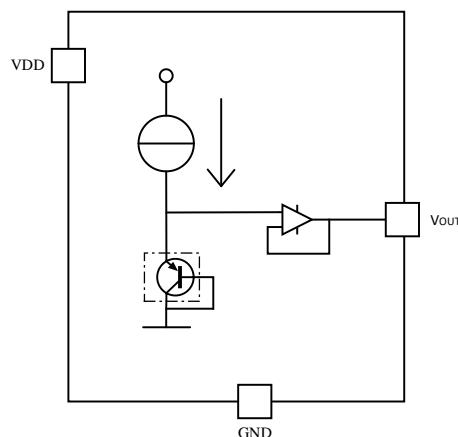

Figure 3.1 NST20 Functional Block Diagram

3.3 Feature Description

3.3.1 NST20 Transfer Function

The transfer function of NST20 has different accuracy when described in different ways. The transfer function ([Equation 3-1](#)) with good accuracy can express the simple linearity of the device near 25°C:

$$V_0 = 1.8663V - 11.69mV/\text{°C} \times T \quad (3-1)$$

The best accuracy is obtained using the quadratic function ([Equation 3-2](#)) over the entire operating temperature range of -55°C to 130°C.

$$V_0 = 1.8639 + (-1.15 \times 10^{-2} \times T) + (-3.88 \times 10^{-6} \times T^2) \quad (3-2)$$

The following temperature-voltage output characteristic table ([Table 3.1](#)) is derived from [Equation 3-2](#).

Table 3.1 Temperature to Voltage Output Characteristic Table

TEMP (°C)	VOUT (V)												
-55	2.4847	-28	2.1829	-1	1.8754	26	1.5623	53	1.2435	80	0.9191	107	0.589

T can be obtained from Equation (3-2):

$$T = -1481.96 + \sqrt{\frac{(1.8639 - V_o)}{3.88 \times 10^{-6}}} + 2.1962 \times 10^6 \quad (3-3)$$

3.3.2 Application Curve

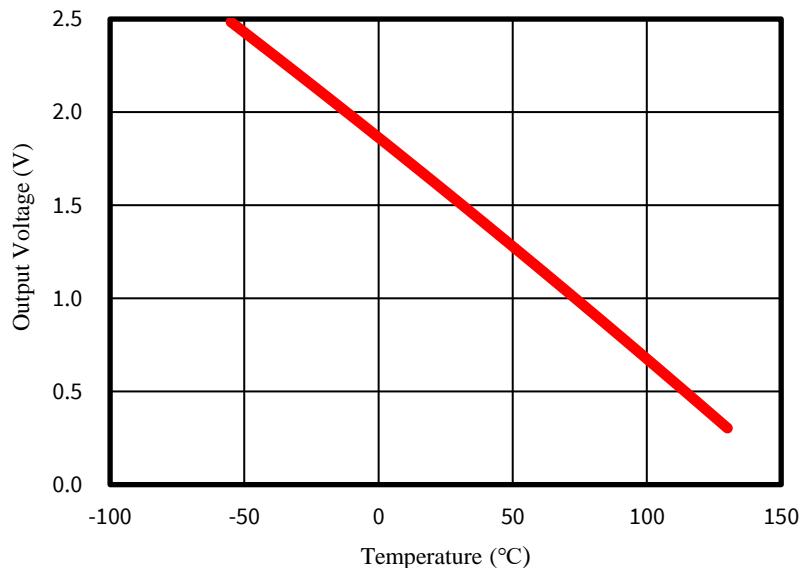

Figure 3.2 Output Voltage vs Temperature

4 Application Information

4.1 Capacitive Loads

As shown in the structure diagram, the output stage of NST20 is an amplifier. Generally, the output of the amplifier directly connected to the capacitive load is unstable. However, NST20 uses a special design, which makes it have 1000pF capacitive load capacity as shown in the [Figure 4.1](#). If a larger capacitor is connected to filter the noise, an isolation resistance should be added between the output of NST20 and the capacitor as shown in the [Table 4.1](#).

When the equipment is in an extremely noisy environment, it may be necessary to add an RC low-pass filter network to the output of NST20, such as a 1μF capacitor and a 200Ω series resistor. This low-pass filter will improve the thermal response time of NST20 and has the function of filtering high-frequency noise as shown in the [Figure 4.2](#).

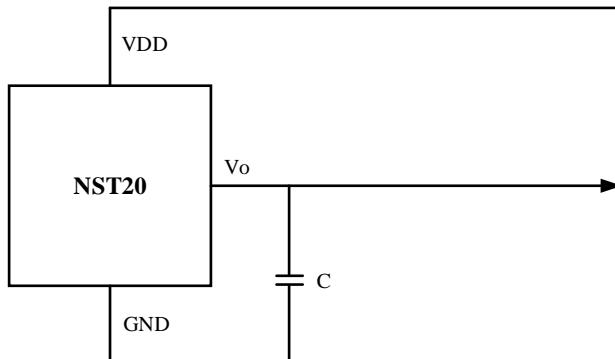

Figure 4.1 NST20 No Decoupling Required for Capacitive Loads Less Than 1000 pF

Table 4.1 Capacitive Loading Isolation

C(μ F)	Minimum R(Ω)
1	200
0.1	470
0.01	680
0.001	1000

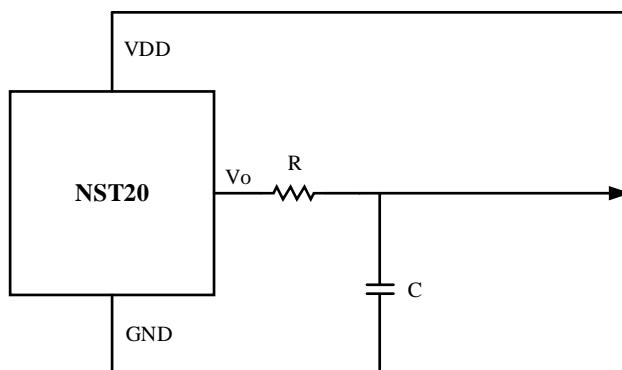

Figure 4.2 NST20 with RC Filter

4.2 Typical Application

As shown in [Figure 4.3](#), the NST20 has an extremely low supply current and a wide supply range, therefore, it can be easily driven by a battery. In order to reduce the noise in the output voltage, it is recommended to add a 0.1μ F capacitor between the power and the ground.

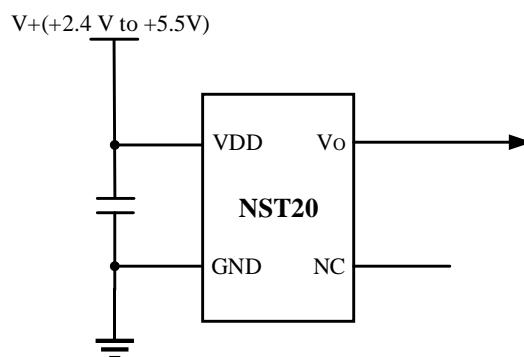

Figure 4.3 Typical Connections of the NST20

4.3 System Examples

4.3.1 Conserving Power Dissipation with Shutdown

Although NST20 has extremely low power consumption, for power-sensitive applications it can simply be shutdown by driving its supply pin with the output of a logic gate as shown in [Figure 4.4](#).

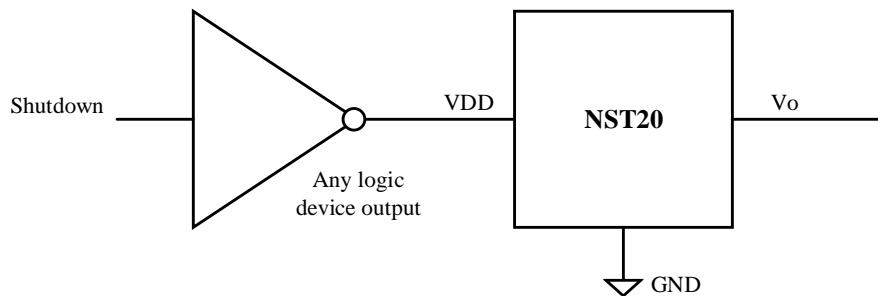

Figure 4.4 Conserving Power Dissipation with Shutdown

4.3.2 Analog-to-Digital Converter Input Stage

The input structure of most CMOS ADCs is sample and hold structure. When ADC charges the sampling capacitor, it needs to draw instantaneous current from the signal source (such as NST20 temperature sensor and many operational amplifiers). By adding RC filter to the output stage of NST20, this requirement can be met. At this time, the instantaneous current is provided by the output capacitor. This ADC is shown as an example only, in [Figure 4.5](#).
