dsPIC33CK256MC506 Family

16-Bit Digital Signal Controllers with High-Speed PWM and CAN Flexible Data-Rate (CAN FD)

Operating Conditions

- 3V to 3.6V, -40°C to +125°C
  - DC to 100 MIPS
- 3V to 3.6V, -40°C to +150°C
  - DC to 70 MIPS

Core: 16-Bit dsPIC33CK CPU

- 128-256 Kbytes of Program Flash with ECC and 16-32K Data RAM
- Fast 6-Cycle Divide
- Code Efficient (C and Assembly) Architecture
- 40-Bit Wide Accumulators
- Single-Cycle (MAC/MPY) with Dual Data Fetch
- Single-Cycle, Mixed-Sign MUL Plus Hardware Divide
- 32-Bit Multiply Support
- Five Sets of Interrupt Context Selected Registers for Fast Interrupt Response
- Zero Overhead Looping
- RAM Memory Built-In Self-Test (MBIST)
- 384 Bytes of One-Time-Programmable (OTP) Memory

Clock Management

- Selectable Oscillator Options Including:
  - High-precision, 8 MHz internal Fast RC (FRC) Oscillator
  - Primary high-speed, crystal/resonator oscillator or external clock
  - Primary PLL, which can be clocked from FRC or crystal oscillator
- Low-Power Management modes (Sleep and Idle)
- Internal Oscillator
- Programmable PLLs and Oscillator Clock Sources
- Reference Clock Output (REFCLKO)
- Fail-Safe Clock Monitor (FSCM)
- Fast Wake-up and Start-up
- Backup Internal Oscillator

Power Management

- Low-Power Management Modes (Sleep, Idle, Doze)
- Integrated Power-on Reset and Brown-out Reset

High-Speed PWM

- Four PWM Pairs
- Up to 2 ns PWM Resolution
- Dead Time for Rising and Falling Edges
- Dead-Time Compensation
- Clock Chopping for High-Frequency Operation
- PWM Support for:
  - DC/DC, AC/DC, inverters, PFC, lighting
  - BLDC, PMSM, ACIM, Stepper motors, SRM motors
- Fault and Current Limit Inputs
- Flexible Trigger Configuration for ADC Triggering

Timers/Output Compare/Input Capture

- One General Purpose 16-Bit Timer
- Peripheral Trigger Generator (PTG):
  - Up to 15 trigger sources to other peripheral modules
  - CPU independent state machine-based instruction sequencer
  - Two 16-bit general purpose timers
- Four SCCP modules which Include Timer, Capture/Compare and PWM:
  - Two 16-bit timers or one 32-bit timer in each module
  - PWM resolution down to 2.5 ns (one output per SCCP module)
  - 16 or 32-bit capture
  - 4-deep capture buffer
- Fully Asynchronous Operation, Available in Sleep Modes

Advanced Analog Features

- High-Speed ADC module:
  - 12-bit with one shared SAR ADC core
  - Configurable resolution (up to 12-bit)
  - Up to 3.5 Msps conversion rate per channel at 12-bit resolution
  - Up to 20 input channels
  - Dedicated result buffer for each analog channel
  - Flexible and independent ADC trigger sources
  - Four digital comparators
  - Four oversampling filters for increased resolution
- Two Analog Comparators:
  - 15 ns analog comparator
- Up to Three Op Amps:
  - 20 MHz GBW
  - 40 v/µs slew rate
  - ±1 mV offset voltage (typical)
- Two 12-Bit DACs:
  - Hardware slope compensation
  - One buffered DAC output

Communication Interfaces

- Three Protocol UARTs with Automated Protocol Handling Support for:
  - LIN 2.2
  - DMX
  - IrDA®
- Two Four-Wire SPI/I²S modules:
  - 16-byte FIFO
  - Variable width
  - I²S mode
- One CAN Flexible Data (FD) module
- One I²C module with SMBus Support
- PPS to Allow Function Remap
- Programmable Cyclic Redundancy Check (CRC)
- One SENT module

Direct Memory Access (DMA)

- Four DMA Channels

Peripheral Features

- One Quadrature Encoder Interface (QEI):
  - Four inputs: Phase A, Phase B, Home, Index
  - One 32-bit timer/counter (in QEI module, available if encoder is not used)
- Small Pin Count Packages Ranging from 28 to 64 Pins, Including UQFN as Small as 4x4 mm
- High-Current I/O Sink/Source
- Edge or Level Change Notification Interrupt on I/O Pins
- Peripheral Pin Select (PPS) Remappable Pins
- Current Bias Generators

Debugger Development Support

- In-Circuit and In-Application Programming
- Three Complex, Five Simple Breakpoints
- IEEE 1149.2 Compatible (JTAG) Boundary Scan
- Trace Buffer and Run-Time Watch

Safety Features

- Backup Fast RC Oscillator (BFRC)
- Brown-out Reset (BOR)
- Capless Internal Voltage Regulator
- Clock Monitor System with Backup Oscillator
- CodeGuard™ Security
- Cyclic Redundancy Check (CRC)
- Dual Watchdog Timer (WDT)
- Fail-Safe Clock Monitoring (FSCM)
- Flash Error Correcting Code (ECC)

- Flash OTP by ICSP™ Write Inhibit
- RAM Memory Built-In Self-Test (MBIST)
- Two-Speed Start-up
- Virtual Pins for Redundancy and Monitoring
- Windowed Deadman Timer (DMT)

Functional Safety Readiness – ISO 26262; IEC 61508; IEC 60730

Qualification Support

- AEC-Q100 REV G (Grade 0: -40°C to +150°C)

dsPIC33CK256MC506 Product Families

The device names, pin counts, memory sizes and peripheral availability of each device are listed in Table 1 and Table 2. The following pages show their pinout diagrams.

Notes:

1. **RPn** represents remappable peripheral functions.
2. Pin has an increased current drive strength. Refer to 32. Electrical Characteristics for details.
3. A pull-up resistor is connected to this pin during programming or when JTAG is enabled in the Configuration bits; this limits the maximum voltage on this pin to 3.6V. If JTAG is disabled, the maximum voltage on this pin can reach 5.5V.
4. This pin is toggled during programming.

Notes:

1. **RPn** represents remappable peripheral functions.
2. Pin has an increased current drive strength. Refer to 32. Electrical Characteristics for details.
3. A pull-up resistor is connected to this pin during programming or when JTAG is enabled in the Configuration bits; this limits the maximum voltage on this pin to 3.6V. If JTAG is disabled, the maximum voltage on this pin can reach 5.5V.
4. This pin is toggled during programming.

To Our Valued Customers

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Website at:

www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Website; www.microchip.com
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

1. Device Overview

Notes:

1. This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive resource. To complement the information in this data sheet, refer to the related section of the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip website (www.microchip.com).
2. Some registers and associated bits described in this section may not be available on all devices. Refer to 4. Memory Organization in this data sheet for device-specific register and bit information.

This document contains device-specific information for the dsPIC33CK256MC506 Digital Signal Controller (DSC) devices.

dsPIC33CK256MC506 devices contain extensive Digital Signal Processor (DSP) functionality with a high-performance, 16-bit MCU architecture.

Figure 1-1 shows a general block diagram of the core and peripheral modules of the dsPIC33CK256MC506 family.

Notes:

1. The numbers in the parentheses are the number of instantiations of the module indicated.
2. Not all I/O pins or features are implemented on all device pinout configurations. See Table 1-1 for specific implementations by pin count.
3. Some peripheral I/Os are only accessible through Peripheral Pin Select (PPS).
4. 28-lead devices have only two op amp instances.
5. The CAN FD module is not available on dsPIC33CKXXXMC1XX devices.

2. Guidelines for Getting Started with 16-Bit Digital Signal Controllers

2.1 Basic Connection Requirements

Getting started with the family devices of the dsPIC33CK256MC506 requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names which must always be connected:

- All V_{DD} and V_{SS} pins
  (see 2.2. Decoupling Capacitors)
- All AV_{DD} and AV_{SS} pins
  regardless if the ADC module is not used (see 2.2. Decoupling Capacitors)
- $\overline{MCLR}$ pin
  (see 2.3. Master Clear (MCLR) Pin)
- PGCx/PGDx pins
  used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see 2.4. ICSP Pins)
- OSCI and OSCO pins
  when an external oscillator source is used (see 2.5. External Oscillator Pins)

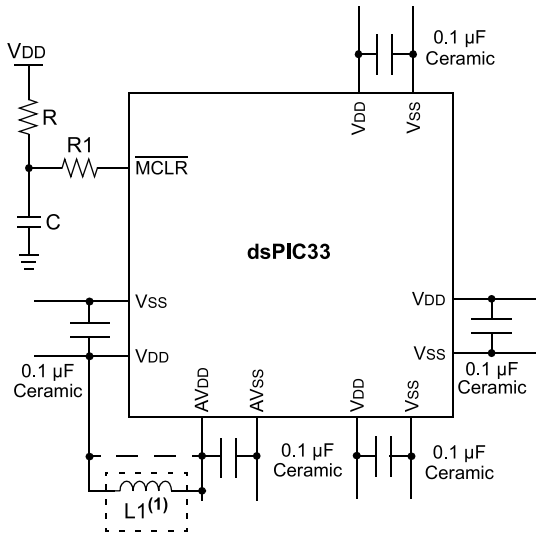
2.2 Decoupling Capacitors

The use of decoupling capacitors on every pair of power supply pins, such as V_{DD}, V_{SS}, AV_{DD} and AV_{SS} is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** Recommendation of 0.1 µF (100 nF), 10-20V. This capacitor should be a low-ESR and have resonance frequency in the range of 20 MHz and higher. It is recommended to use ceramic capacitors.
- **Placement on the Printed Circuit Board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high-frequency noise:** If the board is experiencing high-frequency noise above tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 µF to 0.001 µF. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 µF in parallel with 0.001 µF.
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB track inductance.

Figure 2-1. Recommended Minimum Connection



Note 1: As an option, instead of a hard-wired connection, an inductor (L1) can be substituted between V_{DD} and AV_{DD} to improve ADC noise rejection. The inductor impedance should be less than 1Ω and the inductor capacity greater than 10 mA.

Where:

$$f = \frac{F_{CNV}}{2} \quad \text{(i.e., ADC Conversion Rate/2)}$$

$$f = \frac{1}{(2\pi\sqrt{LC})}$$

$$L = \left(\frac{1}{(2\pi f\sqrt{C})}\right)^2$$

2.3 Master Clear ($\overline{MCLR}$) Pin

The $\overline{MCLR}$ pin provides two specific device functions:

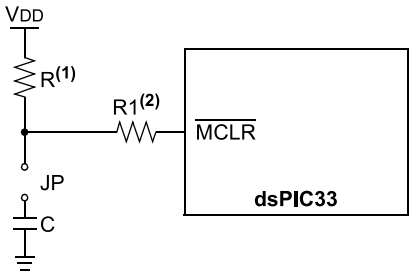
- Device Reset
- Device Programming and Debugging.

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{MCLR}$ pin. Consequently, specific voltage levels (V_{IH} and V_{IL}) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in Figure 2-2, it is recommended that the capacitor, C, be isolated from the $\overline{MCLR}$ pin during programming and debugging operations.

Place the components, as shown in Figure 2-2, within one-quarter inch (6 mm) from the $\overline{MCLR}$ pin.

Figure 2-2. Example of $\overline{\text{MCLR}}$ Pin Connections



Notes:

1. R ≤ 10 kΩ is recommended. A suggested starting value is 10 kΩ. Ensure that the $\overline{\text{MCLR}}$ pin V_{IH} and V_{IL} specifications are met.
2. R1 ≤ 470Ω will limit any current flowing into $\overline{\text{MCLR}}$ from the external capacitor, C, in the event of $\overline{\text{MCLR}}$ pin breakdown due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS). Ensure that the $\overline{\text{MCLR}}$ pin V_{IH} and V_{IL} specifications are met.

2.4 ICSP Pins

The PGCx and PGDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGCx and PGDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin Voltage Input High (V_{IH}) and Voltage Input Low (V_{IL}) requirements.

Ensure that the “Communication Channel Select” (i.e., PGCx/PGDx pins) programmed into the device matches the physical connections for the ICSP to PICkit™ 4, MPLAB® ICD 4 or MPLAB REAL ICE™ emulator.

For more information on MPLAB ICD 3, MPLAB ICD 4 and REAL ICE emulator connection requirements, refer to the following documents that are available on the Microchip website.

2.5 External Oscillator Pins

When the Primary Oscillator (POSC) circuit is used to connect a crystal oscillator, special care and consideration are needed to ensure proper operation. The POSC circuit should be tested across the environmental conditions that the end product is intended to be used. The load capacitors specified in the crystal oscillator data sheet can be used as a starting point, however, the parasitic capacitance from the PCB traces can affect the circuit, and the values may need to be altered to ensure proper start-up and operation. Excessive trace length and other physical interaction can lead to poor signal quality. Poorly tuned oscillator circuits can have reduced amplitude, incorrect frequency (runt pulses), distorted waveforms and long start-up times that may result in unpredictable application behavior, such as instruction misexecution, illegal opcode fetch, etc. Ensure that the crystal oscillator circuit is at full amplitude and correct frequency before the system begins to execute code. In planning the application’s routing and I/O assignments, ensure that adjacent port pins, and other signals in close proximity to the oscillator do not have high

frequencies, short rise and fall times and other similar noise. For further information on the Primary Oscillator, see 9.3. Primary Oscillator (POSC).

2.6 External Oscillator Layout Guidance

Use best practices during PCB layout to ensure robust start-up and operation. The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate it from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. If using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. Suggested layouts are shown in Figure 2-3. With fine-pitch packages, it is not always possible to completely surround the pins and components. A suitable solution is to tie the broken guard sections to a mirrored ground layer. In all cases, the guard trace(s) must be returned to ground.

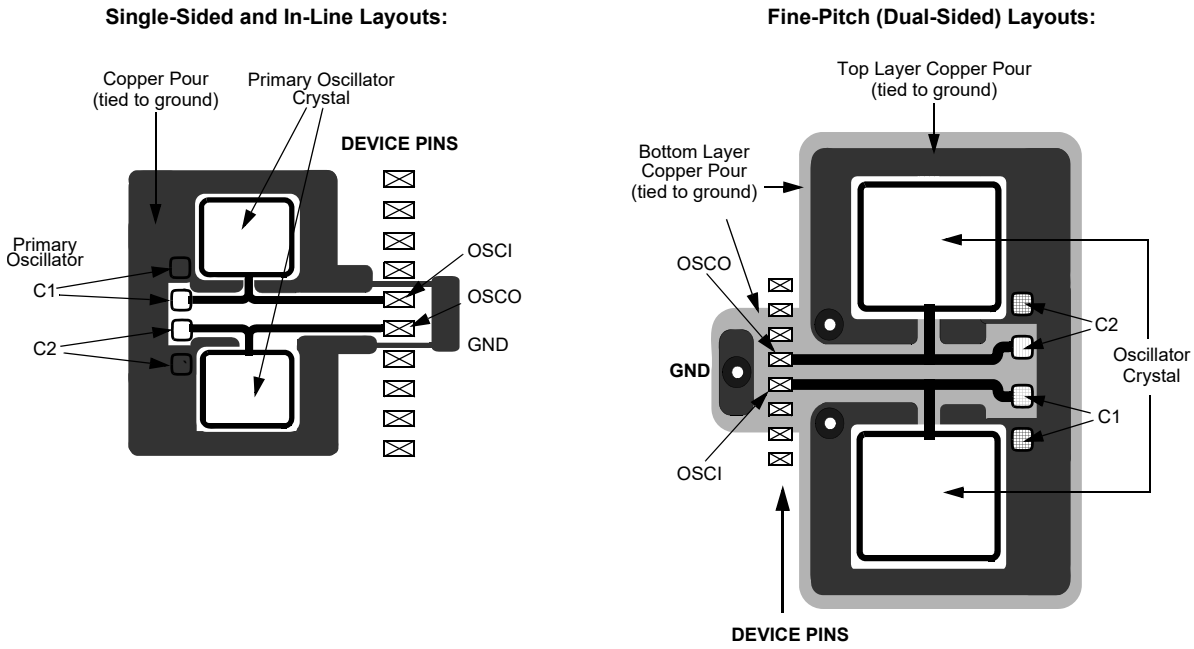
Figure 2-3. Suggested Placement of the Oscillator Circuit



2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to a certain frequency (see 9. Oscillator with High-Frequency PLL) to comply with device PLL start-up conditions. This means that if the external oscillator frequency is outside of this range, the application must start up in FRC mode first. The default PLL settings after a POR, with an oscillator frequency outside of this range, will violate the device operating speed.

Once the device powers up, the application firmware can initialize the PLL SFRs, CLKDIV and PLLFBD, to a suitable value, and then perform a clock switch to the Oscillator + PLL clock source. Note that clock switching must be enabled in the device Configuration Word.

2.8 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic low state.

Alternatively, connect a 1k to 10k resistor between V_{SS} and unused pins, and drive the output to logic low.

2.9 Bulk Capacitors

On boards with power traces running longer than six inches in length, it is suggested to use a bulk capacitor for integrated circuits, including DSCs, to supply a local power source. The value of the bulk capacitor should be determined based on the trace resistance that connects the power supply source to the device and the maximum current drawn by the device in the application. In other words, select the bulk capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 µF to 47 µF.

2.10 Targeted Applications

- Power Factor Correction (PFC):
  - Interleaved PFC
  - Critical Conduction PFC
  - Bridgeless PFC
- DC/DC Converters:
  - Buck, Boost, Forward, Flyback, Push-Pull
  - Half/Full-Bridge
  - Phase-Shift Full-Bridge
  - Resonant Converters
- DC/AC:
  - Half/Full-Bridge Inverter
  - Resonant Inverter
- Motor Control:
  - BLDC
  - PMSM
  - SR
  - ACIM

Examples of typical application connections are shown in Figure 2-4 through Figure 2-6.

3. CPU

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Enhanced CPU"** (www.microchip.com/DS70005158) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The dsPIC33CK256MC506 family CPU has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for Digital Signal Processing (DSP). The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space.

An instruction prefetch mechanism helps maintain throughput and provides predictable execution. Most instructions execute in a single-cycle effective execution rate, with the exception of instructions that change the program flow, the double-word move (`MOV.D`) instruction, PSV accesses and the table instructions. Overhead-free program loop constructs are supported using the `DO` and `REPEAT` instructions, both of which are interruptible at any point.

3.1 Registers

The dsPIC33CK256MC506 devices have sixteen, 16-bit Working registers in the programmer's model. Each of the Working registers can act as a Data, Address or Address Offset register. The 16th Working register (W15) operates as a Software Stack Pointer (SSP) for interrupts and calls.

In addition, the dsPIC33CK256MC506 devices include four Alternate Working register sets, which consist of W0 through W14. The Alternate Working registers can be made persistent to help reduce the saving and restoring of register content during Interrupt Service Routines (ISRs). The Alternate Working registers can be assigned to a specific Interrupt Priority Level (IPL1 through IPL6) by configuring the CTXTx[2:0] bits in the FALTREG Configuration register. The Alternate Working registers can also be accessed manually by using the `CTXTSWP` instruction. The CCTXI[2:0] and MCTXI[2:0] bits in the CTXTSTAT register can be used to identify the current, and most recent, manually selected Working register sets.

3.2 Instruction Set

The instruction set for dsPIC33CK256MC506 devices has two classes of instructions: the MCU class of instructions and the DSP class of instructions. These two instruction classes are seamlessly integrated into the architecture and execute from a single execution unit. The instruction set includes many addressing modes and was designed for optimum C compiler efficiency.

3.3 Data Space Addressing

The base Data Space can be addressed as up to 4K words or 8 Kbytes, and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear Data Space. Certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y Data Space boundary is device-specific.

The upper 32 Kbytes of the Data Space memory map can optionally be mapped into Program Space (PS) at any 16K program word boundary. The program-to-Data Space mapping feature, known as Program Space Visibility (PSV), lets any instruction access Program Space as if it were Data Space. Refer to **"Data Memory"** (www.microchip.com/DS70595) in the *"dsPIC33/PIC24 Family Reference Manual"* for more details on PSV and table accesses.

On dsPIC33CK256MC506 family devices, overhead-free circular buffers (Modulo Addressing) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. The X AGU Circular Addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data re-ordering for radix-2 FFT algorithms.

3.4 Addressing Modes

The CPU supports these addressing modes:

- Inherent (no operand)
- Relative
- Literal
- Memory Direct
- Register Direct
- Register Indirect

Each instruction is associated with a predefined addressing mode group, depending upon its functional requirements. As many as six addressing modes are supported for each instruction.

3.4.1 Programmer's Model

The programmer's model for the dsPIC33CK256MC506 family is shown in Figure 3-2. All registers in the programmer's model are memory-mapped and can be manipulated directly by instructions. Table 3-1 lists a description of each register.

In addition to the registers contained in the programmer's model, the dsPIC33CK256MC506 devices contain control registers for Modulo Addressing, Bit-Reversed Addressing and interrupts. These registers are described in subsequent sections of this document.

All registers associated with the programmer's model are memory-mapped, as shown in Figure 3-2.

Table 3-1. Programmer's Model Register Descriptions

Register(s) Name	Description
W0 through W15(1)	Working Register Array

ACCA, ACCB	40-Bit DSP Accumulators (Additional Four Alternate Accumulators)
PC	23-Bit Program Counter
SR	ALU and DSP Engine STATUS Register
SPLIM	16-bit Stack Pointer Limit Value Register
TBLPAG	8-bit Table Memory Page Address Register
DSRPAG	10-bit Extended Data Space (EDS) Read Page Register
RCOUNT	16-bit REPEAT Loop Counter Register
DCOUNT	16-bit DO Loop Counter Register
DOSTARTL(2)	15-bit DO Loop Start Address Register (bit 0 = 0) (Low)
DOSTARTH(2)	7-bit DO Loop Start Address Register (High)
DOENDL	15-bit DO Loop End Address Register (bit 0 = 0) (Low)
DOENDH	7-bit DO Loop End Address Register (High)
CORCON	Contains DSP Engine, DO Loop Control and Trap Status bits

Notes:
1. Memory-mapped W0 through W14 represent the value of the register in the currently active CPU context.
2. The DOSTARTH and DOSTARTL registers are read-only.

Notes:

1. The IPL[2:0] bits are concatenated with the IPL[3] bit (CORCON[3]) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL[3] = 1. User interrupts are disabled when IPL[3] = 1.
2. The IPL[2:0] Status bits are read-only when the NSTDIS bit (INTCON1[15]) = 1.
3. A data write to the SR register can modify the SA and SB bits by either a data write to SA and SB or by clearing the SAB bit. To avoid a possible SA or SB bit write race condition, the SA and SB bits should not be modified using bit operations.

3.6 Arithmetic Logic Unit (ALU)

The dsPIC33CK256MC506 family ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

Refer to the **"16-Bit MCU and DSC Programmer's Reference Manual"** (www.microchip.com/DS70000157) for information on the SR bits affected by each instruction.

The core CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

3.6.1 Multiplier

Using the high-speed, 17-bit x 17-bit multiplier, the ALU supports unsigned, signed or mixed-sign operation in several MCU Multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit signed x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

3.6.2 Divider

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- 32-bit signed/16-bit signed divide
- 32-bit unsigned/16-bit unsigned divide
- 16-bit signed/16-bit signed divide
- 16-bit unsigned/16-bit unsigned divide

The 16-bit signed and unsigned `DIV` instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute. There are additional instructions: `DIV2` and `DIVF2`. Divide instructions will complete in six cycles.

3.7 DSP Engine

The DSP engine consists of a high-speed 17-bit x 17-bit multiplier, a 40-bit barrel shifter and a 40-bit adder/subtracter (with two target accumulators, round and saturation logic).

The DSP engine can also perform inherent accumulator-to-accumulator operations that require no additional data. These instructions are, `ADD`, `SUB`, `NEG`, `MIN` and `MAX`.

The DSP engine has options selected through bits in the CPU Core Control register (CORCON), as listed below:

- Fractional or integer DSP multiply (IF)
- Signed, unsigned or mixed-sign DSP multiply (USx)
- Conventional or convergent rounding (RND)
- Automatic saturation on/off for ACCA (SATA)
- Automatic saturation on/off for ACCB (SATB)
- Automatic saturation on/off for writes to data memory (SATDW)
- Accumulator Saturation mode selection (ACCSAT)

4. Memory Organization

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"dsPIC33/PIC24 Program Memory"** (www.microchip.com/DS70000613) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The dsPIC33CK256MC506 family architecture features separate program and data memory spaces, and buses. This architecture also allows the direct access of program memory from the Data Space (DS) during code execution.

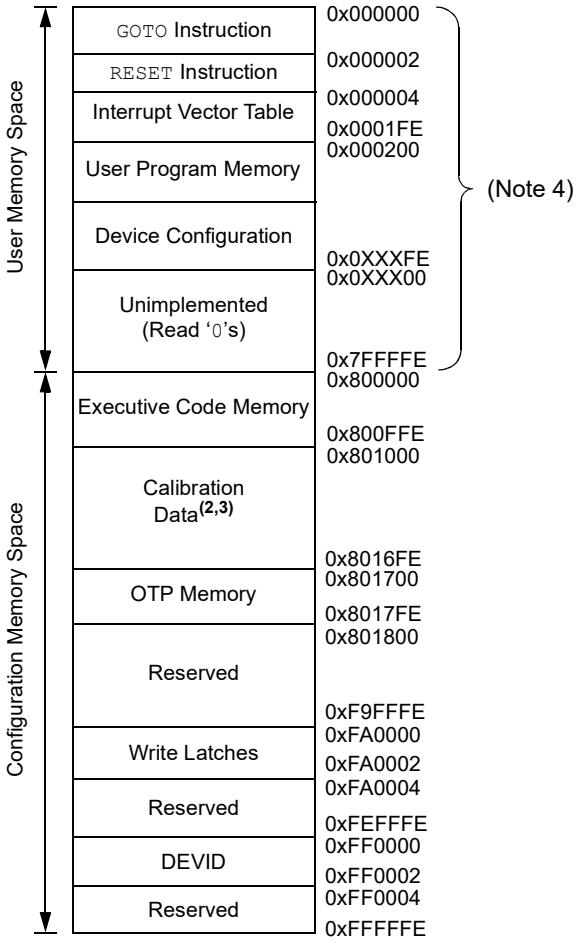
4.1 Program Address Space

The program address memory space of the dsPIC33CK256MC506 family devices is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit PC during program execution, or from table operation or Data Space remapping, as described in 4.6. Interfacing Program and Data Memory Spaces.

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFF). The exception is the use of TBLRD operations, which use TBLPAG[7] to permit access to calibration data and Device ID sections of the configuration memory space.

The program memory maps for dsPIC33CK256MC506 devices are shown in Figure 4-1 through Figure 4-3.

Figure 4-1. Program Memory Map for dsPIC33CK256MC506 Device(1)



Notes:

1. Memory areas are not shown to scale.
2. Calibration data area must be maintained during programming.
3. Calibration data area includes UDID, ICSP™ Write Inhibit and FBOOT registers' locations.
4. See Figure 4-2 and Figure 4-3 for details.

4.1.1 Program Memory Organization

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (4.1.2. Interrupt and Trap Vectors).

Program memory addresses are always word-aligned on the lower word and addresses are incremented or decremented, by two, during code execution. This arrangement provides compatibility with Data Memory Space Addressing and makes data in the program memory space accessible.

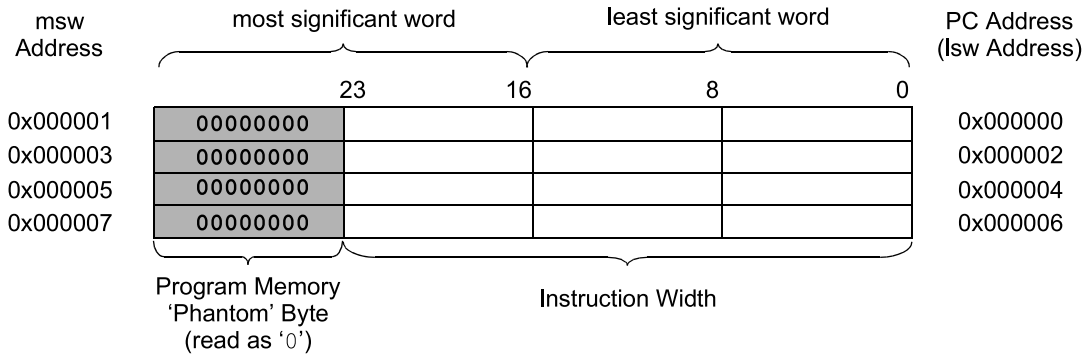
4.1.2 Interrupt and Trap Vectors

All dsPIC33CK256MC506 family devices reserve the addresses between 0x000000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A `GOTO` instruction is programmed by the user application at

address, 0x000000, of Flash memory, with the actual address for the start of code at address, 0x000002, of Flash memory.

A more detailed discussion of the Interrupt Vector Tables (IVTs) is provided in 7. Interrupt Controller.

Figure 4-4. Program Memory Organization



4.1.3 Unique Device Identifier (UDID)

All dsPIC33CK256MC506 family devices are individually encoded during final manufacturing with a Unique Device Identifier or UDID. The UDID cannot be erased by a bulk erase command or any other user-accessible means. This feature allows for manufacturing traceability of Microchip Technology devices in applications where this is a requirement. It may also be used by the application manufacturer for any number of things that may require unique identification, such as:

- Tracking the device
- Unique serial number
- Unique security key

The UDID comprises five 24-bit program words. When taken together, these fields form a unique 120-bit identifier.

The UDID is stored in five read-only locations, located between 0x801200 and 0x801208 in the device configuration space. Table 4-1 lists the addresses of the identifier words and shows their contents.

Table 4-1. UDID Addresses

UDID	Address	Description
UDID1	0x801200	UDID Word 1
UDID2	0x801202	UDID Word 2
UDID3	0x801204	UDID Word 3
UDID4	0x801206	UDID Word 4
UDID5	0x801208	UDID Word 5

4.2 Data Address Space

The dsPIC33CK256MC506 family CPU has a separate 16-bit wide data memory space. The Data Space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory map is shown in 4.2.4. Near Data Space.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the Data Space. This arrangement gives a base Data Space address range of 64 Kbytes or 32K words.

The lower half of the data memory space (i.e., when EA[15] = 0) is used for implemented memory addresses, while the upper half (EA[15] = 1) is reserved for the Program Space Visibility (PSV).

The dsPIC33CK256MC506 family devices implement up to 48 Kbytes of data memory. If an EA points to a location outside of this area, an all-zero word or byte is returned.

4.2.1 Data Space Width

The data memory space is organized in byte-addressable, 16-bit wide blocks. Data are aligned in data memory and registers as 16-bit words, but all Data Space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

4.2.2 Data Memory Organization and Alignment

To maintain backward compatibility with PIC® MCU devices and improve Data Space memory usage efficiency, the dsPIC33CK256MC506 family instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] results in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

A data byte read, reads the complete word that contains the byte, using the LSb of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel, byte-wide entities with shared (word) address decode, but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the LSB; the MSB is not modified.

A Sign-Extend (`SE`) instruction is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a Zero-Extend (`ZE`) instruction on the appropriate address.

4.2.3 SFR Space

The first 4 Kbytes of the Near Data Space, from 0x0000 to 0x0FFF, is primarily occupied by Special Function Registers (SFRs). These are used by the dsPIC33CK256MC506 family core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '`0`'.

Note: The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information.

4.2.4 Near Data Space

The 8-Kbyte area, between 0x0000 and 0x1FFF, is referred to as the Near Data Space. Locations in this space are directly addressable through a 13-bit absolute address field within all memory direct instructions. Additionally, the whole Data Space is addressable using `MOV` instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a Working register as an Address Pointer.

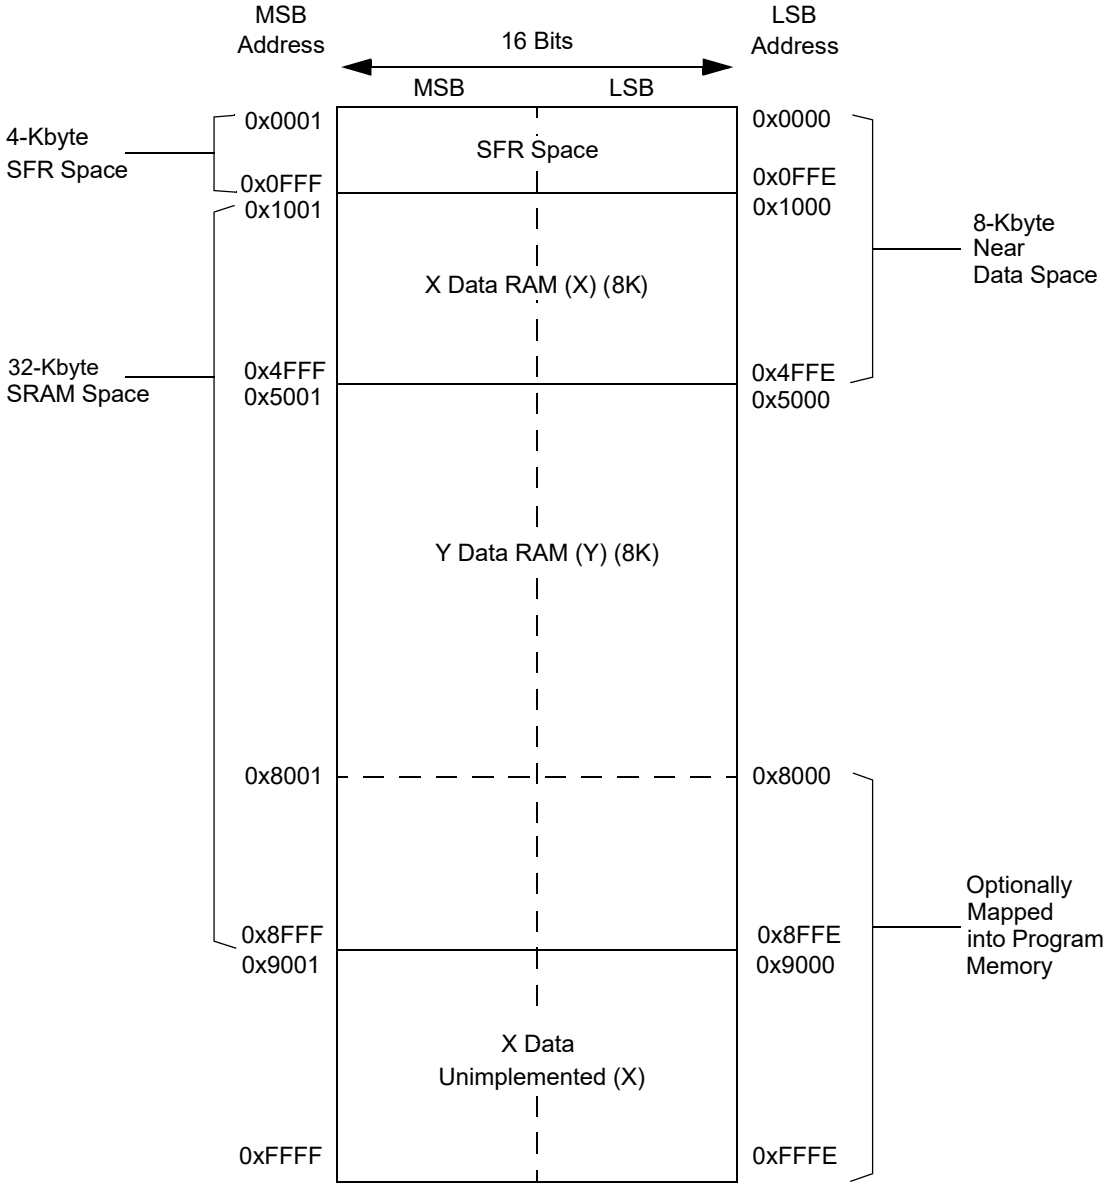
Note: Memory areas are not shown to scale.

Figure 4-6. Data Memory Map for dsPIC33CK256MCX0X Devices



Note: Memory areas are not shown to scale.

4.2.5 X and Y Data Spaces

The dsPIC33CK256MC506 family core has two Data Spaces, X and Y. These Data Spaces can be considered either separate (for some DSP instructions) or as one unified linear address range (for MCU instructions). The Data Spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms, such as Finite Impulse Response (FIR) filtering and Fast Fourier Transform (FFT).

The X Data Space is used by all instructions and supports all addressing modes. X Data Space has separate read and write data buses. The X read data bus is the read data path for all instructions that view Data Space as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y Data Space is used in concert with the X Data Space by the MAC class of instructions (CLR, ED, EDAC, MAC, MOVSAC, MPY, MPY.N and MSC) to provide two concurrent data read paths.

Both the X and Y Data Spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to X Data Space.

All data memory writes, including in DSP instructions, view Data Space as combined X and Y address space. The boundary between the X and Y Data Spaces is device-dependent and is not user-programmable.

4.3 BIST Overview

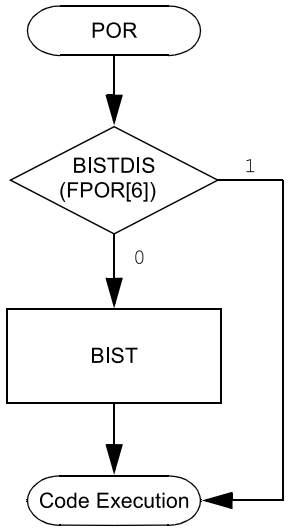
The dsPIC33CK256MC506 family features a data memory Built-In Self-Test (BIST) that has the option to be run at start-up or run time. The memory test checks that all memory locations are functional and provides a pass/fail status of the RAM that can be used by software to take action if needed. If a failure is reported, the specific location(s) are not identified. The BIST feature operates with a clock of FRC+PLL with PLL settings, forced by hardware to result in a 125 MHz clock rate, at both start-up and run time.

The MBISTCON register (4.3.3. MBISTCON) contains control and status bits for BIST operation. The MBISTDONE bit (MBISTCON[7]) indicates if a BIST was run since the last Reset and the MBISTSTAT bit (MBISTCON[4]) provides the pass/fail result.

4.3.1 BIST at Start-up

The BIST can be configured to automatically run on a POR-type Reset, as shown in Figure 4-7. By default, when BISTDIS (FPOR[6]) = 1, the BIST is disabled and will not be part of device start-up. If the BISTDIS bit is cleared during device programming, the BIST will run after all Configuration registers have been loaded and before code execution begins.

Figure 4-7. BIST Flowchart



4.3.2 BIST at Run Time

The BIST can also be run at any time during code execution. Note that a BIST will corrupt all of the RAM contents, including the Stack Pointer, and requires a subsequent Reset. The system should be prepared for a Reset before a BIST is performed. The BIST is invoked by setting the MBISTEN bit (MBISTCON[0]). The MBISTCON register is protected against accidental writes and requires an unlock sequence prior to writing. Only one bit can be set per unlock sequence. The procedure for a run-time BIST is as follows:

1. Execute the unlock sequence by consecutively writing 0x55 and 0xAA to the NVMKEY register.
2. Write 0x0001 to the MBISTCON SFR.
3. Execute a software `RESET` command.
4. Verify a Software Reset has occurred by reading SWR (RCON[6]) (optional).
5. Verify that the MBISTDONE bit is set.
6. Take action depending on test result indicated by MBISTSTAT.

4.3.2.1 Fault Simulation

A mechanism is available to simulate a BIST failure to allow testing of Fault handling software. When the FLTINJ bit is set during a run-time BIST, the MBISTSTAT bit will be set regardless of the test result. The procedure for a BIST Fault simulation is as follows:

1. Execute the unlock sequence by consecutively writing 0x55 and 0xAA to the NVMKEY register.
2. Set the MBISTEN bit (MBISTCON[0]).
3. Execute 2nd unlock sequence by consecutively writing 0x55 and 0xAA to the NVMKEY register.
4. Set the FLTINJ bit (MBISTCON[8]).
5. Execute a software `RESET` command.
6. Verify the MBISTDONE, MBSITSTAT and FLTINJ bits are all set.

4.4.2 Paged Memory Scheme

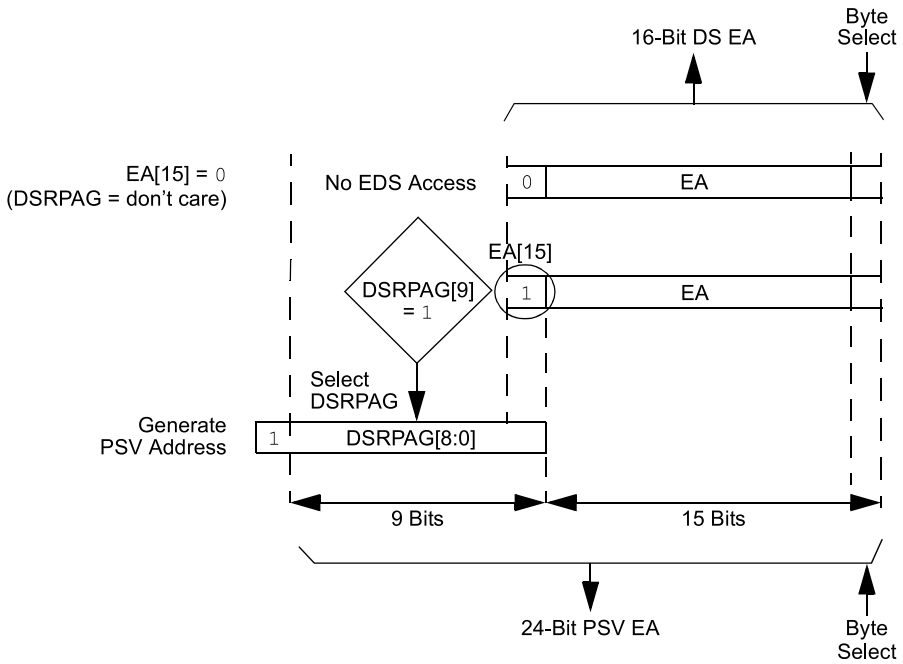
The dsPIC33CK256MC506 architecture extends the available Data Space through a paging scheme, which allows the available Data Space to be accessed using `MOV` instructions in a linear fashion for pre- and post-modified Effective Addresses (EAs). The upper half of the base Data Space address is used in conjunction with the Data Space Read Page (DSRPAG) register to form the Program Space Visibility (PSV) address.

The Data Space Read Page (DSRPAG) register is located in the SFR space. When DSRPAG[9] = `1` and the base address bit, EA[15] = `1`, the DSRPAG[8:0] bits are concatenated onto EA[14:0] to form the 24-bit PSV read address.

The paged memory scheme provides access to multiple 32-Kbyte windows in the PSV memory. The Data Space Read Page (DSRPAG) register, in combination with the upper half of the Data Space address, can provide up to 8 Mbytes of PSV address space. The paged data memory space is shown in Figure 4-8.

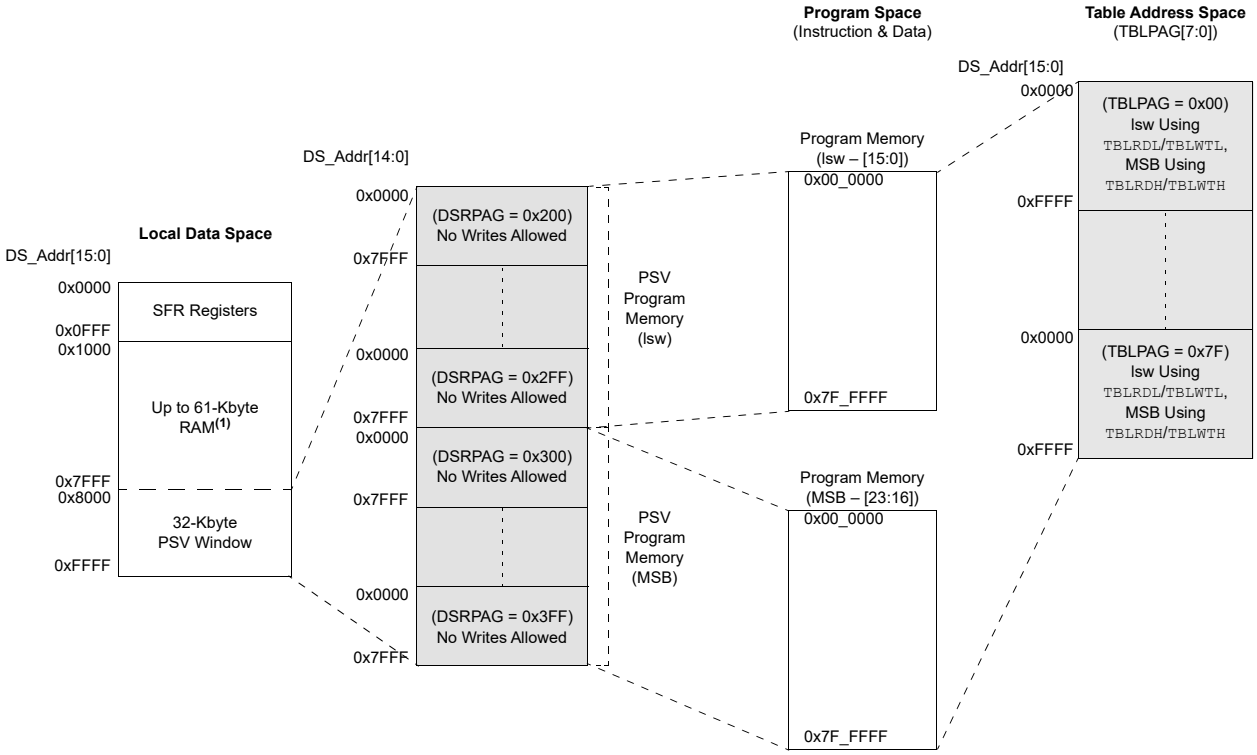
The Program Space (PS) can be accessed with a DSRPAG of 0x200 or greater. Only reads from PS are supported using the DSRPAG.

Figure 4-8. Program Space Visibility (PSV) Read Address Generation



Note: DS read access when DSRPAG = 0x000 will force an address error trap.

Figure 4-9. Paged Data Memory Space



When a PSV page overflow or underflow occurs, EA[15] is cleared as a result of the register indirect EA calculation. An overflow or underflow of the EA in the PSV pages can occur at the page boundaries when:

- The initial address, prior to modification, addresses the PSV page
- The EA calculation uses Pre- or Post-Modified Register Indirect Addressing; however, this does not include Register Offset Addressing

In general, when an overflow is detected, the DSRPAG register is incremented and the EA[15] bit is set to keep the base address within the PSV window. When an underflow is detected, the DSRPAG register is decremented and the EA[15] bit is set to keep the base address within the PSV window. This creates a linear PSV address space, but only when using Register Indirect Addressing modes.

Exceptions to the operation described above arise when entering and exiting the boundaries of Page 0 and PSV spaces. Table 4-2 lists the effects of overflow and underflow scenarios at different boundaries.

In the following cases, when overflow or underflow occurs, the EA[15] bit is set and the DSRPAG is not modified; therefore, the EA will wrap to the beginning of the current page:

- Register Indirect with Register Offset Addressing
- Modulo Addressing
- Bit-Reversed Addressing

Table 4-2. Overflow and Underflow Scenarios at Page 0 and PSV Space Boundaries(2,3,4)

O/U, R/W	Operation	Before			After		
		DSRPAG	DS EA[15]	Page Description	DSRPAG	DS EA[15]	Page Description
O, Read	[++Wn] or [Wn++]	DSRPAG = 0x2FF	1	PSV: Last lsw page	DSRPAG = 0x300	1	PSV: First MSB page
O, Read		DSRPAG = 0x3FF	1	PSV: Last MSB page	DSRPAG = 0x3FF	0	See **Note 1**
U, Read	[--Wn] or [Wn--]	DSRPAG = 0x001	1	PSV page	DSRPAG = 0x001	0	See **Note 1**
U, Read		DSRPAG = 0x200	1	PSV: First lsw page	DSRPAG = 0x200	0	See **Note 1**
U, Read		DSRPAG = 0x300	1	PSV: First MSB page	DSRPAG = 0x2FF	1	PSV: Last lsw page

Legend: O = Overflow, U = Underflow, R = Read, W = Write

Notes:
1. The Register Indirect Addressing now addresses a location in the base Data Space (0x0000-0x8000).
2. An EDS access, with DSRPAG = 0x000, will generate an address error trap.
3. Only reads from PS are supported using DSRPAG.
4. Pseudolinear Addressing is not supported for large offsets.

4.4.2.1 Extended X Data Space

The lower portion of the base address space range, between 0x0000 and 0x7FFF, is always accessible, regardless of the contents of the Data Space Read Page register. It is indirectly addressable through the register indirect instructions. It can be regarded as being located in the default EDS Page 0 (i.e., EDS address range of 0x000000 to 0x007FFF with the base address bit, EA[15] = 0, for this address range). However, Page 0 cannot be accessed through the upper 32 Kbytes, 0x8000 to 0xFFFF of base Data Space, in combination with DSRPAG = 0x00. Consequently, DSRPAG is initialized to 0x001 at Reset.

Notes:
1. DSRPAG should not be used to access Page 0. An EDS access with DSRPAG set to 0x000 will generate an address error trap.
2. Clearing the DSRPAG in software has no effect.

The remaining PSV pages are only accessible using the DSRPAG register in combination with the upper 32 Kbytes, 0x8000 to 0xFFFF, of the base address, where the base address bit, EA[15] = 1.

4.4.2.2 Software Stack

The W15 register serves as a dedicated Software Stack Pointer (SSP), and is automatically modified by exception processing, subroutine calls and returns; however, W15 can be referenced by any instruction in the same manner as all other W registers. This simplifies reading, writing and manipulating the Stack Pointer (for example, creating stack frames).

Note: To protect against misaligned stack accesses, W15[0] is fixed to '0' by the hardware.

W15 is initialized to 0x1000 during all Resets. This address ensures that the SSP points to valid RAM in all dsPIC33CK256MC506 devices and permits stack availability for non-maskable trap exceptions. These can occur before the SSP is initialized by the user software. You can reprogram the SSP during initialization to any location within Data Space.

The Software Stack Pointer always points to the first available free word and fills the software stack, working from lower toward higher addresses. Figure 4-10 illustrates how it pre-decrements for a stack pop (read) and post-increments for a stack push (writes).

When the PC is pushed onto the stack, PC[15:0] are pushed onto the first available stack word, then PC[22:16] are pushed into the second available stack location. For a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, as shown in Figure 4-10. During exception processing, the MSB of the PC is concatenated with the lower eight bits of the CPU STATUS Register, SR. This allows the contents of SRL to be preserved automatically during interrupt processing.

Notes:

1. To maintain system Stack Pointer (W15) coherency, W15 is never subject to (EDS) paging and is therefore, restricted to an address range of 0x0000 to 0xFFFF. The same applies to W14 when used as a Stack Frame Pointer (SFA = 1).
2. As the stack can be placed in, and can access X and Y spaces, care must be taken regarding its use, particularly with regard to local automatic variables in a C development environment.

4.4.3 Instruction Addressing Modes

The addressing modes shown in Table 4-3 form the basis of the addressing modes optimized to support the specific features of individual instructions. The addressing modes provided in the MAC class of instructions differ from those in the other instruction types.

Table 4-3. Fundamental Addressing Modes Supported

Addressing Mode	Description
File Register Direct	The address of the file register is specified explicitly.
Register Direct	The contents of a register are accessed directly.
Register Indirect	The contents of Wn form the Effective Address (EA).
Register Indirect Post-Modified	The contents of Wn form the EA. Wn is post-modified (incremented or decremented) by a constant value.
Register Indirect Pre-Modified	Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA.
Register Indirect with Register Offset (Register Indexed)	The sum of Wn and Wb forms the EA.
Register Indirect with Literal Offset	The sum of Wn and a literal forms the EA.

4.4.3.1 File Registration Instructions

Enter a short description of your concept here (optional).

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (Near Data Space). Most file register instructions employ a Working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the MUL instruction), which writes the result to a register or register pair. The MOV instruction allows additional flexibility and can access the entire Data Space.

4.4.3.2 MCU Instructions

The three-operand MCU instructions are of the form:

```
Operand 3 = Operand 1 [function] Operand 2
```

where Operand 1 is always a Working register (that is, the addressing mode can only be Register Direct), which is referred to as Wb. Operand 2 can be a W register fetched from data memory or a 5-bit literal. The result location can either be a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-Bit or 10-Bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

4.4.3.3 Move and Accumulator Instructions

Move instructions, and the DSP accumulator class of instructions, provide a greater degree of addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the MOV instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-Bit Literal
- 16-Bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

4.4.3.4 MAC Instructions

The dual source operand DSP instructions (CLR, ED, EDAC, MAC, MPY, MPY.N, MOVSAC and MSC), also referred to as MAC instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through register indirect tables.

The two-source operand prefetch registers must be members of the set {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must therefore, be valid addresses within X Data Space for W8 and W9, and Y Data Space for W10 and W11.

Note: Register Indirect with Register Offset Addressing mode is available only for W9 (in X space) and W11 (in Y space).

In summary, the following addressing modes are supported by the MAC class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

4.4.3.5 Other Instructions

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, BRA (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the DISI instruction uses a 14-bit unsigned literal field. In some instructions, such as ULNK, the source of an operand or result is implied by the opcode itself. Certain operations, such as a NOP, do not have any operands.

4.4.4 Modulo Addressing

Modulo Addressing mode is a method of providing an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either Data or Program Space (since the Data Pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into Program Space) and Y Data Spaces. Modulo Addressing can operate on any W Register Pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing since these two registers are used as the Stack Frame Pointer and Stack Pointer, respectively.

In general, any particular circular buffer can be configured to operate in only one direction, as there are certain restrictions on the buffer start address (for incrementing buffers) or end address (for decrementing buffers), based upon the direction of the buffer.

The only exception to the usage restrictions is for buffers that have a power-of-two length. As these buffers satisfy the start and end address criteria, they can operate in a Bidirectional mode (that is, address boundary checks are performed on both the lower and upper address boundaries).

4.4.4.7 Start and End Address

The Modulo Addressing scheme requires that a starting and ending address be specified and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT and YMODEND.

Note: Y space Modulo Addressing EA calculations assume word-sized data (LSb of every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

4.4.4.8 W Address Register Selection

The Modulo and Bit-Reversed Addressing Control register, MODCON, contains enable flags, as well as a W register field to specify the W Address registers. The XWM and YWM fields select the registers that operate with Modulo Addressing:

- If XWM = 1111, X RAGU and X WAGU Modulo Addressing is disabled
- If YWM = 1111, Y AGU Modulo Addressing is disabled

The X Address Space Pointer W (XWM) register, to which Modulo Addressing is to be applied, is stored in MODCON[3:0]. Modulo Addressing is enabled for X Data Space when XWM is set to any value other than '1111' and the XMODEN bit is set (MODCON[15]).

The Y Address Space Pointer W (YWM) register, to which Modulo Addressing is to be applied, is stored in MODCON[7:4]. Modulo Addressing is enabled for Y Data Space when YWM is set to any value other than '1111' and the YMODEN bit (MODCON[14]) is set.

MOV     W0, MODCON      ;enable W1, X AGU for modulo

MOV     #0x0000, W0     ;W0 holds buffer fill value

MOV     #0x1110, W1     ;point W1 to buffer

DO      AGAIN, #0x31    ;fill the 50 buffer locations
MOV     W0, [W1++]      ;fill the next location
AGAIN:  INC W0, W0      ;increment the fill value
```

4.4.4.9 Modulo Addressing Applicability

Modulo Addressing can be applied to the Effective Address (EA) calculation associated with any W register. Address boundaries check for addresses equal to:

- The upper boundary addresses for incrementing buffers
- The lower boundary addresses for decrementing buffers

It is important to realize that the address boundaries check for addresses less than, or greater than, the upper (for incrementing buffers) and lower (for decrementing buffers) boundary addresses (not just equal to). Address changes can therefore, jump beyond boundaries and still be adjusted correctly.

Note: The modulo corrected Effective Address is written back to the register only when Pre-Modify or Post-Modify Addressing mode is used to compute the Effective Address. When an address offset (such as [W7 + W2]) is used, Modulo Addressing correction is performed, but the contents of the register remain unchanged.

4.5 Bit-Reversed Addressing

Bit-Reversed Addressing mode is intended to simplify data reordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

4.5.1 Bit-Reversed Addressing Implementation

Bit-Reversed Addressing mode is enabled in any of these situations:

- BWMx bits (W register selection) in the MODCON register are any value other than '1111' (the stack cannot be accessed using Bit-Reversed Addressing)
- The BREN bit is set in the XBREV register
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment

If the length of a bit-reversed buffer is $M = 2^N$ bytes, the last 'N' bits of the data buffer start address must be zeros.

XB[14:0] are the Bit-Reversed Addressing modifier, or 'pivot point', which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

Note: All bit-reversed EA calculations assume word-sized data (LSb of every EA is always clear). The XB value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word-sized data writes. It does not function for any other addressing mode or for byte-sized data and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always

added to the address modifier (XB) and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word-sized data are a requirement, the LSb of the EA is ignored (and always clear).

Note: Modulo Addressing and Bit-Reversed Addressing can be enabled simultaneously using the same W register, but Bit-Reversed Addressing operation will always take precedence for data writes when enabled.

If Bit-Reversed Addressing has already been enabled by setting the BREN (XBREV[15]) bit, a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the Bit-Reversed Pointer.

4.6 Interfacing Program and Data Memory Spaces

The dsPIC33CK256MC506 family architecture uses a 24-bit wide Program Space (PS) and a 16-bit wide Data Space (DS). The architecture is also a modified Harvard scheme, meaning that data can also be present in the Program Space. To use these data successfully, they must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the architecture of the dsPIC33CK256MC506 family devices provides two methods by which Program Space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the Program Space
- Remapping a portion of the Program Space into the Data Space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. The application can only access the least significant word of the program word.

Table 4-5. Program Space Address Construction

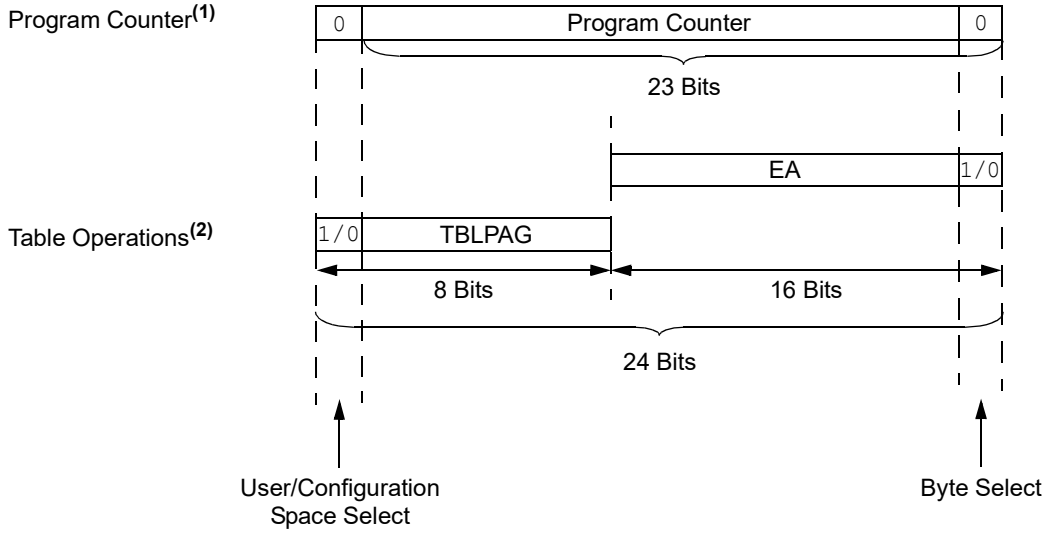
Figure 4-13. Data Access from Program Space Address Generation



Note 1: The Least Significant bit (LSb) of Program Space addresses is always fixed as '0' to maintain word alignment of data in the Program and Data Spaces.

2: Table operations are not required to be word-aligned. Table Read operations are permitted in the configuration memory space.

4.6.1 Data Access from Program Memory Using Table Instructions

The TBLRDL and TBLWTL instructions offer a direct method of reading or writing the lower word of any address within the Program Space without going through Data Space. The TBLRDH and TBLWTH instructions are the only method to read or write the upper eight bits of a Program Space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to Data Space addresses. Program memory can thus be regarded as two 16-bit wide word address spaces, residing side by side, each with the same address range. TBLRDL and TBLWTL access the space that contains the least significant data word. TBLRDH and TBLWTH access the space that contains the upper data byte.

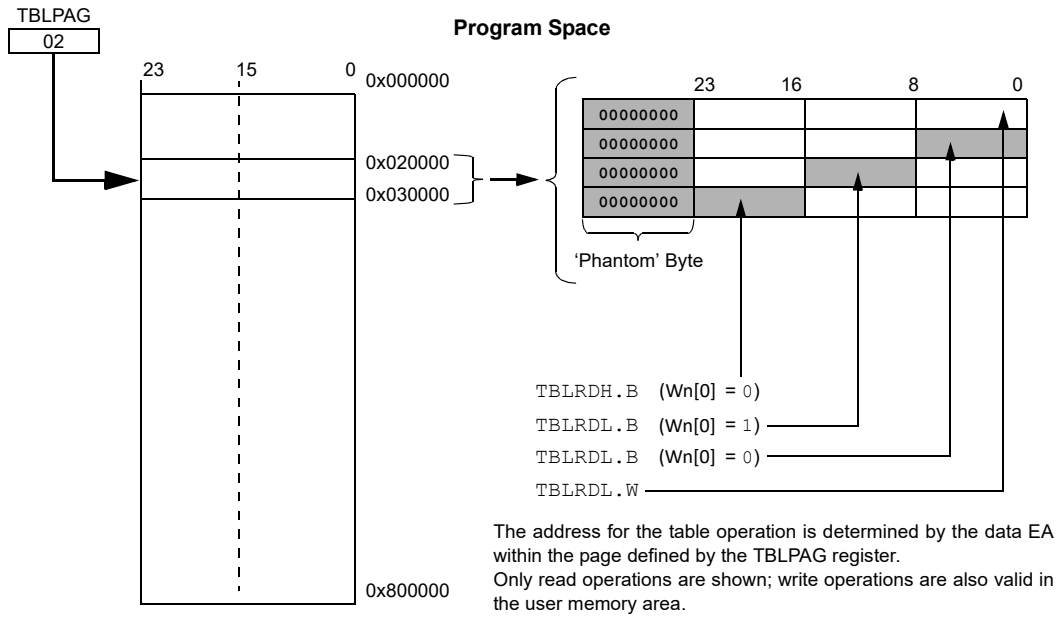
Two table instructions are provided to move byte or word-sized (16-bit) data to and from Program Space. Both function as either byte or word operations.

- TBLRDL (Table Read Low):
  - In Word mode, this instruction maps the lower word of the Program Space location (P[15:0]) to a data address (D[15:0])
  - In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.
- TBLRDH (Table Read High):
  - In Word mode, this instruction maps the entire upper word of a program address (P[23:16]) to a data address. The 'phantom' byte (D[15:8]) is always '0'.
  - In Byte mode, this instruction maps the upper or lower byte of the program word to D[7:0] of the data address in the TBLRDL instruction. The data is always '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a Program Space address. The details of their operation are explained in 5. Flash Program Memory.

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user application and configuration spaces. When TBLPAG[7] = 0, the table page is located in the user memory space. When TBLPAG[7] = 1, the page is located in configuration space.

Figure 4-14. Accessing Program Memory with Table Instructions



The address for the table operation is determined by the data EA within the page defined by the TBLPAG register.
Only read operations are shown; write operations are also valid in the user memory area.

5. Flash Program Memory

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Flash Programming"** (www.microchip.com/DS70000609) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The dsPIC33CK256MC506 family devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire V_{DD} range.

Flash memory can be programmed in three ways:

- In-Circuit Serial Programming™ (ICSP™) programming capability
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)
- Run-Time Self-Programming (RTSP)

ICSP allows for a dsPIC33CK256MC506 family device to be serially programmed while in the end application circuit. This is done with a Programming Clock and Programming Data (PGCx/PGDx) line, and three other lines for power (V_{DD}), ground (V_{SS}) and Master Clear ($\overline{MCLR}$). This allows customers to manufacture boards with unprogrammed devices and then program the device just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

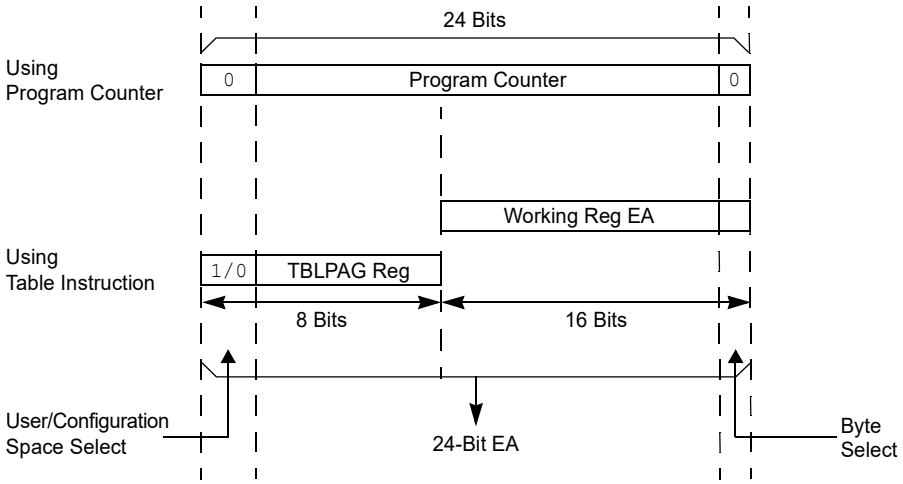
Enhanced In-Circuit Serial Programming uses an on-board bootloader, known as the Programming Executive, to manage the programming process. Using an SPI data frame format, the Programming Executive can erase, program and verify program memory. For more information on Enhanced ICSP, see the device programming specification.

RTSP is accomplished using `TBLRD` (Table Read) and `TBLWT` (Table Write) instructions. With RTSP, the user application can write program memory data by double program memory words or by blocks ('rows') of 128 instructions (256 addressable bytes). RTSP can erase program memory in blocks or 'pages' of 1024 instructions (2048 addressable bytes) at a time.

5.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the Table Read and Table Write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits[7:0] of the TBLPAG register and the Effective Address (EA) from a W register, specified in the table instruction, as shown in Figure 5-1. The `TBLRDL` and `TBLWTL` instructions are used to read or write to bits[15:0] of program memory. `TBLRDL` and `TBLWTL` can access program memory in both Word and Byte modes. The `TBLRDH` and `TBLWTH` instructions are used to read or write to bits[23:16] of program memory. `TBLRDH` and `TBLWTH` can also access program memory in Word or Byte mode.

Figure 5-1. Addressing for Table Registers



5.2 RTSP Operation

RTSP allows the user application to program one double instruction word or one row at a time. The double instruction word write blocks and single row write blocks are edge-aligned, from the beginning of program memory, on boundaries of one double instruction word and 64 double instruction words, respectively.

The basic sequence for RTSP programming is to first load two 24-bit instructions into the NVM write latches found in configuration memory space. Refer to Figure 4-1 through Figure 4-3 for write latch addresses. Then, the WR bit in the NVMCON register is set to initiate the write process. The processor stalls (waits) until the programming operation is finished. The WR bit is automatically cleared when the operation is finished.

Double instruction word writes are performed by manually loading both write latches, using `TBLWTL` and `TBLWTH` instructions, and then initiating the NVM write while the NVMOPx bits are set to '0x1'. The program space destination address is defined by the NVMADR/U registers.

Row programming is performed by first loading 128 instructions into data RAM and then loading the address of the first instruction in that row into the NVMSRCADRL/H registers. Once the write has been initiated, the device will automatically load two instructions into the write latches and write them to the program space destination address defined by the NVMADR/U registers.

The operation will increment the NVMSRCADRL/H and the NVMADR/U registers until all double instruction words have been programmed.

The RPDF bit (NVMCON[9]) selects the format of the stored data in RAM to be either compressed or uncompressed. See Figure 5-2 for data formatting.

Compressed data help to reduce the amount of required RAM by using the upper byte of the second word for the MSB of the second instruction.

All erase and program operations may optionally use the NVM interrupt to signal the successful completion of the operation.

5.3 Error Correcting Code (ECC)

In order to improve program memory performance and durability, the devices include Error Correcting Code functionality (ECC) as an integral part of the Flash memory controller. ECC can determine the presence of single bit errors in program data, including which bit is in error, and correct the data automatically without user intervention. ECC cannot be disabled.

When data are written to program memory, ECC generates a 7-bit Hamming code parity value for every two (24-bit) instruction words. The data are stored in blocks of 48 data bits and seven parity bits; parity data are not memory-mapped and are inaccessible. When the data are read back, the ECC calculates the parity on them and compares it to the previously stored parity value. If a parity mismatch occurs, there are two possible outcomes:

- Single bit error has occurred and has been automatically corrected on read-back.
- Double-bit error has occurred and the read data are not changed.

Single bit error occurrence can be identified by the state of the ECCSBEIF (IFS0[13]) bit. An interrupt can be generated when the corresponding interrupt enable bit is set, ECCSBEIE (IEC0[13]). The ECCSTATL register contains the parity information for single bit errors. The SECOUT[7:0] bit field contains the expected calculated SEC parity and the SECIN[7:0] bits contain the actual value from a Flash read operation. The SECSYNDx bits (ECCSTATH[7:0]) indicate the bit position of the single bit error within the 48-bit pair of instruction words. When no error is present, SECINx equals SECOUTx and SECSYNDx is zero. The ECCSTATL and ECCSTATH registers will only update and be valid when an error has occurred, or when including Fault injection is enabled and an ECCADDR match occurs.

Double-bit errors result in a generic hard trap. The ECCDBE bit (INTCON4[1]) will be set to identify the source of the hard trap. If no Interrupt Service Routine is implemented for the hard trap, a device Reset will also occur. The ECCSTATH register contains double-bit error status information. The DEDOUT bit is the expected calculated DED parity and DEDIN is the actual value from a Flash read operation. When no error is present, DEDIN equals DEDOUT.

5.4 ECC Fault Injection

To test Fault handling, an EEC error can be generated. Both single and double-bit errors can be generated in both the read and write data paths. Read path Fault injection first reads the Flash data and then modifies them prior to entering the ECC logic. Write path Fault injection modifies the actual data prior to them being written into the target Flash and will cause an EEC error on a subsequent Flash read. The following procedure is used to inject a Fault:

1. Load Flash target address into the ECCADDR register.
2. Select 1st Fault bit determined by FLT1PTRx (ECCCONH[7:0]). The target bit is inverted to create the Fault.
3. If a double Fault is desired, select the 2nd Fault bit determined by FLT2PTRx (ECCCONH[15:8]); otherwise, set to all '1's.
4. Write the NVMKEY unlock sequence.
5. Enable the ECC Fault injection logic by setting the FLTINJ bit (ECCCONL[0]).
6. Perform a read or write to the Flash target address.

5.5 Flash OTP by ICSP™ Write Inhibit

ICSP Write Inhibit is an access restriction feature, that when activated, restricts all of Flash memory. Once activated, ICSP Write Inhibit permanently prevents ICSP Flash programming and erase operations, and cannot be deactivated. This feature is intended to prevent alteration of Flash memory contents, with behavior similar to One-Time-Programmable (OTP) devices.

RTSP, including erase and programming operations, is not restricted when ICSP Write Inhibit is activated; however, code to perform these actions must be programmed into the device before ICSP Write Inhibit is activated. This allows for a bootloader-type application to alter Flash contents with ICSP Write Inhibit activated.

Entry into ICSP and Enhanced ICSP modes is not affected by ICSP Write Inhibit. In these modes, it will continue to be possible to read configuration memory space and any user memory space regions which are not code-protected. With ICSP writes inhibited, an attempt to set WR (NVMCON[15]) = 1 will maintain WR = 0, and instead, set WRERR (NVMCON[13]) = 1. All Enhanced ICSP erase and programming commands will have no effect with self-checked programming commands returning a FAIL response opcode (PASS if the destination already exactly matched the requested programming data).

Once ICSP Write Inhibit is activated, it is not possible for a device executing in Debug mode to erase/write Flash, nor can a debug tool switch the device to Production mode. ICSP Write Inhibit should therefore only be activated on devices programmed for production.

5.5.1 Activating Flash OTP by ISCP Write Inhibit

Note: It is not possible to deactivate ICSP Write Inhibit.

ICSP Write Inhibit is activated by executing a pair of NVMCON double-word programming commands to save two 16-bit activation values in the configuration memory space. The target NVM addresses and values required for activation are shown in Table 5-1. Once both addresses contain their activation values, ICSP Write Inhibit will take permanent effect on the next device Reset.

Only the lower 16 data bits stored at the activation addresses are evaluated; the upper eight bits and second 24-bit word written by the double-word programming should be written as '0's. The addresses can be programmed in any order and also during separate ICSP/Enhanced ICSP/RTSP sessions, but any attempt to program an incorrect 16-bit value or use a row programming operation to program the values will be aborted without altering the existing data.

Write Lock 2	0x80102C	0x006870

5.6 Program Flash Memory Control Registers

Six SFRs are used to write and erase the Program Flash Memory: NVMCON, NVMKEY, NVMADR/U and NVMSRCADRL/H.

The NVMCON register selects the operation to be performed (page erase, word/row program) and initiates the program or erase cycle.

NVMKEY is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register. There are two NVM Address registers: NVMADRU and NVMADR. These two registers, when concatenated, form the 24-bit Effective Address (EA) of the selected word/row for programming operations, or the selected page for erase operations. The NVMADRU register is used to hold the upper eight bits of the EA, while the NVMADR register is used to hold the lower 16 bits of the EA.

For row programming operation, data to be written to Program Flash Memory are written into data memory space (RAM) at an address defined by the NVMSRCADRL/H register pair (location of first element in row programming data).

Notes:

1. These bits can only be reset on a POR.
2. If this bit is set, there will be minimal power savings (I_{IDLE}), and upon exiting Idle mode, there is a delay (T_{VREG}) before Flash memory becomes operational.
3. All other combinations of NVMOP[3:0] are unimplemented.
4. Execution of the `PWRSAV` instruction is ignored while any of the NVM operations are in progress.
5. Two adjacent words on a 4-word boundary are programmed during execution of this operation.

6. Resets

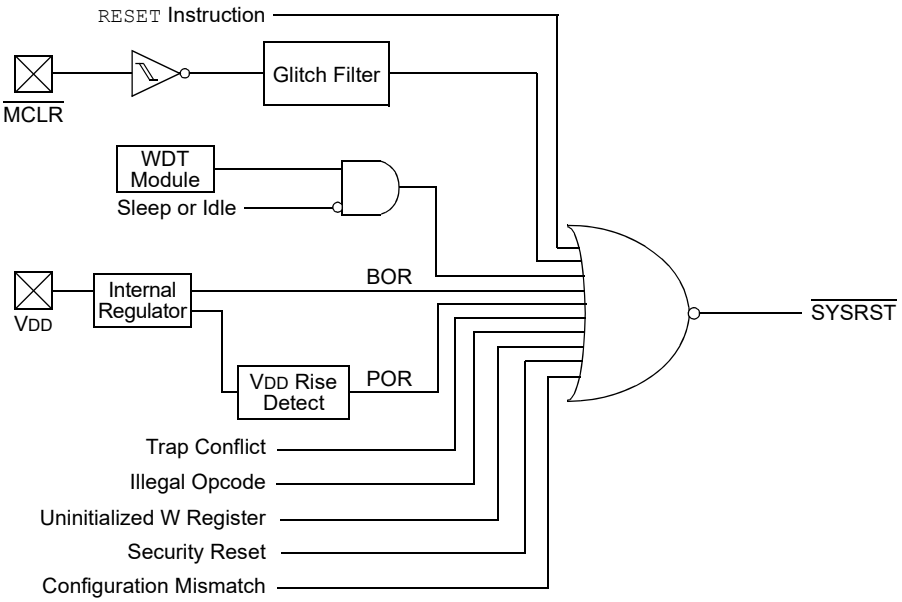
Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Reset"** (www.microchip.com/DS70602) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The Reset module combines all Reset sources and controls the device Master Reset Signal, $\overline{\text{SYSRST}}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- BOR: Brown-out Reset
- $\overline{\text{MCLR}}$: Master Clear Pin Reset
- SWR: `RESET` Instruction
- WDTO: Watchdog Timer Time-out Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
  - Illegal Opcode Reset
  - Uninitialized W Register Reset
  - Security Reset

A simplified block diagram of the Reset module is shown in Figure 6-1

Figure 6-1. Master Reset System Block Diagram



Any active source of Reset will make the $\overline{\text{SYSRST}}$ signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state, and some are unaffected.

Note: Refer to the specific peripheral section or 4. Memory Organization of this data sheet for register Reset states.

All types of device Reset set a corresponding status bit in the RCON register to indicate the type of Reset.

A POR clears all the bits, except for the BOR and POR bits (RCON[1:0]) that are set. The user application can set or clear any bit, at any time, during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this manual.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

For all Resets, the default clock source is determined by the FNOSC[2:0] bits in the FOSCSEL Configuration register. The value of the FNOSCx bits is loaded into the NOSC[2:0] (OSCCON[10:8]) bits on Reset, which in turn, initializes the system clock.

6.1 Reset Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

7. Interrupt Controller

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Interrupts"** (www.microchip.com/DS70000600) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The dsPIC33CK256MC506 family interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33CK256MC506 family CPU.

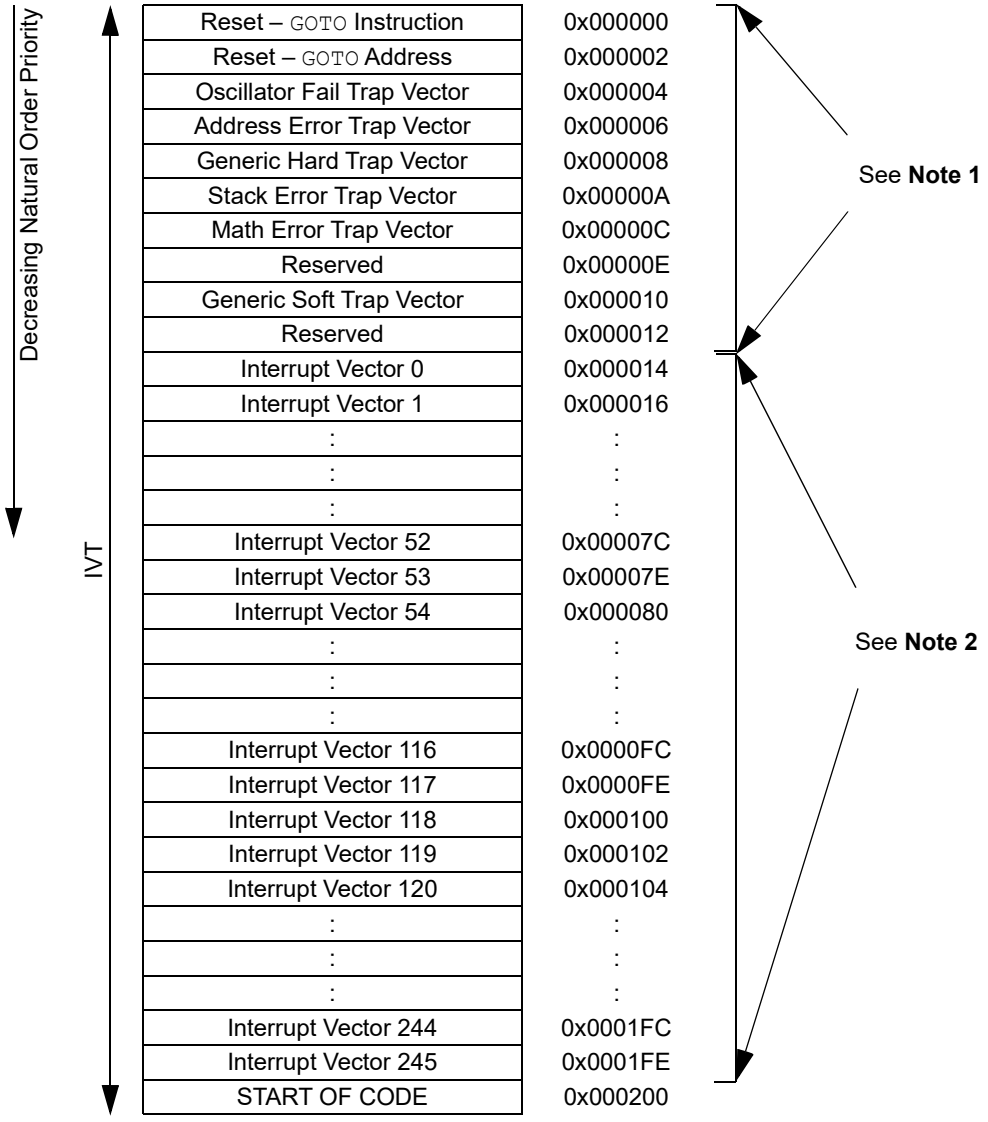
The interrupt controller has the following features:

- Six Processor Exceptions and Software Traps
- Seven User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with a Unique Vector for each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Fixed Interrupt Entry and Return Latencies
- Alternate Interrupt Vector Table (AIVT) for Debug Support

7.1 Interrupt Vector Table

The dsPIC33CK256MC506 family Interrupt Vector Table (IVT), shown in Figure 7-1, resides in program memory, starting at location, 000004h. The IVT contains six non-maskable trap vectors and up to 246 sources of interrupts. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Figure 7-1. dsPIC33CK256MC506 Family Interrupt Vector Table



Notes:

1. See Table 7-1.
2. See Table 7-2.

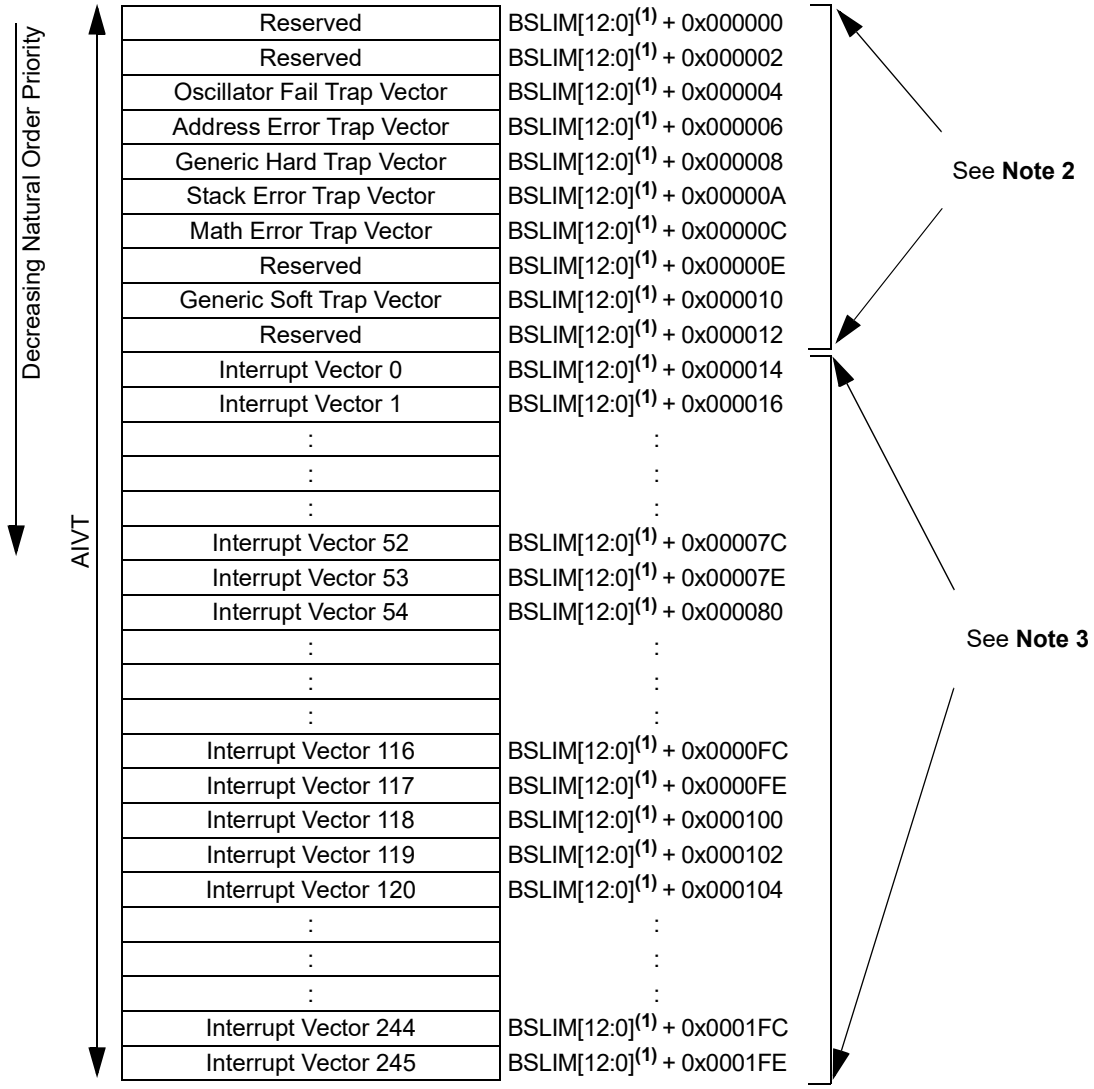
Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with Vector 0 takes priority over interrupts at any other vector address.

7.2 Alternate Interrupt Vector Table

The Alternate Interrupt Vector Table (AIVT), shown in Figure 7-2, is available only when the Boot Segment (BS) is defined and the AIVT has been enabled. To enable the Alternate Interrupt Vector Table, the Configuration bit, AIVTDIS in the FSEC register, must be programmed and the AIVTEN bit must be set (INTCON2[8] = 1). When the AIVT is enabled, all interrupt and exception processes use the alternate vectors instead of the default vectors. The AIVT begins at the start of the last page of the Boot Segment, defined by BSLIM[12:0]. The second half of the page is no longer usable space. The Boot Segment must be at least two pages to enable the AIVT.

Note: Although the Boot Segment must be enabled in order to enable the AIVT, application code does not need to be present inside of the Boot Segment. The AIVT (and IVT) will inherit the Boot Segment code protection.

Figure 7-2. dsPIC33CK256MC506 Alternate Interrupt Vector Table



Notes:

1. The address depends on the size of the Boot Segment defined by BSLIM[12:0]: [(BSLIM[12:0] – 1) x 0x800] + Offset.
2. See Table 7-1.
3. See Table 7-2.

7.3 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33CK256MC506 family devices clear their registers in response to a Reset, which forces the PC to zero. The device then begins program execution at location, 0x000000. A `GOTO` instruction at the Reset address can redirect program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT should be programmed with the address of a default interrupt handler routine that contains a `RESET` instruction.

2. Availability dependent on supported peripherals, refer to Table 1.
3. Availability dependent on number of supported ADC channels. Refer to Table 1 for ADC channel availability on device variants.

7.4 Interrupt Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

7.5 Interrupt Control and Status Registers

The dsPIC33CK256MC506 family devices implement the following registers for the interrupt controller:

- INTCON1
- INTCON2
- INTCON3
- INTCON4
- INTTREG

7.6 INTCON1 through INTCON4

Global interrupt control functions are controlled from INTCON1, INTCON2, INTCON3 and INTCON4.

INTCON1 contains the Interrupt Nesting Disable bit (NSTDIS), as well as the control and status flags for the processor trap sources.

The INTCON2 register controls external interrupt request signal behavior, contains the Global Interrupt Enable bit (GIE) and the Alternate Interrupt Vector Table Enable bit (AIVTEN).

INTCON3 contains the status flags for the Auxiliary PLL and DO stack overflow status trap sources.

The INTCON4 register contains the Software Generated Hard Trap Status bit (SGHT).

7.6.1 IFSx

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared via software.

7.6.2 IECx

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

7.6.3 IPCx

The IPCx registers are used to set the Interrupt Priority Level (IPL) for each source of interrupt. Each user interrupt source can be assigned to one of seven priority levels.

7.6.4 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into the Vector Number (VECNUM[7:0]) and Interrupt Level bits (ILR[3:0]) fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence as they are listed in Table 7-2. For example, INT0 (External Interrupt 0) is shown as having Vector Number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0[0], the INT0IE bit in IEC0[0] and the INT0IP[2:0] bits in the first position of IPC0 (IPC0[2:0]).

Name: IPC6
Offset: 0x84C

Bit	15	14	13	12	11	10	9	8
		U2RXIP[2:0]				INT3IP[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	0	0		1	0	0

Bit	7	6	5	4	3	2	1	0
						T2IP[2:0]		
Access						R/W	R/W	R/W
Reset						1	0	0

Bits 14:12 – U2RXIP[2:0] UART2 Receiver Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 10:8 – INT3IP[2:0] External Interrupt 3 Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 2:0 – T2IP[2:0] Timer2 Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

7.7.28 Interrupt Priority Register 7

Name: IPC7
Offset: 0x84E

Bit	15	14	13	12	11	10	9	8
		C1RXIP[2:0]				SPI2TXIP[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	0	0		1	0	0

Bit	7	6	5	4	3	2	1	0
		SPI2RXIP[2:0]				U2TXIP[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	0	0		1	0	0

Bits 14:12 – C1RXIP[2:0] CAN1 RX Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 10:8 – SPI2TXIP[2:0] SPI2 Transmitter Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 6:4 – SPI2RXIP[2:0] SPI2 Receiver Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 2:0 – U2TXIP[2:0] UART 2 Transmitter Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3

Value	Description
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

7.7.29 Interrupt Priority Register 8

Name: IPC8
Offset: 0x850

Bit	15	14	13	12	11	10	9	8
		IOC3IP[2:0]						
Access		R/W	R/W	R/W				
Reset		1	0	0				

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

Bits 14:12 – IOC3IP[2:0] Interrupt-on-Change 3 Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

7.7.30 Interrupt Priority Register 9

Name: IPC9
Offset: 0x852

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						T3IP[2:0]		
Access						R/W	R/W	R/W
Reset						1	0	0

Bits 2:0 – T3IP[2:0] Timer3 Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

7.7.31 Interrupt Priority Register 10

Name: IPC10
Offset: 0x854

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
		T4IP[2:0]				IOC4IP[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	0	0		1	0	0

Bits 6:4 – T4IP[2:0] Timer4 Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 2:0 – IOC4IP[2:0] Interrupt-on-Change 4 Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

7.7.32 Interrupt Priority Register 11

Name: IPC11
Offset: 0x856

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
		DMTIP[2:0]						
Access		R/W	R/W	R/W				
Reset		1	0	0				

Bits 6:4 – DMTIP[2:0] Deadman Timer Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

7.7.33 Interrupt Priority Register 12

Name: IPC12
Offset: 0x858

Bit	15	14	13	12	11	10	9	8
		CRCIP[2:0]				U2EIP[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	0	0		1	0	0

Bit	7	6	5	4	3	2	1	0
		U1EIP[2:0]				QEI1IP[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	0	0		1	0	0

Bits 14:12 – CRCIP[2:0] Cyclic Redundancy Check Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 10:8 – U2EIP[2:0] UART2 Error Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 6:4 – U1EIP[2:0] UART1 Error Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 2:0 – QEI1IP[2:0] QEI1 Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3

Value	Description
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

7.7.34 Interrupt Priority Register 13

Name: IPC13
Offset: 0x85A

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						C1TXIP[2:0]		
Access						R/W	R/W	R/W
Reset						1	0	0

Bits 2:0 – C1TXIP[2:0] CAN1 TX Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

7.7.35 Interrupt Priority Register 14

Name: IPC14

Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	0	0		1	0	0

Bits 10:8 – U3TXIP[2:0] UART3 Transmitter Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 6:4 – U3RXIP[2:0] UART3 Receiver Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 2:0 – U3EIP[2:0] UART3 External Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

7.7.36 Interrupt Priority Register 15

Name: IPC15
Offset: 0x85E

Bit	15	14	13	12	11	10	9	8
		PTGSTEPIP[2:0]						
Access		R/W	R/W	R/W				
Reset		1	0	0				

Bit	7	6	5	4	3	2	1	0
		ICDIP[2:0]						
Access		R/W	R/W	R/W				
Reset		1	0	0				

Bits 14:12 – PTGSTEPIP[2:0] PTG Step Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2
1	Interrupt Priority Level 1
0	Interrupt Priority Level 0 (lowest)

Bits 6:4 – ICDIP[2:0] ICD Interrupt Priority bits

Value	Description
7	Interrupt Priority Level 7 (highest)
6	Interrupt Priority Level 6
5	Interrupt Priority Level 5
4	Interrupt Priority Level 4 (default)
3	Interrupt Priority Level 3
2	Interrupt Priority Level 2

8. I/O Ports

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"I/O Ports with Edge Detect"** (www.microchip.com/DS70005322) in the *"dsPIC33/PIC24 Family Reference Manual"*.

Many of the device pins are shared among the peripherals and the Parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

Some of the key features of the I/O ports are:

- Individual Output Pin Open-Drain Enable/Disable
- Individual Input Pin Weak Pull-up and Pull-Down
- Monitor Selective Inputs and Generate Interrupt when Change in Pin State is Detected
- Operation during Sleep and Idle modes

8.1 Parallel I/O (PIO) Ports

All port pins have 12 registers directly associated with their operation as digital I/Os. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input.

All port pins are defined as inputs after a Reset. Reads from the latch (LATx), read the latch. Writes to the latch, write the latch. Reads from the port (PORTx), read the port pins, while writes to the port pins, write the latch. Any bit and its associated data and control registers that are not valid for a particular device are disabled. This means the corresponding LATx and TRISx registers, and the port pin are read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs. Table 8-1 shows the pin availability. Figure 8-1 shows the 5V input tolerant pins across this device.

8.1.1 Open-Drain Configuration

In addition to the PORTx, LATx and TRISx registers for data control, port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Enable for PORTx register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs, other than V_{DD}, by using external pull-up resistors. The maximum open-drain voltage allowed on any pin is the same as the maximum V_{IH} specification for that particular pin.

8.2 Configuring Analog and Digital Port Pins

The ANSELx registers control the operation of the analog port pins. The port pins that are to function as analog inputs or outputs must have their corresponding ANSELx and TRISx bits set. In order to use port pins for I/O functionality with digital modules, such as timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx registers have a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

Pins with analog functions affected by the ANSELx registers are listed with a buffer type of analog in the Pinout I/O Descriptions (see Table 1-1).

If the TRISx bit is cleared (output) while the ANSELx bit is set, the digital output level (V_{OH} or V_{OL}) is converted by an analog peripheral, such as the ADC module or comparator module.

When the PORTx register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin, defined as a digital input (including the ANx pins), can cause the input buffer to consume current that exceeds the device specifications.

8.2.1 I/O Port Write/Read Timing

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a `NOP`.

The following registers are in the PORT module:

- ANSELx (one per port)
- TRISx (one per port)
- PORTx (one per port)
- LATx (one per port)
- ODCx (one per port)
- CNPUx (one per port)
- CNPDx (one per port)
- CNCONx (one per port – optional)
- CNEN0x (one per port)
- CNSTATx (one per port – optional)
- CNEN1x (one per port)
- CNFx (one per port)

8.3 Input Change Notification (ICN)

The Input Change Notification function of the I/O ports allows the dsPIC33CK256MC506 family devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States, even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a Change-of-State. Five control registers are associated with the Change Notification (CN) functionality of each I/O port. To enable the Change Notification feature for the port, the ON bit (CNCONx[15]) must be set.

The CNEN0x and CNEN1x registers contain the CN interrupt enable control bits for each of the input pins. The setting of these bits enables a CN interrupt for the corresponding pins. Also, these bits, in combination with the CNSTYLE bit (CNCONx[11]), define a type of transition when the interrupt is generated. Possible CN event options are listed in Table 8-2.

Table 8-2. Change Notification Event Options

CNSTYLE Bit (CNCONx[11])	CNEN1x Bit	CNEN0x Bit	Change Notification Event Description
0	Does not matter	0	Disabled
0	Does not matter	1	Detects a mismatch between the last read state and the current state of the pin
1	0	0	Disabled
1	0	1	Detects a positive transition only (from '0' to '1')
1	1	0	Detects a negative transition only (from '1' to '0')
1	1	1	Detects both positive and negative transitions

The CNSTATx register indicates whether a change occurred on the corresponding pin since the last read of the PORTx bit. In addition to the CNSTATx register, the CNFx register is implemented for each port. This register contains flags for Change Notification events. These flags are set if the valid transition edge, selected in the CNEN0x and CNEN1x registers, is detected. CNFx stores the occurrence of the event. CNFx bits must be cleared in software to get the next Change Notification interrupt. The CN interrupt is generated only for the I/Os configured as inputs (corresponding TRISx bits must be set).

Note: Pull-ups and pull-downs on Input Change Notification pins should always be disabled when the port pin is configured as a digital output.

8.4 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features, while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient work arounds in application code, or a complete redesign, may be the only option.

Peripheral Pin Select configuration provides an alternative to these choices by enabling peripheral set selection and placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The Peripheral Pin Select configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to any one of these I/O pins. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

8.4.1 Available Pins

The number of available pins is dependent on the particular device and its pin count. Pins that support the Peripheral Pin Select feature include the label, “RPn”, in their full pin designation, where “n” is the remappable pin number. “RP” is used to designate pins that support both remappable input and output functions.

8.4.2 Available Peripherals

The peripherals managed by the Peripheral Pin Select are all digital only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer-related peripherals (input capture and output compare) and interrupt-on-change inputs.

In comparison, some digital only peripheral modules are never included in the Peripheral Pin Select feature. This is because the peripheral’s function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. One example includes I^2C modules. A similar requirement excludes all modules with analog inputs, such as the A/D Converter (ADC)

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/Os and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

8.4.3 Controlling Configuration Changes

Because peripheral mapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. The dsPIC33CK256MC506 devices have implemented the control register lock sequence.

8.4.3.1 Control Register Lock

Under normal operation, writes to the RPINRx and RPORx registers are not allowed. Attempted writes will appear to execute normally, but the contents of the registers will remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK bit (RPCON[11]). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear IOLOCK, the NVMKEY unlock sequence must be executed:

1. Write 0x55 to NVMKEY.
2. Write 0xAA to NVMKEY.
3. Clear (or set) IOLOCK as a single operation.

IOLOCK remains in one state until changed. This allows all of the Peripheral Pin Selects to be configured with a single unlock sequence, followed by an update to all of the control registers. Then, IOLOCK can be set with a second lock sequence.

Note: MPLAB® XC16 provides a built-in C language function for unlocking and modifying the RPCON register:
`__builtin_write_RPCON(value);`
For more information, see the MPLAB® XC16 Help files.

8.5 Considerations for Peripheral Pin Selection

The ability to control Peripheral Pin Selection introduces several considerations into application design that most users would never think of otherwise. This is particularly true for several common peripherals, which are only available as remappable peripherals.

The main consideration is that the Peripheral Pin Selects are not available on default pins in the device's default (Reset) state. More specifically, because all RPINRx registers reset to '1's and RPORx registers reset to '0's, this means all PPS inputs are tied to V_{SS}, while all PPS outputs are disconnected. This means that before any other application code is executed, the user must initialize the device with the proper peripheral configuration. Because the IOLOCK bit resets in the unlocked state, it is not necessary to execute the unlock sequence after the device has come out of Reset. For application safety, however, it is always better to set IOLOCK and lock the configuration after writing to the control registers.

The NVMKEY unlock sequence must be executed as an Assembly language routine. If the bulk of the application is written in C, or another high-level language, the unlock sequence should be performed by writing in-line assembly or by using the `__builtin_write_RPCON(value)` function provided by the compiler.

Choosing the configuration requires a review of all Peripheral Pin Selects and their pin assignments, particularly those that will not be used in the application. In all cases, unused pin-selectable peripherals should be disabled completely. Unused peripherals should have their inputs assigned to an unused RPn pin function. I/O pins with unused RPn functions should be configured with the null peripheral output.

8.6 Input Mapping

The inputs of the Peripheral Pin Select options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The RPINRx registers are used to configure peripheral input mapping. Each register contains sets of 8-bit fields, with each set associated with one of the remappable peripherals. Programming a given peripheral's bit field with an appropriate 8-bit index value maps the RPn pin with the corresponding value, or internal signal, to that peripheral. See Table 8-3 for a list of available inputs.

For example, Figure 8-2 illustrates remappable pin selection for the U1RX input.

Example 8-1 provides a configuration for bidirectional communication with flow control using UART1. The following input and output functions are used:

8.7 Virtual Connections

The dsPIC33CK256MC506 devices support six virtual RPn pins (RP176-RP181), which are identical in functionality to all other RPn pins, with the exception of pinouts. These six pins are internal to the devices and are not connected to a physical device pin.

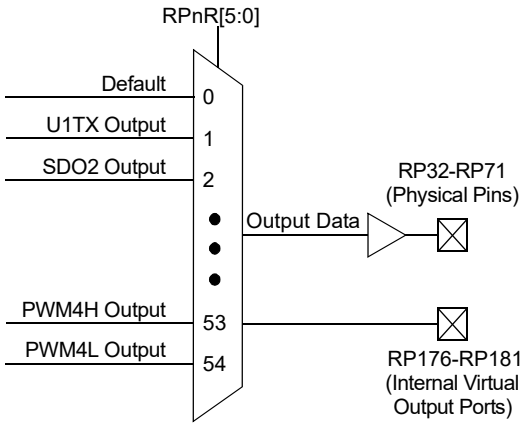
These pins provide a simple way for inter-peripheral connection without utilizing a physical pin. For example, the output of the analog comparator can be connected to RP176 and the PWM Fault input can be configured for RP176 as well. This configuration allows the analog comparator to trigger PWM Faults without the use of an actual physical pin on the device.

8.8 Output Mapping

In contrast to inputs, the outputs of the Peripheral Pin Select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Each register contains sets of 6-bit fields, with each set associated with one RPn pin (see 8.11.2.2. RPINR0 through 8.11.2.31. RPINR49). The value of the bit field corresponds to one of the peripherals and that peripheral's output is mapped to the pin (see Table 8-5 and Figure 8-3).

A null output is associated with the output register Reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

Figure 8-3. Multiplexing Remappable Outputs for RPn



Note: There are six virtual output ports which are not connected to any I/O ports (RP176-RP181). These virtual ports can be accessed by RPOR20, RPOR21 and RPOR22.

8.9 Mapping Limitations

The control schema of the peripheral select pins is not limited to a small range of fixed peripheral configurations. There are no mutual or hardware-enforced lockouts between any of the peripheral mapping SFRs. Literally, any combination of peripheral mappings, across any or all of the RPn pins, is possible. This includes both many-to-one and one-to-many mappings of peripheral inputs, and outputs to pins. While such mappings may be technically possible from a configuration point of view, they may not be supportable from an electrical point of view (see Table 8-5).

8.10 I/O Helpful Tips

1. In some cases, certain pins, as defined in 32.1. DC Characteristics under “Injection Current”, have internal protection diodes to V_{DD} and V_{SS}. The term, “Injection Current”, is also referred to as “Clamp Current”. On designated pins with sufficient external current-limiting precautions by the user, I/O pin input voltages are allowed to be greater or lesser than the data sheet absolute maximum ratings with respect to the V_{SS} and V_{DD} supplies. Note that when the user application forward biases either of the high or low-side internal input clamp diodes, that the resulting current being injected into the device that is clamped internally by the V_{DD} and V_{SS} power rails, may affect the ADC accuracy by four to six counts.
2. I/O pins that are shared with any analog input pin (i.e., ANx) are always analog pins, by default, after any Reset. Consequently, configuring a pin as an analog input pin automatically disables the digital input pin buffer and any attempt to read the digital input level by reading PORTx or LATx will always return a ‘0’, regardless of the digital logic level on the pin. To use a pin as a digital I/O pin on a shared ANx pin, the user application needs to configure the Analog Select for PORTx registers in the I/O ports module (i.e., ANSELx) by setting the appropriate bit that corresponds to that I/O port pin to a ‘0’.

Note: Although it is not possible to use a digital input pin when its analog function is enabled, it is possible to use the digital I/O output function, TRISx = 0x0, while the analog function is also enabled. However, this is not recommended, particularly if the analog input is connected to an external analog voltage source, which would create signal contention between the analog signal and the output pin driver.

3. Most I/O pins have multiple functions. Referring to the device pin diagrams in this data sheet, the priorities of the functions allocated to any pins are indicated by reading the pin name, from left-to-right. The left most function name takes precedence over any function to its right in the naming convention. For example: AN16/T2CK/T7CK/RC1; this indicates that AN16 is the highest priority in this example and will supersede all other functions to its right in the list. Those other functions to its right, even if enabled, would not work as long as any other function to its left was enabled. This rule applies to all of the functions listed for a given pin.
4. Each pin has an internal weak pull-up resistor and pull-down resistor that can be configured using the CNPUx and CNPDx registers, respectively. These resistors eliminate the need for external resistors in certain applications. The internal pull-up is up to ~(V_{DD} – 0.8), not V_{DD}. This value is still above the minimum V_{IH} of CMOS and TTL devices.
5. When driving LEDs directly, the I/O pin can source or sink more current than what is specified in the V_{OH}/I_{OH} and V_{OL}/I_{OL} DC characteristics specification. The respective I_{OH} and I_{OL} current rating only applies to maintaining the corresponding output at or above the V_{OH}, and at or below the V_{OL} levels. However, for LEDs, unlike digital inputs of an externally connected device, they are not governed by the same minimum V_{IH}/V_{IL} levels. An I/O pin output can safely sink or source any current less than that listed in the Absolute Maximum Ratings in 32. Electrical Characteristics of this data sheet. For example:
   V_{OH} = 2.4v @ I_{OH} = -8 mA and V_{DD} = 3.3V

   The maximum output current sourced by any 8 mA I/O pin = 12 mA.

   LED source current < 12 mA is technically permitted.
6. The Peripheral Pin Select (PPS) pin mapping rules are as follows:
   a. Only one “output” function can be active on a given pin at any time, regardless if it is a dedicated or remappable function (one pin, one output).
   b. It is possible to assign a “remappable output” function to multiple pins and externally short or tie them together for increased current drive.
   c. If any “dedicated output” function is enabled on a pin, it will take precedence over any remappable “output” function.
   d. If any “dedicated digital” (input or output) function is enabled on a pin, any number of “input” remappable functions can be mapped to the same pin.
   e. If any “dedicated analog” function(s) are enabled on a given pin, “digital input(s)” of any kind will all be disabled, although a single “digital output”, at the user’s cautionary discretion, can be enabled and active as long as there is no signal contention with an external analog input signal. For example, it is possible for the ADC to convert the digital output logic level, or to toggle a digital output on a comparator or ADC input, provided there is no external analog input, such as for a Built-In Self-Test.
   f. Any number of “input” remappable functions can be mapped to the same pin(s) at the same time, including to any pin with a single output from either a dedicated or remappable “output”.
   g. The TRISx registers control only the digital I/O output buffer. Any other dedicated or remappable active “output” will automatically override the TRISx setting. The TRISx register does not control the digital logic “input” buffer. Remappable digital “inputs” do not automatically override TRISx settings, which means that the TRISx bit must be set to input for pins with only remappable input function(s) assigned.
   h. All analog pins are enabled by default after any Reset and the corresponding digital input buffer on the pin has been disabled. Only the Analog Select for PORTx (ANSELx) registers control the digital input buffer, not the TRISx register. The user must disable the analog function on a pin using the Analog Select for PORTx registers in order to use any “digital input(s)” on a corresponding pin, no exceptions.

9. Oscillator with High-Frequency PLL

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Oscillator Module with High-Speed PLL"** (www.microchip.com/DS70005255) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The dsPIC33CK256MC506 family oscillator with high-frequency PLL includes these characteristics:

- On-Chip Phase-Locked Loop (PLL) to Boost Internal Operating Frequency on Select Internal and External Oscillator Sources
- Doze mode for System Power Savings
- Scalable Reference Clock Output (REFCLKO)
- On-the-Fly Clock Switching between Various Clock Sources
- Fail-Safe Clock Monitoring (FSCM) that Detects Clock Failure and Permits Safe Application Recovery or Shutdown

A block diagram of the dsPIC33CK256MC506 oscillator system is shown in Figure 9-1.

Figure 9-1. dsPIC33CK256MC506 Core Clock Sources Block Diagram

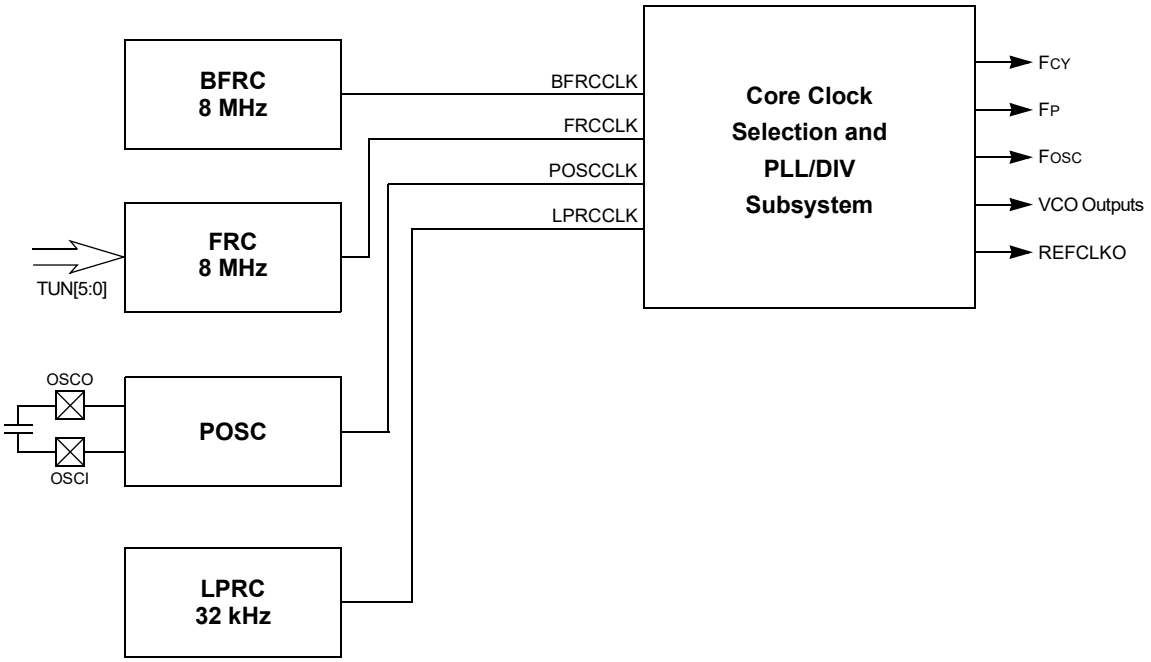

Figure 9-2. dsPIC33CK256MC506 Oscillator Subsystem

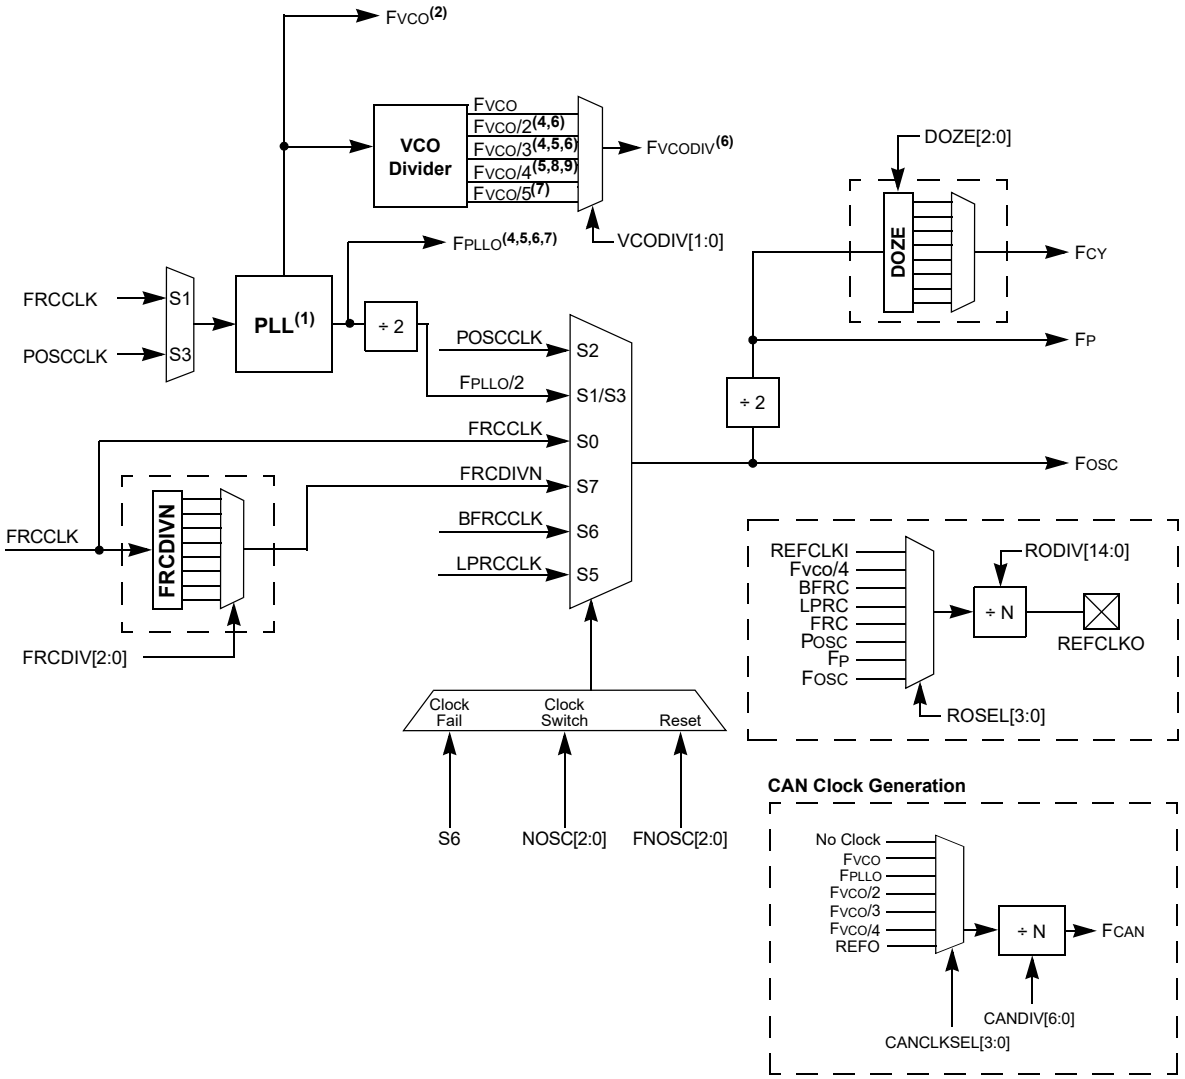

Notes:

1. See Figure 9-3 for details of the PLL module.
2. See Figure 9-3 for the source of F_{VCO}.
3. XTPLL, HSPLL, ECPLL, FRCPLL.
4. Clock option for PWM.

6. Clock option for DAC.
7. Clock option for UART.
8. Clock option for REFO.
9. Clock option for PTG.

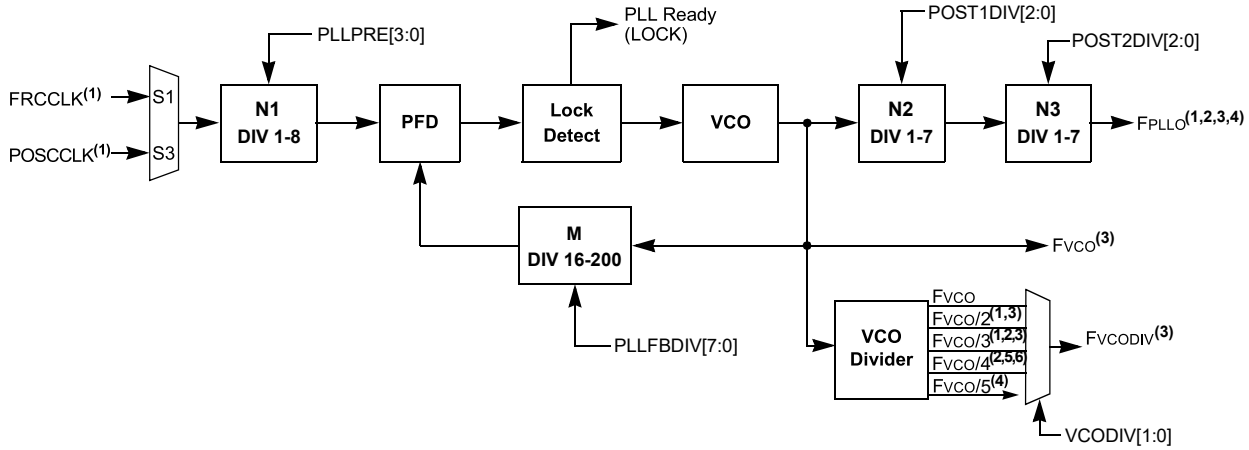
9.1 Primary PLL

The Primary Oscillator and internal FRC Oscillator sources can optionally use an on-chip PLL to obtain higher operating speeds. Figure 9-3 illustrates a block diagram of the Primary PLL module.

For PLL operation, the following requirements must be met at all times without exception:

- The PLL Input Frequency (F_{PLLI}) must be in the range of 8 MHz to 64 MHz
- The PFD Input Frequency (F_{PFD}) must be in the range of 8 MHz to (F_{VCO}/16) MHz
- The VCO Output Frequency (F_{VCO}) must be in the range of 400 MHz to 1600 MHz

Figure 9-3. Primary Core PLL and VCO Detail



Notes:

1. Clock option for PWM.
2. Clock option for ADC.
3. Clock option for DAC.
4. Clock option for UART.
5. Clock option for REFO.
6. Clock option for PTG.

Equation 9-1 provides the relationship between the PLL Input Frequency (F_{PLLI}) and VCO Output Frequency (F_{VCO}).

Equation 9-1. Primary Core F_{VCO} Calculation

$$FVCO = FPLLI \times \left(\frac{M}{N1}\right) = FPLLI \times \left(\frac{PLLFBDIV[7:0]}{PLLPRE[3:0]}\right)$$

Equation 9-2 provides the relationship between the PLL Input Frequency (F_{PLLI}) and PLL Output Frequency (F_{PLLO}).

Equation 9-2. Primary Core F_{PLLO} Calculation

$$FPLLO = FPLLI \times \left(\frac{M}{N1 \times N2 \times N3}\right) = FPLLI \times \left(\frac{PLLFBDIV[7:0]}{PLLPRE[3:0] \times POST1DIV[2:0] \times POST2DIV[2:0]}\right)$$

Where:

$M = PLLFBDIV[7:0]$
$N1 = PLLPRE[3:0]$
$N2 = POST1DIV[2:0]$
$N3 = POST2DIV[2:0]$

Note: The PLL Phase Detector Input Divider Select (PLLPREx) bits and the PLL Feedback Divider (PLLFBDIVx) bits should not be changed when operating in PLL mode. Therefore, the user must start on either a non- PLL source or clock switch to a non-PLL source (e.g., internal FRC Oscillator) to make any necessary changes and then clock switch to the desired PLL source.
Using Two-Speed Start-up (IESO (FOSCSEL[7])) with a PLL source will start the device on the FRC while preparing the PLL. Once the PLL is ready, the device will switch automatically to the new source. This mode should not be used if changes are needed to the PLLPREx and PLLFBDIVx bits because the PLL may be running before user code execution begins.

It is not permitted to directly clock switch from one PLL clock source to a different PLL clock source. The user would need to transition between PLL clock sources with a clock switch to a non-PLL clock source.

Example 9-1. Code Example for Using Primary PLL with 8 MHz Internal FRC

```
//code example for 50 MIPS system clock using 8MHz FRC
// Select Internal FRC at POR
_FOSCSEL(FNOSC_FRC & IESO_OFF);
// Enable Clock Switching
_FOSC(FCKSM_CSECMD);
int main()
{
// Configure PLL prescaler, both PLL postscalers, and PLL feedback divider
CLKDIVbits.PLLPRE = 1;          // N1=1
PLLFBDbits.PLLFBDIV = 125;      // M = 125
PLLDIVbits.POST1DIV = 5;        // N2=5
PLLDIVbits.POST2DIV = 1;        // N3=1
// Initiate Clock Switch to FRC with PLL (NOSC=0b001)
__builtin_write_OSCCONH(0x01);
__builtin_write_OSCCONL(OSCCON | 0x01);
// Wait for Clock switch to occur
while (OSCCONbits.OSWEN!= 0);
}
```

Note: $F_{PLLO} = F_{PLLI} * M/(N1 * N2 * N3)$; $F_{PLLI} = 8$; M = 125; N1 = 1; N2 = 5; N3 = 1;
so $F_{PLLO} = 8 * 125/(1 * 5 * 1) = 200$ MHz or 50 MIPS.

9.2 CPU Clocking

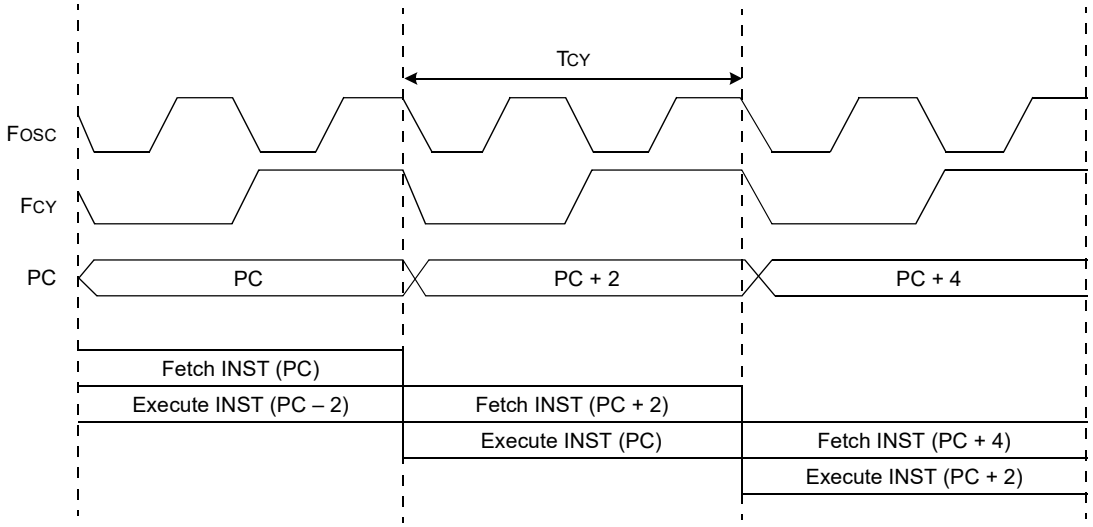
The dsPIC33CK256MC506 devices can be configured to use any of the following clock configurations:

- Primary Oscillator (POSC) on the OSCI and OSCO pins
- Internal Fast RC Oscillator (FRC) with optional clock divider
- Internal Low-Power RC Oscillator (LPRC)
- Primary Oscillator with PLL (ECPLL, HSPLL, XTPLL)
- Internal Fast RC Oscillator with PLL (FRCPLL)
- Backup Internal Fast RC Oscillator (BFRC)

The system clock source is divided by two to produce the internal instruction cycle clock. In this document, the instruction cycle clock is denoted by F_{CY}. The timing diagram in Figure 9-4 illustrates the relationship between the system clock (F_{OSC}), the instruction cycle clock (F_{CY}) and the Program Counter (PC).

The internal instruction cycle clock (F_{CY}) can be output on the OSCO I/O pin if the Primary Oscillator mode (POSCMD[1:0]) is not configured as HS/XT. For more information, see 9. Oscillator with High-Frequency PLL.

Figure 9-4. Clock and Instruction Cycle Timing



9.3 Primary Oscillator (POSC)

The dsPIC33CK256MC506 family devices contain one instance of the Primary Oscillator (POSC). The Primary Oscillator is available on the OSCI and OSCO pins of the dsPIC33CK devices. This connection enables an external crystal (or ceramic resonator) to provide the clock to the device. The Primary Oscillator provides three modes of operation:

- Medium Speed Oscillator (XT Mode): The XT mode is a Medium Gain, Medium Frequency mode used to work with crystal frequencies of 3.5 MHz to 10 MHz.
- High-Speed Oscillator (HS Mode): The HS mode is a High-Gain, High-Frequency mode used to work with crystal frequencies of 10 MHz to 32 MHz.
- External Clock Source Operation (EC Mode): If the on-chip oscillator is not used, the EC mode allows the internal oscillator to be bypassed. The device clocks are generated from an external source (0 MHz to up to 64 MHz) and input on the OSCI pin.

9.3.1 Primary Oscillator Pin Functionality

The Primary Oscillator pins (OSCI and OSCO) can be used for other functions when the Primary Oscillator is not being used. The POSCMD[1:0] Configuration bits in the Oscillator Configuration register (FOSC[1:0]) determine the oscillator pin function. The OSCIOFNC bit (FOSC[2]) determines the OSCO/CLKO pin function. By default, the CLKO function is active and the pin will output a clock frequency of F_{CY}. A clock signal is present on the OSCO/CLKO pin when the device is unprogrammed or during the programming sequence. Care should be taken when the OSCO/CLKO pin is used to drive other circuity.

9.4 Internal Fast RC (FRC) Oscillator

The dsPIC33CK256MC506 family devices contain one instance of the internal Fast RC (FRC) Oscillator. The FRC Oscillator provides a nominal 8 MHz clock without requiring an external crystal or ceramic resonator, which results in system cost savings for applications that do not require a precise clock reference.

The application software can tune the frequency of the oscillator using the FRC Oscillator Tuning bits (TUN[5:0]) in the FRC Oscillator Tuning register (OSCTUN[5:0]).

9.5 Low-Power RC (LPRC) Oscillator

The dsPIC33CK256MC506 family devices contain one instance of the Low-Power RC (LPRC) Oscillator, which provides a nominal clock frequency of 32.768 kHz. The dsPIC33CK256MC506 family devices implement the LPRC function with the BFRC and post-divider to yield a 50% duty cycle output.

The LPRC is the clock source for the Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM) circuits in the clock subsystem. The LPRC Oscillator is shut off in Sleep mode. The LPRC Oscillator remains enabled under these conditions:

- The FSCM is enabled
- The WDT is enabled
- The LPRC Oscillator is selected as the system clock

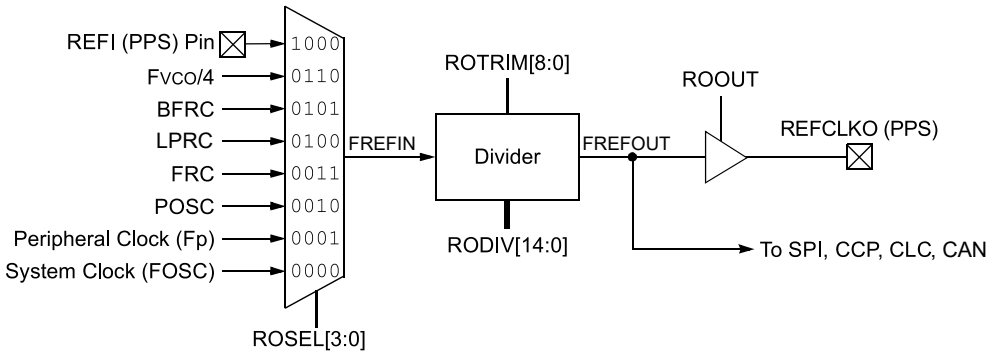
9.6 Internal Backup Fast RC (BFRC) Oscillator

The oscillator block provides a stable reference clock source for the Fail-Safe Clock Monitor (FSCM). When FSCM is enabled in the FCKSM[1:0] Configuration bits (FOSC[7:6]), it constantly monitors the main clock source against a reference signal from the 8 MHz Internal Backup Fast RC (BFRC) Oscillator. In case of a clock failure, the Fail-Safe Clock Monitor switches the clock to the BFRC Oscillator, allowing for continued low-speed operation or a safe application shutdown.

9.7 Reference Clock Output

In addition to the CLKO output ($F_{OSC}/2$), the dsPIC33CK256MC506 family devices can be configured to provide a reference clock output signal to a port pin. This feature is available in all oscillator configurations and allows the user to select a greater range of clock submultiples to drive external devices in the application. CLKO is enabled by Configuration bit, OSCIOFNC, and is independent of the REFCLKO reference clock. REFCLKO is mappable to any I/O pin that has mapped output capability. The reference clock output module block diagram is shown in Figure 9-5.

Figure 9-5. Reference Clock Generator



This reference clock output is controlled by the REFOCONL and REFOCONH registers. Setting the ROEN bit (REFOCONL[15]) makes the clock signal available on the REFCLKO pin. The RODIV[14:0] bits (REFOCONH[14:0]) and ROTRIM[8:0] bits (REFOTRIM[15:7]) enable the selection of different clock divider options. The formula for determining the final frequency output is shown in Equation 9-3. The ROSWEN bit (REFOCONL[9]) indicates that the clock divider has been successfully switched. In order to switch the REFCLKO divider, the user should ensure that this bit reads as '0'. Write the updated values to the RODIV[14:0] or ROTRIM[8:0] bits, set the ROSWEN bit and then wait until it is cleared before assuming that the REFCLKO clock is valid.

Equation 9-3. Calculating Frequency Output

$$FREFOUT = \frac{FREFIN}{2 \bullet (RODIV[14:0] + ROTRIM[8:0]/512)}$$

Where: $FREFOUT$ = Output Frequency
$FREFIN$ = Input Frequency
When $RODIV[14:0]$ = 0, the output clock is the same as the input clock.

The ROSEL[3:0] bits (REFOCONL[3:0]) determine which clock source is used for the reference clock output. The ROSLP bit (REFOCONL[11]) determines if the reference source is available on REFCLKO when the device is in Sleep mode.

To use the reference clock output in Sleep mode, both the ROSLP bit must be set and the clock selected by the ROSEL[3:0] bits must be enabled for operation during Sleep mode, if possible. Clearing the ROSEL[3:0] bits allows the reference output frequency to change, as the system clock changes during any clock switches. The ROOUT bit enables/disables the reference clock output on the REFCLKO pin.

The ROACTIV bit (REFOCONL[8]) indicates that the module is active; it can be cleared by disabling the module (setting ROEN to '0'). The user must not change the reference clock source or adjust the divider when the ROACTIV bit indicates that the module is active. To avoid glitches, the user should not disable the module until the ROACTIV bit is '1'.

9.8 Oscillator Configuration

The oscillator system has both Configuration registers and SFRs to configure, control and monitor the system. The FOSCSEL and FOSC Configuration registers (29.2.4. FOSCSEL and 29.2.5. FOSC, respectively) are used for initial setup.

Table 9-1 lists the configuration settings that select the device's oscillator source and operating mode at a Power-on Reset (POR).

Table 9-1. Configuration Bit Values for Clock Selection

Oscillator Source	Oscillator Mode	FNOSC[2:0] Value	POSCMD[1:0] Value
S0	Fast RC Oscillator (FRC)(1)	000	xx
S1	Fast RC Oscillator with PLL (FRCPLL)(1)	001	xx
S2	Primary Oscillator (EC)(1)	010	00
S2	Primary Oscillator (XT)	010	01
S2	Primary Oscillator (HS)	010	10
S3	Primary Oscillator with PLL (ECPLL)(1)	011	00
S3	Primary Oscillator with PLL (XTPLL)	011	01
S3	Primary Oscillator with PLL (HSPLL)	011	10
S4	Reserved	100	xx
S5	Low-Power RC Oscillator (LPRC)(1)	101	xx
S6	Backup FRC (BFRC)(1)	110	xx
S7	Fast RC Oscillator with ÷ N Divider (FRCDIVN)(1,2)	111	xx

Notes:
1. The OSCO pin function is determined by the OSCIOFNC Configuration bit.
2. This is the default oscillator mode for an unprogrammed (erased) device.

9.9 OSCCON Unlock Sequence

The OSCCON register is protected against unintended writes through a lock mechanism. The upper and lower bytes of OSCCON have their own unlock sequence, and both must be used when writing to both bytes of the register.

Before OSCCON can be written to, the following unlock sequence must be used:

1. Execute the unlock sequence for the OSCCON high byte.
   In two back-to-back instructions:
   - Write 0x78 to OSCCON[15:8]
   - Write 0x9A to OSCCON[15:8]
2. In the instruction immediately following the unlock sequence, the OSCCON[15:8] bits can be modified.
3. Execute the unlock sequence for the OSCCON low byte.
   In two back-to-back instructions:
   - Write 0x46 to OSCCON[7:0]
   - Write 0x57 to OSCCON[7:0]
4. In the instruction immediately following the unlock sequence, the OSCCON[7:0] bits can be modified.

Note: MPLAB® XC16 provides a built-in C language function, including the unlocking sequence to modify high and low bytes in the OSCCON register:

```
__builtin_write_OSCCONH(value)
__builtin_write_OSCCONL(value)
```

9.10.1 Oscillator Control Register

Name: OSCCON(1)
Offset: 0xF84

Notes:

1. Writes to this register require an unlock sequence.
2. Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transitional clock source between the two PLL modes.
3. This bit should only be cleared in software. Setting the bit in software (= 1) will have the same effect as an actual oscillator failure and will trigger an oscillator failure trap.

Bit 7 – CLKLOCK Clock Lock Enable bit

Value	Description
1	If (FCKSM0 = 1), then clock and PLL configurations are locked; if (FCKSM0 = 0), then clock and PLL configurations may be modified
0	Clock and PLL selections are not locked, configurations may be modified

Bit 5 – LOCK PLL Lock Status bit (read-only)

Value	Description
1	Indicates that PLL is in lock or PLL start-up timer is satisfied

Value	Description
0	Indicates that PLL is out of lock, start-up timer is in progress or PLL is disabled

Bit 3 – CF Clock Fail Detect bit(3)

Value	Description
1	FSCM has detected a clock failure
0	FSCM has not detected a clock failure

Bit 0 – OSWEN Oscillator Switch Enable bit

Value	Description
1	Requests oscillator switch to the selection specified by the NOSC[2:0] bits
0	Oscillator switch is complete

9.10.2 Clock Divider Register

Name: CLKDIV
Offset: 0xF86

Notes:

1. The DOZE[2:0] bits can only be written to when the DOZEN bit is clear. If DOZEN = 1, any writes to DOZE[2:0] are ignored.
2. This bit is cleared when the ROI bit is set and an interrupt occurs.
3. The DOZEN bit cannot be set if DOZE[2:0] = 000. If DOZE[2:0] = 000, any attempt by user software to set the DOZEN bit is ignored.
4. PLLPRE[3:0] may be updated while the PLL is operating, but the VCO may overshoot.

10. Direct Memory Access (DMA) Controller

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to **"Direct Memory Access Controller (DMA)"** (www.microchip.com/DS30009742) in the "*dsPIC33/PIC24 Family Reference Manual*".

The Direct Memory Access (DMA) Controller is designed to service high data throughput peripherals operating on the SFR bus, allowing them to access data memory directly and alleviating the need for CPU-intensive management. By allowing these data-intensive peripherals to share their own data path, the main data bus is also deloaded, resulting in additional power savings.

The DMA Controller functions both as a peripheral and a direct extension of the CPU. It is located on the microcontroller data bus, between the CPU and DMA-enabled peripherals, with direct access to SRAM. This partitions the SFR bus into two buses, allowing the DMA Controller access to the DMA-capable peripherals located on the new DMA SFR bus. The controller serves as an Initiator device on the DMA SFR bus, controlling data flow from DMA-capable peripherals.

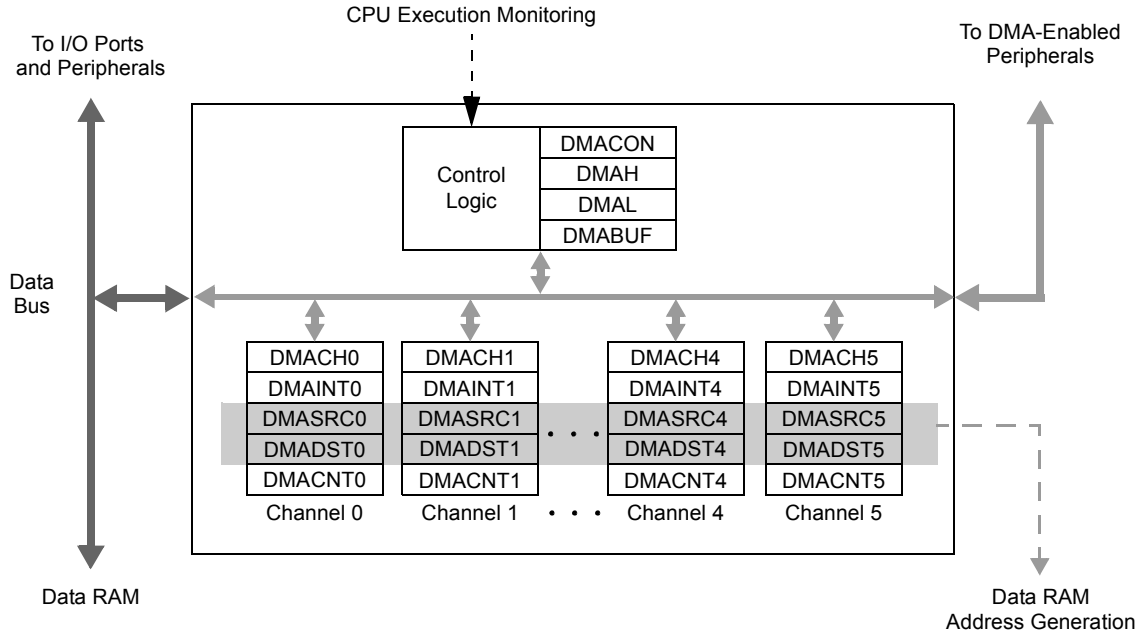
The controller also monitors CPU instruction processing directly, allowing it to be aware of when the CPU requires access to peripherals on the DMA bus and automatically relinquishing control to the CPU as needed. This increases the effective bandwidth for handling data without DMA operations, causing a processor Stall. This makes the controller essentially transparent to the user.

The DMA Controller has these features:

- A Total of Four Independently Programmable Channels
- Concurrent Operation with the CPU (no DMA caused Wait states)
- DMA Bus Arbitration
- Five Programmable Address modes
- Four Programmable Transfer modes
- Four Flexible Internal Data Transfer modes
- Byte or Word Support for Data Transfer
- 16-Bit Source and Destination Address Register for each Channel, Dynamically Updated and Reloadable
- 16-Bit Transaction Count Register, Dynamically Updated and Reloadable
- Upper and Lower Address Limit Registers
- Counter Half-Full Level Interrupt
- Software Triggered Transfer
- Null Write mode for Symmetric Buffer Operations

A simplified block diagram of the DMA Controller is shown if Figure 10-1.

Figure 10-1. DMA Functional Block Diagram



10.1 Summary of DMA Operations

The DMA Controller is capable of moving data between addresses according to a number of different parameters. Each of these parameters can be independently configured for any transaction. In addition, any or all of the DMA channels can independently perform a different transaction at the same time. Transactions are classified by these parameters:

- Source and destination (SFRs and data RAM)
- Data size (byte or word)
- Trigger source
- Transfer mode (One-Shot, Repeated or Continuous)
- Addressing modes (Fixed Address or Address Blocks with or without Address Increment/Decrement)

In addition, the DMA Controller provides channel priority arbitration for all channels.

10.1.1 Source and Destination

Using the DMA Controller, data may be moved between any two addresses in the Data Space. The SFR space (0000h to 0FFFh), or the data RAM space (5000h to 9000h), can serve as either the source or the destination. Data can be moved between these areas in either direction or between addresses in either area. The four different combinations are shown in 10.1.5. Addressing Modes.

If it is necessary to protect areas of data RAM, the DMA Controller allows the user to set upper and lower address boundaries for operations in the Data Space above the SFR space. The boundaries are set by the DMAH and DMAL Limit registers. If a DMA channel attempts an operation outside of the address boundaries, the transaction is terminated and an interrupt is generated.

10.1.2 Data Size

The DMA Controller can handle both 8-bit and 16-bit transactions. Size is user-selectable using the SIZE bit (DMACHn[1]). By default, each channel is configured for word-size transactions. When byte-size transactions are chosen, the LSB of the source and/or destination address determines if the data represent the upper or lower byte of the data RAM location.

10.1.3 Trigger Source

The DMA Controller can use 82 of the device's interrupt sources to initiate a transaction. The DMA trigger sources occur in reverse order from their natural interrupt priority and are shown in 10.1.5. Addressing Modes.

Since the source and destination addresses for any transaction can be programmed independently of the trigger source, the DMA Controller can use any trigger to perform an operation on any peripheral. This also allows DMA channels to be cascaded to perform more complex transfer operations.

10.1.4 Transfer Mode

The DMA Controller supports four types of data transfers, based on the volume of data to be moved for each trigger.

- One-Shot: A single transaction occurs for each trigger.
- Continuous: A series of back-to-back transactions occur for each trigger; the number of transactions is determined by the DMACNTn transaction counter.
- Repeated One-Shot: A single transaction is performed repeatedly, once per trigger, until the DMA channel is disabled.
- Repeated Continuous: A series of transactions are performed repeatedly, one cycle per trigger, until the DMA channel is disabled.

All transfer modes allow the option to have the source and destination addresses, and counter value, automatically reloaded after the completion of a transaction.

10.1.5 Addressing Modes

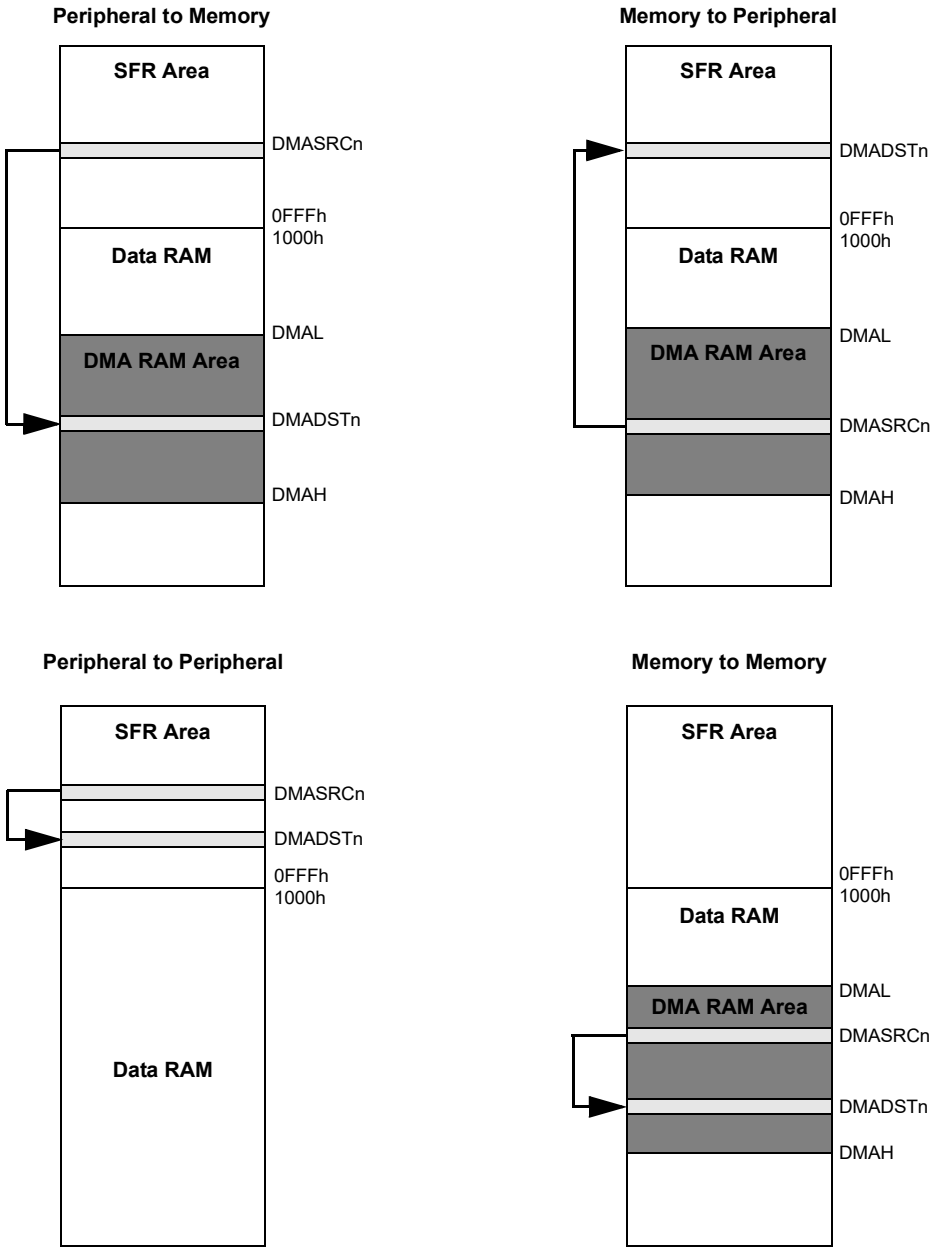
The DMA Controller also supports transfers between single addresses or address ranges. The four basic options are:

- Fixed-to-Fixed: Between two constant addresses
- Fixed-to-Block: From a constant source address to a range of destination addresses
- Block-to-Fixed: From a range of source addresses to a single, constant destination address
- Block-to-Block: From a range of source addresses to a range of destination addresses

The option to select auto-increment or auto-decrement of source and/or destination addresses is available for Block Addressing modes.

In addition to the four basic modes, the DMA Controller also supports Peripheral Indirect Addressing (PIA) mode, where the source or destination address is generated jointly by the DMA Controller and a PIA-capable peripheral. When enabled, the DMA channel provides a base source and/or destination address, while the peripheral provides a fixed range offset address.

Figure 10-2. Types of DMA Data Transfers



Note: Relative sizes of memory areas are not shown to scale.

10.1.6 Channel Priority

Each DMA channel functions independently of the others, but also competes with the others for access to the data and DMA buses. When access collisions occur, the DMA Controller arbitrates between the channels using a user-selectable priority scheme. Two schemes are available:

- Round Robin: When two or more channels collide, the lower numbered channel receives priority on the first collision. On subsequent collisions, the higher numbered channels each receive priority based on their channel number.
- Fixed: When two or more channels collide, the lowest numbered channel always receives priority, regardless of past history; however, any channel being actively processed is not available for an immediate retrigger. If a higher priority channel is continually requesting service, it will be scheduled for service after the next lower priority channel with a pending request.

10.2 Typical Setup

To set up a DMA channel for a basic data transfer:

1. Enable the DMA Controller (DMAEN = 1) and select an appropriate channel priority scheme by setting or clearing PRSSEL.
2. Program DMAH and DMAL with appropriate upper and lower address boundaries for data RAM operations.
3. Select the DMA channel to be used and disable its operation (CHEN = 0).
4. Program the appropriate source and destination addresses for the transaction into the channel's DMASRCn and DMADSTn registers. For PIA Mode Addressing, use the base address value.
5. Program the DMACNTn register for the number of triggers per transfer (One-Shot or Continuous modes) or the number of words (bytes) to be transferred (Repeated modes).
6. Set or clear the SIZE bit to select the data size.
7. Program the TRMODE[1:0] bits to select the Data Transfer mode.
8. Program the SAMODE[1:0] and DAMODE[1:0] bits to select the addressing mode.
9. Enable the DMA channel by setting CHEN.
10. Enable the trigger source interrupt.

10.2.1 Peripheral Module Disable

The channels of the DMA Controller can be individually powered down using the Peripheral Module Disable (PMD) registers.

10.2.2 DMA Registers

The DMA Controller uses a number of registers to control its operation. The number of registers depends on the number of channels implemented for a particular device.

There are always four module-level registers (one control and three buffer/address):

- DMACON: DMA Engine Control Register
- DMAH and DMAL: DMA High and Low Address Limit Registers
- DMABUF: DMA Transfer Data Buffer

Each of the DMA channels implements five registers (two control and three buffer/address):

- DMACHn: DMA Channel n Control Register
- DMAINTn: DMA Channel n Interrupt Register
- DMASRCn: DMA Data Source Address Pointer for Channel n Register
- DMADSTn: DMA Data Destination Source for Channel n Register
- DMACNTn: DMA Transaction Counter for Channel n Register

For devices, there are a total of 34 registers.

10.2.3.5 DMA Channel n Control Register

Name: DMACHn
Offset: 0xAC4, 0xACE, 0xAD8, 0xAE2

Notes:
1. Only the original DMACNTn is required to be stored to recover the original DMASRCn and DMADSTn values.
2. DMACNTn will always be reloaded in Repeated mode transfers, regardless of the state of the RELOAD bit.
3. The number of transfers executed while CHREQ is set depends on the configuration of TRMODE[1:0].

Bit 15 – DBUFWF DMA Buffered Data Write Flag bit(1)

Value	Description
1	The content of the DMA buffer has not been written to the location specified in DMADSTn or DMASRCn in Null Write mode
0	The content of the DMA buffer has been written to the location specified in DMADSTn or DMASRCn in Null Write mode

Bits 14:8 – CHSEL[6:0] DMA Channel Trigger Selection bits (see Table 10-1)

Bit 7 – HIGHIF DMA High Address Limit Interrupt Flag bit(1,2)

Value	Description
1	The DMA channel has attempted to access an address higher than DMAH or the upper limit of the data RAM space
0	The DMA channel has not invoked the high address limit interrupt

Bit 6 – LOWIF DMA Low Address Limit Interrupt Flag bit(1,2)

Value	Description
1	The DMA channel has attempted to access the DMA SFR address lower than DMAL, but above the SFR range (07FFh)
0	The DMA channel has not invoked the low address limit interrupt

Bit 5 – DONEIF DMA Complete Operation Interrupt Flag bit(1)

Value	Description
1	The previous DMA session has ended with completion
0	The current DMA session has not yet completed
	If CHEN = 0:
1	The previous DMA session has ended with completion
0	The previous DMA session has ended without completion

Bit 4 – HALFIF DMA 50% Watermark Level Interrupt Flag bit(1)

Value	Description
1	DMACNTn has reached the halfway point to 0000h
0	DMACNTn has not reached the halfway point

Bit 3 – OVRUNIF DMA Channel Overrun Flag bit(1)

Value	Description
1	The DMA channel is triggered while it is still completing the operation based on the previous trigger
0	The overrun condition has not occurred

Bit 0 – HALFEN Halfway Completion Watermark bit

Value	Description
1	Interrupts are invoked when DMACNTn has reached its halfway point and at completion
0	An interrupt is invoked only at the completion of the transfer

11. Controller Area Network Flexible Data-Rate (CAN FD) Modules

Notes:

1. This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"CAN Flexible Data-Rate (FD) Protocol Module"** (www.microchip.com/DS70005340) in the *"dsPIC33/PIC24 Family Reference Manual"*.
2. Not all device variants include the CAN FD peripheral. Refer to Table 1 for availability.

11.1 Features

The CAN FD modules have the following features:

General

- Nominal (Arbitration) Bit Rate up to 1 Mbps
- Data Bit Rate up to 8 Mbps
- CAN FD Controller modes:
  - Mixed CAN 2.0B and CAN FD mode
  - CAN 2.0B mode
- Conforms to ISO 11898-1:2015

Message FIFOs

- Seven FIFOs, Configurable as Transmit or Receive FIFOs
- One Transmit Queue (TXQ)
- Transmit Event FIFO (TEF) with 32-Bit Timestamp

Message Transmission

- Message Transmission Prioritization:
  - Based on priority bit field, and/or
  - Message with lowest ID gets transmitted first using the TXQ
- Programmable Automatic Retransmission Attempts: Unlimited, Three Attempts or Disabled

Message Reception

- 16 Flexible Filter and Mask Objects.
- Each Object can be Configured to Filter either:
  - Standard ID + first 18 data bits
  - Extended ID
- 32-Bit Timestamp
- The CAN FD Bit Stream Processor (BSP) Implements the Medium Access Control of the CAN FD Protocol Described in ISO 11898-1:2015. It serializes and deserializes the bit stream, encodes and decodes the CAN FD frames, manages the medium access, Acknowledges frames, and detects and signals errors.
- The TX Handler Prioritizes the Messages that are Requested for Transmission by the Transmit FIFOs. It uses the RAM interface to fetch the transmit data from RAM and provides them to the BSP for transmission.
- The BSP provides Received Messages to the RX Handler. The RX handler uses acceptance filters to filter out messages that shall be stored in the Receive FIFOs. It uses the RAM interface to store received data into RAM.
- Each FIFO can be Configured either as a Transmit or Receive FIFO. The FIFO control keeps track of the FIFO head and tail, and calculates the user address. In a TX FIFO, the user address points to the address in RAM where the data for the next transmit message shall be stored. In an RX FIFO, the user address points to the address in RAM where the data of the next receive message shall be read. The user notifies the FIFO that a message was written to or read from RAM by incrementing the head/tail of the FIFO.
- The Transmit Queue (TXQ) is a Special Transmit FIFO that Transmits the Messages based on the ID of the Messages Stored in the Queue.
- The Transmit Event FIFO (TEF) Stores the Message IDs of the Transmitted Messages.

- A Free-Running Time Base Counter is used to Timestamp Received Messages. Messages in the TEF can also be timestamped.
- The CAN FD Controller Modules Generate Interrupts when New Messages are Received or when Messages were Transmitted Successfully.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	0	0	0	0	0

Bit 15 – CON CAN Enable bit

Value	Description
1	CAN module is enabled
0	CAN module is disabled

Bit 13 – SIDL CAN Stop in Idle Control bit

Value	Description
1	Stops module operation in Idle mode
0	Does not stop module operation in Idle mode

Bit 12 – BRSDIS Bit Rate Switching (BRS) Disable bit

Value	Description
1	Bit Rate Switching is disabled, regardless of BRS in the transmit message object
0	Bit Rate Switching depends on BRS in the transmit message object

Bit 11 – BUSY CAN Module is Busy bit

Value	Description
1	The CAN module is active
0	The CAN module is inactive

Bits 10:9 – WFT[1:0] Selectable Wake-up Filter Time bits

Value	Description
11	$T11_{FILTER}$
10	$T10_{FILTER}$
01	$T01_{FILTER}$
00	$T00_{FILTER}$

Bit 8 – WAKFIL Enable CAN Bus Line Wake-up Filter bit(1)

Value	Description
1	Uses CAN bus line filter for wake-up
0	CAN bus line filter is not used for wake-up

Bit 7 – CLKSEL Module Clock Source Select bit(1)

Value	Description
1	REFO clock is active when module is enabled
0	CAN clock is not active when module is enabled

Bit 6 – PXEDIS Protocol Exception Event Detection Disabled bit(1)

A recessive “reserved bit” following a recessive FDF bit is called a Protocol Exception.

Value	Description
1	Protocol Exception is treated as a form error
0	If a Protocol Exception is detected, CAN will enter the bus integrating state

Bit 5 – ISOCRCEN Enable ISO CRC in CAN FD Frames bit(1)

Value	Description
1	Includes stuff bit count in CRC field and uses non-zero CRC initialization vector
0	Does not include stuff bit count in CRC field and uses CRC initialization vector with all zeros

Bits 4:0 – DNCNT[4:0] DeviceNet™ Filter Bit Number bits

Value	Description
10011-11111	Invalid selection (compares up to 18 bits of data with EID)
10010	Compares up to Data Byte 2, bit 6 with EID17
. . .	
00001	Compares up to Data Byte 0, bit 7 with EID0
00000	Does not compare data bytes

11.2.2 CAN Control Register High

Name: C1CONH

Bits 15:12 – TXBWS[3:0] Transmit Bandwidth Sharing bits

Value	Description
1111-1100	4096
1011	2048
1010	1024
1001	512
1000	256

0101	32
0100	16
0011	8
0010	4
0001	2
0000	No delay

Bit 11 – ABAT Abort All Pending Transmissions bit

Value	Description
1	Signals all transmit buffers to abort transmission
0	Module will clear this bit when all transmissions are aborted

Bits 10:8 – REQOP[2:0] Request Operation Mode bits

Value	Description
111	Sets Restricted Operation mode
110	Sets Normal CAN 2.0 mode; error frames on CAN FD frames
101	Sets External Loopback mode
100	Sets Configuration mode
011	Sets Listen Only mode
010	Sets Internal Loopback mode
001	Sets Disable mode
000	Sets Normal CAN FD mode; supports mixing of full CAN FD and classic CAN 2.0 frames

Bits 7:5 – OPMOD[2:0] Operation Mode Status bits

Value	Description
111	Module is in Restricted Operation mode
110	Module is in Normal CAN 2.0 mode; error frames on CAN FD frames
101	Module is in External Loopback mode

Value	Description
100	Module is in Configuration mode
011	Module is in Listen Only mode
010	Module is in Internal Loopback mode
001	Module is in Disable mode
000	Module is in Normal CAN FD mode; supports mixing of full CAN FD and classic CAN 2.0 frames

Bit 4 – TXQEN Enable Transmit Queue bit(1)

Value	Description
1	Enables Transmit Message Queue (TXQ) and reserves space in RAM
0	Does not reserve space in RAM for TXQ

Bit 3 – STEF Store in Transmit Event FIFO bit(1)

Value	Description
1	Saves transmitted messages in TEF
0	Does not save transmitted messages in TEF

Bit 2 – SERRLOM Transition to Listen Only Mode on System Error bit(1)

Value	Description
1	Transitions to Listen Only mode
0	Transitions to Restricted Operation mode

Bit 1 – ESIGM Transmit ESI in Gateway Mode bit(1)

Value	Description
1	ESI is transmitted as recessive when ESI of the message is high or CAN controller is error passive
0	ESI reflects error status of CAN controller

Bit 0 – RTXAT Restrict Retransmission Attempts bit(1)

Value	Description
1	Restricted retransmission attempts, uses TXAT[1:0] bits (C1TXQCONH[6:5])
0	Unlimited number of retransmission attempts, TXAT[1:0] bits will be ignored

11.2.3 CAN Nominal Bit Time Configuration Register Low

Reset							0	0

Bit	7	6	5	4	3	2	1	0
							TDCMOD[1:0]	
Access							R/W	R/W
Reset							1	0

Bit 9 – EDGFLTEN Enable Edge Filtering During Bus Integration State bit

Value	Description
1	Edge filtering is enabled according to ISO 11898-1:2015
0	Edge filtering is disabled

Bit 8 – SID11EN Enable 12-Bit SID in CAN FD Base Format Messages bit

Value	Description
1	RRS is used as SID11 in CAN FD base format messages: SID[11:0] = {SID[10:0], SID11}
0	Does not use RRS; SID[10:0]

Bits 1:0 – TDCMOD[1:0] Transmitter Delay Compensation Mode bits (Secondary Sample Point (SSP))

Value	Description
10-11	Auto: Measures delay and adds TSEG1[4:0] (C1DBTCFGH[4:0]), adds TDCO[6:0]
01	Manual: Does not measure, uses TDCV[5:0] + TDCO[6:0] from register
00	Disabled

11.2.9 CAN Time Base Counter Register Low

Name: C1TBCL(1,2)
Offset: 0x5D0

Notes:

1. The Time Base Counter (TBC) will be stopped and reset when TBCEN = 0 to save power.
2. The TBC prescaler count will be reset on any write to C1TBCH/L (TBCPREx will be unaffected).

Bit	15	14	13	12	11	10	9	8

Bit	7	6	5	4	3	2	1	0
						TSRES	TSEOF	TBCEN
Access						R/W	R/W	R/W
Reset						0	0	0

Bit 2 – TSRES Timestamp Reset bit (CAN FD frames only)

Value	Description
1	At sample point of the bit following the FDF bit
0	At sample point of Start-of-Frame (SOF)

Bit 1 – TSEOF Timestamp End-of-Frame (EOF) bit

Value	Description
1	Timestamp when frame is taken valid (11898-1 10.7): • RX no error until last, but one bit of EOF • TX no error until the end of EOF
0	Timestamp at “beginning” of frame: • Classical Frame: At sample point of SOF • FD Frame: See TSRES bit

Bit 0 – TBCEN Time Base Counter Enable bit

Value	Description
1	Enables TBC
0	Stops and resets TBC

11.2.13 CAN Interrupt Code Register Low

Name: C1VECL
Offset: 0x5D8

Bits 12:8 – FILHIT[4:0] Filter Hit Number bits

Value	Description
01111	Filter 15
01110	Filter 14
. . .	
00001	Filter 1
00000	Filter 0

Bits 6:0 – ICODE[6:0] Interrupt Flag Code bits

Value	Description
1001011-1111111	Reserved
1001010	Transmit attempt interrupt (any bit in C1TXATIF is set)
1001001	Transmit event FIFO interrupt (any bit in C1TEFSTA is set)
1001000	Invalid message occurred (IVMIF/IE)
1000111	CAN module mode change occurred (MODIF/IE)
1000110	CAN timer overflow (TBCIF/IE)
1000101	RX/TX MAB overflow/underflow (RX: Message received before previous message was saved to memory; TX: Can't feed TX MAB fast enough to transmit consistent data)
1000100	Address error interrupt (illegal FIFO address presented to system)
1000011	Receive FIFO overflow interrupt (any bit in C1RXOVIF is set)
1000010	Wake-up interrupt (WAKIF/WAKIE)
1000001	Error interrupt (CERRIF/IE)
1000000	No interrupt
0001000-0111111	Reserved
0000111	FIFO 7 interrupt (TFIF7 or RFIF7 is set)
. . .	
0000001	FIFO 1 interrupt (TFIF1 or RFIF1 is set)
0000000	FIFO 0 interrupt (TFIF0 is set)

Bit 14 – WAKIF Bus Wake-up Activity Interrupt Flag bit(1)

Value	Description
1	Wake-up activity interrupt occurred
0	No wake-up activity interrupt

Bit 13 – CERRIF CAN Bus Error Interrupt Flag bit(1)

Value	Description
1	CAN bus error interrupt occurred
0	No CAN bus error interrupt

Bit 12 – SERRIF System Error Interrupt Flag bit(1)

Value	Description
1	System error interrupt occurred
0	No system error interrupt

Bit 11 – RXOVIF Receive Buffer Overflow Interrupt Flag bit

Value	Description
1	Receive buffer overflow interrupt occurred
0	No receive buffer overflow interrupt

Bit 10 – TXATIF Transmit Attempt Interrupt Flag bit

Value	Description
1	Transmit attempt interrupt occurred
0	No Transmit Attempt Interrupt

Bit 4 – TEFIF Transmit Event FIFO Interrupt Flag bit

Value	Description
1	Transmit event FIFO interrupt occurred
0	No transmit event FIFO interrupt

Bit 3 – MODIF CAN Mode Change Interrupt Flag bit(1)

Value	Description
1	CAN module mode change occurred (OPMOD[2:0] have changed to reflect REQOP[2:0])
0	No mode change occurred

Bit 2 – TBCIF CAN Timer Overflow Interrupt Flag bit(1)

Value	Description
1	TBC has overflowed
0	TBC has not overflowed

Bit 1 – RXIF Receive Object Interrupt Flag bit

Value	Description
1	Receive object interrupt is pending
0	No receive object interrupts are pending

Bit 0 – TXIF Transmit Object Interrupt Flag bit

Value	Description
1	Transmit object interrupt is pending
0	No transmit object interrupts are pending

Bit 15 – DLCMM DLC Mismatch bit
During a transmission or reception, the specified DLC is larger than the PLSIZE[2:0] of the FIFO element.

Bit 14 – ESI ESI Flag of a Received CAN FD Message Set bit

Bit 13 – DCRCERR Same as for nominal bit rate

Bit 12 – DSTUFERR Same as for nominal bit rate

Bit 11 – DFORMERR Same as for nominal bit rate

Bit 9 – DBIT1ERR Same as for nominal bit rate

Bit 8 – DBIT0ERR Same as for nominal bit rate

Bit 7 – TXBOERR Device Went to Bus Off bit (and auto-recovered)

Bit 5 – NCRCERR Received Message with CRC Incorrect Checksum bit
The CRC checksum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data.

Bit 4 – NSTUFERR Received Message with Illegal Sequence bit
More than five equal bits in a sequence have occurred in a part of a received message where this is not allowed.

Bit 3 – NFORMERR Received Frame Fixed Format bit
A fixed format part of a received frame has the wrong format.

Bit 2 – NACKERR Transmitted Message Not Acknowledged bit
Transmitted message was not Acknowledged.

Bit 1 – NBIT1ERR Transmitted Message Recessive Level bit
During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.

Bit 0 – NBIT0ERR Transmitted Message Dominant Level bit
During the transmission of a message (or Acknowledge bit, active error flag or overload flag), the device wanted to send a dominant level (data or identifier bit of logical value '0'), but the monitored bus value was recessive. During bus off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the bus off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).

11.2.42 CAN Transmit Queue Status Register

Name: C1TXQSTA
Offset: 0x614

Notes:

1. The TXQCI[4:0] bits give a zero-indexed value to the message in the TXQ. If the TXQ is four messages deep (FSIZE[4:0] = 3), TXQCIx will take on a value of 0 to 3, depending on the state of the TXQ.
2. This bit is updated when a message completes (or aborts) or when the TXQ is reset.

Legend: HS = Hardware Settable bit; C = Clearable bit

Access	R	R	R	HS/C		R		R
Reset	0	0	0	0		1		1

Bits 12:8 – TXQCI[4:0] Transmit Message Queue Index bits(1)
A read of this register will return an index to the message that the FIFO will next attempt to transmit.

Bit 7 – TXABT Message Aborted Status bit(2)

Value	Description
1	Message was aborted
0	Message completed successfully

Bit 6 – TXLARB Message Lost Arbitration Status bit

Value	Description
1	Message lost arbitration while being sent
0	Message did not lose arbitration while being sent

Bit 5 – TXERR Error Detected During Transmission bit

Value	Description
1	A bus error occurred while the message was being sent
0	A bus error did not occur while the message was being sent

Bit 4 – TXATIF Transmit Attempts Exhausted Interrupt Pending bit

Value	Description
1	Interrupt is pending
0	Interrupt is not pending

Bit 2 – TXQEIF Transmit Queue Empty Interrupt Flag bit

Value	Description
1	TXQ is empty
0	TXQ is not empty, at least one message is queued to be transmitted

Bit 0 – TXQNIF Transmit Queue Not Full Interrupt Flag bit

Value	Description
1	TXQ is not full
0	TXQ is full

Bit 10 – FRESET FIFO Reset bit

Value	Description
1	FIFO will be reset when bit is set, cleared by hardware when FIFO is reset; user should poll whether this bit is clear before taking any action
0	No effect

Bit 9 – TXREQ Message Send Request bit
TXEN = 0 (FIFO configured as a receive FIFO):
This bit has no effect.
TXEN = 1 (FIFO configured as a transmit FIFO):

Value	Description
1	Requests sending a message; the bit will automatically clear when all the messages queued in the FIFO are successfully sent
0	Clearing the bit to '0' while set ('1') will request a message abort

Bit 8 – UINC Increment Head/Tail bit
TXEN = 1 (FIFO configured as a transmit FIFO):
When this bit is set, the FIFO head will increment by a single message.
TXEN = 0 (FIFO configured as a receive FIFO):
When this bit is set, the FIFO tail will increment by a single message.

Bit 7 – TXEN TX/RX Buffer Selection bit

Value	Description
1	Transmits message object
0	Receives message object

Bit 6 – RTREN Auto-Remote Transmit (RTR) Enable bit

Value	Description
1	When a Remote Transmit is received, TXREQ will be set
0	When a Remote Transmit is received, TXREQ will be unaffected

Bit 5 – RXTSEN Received Message Timestamp Enable bit(1)

Value	Description
1	Captures timestamp in received message object in RAM
0	Does not capture timestamp

Bit 4 – TXATIE Transmit Attempts Exhausted Interrupt Enable bit

Value	Description
1	Enables interrupt
0	Disables interrupt

Bit 3 – RXOVIE Overflow Interrupt Enable bit

Value	Description
1	Interrupt is enabled for overflow event
0	Interrupt is disabled for overflow event

Bit 2 – TFERFFIE Transmit/Receive FIFO Empty/Full Interrupt Enable bit
TXEN = 1 (FIFO configured as a transmit FIFO):
Transmit FIFO Empty Interrupt Enable.

Value	Description
1	Interrupt is enabled for FIFO empty
0	Interrupt is disabled for FIFO empty

TXEN = 0 (FIFO configured as a receive FIFO):
Receive FIFO Full Interrupt Enable.

Value	Description
1	Interrupt is enabled for FIFO full
0	Interrupt is disabled for FIFO full

Bit 1 – TFHRFHIE Transmit/Receive FIFO Half Empty/Half Full Interrupt Enable bit
TXEN = 1 (FIFO configured as a transmit FIFO):
Transmit FIFO Half Empty Interrupt Enable.

Value	Description
1	Interrupt is enabled for FIFO half empty
0	Interrupt is disabled for FIFO half empty

TXEN = 0 (FIFO configured as a receive FIFO):
Receive FIFO Half Full Interrupt Enable.

Value	Description
1	Interrupt is enabled for FIFO half full
0	Interrupt is disabled for FIFO half full

Bit 0 – TFNRFNIE Transmit/Receive FIFO Not Full/Not Empty Interrupt Enable bit
TXEN = 1 (FIFO configured as a transmit FIFO):
Transmit FIFO Not Full Interrupt Enable.

Value	Description
1	Interrupt is enabled for FIFO not full
0	Interrupt is disabled for FIFO not full

TXEN = 0 (FIFO configured as a receive FIFO):
Receive FIFO Not Empty Interrupt Enable.

Value	Description
1	Interrupt is enabled for FIFO not empty
0	Interrupt is disabled for FIFO not empty

Bit 14 – MIDE Identifier Receive Mode bit

Value	Description
1	Matches only message types (standard or extended address) that correspond to the EXIDE bit in the filter
0	Matches either standard or extended address message if filters match (i.e., if (Filter SID) = (Message SID) or if (Filter SID/EID) = (Message SID/EID))

Bit 13 – MSID11 Standard Identifier Mask bit

Bits 12:0 – MEID[17:5] Extended Identifier Mask bits
In DeviceNet™ mode, these are the mask bits for the first two data bytes.

12. High-Speed PWM

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"HRPWM with Fine Edge Placement"** (www.microchip.com/DS70005320) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The High-Speed PWM (HSPWM) module is a Pulse-Width Modulated (PWM) module to support both motor control and power supply applications. This flexible module provides features to support many types of Motor Control (MC) and Power Control (PC) applications, including:

- AC-to-DC Converters
- DC-to-DC Converters
- AC and DC Motors: BLDC, PMSM, ACIM, SRM, etc.
- Inverters
- Battery Chargers
- Digital Lighting
- Power Factor Correction (PFC)

Note: The Fine Edge Placement feature is not available in this family of devices.

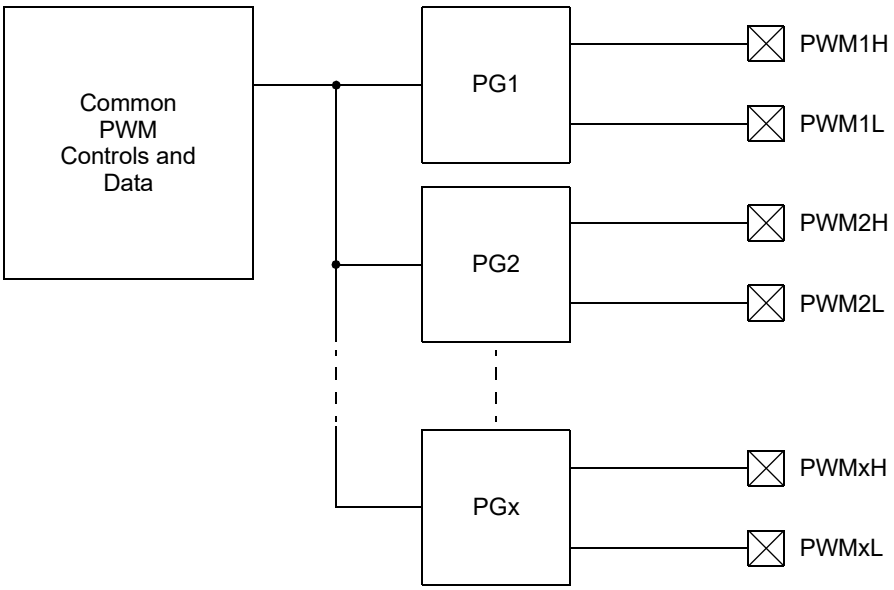
12.1 Features

- Four Independent PWM Generators, each with Dual Outputs
- Operating modes:
  - Independent Edge mode
  - Variable Phase PWM mode
  - Center-Aligned mode
  - Double Update Center-Aligned mode
  - Dual Edge Center-Aligned mode
  - Dual PWM mode
- Output modes:
  - Complementary
  - Independent
  - Push-Pull
- Dead-Time Generator
- Leading-Edge Blanking (LEB)
- Output Override for Fault Handling
- Flexible Period/Duty Cycle Updating Options
- Programmable Control Inputs (PCI)
- Advanced Triggering Options
- Six Combinatorial Logic Outputs
- Six PWM Event Outputs

12.2 Architecture Overview

The PWM module consists of a common set of controls and features, and multiple instantiations of PWM Generators (PGs). Each PWM Generator can be independently configured or multiple PWM Generators can be used to achieve complex multiphase systems. PWM Generators can also be used to implement sophisticated triggering, protection and logic functions. A high-level block diagram is shown in Figure 12-1.

Figure 12-1. PWM High-Level Block Diagram



12.3 Lock and Write Restrictions

The LOCK bit (PCLKCON[8]) may be set in software to block writes to certain registers. For more information, refer to **"HRPWM with Fine Edge Placement"** (www.microchip.com/DS70005320) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The following lock/unlock sequence is required to set or clear the LOCK bit.

1. Write 0x55 to NVMKEY.
2. Write 0xAA to NVMKEY.
3. Clear (or set) the LOCK bit (PCLKCON[8]) as a single operation.

In general, modifications to configuration controls should not be done while the module is running, as indicated by the ON bit (PGxCONL[15]) being set.

12.4 PWM4H/L Output on Peripheral Pin Select

All devices support the capability to output PWM4H and PWM4L signals via Peripheral Pin Select (PPS) on to any "RPn" pin. This feature is intended for lower pin count devices that do not have PWM4H/L on dedicated pins. If PWM4H/L PPS output functions are used on devices that also have fixed PWM4H/L pins, the output signal will be present on both dedicated and "RPn" pins. The Output Port Enable bits, PENH and PENL (PGxIOCONH[3:2]), control both dedicated and PPS pins together; it is not possible to disable the dedicated pins and use only PPS.

Given the natural priority of the "RPn" functions above that of the PWM, it is possible to use the PPS output functions on the dedicated PWM4H/L pins, while the PWM4 signals are routed to other pins via PPS. Any of the peripheral outputs listed in 8.9. Mapping Limitations, with the exception of 'Default Port', can be used. Input functions, including the ports and peripherals listed in 8.7. Virtual Connections, cannot be used through the "RPn" function on dedicated PWM4H/L pins when PWM4 is active.

12.5 PWM Control/Status Registers

There are two categories of Special Function Registers (SFRs) used to control the operation of the PWM module:

- Common, shared by all PWM Generators
- PWM Generator-specific

An ‘x’ in the register name denotes an instance of a PWM Generator.

A ‘y’ in the register name denotes an instance of the common function.

12.6.1 PWM Clock Control Register

Name: PCLKCON
Offset: 0x300

Notes:

1. A device-specific unlock sequence must be performed before this bit can be cleared.
2. Changing the MCLKSEL[1:0] bits while ON (PGxCONL[15]) = 1 is not recommended.

Bit	15	14	13	12	11	10	9	8
								LOCK
Access								R/W
Reset								0

Bit	7	6	5	4	3	2	1	0
			DIVSEL[1:0]				MCLKSEL[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

Bit 8 – LOCK Lock bit(1)

Value	Description
1	Write-protected registers and bits are locked
0	Write-protected registers and bits are unlocked

Bits 5:4 – DIVSEL[1:0] PWM Clock Divider Selection bits

Value	Description
11	Divide ratio is 1:16
10	Divide ratio is 1:8
01	Divide ratio is 1:4
00	Divide ratio is 1:2

Bits 1:0 – MCLKSEL[1:0] PWM Master Clock Selection bits(2)

Value	Description
11	$F_{VCO}/3$
10	F_{PLLO}
01	$F_{VCO}/2$
00	F_{CY}

12.6.2 Frequency Scale Register

Name: FSCL
Offset: 0x302

Bit	15	14	13	12	11	10	9	8
	FSCL[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – FSCL[15:0] Frequency Scale Register bits
The value in this register is added to the frequency scaling accumulator at each pwm_master_clk. When the accumulated value exceeds the value of FSMINPER, a clock pulse is produced.

12.6.3 Frequency Scaling Minimum Period Register

Name: FSMINPER
Offset: 0x304

Bit	15	14	13	12	11	10	9	8
	FSMINPER[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – FSMINPER[15:0] Frequency Scaling Minimum Period Register bits
This register holds the minimum clock period (maximum clock frequency) that can be produced by the frequency scaling circuit.

12.6.4 Master Phase Register

Name: MPHASE
Offset: 0x306

Bit	15	14	13	12	11	10	9	8
	MPHASE[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0

Bits 15:0 – MDC[15:0] Master Duty Cycle Register bits

12.6.6 Master Period Register

Name: MPER
Offset: 0x30A

Note:

1. Period values less than '0x0010' should not be selected.

Bit	15	14	13	12	11	10	9	8
	MPER[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 14:0 – LFSR[14:0] Linear Feedback Shift Register bits
A read of this register will provide a 15-bit pseudorandom value.

12.6.8 Combinatorial Trigger Register Low

Name: CMBTRIGL
Offset: 0x30E

Bit	15	14	13	12	11	10	9	8
Access

12.6.10 Combinatorial PWM Logic Control Register y

Name: LOGCONy
Offset: 0x312, 0x314, 0x316, 0x318, 0x31A, 0x31C

Note:

1. Logic function input will be connected to '0' if the PWM channel is not present.

Bit 7 – S1yPOL Combinatorial PWM Logic Source #1 Polarity bit

Value	Description
1	Input is inverted
0	Input is positive logic

Bit 6 – S2yPOL Combinatorial PWM Logic Source #2 Polarity bit

Value	Description
1	Input is inverted
0	Input is positive logic

Bits 5:4 – PWMLFy[1:0] Combinatorial PWM Logic Function Selection bits

Value	Description
11	Reserved
10	PWMS1 ^ PWMS2 (XOR)

Value	Description
01	PWMS1 & PWMS2 (AND)
00	PWMS1 | PWMS2 (OR)

Bits 2:0 – PWMLFyD[2:0] Combinatorial PWM Logic Destination Selection bits

Value	Description
111-100	Reserved
011	Logic function is assigned to the PWM4H or PWM4L pin
010	Logic function is assigned to the PWM3H or PWM3L pin
001	Logic function is assigned to the PWM2H or PWM2L pin
000	No assignment, combinatorial PWM logic function is disabled

12.6.11 PWM Event Output Control Register y

Name: PWMEVTy
Offset: 0x31E, 0x320, 0x322, 0x324, 0x326, 0x328

Notes:

1. The event signal is stretched using the peripheral clock because different PGs may be operating from different clock sources. The leading edge of the event pulse is produced in the clock domain of the PWM Generator. The trailing edge of the stretched event pulse is produced in the peripheral clock domain.
2. No event will be produced if the selected PWM Generator is not present.
3. This is the PWM Generator output signal prior to Output mode logic and any output override logic.
4. This signal should be the PGx_clk domain signal prior to any synchronization into the system clock domain.

Bit	15	14	13	12	11	10	9	8

Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

Bit 15 – EVTyOEN PWM Event Output Enable bit

Value	Description
1	Event output signal is output on PWMEVTy pin
0	Event output signal is internal only

Bit 14 – EVTyPOL PWM Event Output Polarity bit

Value	Description
1	Event output signal is active-low
0	Event output signal is active-high

Bit 13 – EVTySTRD PWM Event Output Stretch Disable bit

Value	Description
1	Event output signal pulse width is not stretched
0	Event output signal is stretched to eight PWM clock cycles minimum(1)

Bit 12 – EVTySYNC PWM Event Output Sync bit
Event output signal pulse will be two system clocks when this bit is set and EVTySTRD = 1.

Value	Description
1	Event output signal is synchronized to the system clock
0	Event output is not synchronized to the system clock

Bits 7:4 – EVTySEL[3:0] PWM Event Selection bits

Value	Description
1111-1010	Reserved
1001	ADC Trigger 2 signal
1000	ADC Trigger 1 signal
0111	STEER signal (available in Push-Pull Output modes only)(4)
0110	CAHALF signal (available in Center-Aligned modes only)(4)
0101	PCI Fault active output signal
0100	PCI current-limit active output signal
0011	PCI feed-forward active output signal
0010	PCI Sync active output signal
0001	PWM Generator output signal(3)

Value	Description
0000	Source is selected by the PGTRGSEL[2:0] bits

Bits 2:0 – EVTyPGS[2:0] PWM Event Source Selection bits(2)

Value	Description
111-100	Reserved
011	PWM Generator 4
010	PWM Generator 3
001	PWM Generator 2
000	PWM Generator 1

12.6.12 PWM Generator x Control Register Low

Name: PGxCONL
Offset: 0x32A, 0x360, 0x396, 0x3CC

Note:

1. The PWM Generator time base operates from the frequency scaling circuit clock, effectively scaling the duty cycle and period of the PWM Generator output.

Legend: r = Reserved bit

Bit 14 – Reserved Maintain as '0'

Bits 10:8 – TRGCNT[2:0] Trigger Count Select bits

Value	Description
111	PWM Generator produces eight PWM cycles after triggered
110	PWM Generator produces seven PWM cycles after triggered
101	PWM Generator produces six PWM cycles after triggered
100	PWM Generator produces five PWM cycles after triggered
011	PWM Generator produces four PWM cycles after triggered
010	PWM Generator produces three PWM cycles after triggered
001	PWM Generator produces two PWM cycles after triggered
000	PWM Generator produces one PWM cycle after triggered

Bits 4:3 – CLKSEL[1:0] Clock Selection bits

Value	Description
11	PWM Generator uses Master clock scaled by frequency scaling circuit(1)
10	PWM Generator uses Master clock divided by clock divider circuit(1)
01	PWM Generator uses Master clock selected by the MCLKSEL[1:0] (PCLKCON[1:0]) control bits
00	No clock selected, PWM Generator is in lowest power state (default)

Bits 2:0 – MODSEL[2:0] Mode Selection bits

Value	Description
111	Dual Edge Center-Aligned PWM mode (interrupt/register update twice per cycle)
110	Dual Edge Center-Aligned PWM mode (interrupt/register update once per cycle)
101	Double-Update Center-Aligned PWM mode
100	Center-Aligned PWM mode
011	Reserved
010	Independent Edge PWM mode, dual output
001	Variable Phase PWM mode
000	Independent Edge PWM mode

12.6.13 PWM Generator x Control Register High

Name: PGxCONH
Offset: 0x32C, 0x362, 0x398, 0x3CE

Notes:

1. The PCI selected Sync signal is always available to be OR'd with the selected SOC signal per the SOCS[3:0] bits if the PCI Sync function is enabled.
2. The source selected by the SOCS[3:0] bits MUST operate from the same clock source as the local PWM Generator. If not, the source must be routed through the PCI Sync logic so the trigger signal may be synchronized to the PWM Generator clock domain.
3. PWM Generators are grouped into groups of four: PG1-PG4 and PG5-PG8, if available. Any generator within a group of four may be used to trigger another generator within the same group.

Value	Description
1	PWM Generator uses the MDC register
0	PWM Generator uses the PGxDC register

Bit 14 – MPERSEL Master Period Register Select bit

Value	Description
1	PWM Generator uses the MPER register
0	PWM Generator uses the PGxPER register

Bit 13 – MPHSEL Master Phase Register Select bit

Value	Description
1	PWM Generator uses the MPHASE register
0	PWM Generator uses the PGxPHASE register

Bit 11 – MSTEN Master Update Enable bit

Value	Description
1	PWM Generator broadcasts software set/clear of the UPDATE status bit and EOC signal to other PWM Generators
0	PWM Generator does not broadcast the UPDATE status bit state or EOC signal

Bits 10:8 – UPMOD[2:0] PWM Buffer Update Mode Selection bits

Value	Description
011	Client Immediate Update: Updates Data registers immediately, or as soon as possible, when a Master update request is received. A Master update request will be transmitted if MSTEN = 1 and UPDREQ = 1 for the requesting PWM Generator.
010	Client SOC Update: Updates Data registers at start of next cycle if a Master update request is received. A Master update request will be transmitted if MSTEN = 1 and UPDREQ = 1 for the requesting PWM Generator.

Value	Description
001	Immediate Update: Updates Data registers immediately, or as soon as possible, if UPDREQ = 1. The UPDATE status bit will be cleared automatically after the update occurs.
000	SOC Update: Updates Data registers at start of next PWM cycle if UPDREQ = 1. The UPDATE status bit will be cleared automatically after the update occurs.(1)

Bit 7 – Reserved Maintain as '0'

Bit 6 – TRGMOD PWM Generator Trigger Mode Selection bit

Value	Description
1	PWM Generator operates in Retriggerable mode
0	PWM Generator operates in Single Trigger mode

Bits 3:0 – SOCS[3:0] Start-of-Cycle Selection bits(1,2,3)

Value	Description
1111	TRIG bit or PCI Sync function only (no hardware trigger source is selected)
1110-0101	Reserved
0100	PWM4 trigger output selected by PGTRGSEL[2:0] (PGxEVT[2:0])

0001	PWM1 trigger output selected by PGTRGSEL[2:0] (PGxEVT[2:0])
0000	Local EOC – PWM Generator is self-triggered

12.6.14 PWM Generator x Status Register

Name: PGxSTAT
Offset: 0x32E, 0x364, 0x39A, 0x3D0

Note:

1. User software may write a '1' to CAP as a request to initiate a software capture. The CAP status bit will be set when the capture event has occurred. No further captures will occur until CAP is cleared by software.

Legend: C = Clearable bit; HS = Hardware Settable bit

Bit 15 – SEVT PCI Sync Event bit

Value	Description
1	A PCI Sync event has occurred (rising edge on PCI Sync output or PCI Sync output is high when module is enabled)
0	No PCI Sync event has occurred

Bit 14 – FLTEVT PCI Fault Active Status bit

Value	Description
1	A Fault event has occurred (rising edge on PCI Fault output or PCI Fault output is high when module is enabled)
0	No Fault event has occurred

Bit 13 – CLEVT PCI Current-Limit Status bit

Value	Description
1	A PCI current-limit event has occurred (rising edge on PCI current-limit output or PCI current-limit output is high when module is enabled)
0	No PCI current-limit event has occurred

Bit 12 – FFEVT PCI Feed-Forward Active Status bit

Value	Description
1	A PCI feed-forward event has occurred (rising edge on PCI feed-forward output or PCI feed-forward output is high when module is enabled)
0	No PCI feed-forward event has occurred

Bit 11 – SACT PCI Sync Status bit

Value	Description
1	PCI Sync output is active
0	PCI Sync output is inactive

Bit 10 – FLTACT PCI Fault Active Status bit

Value	Description
1	PCI Fault output is active
0	PCI Fault output is inactive

Bit 9 – CLACT PCI Current-Limit Status bit

Value	Description
1	PCI current-limit output is active
0	PCI current-limit output is inactive

Bit 8 – FFACT PCI Feed-Forward Active Status bit

Value	Description
1	PCI feed-forward output is active
0	PCI feed-forward output is inactive

Bit 7 – TRSET PWM Generator Software Trigger Set bit
User software writes a '1' to this bit location to trigger a PWM Generator cycle. The bit location always reads as '0'. The TRIG bit will indicate '1' when the PWM Generator is triggered.

Bit 6 – TRCLR PWM Generator Software Trigger Clear bit
User software writes a '1' to this bit location to stop a PWM Generator cycle. The bit location always reads as '0'. The TRIG bit will indicate '0' when the PWM Generator is not triggered.

Bit 5 – CAP Capture Status bit(1)

Value	Description
1	PWM Generator time base value has been captured in PGxCAP
0	No capture has occurred

Bit 4 – UPDATE PWM Data Register Update Status/Control bit

Value	Description
1	PWM Data register update is pending – user Data registers are not writable
0	No PWM Data register update is pending

Bit 3 – UPDREQ PWM Data Register Update Request bit
User software writes a '1' to this bit location to request a PWM Data register update. The bit location always reads as '0'. The UPDATE status bit will indicate '1' when an update is pending.

Bit 2 – STEER Output Steering Status bit (Push-Pull Output mode only)

Value	Description
1	PWM Generator is in 2nd cycle of Push-Pull mode
0	PWM Generator is in 1st cycle of Push-Pull mode

Bit 1 – CAHALF Half Cycle Status bit (Center-Aligned modes only)

Value	Description
1	PWM Generator is in 2nd half of time base cycle
0	PWM Generator is in 1st half of time base cycle

Bit 0 – TRIG PWM Trigger Status bit

Value	Description
1	PWM Generator is triggered and PWM cycle is in progress
0	No PWM cycle is in progress

12.6.15 PWM Generator x I/O Control Register Low

Bit 15 – CLMOD Current-Limit Mode Select bit

Value	Description
1	If PCI current limit is active, then the PWMxH and PWMxL output signals are inverted (bit flipping), and the CLDAT[1:0] bits are not used
0	If PCI current limit is active, then the CLDAT[1:0] bits define the PWM output levels

Bit 14 – SWAP Swap PWM Signals to PWMxH and PWMxL Device Pins bit

Value	Description
1	The PWMxH signal is connected to the PWMxL pin and the PWMxL signal is connected to the PWMxH pin
0	PWMxH/L signals are mapped to their respective pins

Bit 13 – OVRENH User Override Enable for PWMxH Pin bit

Value	Description
1	OVRDAT1 provides data for output on the PWMxH pin
0	PWM Generator provides data for the PWMxH pin

Bit 12 – OVRENL User Override Enable for PWMxL Pin bit

Value	Description
1	OVRDAT0 provides data for output on the PWMxL pin
0	PWM Generator provides data for the PWMxL pin

Bits 11:10 – OVRDAT[1:0] Data for PWMxH/PWMxL Pins if Override is Enabled bits
If OVERENH = 1, then OVRDAT1 provides data for PWMxH.
If OVERENL = 1, then OVRDAT0 provides data for PWMxL.

Bits 9:8 – OSYNC[1:0] User Output Override Synchronization Control bits

Value	Description
11	Reserved
10	User output overrides via the OVRENH/L and OVRDAT[1:0] bits occur when specified by the UPDMOD[2:0] bits in the PGxCONH register
01	User output overrides via the OVRENH/L and OVRDAT[1:0] bits occur immediately (as soon as possible)
00	User output overrides via the OVRENH/L and OVRDAT[1:0] bits are synchronized to the local PWM time base (next Start-of-Cycle)

Bits 7:6 – FLTDAT[1:0] Data for PWMxH/PWMxL Pins if Fault Event is Active bits
If Fault is active, then FLTDAT1 provides data for PWMxH.
If Fault is active, then FLTDAT0 provides data for PWMxL.

Bits 5:4 – CLDAT[1:0] Data for PWMxH/PWMxL Pins if Current-Limit Event is Active bits
If current limit is active, then CLDAT1 provides data for PWMxH.
If current limit is active, then CLDAT0 provides data for PWMxL.

Bits 3:2 – FFDAT[1:0] Data for PWMxH/PWMxL Pins if Feed-Forward Event is Active bits
If feed-forward is active, then FFDAT1 provides data for PWMxH.
If feed-forward is active, then FFDAT0 provides data for PWMxL.

Bits 1:0 – DBDAT[1:0] Data for PWMxH/PWMxL Pins if Debug Mode is Active and PTFRZ = 1 bits
If Debug mode is active and PTFRZ = 1, then DBDAT1 provides data for PWMxH.
If Debug mode is active and PTFRZ = 1, then DBDAT0 provides data for PWMxL.

12.6.23 PWM Generator x Leading-Edge Blanking Register Low

Name: PGxLEBL
Offset: 0x348, 0x37E, 0x3B4, 0x3EA

Note:

1. Bits[2:0] are read-only and always remain as '0'.

Bit	15	14	13	12	11	10	9	8
	LEB[12:5]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	LEB[4:0]							
Access	R/W	R/W	R/W	R/W	R/W			
Reset	0	0	0	0	0			

Bits 15:3 – LEB[12:0] Leading-Edge Blanking Period bits(1)
Leading-Edge Blanking period. The three LSBs of the blanking time are not used, providing a blanking resolution of eight clock periods. The minimum blanking period is eight clock periods, which occurs when LEB[15:3] = 0.

12.6.24 PWM Generator x Leading-Edge Blanking Register High

Name: PGxLEBH
Offset: 0x34A, 0x380, 0x3B6, 0x3EC

Note:

1. The selected PWM Generator source does not affect the LEB counter. This source can be optionally used as a PCI input, PCI qualifier, PCI terminator or PCI terminator qualifier (see the description in 12.6.19. PGxCLPCIL and 12.6.20. PGxCLPCIH for more information).

Bit	15	14	13	12	11	10	9	8

Bits 10:8 – PWMPCI[2:0] PWM Source for PCI Selection bits(1)

Value	Description
111-100	Reserved
011	PWM Generator #4 output is made available to PCI logic
010	PWM Generator #3 output is made available to PCI logic
001	PWM Generator #2 output is made available to PCI logic
000	PWM Generator #1 output is made available to PCI logic

Bit 3 – PHR PWMxH Rising bit

Value	Description
1	Rising edge of PWMxH will trigger the LEB duration counter
0	LEB ignores the rising edge of PWMxH

Bit 2 – PHF PWMxH Falling bit

Value	Description
1	Falling edge of PWMxH will trigger the LEB duration counter
0	LEB ignores the falling edge of PWMxH

Bit 1 – PLR PWMxL Rising bit

Value	Description
1	Rising edge of PWMxL will trigger the LEB duration counter
0	LEB ignores the rising edge of PWMxL

Bit 0 – PLF PWMxL Falling bit

Value	Description
1	Falling edge of PWMxL will trigger the LEB duration counter
0	LEB ignores the falling edge of PWMxL

12.6.25 PWM Generator x PCI Register Low

Name: PGxFFPCIL
Offset: 0x340, 0x376, 0x3AC, 0x3E2

Bit 15 – TSYNCDIS Termination Synchronization Disable bit

Value	Description
1	Termination of latched PCI occurs immediately
0	Termination of latched PCI occurs at PWM EOC

Bits 14:12 – TERM[2:0] Termination Event Selection bits

Value	Description
111	Selects PCI Source #9
110	Selects PCI Source #8
101	Selects PCI Source #1 (PWM Generator output selected by the PWMPCI[2:0] bits)
100	PGxTRIGC trigger event

010	PGxTRIGA trigger event
001	Auto-Terminate: Terminates when PCI source transitions from active to inactive
000	Manual Terminate: Terminates on a write of '1' to the SWTERM bit location

Bit 11 – AQPS Acceptance Qualifier Polarity Select bit

Value	Description
1	Inverted
0	Not inverted

Bits 10:8 – AQSS[2:0] Acceptance Qualifier Source Selection bits

Value	Description
111	SWPCI control bit only (qualifier forced to '0')
110	Selects PCI Source #9
101	Selects PCI Source #8
100	Selects PCI Source #1 (PWM Generator output selected by the PWMPCI[2:0] bits)
011	PWM Generator is triggered
010	LEB is active
001	Duty cycle is active (base PWM Generator signal)
000	No acceptance qualifier is used (qualifier forced to '1')

Bit 7 – SWTERM PCI Software Termination bit
A write of '1' to this location will produce a termination event. This bit location always reads as '0'.

Bit 6 – PSYNC PCI Synchronization Control bit

Value	Description
1	PCI source is synchronized to PWM EOC
0	PCI source is not synchronized to PWM EOC

Bit 5 – PPS PCI Polarity Select bit

Value	Description

13. High-Speed, 12-Bit Analog-to-Digital Converter

Notes:

1. This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"12-Bit High-Speed, Multiple SARs A/D Converter (ADC)"** (www.microchip.com/DS70005213) in the *"dsPIC33/PIC24 Family Reference Manual"*.
2. Some registers and associated bits described in this section may not be available on all devices due to the number of implemented ADC channels. Refer to dsPIC33CK256MC506 Product Families for ADC channel availability on device variants.

dsPIC33CK256MC506 devices have a high-speed, 12-bit Analog-to-Digital Converter (ADC) that features a low conversion latency, high resolution and oversampling capabilities to improve performance in AC/DC and DC/DC power converters. The devices implement the ADC with one shared core.

The number of available channels and negative inputs is dependent on package size, as shown in Table 13-1

Table 13-1. ADC External Input Availability

Package Type	External Inputs	Negative Inputs
64-pin	AN0-AN19	ANN0
48-pin	AN0-AN19	ANN0
36-pin	AN0-AN6, AN8- AN17	—
28-pin	AN0-AN6, AN8-AN11, AN16-AN17	—

13.1 ADC Features Overview

The high-speed, 12-bit multiple SARs Analog-to-Digital Converter (ADC) includes the following features:

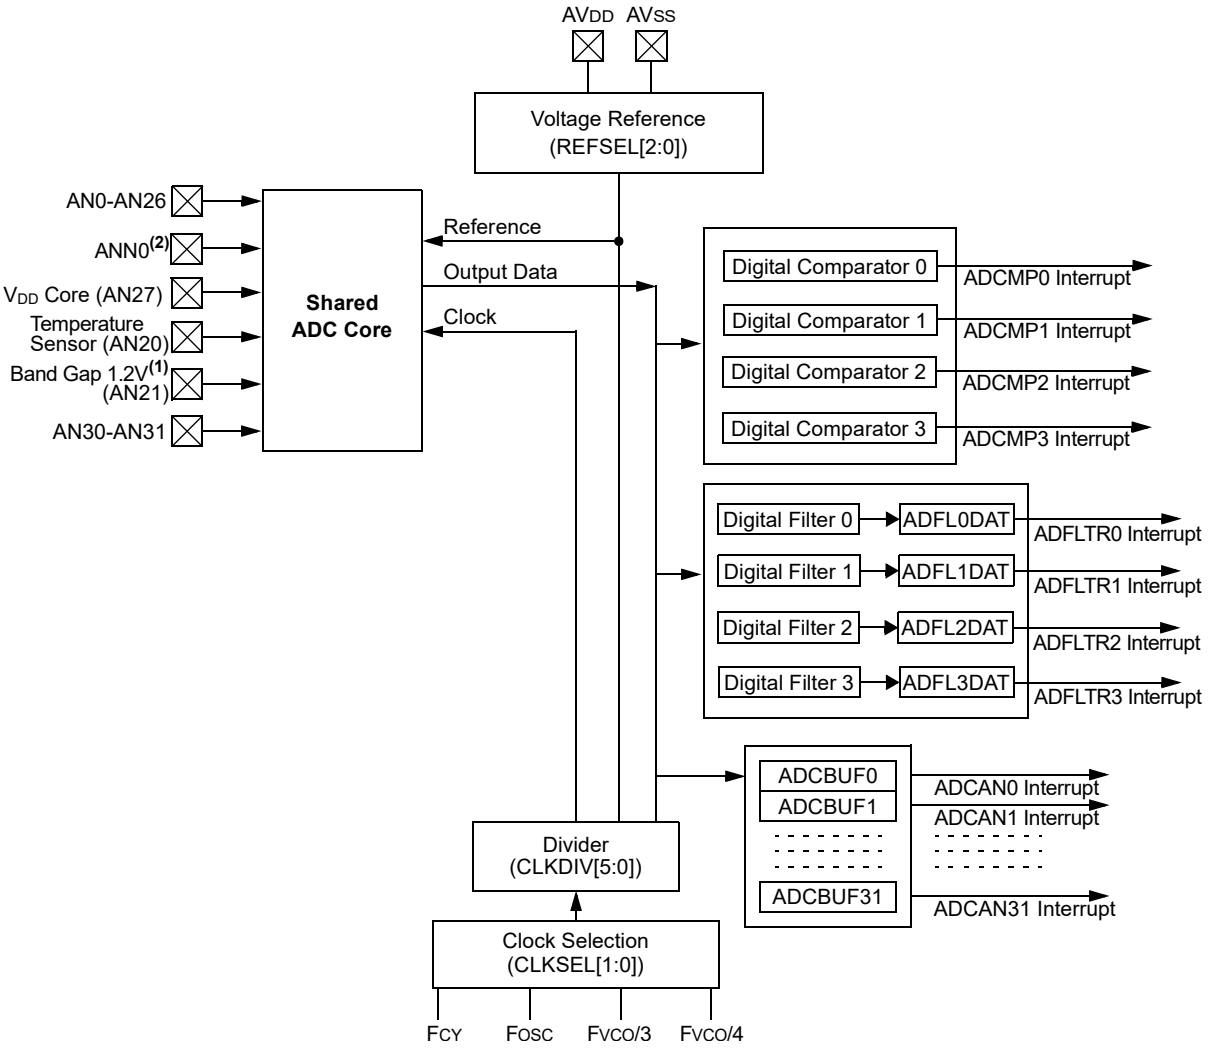
- One Shared (common) Core
- User-Configurable Resolution of Up to 12 Bits
- Up to 3.25 Msps Conversion Rate per Channel at 12-Bit Resolution
- Low Latency Conversion
- Up to 18 Analog Input Channels with a Separate 16-Bit Conversion Result Register for each Input Channel
- Conversion Result can be Formatted as Unsigned or Signed Data, on a per Channel Basis, for All Channels
- Channel Scan Capability
- Multiple Conversion Trigger Options, Including:
  - PWM triggers from CPU core
  - SCCP modules triggers
  - CLC modules triggers
  - External pin trigger event (ADTRG31)
  - Software trigger
- Four Integrated Digital Comparators with Dedicated Interrupts:
  - Multiple comparison options
  - Assignable to specific analog inputs
- Four Oversampling Filters with Dedicated Interrupts:
  - Provide increased resolution
  - Assignable to a specific analog input

Simplified block diagrams of the 12-bit ADC are shown in Figure 13-1 and Figure 13-2.

The analog inputs (channels) are connected through multiplexers and switches to the Sample-and-Hold (S&H) circuit of the ADC core. The core uses the channel information (the output format, the Measurement mode and the input number) to process the analog sample. When conversion is complete, the result is stored in the result buffer for the specific analog input, and passed to the digital filter and digital comparator if they were configured to use data from this particular channel. If multiple ADC inputs request conversion on the shared core, the module will convert them in a sequential manner, starting with the lowest order input.

The ADC provides each analog input the ability to specify its own trigger source. This capability allows the ADC to sample and convert analog inputs that are associated with PWM Generators operating on independent time bases.

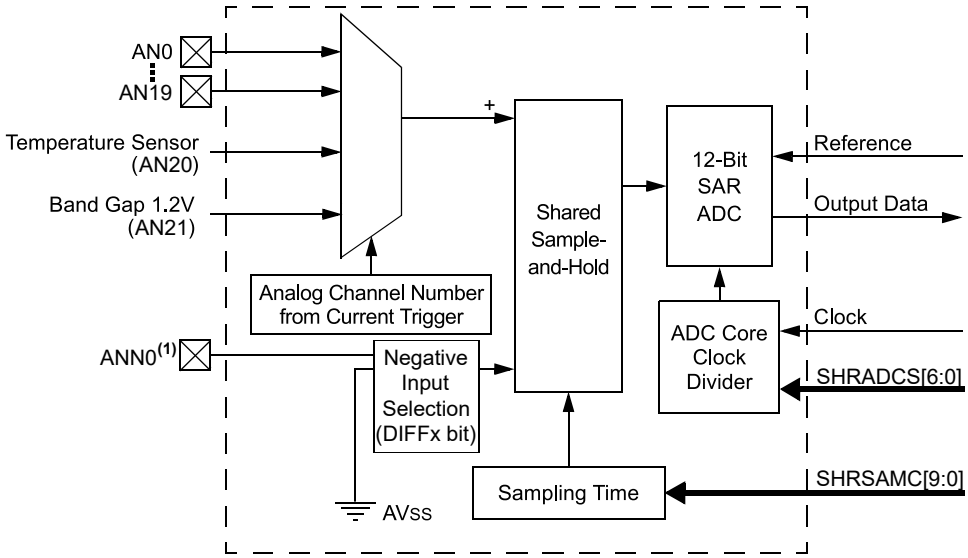
Figure 13-1. ADC Module Block Diagram



Notes:

1. Band Gap Reference (V_{BG}) is an internal analog input and is not available on device pins.
2. Pin ANN0 is only available in the 48-pin and 64-pin packages.

Figure 13-2. Shared Core Block Diagram



Note:

1. Pin ANN0 is only available in the 48-pin and 64-pin packages.

13.1.1 Temperature Sensor

The ADC channel, AN20, is connected to a forward-biased diode. It can be used to measure a die temperature. This diode provides a voltage output that can be monitored by the ADC.

The temperature coefficient is listed in Table 32-33 in 32. Electrical Characteristics. To get the exact gain and offset numbers, the two temperature points' calibration is recommended.

13.2 Analog-to-Digital Converter Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

13.2.1 Differential-Mode

ANNx negative external inputs are used for Differential-mode as shown in Figure 13-2. To enable Differential-mode, the DIFF bit (in the ADMODxL or ADMODxH register) is set for the corresponding channel.

Value	Description
1	Band gap was removed after the ADC module was enabled (ADON = 1)
0	No band gap error was detected

Bits 9:0 – SHRSAMC[9:0] Shared ADC Core Sample Time Selection bits
These bits specify the number of shared ADC Core Clock Periods (T_{ADCORE}) for the shared ADC core sample time (Sample Time = (SHRSAMC[9:0] + 2) * T_{ADCORE}).

Value	Description
1111111111	1025 T_{ADCORE}

Bit 12 – SUSPEND All ADC Core Triggers Disable bit

Value	Description
1	All new trigger events for the ADC core are disabled
0	The ADC core can be triggered

Bit 11 – SUSPCIE Suspend All ADC Cores Common Interrupt Enable bit

Value	Description
1	Common interrupt will be generated when ADC core triggers are suspended (SUSPEND bit = 1) and all previous conversions are finished (SUSPRDY bit becomes set)
0	Common interrupt is not generated for suspend ADC cores event

Bit 10 – SUSPRDY ADC Core Suspended Flag bit

Value	Description
1	The ADC core is suspended (SUSPEND bit = 1) and has no conversions in progress
0	The ADC core has previous conversions in progress

Bit 9 – SHRSAMP Shared ADC Core Sampling Direct Control bit
This bit should be used with the individual channel conversion trigger controlled by the CNVRTCH bit. It connects an analog input, specified by the CNVCHSEL[5:0] bits, to the shared ADC core and allows extending the sampling time. This bit is not controlled by hardware and must be cleared before the conversion starts (setting CNVRTCH to '1').

Value	Description
1	Shared ADC core samples an analog input specified by the CNVCHSEL[5:0] bits
0	Sampling is controlled by the shared ADC core hardware

Bit 8 – CNVRTCH Software Individual Channel Conversion Trigger bit

Value	Description
1	Single trigger is generated for an analog input specified by the CNVCHSEL[5:0] bits; when the bit is set, it is automatically cleared by hardware on the next instruction cycle
0	Next individual channel conversion trigger can be generated

Bit 7 – SWLCTRG Software Level-Sensitive Common Trigger bit

Value	Description
1	Triggers are continuously generated for all channels with the software; level-sensitive common trigger selected as a source in the ADTRIGnL and ADTRIGxH registers
0	No software, level-sensitive common triggers are generated

Bit 6 – SWCTRG Software Common Trigger bit

Value	Description
1	Single trigger is generated for all channels with the software; common trigger selected as a source in the ADTRIGnL and ADTRIGxH registers; when the bit is set, it is automatically cleared by hardware on the next instruction cycle
0	Ready to generate the next software common trigger

Bits 5:0 – CNVCHSEL[5:0] Channel No. Selection for Software Individual Channel Conv. Trigger bits
These bits define a channel to be converted when the CNVRTCH bit is set.

13.3.6 ADC Control Register 3 High

Name: ADCON3H
Offset: 0xB0A

Notes:

1. The ADC input clock frequency, selected by the CLKSEL[1:0] bits, must not exceed parameters AD9, AD10 and AD11 in Table 32-32.
2. The ADC clock frequency, after the first divider selected by the CLKDIV[5:0] bits, must not exceed parameters AD9, AD10 and AD11 in Table 32-32.

10	$F_{VCO}/3$
01	F_{CY}
00	F_{OSC}

Bits 13:8 – CLKDIV[5:0] ADC Module Clock Source Divider bits(2)
The divider forms a $T_{CORESRC}$ clock used by the ADC core, from the T_{SRC} ADC module clock source, selected by the CLKSEL[1:0] bits. Then, each ADC core individually divides the $T_{CORESRC}$ clock to get a core-specific T_{ADCORE} clock using the ADCS[6:0] bits in the ADCORExH register or the SHRADCS[6:0] bits in the ADCON2L register.

14. High-Speed Analog Comparator with Slope Compensation DAC

Notes:

1. This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"High-Speed Analog Comparator Module"** (www.microchip.com/DS70005280) in the *"dsPIC33/PIC24 Family Reference Manual"*.
2. Some registers and associated bits described in this section may not be available on all devices. Refer to 4. Memory Organization in this data sheet for device-specific register and bit information.

The high-speed analog comparator module provides a method to monitor voltage, current and other critical signals in a power conversion application that may be too fast for the CPU and ADC to capture. The analog comparator module can be used to implement Peak Current mode control, Critical Conduction mode (variable frequency) and Hysteretic Control mode. Figure 14-1 shows an overview of the comparator/DAC module.

14.1 Overview

The high-speed analog comparator module is comprised of a high-speed comparator, Pulse Density Modulation (PDM) DAC and a slope compensation unit. The slope compensation unit provides a user-defined slope which can be used to alter the DAC output. This feature is useful in applications, such as Peak Current mode control, where slope compensation is required to maintain the stability of the power supply. The user simply specifies the direction and rate of change for the slope compensation and the output of the DAC is modified accordingly.

The DAC consists of a PDM unit, followed by a digitally controlled multiphase RC filter. The PDM unit uses a phase accumulator circuit to generate an output stream of pulses. The density of the pulse stream is proportional to the input data value, relative to the maximum value supported by the bit width of the accumulator. The output pulse density is representative of the desired output voltage. The pulse stream is filtered with an RC filter to yield an analog voltage. The output of the DAC is connected to the negative input of the comparator. The positive input of the comparator can be selected using a MUX from the input pins. The comparator provides a high-speed operation with a typical delay of 15 ns.

The output of the comparator is processed by the pulse stretcher and the digital filter blocks, which prevent comparator response to unintended fast transients in the inputs. Figure 14-1 shows a block diagram of the high-speed analog comparator module. The DAC module can be operated in one of three modes: Slope Generation mode, Hysteretic mode and Triangle Wave mode. Each of these modes can be used in a variety of power supply applications.

Note: The DACOUT1 pin can only be associated with a single DAC output at any given time. If more than one DACOEN bit is set, the DACOUT1 pin will be a combination of the signals.

14.2 Features Overview

- Two Rail-to-Rail Analog Comparators
- Four Selectable Input Sources per Comparator
- Programmable Comparator Hysteresis
- Programmable Output Polarity
- Interrupt Generation Capability
- Dedicated Pulse Density Modulation DAC for each Analog Comparator:
  - PDM unit followed by a digitally controlled multimode multipole RC filter
- Multimode Multipole RC Output Filter:
  - Transition mode: Provides the fastest response
  - Fast mode: For tracking DAC slopes
  - Steady-State mode: Provides 12-bit resolution
- Slope Compensation along with each DAC:
  - Slope Generation mode
  - Hysteretic Control mode
  - Triangle Wave mode
- Functional Support for the High-Speed PWM module which Includes:
  - PWM duty cycle control
  - PWM period control
  - PWM Fault detect

14.3 DAC Control Registers

The DACCTRL1L and DACCTRL2H/L registers are common configuration registers for DAC modules. The DACxCON, DACxDAT, SLPxCON and SLPxDAT registers specify the operation of individual modules.

14.4.1 DAC Control 1 Low Register

Name: DACCTRL1L
Offset: 0xC80

Notes:

1. These bits should only be changed when DACON = 0 to avoid unpredictable behavior.
2. The input clock to this divider is the selected clock input, CLKSEL[1:0], and then divided by two.
3. Clock source and dividers should yield an effective DAC clock input as specified in Table 32-35.

Bit 15 – DACEN Individual DACx Module Enable bit

Value	Description
1	Enables DACx module
0	Disables DACx module to reduce power consumption; any pending Slope mode and/or underflow conditions are cleared

Bits 14:13 – IRQM[1:0] Interrupt Mode Select bits(1,2)

Value	Description
11	Generates an interrupt on either a rising or falling edge detect
10	Generates an interrupt on a falling edge detect
01	Generates an interrupt on a rising edge detect
00	Interrupts are disabled

Bit 10 – CBE Comparator Blank Enable bit

Value	Description
1	Enables the analog comparator output to be blanked (gated off) during the recovery transition following the completion of a slope operation
0	Disables the blanking signal to the analog comparator; therefore, the analog comparator output is always active

Bit 9 – DACOEN DACx Output Buffer Enable bit

Value	Description
1	DACx analog voltage is connected to the DACOUT1 pin
0	DACx analog voltage is not connected to the DACOUT1 pin

Bit 8 – FLTREN Comparator Digital Filter Enable bit

Value	Description
1	Digital filter is enabled
0	Digital filter is disabled

Bit 7 – CMPSTAT Comparator Status bits
The current state of the comparator output including the CMPPOL selection.

Bit 6 – CMPPOL Comparator Output Polarity Control bit

Value	Description
1	Output is inverted
0	Output is noninverted

Bits 5:3 – INSEL[2:0] Comparator Input Source Select bits

15. Quadrature Encoder Interface (QEI)

Notes:

1. This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive resource. For more information, refer to **"Quadrature Encoder Interface (QEI)"** (www.microchip.com/DS70000601) in the *"dsPIC33/PIC24 Family Reference Manual"*.
2. Some registers and associated bits described in this section may not be available on all devices. Refer to 4. Memory Organization in this data sheet for device-specific register and bit information.

The Quadrature Encoder Interface (QEI) module provides the interface to incremental encoders for obtaining mechanical position data. Quadrature Encoders, also known as incremental encoders or optical encoders, detect position and speed of rotating motion systems. Quadrature Encoders enable closed-loop control of motor control applications, such as Switched Reluctance (SR) and AC Induction Motors (ACIM).

A typical Quadrature Encoder includes a slotted wheel attached to the shaft of the motor and an emitter/detector module that senses the slots in the wheel. Typically, three output channels, Phase A (QEAx), Phase B (QEBx) and Index (INDXx), provide information on the movement of the motor shaft, including distance and direction.

The two channels, Phase A (QEAx) and Phase B (QEBx), are typically 90 degrees out of phase with respect to each other. The Phase A and Phase B channels have a unique relationship. If Phase A leads Phase B, the direction of the motor is deemed positive or forward. If Phase A lags Phase B, the direction of the motor is deemed negative or reverse. The Index pulse occurs once per mechanical revolution and is used as a reference to indicate an absolute position. Figure 15-1 illustrates the Quadrature Encoder Interface signals.

The Quadrature signals from the encoder can have four unique states ('01', '00', '10' and '11') that reflect the relationship between QEAx and QEBx. Figure 15-1 illustrates these states for one count cycle. The order of the states gets reversed when the direction of travel changes.

The Quadrature Decoder increments or decrements the 32-bit up/down Position x Counter (POSxCNTH/L) registers for each Change-of-State (COS). The counter increments when QEAx leads QEBx and decrements when QEBx leads QEAx. Table 15-1 shows an overview of the QEI module.

Figure 15-1. Quadrature Encoder Interface Signals

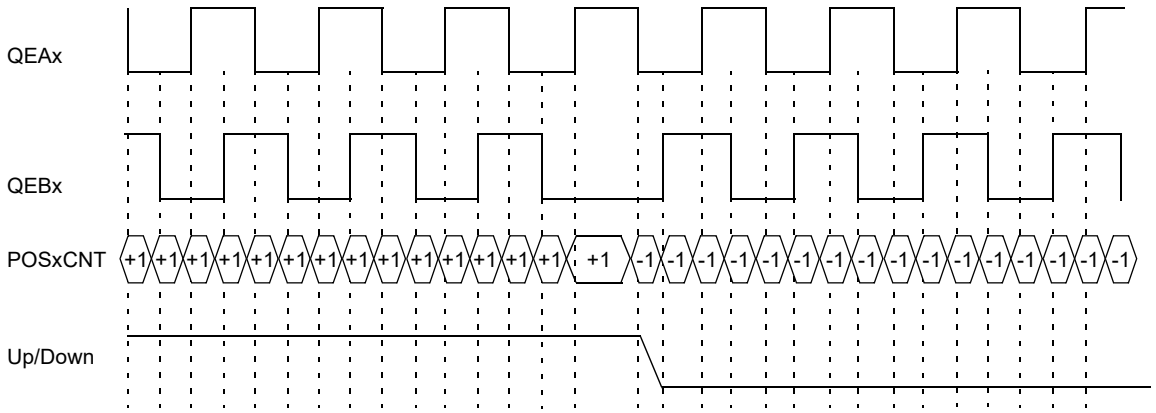

Table 15-1 shows the truth table that describes how the Quadrature signals are decoded.

Table 15-1. Truth Table For Quadrature Encoder

Current Quadrature State		Previous Quadrature State		Action
QA	QB	QA	QB	
1	1	1	1	No count or direction change
1	1	1	0	Count up

.....continued

Current Quadrature State		Previous Quadrature State		Action
QA	QB	QA	QB	
1	1	0	1	Count down
1	1	0	0	Invalid state change; ignore
1	0	1	1	Count down
1	0	1	0	No count or direction change
1	0	0	1	Invalid state change; ignore
1	0	0	0	Count up
0	1	1	1	Count up
0	1	1	0	Invalid state change; ignore
0	1	0	1	No count or direction change
0	1	0	0	Count down
0	0	1	1	Invalid state change; ignore
0	0	1	0	Count down
0	0	0	1	Count up
0	0	0	0	No count or direction change

Figure 15-2 illustrates the simplified block diagram of the QEI module. The QEI module consists of decoder logic to interpret the Phase A (QEAx) and Phase B (QEBx) signals, and an up/down counter to accumulate the count. The counter pulses are generated when the Quadrature state changes. The count direction information must be maintained in a register until a direction change is detected. The module also includes digital noise filters, which condition the input signal.

The QEI module consists of the following major features:

- Four Input Pins: Two Phase Signals, an Index Pulse and a Home Pulse
- Programmable Digital Noise Filters on Inputs
- Quadrature Decoder providing Counter Pulses and Count Direction
- Count Direction Status
- 4x Count Resolution
- Index (INDXx) Pulse to Reset the Position Counter
- General Purpose 32-Bit Timer/Counter mode
- Interrupts generated by QEI or Counter Events
- 32-Bit Velocity Counter
- 32-Bit Position Counter
- 32-Bit Index Pulse Counter
- 32-Bit Interval Timer
- 32-Bit Position Initialization/Capture Register
- 32-Bit Compare Less Than and Greater Than Registers
- External Up/Down Count mode
- External Gated Count mode
- External Gated Timer mode
- Interval Timer mode

15.1.1 QEI1 Control Register

Name: QEI1CON
Offset: 0x140

Notes:

1. When CCMx = 10 or CCMx = 11, all of the QEI counters operate as timers and the PIMOD[2:0] bits are ignored.
2. When CCMx = 00, and QEAx and QEBx values match the Index Match Value (IMV), the POSxCNTH and POSxCNTL registers are reset.
3. The selected clock rate should be at least twice the expected maximum quadrature count rate.
4. Not all devices support this mode.
5. The QCAPEN and HCAPEN bits must be cleared during PIMODx Modes 2 through 7 to ensure proper functionality. Not all devices support HCAPEN.

Bit 1 – QEB Status of QEBx Input Pin After Polarity Control and SWPAB Pin Swapping bit (read-only)

Value	Description
1	Physical pin, QEBx, is at logic '1' if QEBPOL bit is set to '0' and SWPAB bit is set to '0'; physical pin, QEBx, is at logic '0' if QEBPOL bit is set to '1' and SWPAB bit is set to '0'; physical pin, QEAx, is at logic '1' if QEBPOL bit is set to '0' and SWPAB bit is set to '1'; physical pin, QEAx, is at logic '0' if QEBPOL bit is set to '1' and SWPAB bit is set to '1'
0	Physical pin, QEBx, is at logic '0' if QEBPOL bit is set to '0' and SWPAB bit is set to '0'; physical pin, QEBx, is at logic '1' if QEBPOL bit is set to '1' and SWPAB bit is set to '0'; physical pin, QEAx, is at logic '0' if QEBPOL bit is set to '0' and SWPAB bit is set to '1'; physical pin, QEAx, is at logic '1' if QEBPOL bit is set to '1' and SWPAB bit is set to '1'

Bit 0 – QEA Status of QEAx Input Pin After Polarity Control and SWPAB Pin Swapping bit (read-only)

Value	Description
1	Physical pin, QEAx, is at logic '1' if QEAPOL bit is set to '0' and SWPAB bit is set to '0'; physical pin, QEAx, is at logic '0' if QEAPOL bit is set to '1' and SWPAB bit is set to '0'; physical pin, QEBx, is at logic '1' if QEAPOL bit is set to '0' and SWPAB bit is set to '1'; physical pin, QEBx, is at logic '0' if QEAPOL bit is set to '1' and SWPAB bit is set to '1'

Value	Description
0	Physical pin, QEAx, is at logic '0' if QEAPOL bit is set to '0' and SWPAB bit is set to '0'; physical pin, QEAx, is at logic '1' if QEAPOL bit is set to '1' and SWPAB bit is set to '0'; physical pin, QEBx, is at logic '0' if QEAPOL bit is set to '0' and SWPAB bit is set to '1'; physical pin, QEBx, is at logic '1' if QEAPOL bit is set to '1' and SWPAB bit is set to '1'

16. Universal Asynchronous Receiver Transmitter (UART)

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Multiprotocol Universal Asynchronous Receiver Transmitter (UART) Module"** (www.microchip.com/DS70005288) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The Universal Asynchronous Receiver Transmitter (UART) is a flexible serial communication peripheral used to interface dsPIC® microcontrollers with other equipment, including computers and peripherals. The UART is a full-duplex, asynchronous communication channel that can be used to implement protocols, such as RS-232 and RS-485. The UART also supports the following hardware extensions:

- LIN/J2602
- IrDA®
- Digital Multiplex (DMX)
- Smart Card

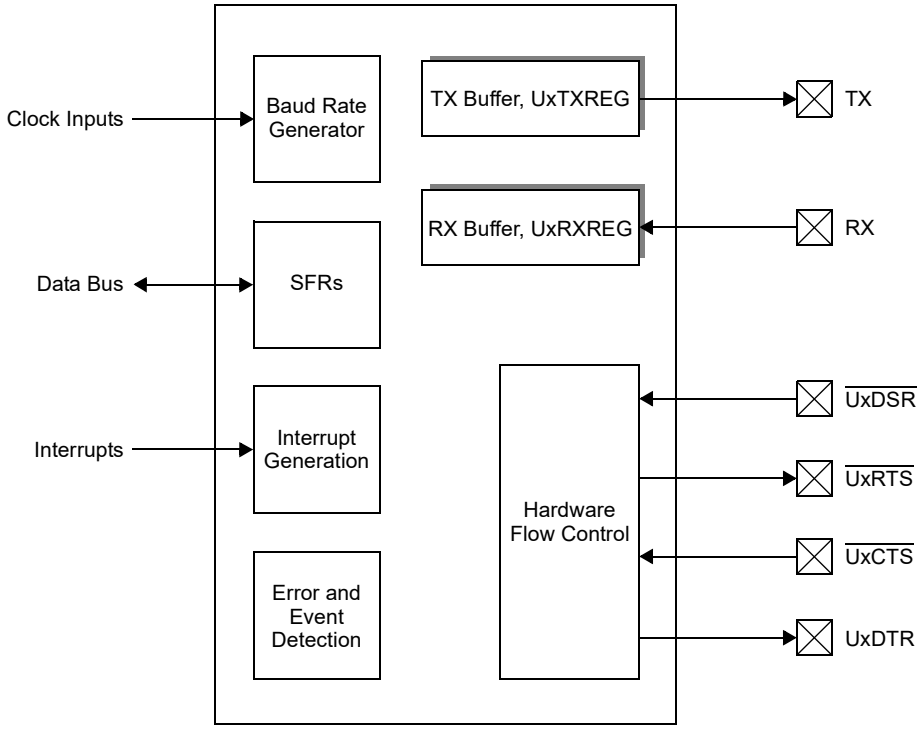
The primary features of the UART are:

- Full or Half-Duplex Operation
- Up to 8-Deep TX and RX First-In First-Out (FIFO) Buffers
- 8-Bit or 9-Bit Data Width
- Configurable Stop Bit Length
- Flow Control
- Auto-Baud Calibration
- Parity, Framing and Buffer Overrun Error Detection
- Address Detect
- Break Transmission
- Transmit and Receive Polarity Control
- Manchester Encoder/Decoder
- Operation in Sleep mode
- Wake from Sleep on Sync Break Received Interrupt

16.1 Architectural Overview

The UART transfers bytes of data, to and from device pins, using First-In First-Out (FIFO) buffers up to eight bytes deep. The status of the buffers and data is made available to user software through Special Function Registers (SFRs). The UART implements multiple interrupt channels for handling transmit, receive and error events. A simplified block diagram of the UART is shown in Figure 16-1.

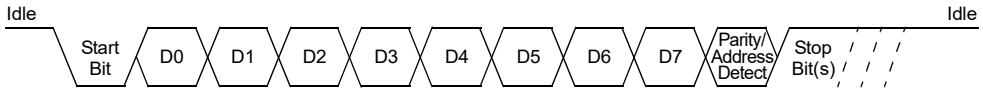
Figure 16-1. Simplified UARTx Block Diagram



16.2 Character Frame

A typical UART character frame is shown in Figure 16-2. The Idle state is high with a 'Start' condition indicated by a falling edge. The Start bit is followed by the number of data, parity/address detect and Stop bits defined by the MOD[3:0] (UxMODE[3:0]) bits selected.

Figure 16-2. UART Character Frame



16.3 Data Buffers

Both transmit and receive functions use buffers to store data shifted to/from the pins. These buffers are FIFOs and are accessed by reading the SFRs, UxTXREG and UxRXREG, respectively. Each data buffer has multiple flags associated with its operation to allow software to read the status. Interrupts can also be configured based on the space available in the buffers. The transmit and receive buffers can be cleared and their pointers reset using the associated TX/RX Buffer Empty Status bits, UTXBE (UxSTAH[5]) and URXBE (UxSTAH[1]).

16.4 Protocol Extensions

The UART provides hardware support for LIN/J2602, DMX and smart card protocol extensions to reduce software overhead. A protocol extension is enabled by writing a value to the MOD[3:0] (UxMODE[3:0]) selection bits and further configured using the UARTx Timing Parameter registers, UxP1, UxP2, UxP3 and UxP3H. Details regarding operation and usage are discussed in their respective chapters. Not all protocols are available on all devices.

Bit 15 – UARTEN UART Enable bit

Value	Description
1	UART is ready to transmit and receive
0	UART state machine, FIFO Buffer Pointers and counters are reset; registers are readable and writable

Bit 13 – USIDL UART Stop in Idle Mode bit

Value	Description
1	Discontinues module operation when device enters Idle mode
0	Continues module operation in Idle mode

Bit 12 – WAKE Wake-up Enable bit

Value	Description
1	Module will continue to sample the RX pin – interrupt generated on falling edge, bit cleared in hardware on following rising edge; if ABAUD is set, Auto-Baud Detection (ABD) will begin immediately
0	RX pin is not monitored nor rising edge detected

Bit 11 – RXBIMD Receive Break Interrupt Mode bit

Value	Description
1	RXBKIF flag when a minimum of 23 (DMX)/11 (asynchronous or LIN/J2602) low bit periods are detected
0	RXBKIF flag when the Break makes a low-to-high transition after being low for at least 23/11-bit periods

Bit 9 – BRKOVR Send Break Software Override bit
Overrides the TX Data Line:

Value	Description
1	Makes the TX line active (Output 0 when UTXINV = 0, Output 1 when UTXINV = 1)
0	TX line is driven by the shifter

Bit 8 – UTXBRK UART Transmit Break bit(1)

Value	Description
1	Sends Sync Break on next transmission; cleared by hardware upon completion
0	Sync Break transmission is disabled or has completed

Bit 7 – BRGH High Baud Rate Select bit

Value	Description
1	High Speed: Baud rate is baudclk/4

Value	Description
0	Low Speed: Baud rate is baudclk/16

Bit 6 – ABAUD Auto-Baud Detect Enable bit (read-only when MOD[3:0] = 1xxx)

Value	Description
1	Enables baud rate measurement on the next character – requires reception of a Sync field (55h); cleared in hardware upon completion
0	Baud rate measurement is disabled or has completed

Bit 5 – UTXEN UART Transmit Enable bit

Value	Description
1	Transmit enabled – except during Auto-Baud Detection
0	Transmit disabled – all transmit counters, pointers and state machines are reset; TX buffer is not flushed, status bits are not reset

Bit 4 – URXEN UART Receive Enable bit

Value	Description
1	Receive enabled – except during Auto-Baud Detection
0	Receive disabled – all receive counters, pointers and state machines are reset; RX buffer is not flushed, status bits are not reset

Bits 3:0 – MOD[3:0] UART Mode bits

Value	Description

Bit 15 – SLPEN Run During Sleep Enable bit

Value	Description
1	UART BRG clock runs during Sleep
0	UART BRG clock is turned off during Sleep

Bit 14 – ACTIVE UART Running Status bit

Value	Description
1	UART clock request is active (user can not update the UxMODE/UxMODEH registers)
0	UART clock request is not active (user can update the UxMODE/UxMODEH registers)

Bit 11 – BCLKMOD Baud Clock Generation Mode Select bit

Value	Description
1	Uses fractional Baud Rate Generation
0	Uses legacy divide-by-x counter for baud clock generation (x = 4 or 16 depending on the BRGH bit)

Bits 10:9 – BCLKSEL[1:0] Baud Clock Source Selection bits

Value	Description
11	F_{VCODIV}
10	F_{OSC}
01	$F_{VCO}/5$
00	F_P

Bit 8 – HALFDPLX UART Half-Duplex Selection Mode bit

Value	Description
1	Half-Duplex mode: UxTX is driven as an output when transmitting and tri-stated when TX is Idle
0	Full-Duplex mode: UxTX is driven as an output at all times when both UARTEN and UTXEN are set

Bit 7 – RUNOVF Run During Overflow Condition Mode bit

Value	Description
1	When an Overflow Error (OERR) condition is detected, the RX shifter continues to run so as to remain synchronized with incoming RX data; data are not transferred to UxRXREG when it is full (i.e., no UxRXREG data are overwritten)
0	When an Overflow Error (OERR) condition is detected, the RX shifter stops accepting new data (Legacy mode)

Bit 6 – URXINV UART Receive Polarity bit

Value	Description
1	Inverts RX polarity; Idle state is low
0	Input is not inverted; Idle state is high

Bits 5:4 – STSEL[1:0] Number of Stop Bits Selection bits

Value	Description
11	2 Stop bits sent, 1 checked at receive
10	2 Stop bits sent, 2 checked at receive
01	1.5 Stop bits sent, 1.5 checked at receive
00	1 Stop bit sent, 1 checked at receive

Bit 3 – C0EN Enable Legacy Checksum (C0) Transmit and Receive bit

Value	Description
1	Checksum Mode 1 (enhanced LIN checksum in LIN mode; add all TX/RX words in all other modes)
0	Checksum Mode 0 (legacy LIN checksum in LIN mode; not used in all other modes)

Bit 2 – UTXINV UART Transmit Polarity bit

Value	Description
1	Inverts TX polarity; TX is low in Idle state
0	Output data are not inverted; TX output is high in Idle state

Bits 1:0 – FLO[1:0] Flow Control Enable bits (Only valid when MOD[3:0] = 0xxx)

Value	Description
11	Reserved
10	$\overline{\text{RTS}}$-$\overline{\text{DSR}}$ (for TX side)/$\overline{\text{CTS}}$-DTR (for RX side) hardware flow control
01	XON/XOFF software flow control
00	Flow control off

Bit 10 – RXBKIE Receive Break Interrupt Enable bit

Value	Description
1	Interrupt is enabled
0	Interrupt is disabled

Bit 9 – OERIE Receive Buffer Overflow Interrupt Enable bit

Value	Description
1	Interrupt is enabled
0	Interrupt is disabled

Bit 8 – TXCIE Transmit Collision Interrupt Enable bit

Value	Description
1	Interrupt is enabled
0	Interrupt is disabled

Bit 7 – TRMT Transmit Shifter Empty Interrupt Flag bit (read-only)

Value	Description
1	Transmit Shift Register (TSR) is empty (end of last Stop bit when STPMD = 1 or middle of first Stop bit when STPMD = 0)
0	Transmit Shift Register is not empty

Bit 6 – PERR Parity Error/Address Received/Forward Frame Interrupt Flag bit
LIN and Parity Modes:
1 = Parity error detected
0 = No parity error detected
Address Mode:
1 = Address received
0 = No address detected
All Other Modes:
Not used.

Bit 5 – ABDOVF Auto-Baud Rate Acquisition Interrupt Flag bit (must be cleared by software)

Value	Description
1	BRG rolled over during the auto-baud rate acquisition sequence (must be cleared in software)
0	BRG has not rolled over during the auto-baud rate acquisition sequence

Bit 4 – CERIF Checksum Error Interrupt Flag bit (must be cleared by software)

Value	Description
1	Checksum error
0	No checksum error

Bit 3 – FERR Framing Error Interrupt Flag bit

Value	Description
1	Framing Error: Inverted level of the Stop bit corresponding to the topmost character in the buffer; propagates through the buffer with the received character
0	No framing error

Bit 2 – RXBKIF Receive Break Interrupt Flag bit (must be cleared by software)

Value	Description
1	A Break was received
0	No Break was detected

Bit 1 – OERR Receive Buffer Overflow Interrupt Flag bit (must be cleared by software)

Value	Description
1	Receive buffer has overflowed
0	Receive buffer has not overflowed

Bit 0 – TXCIF Transmit Collision Interrupt Flag bit (must be cleared by software)

Value	Description
1	Transmitted word is not equal to the received word
0	Transmitted word is equal to the received word

Value	Description
111	Sets transmit interrupt when there is one empty slot left in the buffer
. . .	
010	Sets transmit interrupt when there are six empty slots or more in the buffer
001	Sets transmit interrupt when there are seven empty slots or more in the buffer
000	Sets transmit interrupt when there are eight empty slots in the buffer; TX buffer is empty

Bits 10:8 – URXISEL[2:0] UART Receive Interrupt Select bits(1)

Value	Description
111	Triggers receive interrupt when there are eight words in the buffer; RX buffer is full
. . .	
001	Triggers receive interrupt when there are two words or more in the buffer
000	Triggers receive interrupt when there is one word or more in the buffer

Bit 7 – TXWRE TX Write Transmit Error Status bit
LIN and Parity Modes:
1 = A new byte was written when buffer was full or when P2[8:0] = 0 (must be cleared by software)
0 = No error
Address Detect Mode:
1 = A new byte was written when buffer was full or to P1[8:0] when P1x was full (must be cleared by software)
0 = No error
Other Modes:
1 = A new byte was written when buffer was full (must be cleared by software)
0 = No error

Bit 6 – STPMD Stop Bit Detection Mode bit

Value	Description
1	Triggers RXIF at the end of the last Stop bit
0	Triggers RXIF in the middle of the first (or second, depending on the STSEL[1:0] setting) Stop bit

Bit 5 – UTXBE UART TX Buffer Empty Status bit

Value	Description
1	Transmit buffer is empty; writing '1' when UTXEN = 0 will reset the TX FIFO Pointers and counters
0	Transmit buffer is not empty

Bit 4 – UTXBF UART TX Buffer Full Status bit

Value	Description
1	Transmit buffer is full
0	Transmit buffer is not full

Bit 3 – RIDLE Receive Idle bit

Value	Description
1	UART RX line is in the Idle state
0	UART RX line is receiving something

Bit 2 – XON UART in XON Mode bit
Only valid when FLO[1:0] control bits are set to XON/XOFF mode.

Value	Description
1	UART has received XON
0	UART has not received XON or XOFF was received

Bit 1 – URXBE UART RX Buffer Empty Status bit

Value	Description
1	Receive buffer is empty; writing '1' when URXEN = 0 will reset the RX FIFO Pointers and counters
0	Receive buffer is not empty

Bit 0 – URXBF UART RX Buffer Full Status bit

Value	Description
1	Receive buffer is full
0	Receive buffer is not full

17. Serial Peripheral Interface (SPI)

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Serial Peripheral Interface (SPI) with Audio Codec Support"** (www.microchip.com/DS70005136) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface, useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, shift registers, display drivers, A/D Converters, etc. The SPI module is compatible with the Motorola® SPI and SIOP interfaces. All devices in the dsPIC33CK256MC506 family include two SPI modules.

On 48-pin and 64-pin devices, the SPI instance, SPI2, can operate at higher speeds when selected as a non-PPS pin. The selection is done using the SPI2PIN bit (FDEVOPT[13]). If the bit for SPI2PIN is '1', the PPS pin will be used. When SPI2PIN is '0', the SPI signals are routed to dedicated pins.

The module supports operation in two Buffer modes. In Standard Buffer mode, data are shifted through a single serial buffer. In Enhanced Buffer mode, data are shifted through a FIFO buffer. The FIFO level depends on the configured mode.

Note: FIFO depth for this device is four (in 8-Bit Data mode).

Variable length data can be transmitted and received, from 2 to 32 bits.

Note: Do not perform Read-Modify-Write operations (such as bit-oriented instructions) on the SPIxBUF register in either Standard or Enhanced Buffer mode.

The module also supports a basic framed SPI protocol while operating in either Host or Client mode. A total of four framed SPI configurations are supported.

The module also supports Audio modes. Four different Audio modes are available.

- I^2S mode
- Left Justified mode
- Right Justified mode
- PCM/DSP mode

If an audio protocol data transfer takes place between two devices, one device is usually the Host and the other is the Client. However, audio data can be transferred between two Clients. Because the audio protocols require free-running clocks, the Host can be a third-party controller. In either case, the Host generates two free-running clocks: SCKx and LRC (Left, Right Channel Clock/$\overline{SSx}$/FSYNC). In each of these modes, the serial clock is free-running and audio data are always transferred.

The SPI serial interface consists of four pins:

- SDIx: Serial Data Input
- SDOx: Serial Data Output
- SCKx: Shift Clock Input or Output
- $\overline{SSx}$: Active-Low Client Select or Frame Synchronization I/O Pulse

The SPI module can be configured to operate using two, three or four pins. In the 3-pin mode, $\overline{SSx}$ is not used. In the 2-pin mode, both SDOx and $\overline{SSx}$ are not used.

The SPI module has the ability to generate three interrupts, reflecting the events that occur during the data communication. The following types of interrupts can be generated:

1. Receive interrupts are signaled by SPIxRXIF. This event occurs when:
   – RX watermark interrupt
   – SPIROV = 1
   – SPIRBF = 1
   – SPIRBE = 1

   provided the respective mask bits are enabled in SPIxIMSKL/H.
2. Transmit interrupts are signalled by SPIxTXIF. This event occurs when:
   – TX watermark interrupt
   – SPITUR = 1
   – SPITBF = 1
   – SPITBE = 1

   provided the respective mask bits are enabled in SPIxIMSKL/H.
3. General interrupts are signalled by SPIxGIF. This event occurs when:
   – FRMERR = 1
   – SPIBUSY = 1
   – SRMT = 1

   provided the respective mask bits are enabled in SPIxIMSKL/H.

Block diagrams of the module in Standard and Enhanced modes are shown in Figure 17-1 and Figure 17-2.

Note: In this section, the SPI modules are referred to together as SPIx, or separately as SPI1, SPI2 or SPI3. Special Function Registers will follow a similar notation. For example, SPIxCON1 and SPIxCON2 refer to the control registers for any of the three SPI modules.

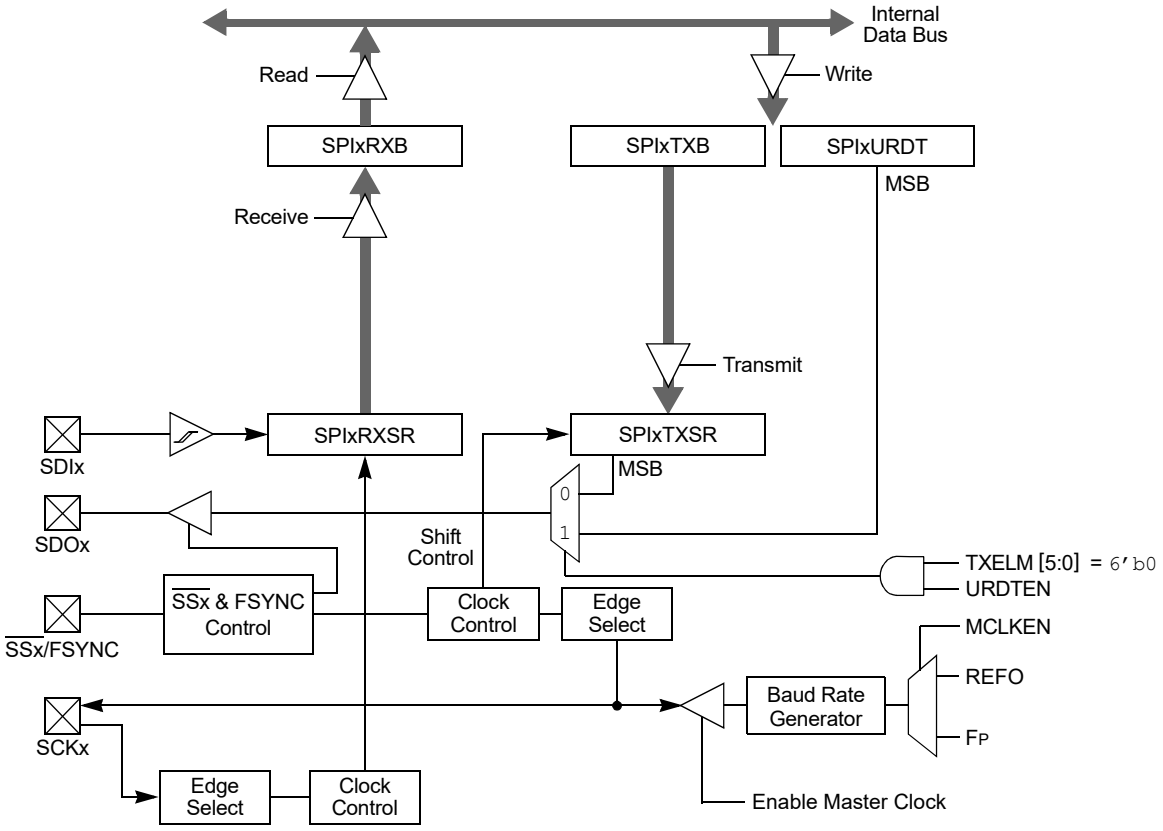
To set up the SPIx module for the Standard Host mode of operation:

1. If using interrupts:
   a. Clear the interrupt flag bits in the respective IFSx register.
   b. Set the interrupt enable bits in the respective IECx register.
   c. Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
2. Write the desired settings to the SPIxCON1L and SPIxCON1H registers with the MSTEN bit (SPIxCON1L[5]) = 1.
3. Clear the SPIROV bit (SPIxSTATL[6]).
4. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
5. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

To set up the SPIx module for the Standard Client mode of operation:

1. Clear the SPIxBUF registers.
2. If using interrupts:
   a. Clear the SPIxBUFL and SPIxBUFH registers.
   b. Set the interrupt enable bits in the respective IECx register.
   c. Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with the MSTEN bit (SPIxCON1L[5]) = 0.
4. Clear the SMP bit.
5. If the CKE bit (SPIxCON1L[8]) is set, then the SSEN bit (SPIxCON1L[7]) must be set to enable the $\overline{SSx}$ pin.
6. Clear the SPIROV bit (SPIxSTATL[6]).
7. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).

Figure 17-1. SPIx Module Block Diagram (Standard Mode)



To set up the SPIx module for the Enhanced Buffer Host mode of operation:

1. If using interrupts:
   a. Clear the interrupt flag bits in the respective IFSx register.
   b. Set the interrupt enable bits in the respective IECx register.
   c. Write the SPIxIP bits in the respective IPCx register.
2. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with MSTEN (SPIxCON1L[5]) = `1`.
3. Clear the SPIROV bit (SPIxSTATL[6]).
4. Select Enhanced Buffer mode by setting the ENHBUF bit (SPIxCON1L[0]).
5. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
6. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

To set up the SPIx module for the Enhanced Buffer Client mode of operation:

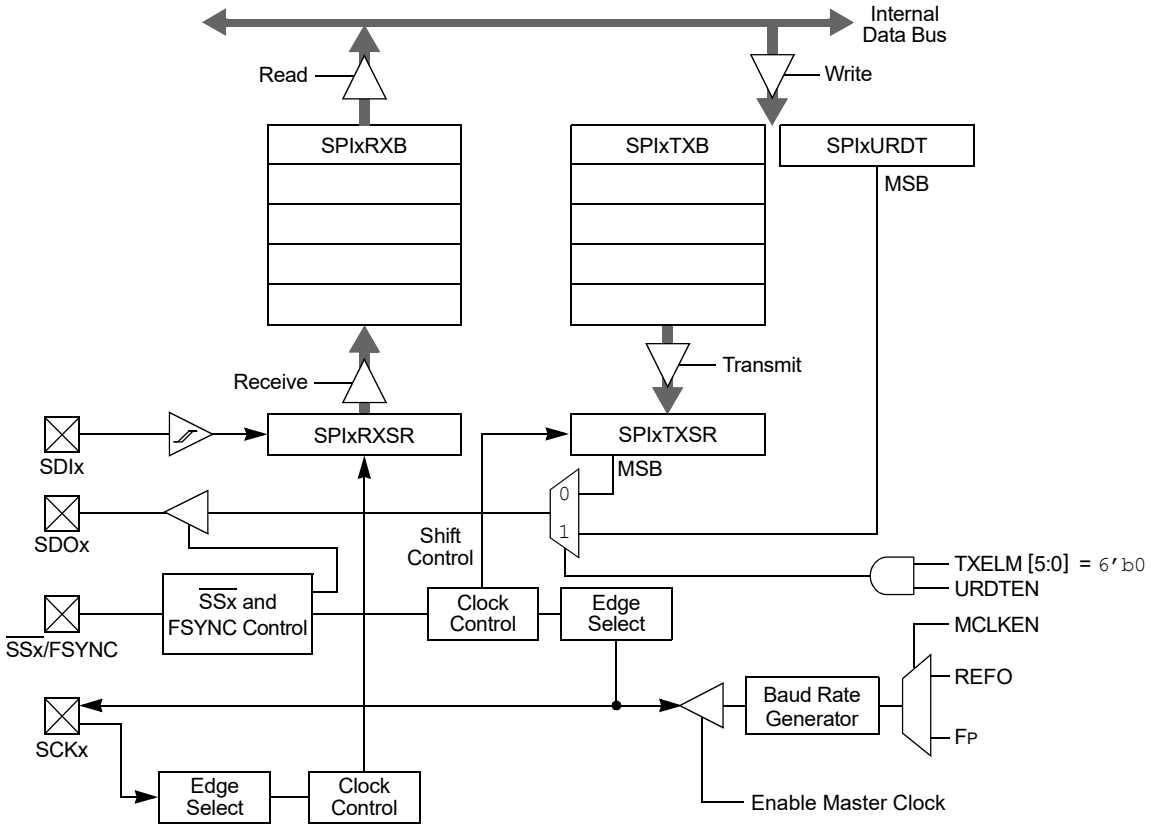
1. Clear the SPIxBUFL and SPIxBUFH registers.
2. If using interrupts:
   Clear the interrupt flag bits in the respective IFSx register.

   Set the interrupt enable bits in the respective IECx register.

   Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with the MSTEN bit (SPIxCON1L[5]) = `0`.
4. Clear the SMP bit.
5. If the CKE bit is set, then the SSEN bit must be set, thus enabling the $\overline{SSx}$ pin.
6. Clear the SPIROV bit (SPIxSTATL[6]).

7. Select Enhanced Buffer mode by setting the ENHBUF bit (SPIxCON1L[0]).
8. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).

Figure 17-2. SPIx Module Block Diagram (Enhanced Mode)



To set up the SPIx module for Audio mode:

1. Clear the SPIxBUFL and SPIxBUFH registers.
2. If using interrupts:
   a. Clear the interrupt flag bits in the respective IFSx register.
   b. Set the interrupt enable bits in the respective IECx register.
   c. Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with AUDEN (SPIxCON1H[15]) = `1`.
4. Clear the SPIROV bit (SPIxSTATL[6]).
5. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
6. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

17.1.1 SPIx Control Register 1 Low

Name: SPIxCON1L
Offset: 0x2AC, 0x2C8

Notes:

1. When AUDEN = 1, this module functions as if CKE = 0, regardless of its actual value.
2. When FRMEN = 1, SSEN is not used.
3. MCLKEN can only be written when the SPIEN bit = 0.
4. This channel is not meaningful for DSP/PCM mode as LRC follows FRMSYPW.

Bit 15 – AUDEN Audio Codec Support Enable bit(1)

Value	Description
1	Audio protocol is enabled; MSTEN controls the direction of both SCKx and frame (a.k.a. LRC), and this module functions as if FRMEN = 1, FRMSYNC = MSTEN, FRMCNT[2:0] = 001 and SMP = 0, regardless of their actual values
0	Audio protocol is disabled

Bit 14 – SPISGNEXT SPIx Sign-Extend RX FIFO Read Data Enable bit

Value	Description
1	Data from RX FIFO are sign-extended
0	Data from RX FIFO are not sign-extended

Bit 13 – IGNROV Ignore Receive Overflow bit

Value	Description
1	A Receive Overflow (ROV) is NOT a critical error; during ROV, data in the FIFO are not overwritten by the receive data
0	A ROV is a critical error that stops SPI operation

Bit 12 – IGNTUR Ignore Transmit Underrun bit

Value	Description
1	A Transmit Underrun (TUR) is NOT a critical error and data indicated by URDTEN are transmitted until the SPIxTXB is not empty
0	A TUR is a critical error that stops SPI operation

Bit 11 – AUDMONO Audio Data Format Transmit bit(2)

Value	Description
1	Audio data are mono (i.e., each data word is transmitted on both left and right channels)
0	Audio data are stereo

Bit 10 – URDTEN Transmit Underrun Data Enable bit(3)

Value	Description
1	Transmits data out of SPIxURDT register during Transmit Underrun conditions
0	Transmits the last received data during Transmit Underrun conditions

Bits 9:8 – AUDMOD[1:0] Audio Protocol Mode Selection bits(4)

Value	Description
11	PCM/DSP mode
10	Right Justified mode: This module functions as if SPIFE = 1, regardless of its actual value
01	Left Justified mode: This module functions as if SPIFE = 1, regardless of its actual value
00	I^2S mode: This module functions as if SPIFE = 0, regardless of its actual value

Bit 7 – FRMEN Framed SPIx Support bit

Value	Description
1	Framed SPIx support is enabled ($\overline{SSx}$ pin is used as the FSYNC input/output)
0	Framed SPIx support is disabled

Bit 6 – FRMSYNC Frame Sync Pulse Direction Control bit

Value	Description
1	Frame Sync pulse input (Client)
0	Frame Sync pulse output (Host)

Bit 5 – FRMPOL Frame Sync/Slave Select Polarity bit

Value	Description
1	Frame Sync pulse/Slave select is active-high
0	Frame Sync pulse/Slave select is active-low

Bit 4 – MSSEN Master Mode Slave Select Enable bit

Value	Description
1	SPIx Slave select support is enabled with polarity determined by FRMPOL ($\overline{SSx}$ pin is automatically driven during transmission in Master mode)
0	Slave select SPIx support is disabled ($\overline{SSx}$ pin will be controlled by port I/O)

Bit 3 – FRMSYPW Frame Sync Pulse-Width bit

Value	Description
1	Frame Sync pulse is one serial word length wide (as defined by MODE[32,16]/WLENGTH[4:0])
0	Frame Sync pulse is one clock (SCKx) wide

Bits 2:0 – FRMCNT[2:0] Frame Sync Pulse Counter bits
Controls the number of serial words transmitted per Sync pulse.

Value	Description
111	Reserved
110	Reserved
101	Generates a Frame Sync pulse on every 32 serial words
100	Generates a Frame Sync pulse on every 16 serial words
011	Generates a Frame Sync pulse on every 8 serial words
010	Generates a Frame Sync pulse on every 4 serial words
001	Generates a Frame Sync pulse on every 2 serial words (value used by audio protocols)
000	Generates a Frame Sync pulse on each serial word

17.1.3 SPIx Control Register 2 Low

Name: SPIxCON2L

Value	Description
1	No current or pending transactions (i.e., neither SPIxTXB or SPIxTXSR contains data to transmit)
0	Current or pending transactions

Bit 6 – SPIROV SPIx Receive Overflow Status bit

Value	Description
1	A new byte/half-word/word has been completely received when the SPIxRXB was full
0	No overflow

Bit 5 – SPIRBE SPIx RX Buffer Empty Status bit
Standard Buffer Mode:
Automatically set in hardware when SPIxBUF is read from, reading SPIxRXB. Automatically cleared in hardware when SPIx transfers data from SPIxRXSR to SPIxRXB.
Enhanced Buffer Mode:
Indicates RXELM[5:0] = 000000.

Value	Description
1	RX buffer is empty
0	RX buffer is not empty

Bit 3 – SPITBE SPIx Transmit Buffer Empty Status bit
Standard Buffer Mode:
Automatically set in hardware when SPIx transfers data from SPIxTXB to SPIxTXSR. Automatically cleared in hardware when SPIxBUF is written, loading SPIxTXB.

These bits are only used when URDTEN = 1. This register holds the data to transmit when a Transmit Underrun condition occurs.
When the MODE[32:16] or WLENGTH[4:0] bits select 32 to 25-bit data, the SPIx only uses URDATA[31:16]. When the MODE[32:16] or WLENGTH[4:0] bits select 24 to 17-bit data, the SPIx only uses URDATA[23:16].

18. Inter-Integrated Circuit (I^2C)

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to **"Inter-Integrated Circuit (I^2C)"** (www.microchip.com/DS70000195) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The Inter-Integrated Circuit (I^2C) module is a serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, display drivers, A/D Converters, etc.

The I^2C module supports these features:

- 7-Bit and 10-Bit Device Addresses
- General Call Address as Defined in the I^2C Protocol
- Both 100 kHz and 400 kHz Bus Specifications
- Configurable Address Masking
- Multi-Main modes to Prevent Loss of Messages in Arbitration
- Bus Repeater mode, Allowing the Acceptance of All Messages as a Secondary, regardless of the Address
- Automatic SCL

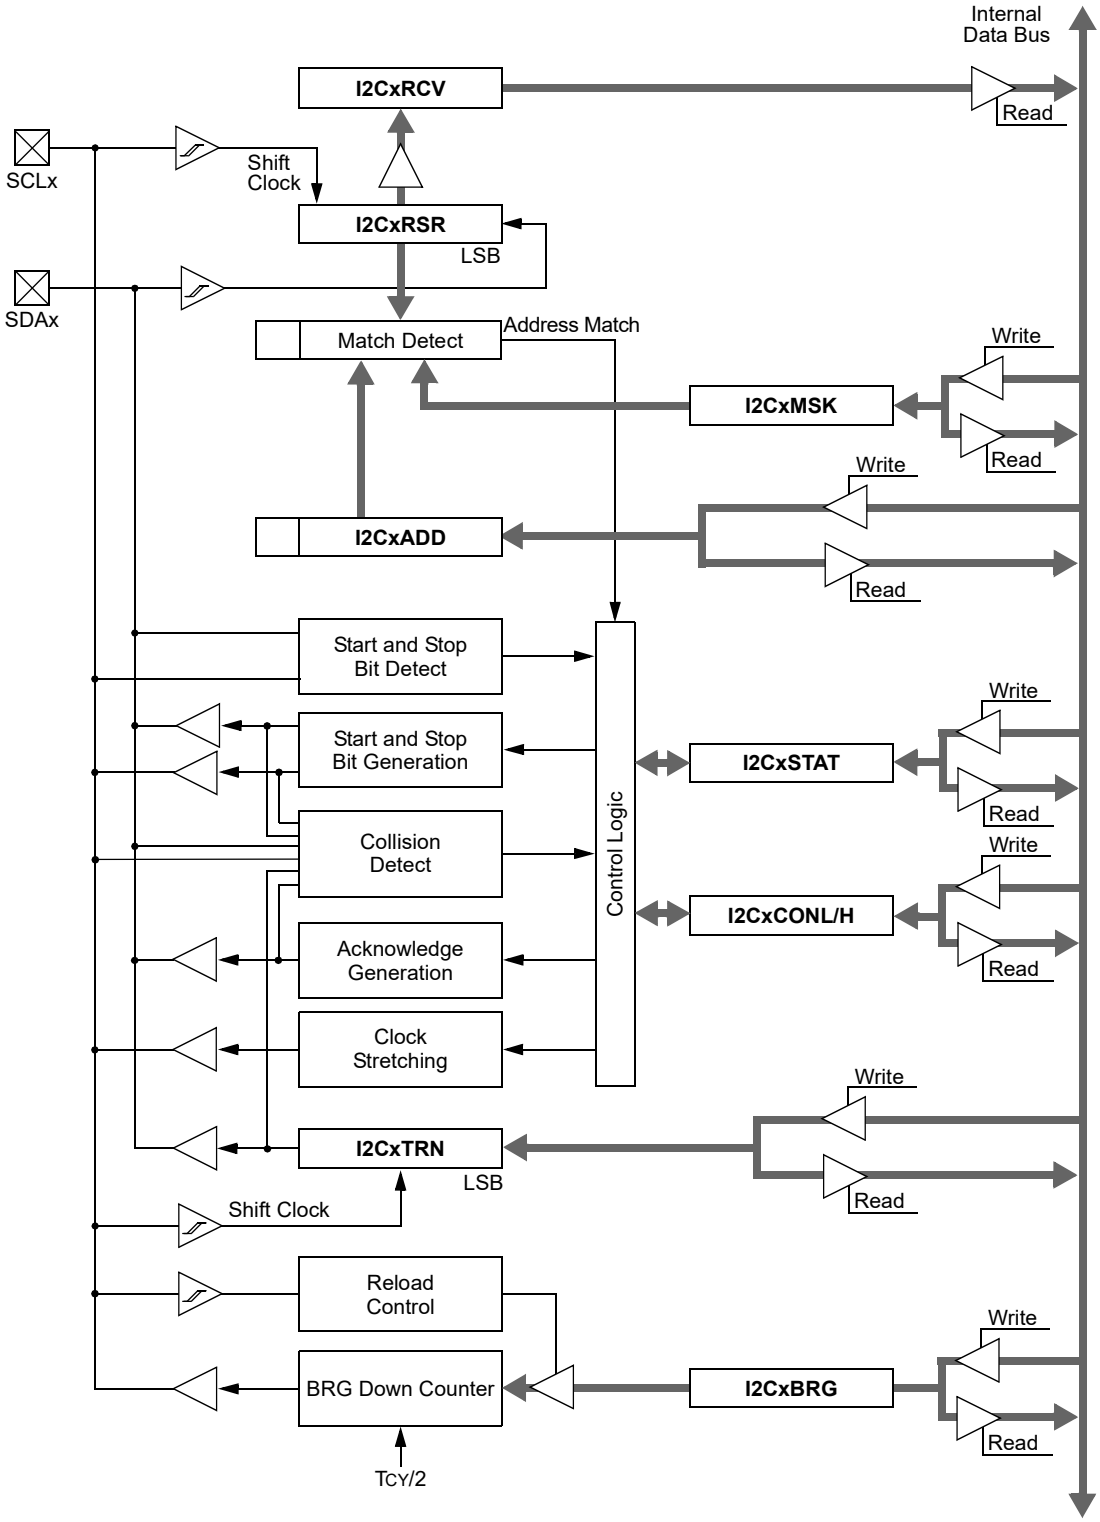
A block diagram of the module is shown in Figure 18-1.

18.1 Communicating as a Host in a Single Host Environment

The details of sending a message in Host mode depends on the communication protocol for the device being communicated with. Typically, the sequence of events is as follows:

1. Assert a Start condition on SDAx and SCLx.
2. Send the I^2C device address byte to the Client with a write indication.
3. Wait for and verify an Acknowledge from the Client.
4. Send the first data byte (sometimes known as the command) to the Client.
5. Wait for and verify an Acknowledge from the Client.
6. Send the serial memory address low byte to the Client.
7. Repeat Steps 4 and 5 until all data bytes are sent.
8. Assert a Repeated Start condition on SDAx and SCLx.
9. Send the device address byte to the Client with a read indication.
10. Wait for and verify an Acknowledge from the Client.
11. Enable Host reception to receive serial memory data.
12. Generate an ACK or NACK condition at the end of a received byte of data.
13. Generate a Stop condition on SDAx and SCLx.

Figure 18-1. I2Cx Block Diagram



18.2 Setting Baud Rate When Operating as a Bus Main

To compute the Baud Rate Generator reload value, use Equation 18-1.

Equation 18-1. Computing Baud Rate Reload Value(1,2,3)

$I2CxBRG = ((1/F_{SCL} - Delay) \bullet F_P) - 2$

Notes:

1. These clock rate values are for guidance only. The actual clock rate should be measured in its intended application.
2. Typical value of delay varies from 110 ns to 150 ns.
3. I2CxBRG values of 0 to 3 are expressly forbidden. The user should never program the I2CxBRG with a value of 0x0, 0x1, 0x2 or 0x3 as indeterminate results may occur.

18.3 Secondary Address Masking

The I2C1MSK register (18.5.5. I2C1MSK) designates address bit positions as “don’t care” for both 7-Bit and 10-Bit Addressing modes. Setting a particular bit location (= 1) in the I2C1MSK register causes the Secondary module to respond, whether the corresponding address bit value is a ‘0’ or a ‘1’. For example, when I2C1MSK is set to ‘0010000000’, the Secondary module will detect both addresses, ‘0000000000’ and ‘0010000000’.

To enable address masking, the Intelligent Peripheral Management Interface (IPMI) must be disabled by clearing the STRICT bit (I2CxCONL[11]).

Note: As a result of changes in the I^2C protocol, the addresses in Table 18-2 are reserved and will not be Acknowledged in Secondary mode. This includes any address mask settings that include any of these addresses.

Table 18-1. I2Cx Clock Rates(1,2)

F_{CY}	F_{SCL}	I2CxBRG Value

40 MHz	400 kHz	45	2D
40 MHz	100 kHz	195	C3
20 MHz	1 MHz	7	7

Notes:

1. Based on $F_{CY} = F_{OSC}/2$; Doze mode and PLL are disabled.
2. These clock rate values are for guidance only. The actual clock rate can be affected by various system-level parameters. The actual clock rate should be measured in its intended application.

.....continued

F_{CY}	F_{SCL}	I2CxBRG Value	
		Decimal	Hexadecimal
20 MHz	400 kHz	22	16
20 MHz	100 kHz	97	61

1. Based on $F_{CY} = F_{OSC}/2$; Doze mode and PLL are disabled.
2. These clock rate values are for guidance only. The actual clock rate can be affected by various system-level parameters. The actual clock rate should be measured in its intended application.

Table 18-2. I2Cx Reserved Addresses(1)

Secondary Address	R/W Bit	Description
0000 000	0	General Call Address(2)
0000 000	1	Start Byte
0000 001	x	Cbus Address
0000 01x	x	Reserved
0000 1xx	x	HS Mode Host Code
1111 0xx	x	10-Bit Client Upper Byte(3)
1111 1xx	x	Reserved

Note:

1. The address bits listed here will never cause an address match independent of address mask settings.
2. This address will be Acknowledged only if GCEN = 1.
3. A match on this address can only occur on the upper byte in 10-Bit Addressing mode.

18.4 SMBus Support

The dsPIC33CK256MC506 family devices have support for SMBus through options in the input voltage thresholds. There are two control bits to select one of three options: SMEN (I2CxCONL[8]) and Configuration bit, SMBEN (FDEVOPT[10]). 18.5.1. I2C1CONL details the setting of these control bits.

Table 18-3. I²C Pin Voltage Threshold

	SMEN SFR Bit (I2CxCONL[8])	SMBEN Configuration Bit (FDEVOPT[10])
I²C (default)	0	x
SMBus 2.0	1	0

Bit 15 – I2CEN I2C1 Enable bit (writable from software only)

Value	Description
1	Enables the I2C1 module, and configures the SDAx and SCLx pins as serial port pins
0	Disables the I2C1 module; all I^2C pins are controlled by port functions

Bit 13 – I2CSIDL I2C1 Stop in Idle Mode bit

Value	Description
1	Discontinues module operation when device enters Idle mode
0	Continues module operation in Idle mode

Bit 12 – SCLREL SCLx Release Control bit (I^2C Client mode only)(1)
If STREN = 1:(2)
User software may write '0' to initiate a clock stretch and write '1' to release the clock. Hardware clears at the beginning of every Client data byte transmission. Hardware clears at the end of every Client address byte reception. Hardware clears at the end of every Client data byte reception.

Value	Description
1	Releases the SCLx clock
0	Holds the SCLx clock low (clock stretch)

If STREN = 0:
User software may only write '1' to release the clock. Hardware clears at the beginning of every Client data byte transmission. Hardware clears at the end of every Client address byte reception.

Value	Description
1	Releases the SCLx clock
0	Holds the SCLx clock low (clock stretch)

Bit 11 – STRICT I2C1 Strict Reserved Address Rule Enable bit

Value	Description
1	Strict Reserved Addressing is enforced; for reserved addresses. (In Client Mode) – The device doesn't respond to reserved address space and addresses falling in that category are NACKed. (In Host Mode) – The device is allowed to generate addresses with reserved address space.

Value	Description
0	Reserved Addressing would be Acknowledged. (In Client Mode) – The device will respond to an address falling in the reserved address space. When there is a match with any of the reserved addresses, the device will generate an ACK. (In Host Mode) – Reserved.

Bit 10 – A10M 10-Bit Client Address Flag bit

Value	Description
1	I2CxADD is a 10-bit Client address
0	I2CxADD is a 7-bit Client address

Bit 9 – DISSLW Slew Rate Control Disable bit

Value	Description
1	Slew rate control is disabled for Standard Speed mode (100 kHz, also disabled for 1 MHz mode)
0	Slew rate control is enabled for High-Speed mode (400 kHz)

Bit 8 – SMEN SMBus Input Levels Enable bit

Value	Description
1	Enables input logic so thresholds are compliant with the SMBus specification
0	Disables SMBus-specific inputs

Bit 7 – GCEN General Call Enable bit (in I^2C Client mode only)

Value	Description
1	Enables interrupt when a general call address is received in I2CxRSR; module is enabled for reception
0	General call address is disabled.

Bit 6 – STREN SCL1 Clock Stretch Enable bit
In I^2C Client mode only; used in conjunction with the SCLREL bit.

Value	Description
1	Enables clock stretching
0	Disables clock stretching

Bit 5 – ACKDT Acknowledge Data bit
In I^2C Host mode during Host Receive mode. The value that will be transmitted when the user initiates an Acknowledge sequence at the end of a receive.
In I^2C Client mode when AHEN = 1 or DHEN = 1. The value that the Client will transmit when it initiates an Acknowledge sequence at the end of an address or data reception.

Value	Description
1	NACK is sent
0	ACK is sent

Bit 4 – ACKEN Acknowledge Sequence Enable bit
In I^2C Host mode only; applicable during Host Receive mode.

Value	Description
1	Initiates Acknowledge sequence on SDAx and SCLx pins, and transmits ACKDT data bit
0	Acknowledge sequence is Idle

Bit 3 – RCEN Receive Enable bit (in I^2C Host mode only)

Value	Description
1	Enables Receive mode for I^2C; automatically cleared by hardware at end of 8-bit receive data byte
0	Receive sequence is not in progress

Bit 2 – PEN Stop Condition Enable bit (in I^2C Host mode only)

Value	Description
1	Initiates Stop condition on SDAx and SCLx pins
0	Stop condition is Idle

Bit 1 – RSEN Restart Condition Enable bit (in I^2C Host mode only)

Value	Description
1	Initiates Restart condition on SDAx and SCLx pins
0	Restart condition is Idle

Bit 0 – SEN Start Condition Enable bit (in I^2C Host mode only)

Value	Description
1	Initiates Start condition on SDAx and SCLx pins
0	Start condition is Idle

Bit 6 – PCIE Stop Condition Interrupt Enable bit

Value	Description
1	Enables interrupt on detection of Stop condition
0	Stop detection interrupts are disabled

Bit 5 – SCIE Start Condition Interrupt Enable bit

Value	Description
1	Enables interrupt on detection of Start or Restart conditions
0	Start detection interrupts are disabled

Bit 4 – BOEN Buffer Overwrite Enable bit

Value	Description
1	I2CxRCV is updated and an ACK is generated for a received address/data byte, ignoring the state of the I2COV bit only if RBF bit = 0
0	I2CxRCV is only updated when I2COV is clear

Bit 3 – SDAHT SDAx Hold Time Selection bit

Value	Description
1	Minimum of 300 ns hold time on SDAx after the falling edge of SCLx
0	Minimum of 100 ns hold time on SDAx after the falling edge of SCLx

Bit 2 – SBCDE Client Mode Bus Collision Detect Enable bit
If, on the rising edge of SCLx, SDAx is sampled low when the module is outputting a high state, the BCL bit is set and the bus goes Idle. This Detection mode is only valid during data and ACK transmit sequences.

Value	Description
1	Enables Client bus collision interrupts
0	Client bus collision interrupts are disabled

Bit 1 – AHEN Address Hold Enable bit

Value	Description
1	Following the 8th falling edge of SCLx for a matching received address byte; SCLREL bit (I2CxCONL[12]) will be cleared and SCLx will be held low
0	Address holding is disabled

Bit 0 – DHEN Data Hold Enable bit

Value	Description
1	Following the 8th falling edge of SCLx for a received data byte; Client hardware clears the SCLREL bit (I2CxCONL[12]) and SCLx is held low
0	Data holding is disabled

18.5.3 I2C1 Status Register

Bit 15 – ACKSTAT Acknowledge Status bit
(updated in all Host and Client modes)

Value	Description
1	Acknowledge was not received from Client
0	Acknowledge was received from Client

Bit 14 – TRSTAT Transmit Status bit
(when operating as I^2C Host; applicable to Host transmit operation)

Value	Description
1	Host transmit is in progress (8 bits + ACK)
0	Host transmit is not in progress

Bit 13 – ACKTIM Acknowledge Time Status bit
(valid in I^2C Client mode only)

Value	Description
1	Indicates I^2C bus is in an Acknowledge sequence, set on 8th falling edge of SCLx clock
0	Not an Acknowledge sequence, cleared on 9th rising edge of SCLx clock

Bit 10 – BCL Bus Collision Detect bit
(Host/Client mode; cleared when I^2C module is disabled, I2CEN = 0)

Value	Description
1	A bus collision has been detected during a Host or Client transmit operation
0	No bus collision has been detected

Bit 9 – GCSTAT General Call Status bit
(cleared after Stop detection)

Value	Description
1	General call address was received
0	General call address was not received

Bit 8 – ADD10 10-Bit Address Status bit
(cleared after Stop detection)

Value	Description
1	10-bit address was matched
0	10-bit address was not matched

Bit 7 – IWCOL I2Cx Write Collision Detect bit

Value	Description
1	An attempt to write to the I2CxTRN register failed because the I^2C module is busy; must be cleared in software

Value	Description
0	No collision

Bit 6 – I2COV I2Cx Receive Overflow Flag bit

Value	Description
1	A byte was received while the I2CxRCV register is still holding the previous byte; I2COV is a “don’t care” in Transmit mode, must be cleared in software
0	No overflow

Bit 5 – D/$\overline{A}$ Data/$\overline{\text{Address}}$ bit
(when operating as I^2C Client)

Value	Description
1	Indicates that the last byte received was data
0	Indicates that the last byte received or transmitted was an address

Bit 4 – P I2Cx Stop bit
Updated when Start, Reset or Stop is detected; cleared when the I^2C module is disabled, I2CEN = 0.

Value	Description
1	Indicates that a Stop bit has been detected last
0	Stop bit was not detected last

Bit 3 – S I2Cx Start bit
Updated when Start, Reset or Stop is detected; cleared when the I^2C module is disabled, I2CEN = 0.

Value	Description
1	Indicates that a Start (or Repeated Start) bit has been detected last
0	Start bit was not detected last

Bit 2 – R/$\overline{W}$ Read/$\overline{\text{Write}}$ Information bit
(when operating as I^2C Client)

Value	Description
1	Read: Indicates the data transfer is output from the Client
0	Write: Indicates the data transfer is input to the Client

Bit 1 – RBF Receive Buffer Full Status bit

Value	Description
1	Receive is complete, I2CxRCV is full
0	Receive is not complete, I2CxRCV is empty

Bit 0 – TBF Transmit Buffer Full Status bit

Value	Description
1	Transmit is in progress, I2CxTRN is full (8 bits of data)
0	Transmit is complete, I2CxTRN is empty

19. Single-Edge Nibble Transmission (SENT)

Note: This data sheet summarizes the features of this group of dsPIC33CK256MC506 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Single-Edge Nibble Transmission (SENT) Module"** (www.microchip.com/DS70005145) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The Single-Edge Nibble Transmission (SENT) module is based on the SAE J2716, *"SENT – Single-Edge Nibble Transmission for Automotive Applications"*. The SENT protocol is a one-way, single wire, time modulated serial communication, based on successive falling edges. It is intended for use in applications where high-resolution sensor data need to be communicated from a sensor to an Engine Control Unit (ECU).

The SENTx module has the following major features:

- Selectable Transmit or Receive mode
- Synchronous or Asynchronous Transmit modes
- Automatic Data Rate Synchronization
- Optional Automatic Detection of CRC Errors in Receive mode
- Optional Hardware Calculation of CRC in Transmit mode
- Support for Optional Pause Pulse Period
- Data Buffering for One Message Frame
- Selectable Data Length for Transmit/Receive, Up to Six Nibbles
- Automatic Detection of Framing Errors

SENT protocol timing is based on a predetermined time unit, T_{TICK}. Both the transmitter and receiver must be preconfigured for T_{TICK}, which can vary from 3 to 90 µs. A SENT message frame starts with a Sync pulse. The purpose of the Sync pulse is to allow the receiver to calculate the data rate of the message encoded by the transmitter. The SENT specification allows messages to be validated with up to a 20% variation in T_{TICK}. This allows for the transmitter and receiver to run from different clocks that may be inaccurate, and drift with time and temperature. The data nibbles are four bits in length and are encoded as the data value + 12 ticks. This yields a 0 value of 12 ticks and the maximum value, 0xF, of 27 ticks.

A SENT message consists of the following:

- A synchronization/calibration period of 56 tick times
- A status nibble of 12-27 tick times
- Up to six data nibbles of 12-27 tick times
- A CRC nibble of 12-27 tick times
- An optional pause pulse period of 12-768 tick times

Figure 19-1 shows a block diagram of the SENTx module.

Figure 19-2 shows the construction of a typical 6-nibble data frame, with the numbers representing the minimum or maximum number of tick times for each section.

Figure 19-1. SENTx Module Block Diagram

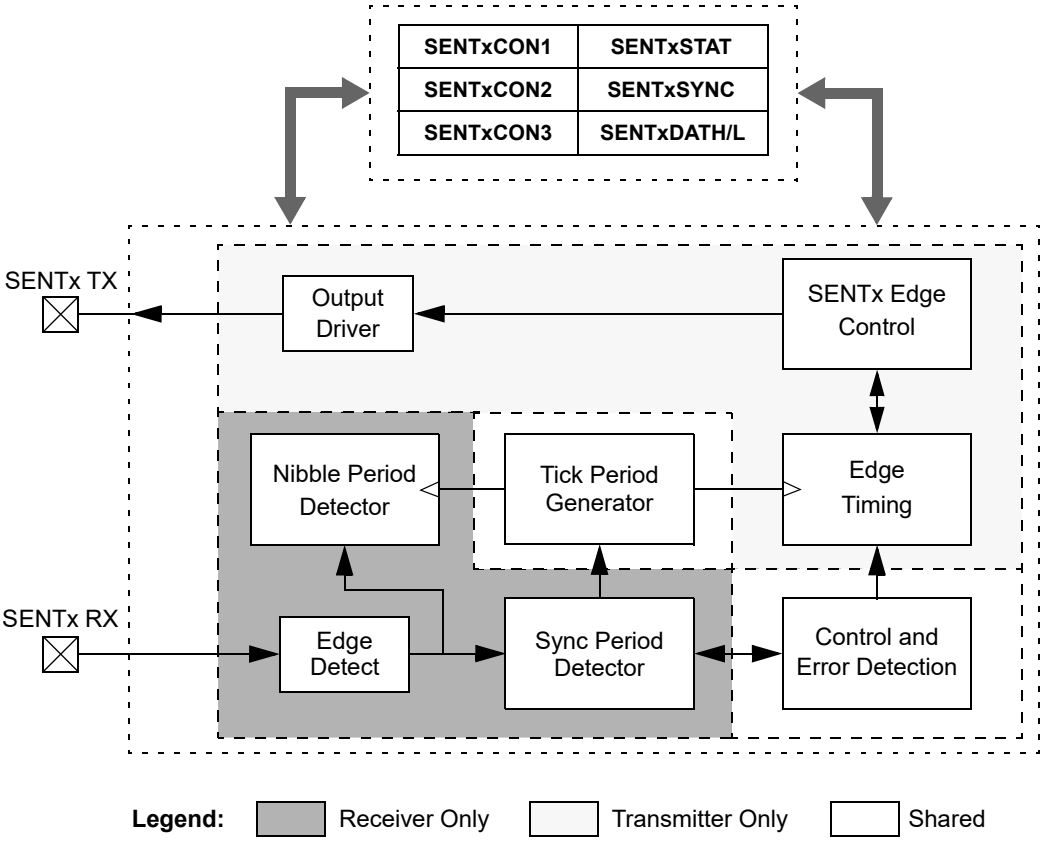

Figure 19-2. SENTx Protocol Data Frames

19.1 Transmit Mode

By default, the SENTx module is configured for transmit operation. The module can be configured for continuous asynchronous message frame transmission, or alternatively, for Synchronous mode triggered by software. When enabled, the transmitter will send a Sync, followed by the appropriate number of data nibbles, an optional CRC and optional pause pulse. The tick period used by the SENTx transmitter is set by writing a value to the TICKTIME[15:0] (SENTxCON2L[15:0]) bits. The tick period calculations are shown in Equation 19-1.

Equation 19-1. TICK Period Calculation

$$TICKTIME[15:0] = \frac{T_{TICK}}{T_{CLK}} - 1$$

An optional pause pulse can be used in Asynchronous mode to provide a fixed message frame time period. The frame period used by the SENTx transmitter is set by writing a value to the FRAMETIME[15:0] (SENTxCON3L[15:0]) bits. The formulas used to calculate the value of frame time are shown in Equation 19-2.

Equation 19-2. Frame Time Calculations

$$FRAMETIME[15:0] = T_{TICK}/T_{FRAME}$$

$$FRAMETIME[15:0] \geq 122 + 27N$$

$$FRAMETIME[15:0] \geq 848 + 12N$$

Where:

T_{FRAME} = Total time of the message from ms

N = The number of data nibbles in message, 1-6

Note: The module will not produce a pause period with less than 12 ticks, regardless of the FRAMETIME[15:0] value. FRAMETIME[15:0] values beyond 2047 will have no effect on the length of a data frame.

19.1.1 Transmit Mode Configuration

19.1.1.1 Initializing the SENTx Module

Perform the following steps to initialize the module:

1. Write RCVEN (SENT1CON1L[11]) = 0 for Transmit mode.
2. Write TXM (SENT1CON1L[10]) = 0 for Asynchronous Transmit mode or TXM = 1 for Synchronous mode.
3. Write NIBCNT[2:0] (SENT1CON1L[2:0]) for the desired data frame length.
4. Write CRCEN (SENT1CON1L[8]) for hardware or software CRC calculation.
5. Write PPP (SENT1CON1L[7]) for optional pause pulse.
6. If PPP = 1, write T_{FRAME} to SENT1CON3L.
7. Write SENT1CON2L with the appropriate value for the desired tick period.
8. Enable interrupts and set interrupt priority.
9. Write initial status and data values to SENT1DATH/L.
10. If CRCEN = 0, calculate CRC and write the value to CRC[3:0] (SENT1DATL[3:0]).
11. Set the SNTEN (SENT1CON1L[15]) bit to enable the module.

User software updates to SENT1DATH/L must be performed after the completion of the CRC and before the next message frame's status nibble. The recommended method is to use the message frame completion interrupt to trigger data writes.

19.2 Receive Mode

The module can be configured for receive operation by setting the RCVEN (SENT1CON1L[11]) bit. The time between each falling edge is compared to SYNCMIN[15:0] (SENT1CON3L[15:0]) and SYNCMAX[15:0] (SENT1CON2L[15:0]), and if the measured time lies between the minimum and maximum limits, the module begins to receive data. The validated Sync time is captured in the SENT1SYNC register and the tick time is calculated. Subsequent falling edges are verified to be within the valid data width and the data are stored in the SENT1DATL/H registers. An interrupt event is generated at the completion of the message and the user software should read the SENTx Data registers before the reception of the next nibble. The equation for SYNCMIN[15:0] and SYNCMAX[15:0] is shown in Equation 19-3.

Equation 19-3. SYNCMIN[15:0] and SYNCMAX[15:0] Calculations

$$T_{TICK} = T_{CLK} \bullet (TICKTIME[15:0] + 1)$$

$$FRAMETIME[15:0] = T_{TICK}/T_{FRAME}$$

$$SyncCount = 8 \times F_{RCV} \times T_{TICK}$$

$$SYNCMIN[15:0] = 0.8 \times SyncCount$$

$$SYNCMAX[15:0] = 1.2 \times SyncCount$$

$$FRAMETIME[15:0] \geq 122 + 27N$$

$$FRAMETIME[15:0] \geq 848 + 12N$$

Where:
T_{FRAME} = Total time of the message from ms
N = The number of data nibbles in message, 1-6
F_{RCV} = FCY x Prescaler
T_{CLK} = FCY/Prescaler

For T_{TICK} = 3.0 µs and F_{CLK} = 4 MHz, SYNCMIN[15:0] = 76.

Note: To ensure a Sync period can be identified, the value written to SYNCMIN[15:0] must be less than the value written to SYNCMAX[15:0].

19.2.1 Receive Mode Configuration

19.2.1.1 Initializing the SENTx Module

Perform the following steps to initialize the module:

1. Write RCVEN (SENT1CON1L[11]) = 1 for Receive mode.
2. Write NIBCNT[2:0] (SENT1CON1L[2:0]) for the desired data frame length.
3. Write CRCEN (SENT1CON1L[8]) for hardware or software CRC validation.
4. Write PPP (SENT1CON1L[7]) = 1 if pause pulse is present.
5. Write SENT1CON2L with the value of SYNCMAXx (Nominal Sync Period + 20%).
6. Write SENT1CON3L with the value of SYNCMINx (Nominal Sync Period – 20%).
7. Enable interrupts and set interrupt priority.
8. Set the SNTEN (SENT1CON1L[15]) bit to enable the module.

The data should be read from the SENT1DATL/H registers after the completion of the CRC and before the next message frame's status nibble. The recommended method is to use the message frame completion interrupt trigger.

Bits 15:0 – SENT1CON2[15:0] SENT1 Control Register 2
The SENT1CON2L register is a 16-bit readable and writable register.
Transmit mode:
Stores the 16-bit value for TICKTIME[15:0], the period of the Tick Clock Generator.
Receive mode:
Stores the 16-bit value for SYNCMAX[15:0], the maximum time interval for a valid Sync period.

19.3.3 SENT1 Control Register 3

Name: SENT1CON3L
Offset: 0x088

Bits 15:0 – SENT1CON3[15:0] SENT1 Control Register 3
In Transmit modes:
Stores the 16-bit value of FRAMETIME[15:0], the total number of Ticks for a data frame when the Pause Pulse is used.
Receive mode:
Stores the 16-bit value for SYNCMIN[15:0], the minimum time interval for a valid Sync period.

19.3.4 SENT1 Status Register

Name: SENT1STATL
Offset: 0x08C

Note:

1. In Receive mode (RCVEN = 1), the SYNCTXEN bit is read-only.

Legend: C = Clearable bit; HC = Hardware Clearable bit

Bit 7 – PAUSE Pause Period Status bit

Value	Description
1	The module is transmitting/receiving a pause period
0	The module is not transmitting/receiving a pause period

Bits 6:4 – NIB[2:0] Nibble Status bits
Module in Transmit Mode (RCVEN = 0):
111 = Module is transmitting a CRC nibble
110 = Module is transmitting Data Nibble 6
101 = Module is transmitting Data Nibble 5
100 = Module is transmitting Data Nibble 4
011 = Module is transmitting Data Nibble 3
010 = Module is transmitting Data Nibble 2
001 = Module is transmitting Data Nibble 1
000 = Module is transmitting a status nibble or pause period, or is not transmitting
Module in Receive Mode (RCVEN = 1):
111 = Module is receiving a CRC nibble or was receiving this nibble when an error occurred
110 = Module is receiving Data Nibble 6 or was receiving this nibble when an error occurred
101 = Module is receiving Data Nibble 5 or was receiving this nibble when an error occurred
100 = Module is receiving Data Nibble 4 or was receiving this nibble when an error occurred
011 = Module is receiving Data Nibble 3 or was receiving this nibble when an error occurred
010 = Module is receiving Data Nibble 2 or was receiving this nibble when an error occurred
001 = Module is receiving Data Nibble 1 or was receiving this nibble when an error occurred
000 = Module is receiving a status nibble or waiting for Sync

Bit 3 – CRCERR CRC Status bit (Receive mode only)

Value	Description
1	A CRC error has occurred for the 1-6 data nibbles in SENT1DATL/H
0	A CRC error has not occurred

Bit 2 – FRMERR Framing Error Status bit (Receive mode only)

Value	Description
1	A data nibble was received with less than 12 tick periods or greater than 27 tick periods
0	Framing error has not occurred

Bit 1 – RXIDLE SENTx Receiver Idle Status bit (Receive mode only)

Value	Description
1	The SENTx data bus has been Idle (high) for a period of SYNCMAX[15:0] or greater
0	The SENTx data bus is not Idle

Bit 0 – SYNCTXEN SENTx Synchronization Period Status/Transmit Enable bit(1)
Module in Receive Mode (RCVEN = 1):
1 = A valid synchronization period was detected; the module is receiving nibble data
0 = No synchronization period has been detected; the module is not receiving nibble data
Module in Asynchronous Transmit Mode (RCVEN = 0, TXM = 0):
The bit always reads as '1' when the module is enabled, indicating the module transmits SENTx data frames continuously. The bit reads '0' when the module is disabled.
Module in Synchronous Transmit Mode (RCVEN = 0, TXM = 1):
1 = The module is transmitting a SENTx data frame
0 = The module is not transmitting a data frame, user software may set SYNCTXEN to start another data frame transmission

20. Timer1

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Timer1 Module"** (www.microchip.com/DS70005279) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The Timer1 module is a 16-bit timer that can operate as a free-running interval timer/counter.

The Timer1 module has the following unique features over other timers:

- Can be Operated in Asynchronous Counter mode
- Asynchronous Timer
- Operational during CPU Sleep mode
- Software Selectable Prescalers 1:1, 1:8, 1:64 and 1:256
- External Clock Selection Control
- The Timer1 External Clock Input (T1CK) can Optionally be Synchronized to the Internal Device Clock and the Clock Synchronization is Performed after the Prescaler

If Timer1 is used for SCCP, the timer should be running in Synchronous mode.

The Timer1 module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode
- Asynchronous Counter mode

A block diagram of Timer1 is shown in Figure 20-1.

21. Capture/Compare/PWM/Timer Modules (SCCP)

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Capture/Compare/PWM/Timer (MCCP and SCCP)"** (www.microchip.com/DS30003035) in the *"dsPIC33/PIC24 Family Reference Manual"*.

dsPIC33CK256MC506 family devices include several Capture/Compare/PWM/Timer base modules, which provide the functionality of three different peripherals from earlier PIC24F devices. The module can operate in one of three major modes:

- General Purpose Timer
- Input Capture
- Output Compare/PWM

Single Capture/Compare/PWM (SCCP) output modules provide only one PWM output.

The SCCP module can be operated only in one of the three major modes at any time. The other modes are not available unless the module is reconfigured for the new mode.

A conceptual block diagram for the module is shown in Figure 21-1. All three modes share a time base generator and a common Timer register pair (CCPxTMRH/L); other shared hardware components are added as a particular mode requires.

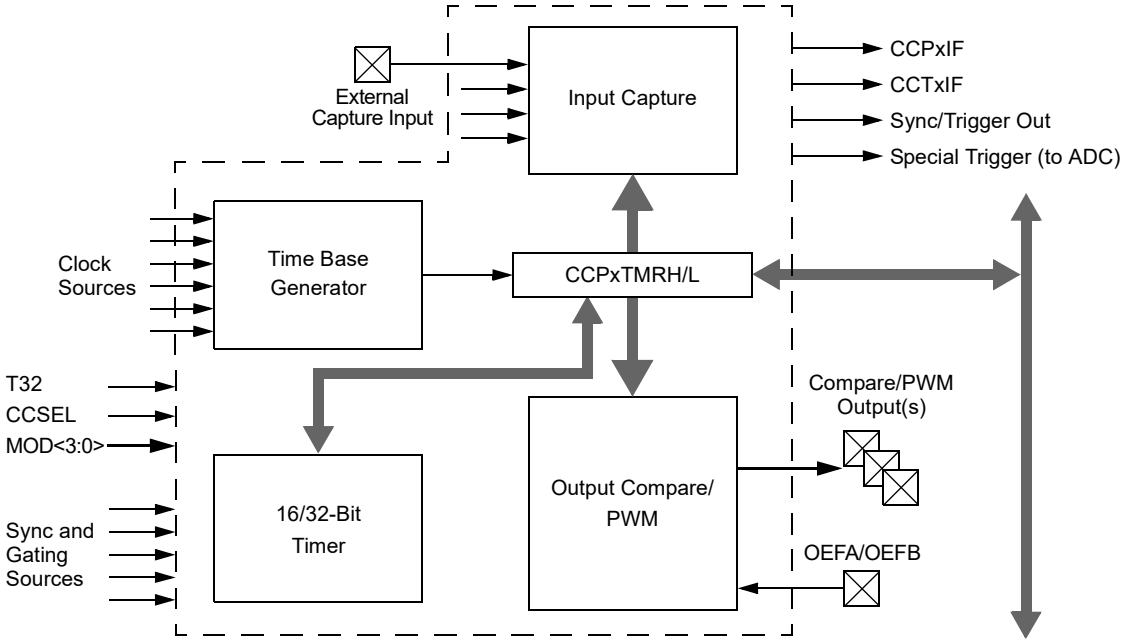
Each module has a total of six control and status registers:

- 21.6.1. CCPxCON1L
- 21.6.2. CCPxCON1H
- 21.6.4. CCPxCON2L
- 21.6.6. CCPxCON2H
- 21.6.7. CCPxCON3H
- 21.6.8. CCPxSTATL

Each module also includes eight buffer/counter registers that serve as Timer Value registers or data holding buffers:

- CCPxTMRH/CCPxTMRL (CCPx Timer High/Low Counters)
- CCPxPRH/CCPxPRL (CCPx Timer Period High/Low)
- CCPxRA (CCPx Primary Output Compare Data Buffer)
- CCPxRB (CCPx Secondary Output Compare Data Buffer)
- CCPxBUFH/CCPxBUFL (CCPx Input Capture High/Low Buffers)

Figure 21-1. SCCPx Conceptual Block Diagram

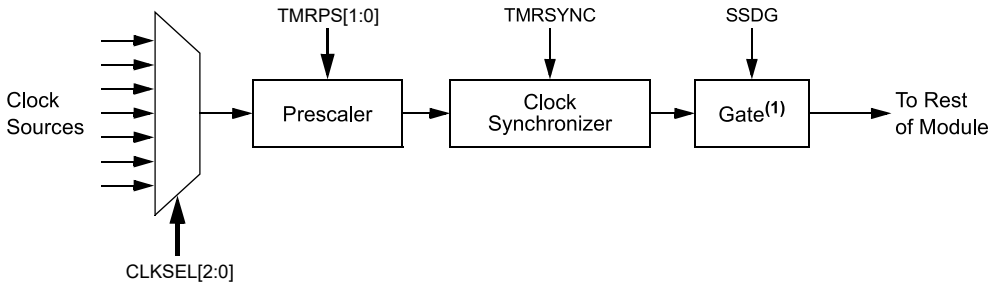


21.1 Time Base Generator

The Timer Clock Generator (TCG) generates a clock for the module's internal time base, using one of the clock signals already available on the microcontroller. This is used as the time reference for the module in its three major modes. The internal time base is shown in Figure 21-2.

There are eight inputs available to the clock generator, which are selected using the CLKSEL[2:0] bits (CCPxCON1L[10:8]). Available sources include the FRC and LPRC, the Secondary Oscillator and the TCLKI External Clock inputs. The system clock is the default source (CLKSEL[2:0] = 000).

Figure 21-2. Timer Clock Generator



Note 1: Gating is available in Timer modes only.

21.2 General Purpose Timer

Timer mode is selected when CCSEL = 0 and MOD[3:0] = 0000. The timer can function as a 32-bit timer or a dual 16-bit timer, depending on the setting of the T32 bit (Table 21-1).

Table 21-1. Timer Operation Mode

T32 (CCPxCON1L[5])	Operating Mode
0	Dual Timer Mode (16-bit)
1	Timer Mode (32-bit)

Dual 16-Bit Timer mode provides a simple timer function with two independent 16-bit timer/counters. The primary timer uses CCPxTMRL and CCPxPRL. Only the primary timer can interact with other modules on the device. It generates the SCCPx sync out signals for use by other SCCP modules. It can also use the SYNC[4:0] bits signal generated by other modules.

The secondary timer uses CCPxTMRH and CCPxPRH. It is intended to be used only as a periodic interrupt source for scheduling CPU events. It does not generate an output sync/trigger signal like the primary time base. In Dual Timer mode, the CCPx Secondary Timer Period register, CCPxPRH, generates the SCCP compare event (CCPxIF) used by many other modules on the device.

The 32-Bit Timer mode uses the CCPxTMRL and CCPxTMRH registers, together, as a single 32-bit timer. When CCPxTMRL overflows, CCPxTMRH increments by one. This mode provides a simple timer function when it is important to track long time periods. Note that the T32 bit (CCPxCON1L[5]) should be set before the CCPxTMRL or CCPxPRH registers are written to initialize the 32-bit timer.

21.2.1 Sync and Trigger Operation

In both 16-bit and 32-bit modes, the timer can also function in either synchronization (“sync”) or trigger operation. Both use the SYNC[4:0] bits (CCPxCON1H[4:0]) to determine the input signal source. The difference is how that signal affects the timer.

In sync operation, the timer Reset or clear occurs when the input selected by SYNC[4:0] is asserted. The timer immediately begins to count again from zero unless it is held for some other reason. Sync operation is used whenever the TRIGEN bit (CCPxCON1H[7]) is cleared. SYNC[4:0] can have any value, except ‘11111’.

In trigger operation, the timer is held in Reset until the input selected by SYNC[4:0] is asserted; when it occurs, the timer starts counting. Trigger operation is used whenever the TRIGEN bit is set. In Trigger mode, the timer will continue running after a trigger event as long as the CCPTRIG bit (CCPxSTATL[7]) is set. To clear CCPTRIG, the TRCLR bit (CCPxSTATL[5]) must be set to clear the trigger event, reset the timer and hold it at zero until another trigger event occurs. On dsPIC33CK256MC506 family devices, trigger operation can only be used when the system clock is the time base source (CLKSEL[2:0] = 000).

Figure 21-3. Dual 16-Bit Timer Mode

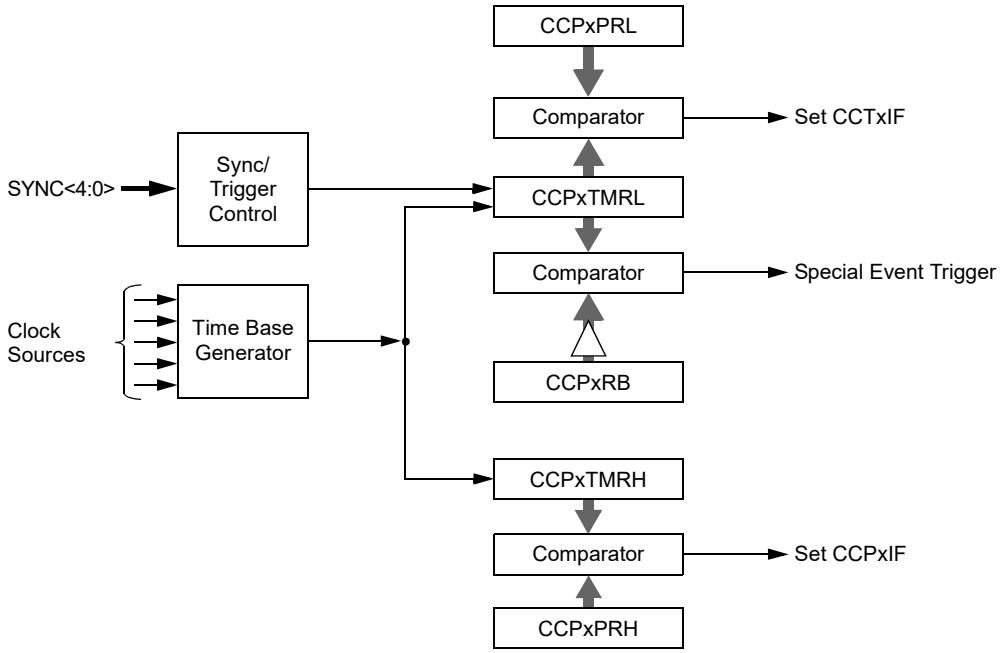


Figure 21-4. 32-Bit Timer Mode

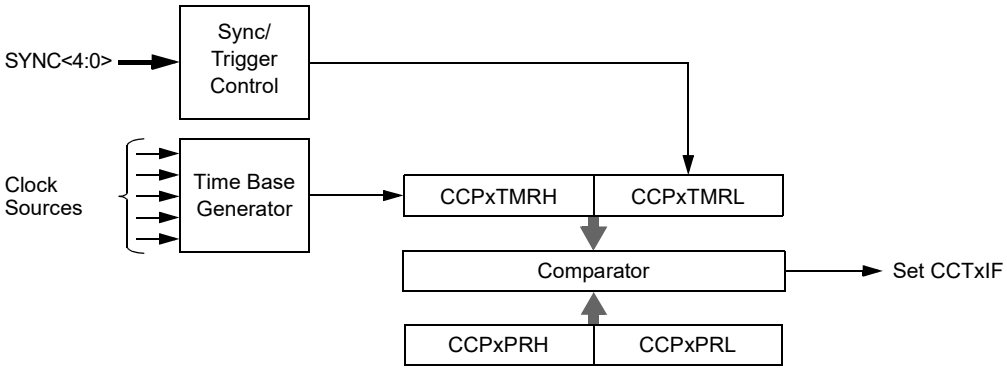


21.3 Output Compare Mode

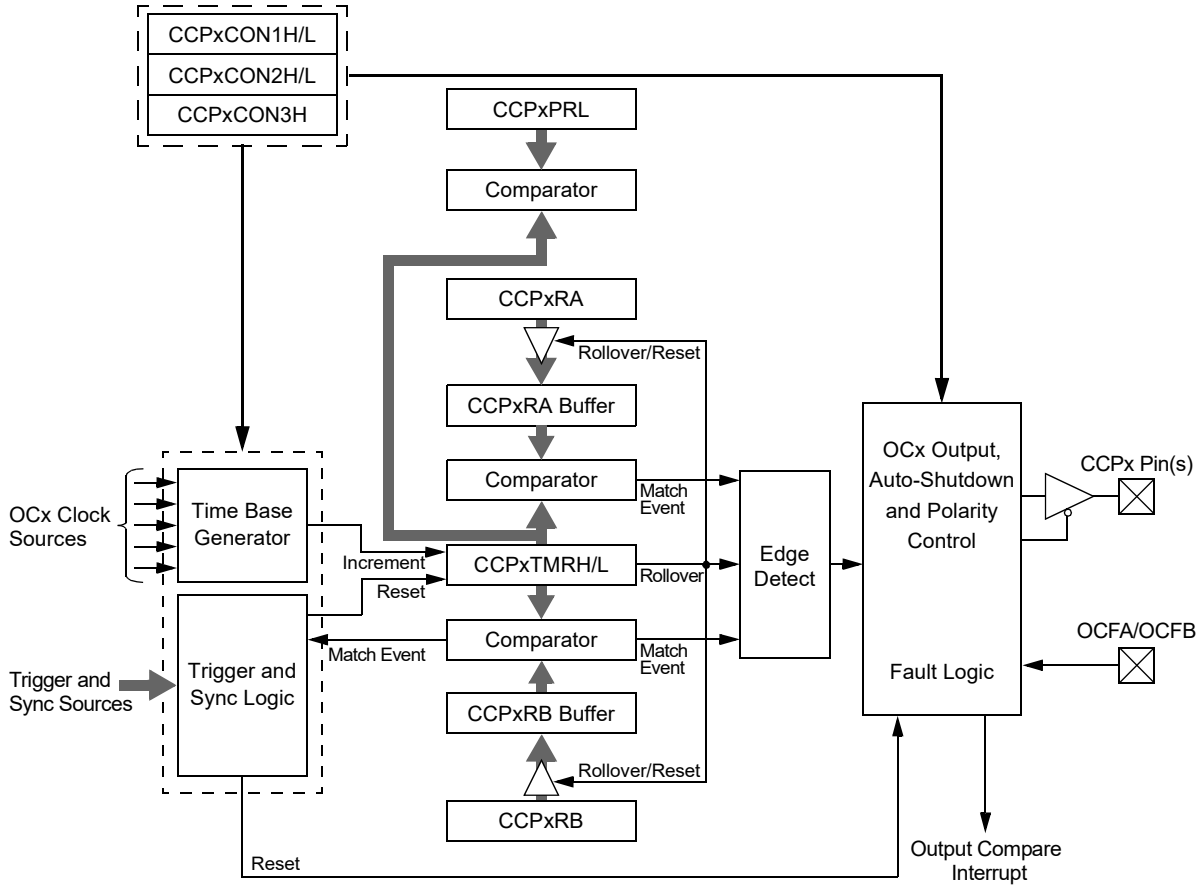
Output Compare mode compares the Timer register value with the value of one or two Compare registers, depending on its mode of operation. The Output Compare x module, on compare match events, has the ability to generate a single output transition or a train of output pulses. Like most PIC® MCU peripherals, the Output Compare x module can also generate interrupts on a compare match event.

Table 21-2 shows the various modes available in Output Compare modes.

Table 21-2. Output Compare x/PWMx Modes

MOD[3:0] (CCPxCON1L[3:0])	T32 (CCPxCON1L[5])	Operating Mode	
0001	0	Output High on Compare (16-bit)	Single Edge Mode
0001	1	Output High on Compare (32-bit)	
0010	0	Output Low on Compare (16-bit)	
0010	1	Output Low on Compare (32-bit)	
0011	0	Output Toggle on Compare (16-bit)	
0011	1	Output Toggle on Compare (32-bit)	
0100	0	Dual Edge Compare (16-bit)	Dual Edge Mode
0101	0	Dual Edge Compare (16-bit buffered)	PWM Mode

Figure 21-5. Output Compare x Block Diagram



21.4 Input Capture Mode

Input Capture mode is used to capture a timer value from an independent timer base, upon an event, on an input pin or other internal trigger source. The input capture features are useful in applications requiring frequency (time period) and pulse measurement. Figure 21-6 depicts a simplified block diagram of Input Capture mode.

Input Capture mode uses a dedicated 16/32-bit, synchronous, up counting timer for the capture function. The timer value is written to the FIFO when a capture event occurs. The internal value may be read (with a synchronization delay) using the CCPxTMRH/L registers.

To use Input Capture mode, the CCSEL bit (CCPxCON1L[4]) must be set. The T32 and the MOD[3:0] bits are used to select the proper Capture mode, as shown in Table 21-3.

Table 21-3. Input Capture x Modes

MOD[3:0] (CCPxCON1L[3:0])	T32 (CCPxCON1L[5])	Operating Mode
0000	0	Edge Detect (16-bit capture)
0000	1	Edge Detect (32-bit capture)
0001	0	Every Rising (16-bit capture)
0001	1	Every Rising (32-bit capture)
0010	0	Every Falling (16-bit capture)

21.5 Auxiliary Output

The SCCPx modules have an auxiliary (secondary) output that provides other peripherals access to internal module signals. The auxiliary output is intended to connect to other SCCP modules, or other digital peripherals, to provide these types of functions:

- Time Base Synchronization
- Peripheral Trigger and Clock Inputs
- Signal Gating

The type of output signal is selected using the AUXOUT[1:0] control bits (CCPxCON2H[4:3]). The type of output signal is also dependent on the module operating mode.

Table 21-4. Auxiliary Output

Bit 15 – CCPON CCPx Module Enable bit

Value	Description
1	Module is enabled with an operating mode specified by the MOD[3:0] control bits
0	Module is disabled

Bit 13 – CCPSIDL CCPx Stop in Idle Mode Bit

Value	Description
1	Discontinues module operation when device enters Idle mode
0	Continues module operation in Idle mode

Bit 12 – CCPSLP CCPx Sleep Mode Enable bit

Value	Description
1	Module continues to operate in Sleep modes
0	Module does not operate in Sleep modes

Bit 11 – TMRSYNC Time Base Clock Synchronization bit

Value	Description
1	Asynchronous module time base clock is selected and synchronized to the internal system clocks (CLKSEL[2:0] ≠ 000)
0	Synchronous module time base clock is selected and does not require synchronization (CLKSEL[2:0] = 000)

Bits 10:8 – CLKSEL[2:0] CCPx Time Base Clock Select bits(1)

Value	Description
111	PPS TxCK input
110	CLC4 out
101	CLC3 out
100	CLC2 out
011	CLC1 out
010	F_{CY}
001	Reference Clock (REFCLKO)
000	F_P

Bits 7:6 – TMRPS[1:0] Time Base Prescale Select bits

Value	Description
11	1:64 Prescaler
10	1:16 Prescaler
01	1:4 Prescaler

Value	Description
00	1:1 Prescaler

Bit 5 – T32 32-Bit Time Base Select bit

Value	Description
1	Uses 32-bit time base for timer, single edge output compare or input capture function
0	Uses 16-bit time base for timer, single edge output compare or input capture function

Bit 4 – CCSEL Capture/Compare Mode Select bit

Value	Description
1	Input capture peripheral
0	Output Compare/PWM/Timer peripheral (exact function is selected by the MOD[3:0] bits)

Bits 3:0 – MOD[3:0] CCPx Mode Select bits

For CCSEL = 1 (Input Capture modes):

Value	Description
1xxx	Reserved
011x	Reserved
0101	Capture every 16th rising edge
0100	Capture every 4th rising edge
0011	Capture every rising and falling edge
0010	Capture every falling edge
0001	Capture every rising edge
0000	Capture every rising and falling edge (Edge Detect mode)

For CCSEL = 0 (Output Compare/Timer modes):

Value	Description
1111	External Input mode: Pulse generator is disabled, source is selected by ICS[2:0]
1110	Reserved
110x	Reserved
10xx	Reserved
0111	Reserved
0110	Reserved
0101	Dual Edge Compare mode, buffered
0100	Dual Edge Compare mode
0011	16-Bit/32-Bit Single Edge mode, toggles output on compare match
0010	16-Bit/32-Bit Single Edge mode, drives output low on compare match
0001	16-Bit/32-Bit Single Edge mode, drives output high on compare match
0000	16-Bit/32-Bit Timer mode, output functions are disabled

21.6.2 CCPx Control 1 High Register

Name: CCPxCON1H
Offset: 0x952, 0x976, 0x99A, 0x9BE

Notes:

1. This control bit has no function in Input Capture modes.
2. This control bit has no function when TRIGEN = 0.
3. Output postscale settings, from 1:5 to 1:16 (0100-1111), will result in a FIFO buffer overflow for Input Capture modes.

Bit 15 – OPSSRC Output Postscaler Source Select bit(1)

Value	Description
1	Output postscaler scales module trigger output events
0	Output postscaler scales time base interrupt events

Bit 14 – RTRGEN Retrigger Enable bit(2)

Value	Description
1	Time base can be retriggered when TRIGEN bit = 1
0	Time base may not be retriggered when TRIGEN bit = 1

Bits 11:8 – OPS3[3:0] CCPx Interrupt Output Postscale Select bits(3)

Value	Description
1111	Interrupt every 16th time base period match
1110	Interrupt every 15th time base period match
. . .	
0100	Interrupt every 5th time base period match
0011	Interrupt every 4th time base period match or 4th input capture event
0010	Interrupt every 3rd time base period match or 3rd input capture event
0001	Interrupt every 2nd time base period match or 2nd input capture event
0000	Interrupt after each time base period match or input capture event

Bit 7 – TRIGEN CCPx Trigger Enable bit

Value	Description
1	Trigger operation of time base is enabled
0	Trigger operation of time base is disabled

Bit 6 – ONESHOT One-Shot Trigger Mode Enable bit

Value	Description
1	One-Shot Trigger mode is enabled; trigger duration is set by OSCNT[2:0]
0	One-Shot Trigger mode is disabled

Bit 5 – ALTSYNC CCPx Clock Select bits

Value	Description
1	An alternate signal is used as the module synchronization output signal
0	The module synchronization output signal is the Time Base Reset/rollover event

Bits 4:0 – SYNC[4:0] CCPx Synchronization Source Select bits

21.6.3 Synchronization Sources

Table 21-5. Synchronization Sources

SYNC[4:0]	Synchronization Source
00000	None; Timer with Rollover on CCPxPR Match or FFFFh
00001	Module's Own Timer Sync Out
00010	Sync Output SCCP2
00011	Sync Output SCCP3
00100	Sync Output SCCP4
00101-01000	Reserved

10001	CLC2 Output
10010	CLC3 Output
10011	CLC4 Output
10100	UART3 RX Edge Detect
10101	UART3 TX Edge Detect
10110	Reserved
10111	Comparator 1 Output
11000	Comparator 2 Output
11001-11110	Reserved
11111	None; Timer with Auto-Rollover (FFFFh → 0000h)

21.6.4 CCPx Control 2 Low Register

Name: CCPxCON2L
Offset: 0x954, 0x978, 0x99C, 0x9C0

Reset	0	0	0	0	0	0	0	0

Bit 15 – PWMRSEN CCPx PWM Restart Enable bit

Value	Description
1	ASEVT bit clears automatically at the beginning of the next PWM period, after the shutdown input has ended
0	ASEVT bit must be cleared in software to resume PWM activity on output pins

Bit 14 – ASDGM CCPx Auto-Shutdown Gate Mode Enable bit

Value	Description
1	Waits until the next Time Base Reset or rollover for shutdown to occur
0	Shutdown event occurs immediately

Bit 12 – SSDG CCPx Software Shutdown/Gate Control bit

Value	Description
1	Manually forces auto-shutdown, timer clock gate or input capture signal gate event (setting of ASDGM bit still applies)
0	Normal module operation

Bits 7:0 – ASDG[7:0] CCPx Auto-Shutdown/Gating Source Enable bits

Value	Description
1	ASDGx Source n is enabled (see 21.6.5. Auto-Shutdown and Gating Sources for auto-shutdown/gating sources)
0	ASDGx Source n is disabled

21.6.5 Auto-Shutdown and Gating Sources

Bit 15 – OENSYNC Output Enable Synchronization bit

Value	Description
1	Update by output enable bits occurs on the next Time Base Reset or rollover
0	Update by output enable bits occurs immediately

Bit 8 – OCAEN Output Enable/Steering Control bit

Value	Description
1	OCMA pin is controlled by the CCPx module and produces an output compare or PWM signal
0	OCMA pin is not controlled by the CCPx module; the pin is available to the port logic or another peripheral multiplexed on the pin

Bits 7:6 – ICGSM[1:0] Input Capture Gating Source Mode Control bits

Value	Description
11	Reserved
10	One-Shot mode: Falling edge from gating source disables future capture events (ICDIS = 1)
01	One-Shot mode: Rising edge from gating source enables future capture events (ICDIS = 0)
00	Level-Sensitive mode: A high level from gating source will enable future capture events; a low level will disable future capture events

Bits 4:3 – AUXOUT[1:0] Auxiliary Output Signal on Event Selection bits

Value	Description
11	Input capture or output compare event; no signal in Timer mode
10	Signal output is defined by module operating mode (see 21.5. Auxiliary Output)
01	Time base rollover event (all modes)
00	Disabled

Bits 2:0 – ICS[2:0] Input Capture Source Select bits

Value	Description
111	CLC4 output
110	CLC3 output
101	CLC2 output
100	CLC1 output
011	Reserved
010	Comparator 2 output
001	Comparator 1 output
000	SCCP Input Capture x (ICx) pin (PPS)

21.6.7 CCPx Control 3 High Register

Name: CCPxCON3H
Offset: 0x95A, 0x97E, 0x9A2, 0x9C6

Bit 15 – OETRIG CCPx Dead-Time Select bit

Value	Description
1	For Triggered mode (TRIGEN = 1): Module does not drive enabled output pins until triggered
0	Normal output pin operation

Bits 14:12 – OSCNT[2:0] One-Shot Event Count bits

Value	Description
111	Extends one-shot event by seven time base periods (eight time base periods total)
110	Extends one-shot event by six time base periods (seven time base periods total)
101	Extends one-shot event by five time base periods (six time base periods total)
100	Extends one-shot event by four time base periods (five time base periods total)
011	Extends one-shot event by three time base periods (four time base periods total)
010	Extends one-shot event by two time base periods (three time base periods total)
001	Extends one-shot event by one time base period (two time base periods total)
000	Does not extend one-shot trigger event

Bit 5 – POLACE CCPx Output Pins, OCxA, OCxC and OCxE, Polarity Control bit

Value	Description
1	Output pin polarity is active-low
0	Output pin polarity is active-high

Bits 3:2 – PSSACE[1:0] PWMx Output Pins, OCxA, OCxC and OCxE, Shutdown State Control bits

Value	Description
11	Pins are driven active when a shutdown event occurs
10	Pins are driven inactive when a shutdown event occurs
0x	Pins are in a High-Impedance state when a shutdown event occurs

21.6.8 CCPx Status Register

Name: CCPxSTATL
Offset: 0x95C, 0x980, 0x9A4, 0x9C8

Legend: C = Clearable bit; W1 = Write '1' Only bit

Bit	15	14	13	12	11	10	9	8

Access	R	W1	W1	R/C	R/C	R/C	R/C	R/C
Reset	0	0	0	0	0	0	0	0

Bit 10 – ICGARM Input Capture Gate Arm bit
A write of '1' to this location will arm the input capture gating logic for a one-shot gate event when ICGSM[1:0] = 01 or 10. Bit always reads as '0'.

Bit 7 – CCPTRIG CCPx Trigger Status bit

Value	Description
1	Timer has been triggered and is running
0	Timer has not been triggered and is held in Reset

Bit 6 – TRSET CCPx Trigger Set Request bit
Writes '1' to this location to trigger the timer when TRIGEN = 1 (location always reads as '0').

Bit 5 – TRCLR CCPx Trigger Clear Request bit
Writes '1' to this location to cancel the timer trigger when TRIGEN = 1 (location always reads as '0').

Bit 4 – ASEVT CCPx Auto-Shutdown Event Status/Control bit

Value	Description
1	A shutdown event is in progress; CCPx outputs are in the Shutdown state
0	CCPx outputs operate normally

Bit 3 – SCEVT Single Edge Compare Event Status bit

Value	Description
1	A single edge compare event has occurred
0	A single edge compare event has not occurred

Bit 2 – ICDIS Input Capture x Disable bit

Value	Description
1	Event on Input Capture x pin (ICx) does not generate a capture event
0	Event on Input Capture x pin will generate a capture event

Bit 1 – ICOV Input Capture x Buffer Overflow Status bit

Value	Description
1	The Input Capture x FIFO buffer has overflowed
0	The Input Capture x FIFO buffer has not overflowed

Bit 0 – ICBNE Input Capture x Buffer Status bit

Value	Description
1	Input Capture x buffer has data available
0	Input Capture x buffer is empty

21.6.9 CCPx Status Register High

Bit 4 – PRLWIP CCPxPRL Write in Progress Status bit

Bit 3 – TMRHWIP CCPxTMRH Write in Progress Status bit

Value	Description
1	An update to the CCPxTMRH register with the buffered contents is in progress
0	An update to the CCPxTMRH register is not in progress

Bit 2 – TMRLWIP CCPxTMRL Write in Progress Status bit

Value	Description
1	An update to the CCPxTMRL register with the buffered contents is in progress
0	An update to the CCPxTMRL register is not in progress

Bit 1 – RBWIP CCPxRB Write in Progress Status bit

Value	Description
1	An update to the CCPxRB register with the buffered contents is in progress
0	An update to the CCPxRB register is not in progress

Bit 0 – RAWIP CCPxRA Write in Progress Status bit

Value	Description
1	An update to the CCPxRA register with the buffered contents is in progress
0	An update to the CCPxRA register is not in progress

22. Configurable Logic Cell (CLC)

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to **"Configurable Logic Cell (CLC)"** (www.microchip.com/DS70005298) in the *"dsPIC33/PIC24 Family Reference Manual"*. The information in this data sheet supersedes the information in the FRM.

The Configurable Logic Cell (CLC) module allows the user to specify combinations of signals as inputs to a logic function and to use the logic output to control other peripherals or I/O pins. This provides greater flexibility and potential in embedded designs, since the CLC module can operate outside the limitations of software execution, and supports a vast amount of output designs.

There are four input gates to the selected logic function. These four input gates select from a pool of up to 32 signals that are selected using four data source selection multiplexers. Figure 22-1 shows an overview of the module.

Figure 22-3 shows the details of the data source multiplexers and Figure 22-2 shows the logic input gate connections.

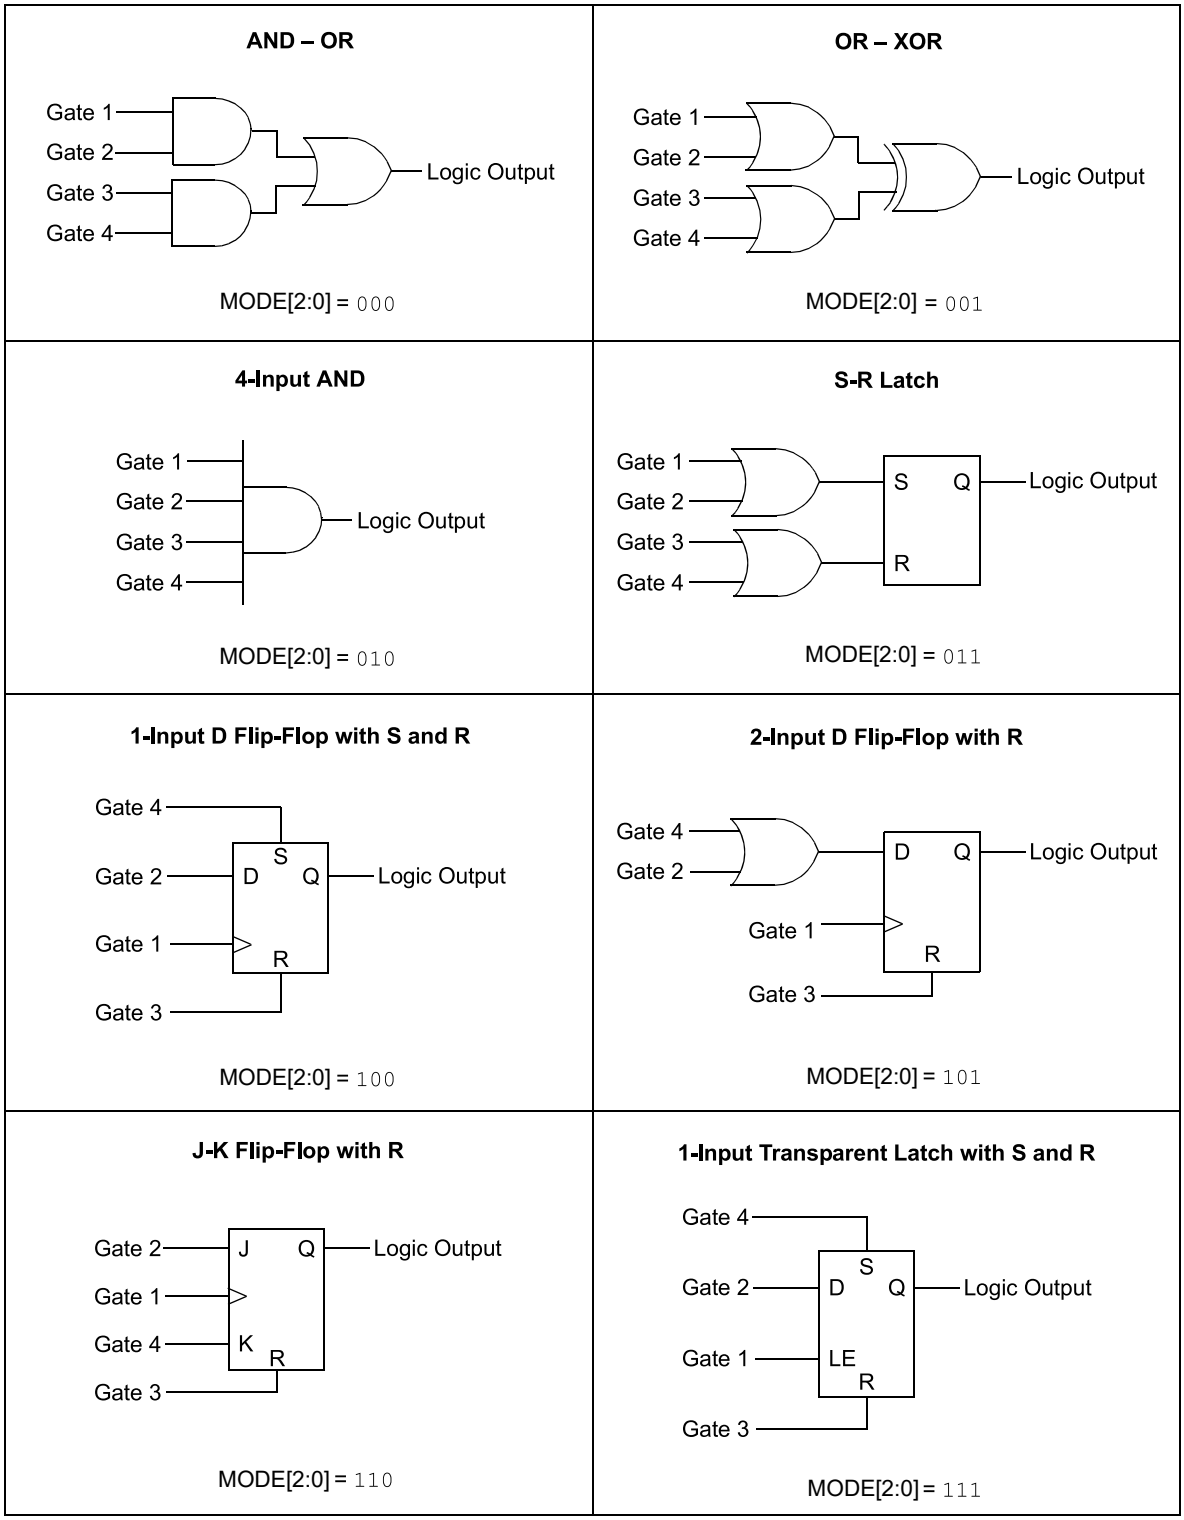

Figure 22-3. CLCx Input Source Selection Diagram

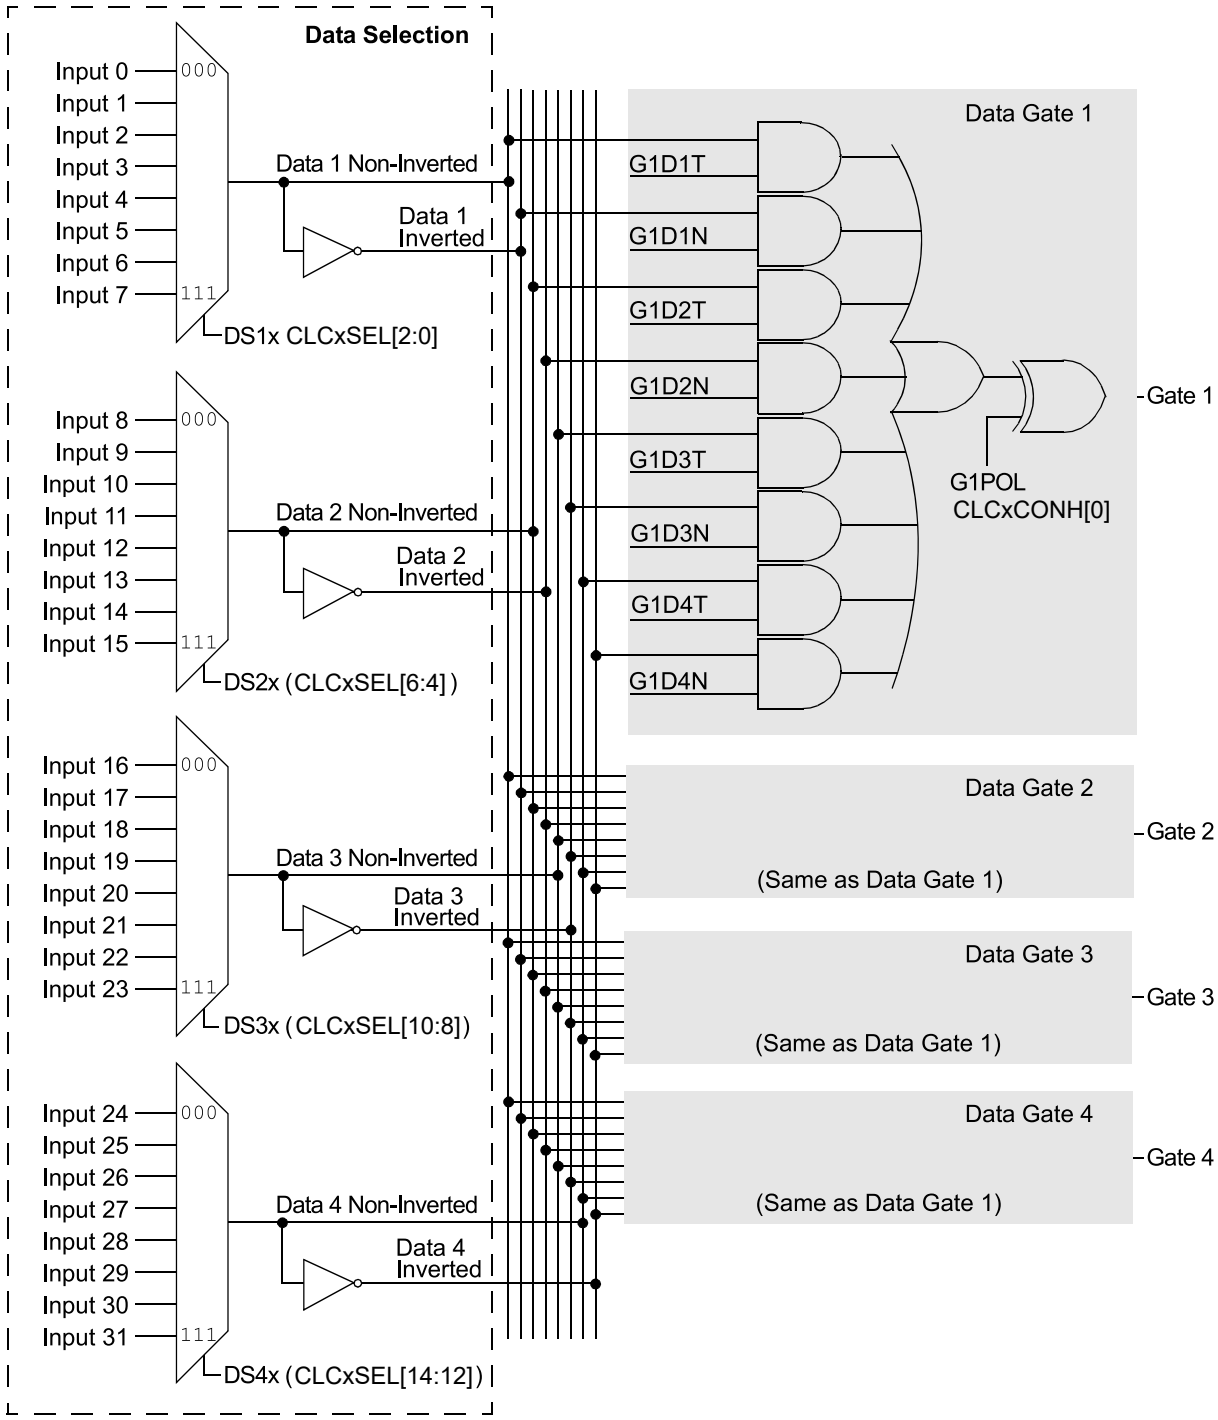

Note: All controls are undefined at power-up.

22.1 Control Registers

The CLCx Control registers (CLCxCONL and CLCxCONH) are used to enable the module and interrupts, control the output enable bit, select output polarity and select the logic function. The CLCx Control registers also allow the user to control the logic polarity of not only the cell output, but also some intermediate variables.

The CLCx Input MUX Select register (CLCxSEL) allows the user to select up to four data input sources using the four data input selection multiplexers. Each multiplexer has a list of eight data sources available.

The CLCx Gate Logic Input Select registers (CLCxGLSL and CLCxGLSH) allow the user to select which outputs from each of the selection MUXes are used as inputs to the input gates of the logic cell. Each data source MUX outputs both a true and a negated version of its output. All of these eight signals are enabled, ORed together by the logic cell input gates. If no inputs are selected (CLCxGLS = 0x00), the output will be zero or one, depending on the GxPOL bits.

23. Peripheral Trigger Generator (PTG)

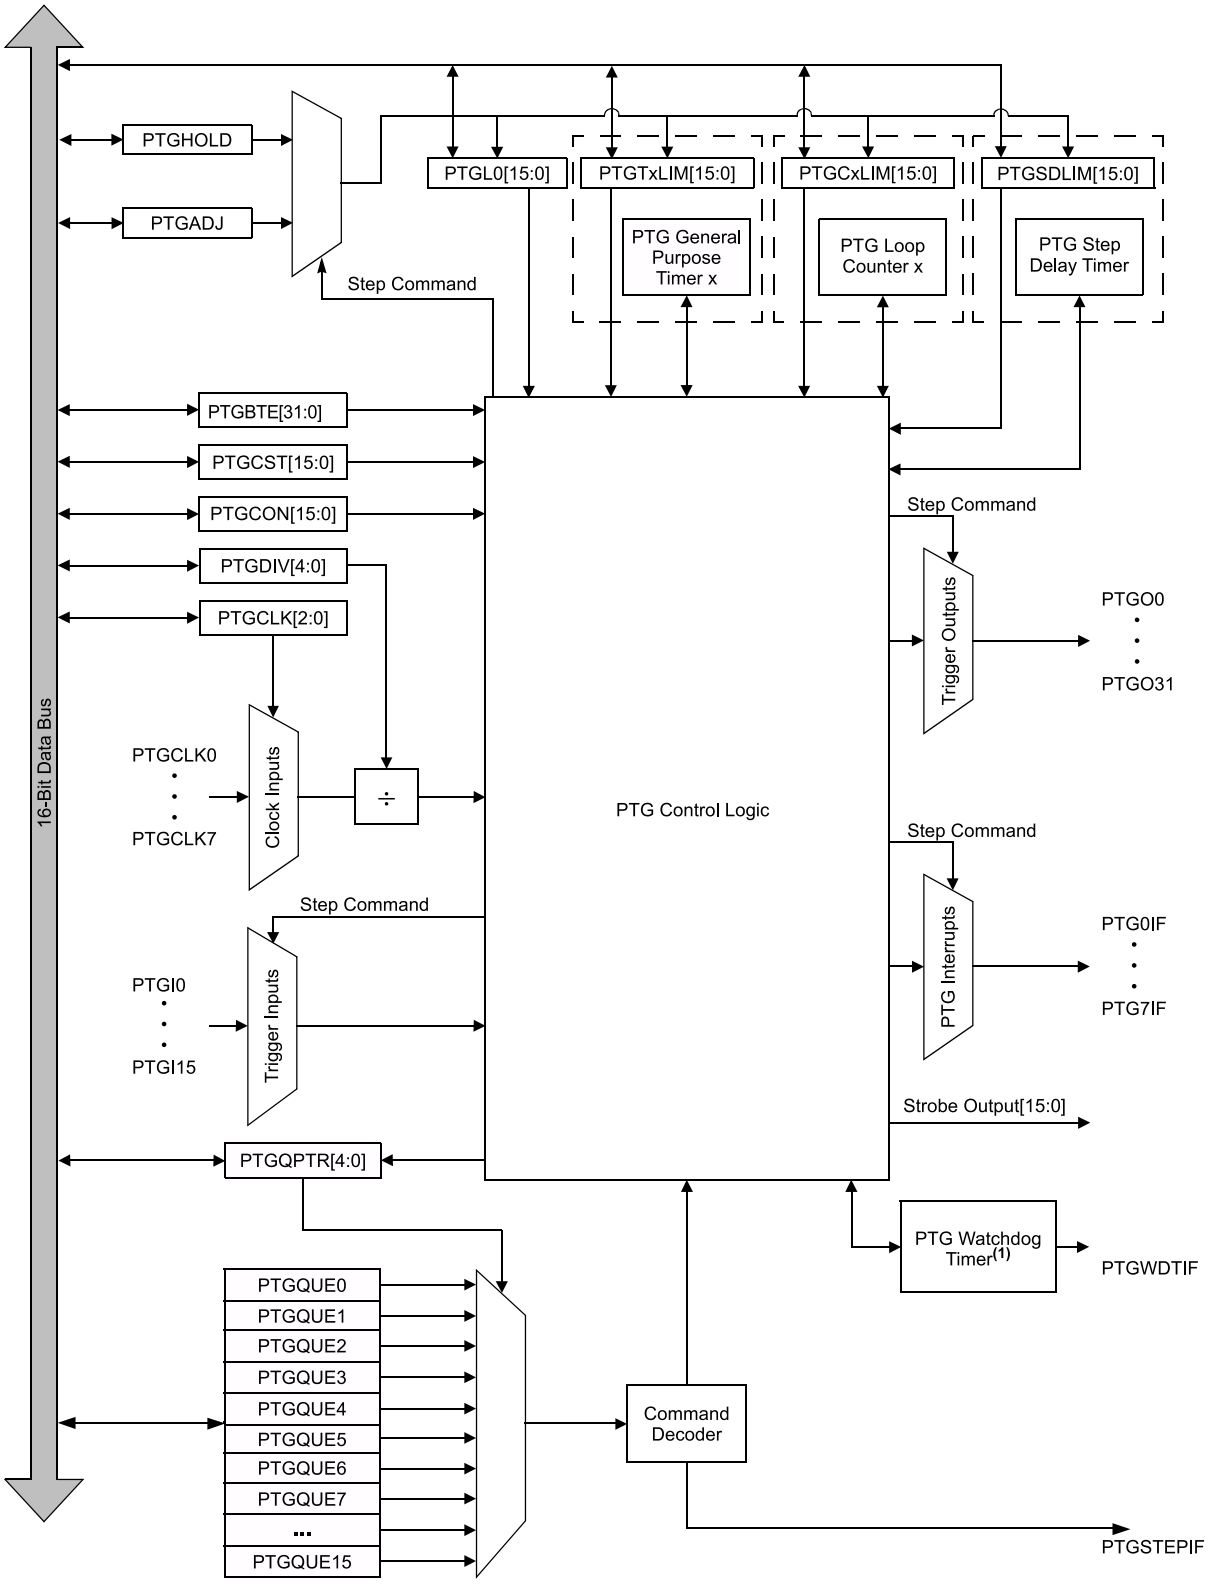
Note: This data sheet summarizes the features of the dsPIC33CK512MP608 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Peripheral Trigger Generator (PTG)"** (www.microchip.com/DS70000669) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The dsPIC33CK256MC506 family Peripheral Trigger Generator (PTG) module is a user-programmable sequencer that is capable of generating complex trigger signal sequences to coordinate the operation of other peripherals. The PTG module is designed to interface with the modules, such as an Analog-to-Digital Converter (ADC), output compare and PWM modules, timers and interrupt controllers.

23.1 Features

- Behavior is Step Command Driven:
  - Step commands are eight bits wide
- Commands are Stored in a Step Queue:
  - Queue depth is up to 32 entries
  - Programmable Step execution time (Step delay)
- Supports the Command Sequence Loop:
  - Can be nested one-level deep
  - Conditional or unconditional loop
  - Two 16-bit loop counters
- 15 Hardware Input Triggers:
  - Sensitive to either positive or negative edges, or a high or low level
- One Software Input Trigger
- Generates up to 32 Unique Output Trigger Signals
- Generates Two Types of Trigger Outputs:
  - Individual
  - Broadcast
- Strobed Output Port for Literal Data Values:
  - 5-bit literal write (literal part of a command)
  - 16-bit literal write (literal held in the PTGL0 register)
- Generates up to Ten Unique Interrupt Signals
- Two 16-Bit General Purpose Timers
- Flexible Self-Contained Watchdog Timer (WDT) to Set an Upper Limit to Trigger Wait Time
- Single-Step Command Capability in Debug mode
- Selectable Clock (System, Pulse-Width Modulator (PWM) or ADC)
- Programmable Clock Divider

Figure 23-1. PTG Block Diagram



Notes:

1. Dedicated Watchdog Timer for the PTG module, independent of the device Watchdog Timer.
2. Some devices support only PTGBTE[15:0] (16 outputs).

23.2.1 PTG Control/Status Low Register

Name: PTGCST
Offset: 0x900

Notes:

1. These bits apply to the PTGWHI and PTGWLO commands only.
2. This bit is only used with the PTGCTRL Step command software trigger option.
3. The PTGSSEN bit may only be written when in Debug mode.

Bit	15	14	13	12	11	10	9	8
	PTGEN		PTGSIDL	PTGTOGL		PTGSWT	PTGSSEN	PTGIVIS
Access	R/W		R/W	R/W		R/W	R/W	R/W
Reset	0		0	0		0	0	0

Bit	7	6	5	4	3	2	1	0
	PTGSTRT	PTGWTO	PTGBUSY				PTGITM[1:0]	
Access	R/W	R/W	R/W				R/W	R/W
Reset	0	0	0				0	0

Bit 15 – PTGEN PTG Broadcast Trigger Enable bits

Value	Description
1	PTG is enabled
0	PTG is disabled

Bit 13 – PTGSIDL PTG Freeze in Debug Mode bit

Value	Description
1	Halts PTG operation when device is Idle
0	PTG operation continues when device is Idle

Bit 12 – PTGTOGL PTG Toggle Trigger Output bit

Value	Description
1	Toggles state of TRIG output for each execution of PTGTRIG
0	Generates a single TRIG pulse for each execution of PTGTRIG

Bit 10 – PTGSWT PTG Software Trigger bit(2)

Value	Description
1	If the PTG state machine is executing the “Wait for software trigger” Step command (OPTION[3:0] = 1010 or 1011), the command will complete and execution will continue
0	No action other than to clear the bit

Bit 9 – PTGSSEN PTG Single-Step Command bit(3)

Value	Description
1	Enables single Step when in Debug mode
0	Disables single Step

Bit 8 – PTGIVIS PTG Counter/Timer Visibility bit

Value	Description
1	Reading the PTGSDLIM, PTGCxLIM or PTGTxLIM registers returns the current values of their corresponding Counter/Timer registers (PTGSDLIM, PTGCxLIM and PTGTxLIM)
0	Reading the PTGSDLIM, PTGCxLIM or PTGTxLIM registers returns the value of these Limit registers

Bit 7 – PTGSTRT PTG Start Sequencer bit

Value	Description
1	Starts to sequentially execute the commands (Continuous mode)
0	Stops executing the commands

Bit 6 – PTGWTO PTG Watchdog Timer Time-out Status bit

Value	Description
1	PTG Watchdog Timer has timed out
0	PTG Watchdog Timer has not timed out

Bit 5 – PTGBUSY PTG State Machine Busy bit

Value	Description
1	PTG is running on the selected clock source; no SFR writes are allowed to PTGCLK[2:0] or PTGDIV[4:0]
0	PTG state machine is not running

Bits 1:0 – PTGITM[1:0] PTG Input Trigger Operation Selection bit(1)

Value	Description
11	Single-level detect with Step delay not executed on exit of command (regardless of the PTGCTRL command) (Mode 3)
10	Single-level detect with Step delay executed on exit of command (Mode 2)
01	Continuous edge detect with Step delay not executed on exit of command (regardless of the PTGCTRL command) (Mode 1)
00	Continuous edge detect with Step delay executed on exit of command (Mode 0)

23.2.2 PTG Control/Status Register

Name: PTGCON
Offset: 0x902

Reset	0	0	0	0		0	0	0

Bits 15:13 – PTGCLK[2:0] PTG Module Clock Source Selection bits

Value	Description
111	CLC1 output
110	$F_{VCO}/4$
101	Reserved
100	Reserved
011	Input from Timer1 Clock pin, T1CK
010	ADC clock
001	F_{CY}
000	F_P

Bits 12:8 – PTGDIV[4:0] PTG Module Clock Prescaler (Divider) bits

Value	Description
11111	Divide-by-32
11110	Divide-by-31
. . .	
00001	Divide-by-2
00000	Divide-by-1

Bits 7:4 – PTGPWD[3:0] PTG Trigger Output Pulse-Width (in PTG clock cycles) bits

Value	Description
1111	All trigger outputs are 16 PTG clock cycles wide
1110	All trigger outputs are 15 PTG clock cycles wide
. . .	
0001	All trigger outputs are 2 PTG clock cycles wide
0000	All trigger outputs are 1 PTG clock cycle wide

Bits 2:0 – PTGWDT[2:0] PTG Watchdog Timer Time-out Selection bits

Value	Description
111	Watchdog Timer will time out after 512 PTG clocks
110	Watchdog Timer will time out after 256 PTG clocks
101	Watchdog Timer will time out after 128 PTG clocks
100	Watchdog Timer will time out after 64 PTG clocks
011	Watchdog Timer will time out after 32 PTG clocks
010	Watchdog Timer will time out after 16 PTG clocks
001	Watchdog Timer will time out after 8 PTG clocks
000	Watchdog Timer is disabled

23.2.3 PTG Broadcast Trigger Enable Low Register

Name: PTGBTEL
Offset: 0x904

Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGBTE[15:0] PTG Broadcast Trigger Enable bits

Value	Description
1	Generates trigger when the broadcast command is executed
0	Does not generate trigger when the broadcast command is executed

23.2.4 PTG Broadcast Trigger Enable Low Register

Name: PTGBTEH
Offset: 0x906

Bit	15	14	13	12	11	10	9	8

Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGBTE[31:16] PTG Broadcast Trigger Enable bits

Value	Description
1	Generates trigger when the broadcast command is executed
0	Does not generate trigger when the broadcast command is executed

23.2.5 PTG Hold Register

Name: PTGHOLD
Offset: 0x908

Bit	15	14	13	12	11	10	9	8
	PTGHOLD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGHOLD[15:0] PTG General Purpose Hold Register bits
This register holds the user-supplied data to be copied to the PTGTxLIM, PTGCxLIM, PTGSDLIM or PTGL0 register using the `PTGCOPY` command.

23.2.6 PTG Timer0 Limit Register

Name: PTGT0LIM
Offset: 0x90C

Bit	15	14	13	12	11	10	9	8
	PTGT0LIM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGT0LIM[15:0] PTG Timer0 Limit Register bits
General Purpose Timer0 Limit register.

23.2.7 PTG Timer1 Limit Register

Name: PTGT1LIM
Offset: 0x910

Bit	15	14	13	12	11	10	9	8
	PTGT1LIM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PTGT1LIM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGT1LIM[15:0] PTG Timer1 Limit Register bits
General Purpose Timer1 Limit register.

23.2.8 PTG Step Delay Limit Register

Name: PTGSDLIM
Offset: 0x914

Bit	15	14	13	12	11	10	9	8
	PTGSDLIM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PTGSDLIM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGSDLIM[15:0] PTG Step Delay Limit Register bits
This register holds a PTG Step delay value representing the number of additional PTG clocks between the start of a Step command and the completion of a Step command.

23.2.9 PTG Counter 0 Limit Register

Name: PTGC0LIM
Offset: 0x918

Bit	15	14	13	12	11	10	9	8
	PTGC0LIM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PTGC0LIM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGC0LIM[15:0] PTG Counter 0 Limit Register bits
This register is used to specify the loop count for the `PTGJMPC0` Step command or as a Limit register for the General Purpose Counter 0.

23.2.10 PTG Counter 1 Limit Register

Name: PTGC1LIM
Offset: 0x91C

Bit	15	14	13	12	11	10	9	8
	PTGC1LIM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PTGC1LIM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGC1LIM[15:0] PTG Counter 1 Limit Register bits
This register is used to specify the loop count for the `PTGJMPC1` Step command or as a Limit register for the General Purpose Counter 1.

23.2.11 PTG Adjust Register

Name: PTGADJ
Offset: 0x920

Bit	15	14	13	12	11	10	9	8
	PTGADJ[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PTGADJ[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGADJ[15:0] PTG Adjust Register bits
This register holds the user-supplied data to be added to the PTGTxLIM, PTGCxLIM, PTGSDLIM or PTGL0 register using the `PTGADD` command.

23.2.12 PTG Literal 0 Register

Name: PTGL0
Offset: 0x924

Bit	15	14	13	12	11	10	9	8
	PTGL0[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGL0[15:0] PTG Literal 0 Register bits
This register holds the 6-bit value to be written to the CNVCHSEL[5:0] bits (ADCON3L[5:0]) with the `PTGCTRL` Step command.

23.2.13 PTG Step Queue Pointer Register

Name: PTGQPTR
Offset: 0x928

Bits 4:0 – PTGQPTR[4:0] PTG Step Queue Pointer Register bits
This register points to the currently active Step command in the Step queue.

23.2.14 PTG Step Queue 0 Pointer Register

Name: PTGQUE0
Offset: 0x930

Bit	15	14	13	12	11	10	9	8

Reset	0	0	0	0	0	0	0	0

Bits 15:8 – STEP1[7:0] PTG Command 2n+1 bits(2)
A queue location for storage of the STEP(2n+1) command byte, where ‘n’ is from PTGQUEn.

Bits 7:0 – STEP0[7:0] PTG Command 2n bits(2)
A queue location for storage of the STEP(2n) command byte, where ‘n’ is the odd numbered Step Queue Pointers.

23.2.15 PTG Step Queue 1 Pointer Register

Name: PTGQUE1
Offset: 0x932

Bit	15	14	13	12	11	10	9	8

Bits 15:8 – STEP3[7:0] PTG Command 2n+1 bits
A queue location for storage of the STEP(2n+1) command byte, where ‘n’ is from PTGQUEn.

Bits 7:0 – STEP2[7:0] PTG Command 2n bits
A queue location for storage of the STEP(2n) command byte, where ‘n’ is the odd numbered Step Queue Pointers.

23.2.16 PTG Step Queue 2 Pointer Register

Name: PTGQUE2
Offset: 0x934

Bit	15	14	13	12	11	10	9	8

Bits 15:8 – STEP5[7:0] PTG Command 2n+1 bits
A queue location for storage of the STEP(2n+1) command byte, where ‘n’ is from PTGQUEn.

Bits 7:0 – STEP4[7:0] PTG Command 2n bits
A queue location for storage of the STEP(2n) command byte, where ‘n’ is the odd numbered Step Queue Pointers.

23.2.17 PTG Step Queue 3 Pointer Register

Name: PTGQUE3
Offset: 0x936

Bit	15	14	13	12	11	10	9	8

Step Command	CMD[3:0]	Command Description
PTGCTRL	0000	Execute the control command as described by the OPTION[3:0] bits.
PTGADD	0001	Add contents of the PTGADJ register to the target register as described by the OPTION[3:0] bits.
PTGCOPY		Copy contents of the PTGHOLD register to the target register as described by the OPTION[3:0] bits.
PTGSTRB	001x	Copy the values contained in the bits, CMD[0]:OPTION[3:0], to the strobe output bits[4:0].
PTGWHI	0100	Wait for a low-to-high edge input from a selected PTG trigger input as described by the OPTION[3:0] bits.
PTGWLO	0101	Wait for a high-to-low edge input from a selected PTG trigger input as described by the OPTION[3:0] bits.
—	0110	Reserved; do not use.(1)
PTGIRQ	0111	Generate individual interrupt request as described by the OPTION[3:0] bits.
PTGTRIG	100x	Generate individual trigger output as described by the bits, CMD[0]:OPTION[3:0].
PTGJMP	101x	Copy the values contained in the bits, CMD[0]:OPTION[3:0], to the PTGQPTR register and jump to that Step queue.
PTGJMPC0	110x	PTGC0 = PTGC0LIM: Increment the PTGQPTR register.
		PTGC0 ≠ PTGC0LIM: Increment Counter 0 (PTGC0) and copy the values contained in the bits, CMD[0]:OPTION[3:0] to the PTGQPTR register, and jump to that Step queue.

24. 32-Bit Programmable Cyclic Redundancy Check (CRC) Generator

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to **"32-Bit Programmable Cyclic Redundancy Check (CRC)"** (www.microchip.com/ DS30009729) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The 32-bit programmable CRC generator provides a hardware implemented method of quickly generating checksums for various networking and security applications. It offers the following features:

- User-Programmable CRC Polynomial Equation, Up to 32 Bits
- Programmable Shift Direction (little or big-endian)
- Independent Data and Polynomial Lengths
- Configurable Interrupt Output
- Data FIFO

A simple version of the CRC shift engine is displayed in Figure 24-1.

Indicates the number of valid words in the FIFO. Has a maximum value of 8 when PLEN[4:0] ≥ 7 or 16 when PLEN[4:0] ≤ 7.

Bit 7 – CRCFUL CRC FIFO Full bit

Value	Description
1	FIFO is full
0	FIFO is not full

Bit 6 – CRCMPT CRC FIFO Empty bit

Value	Description
1	FIFO is empty
0	FIFO is not empty

Bit 5 – CRCISEL CRC Interrupt Selection bit

Value	Description
1	Interrupt on FIFO is empty; the final word of data is still shifting through the CRC
0	Interrupt on shift is complete and results are ready

Bit 4 – CRCGO CRC Start bit

Value	Description
1	Starts CRC serial shifter
0	CRC serial shifter is turned off

Bit 3 – LENDIAN Data Shift Direction Select bit

Value	Description
1	Data word is shifted into the FIFO, starting with the LSb (little-endian)
0	Data word is shifted into the FIFO, starting with the MSb (big-endian)

Bit 2 – MOD CRC Calculation Mode bit

Value	Description
1	Alternate mode
0	Legacy mode bit

25. Current Bias Generator (CBG)

Notes:

1. This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Current Bias Generator (CBG)"** (www.microchip.com/DS70005253) in the *"dsPIC33/PIC24 Family Reference Manual"*.
2. Some registers and associated bits described in this section may not be available on all devices. Refer to 4. Memory Organization in this data sheet for device-specific register and bit information.

The Current Bias Generator (CBG) consists of two classes of current sources: 10 µA and 50 µA sources. The major features of each current source are:

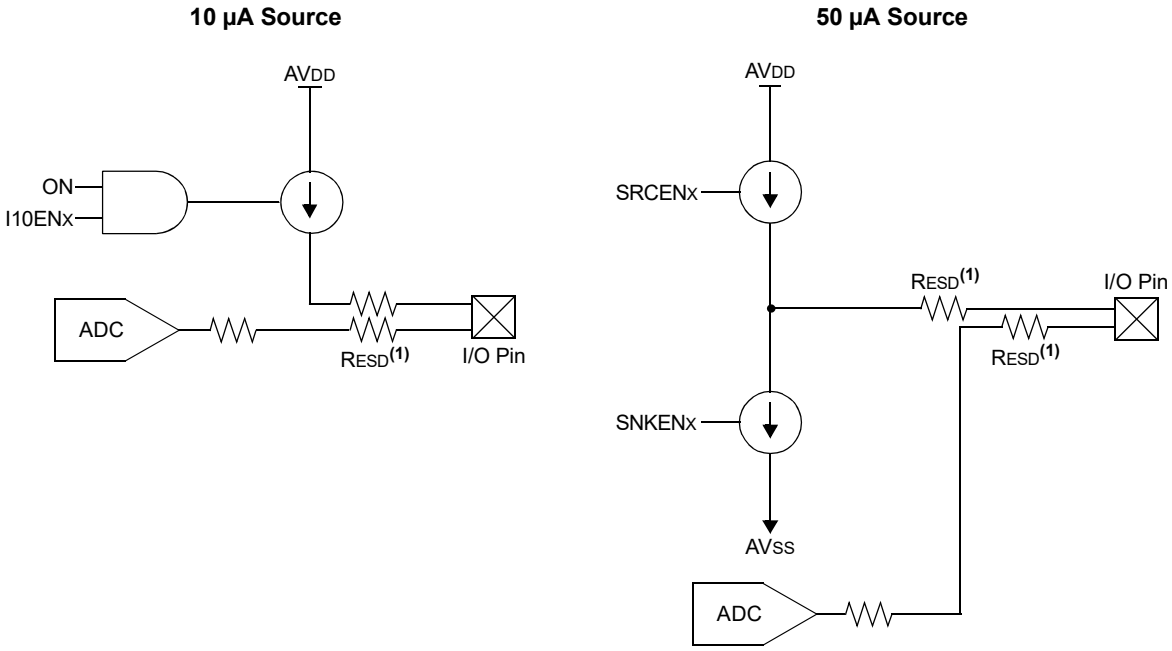
- 10 µA Current Sources:
  - Current sourcing only
  - Up to four independent sources
- 50 µA Current Sources:
  - Selectable current sourcing or sinking
  - Selectable current mirroring for sourcing and sinking

Table 25-1. CBG Channel Availability

Package Type	ISRCx	IBIASx
28-pin	—	0, 3
36-pin	0, 1	0, 2, 3
48-pin	0, 1, 2, 3	0, 1, 2, 3
64-pin	0, 1, 2, 3	0, 1, 2, 3

A simplified block diagram of the CBG module is shown in Figure 25-1.

Figure 25-1. Constant-Current Source Module Block Diagram(2)



Notes:

1. R_{ESD} is typically 350 Ohms.
2. The ADC analog input is shown only for clarity. Each analog peripheral connected to the pin has a separate Electrostatic Discharge (ESD) resistor.

26. Operational Amplifier

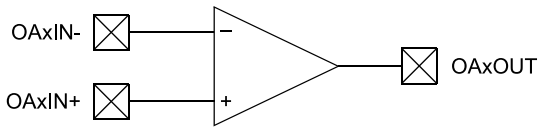
Note: Some device variants support only two op amp instances. Refer to dsPIC33CK256MC506 Product Families and Table 26-1 for availability.

Table 26-1. Op Amp Availability

Package Type	Op Amps
28-pin	1, 2
36-pin	1, 2, 3
48-pin	1, 2, 3
64-pin	1, 2, 3

The dsPIC33CK256MC506 family implements three instances of operational amplifiers (op amps). The op amps can be used for a wide variety of purposes, including signal conditioning and filtering. The three op amps are functionally identical. The block diagram for a single amplifier is shown in Figure 26-1 .

Figure 26-1. Single Operational Amplifier Block Diagram



The op amps are controlled by two SFR registers: AMPCON1L and AMPCON1H. They remain in a Low-Power state until the AMPON bit is set. Each op amp can then be enabled independently by setting the corresponding AMPENx bit (x = 1, 2, 3).

The NCHDISx bit provides some flexibility regarding input range versus Integral Nonlinearity (INL). When NCHDISx = 0 (default), the op amps have a wider input voltage range (see 32.2. AC Characteristics and Timing Parameters). When NCHDISx = 1, the wider input range is traded for improved INL performance (lower INL).

27. Deadman Timer (DMT)

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Deadman Timer (DMT)"** (www.microchip.com/DS70005155) in the *"dsPIC33/PIC24 Family Reference Manual"*.

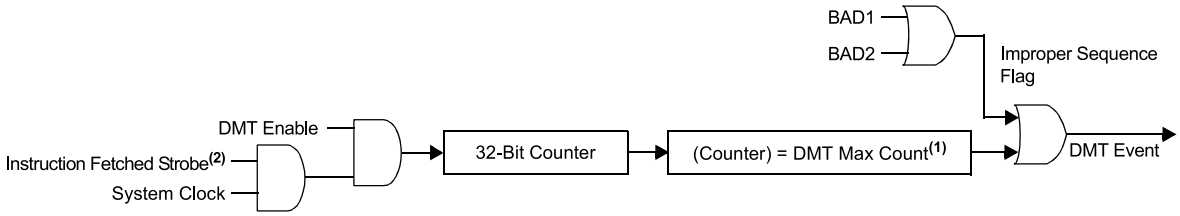
The primary function of the Deadman Timer (DMT) is to interrupt the processor in the event of a software malfunction. The DMT, which works on the system clock, is a free-running instruction fetch timer, which is clocked whenever an instruction fetch occurs until a count match occurs. Instructions are not fetched when the processor is in Sleep mode.

DMT can be enabled in the Configuration fuse or by software in the DMTCON register by setting the ON bit. The DMT consists of a 32-bit counter with a time-out count match value, as specified by the two 16-bit Configuration Fuse registers: FDMTCNTL and FDMTCNTH.

A DMT is typically used in mission-critical and safety-critical applications, where any single failure of the software functionality and sequencing must be detected.

Figure 27-1 shows a block diagram of the Deadman Timer module.

Figure 27-1. Deadman Timer Block Diagram



Notes:

1. DMT Max Count is controlled by the initial value of the FDMTCNTL and FDMTCNTH Configuration registers.
2. DMT window interval is controlled by the value of the FDMTIVTL and FDMTIVTH Configuration registers.

28. Power-Saving Features

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Watchdog Timer and Power-Saving Modes"** (www.microchip.com/DS70615) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The dsPIC33CK256MC506 family devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of peripherals being clocked constitutes lower consumed power.

dsPIC33CK256MC506 family devices can manage power consumption in four ways:

- Clock Frequency
- Instruction-Based Sleep and Idle modes
- Software-Controlled Doze mode
- Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application's power consumption while still maintaining critical application features, such as timing-sensitive communications.

28.1 Clock Frequency and Clock Switching

The dsPIC33CK256MC506 family devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSCx bits (OSCCON[10:8]). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in 9. Oscillator with High-Frequency PLL.

28.2 Instruction-Based Power-Saving Modes

The dsPIC33CK256MC506 family devices have two special power-saving modes that are entered through the execution of a special `PWRSAV` instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the `PWRSAV` instruction is shown in Example 28-1 and Example 28-2.

Note: `SLEEP_MODE` and `IDLE_MODE` are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to "wake-up".

Example 28-1. `PWRSAV` Instruction Syntax in Assembly

```
PWRSAV #SLEEP_MODE    ; Put the device into Sleep mode
PWRSAV #IDLE_MODE     ; Put the device into Idle mode
```

Example 28-2. `PWRSAV` Instruction Syntax in C Language

```
Sleep ()    ; Put the device into Sleep mode
Idle ()     ; Put the device into Idle mode
```

28.2.1 Sleep Mode

The following occurs in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled.
- The LPRC clock continues to run in Sleep mode if the WDT is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals can continue to operate. This includes items such as the Input Change Notification on the I/O ports or peripherals that use an External Clock input.
- Any peripheral that requires the system clock source for its operation is disabled.

The device wakes up from Sleep mode on any of these events:

- Any interrupt source that is individually enabled
- Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

For optimal power savings, the internal regulator and the Flash regulator can be configured to go into standby when Sleep mode is entered by clearing the VREGS (RCON[8]) bit (default configuration).

If the application requires a faster wake-up time and can accept higher current requirements, the VREGS (RCON[8]) bit can be set to keep the internal regulator and the Flash regulator active during Sleep mode. The available Low-Power Sleep modes are shown in Table 28-1. Additional regulator information is available in 29.5. On-Chip Voltage Regulator

Table 28-1. Low-Power Sleep Modes

Relative Power	LPWREN	VREGS	MODE
Highest	0	1	Full power, active
—	0	0	Full power, standby
—	1(1)	1	Low power, active
Lowest	1(1)	0	Low power, standby

Note:
1. Low-Power modes, when LPWREN = 1, can only be used in the industrial temperature range.

28.2.2 Idle Mode

The following occurs in Idle mode:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see 28.5. Peripheral Module Disable).
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device wakes up from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (two to four clock cycles later), starting with the instruction following the PWRSAV instruction or the first instruction in the ISR.

All peripherals also have the option to discontinue operation when Idle mode is entered to allow for increased power savings. This option is selectable in the control register of each peripheral; for example, the SIDL bit in the Timer1 Control register (T1CON[13]).

28.3 Interrupts Coincident with Power Save Instructions

Any interrupt that coincides with the execution of a `PWRSAV` instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

28.4 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this cannot be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV[11]). The ratio between peripheral and core clock speed is determined by the DOZE[2:0] bits (CLKDIV[14:12]). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU Idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (CLKDIV[15]). By default, interrupt events have no effect on Doze mode operation.

28.5 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have any effect and read values are invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC® DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

Note: If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation).

29. Special Features

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip website (www.microchip.com).

The dsPIC33CK256MC506 family devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard™ Security
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation
- Brown-out Reset (BOR)

29.1 Configuration Bits

In dsPIC33CK256MC506 family devices, the Configuration Words are implemented as volatile memory. This means that configuration data will get loaded to volatile memory (from the Flash Configuration Words) each time the device is powered up. Configuration data are stored at the end of the on-chip program memory space, known as the Flash Configuration Words. Their specific locations are shown in Table 29-1. The configuration data are automatically loaded from the Flash Configuration Words to the proper Configuration Shadow registers during device Resets.

When creating applications for these devices, users should always specifically allocate the location of the Flash Configuration Words for configuration data in their code for the compiler. This is to make certain that program code is not stored in this address when the code is compiled. Program code executing out of configuration space will cause a device Reset.

Note: Performing a page erase operation on the last page of program memory clears the Flash Configuration Words.

Value	Description
1	Boosts the kick-start
0	Default kick-start

Bits 11:10 – XTCFG[1:0] Crystal Oscillator Drive Select bits
Current gain programmability for oscillator (output drive).

Value	Description
11	Gain3 (use for 24-32 MHz crystals)
10	Gain2 (use for 16-24 MHz crystals)
01	Gain1 (use for 8-16 MHz crystals)
00	Gain0 (use for 4-8 MHz crystals)

Bit 8 – PLLKEN PLL Lock Status Control bit(1)

Value	Description
1	PLL lock signal will be used to disable PLL clock output if lock is lost
0	PLL lock signal is not used; the PLL clock output will not be disabled if lock is lost

Bits 7:6 – FCKSM[1:0] Clock Switching Mode bits

Value	Description
1x	Clock switching is disabled, Fail-Safe Clock Monitor is disabled
01	Clock switching is enabled, Fail-Safe Clock Monitor is disabled
00	Clock switching is enabled, Fail-Safe Clock Monitor is enabled

Bit 2 – OSCIOFNC OSCO Pin Function bit (except in XT and HS modes)(1)

Value	Description
1	OSCO is the clock output
0	OSCO is the general purpose digital I/O pin

Bits 1:0 – POSCMD[1:0] Primary Oscillator Mode Select bits

Value	Description
11	Primary Oscillator is disabled
10	HS Crystal Oscillator mode (10 MHz-32 MHz)
01	XT Crystal Oscillator mode (3.5 MHz-10 MHz)
00	EC (External Clock) mode

29.3 Device Calibration and Identification

The dsPIC33CK256MC506 devices have two Identification registers, near the end of configuration memory space, that store the Device ID (DEVID) and Device Revision (DEVREV). These registers are used to determine the mask, variant and manufacturing information about the device. These registers are read-only and are shown in 29.3.1. DEVREV and 29.3.2. DEVID.

29.3.1 Device Revision Register

Name: DEVREV

29.4 User OTP Memory

The dsPIC33CK256MC506 family devices contain 64 One-Time-Programmable (OTP) double words, located at addresses, 801700h through 8017FEh. Each 48-bit OTP double word can only be written one time. The OTP Words can be used for storing checksums, code revisions, manufacturing dates, manufacturing lot numbers or any other application-specific information.

The OTP area is not cleared by any erase command. This memory can be written only once.

29.5 On-Chip Voltage Regulator

All of the dsPIC33CK256MC506 family devices have an internal voltage regulator to supply power to the core at 1.2V (typical).

The voltage regulator power can be controlled by the LPWREN bit in the VREGCON register when LPWREN (VREGCON[15]) = 1. Then, the regulators are put in a lower power mode.

The regulators have Low-Power and Standby modes for use in Sleep modes. For additional information about Sleep, see 28.2.1. Sleep Mode. When the regulators are in Low-Power mode (LPWREN = 1), the power available to the core is limited.

Before the LPWREN bit is set, the device should be placed into a Lower Power state by disabling peripherals and lowering CPU frequency (e.g., 8 MHz FRC without PLL). The output voltages of the three regulators can be controlled independently by the user, which gives the capability to save additional power during Sleep mode.

29.5.1 Voltage Regulator Control Register

Name: VREGCON

Note:

1. Low-Power mode can only be used within the industrial temperature range. The CPU should be run at slow speed (8 MHz or less) before setting this bit.

29.6 Brown-out Reset (BOR)

The Brown-out Reset (BOR) module is based on an internal voltage reference circuit that monitors the regulated supply voltage. The main purpose of the BOR module is to generate a device Reset when a brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse which resets the device. The BOR selects the clock source based on the device Configuration bit selections.

If an Oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON[5]) is '1'.

The BOR status bit (RCON[1]) is set to indicate that a BOR has occurred. The BOR circuit continues to operate while in Sleep or Idle mode and resets the device should V_{DD} fall below the BOR threshold voltage.

29.7 Dual Watchdog Timer (WDT)

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Dual Watchdog Timer"**, (www.microchip.com/DS70005250) in the *"dsPIC33/PIC24 Family Reference Manual"*.

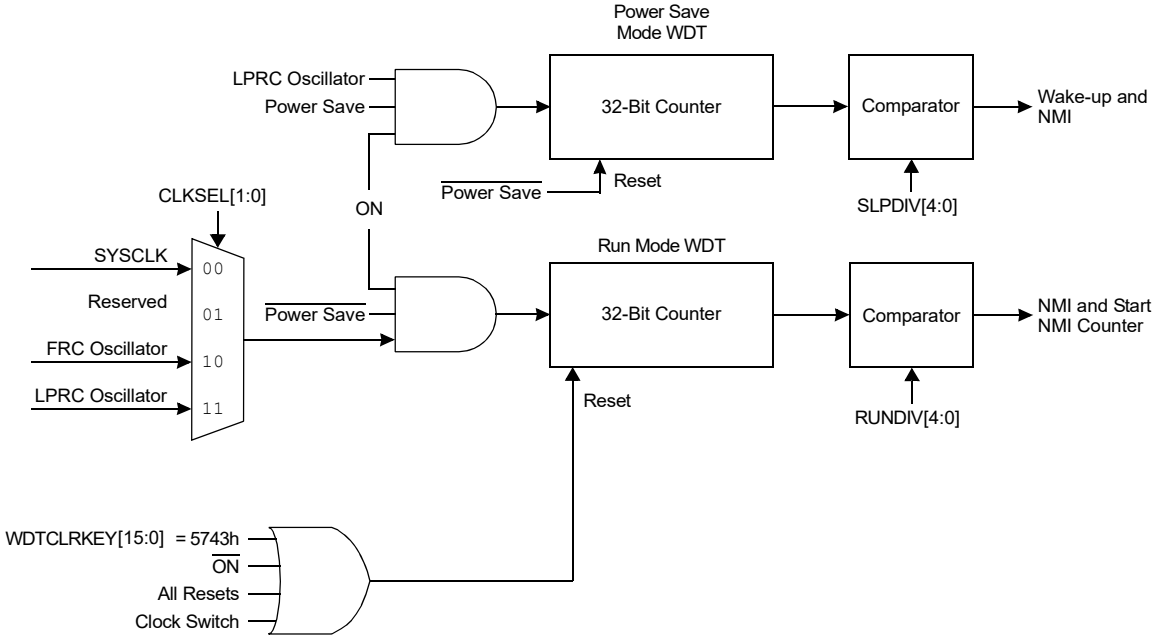
The dsPIC33 dual Watchdog Timer (WDT) is described in this section. Refer to Figure 29-1 for a block diagram of the WDT.

The WDT, when enabled, operates from the internal Low-Power RC (LPRC) Oscillator clock source or a selectable clock source in Run mode. The WDT can be used to detect system software malfunctions by resetting the device if the WDT is not cleared periodically in software. The WDT can be configured in Windowed mode or Non-Windowed mode. Various WDT time-out periods can be selected using the WDT postscaler. The WDT can also be used to wake the device from Sleep or Idle mode (Power Save mode). If the WDT expires and issues a device Reset, the WTDO bit in the RCON register will be set.

The following are some of the key features of the WDT modules:

- Configuration or Software Controlled
- Separate User-Configurable Time-out Periods for Run and Sleep/Idle
- Can Wake the Device from Sleep or Idle
- User-Selectable Clock Source in Run mode
- Operates from LPRC in Sleep/Idle mode

Figure 29-1. Watchdog Timer Block Diagram



29.7.1 Watchdog Timer Control Register Low

Name: WDTCONL

Notes:

1. A read of this bit will result in a '1' if the WDT is enabled by the device configuration or by software. The user's software should not read or write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.
2. The user's software should not read or write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.
3. These bits reflect the value of the Configuration bits.
4. The WDTWINEN bit reflects the status of the Configuration bit if the bit is set. If the bit is cleared, the value is controlled by software.
5. The available clock sources are device-dependent.

29.8 JTAG Interface

The dsPIC33CK256MC506 family devices implement a JTAG interface, which supports boundary scan device testing. The JTAG interface only supports boundary scan; programming is not supported.

Note: Refer to **"Programming and Diagnostics"** (www.microchip.com/DS70608) in the *"dsPIC33/PIC24 Family Reference Manual"* for further information on usage, configuration and operation of the JTAG interface.

29.9 In-Circuit Serial Programming™ (ICSP™)

The dsPIC33CK256MC506 family devices can be serially programmed while in the end application circuit. This is done with two lines for clock and data, and three other lines for power, ground and the programming sequence. Serial programming allows customers to manufacture boards with unprogrammed devices and then program the device just before shipping the product. Serial programming also allows the most recent firmware or a custom firmware to be programmed. Refer to the *"dsPIC33CK256MC506 Family Flash Programming Specification"* (www.microchip.com/DS70005446) for details about In-Circuit Serial Programming (ICSP).

Any of the three pairs of programming clock/data pins can be used:

- PGC1 and PGD1
- PGC2 and PGD2
- PGC3 and PGD3

29.10 In-Circuit Debugger

When MPLAB® ICD 3 or the REAL ICE™ emulator is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGCx (Emulation/Debug Clock) and PGDx (Emulation/Debug Data) pin functions.

Any of the three pairs of debugging clock/data pins can be used:

- PGC1 and PGD1
- PGC2 and PGD2
- PGC3 and PGD3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to $\overline{MCLR}$, V_{DD}, V_{SS} and the PGCx/PGDx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two or five I/O pins (PGCx and PGDx).

29.11 Code Protection and CodeGuard™ Security

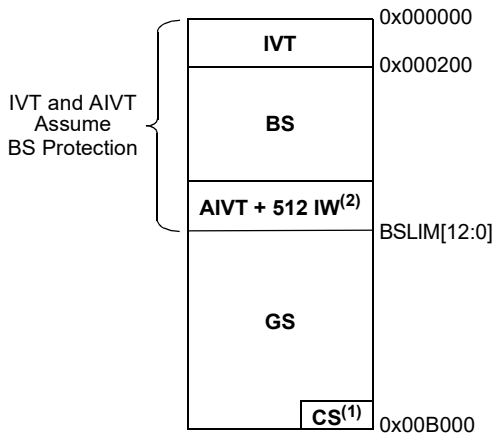
dsPIC33CK256MC506 family devices offer multiple levels of security for protecting individual intellectual property. The program Flash protection can be broken up into three segments: Boot Segment (BS), General Segment (GS) and Configuration Segment (CS). Boot Segment has the highest security privilege and can be thought to have limited restrictions when accessing other segments. General Segment has the least security and is intended for the end user system code. Configuration Segment contains only the device user configuration data, which are located at the end of the program memory space.

The code protection features are controlled by the Configuration registers, FSEC and FBSLIM. The FSEC register controls the code-protect level for each segment and if that segment is write-protected. The size of BS and GS will depend on the BSLIM[12:0] bits setting and if the Alternate Interrupt Vector Table (AIVT) is enabled. The BSLIM[12:0] bits define the number of pages for BS, with each page containing 1024 IW. The smallest BS size is one page, which will consist of the Interrupt Vector Table (IVT) and 512 IW of code protection.

If the AIVT is enabled, the last page of BS will contain the AIVT and will not contain any BS code. With AIVT enabled, the smallest BS size is now two pages (2048 IW), with one page for the IVT and BS code, and the other page for the AIVT. Write protection of the BS does not cover the AIVT. The last page of BS can always be programmed or erased by BS code. The General Segment will start at the next page and will consume the rest of program Flash, except for the Flash Configuration Words. The IVT will assume GS security only if BS is not enabled. The IVT is protected from being programmed or page erased when either security segment has enabled write protection.

The different device security segments are shown in Figure 29-2. Here, all three segments are shown, but are not required. If only basic code protection is required, then GS can be enabled independently or combined with CS, if desired.

Figure 29-2. Security Segments Example



Note 1: If CS is write-protected, the last page (GS + CS) of program memory will be protected from an erase condition.

2: The last half (256 IW) of the last page of BS is unusable program memory.

30. Instruction Set Summary

Note: This data sheet summarizes the features of the dsPIC33CK256MC506 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip website (www.microchip.com).

The dsPIC33CK instruction set is almost identical to that of the dsPIC30F and dsPIC33F.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 30-1 lists the general symbols used in describing the instructions.

The dsPIC33 instruction set summary in Table 30-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register 'Wb' without any address modifier
- The second source operand, which is typically a register 'Ws' with or without an address modifier
- The destination of the result, which is typically a register 'Wd' with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value 'f'
- The destination, which could be either the file register 'f' or the W0 register, which is denoted as 'WREG'

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of 'Ws' or 'f')
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register 'Wb')

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by 'k')
- The W register or file register where the literal value is to be loaded (specified by 'Wb' or 'f')

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register 'Wb' without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register 'Wd' with or without an address modifier

The `MAC` class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- The accumulator write-back destination

The other DSP instructions do not involve any multiplication and can include:

- The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register 'Wn' or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the Table Read and Table Write instructions

Most instructions are a single word. Certain double-word instructions are designed to provide all the required information in these 48 bits. In the second word, the eight MSbs are '0's. If this second word is executed as an instruction (by itself), it executes as a NOP.

The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true or the Program Counter is changed as a result of the instruction, or a PSV or Table Read is performed. In these cases, the execution takes multiple instruction cycles, with the additional instruction cycle(s) executed as a NOP. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

Note: For more details on the instruction set, refer to the *"16-Bit MCU and DSC Programmer's Reference Manual"* (www.microchip.com/DS70000157).

31. Development Support

Move a design from concept to production in record time with Microchip's award-winning development tools. Microchip tools work together to provide state of the art debugging for any project with easy-to-use Graphical User Interfaces (GUIs) in our free MPLAB® X and Atmel Studio Integrated Development Environments (IDEs), and our code generation tools. Providing the ultimate ease-of-use experience, Microchip's line of programmers, debuggers and emulators work seamlessly with our software tools. Microchip development boards help evaluate the best silicon device for an application, while our line of third party tools round out our comprehensive development tool solutions.

Microchip's MPLAB X and Atmel Studio ecosystems provide a variety of embedded design tools to consider, which support multiple devices, such as PIC® MCUs, AVR® MCUs, SAM MCUs and dsPIC® DSCs. MPLAB X tools are compatible with Windows®, Linux® and Mac® operating systems while Atmel Studio tools are compatible with Windows.

32. Electrical Characteristics

This section provides an overview of the dsPIC33CK256MC506 family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33CK256MC506 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Table 32-1. Absolute Maximum Ratings(1)

Parameter	Rating
Ambient temperature under bias	-40°C to +125°C
Storage temperature	-65°C to +150°C
Voltage on V_{DD} with respect to V_{SS}	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to V_{SS}(3)	-0.3V to (V_{DD} + 0.3V)
Voltage on any 5V tolerant pin with respect to V_{SS}(3)	-0.3V to +5.5V
Maximum current out of V_{SS} pin	300 mA
Maximum current into V_{DD} pin(2)	300 mA
Maximum current sunk/sourced by any regular I/O pin	15 mA
Maximum current sunk/sourced by an I/O pin with increased current drive strength (RB1, RC8, RC9 and RD8)	25 mA
Maximum current sunk by a group of I/Os between two V_{SS} pins(4)	75 mA
Maximum current sourced by a group of I/Os between two V_{DD} pins(4)	75 mA
Maximum current sunk by all I/Os(2,5)	200 mA
Maximum current sourced by all I/Os(2,5)	200 mA

Notes:

1. Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those, or any other conditions above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
2. Maximum allowable current is a function of device maximum power dissipation (see 32.1. DC Characteristics).
3. See the Pin Diagrams section for the 5V tolerant pins.
4. Not applicable to AV_{DD} and AV_{SS} pins.
5. For 28-pin packages, the maximum current sunk/sourced by all I/Os is limited by 150 mA.

Notes:

1. Data in the “Typ.” column are for design guidance only and are not tested.
2. I_{DD} is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. Base run current (I_{DD}) is measured as follows:
   - Oscillator is switched to EC+PLL mode in software
   - OSC1 pin is driven with external 8 MHz square wave with levels from 0.3V to V_{DD} – 0.3V
   - OSC2 pin is configured as an I/O in the Configuration Words (OSCIOFNC (FOSC[2]) = `0`)
   - FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = `01`)
   - Watchdog Timer is disabled (FWDT[15]) = `0` and WDTCONL[15] = `0`)
   - All I/O pins (except OSC1) are configured as outputs and driving low
   - No peripheral modules are operating or being clocked (defined PMDx bits are all ‘`1`’s)
   - JTAG is disabled (JTAGEN (FICD[5]) = `0`)
   - `NOP` instructions are executed in `while(1)` loop

Notes:

1. Data in the “Typ.” column are for design guidance only and are not tested.
2. Base Sleep current (I_{PD}) is measured as follows:
   - CPU core is off, oscillator is configured in EC mode and External Clock is active; OSCI is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
   - CLKO is configured as an I/O input pin in the Configuration Word
   - FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = 01)
   - All I/O pins are configured as output low
   - $\overline{MCLR}$ = V_{DD}, WDT and FSCM are disabled
   - All peripheral modules are disabled (PMDx bits are all set)
   - The VREGS bit (RCON[8]) = 0 (i.e., core regulator is set to standby while the device is in Sleep mode)
   - JTAG is disabled
3. The regulators are in High-Power mode, LPWREN (VREGCON[15]) = 0.

DI60b	I_{ICH}	**Input High Injection Current**	0	+5**(2,3,4)**	mA	This parameter applies to all pins, except all 5V tolerant pins
DI60c	Σ_{LICT}	**Total Input Injection Current (sum of all I/O and control pins)**	-20**(5)**	+20**(5)**	mA	Absolute instantaneous sum of all ± input injection currents from all I/O pins $\Sigma (\lvert I_{ICL} \rvert + \lvert I_{ICH} \rvert) \le \Sigma_{LICT}$

Notes:

1. V_{IL} Source < (V_{SS} – 0.3).
2. V_{IH} Source > (V_{DD} + 0.3) for non-5V tolerant pins only.
3. 5V tolerant pins do not have an internal high-side diode to V_{DD} and therefore, cannot tolerate any “positive” input injection current.
4. Injection currents can affect the ADC results.
5. Any number and/or combination of I/O pins, not excluded under I_{ICL} or I_{ICH} conditions, are permitted in the sum.

Notes:

1. Parameters are for design guidance only and are not tested in manufacturing.
2. The op amps use CMOS input circuitry with negligible input bias current. The maximum “effective bias current” is the I/O pin leakage specified by electrical Parameter DI50.
3. This parameter is characterized but not tested in manufacturing.

33. High-Temperature Electrical Characteristics

This section provides an overview of the dsPIC33CK256MC506 family devices operating in an ambient temperature range of -40°C to +150°C.

The specifications between -40°C to +150°C are identical to those shown in 32. Electrical Characteristics for operation between -40°C to +125°C, with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, Parameter DC20 in 32. Electrical Characteristics is the Industrial and Extended temperature equivalent of HDC20.

Absolute maximum ratings for the dsPIC33CK256MC506 family are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Table 33-1. Absolute Maximum Ratings(1)

Parameter	Rating
Ambient temperature under bias	-40°C to +150°C
Storage temperature	-65°C to +150°C
Voltage on V_{DD} with respect to V_{SS}	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to V_{SS}(3)	-0.3V to (V_{DD} + 0.3V)
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} \geq 3.0V$(3)	-0.3V to +5.5V
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} \geq 3.0V$(3)	-0.3V to +3.6V
Maximum current out of V_{SS} pin	300 mA
Maximum current into V_{DD} pin(2)	300 mA
Maximum current sunk/sourced by any regular I/O pin	15 mA
Maximum current sunk/sourced by an I/O pin with increased current drive strength (RB1, RC8, RC9 and RD8)	25 mA
Maximum current sunk by a group of I/Os between two V_{SS} pins(4)	75 mA
Maximum current sourced by a group of I/Os between two V_{DD} pins(4)	75 mA
Maximum current sunk by all I/Os(2,5)	200 mA
Maximum current sourced by all I/Os(2,5)	200 mA

Notes:

1. Stresses above those listed under **"Absolute Maximum Ratings"** may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those, or any other conditions above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
2. Maximum allowable current is a function of device maximum power dissipation (see Table 32-3).
3. See the **"Pin Diagrams"** section for the 5V tolerant pins.
4. Not applicable to AV_{DD} and AV_{SS} pins.
5. For 28-pin packages, the maximum current sunk/sourced by all I/Os is limited by 150 mA.

35. Revision History

Revision A (August 2021)

This is the initial version of the document.

Revision B (September 2021)

- Sections:
  - Updates heading and text of the **"Functional Safety Collateral"** section to **"Functional Safety Readiness"**.
  - Updates the **"Product Identification System"** section.
  - Adds **Section 33. "High-Temperature Electrical Characteristics"**.
- Registers:
  - Updates to the**"Voltage Regulator Control Register (VREGCON)"**.
- Tables:
  - Updates Table 32-6, Table 32-7, Table 32-8, Table 32-9, Table 32-10, Table 32-11, Table 32-12, Table 32-13 and Table 32-14.

Revision C (January 2022)

- Sections:
  - Updates **"Advanced Analog Features"** section.
  - Updates the **"Functional Safety Readiness"** section.
  - Adds **Section 9.3.1 "Primary Oscillator Pin Functionality"**.
  - Updates **Section 13.1.1 "Temperature Sensor"**.
  - Updates **Section 16 "Universal Asynchronous Receiver Transmitter (UART)"**.
- Registers:
  - Updates **7.7.3 "Interrupt Request Flags Register 2 (IFS2)"**, **7.7.13 "Interrupt Enable Register 2 (IEC2)"** and **7.7.60 "Interrupt Control Register 3 (INTCON3)"**.
  - Removes Note 2 from all the LOGCONy Registers.
  - Removes Note 5 from all the PWMEVTy Registers.
  - Updates bit names in **12.6.10 "Combinatorial PWM Logic Control Register y (LOGCONy)"**.
  - Updates bit names in **12.6.11 "PWM Event Output Control Register y (PWMEVTy)"**.
  - Added missing registers: PG2FFPCIL, PG3FFPCIL, PG4FFPCIL, PG2FFPCIH, PG3FFPCIH, PG4FFPCIH, PG3SPCIL,PG4SPCIL, PG3SPCIH, PG4SPCIH, PG4FPCIL and PG4FPCIH.
  - Updates **13.3.20 "ADC Channel Trigger 0 Selection Register Low (ADTRIG0L)"**.
  - Removes Notes 1 and 2 from all the PTG Registers.
  - Updates **29.2.13 "FDMT Configuration Register (FDMT)"**.
- Tables:
  - Updates Table 1-1, Table 7-1, Table 32-5 and Table 32-24.
  - Adds Table 32-33.
- Figures:
  - Updates Figure 13-1.

The Microchip Website

Microchip provides online support via our website at www.microchip.com/. This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Product Change Notification Service

Microchip's product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to www.microchip.com/pcn and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: www.microchip.com/support

Product Identification System

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

	E	-40°C to +125°C (Extended)
	H	-40°C to +150°C (High)
Package:	SS	28L SSOP (5.30 mm)
	M6	28L UQFN (4x4 mm)
	2N	28L UQFN (6x6 mm)
	M5	36L UQFN (5x5 mm)
	PT	48L TQFP (7x7 mm)
	M7	48L VQFN (6x6 mm)
	MR	64L QFN (9x9 mm)
	PT	64L TQFP (10x10 mm)

Examples:

- dsPIC33CK256MC506-I/PT: dsPIC33, Enhanced Performance, 256-Kbyte Program Memory, 64-Pin, Industrial Temperature, TQFP package.

Notes:

1. Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.
2. Small form-factor packaging options may be available. Please check www.microchip.com/packaging for small-form factor package availability, or contact your local Sales Office.

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
