**Table 21.35 RSCANnGAFLP0j Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | GAFLDLC[3:0] | Receive Rule DLC<br>b31 b30 b29 b28<br>0 0 0 0: DLC check is disabled.<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 16 | GAFLPTR[11:0] | Receive Rule Label<br>Set the 12-bit label information. |
| 15 | GAFLRMV | Receive Buffer Enable<br>0: No receive buffer is used.<br>1: A receive buffer is used. |
| 14 to 8 | GAFLRMDP[6:0] | Receive Buffer Number Select<br>Set the receive buffer number to store receive messages. |
| 7 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Modify the RSCANnGAFLP0j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to $0000_B$ disables the DLC check function allowing messages with any data length to pass the DLC check.

#### GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

#### GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

#### GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

### 21.4.4.7 RSCANnGAFLP1j — Receive Rule Pointer 1 Register (j = 0 to 15)

**Access:** RSCANnGAFLP1j register can be read or written in 32-bit units
RSCANnGAFLP1jL, RSCANnGAFLP1jH registers can be read or written in 16-bit units
RSCANnGAFLP1jLL, RSCANnGAFLP1jLH, RSCANnGAFLP1jHL, RSCANnGAFLP1jHH registers can be read or written in 8-bit units

**Address:** RSCANnGAFLP1j: <RSCANn_base> + $050C_H$ + ($10_H$ × j)

RSCANnGAFLP1jL: <RSCANn_base> + $050C_H$ + ($10_H$ × j),
RSCANnGAFLP1jH: <RSCANn_base> + $050E_H$ + ($10_H$ × j)

RSCANnGAFLP1jLL: <RSCANn_base> + $050C_H$ + ($10_H$ × j),
RSCANnGAFLP1jLH: <RSCANn_base> + $050D_H$ + ($10_H$ × j),
RSCANnGAFLP1jHL: <RSCANn_base> + $050E_H$ + ($10_H$ × j),
RSCANnGAFLP1jHH: <RSCANn_base> + $050F_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.36 RSCANnGAFLP1j Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 26 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 25 to 8 | GAFLFDP[25:8] | Transmit/Receive FIFO Buffer k Select<br>(Bit position –8 = target transmit/receive FIFO buffer number k)<br>0: Transmit/receive FIFO buffer is not selected.<br>1: Transmit/receive FIFO buffer is selected. |
| 7 to 0 | GAFLFDP[7:0] | Receive FIFO Buffer x Select<br>(Bit position = target receive FIFO buffer number x)<br>0: Receive FIFO buffer is not selected.<br>1: Receive FIFO buffer is selected. |

Modify the RSCANnGAFLP1j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLFDP[25:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCANnGAFLP0j register is set to 1 (messages are stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCANnCFCCk register are set to $00_B$ (receive mode) or $10_B$ (gateway mode) can be selected.

## 21.4.5 Details of Receive Buffer-Related Registers

### 21.4.5.1 RSCANnRMNB — Receive Buffer Number Register

**Access:** RSCANnRMNB register can be read or written in 32-bit units
RSCANnRMNBL register can be read or written in 16-bit units
RSCANnRMNBLL register can be read or written in 8-bit units

**Address:** RSCANnRMNB: <RSCANn_base> + $00A4_H$
RSCANnRMNBL: <RSCANn_base> + $00A4_H$
RSCANnRMNBLL: <RSCANn_base> + $00A4_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | NRXMB[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.37 RSCANnRMNB Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 7 to 0 | NRXMB[7:0] | Receive Buffer Number Configuration<br>Set the number of receive buffers.<br>Set a value of 0 to 96. |

Modify the RSCANnRMNB register only in global reset mode.

#### NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

### 21.4.5.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0 to 2)

**Access:** RSCANnRMNDy register can be read or written in 32-bit units
RSCANnRMNDyL, RSCANnRMNDyH registers can be read or written in 16-bit units
RSCANnRMNDyLL, RSCANnRMNDyLH, RSCANnRMNDyHL, RSCANnRMNDyHH registers can be read or written in 8-bit units

**Address:** RSCANnRMNDy: <RSCANn_base> + $00A8_H$ + ($04_H$ × y)

RSCANnRMNDyL: <RSCANn_base> + $00A8_H$ + ($04_H$ × y),
RSCANnRMNDyH: <RSCANn_base> + $00AA_H$ + ($04_H$ × y)

RSCANnRMNDyLL: <RSCANn_base> + $00A8_H$ + ($04_H$ × y),
RSCANnRMNDyLH: <RSCANn_base> + $00A9_H$ + ($04_H$ × y),
RSCANnRMNDyHL: <RSCANn_base> + $00AA_H$ + ($04_H$ × y),
RSCANnRMNDyHH: <RSCANn_base> + $00AB_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMNSq (q = y × 32 + 31 to y × 32 + 16 (y = 0, 1, 2)) | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.38 RSCANnRMNDy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | RMNSq | Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16)<br>0: There is no new message in receive buffer q.<br>1: There is a new message in receive buffer q. |
| 15 to 0 | RMNSq | Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0)<br>0: There is no new message in receive buffer q.<br>1: There is a new message in receive buffer q. |

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

#### RMNSq Flags (q = 0 to 95)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message.

These flags are cleared to 0 in global reset mode.

### 21.4.5.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 95)

**Access:** RSCANnRMIDq register is a read-only register that can be read in 32-bit units
RSCANnRMIDqL, RSCANnRMIDqH registers are read-only registers that can be read in 16-bit units
RSCANnRMIDqLL, RSCANnRMIDqLH, RSCANnRMIDqHL, RSCANnRMIDqHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnRMIDq: <RSCANn_base> + $0600_H$ + ($10_H$ × q)

RSCANnRMIDqL: <RSCANn_base> + $0600_H$ + ($10_H$ × q),
RSCANnRMIDqH: <RSCANn_base> + $0602_H$ + ($10_H$ × q)

RSCANnRMIDqLL: <RSCANn_base> + $0600_H$ + ($10_H$ × q),
RSCANnRMIDqLH: <RSCANn_base> + $0601_H$ + ($10_H$ × q),
RSCANnRMIDqHL: <RSCANn_base> + $0602_H$ + ($10_H$ × q),
RSCANnRMIDqHH: <RSCANn_base> + $0603_H$ + ($10_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMIDE | RMRTR | — | RMID[28:16] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.39 RSCANnRMIDq Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | RMIDE | Receive Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | RMRTR | Receive Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | Reserved | When read, the value after reset is returned. |
| 28 to 0 | RMID[28:0] | Receive Buffer ID Data<br>These bits contain the standard ID or extended ID of the received message.<br>Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

#### RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

#### RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

#### RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

### 21.4.5.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 95)

**Access:** RSCANnRMPTRq register is a read-only register that can be read in 32-bit units
RSCANnRMPTRqL, RSCANnRMPTRqH registers are read-only registers that can be read in 16-bit units
RSCANnRMPTRqLL, RSCANnRMPTRqLH, RSCANnRMPTRqHL, RSCANnRMPTRqHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnRMPTRq: <RSCANn_base> + $0604_H$ + ($10_H$ × q)

RSCANnRMPTRqL: <RSCANn_base> + $0604_H$ + ($10_H$ × q),
RSCANnRMPTRqH: <RSCANn_base> + $0606_H$ + ($10_H$ × q)

RSCANnRMPTRqLL: <RSCANn_base> + $0604_H$ + ($10_H$ × q),
RSCANnRMPTRqLH: <RSCANn_base> + $0605_H$ + ($10_H$ × q),
RSCANnRMPTRqHL: <RSCANn_base> + $0606_H$ + ($10_H$ × q),
RSCANnRMPTRqHH: <RSCANn_base> + $0607_H$ + ($10_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMDLC[3:0] | | | | RMPTR[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMTS[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.40 RSCANnRMPTRq Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | RMDLC[3:0] | Receive Buffer DLC Data<br>b31 b30 b29 b28<br>0 0 0 0: No data byte<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 16 | RMPTR[11:0] | Receive Buffer Label Data<br>Label information of the received message. |
| 15 to 0 | RMTS[15:0] | Receive Buffer Timestamp Data<br>Timestamp value of the received message. |

#### RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

#### RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

#### RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

### 21.4.5.5 RSCANnRMDF0q — Receive Buffer Data Field 0 Register (q = 0 to 95)

**Access:** RSCANnRMDF0q register is a read-only register that can be read in 32-bit units
RSCANnRMDF0qL, RSCANnRMDF0qH registers are read-only registers that can be read in 16-bit units
RSCANnRMDF0qLL, RSCANnRMDF0qLH, RSCANnRMDF0qHL, RSCANnRMDF0qHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnRMDF0q: <RSCANn_base> + $0608_H$ + ($10_H$ × q)

RSCANnRMDF0qL: <RSCANn_base> + $0608_H$ + ($10_H$ × q),
RSCANnRMDF0qH: <RSCANn_base> + $060A_H$ + ($10_H$ × q)

RSCANnRMDF0qLL: <RSCANn_base> + $0608_H$ + ($10_H$ × q),
RSCANnRMDF0qLH: <RSCANn_base> + $0609_H$ + ($10_H$ × q),
RSCANnRMDF0qHL: <RSCANn_base> + $060A_H$ + ($10_H$ × q),
RSCANnRMDF0qHH: <RSCANn_base> + $060B_H$ + ($10_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMDB3[7:0] | | | | | | | | RMDB2[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMDB1[7:0] | | | | | | | | RMDB0[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.41 RSCANnRMDF0q Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RMDB3[7:0] | Receive Buffer Data Byte 3 |
| 23 to 16 | RMDB2[7:0] | Receive Buffer Data Byte 2 |
| 15 to 8 | RMDB1[7:0] | Receive Buffer Data Byte 1 |
| 7 to 0 | RMDB0[7:0] | Receive Buffer Data Byte 0<br>Data for a message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

### 21.4.5.6 RSCANnRMDF1q — Receive Buffer Data Field 1 Register (q = 0 to 95)

**Access:** RSCANnRMDF1q register is a read-only register that can be read in 32-bit units
RSCANnRMDF1qL, RSCANnRMDF1qH registers are read-only registers that can be read in 16-bit units
RSCANnRMDF1qLL, RSCANnRMDF1qLH, RSCANnRMDF1qHL, RSCANnRMDF1qHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnRMDF1q: <RSCANn_base> + $060C_H$ + ($10_H$ × q)

RSCANnRMDF1qL: <RSCANn_base> + $060C_H$ + ($10_H$ × q),
RSCANnRMDF1qH: <RSCANn_base> + $060E_H$ + ($10_H$ × q)

RSCANnRMDF1qLL: <RSCANn_base> + $060C_H$ + ($10_H$ × q),
RSCANnRMDF1qLH: <RSCANn_base> + $060D_H$ + ($10_H$ × q),
RSCANnRMDF1qHL: <RSCANn_base> + $060E_H$ + ($10_H$ × q),
RSCANnRMDF1qHH: <RSCANn_base> + $060F_H$ + ($10_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMDB7[7:0] | | | | | | | | RMDB6[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 21.42 RSCANnRMDF1q Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RMDB7[7:0] | Receive Buffer Data Byte 7 |
| 23 to 16 | RMDB6[7:0] | Receive Buffer Data Byte 6 |
| 15 to 8 | RMDB5[7:0] | Receive Buffer Data Byte 5 |
| 7 to 0 | RMDB4[7:0] | Receive Buffer Data Byte 4<br>Data for a message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

## 21.4.6 Details of Receive FIFO Buffer-Related Registers

### 21.4.6.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

**Access:** RSCANnRFCCx register can be read or written in 32-bit units
RSCANnRFCCxL register can be read or written in 16-bit units
RSCANnRFCCxLL, RSCANnRFCCxLH registers can be read or written in 8-bit units

**Address:** RSCANnRFCCx: <RSCANn_base> + $00B8_H$ + ($04_H$ × x)

RSCANnRFCCxL: <RSCANn_base> + $00B8_H$ + ($04_H$ × x)

RSCANnRFCCxLL: <RSCANn_base> + $00B8_H$ + ($04_H$ × x),
RSCANnRFCCxLH: <RSCANn_base> + $00B9_H$ + ($04_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Table 21.43 RSCANnRFCCx Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 1 | RFIE | Receive FIFO Interrupt Enable<br>0: Receive FIFO interrupt is disabled.<br>1: Receive FIFO interrupt is enabled. |
| 0 | RFE | Receive FIFO Buffer Enable<br>0: No receive FIFO buffer is used.<br>1: Receive FIFO buffers are used. |

### RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to $001_B$ (4 messages), set the RFIGCV[2:0] bits to $001_B$, $011_B$, $101_B$, or $111_B$. Modify these bits only in global reset mode.

### RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

### RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to $000_B$, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

### RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

### RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCANnRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done.

This bit is cleared to 0 in global reset mode.

### 21.4.6.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

**Access:** RSCANnRFSTSx register can be read or written in 32-bit units
RSCANnRFSTSxL register can be read or written in 16-bit units
RSCANnRFSTSxLL register can be read or written in 8-bit units
RSCANnRFSTSxLH register is a read-only register that can be read in 8-bit units

**Address:** RSCANnRFSTSx: <RSCANn_base> + $00D8_H$ + ($04_H$ × x)

RSCANnRFSTSxL: <RSCANn_base> + $00D8_H$ + ($04_H$ × x)

RSCANnRFSTSxLL: <RSCANn_base> + $00D8_H$ + ($04_H$ × x),
RSCANnRFSTSxLH: <RSCANn_base> + $00D9_H$ + ($04_H$ × x)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFMC[7:0] | | | | | | | | — | — | — | — | RFIF | RFMLT | RFFLL | RFEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.44 RSCANnRFSTSx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 to 8 | RFMC[7:0] | Receive FIFO Unread Message Counter<br>The number of unread messages stored in the receive FIFO buffer is displayed. |
| 7 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | RFIF | Receive FIFO Interrupt Request Flag<br>0: No receive FIFO interrupt request is present.<br>1: A receive FIFO interrupt request is present. |
| 2 | RFMLT | Receive FIFO Message Lost Flag<br>0: No receive FIFO message is lost.<br>1: A receive FIFO message is lost. |
| 1 | RFFLL | Receive FIFO Buffer Full Status Flag<br>0: The receive FIFO buffer is not full.<br>1: The receive FIFO buffer is full. |
| 0 | RFEMP | Receive FIFO Buffer Empty Status Flag<br>0: The receive FIFO buffer contains unread message.<br>1: The receive FIFO buffer contains no unread message (buffer empty). |

#### RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes $00_H$ when the RFE bit in the RSCANnRFCCx register is set to 0.

### RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

### RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

**NOTE**

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

### 21.4.6.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

**Access:** RSCANnRFPCTRx register is a write-only register that can be written in 32-bit units
RSCANnRFPCTRxL register is a write-only register that can be written in 16-bit units
RSCANnRFPCTRxLL register is a write-only register that can be written in 8-bit units

**Address:** RSCANnRFPCTRx: <RSCANn_base> + $00F8_H$ + ($04_H$ × x)

RSCANnRFPCTRxL: <RSCANn_base> + $00F8_H$ + ($04_H$ × x)

RSCANnRFPCTRxLL: <RSCANn_base> + $00F8_H$ + ($04_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | RFPC[7:0] | | | | | | | |

| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.45 RSCANnRFPCTRx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | RFPC[7:0] | Receive FIFO Pointer Control<br>When these bits are set to $FF_H$, the read pointer moves to the next unread message in the receive FIFO buffer. |

#### RFPC[7:0] Bits

When the RFPC[7:0] bits are set to $FF_H$, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFSTSx register is decremented. Read the RSCANnRFIDx, RSCANnRFPTRx, RSCANnRFDF0x, and RSCANnRFDF1x registers to read messages in the receive FIFO buffer, and then write $FF_H$ to the RFPC[7:0] bits.

When writing $FF_H$ to these bits, make sure that the RFE bit in the RSCANnRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

### 21.4.6.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

**Access:** RSCANnRFIDx register is a read-only register that can be read in 32-bit units
RSCANnRFIDxL, RSCANnRFIDxH registers are read-only registers that can be read in 16-bit units
RSCANnRFIDxLL, RSCANnRFIDxLH, RSCANnRFIDxHL, RSCANnRFIDxHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnRFIDx: <RSCANn_base> + $0E00_H$ + ($10_H$ × x)

RSCANnRFIDxL: <RSCANn_base> + $0E00_H$ + ($10_H$ × x),
RSCANnRFIDxH: <RSCANn_base> + $0E02_H$ + ($10_H$ × x)

RSCANnRFIDxLL: <RSCANn_base> + $0E00_H$ + ($10_H$ × x),
RSCANnRFIDxLH: <RSCANn_base> + $0E01_H$ + ($10_H$ × x),
RSCANnRFIDxHL: <RSCANn_base> + $0E02_H$ + ($10_H$ × x),
RSCANnRFIDxHH: <RSCANn_base> + $0E03_H$ + ($10_H$ × x)

**Value after reset:** $0000\ 0000_H$

**Table 21.46 RSCANnRFIDx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | RFIDE | Receive FIFO Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | RFRTR | Receive FIFO Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | Reserved | When read, the value after reset is returned. |
| 28 to 0 | RFID[28:0] | Receive FIFO Buffer ID Data<br>The standard ID or extended ID of received message can be read.<br>Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

#### RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

#### RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

#### RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

### 21.4.6.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

**Access:** RSCANnRFPTRx register is a read-only register that can be read in 32-bit units
RSCANnRFPTRxL, RSCANnRFPTRxH registers are read-only registers that can be read in 16-bit units
RSCANnRFPTRxLL, RSCANnRFPTRxLH, RSCANnRFPTRxHL, RSCANnRFPTRxHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnRFPTRx: <RSCANn_base> + $0E04_H$ + ($10_H$ × x)

RSCANnRFPTRxL: <RSCANn_base> + $0E04_H$ + ($10_H$ × x),
RSCANnRFPTRxH: <RSCANn_base> + $0E06_H$ + ($10_H$ × x)

RSCANnRFPTRxLL: <RSCANn_base> + $0E04_H$ + ($10_H$ × x),
RSCANnRFPTRxLH: <RSCANn_base> + $0E05_H$ + ($10_H$ × x),
RSCANnRFPTRxHL: <RSCANn_base> + $0E06_H$ + ($10_H$ × x),
RSCANnRFPTRxHH: <RSCANn_base> + $0E07_H$ + ($10_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 to 0 | RFTS[15:0] | Receive FIFO Buffer Timestamp Data<br>Timestamp value of the received message can be read. |

#### RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

#### RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

#### RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

### 21.4.6.6 RSCANnRFDF0x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)

**Access:** RSCANnRFDF0x register is a read-only register that can be read in 32-bit units
RSCANnRFDF0xL, RSCANnRFDF0xH registers are read-only registers that can be read in 16-bit units
RSCANnRFDF0xLL, RSCANnRFDF0xLH, RSCANnRFDF0xHL, RSCANnRFDF0xHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnRFDF0x: <RSCANn_base> + $0E08_H$ + ($10_H$ × x)

RSCANnRFDF0xL: <RSCANn_base> + $0E08_H$ + ($10_H$ × x),
RSCANnRFDF0xH: <RSCANn_base> + $0E0A_H$ + ($10_H$ × x)

RSCANnRFDF0xLL: <RSCANn_base> + $0E08_H$ + ($10_H$ × x),
RSCANnRFDF0xLH: <RSCANn_base> + $0E09_H$ + ($10_H$ × x),
RSCANnRFDF0xHL: <RSCANn_base> + $0E0A_H$ + ($10_H$ × x),
RSCANnRFDF0xHH: <RSCANn_base> + $0E0B_H$ + ($10_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.48 RSCANnRFDF0x Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RFDB3[7:0] | Receive FIFO Buffer Data Byte 3 |
| 23 to 16 | RFDB2[7:0] | Receive FIFO Buffer Data Byte 2 |
| 15 to 8 | RFDB1[7:0] | Receive FIFO Buffer Data Byte 1 |
| 7 to 0 | RFDB0[7:0] | Receive FIFO Buffer Data Byte 0<br>Data for a message stored in the receive FIFO buffer can be read. |

When the RFDLC[3:0] value in the RSCANnRFPTRx register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

### 21.4.6.7 RSCANnRFDF1x — Receive FIFO Buffer Access Data Field 1 Register (x = 0 to 7)

**Access:** RSCANnRFDF1x register is a read-only register that can be read in 32-bit units
RSCANnRFDF1xL, RSCANnRFDF1xH registers are read-only registers that can be read in 16-bit units
RSCANnRFDF1xLL, RSCANnRFDF1xLH, RSCANnRFDF1xHL, RSCANnRFDF1xHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnRFDF1x: <RSCANn_base> + $0E0C_H$ + ($10_H$ × x)

RSCANnRFDF1xL: <RSCANn_base> + $0E0C_H$ + ($10_H$ × x),
RSCANnRFDF1xH: <RSCANn_base> + $0E0E_H$ + ($10_H$ × x)

RSCANnRFDF1xLL: <RSCANn_base> + $0E0C_H$ + ($10_H$ × x),
RSCANnRFDF1xLH: <RSCANn_base> + $0E0D_H$ + ($10_H$ × x),
RSCANnRFDF1xHL: <RSCANn_base> + $0E0E_H$ + ($10_H$ × x),
RSCANnRFDF1xHH: <RSCANn_base> + $0E0F_H$ + ($10_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.49 RSCANnRFDF1x Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RFDB7[7:0] | Receive FIFO Buffer Data Byte 7 |
| 23 to 16 | RFDB6[7:0] | Receive FIFO Buffer Data Byte 6 |
| 15 to 8 | RFDB5[7:0] | Receive FIFO Buffer Data Byte 5 |
| 7 to 0 | RFDB4[7:0] | Receive FIFO Buffer Data Byte 4<br>Data for a message stored in the receive FIFO buffer can be read. |

When the RFDLC[3:0] value in the RSCANnRFPTRx register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

## 21.4.7 Details of Transmit/Receive FIFO Buffer-Related Registers

### 21.4.7.1 RSCANnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 17)

**Access:** RSCANnCFCCk register can be read or written in 32-bit units
RSCANnCFCCkL, RSCANnCFCCkH registers can be read or written in 16-bit units
RSCANnCFCCkLL, RSCANnCFCCkLH, RSCANnCFCCkHL, RSCANnCFCCkHH registers can be read or written in 8-bit units

**Address:** RSCANnCFCCk: <RSCANn_base> + $0118_H$ + ($04_H$ × k)

RSCANnCFCCkL: <RSCANn_base> + $0118_H$ + ($04_H$ × k),
RSCANnCFCCkH: <RSCANn_base> + $011A_H$ + ($04_H$ × k)

RSCANnCFCCkLL: <RSCANn_base> + $0118_H$ + ($04_H$ × k),
RSCANnCFCCkLH: <RSCANn_base> + $0119_H$ + ($04_H$ × k),
RSCANnCFCCkHL: <RSCANn_base> + $011A_H$ + ($04_H$ × k),
RSCANnCFCCkHH: <RSCANn_base> + $011B_H$ + ($04_H$ × k)

**Value after reset:** $0000\ 0000_H$

| 0 | CFE | Transmit/Receive FIFO Buffer Enable<br>0: No transmit/receive FIFO buffer is used.<br>1: Transmit/receive FIFO buffers are used. |

### CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to $01_B$ (transmit mode) or $10_B$ (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

### CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to $01_B$ (transmit mode) or $10_B$ (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 21.15** and **Table 21.16**, for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to $001_B$ or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register × 10.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

#### CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to $00_B$ (receive mode) or $10_B$ (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to $001_B$ (4 messages), set the CFIGCV[2:0] bits to $001_B$, $011_B$, $101_B$, or $111_B$.

Modify these bits only in global reset mode.

#### CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

#### CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to $000_B$, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

### CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

### CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

### 21.4.7.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 17)

**Access:** RSCANnCFSTSk register can be read or written in 32-bit units
RSCANnCFSTSkL register can be read or written in 16-bit units
RSCANnCFSTSkLL register can be read or written in 8-bit units
RSCANnCFSTSkLH register is a read-only register that can be read in 8-bit units

**Address:** RSCANnCFSTSk: <RSCANn_base> + $0178_H$ + ($04_H$ × k)

RSCANnCFSTSkL: <RSCANn_base> + $0178_H$ + ($04_H$ × k)

RSCANnCFSTSkLL: <RSCANn_base> + $0178_H$ + ($04_H$ × k),
RSCANnCFSTSkLH: <RSCANn_base> + $0179_H$ + ($04_H$ × k)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CFMC[7:0] | | | | | | | | — | — | — | CFTXIF | CFRXIF | CFMLT | CFFLL | CFEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.51 RSCANnCFSTSk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 to 8 | CFMC[7:0] | Transmit/Receive FIFO Message Counter<br>The number of messages stored in the transmit/receive FIFO buffer. |
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | CFTXIF | Transmit/Receive FIFO Transmit Interrupt Request Flag<br>0: No transmit/receive FIFO transmit interrupt request is present.<br>1: A transmit/receive FIFO transmit interrupt request is present. |
| 3 | CFRXIF | Transmit/Receive FIFO Receive Interrupt Request Flag<br>0: No transmit/receive FIFO receive interrupt request is present.<br>1: A transmit/receive FIFO receive interrupt request is present. |
| 2 | CFMLT | Transmit/Receive FIFO Message Lost Flag<br>0: No transmit/receive FIFO message is lost.<br>1: A transmit/receive FIFO message is lost. |
| 1 | CFFLL | Transmit/Receive FIFO Buffer Full Status Flag<br>0: The transmit/receive FIFO buffer is not full.<br>1: The transmit/receive FIFO buffer is full. |
| 0 | CFEMP | Transmit/Receive FIFO Buffer Empty Status Flag<br>0: The transmit/receive FIFO buffer contains messages.<br>1: The transmit/receive FIFO buffer contains no message (buffer empty). |

#### CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is $01_B$ (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is $00_B$ (receive mode): Number of unread received messages in the buffer

- When CFM[1:0] value is $10_B$ (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is $00_B$: In global reset mode
- When CFM[1:0] value is $01_B$ or $10_B$: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

#### CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $01_B$ or $10_B$, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_B$ or $10_B$, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag

- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCANnCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCANnCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not performing the transmit abort
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

#### CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_B$: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_B$ or $10_B$: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to $01_B$: A value of $FF_H$ has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0k, and RSCANnCFDF1k registers.

**NOTE**

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

### 21.4.7.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 17)

**Access:** RSCANnCFPCTRk register is a write-only register that can be written in 32-bit units
RSCANnCFPCTRkL register is a write-only register that can be written in 16-bit units
RSCANnCFPCTRkLL register is a write-only register that can be written in 8-bit units

**Address:** RSCANnCFPCTRk: <RSCANn_base> + $01D8_H$ + ($04_H$ × k)

RSCANnCFPCTRkL: <RSCANn_base> + $01D8_H$ + ($04_H$ × k)

RSCANnCFPCTRkLL: <RSCANn_base> + $01D8_H$ + ($04_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.52 RSCANnCFPCTRk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | CFPC[7:0] | Transmit/Receive FIFO Pointer Control<br>• Receive mode:<br>Writing $FF_H$ to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer.<br>• Transmit mode:<br>Writing $FF_H$ to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer.<br>• Gateway mode:<br>Setting prohibited |

#### CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is $00_B$):
  Writing $FF_H$ to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented. Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0k, and RSCANnCFDF1k registers to read messages from the transmit/receive FIFO buffer, and then write $FF_H$ to the CFPC[7:0] bits.
  When writing $FF_H$ to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is $01_B$):
  Writing $FF_H$ to the CFPC[7:0] bits stores the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0k, and RSCANnCFDF1k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0k, and RSCANnCFDF1k registers before writing $FF_H$ to the CFPC[7:0] bits.
  When writing $FF_H$ to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is $10_B$):
  Setting prohibited

### 21.4.7.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 17)

**Access:** RSCANnCFIDk register can be read or written in 32-bit units
RSCANnCFIDkL, RSCANnCFIDkH registers can be read or written in 16-bit units
RSCANnCFIDkLL, RSCANnCFIDkLH, RSCANnCFIDkHL, RSCANnCFIDkHH registers can be read or written in 8-bit units

**Address:** RSCANnCFIDk: <RSCANn_base> + $0E80_H$ + ($10_H$ × k)

RSCANnCFIDkL: <RSCANn_base> + $0E80_H$ + ($10_H$ × k),
RSCANnCFIDkH: <RSCANn_base> + $0E82_H$ + ($10_H$ × k)

RSCANnCFIDkLL: <RSCANn_base> + $0E80_H$ + ($10_H$ × k),
RSCANnCFIDkLH: <RSCANn_base> + $0E81_H$ + ($10_H$ × k),
RSCANnCFIDkHL: <RSCANn_base> + $0E82_H$ + ($10_H$ × k),
RSCANnCFIDkHH: <RSCANn_base> + $0E83_H$ + ($10_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.53 RSCANnCFIDk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | CFIDE | Transmit/Receive FIFO Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | CFRTR | Transmit/Receive FIFO Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | THLEN | Transmit History Data Store Enable<br>This bit is valid only when the CFM[1:0] value is $01_B$ (transmit mode).<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |
| 28 to 0 | CFID[28:0] | Transmit/Receive FIFO Buffer ID Data<br>• When CFM[1:0] value is $01_B$ (transmit mode):<br>Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.<br>• When CFM[1:0] value is $00_B$ (receive mode):<br>Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0. |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is $01_B$ (transmit mode). This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). This RSCANnCFIDk register should not be accessed when the CFM[1:0] value is $10_B$ (gateway mode).

#### CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

#### CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

#### THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is $01_B$ (transmit mode).

#### CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$.

When the CFM[1:0] value is $01_B$, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

### 21.4.7.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 17)

**Access:** RSCANnCFPTRk register can be read or written in 32-bit units
RSCANnCFPTRkL, RSCANnCFPTRkH registers can be read or written in 16-bit units
RSCANnCFPTRkLL, RSCANnCFPTRkLH, RSCANnCFPTRkHL, RSCANnCFPTRkHH registers can be read or written in 8-bit units

**Address:** RSCANnCFPTRk: <RSCANn_base> + $0E84_H$ + ($10_H$ × k)

RSCANnCFPTRkL: <RSCANn_base> + $0E84_H$ + ($10_H$ × k),
RSCANnCFPTRkH: <RSCANn_base> + $0E86_H$ + ($10_H$ × k)

RSCANnCFPTRkLL: <RSCANn_base> + $0E84_H$ + ($10_H$ × k),
RSCANnCFPTRkLH: <RSCANn_base> + $0E85_H$ + ($10_H$ × k),
RSCANnCFPTRkHL: <RSCANn_base> + $0E86_H$ + ($10_H$ × k),
RSCANnCFPTRkHH: <RSCANn_base> + $0E87_H$ + ($10_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.54 RSCANnCFPTRk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | CFDLC[3:0] | Transmit/Receive FIFO Buffer DLC Data<br>b31 b30 b29 b28<br>0 0 0 0: 0 data bytes<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 16 | CFPTR[11:0] | Transmit/Receive FIFO Buffer Label Data<br>• When CFM[1:0] value is $01_B$ (transmit mode):<br>Set the label information to be stored in the transmit history buffer.<br>Only bits CFPTR[7:0] are valid.<br>• When CFM[1:0] value is $00_B$ (receive mode):<br>The label information of the received message can be read. |
| 15 to 0 | CFTS[15:0] | Transmit/Receive FIFO Buffer Timestamp Data<br>These bits are valid only when the CFM[1:0] value is $00_B$ (receive mode).<br>The timestamp value of the received message can be read. |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is $01_B$ (transmit mode). This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). This register should not be read or written when the CFM[1:0] value is $10_B$ (gateway mode).

#### CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to $1001_B$ or more, the actual transmit data defaults to 8 bytes.

#### CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

#### CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is $00_B$.

### 21.4.7.6 RSCANnCFDF0k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 17)

**Access:** RSCANnCFDF0k register can be read or written in 32-bit units
RSCANnCFDF0kL, RSCANnCFDF0kH registers can be read or written in 16-bit units
RSCANnCFDF0kLL, RSCANnCFDF0kLH, RSCANnCFDF0kHL, RSCANnCFDF0kHH registers can be read or written in 8-bit units

**Address:** RSCANnCFDF0k: <RSCANn_base> + $0E88_H$ + ($10_H$ × k)

RSCANnCFDF0kL: <RSCANn_base> + $0E88_H$ + ($10_H$ × k),
RSCANnCFDF0kH: <RSCANn_base> + $0E8A_H$ + ($10_H$ × k)

RSCANnCFDF0kLL: <RSCANn_base> + $0E88_H$ + ($10_H$ × k),
RSCANnCFDF0kLH: <RSCANn_base> + $0E89_H$ + ($10_H$ × k),
RSCANnCFDF0kHL: <RSCANn_base> + $0E8A_H$ + ($10_H$ × k),
RSCANnCFDF0kHH: <RSCANn_base> + $0E8B_H$ + ($10_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CFDB3[7:0] | | | | | | | | CFDB2[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CFDB1[7:0] | | | | | | | | CFDB0[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.55 RSCANnCFDF0k Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | CFDB3[7:0] | Transmit/Receive FIFO Buffer Data Byte 3<br>Transmit/Receive FIFO Buffer Data Byte 2<br>Transmit/Receive FIFO Buffer Data Byte 1<br>Transmit/Receive FIFO Buffer Data Byte 0<br>• When CFM[1:0] value is $01_B$ (transmit mode): Set the transmit/receive FIFO buffer data.<br>• When CFM[1:0] value is $00_B$ (receive mode): The message data stored in the transmit/receive FIFO buffer can be read. |
| 23 to 16 | CFDB2[7:0] | |
| 15 to 8 | CFDB1[7:0] | |
| 7 to 0 | CFDB0[7:0] | |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is $01_B$ (transmit mode).

This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

This register should not be read or written when the CFM[1:0] value is $10_B$ (gateway mode).

### 21.4.7.7 RSCANnCFDF1k — Transmit/receive FIFO Buffer Access Data Field 1 Register (k = 0 to 17)

**Access:** RSCANnCFDF1k register can be read or written in 32-bit units
RSCANnCFDF1kL, RSCANnCFDF1kH registers can be read or written in 16-bit units
RSCANnCFDF1kLL, RSCANnCFDF1kLH, RSCANnCFDF1kHL, RSCANnCFDF1kHH registers can be read or written in 8-bit units

**Address:** RSCANnCFDF1k: <RSCANn_base> + $0E8C_H$ + ($10_H$ × k)

RSCANnCFDF1kL: <RSCANn_base> + $0E8C_H$ + ($10_H$ × k),
RSCANnCFDF1kH: <RSCANn_base> + $0E8E_H$ + ($10_H$ × k)

RSCANnCFDF1kLL: <RSCANn_base> + $0E8C_H$ + ($10_H$ × k),
RSCANnCFDF1kLH: <RSCANn_base> + $0E8D_H$ + ($10_H$ × k),
RSCANnCFDF1kHL: <RSCANn_base> + $0E8E_H$ + ($10_H$ × k),
RSCANnCFDF1kHH: <RSCANn_base> + $0E8F_H$ + ($10_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CFDB7[7:0] | | | | | | | | CFDB6[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.56 RSCANnCFDF1k Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | CFDB7[7:0] | Transmit/Receive FIFO Buffer Data Byte 7<br>Transmit/Receive FIFO Buffer Data Byte 6<br>Transmit/Receive FIFO Buffer Data Byte 5<br>Transmit/Receive FIFO Buffer Data Byte 4<br>• When CFM[1:0] value is $01_B$ (transmit mode): Set the transmit/receive FIFO buffer data.<br>• When CFM[1:0] value is $00_B$ (receive mode): The message data stored in the transmit/receive FIFO buffer can be read. |
| 23 to 16 | CFDB6[7:0] | |
| 15 to 8 | CFDB5[7:0] | |
| 7 to 0 | CFDB4[7:0] | |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is $01_B$ (transmit mode).

This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

This register should not be read or written when the CFM[1:0] value is $10_B$ (gateway mode).

## 21.4.8 Details of FIFO Status-Related Registers

### 21.4.8.1 RSCANnFESTS — FIFO Empty Status Register

**Access:** RSCANnFESTS register is a read-only register that can be read in 32-bit units
RSCANnFESTSL, RSCANnFESTSH registers are read-only registers that can be read in 16-bit units
RSCANnFESTSLL, RSCANnFESTSLH, RSCANnFESTSHL, RSCANnFESTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnFESTS: <RSCANn_base> + $0238_H$

RSCANnFESTSL: <RSCANn_base> + $0238_H$,
RSCANnFESTSH: <RSCANn_base> + $023A_H$

RSCANnFESTSLL: <RSCANn_base> + $0238_H$,
RSCANnFESTSLH: <RSCANn_base> + $0239_H$,
RSCANnFESTSHL: <RSCANn_base> + $023A_H$,
RSCANnFESTSHH: <RSCANn_base> + $023B_H$

**Value after reset:** $03FF\ FFFF_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.57 RSCANnFESTS Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 26 | Reserved | When read, the value after reset is returned. |
| 25 | CF17EMP | Transmit/Receive FIFO Buffer Empty Status Flag<br>0: Transmit/receive FIFO buffer k contains a message.<br>1: Transmit/receive FIFO buffer k contains no message.<br>(k = 0 to 17) |
| 24 | CF16EMP | |
| 23 | CF15EMP | |
| 22 | CF14EMP | |
| 21 | CF13EMP | |
| 20 | CF12EMP | |
| 19 | CF11EMP | |
| 18 | CF10EMP | |
| 17 | CF9EMP | |
| 16 | CF8EMP | |
| 15 | CF7EMP | |
| 14 | CF6EMP | |
| 13 | CF5EMP | |
| 12 | CF4EMP | |
| 11 | CF3EMP | |
| 10 | CF2EMP | |
| 9 | CF1EMP | |
| 8 | CF0EMP | |

Table 21.57 RSCANnFESTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | RF7EMP | Receive FIFO Buffer Empty Status Flag<br>0: Receive FIFO buffer x contains an unread message.<br>1: Receive FIFO buffer x contains no unread message (buffer empty).<br>(x = 0 to 7) |
| 6 | RF6EMP | |
| 5 | RF5EMP | |
| 4 | RF4EMP | |
| 3 | RF3EMP | |
| 2 | RF2EMP | |
| 1 | RF1EMP | |
| 0 | RF0EMP | |

The RSCANnFESTS register is set to 03FF $FFFF_H$ in global reset mode.

### CFkEMP Flag (k = 0 to 17)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

### RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

### 21.4.8.2 RSCANnFFSTS — FIFO Full Status Register

**Access:** RSCANnFFSTS register is a read-only register that can be read in 32-bit units
RSCANnFFSTSL, RSCANnFFSTSH registers are read-only registers that can be read in 16-bit units
RSCANnFFSTSLL, RSCANnFFSTSLH, RSCANnFFSTSHL, RSCANnFFSTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnFFSTS: <RSCANn_base> + $023C_H$

RSCANnFFSTSL: <RSCANn_base> + $023C_H$,
RSCANnFFSTSH: <RSCANn_base> + $023E_H$

RSCANnFFSTSLL: <RSCANn_base> + $023C_H$,
RSCANnFFSTSLH: <RSCANn_base> + $023D_H$,
RSCANnFFSTSHL: <RSCANn_base> + $023E_H$,
RSCANnFFSTSHH: <RSCANn_base> + $023F_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 11 | CF3FLL | |
| 10 | CF2FLL | |
| 9 | CF1FLL | |
| 8 | CF0FLL | |

Table 21.58 RSCANnFFSTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | RF7FLL | Receive FIFO Buffer Full Status Flag<br>0: Receive FIFO buffer x is not full.<br>1: Receive FIFO buffer x is full.<br>(x = 0 to 7) |
| 6 | RF6FLL | |
| 5 | RF5FLL | |
| 4 | RF4FLL | |
| 3 | RF3FLL | |
| 2 | RF2FLL | |
| 1 | RF1FLL | |
| 0 | RF0FLL | |

The RSCANnFFSTS register is cleared to 0000 $0000_H$ in global reset mode.

### CFkFLL Flag (k = 0 to 17)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

### RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

### 21.4.8.3 RSCANnFMSTS — FIFO Message Lost Status Register

**Access:** RSCANnFMSTS register is a read-only register that can be read in 32-bit units
RSCANnFMSTSL, RSCANnFMSTSH registers are read-only registers that can be read in 16-bit units
RSCANnFMSTSLL, RSCANnFMSTSLH, RSCANnFMSTSHL, RSCANnFMSTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnFMSTS: <RSCANn_base> + $0240_H$

RSCANnFMSTSL: <RSCANn_base> + $0240_H$,
RSCANnFMSTSH: <RSCANn_base> + $0242_H$

RSCANnFMSTSLL: <RSCANn_base> + $0240_H$,
RSCANnFMSTSLH: <RSCANn_base> + $0241_H$,
RSCANnFMSTSHL: <RSCANn_base> + $0242_H$,
RSCANnFMSTSHH: <RSCANn_base> + $0243_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 4 | RF4MLT | |
| 3 | RF3MLT | |
| 2 | RF2MLT | |
| 1 | RF1MLT | |
| 0 | RF0MLT | |

The RSCANnFMSTS register is cleared to 0000 $0000_H$ in global reset mode.

### CFkMLT Flag (k = 0 to 17)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

### RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

### 21.4.8.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

**Access:** RSCANnRFISTS register is a read-only register that can be read in 32-bit units
RSCANnRFISTSL register is a read-only register that can be read in 16-bit units
RSCANnRFISTSLL register is a read-only register that can be read in 8-bit units

**Address:** RSCANnRFISTS: <RSCANn_base> + $0244_H$

RSCANnRFISTSL: <RSCANn_base> + $0244_H$

RSCANnRFISTSLL: <RSCANn_base> + $0244_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 21.60 RSCANnRFISTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned. |
| 7 | RF7IF | Receive FIFO Buffer Interrupt Request Status Flag<br>0: No receive FIFO buffer x interrupt request is present.<br>1: A receive FIFO buffer x interrupt request is present.<br>(x = 0 to 7) |
| 6 | RF6IF | |
| 5 | RF5IF | |
| 4 | RF4IF | |
| 3 | RF3IF | |
| 2 | RF2IF | |
| 1 | RF1IF | |
| 0 | RF0IF | |

The RSCANnRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

#### RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

### 21.4.8.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

**Access:** RSCANnCFRISTS register is a read-only register that can be read in 32-bit units
RSCANnCFRISTSL, RSCANnCFRISTSH registers are read-only registers that can be read in 16-bit units
RSCANnCFRISTSLL, RSCANnCFRISTSLH, RSCANnCFRISTSHL registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnCFRISTS: <RSCANn_base> + $0248_H$

RSCANnCFRISTSL: <RSCANn_base> + $0248_H$,
RSCANnCFRISTSH: <RSCANn_base> + $024A_H$

RSCANnCFRISTSLL: <RSCANn_base> + $0248_H$,
RSCANnCFRISTSLH: <RSCANn_base> + $0249_H$,
RSCANnCFRISTSHL: <RSCANn_base> + $024A_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CF17RXIF | CF16RXIF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CF15RXIF | CF14RXIF | CF13RXIF | CF12RXIF | CF11RXIF | CF10RXIF | CF9RXIF | CF8RXIF | CF7RXIF | CF6RXIF | CF5RXIF | CF4RXIF | CF3RXIF | CF2RXIF | CF1RXIF | CF0RXIF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.61 RSCANnCFRISTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 18 | Reserved | When read, the value after reset is returned. |
| 17 | CF17RXIF | Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag<br>0: No transmit/receive FIFO buffer k receive interrupt request is present.<br>1: A transmit/receive FIFO buffer k receive interrupt request is present.<br>(k = 0 to 17) |
| 16 | CF16RXIF | |
| 15 | CF15RXIF | |
| 14 | CF14RXIF | |
| 13 | CF13RXIF | |
| 12 | CF12RXIF | |
| 11 | CF11RXIF | |
| 10 | CF10RXIF | |
| 9 | CF9RXIF | |
| 8 | CF8RXIF | |
| 7 | CF7RXIF | |
| 6 | CF6RXIF | |
| 5 | CF5RXIF | |
| 4 | CF4RXIF | |
| 3 | CF3RXIF | |
| 2 | CF2RXIF | |
| 1 | CF1RXIF | |
| 0 | CF0RXIF | |

The RSCANnCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

**CFkRXIF Flag (k = 0 to 17)**

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

### 21.4.8.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

**Access:** RSCANnCFTISTS register is a read-only register that can be read in 32-bit units
RSCANnCFTISTSL, RSCANnCFTISTSH registers are read-only registers that can be read in 16-bit units
RSCANnCFTISTSLL, RSCANnCFTISTSLH, RSCANnCFTISTSHL registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnCFTISTS: <RSCANn_base> + $024C_H$

RSCANnCFTISTSL: <RSCANn_base> + $024C_H$,
RSCANnCFTISTSH: <RSCANn_base> + $024E_H$

RSCANnCFTISTSLL: <RSCANn_base> + $024C_H$,
RSCANnCFTISTSLH: <RSCANn_base> + $024D_H$,
RSCANnCFTISTSHL: <RSCANn_base> + $024E_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CF17TXIF | CF16TXIF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CF15TXIF | CF14TXIF | CF13TXIF | CF12TXIF | CF11TXIF | CF10TXIF | CF9TXIF | CF8TXIF | CF7TXIF | CF6TXIF | CF5TXIF | CF4TXIF | CF3TXIF | CF2TXIF | CF1TXIF | CF0TXIF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.62 RSCANnCFTISTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 18 | Reserved | When read, the value after reset is returned. |
| 17 | CF17TXIF | Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag<br>0: No transmit/receive FIFO buffer k transmit interrupt request is present.<br>1: A transmit/receive FIFO buffer k transmit interrupt request is present.<br>(k = 0 to 17) |
| 16 | CF16TXIF | |
| 15 | CF15TXIF | |
| 14 | CF14TXIF | |
| 13 | CF13TXIF | |
| 12 | CF12TXIF | |
| 11 | CF11TXIF | |
| 10 | CF10TXIF | |
| 9 | CF9TXIF | |
| 8 | CF8TXIF | |
| 7 | CF7TXIF | |
| 6 | CF6TXIF | |
| 5 | CF5TXIF | |
| 4 | CF4TXIF | |
| 3 | CF3TXIF | |
| 2 | CF2TXIF | |
| 1 | CF1TXIF | |
| 0 | CF0TXIF | |

The RSCANnCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

**CFkTXIF Flag (k = 0 to 17)**

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

## 21.4.9 Details of Transmit Buffer-Related Registers

### 21.4.9.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 95)

**Access:** RSCANnTMCp register can be read or written in 8-bit units

**Address:** RSCANnTMCp: <RSCANn_base> + $0250_H$ + ($01_H$ × p)

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TMOM | TMTAR | TMTR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W*1 | R/W*1 |

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.63 RSCANnTMCp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 | TMOM | One-Shot Transmission Enable<br>0: One-shot transmission is disabled.<br>1: One-shot transmission is enabled. |
| 1 | TMTAR | Transmit Abort Request<br>0: Transmit abort is not requested.<br>1: Transmit abort is requested. |
| 0 | TMTR | Transmit Request<br>0: Transmission is not requested.<br>1: Transmission is requested. |

When the RSCANnTMCp register meets any of the following conditions, set it to $00_H$.

- The RSCANnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCANnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm (m = 0 to 5) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCANnTMCp register are all cleared to 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

#### TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

### TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

### TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCANnTMSTSp register is $00_B$.

### 21.4.9.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 95)

**Access:** RSCANnTMSTSp register can be read or written in 8-bit units

**Address:** RSCANnTMSTSp: <RSCANn_base> + $02D0_H$ + ($01_H$ × p)

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | TMTARM | TMTRM | TMTRF[1:0] | | TMTSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R |

**Table 21.64 RSCANnTMSTSp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | TMTARM | Transmit Buffer Transmit Abort Request Status Flag<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |
| 3 | TMTRM | Transmit Buffer Transmit Request Status Flag<br>0: No transmit request is present.<br>1: A transmit request is present. |
| 2, 1 | TMTRF[1:0] | Transmit Buffer Transmit Result Status Flag<br>b2 b1<br>0 0: Transmission is in progress or no transmit request is present.<br>0 1: Transmit abort has been completed.<br>1 0: Transmission has been completed (without transmit abort request).<br>1 1: Transmission has been completed (with transmit abort request). |
| 0 | TMTSTS | Transmit Buffer Transmit Status Flag<br>0: Transmission is not in progress.<br>1: Transmission is in progress. |

The RSCANnTMSTSp register is cleared to all 0 in channel reset mode.

#### TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCANnTMCp register is set to 0.

#### TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCANnTMCp register is set to 0.

#### TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

$00_B$: Transmission is in progress or no transmit request is present.

$01_B$: Transmission from the transmit buffer was aborted.

$10_B$: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).

$11_B$: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).

Write $00_B$ to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than $00_B$ to this flag.

#### TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

### 21.4.9.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 95)

**Access:** RSCANnTMIDp register can be read or written in 32-bit units
RSCANnTMIDpL, RSCANnTMIDpH registers can be read or written in 16-bit units
RSCANnTMIDpLL, RSCANnTMIDpLH, RSCANnTMIDpHL, RSCANnTMIDpHH registers can be read or written in 8-bit units

**Address:** RSCANnTMIDp: <RSCANn_base> + $1000_H$ + ($10_H$ × p)

RSCANnTMIDpL: <RSCANn_base> + $1000_H$ + ($10_H$ × p),
RSCANnTMIDpH: <RSCANn_base> + $1002_H$ + ($10_H$ × p)

RSCANnTMIDpLL: <RSCANn_base> + $1000_H$ + ($10_H$ × p),
RSCANnTMIDpLH: <RSCANn_base> + $1001_H$ + ($10_H$ × p),
RSCANnTMIDpHL: <RSCANn_base> + $1002_H$ + ($10_H$ × p),
RSCANnTMIDpHH: <RSCANn_base> + $1003_H$ + ($10_H$ × p)

**Value after reset:** 0000 $0000_H$

**Table 21.65 RSCANnTMIDp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | TMIDE | Transmit Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | TMRTR | Transmit Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | THLEN | Transmit History Data Store Enable<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |
| 28 to 0 | TMID[28:0] | Transmit Buffer ID Data<br>Set standard ID or extended ID.<br>For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

#### TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

#### TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

#### THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type, and timestamp (timestamp is included if the TMTSCE bit in the RSCANnGCFG register is 1)) of transmit messages is stored in the transmit history buffer after transmission is completed.

#### TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

### 21.4.9.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 95)

**Access:** RSCANnTMPTRp register can be read or written in 32-bit units
RSCANnTMPTRpH register can be read or written in 16-bit units
RSCANnTMPTRpHL, RSCANnTMPTRpHH registers can be read or written in 8-bit units

**Address:** RSCANnTMPTRp: <RSCANn_base> + $1004_H$ + ($10_H$ × p)

RSCANnTMPTRpH: <RSCANn_base> + $1006_H$ + ($10_H$ × p)

RSCANnTMPTRpHL: <RSCANn_base> + $1006_H$ + ($10_H$ × p),
RSCANnTMPTRpHH: <RSCANn_base> + $1007_H$ + ($10_H$ × p)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMDLC[3:0] | | | | — | — | — | — | TMPTR[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.66 RSCANnTMPTRp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | TMDLC[3:0] | Transmit Buffer DLC Data<br>b31 b30 b29 b28<br>0 0 0 0: 0 data bytes<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 24 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 to 16 | TMPTR[7:0] | Transmit Buffer Label Data<br>Set the label information to be stored in the transmit history buffer. |
| 15 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

#### TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the data length is set to $1001_B$ or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

**TMPTR[7:0] Bits**

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

### 21.4.9.5 RSCANnTMDF0p — Transmit Buffer Data Field 0 Register (p = 0 to 95)

**Access:** RSCANnTMDF0p register can be read or written in 32-bit units
RSCANnTMDF0pL, RSCANnTMDF0pH registers can be read or written in 16-bit units
RSCANnTMDF0pLL, RSCANnTMDF0pLH, RSCANnTMDF0pHL, RSCANnTMDF0pHH registers can be read or written in 8-bit units

**Address:** RSCANnTMDF0p: <RSCANn_base> + $1008_H$ + ($10_H$ × p)

RSCANnTMDF0pL: <RSCANn_base> + $1008_H$ + ($10_H$ × p),
RSCANnTMDF0pH: <RSCANn_base> + $100A_H$ + ($10_H$ × p)

RSCANnTMDF0pLL: <RSCANn_base> + $1008_H$ + ($10_H$ × p),
RSCANnTMDF0pLH: <RSCANn_base> + $1009_H$ + ($10_H$ × p),
RSCANnTMDF0pHL: <RSCANn_base> + $100A_H$ + ($10_H$ × p),
RSCANnTMDF0pHH: <RSCANn_base> + $100B_H$ + ($10_H$ × p)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.67 RSCANnTMDF0p Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | TMDB3[7:0] | Transmit Buffer Data Byte 3 |
| 23 to 16 | TMDB2[7:0] | Transmit Buffer Data Byte 2 |
| 15 to 8 | TMDB1[7:0] | Transmit Buffer Data Byte 1 |
| 7 to 0 | TMDB0[7:0] | Transmit Buffer Data Byte 0<br><br>Set the transmit buffer data. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

### 21.4.9.6 RSCANnTMDF1p — Transmit Buffer Data Field 1 Register (p = 0 to 95)

**Access:** RSCANnTMDF1p register can be read or written in 32-bit units
RSCANnTMDF1pL, RSCANnTMDF1pH registers can be read or written in 16-bit units
RSCANnTMDF1pLL, RSCANnTMDF1pLH, RSCANnTMDF1pHL, RSCANnTMDF1pHH registers can be read or written in 8-bit units

**Address:** RSCANnTMDF1p: <RSCANn_base> + $100C_H$ + ($10_H$ × p)

RSCANnTMDF1pL: <RSCANn_base> + $100C_H$ + ($10_H$ × p),
RSCANnTMDF1pH: <RSCANn_base> + $100E_H$ + ($10_H$ × p)

RSCANnTMDF1pLL: <RSCANn_base> + $100C_H$ + ($10_H$ × p),
RSCANnTMDF1pLH: <RSCANn_base> + $100D_H$ + ($10_H$ × p),
RSCANnTMDF1pHL: <RSCANn_base> + $100E_H$ + ($10_H$ × p),
RSCANnTMDF1pHH: <RSCANn_base> + $100F_H$ + ($10_H$ × p)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.68 RSCANnTMDF1p Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | TMDB7[7:0] | Transmit Buffer Data Byte 7 |
| 23 to 16 | TMDB6[7:0] | Transmit Buffer Data Byte 6 |
| 15 to 8 | TMDB5[7:0] | Transmit Buffer Data Byte 5 |
| 7 to 0 | TMDB4[7:0] | Transmit Buffer Data Byte 4<br><br>Set the transmit buffer data. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

### 21.4.9.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0 to 2)

**Access:** RSCANnTMIECy register can be read or written in 32-bit units
RSCANnTMIECyL, RSCANnTMIECyH registers can be read or written in 16-bit units
RSCANnTMIECyLL, RSCANnTMIECyLH, RSCANnTMIECyHL, RSCANnTMIECyHH registers can be read or written in 8-bit units

**Address:** RSCANnTMIECy: <RSCANn_base> + $0390_H$ + ($04_H$ × y)

RSCANnTMIECyL: <RSCANn_base> + $0390_H$ + ($04_H$ × y),
RSCANnTMIECyH: <RSCANn_base> + $0392_H$ + ($04_H$ × y)

RSCANnTMIECyLL: <RSCANn_base> + $0390_H$ + ($04_H$ × y),
RSCANnTMIECyLH: <RSCANn_base> + $0391_H$ + ($04_H$ × y),
RSCANnTMIECyHL: <RSCANn_base> + $0392_H$ + ($04_H$ × y),
RSCANnTMIECyHH: <RSCANn_base> + $0393_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 21.69 RSCANnTMIECy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | TMIEp | Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16)<br>0: Transmit buffer interrupt is disabled<br>1: Transmit buffer interrupt is enabled |
| 15 to 0 | TMIEp | Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmit buffer interrupt is disabled.<br>1: Transmit buffer interrupt is enabled. |

#### TMIEp Bits (p = 0 to 95)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

**Table 21.70** shows the bit assignment.

**Table 21.70 TMIEp Bit Assignment**

| Bit Position | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |

## 21.4.10 Details of Transmit Buffer Status-Related Registers

### 21.4.10.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0 to 2)

**Access:** RSCANnTMTRSTSy register is a read-only register that can be read in 32-bit units
RSCANnTMTRSTSyL, RSCANnTMTRSTSyH registers are read-only registers that can be read in 16-bit units
RSCANnTMTRSTSyLL, RSCANnTMTRSTSyLH, RSCANnTMTRSTSyHL, RSCANnTMTRSTSyHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnTMTRSTSy: <RSCANn_base> + $0350_H$ + ($04_H$ × y)

RSCANnTMTRSTSyL: <RSCANn_base> + $0350_H$ + ($04_H$ × y),
RSCANnTMTRSTSyH: <RSCANn_base> + $0352_H$ + ($04_H$ × y)

RSCANnTMTRSTSyLL: <RSCANn_base> + $0350_H$ + ($04_H$ × y),
RSCANnTMTRSTSyLH: <RSCANn_base> + $0351_H$ + ($04_H$ × y),
RSCANnTMTRSTSyHL: <RSCANn_base> + $0352_H$ + ($04_H$ × y),
RSCANnTMTRSTSyHH: <RSCANn_base> + $0353_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 21.71 RSCANnTMTRSTSy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | TMTRSTSp | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: No transmit request is present.<br>1: A transmit request is present. |
| 15 to 0 | TMTRSTSp | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit request is present.<br>1: A transmit request is present. |

#### TMTRSTSp Flags (p = 0 to 95)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

**Table 21.72** shows the bit assignment.

**Table 21.72 TMTRSTSp Bit Assignment**

| Bit Position | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |

### 21.4.10.2 RSCANnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0 to 2)

**Access:** RSCANnTMTARSTSy register is a read-only register that can be read in 32-bit units
RSCANnTMTARSTSyL, RSCANnTMTARSTSyH registers are read-only registers that can be read in 16-bit units
RSCANnTMTARSTSyLL, RSCANnTMTARSTSyLH, RSCANnTMTARSTSyHL, RSCANnTMTARSTSyHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnTMTARSTSy: <RSCANn_base> + $0360_H$ + ($04_H$ × y)

RSCANnTMTARSTSyL: <RSCANn_base> + $0360_H$ + ($04_H$ × y),
RSCANnTMTARSTSyH: <RSCANn_base> + $0362_H$ + ($04_H$ × y)

RSCANnTMTARSTSyLL: <RSCANn_base> + $0360_H$ + ($04_H$ × y),
RSCANnTMTARSTSyLH: <RSCANn_base> + $0361_H$ + ($04_H$ × y),
RSCANnTMTARSTSyHL: <RSCANn_base> + $0362_H$ + ($04_H$ × y),
RSCANnTMTARSTSyHH: <RSCANn_base> + $0363_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 16 | TMTARSTSp | Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |
| 15 to 0 | TMTARSTSp | Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |

#### TMTARSTSp Flags (p = 0 to 95)

These flags indicate the status of the TMTAR bit in the RSCANnTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

**Table 21.74** shows the bit assignment.

### 21.4.10.3 RSCANnTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0 to 2)

**Access:** RSCANnTMTCSTSy register is a read-only register that can be read in 32-bit units
RSCANnTMTCSTSyL, RSCANnTMTCSTSyH registers are read-only registers that can be read in 16-bit units
RSCANnTMTCSTSyLL, RSCANnTMTCSTSyLH, RSCANnTMTCSTSyHL, RSCANnTMTCSTSyHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnTMTCSTSy: <RSCANn_base> + $0370_H$ + ($04_H$ × y)

RSCANnTMTCSTSyL: <RSCANn_base> + $0370_H$ + ($04_H$ × y),
RSCANnTMTCSTSyH: <RSCANn_base> + $0372_H$ + ($04_H$ × y)

RSCANnTMTCSTSyLL: <RSCANn_base> + $0370_H$ + ($04_H$ × y),
RSCANnTMTCSTSyLH: <RSCANn_base> + $0371_H$ + ($04_H$ × y),
RSCANnTMTCSTSyHL: <RSCANn_base> + $0372_H$ + ($04_H$ × y),
RSCANnTMTCSTSyHH: <RSCANn_base> + $0373_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 to 0 | TMTCSTSp | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmission has not been completed.<br>1: Transmission has been completed. |

#### TMTCSTSp Flags (p = 0 to 95)

When the TMTRF[1:0] flag in the RSCANnTMSTSp register is set to $10_B$ (transmission has been completed (without transmit abort request)) or $11_B$ (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1.

A TMTCSTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to $00_B$ or in channel reset mode.

**Table 21.76** shows the bit assignment.

Table 21.76 TMTCSTSp Bit Assignment

| Bit Position | Channel | Transmit Buffer Number |

### 21.4.10.4 RSCANnTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0 to 2)

**Access:** RSCANnTMTASTSy register is a read-only register that can be read in 32-bit units
RSCANnTMTASTSyL, RSCANnTMTASTSyH registers are read-only registers that can be read in 16-bit units
RSCANnTMTASTSyLL, RSCANnTMTASTSyLH, RSCANnTMTASTSyHL, RSCANnTMTASTSyHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnTMTASTSy: <RSCANn_base> + $0380_H$ + ($04_H$ × y)

RSCANnTMTASTSyL: <RSCANn_base> + $0380_H$ + ($04_H$ × y),
RSCANnTMTASTSyH: <RSCANn_base> + $0382_H$ + ($04_H$ × y)

RSCANnTMTASTSyLL: <RSCANn_base> + $0380_H$ + ($04_H$ × y),
RSCANnTMTASTSyLH: <RSCANn_base> + $0381_H$ + ($04_H$ × y),
RSCANnTMTASTSyHL: <RSCANn_base> + $0382_H$ + ($04_H$ × y),
RSCANnTMTASTSyHH: <RSCANn_base> + $0383_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.77 RSCANnTMTASTSy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | TMTASTSp | Transmit Buffer Transmit Abort Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: Transmission is not aborted<br>1: Transmission is aborted |
| 15 to 0 | TMTASTSp | Transmit Buffer Transmit Abort Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmission is not aborted.<br>1: Transmission is aborted. |

#### TMTASTSp Flags (p = 0 to 95)

When the TMTRF[1:0] flag in the RSCANnTMSTSp register is set to $01_B$ (transmit abort has been completed), the corresponding TMTASTSp flag is set to 1.

A TMTASTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to $00_B$ or in channel reset mode.

**Table 21.78** shows the bit assignment.

Table 21.78 TMTASTSp Bit Assignment

| Bit Position | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| . . | . . | . . |

## 21.4.11 Details of Transmit Queue-Related Registers

### 21.4.11.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 5)

**Access:** RSCANnTXQCCm register can be read or written in 32-bit units
RSCANnTXQCCmL register can be read or written in 16-bit units
RSCANnTXQCCmLL, RSCANnTXQCCmLH registers can be read or written in 8-bit units

**Address:** RSCANnTXQCCm: <RSCANn_base> + $03A0_H$ + ($04_H$ × m)

RSCANnTXQCCmL: <RSCANn_base> + $03A0_H$ + ($04_H$ × m)

RSCANnTXQCCmLL: <RSCANn_base> + $03A0_H$ + ($04_H$ × m),
RSCANnTXQCCmLH: <RSCANn_base> + $03A1_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.79 RSCANnTXQCCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | TXQIM | Transmit Queue Interrupt Source Select<br>0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated.<br>1: A transmit queue interrupt request is generated each time a message has been transmitted. |
| 12 | TXQIE | Transmit Queue Interrupt Enable<br>0: Transmit queue interrupt is disabled.<br>1: Transmit queue interrupt is enabled. |
| 11 to 8 | TXQDC[3:0] | Transmit Queue Depth Configuration<br>Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available.<br>Setting these bits to 0 disables the transmit queue.<br>Setting these bits to 1 is prohibited. |
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TXQE | Transmit Queue Enable<br>0: The transmit queue is not used.<br>1: The transmit queue is used. |

#### TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

#### TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

#### TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 21.9**. Modify these bits only in channel reset mode.

#### TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to $0010_B$ or more.

### 21.4.11.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0 to 5)

**Access:** RSCANnTXQSTSm register can be read or written in 32-bit units
RSCANnTXQSTSmL register can be read or written in 16-bit units
RSCANnTXQSTSmLL register can be read or written in 8-bit units

**Address:** RSCANnTXQSTSm: <RSCANn_base> + $03C0_H$ + ($04_H$ × m)

RSCANnTXQSTSmL: <RSCANn_base> + $03C0_H$ + ($04_H$ × m)

RSCANnTXQSTSmLL: <RSCANn_base> + $03C0_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | TXQIF | TXQFLL | TXQEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.80 RSCANnTXQSTSm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | Reserved | When read, the undefined value is returned. When writing to these bits, write 0. |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | TXQIF | Transmit Queue Interrupt Request Flag<br>0: No transmit queue interrupt request is present.<br>1: A transmit queue interrupt request is present. |
| 1 | TXQFLL | Transmit Queue Full Status Flag<br>0: The transmit queue is not full.<br>1: The transmit queue is full. |
| 0 | TXQEMP | Transmit Queue Empty Status Flag<br>0: The transmit queue contains messages.<br>1: The transmit queue contains no message (transmit queue empty). |

#### TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCANnTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

#### TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

#### TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

### 21.4.11.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 5)

**Access:** RSCANnTXQPCTRm register is a write-only register that can be written in 32-bit units
RSCANnTXQPCTRmL register is a write-only register that can be written in 16-bit units
RSCANnTXQPCTRmLL register is a write-only register that can be written in 8-bit units

**Address:** RSCANnTXQPCTRm: <RSCANn_base> + $03E0_H$ + ($04_H$ × m)

RSCANnTXQPCTRmL: <RSCANn_base> + $03E0_H$ + ($04_H$ × m)

RSCANnTXQPCTRmLL: <RSCANn_base> + $03E0_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TXQPC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.81 RSCANnTXQPCTRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | TXQPC[7:0] | Transmit Queue Pointer Control<br>Writing $FF_H$ to these bits moves the write pointer of the transmit queue to the next queue buffer. |

#### TXQPC[7:0] Bits

Writing $FF_H$ to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDF0p, and RSCANnTMDF1p registers (p = 15, 31, 47, 63, 79, and 95) before writing $FF_H$ to the TXQPC[7:0] bits.

When writing $FF_H$ to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (the transmit queue is not full).

## 21.4.12 Details of Transmit history-related Registers

### 21.4.12.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0 to 5)

**Access:** RSCANnTHLCCm register can be read or written in 32-bit units
RSCANnTHLCCmL register can be read or written in 16-bit units
RSCANnTHLCCmLL, RSCANnTHLCCmLH registers can be read or written in 8-bit units

**Address:** RSCANnTHLCCm: <RSCANn_base> + $0400_H$ + ($04_H$ × m)

RSCANnTHLCCmL: <RSCANn_base> + $0400_H$ + ($04_H$ × m)

RSCANnTHLCCmLL: <RSCANn_base> + $0400_H$ + ($04_H$ × m),
RSCANnTHLCCmLH: <RSCANn_base> + $0401_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | THL DTE | THLIM | THLIE | — | — | — | — | — | — | — | THLE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R | R | R | R | R | R | R | R/W |

**Table 21.82 RSCANnTHLCCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | THLDTE | Transmit History Target Buffer Select<br>0: Entry from transmit/receive FIFO buffers and transmit queue<br>1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue |
| 9 | THLIM | Transmit History Interrupt Source Select<br>0: When 12 sets of data have been stored in the transmit history buffer<br>1: When a single set of transmit history data has been stored |
| 8 | THLIE | Transmit History Interrupt Enable<br>0: Transmit history interrupt is disabled.<br>1: Transmit history interrupt is enabled. |
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | THLE | Transmit History Buffer Enable<br>0: Transmit history buffer is not used.<br>1: Transmit history buffer is used. |

#### THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

### THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

### THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit is set to 0.

### THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

### 21.4.12.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0 to 5)

**Access:** RSCANnTHLSTSm register can be read or written in 32-bit units
RSCANnTHLSTSmL register can be read or written in 16-bit units
RSCANnTHLSTSmLL register can be read or written in 8-bit units
RSCANnTHLSTSmLH register is a read-only register that can be read in 8-bit units

**Address:** RSCANnTHLSTSm: <RSCANn_base> + $0420_H$ + ($04_H$ × m)

RSCANnTHLSTSmL: <RSCANn_base> + $0420_H$ + ($04_H$ × m)

RSCANnTHLSTSmLL: <RSCANn_base> + $0420_H$ + ($04_H$ × m),
RSCANnTHLSTSmLH: <RSCANn_base> + $0421_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | THLMC[4:0] | | | | | — | — | — | — | THLIF | THLELT | THLFLL | THL EMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.83 RSCANnTHLSTSm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | THLMC[4:0] | Transmit History Buffer Unread Data Counter<br>These bits indicate the number of unread data sets stored in the transmit history buffer. |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | THLIF | Transmit History Interrupt Request Flag<br>0: No transmit history interrupt request is present.<br>1: A transmit history interrupt request is present. |
| 2 | THLELT | Transmit History Buffer Overflow Flag<br>0: Transmit history buffer overflow has not occurred.<br>1: Transmit history buffer overflow has occurred. |
| 1 | THLFLL | Transmit history Buffer Full Status Flag<br>0: Transmit history buffer is not full.<br>1: Transmit history buffer is full. |
| 0 | THLEMP | Transmit History Buffer Empty Status Flag<br>0: Transmit history buffer contains unread data.<br>1: Transmit history buffer contains no unread data (buffer empty). |

#### THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

#### THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCANnTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

#### THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

### 21.4.12.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 5)

**Access:** RSCANnTHLPCTRm register is a write-only register that can be written in 32-bit units
RSCANnTHLPCTRmL register is a write-only register that can be written in 16-bit units
RSCANnTHLPCTRmLL register is a write-only register that can be written in 8-bit units

**Address:** RSCANnTHLPCTRm: <RSCANn_base> + $0440_H$ + ($04_H$ × m)

RSCANnTHLPCTRmL: <RSCANn_base> + $0440_H$ + ($04_H$ × m)

RSCANnTHLPCTRmLL: <RSCANn_base> + $0440_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | THLPC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.84 RSCANnTHLPCTRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | THLPC[7:0] | Transmit History List Pointer Control<br>Writing $FF_H$ to these bits moves the read pointer to the next unread data in the transmit history buffer. |

#### THLPC[7:0] Bits

When the THLPC[7:0] bits are set to $FF_H$, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented. Write $FF_H$ to the THLPC[7:0] bits after reading from the RSCANnTHLACCm register.

When writing $FF_H$ to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0.

### 21.4.12.4 RSCANnTHLACCm — Transmit History Access Register (m = 0 to 5)

**Access:** RSCANnTHLACCm register is a read-only register that can be read in 32-bit units
RSCANnTHLACCmL, RSCANnTHLACCmH registers are read-only registers that can be read in 16-bit units
RSCANnTHLACCmLL, RSCANnTHLACCmLH, RSCANnTHLACCmHL, RSCANnTHLACCmHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnTHLACCm: <RSCANn_base> + $1800_H$ + ($04_H$ × m)

RSCANnTHLACCmL: <RSCANn_base> + $1800_H$ + ($04_H$ × m),
RSCANnTHLACCmH: <RSCANn_base> + $1802_H$ + ($04_H$ × m)

RSCANnTHLACCmLL: <RSCANn_base> + $1800_H$ + ($04_H$ × m),
RSCANnTHLACCmLH: <RSCANn_base> + $1801_H$ + ($04_H$ × m),
RSCANnTHLACCmHL: <RSCANn_base> + $1802_H$ + ($04_H$ × m),
RSCANnTHLACCmHH: <RSCANn_base> + $1803_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTS[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TID[7:0] | | | | | | | | — | BN[3:0] | | | | BT[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.85 RSCANnTHLACCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | TMTS[15:0] | Transmit Timestamp Data<br>The timestamp data of stored data can be read. |
| 15 to 8 | TID[7:0] | Label Data<br>The label information of stored data can be read. |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 3 | BN[3:0] | Buffer Number Data<br>The buffer number of transmit source (transmit buffer, transmit/receive FIFO buffer or transmit queue) can be read. |
| 2 to 0 | BT[2:0] | Buffer Type Data<br>b2 b1 b0<br>0 0 1: Transmit buffer<br>0 1 0: Transmit/receive FIFO buffer<br>1 0 0: Transmit queue |

#### TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1, timestamp values in transmit history data stored in the transmit history buffer are displayed. When the TMTSCE bit is 0, these bits are always read as 0.

#### TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

#### BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

**BT[2:0] Bits**

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

## 21.4.13 Details of Test-Related Registers

### 21.4.13.1 RSCANnGTSTCFG — Global Test Configuration Register

**Access:** RSCANnGTSTCFG register can be read or written in 32-bit units
RSCANnGTSTCFGL, RSCANnGTSTCFGH registers can be read or written in 16-bit units
RSCANnGTSTCFGLL, RSCANnGTSTCFGHL registers can be read or written in 8-bit units

**Address:** RSCANnGTSTCFG: <RSCANn_base> + $0468_H$

RSCANnGTSTCFGL: <RSCANn_base> + $0468_H$,
RSCANnGTSTCFGH: <RSCANn_base> + $046A_H$

RSCANnGTSTCFGLL: <RSCANn_base> + $0468_H$,
RSCANnGTSTCFGHL: <RSCANn_base> + $046A_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | RTMPS[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.86 RSCANnGTSTCFG Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | RTMPS[6:0] | RAM Test Page Configuration<br>Set a value within the range of page 0 ($00_H$) to page 59 ($3B_H$). |
| 15 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | C5ICBCE | CAN5 Inter-channel Communication Test Enable<br>0: CAN5 inter-channel communication test is disabled<br>1: CAN5 inter-channel communication test is enabled. |
| 4 | C4ICBCE | CAN4 Inter-channel Communication Test Enable<br>0: CAN4 inter-channel communication test is disabled<br>1: CAN4 inter-channel communication test is enabled. |
| 3 | C3ICBCE | CAN3 Inter-channel Communication Test Enable<br>0: CAN3 inter-channel communication test is disabled<br>1: CAN3 inter-channel communication test is enabled. |
| 2 | C2ICBCE | CAN2 Inter-channel Communication Test Enable<br>0: CAN2 inter-channel communication test is disabled<br>1: CAN2 inter-channel communication test is enabled. |
| 1 | C1ICBCE | CAN1 Inter-Channel Communication Test Enable<br>0: CAN1 inter-channel communication test is disabled.<br>1: CAN1 inter-channel communication test is enabled. |
| 0 | C0ICBCE | CAN0 Inter-Channel Communication Test Enable<br>0: CAN0 inter-channel communication test is disabled.<br>1: CAN0 inter-channel communication test is enabled. |

Modify the RSCANnGTSTCFG register only in global test mode.

#### RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of $00_H$ to $3B_H$, inclusive.

#### C5ICBCE Bit

Setting this bit to 1 enables the channel 5 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C4ICBCE Bit

Setting this bit to 1 enables the channel 4 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C3ICBCE Bit

Setting this bit to 1 enables the channel 3 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

### 21.4.13.2 RSCANnGTSTCTR — Global Test Control Register

**Access:** RSCANnGTSTCTR register can be read or written in 32-bit units
RSCANnGTSTCTRL register can be read or written in 16-bit units
RSCANnGTSTCTRLL register can be read or written in 8-bit units

**Address:** RSCANnGTSTCTR: <RSCANn_base> + $046C_H$

RSCANnGTSTCTRL: <RSCANn_base> + $046C_H$

RSCANnGTSTCTRLL: <RSCANn_base> + $046C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RTME | — | ICBCTME |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W |

**Table 21.87 RSCANnGTSTCTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | RTME | RAM Test Enable<br>0: RAM test is disabled.<br>1: RAM test is enabled. |
| 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ICBCTME | Communication Test between Channels Enable<br>0: Communication test between channels disabled<br>1: Communication test between channels enabled |

#### RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to $10_B$ (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

#### ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 5) in the RSCANnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

### 21.4.13.3 RSCANnGLOCKK — Global Lock Key Register

**Access:** RSCANnGLOCKK register is a write-only register that can be written in 32-bit units.
RSCANnGLOCKKL register is a write-only register that can be written in 16-bit units.

**Address:** RSCANnGLOCKK: <RSCANn_base> + $047C_H$

RSCANnGLOCKKL: <RSCANn_base> + $047C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LOCK[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 |

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

**Table 21.88 RSCANnGLOCKK Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When writing, write the value after reset. |
| 15 to 0 | LOCK[15:0] | Lock Key<br>These bits are key bits to release protection of test mode. |

The RSCANnGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 21.11.4.2, Procedure for Releasing the Protection**.

#### LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCANnGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCANn_base> + $0000_H$ to <RSCANn_base> + $04FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

### 21.4.13.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63)

**Access:** RSCANnRPGACCr register can be read or written in 32-bit units
RSCANnRPGACCrL, RSCANnRPGACCrH registers can be read or written in 16-bit units
RSCANnRPGACCrLL, RSCANnRPGACCrLH, RSCANnRPGACCrHL, RSCANnRPGACCrHH registers can be read or written in 8-bit units

**Address:** RSCANnRPGACCr: <RSCANn_base> + $1900_H$ + ($04_H$ × r)

RSCANnRPGACCrL: <RSCANn_base> + $1900_H$ + ($04_H$ × r),
RSCANnRPGACCrH: <RSCANn_base> + $1902_H$ + ($04_H$ × r)

RSCANnRPGACCrLL: <RSCANn_base> + $1900_H$ + ($04_H$ × r),
RSCANnRPGACCrLH: <RSCANn_base> + $1901_H$ + ($04_H$ × r),
RSCANnRPGACCrHL: <RSCANn_base> + $1902_H$ + ($04_H$ × r),
RSCANnRPGACCrHH: <RSCANn_base> + $1903_H$ + ($04_H$ × r)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RDTA[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RDTA[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.89 RSCANnRPGACCr Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | RDTA [31:0] | RAM Data Test Access<br>Data can be read and written in RSCAN RAM. |

Modify the RSCANnRPGACCr register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).

The RSCANnRPGACCr register is readable and writable when the RTME bit is set to 1.

# 21.5 Registers (CAN FD Mode)

This section describes all registers to be used when the RS-CANFD is used in CAN FD mode.

## 21.5.1 List of Registers

The following tables list RS-CANFD registers to be used in CAN FD mode.

For details about <RSCANn_base>, see **Section 21.2.1, Register Base Address**.

**Table 21.90 Registers (1/3)**

| Module Name | Register | Symbol | Address | Guard Group |
|---|---|---|---|---|
| **Interface mode-related registers** | | | | |
| RSCFDn | Global interface mode select register | RSCFDnCFDGRMCFG | <RSCANn_base> + $04FC_H$ | RSCANn global |
| **Channel-related registers** | | | | |
| RSCFDn | Channel m nominal bit rate configuration register | RSCFDnCFDCmNCFG | <RSCANn_base> + $0000_H$ + ($10_H$ × m) | RSCANn Chm |
| | Channel m control register | RSCFDnCFDCmCTR | <RSCANn_base> + $0004_H$ + ($10_H$ × m) | RSCANn Chm |
| | Channel m status register | RSCFDnCFDCmSTS | <RSCANn_base> + $0008_H$ + ($10_H$ × m) | RSCANn Chm |
| | Channel m error flag register | RSCFDnCFDCmERFL | <RSCANn_base> + $000C_H$ + ($10_H$ × m) | RSCANn Chm |
| | Channel m data bit rate configuration register | RSCFDnCFDCmDCFG | <RSCANn_base> + $0500_H$ + ($20_H$ × m) | RSCANn Chm |
| | Channel m CAN FD configuration register | RSCFDnCFDCmFDCFG | <RSCANn_base> + $0504_H$ + ($20_H$ × m) | RSCANn Chm |
| | Channel m CAN FD control register | RSCFDnCFDCmFDCTR | <RSCANn_base> + $0508_H$ + ($20_H$ × m) | RSCANn Chm |
| | Channel m CAN FD status register | RSCFDnCFDCmFDSTS | <RSCANn_base> + $050C_H$ + ($20_H$ × m) | RSCANn Chm |
| | Channel m CAN FD CRC register | RSCFDnCFDCmFDCRC | <RSCANn_base> + $0510_H$ + ($20_H$ × m) | RSCANn Chm |
| **Global-related registers** | | | | |
| RSCFDn | Global configuration register | RSCFDnCFDGCFG | <RSCANn_base> + $0084_H$ | RSCANn global |
| | Global control register | RSCFDnCFDGCTR | <RSCANn_base> + $0088_H$ | RSCANn global |
| | Global status register | RSCFDnCFDGSTS | <RSCANn_base> + $008C_H$ | RSCANn global |
| | Global error flag register | RSCFDnCFDGERFL | <RSCANn_base> + $0090_H$ | RSCANn global |
| | Global timestamp counter register | RSCFDnCFDGTSC | <RSCANn_base> + $0094_H$ | RSCANn global |
| | Global TX Interrupt Status register 0 | RSCFDnCFDGTINTSTS0 | <RSCANn_base> + $0460_H$ | RSCANn global |
| | Global TX Interrupt Status register 1 | RSCFDnCFDGTINTSTS1 | <RSCANn_base> + $0464_H$ | RSCANn global |
| | Global FD configuration register | RSCFDnCFDGFDCFG | <RSCANn_base> + $0474_H$ | RSCANn global |
| **Receive rule-related registers** | | | | |
| RSCFDn | Receive Rule Entry Control register | RSCFDnCFDGAFLECTR | <RSCANn_base> + $0098_H$ | RSCANn global |
| | Receive Rule Configuration register 0 | RSCFDnCFDGAFLCFG0 | <RSCANn_base> + $009C_H$ | RSCANn global |
| | Receive Rule Configuration register 1 | RSCFDnCFDGAFLCFG1 | <RSCANn_base> + $00A0_H$ | RSCANn global |
| | Receive Rule ID register j | RSCFDnCFDGAFLIDj | <RSCANn_base> + $1000_H$ + ($10_H$ × j) | RSCANn global |
| | Receive Rule Mask register j | RSCFDnCFDGAFLMj | <RSCANn_base> + $1004_H$ + ($10_H$ × j) | RSCANn global |
| | Receive Rule Pointer 0 register j | RSCFDnCFDGAFLP0_j | <RSCANn_base> + $1008_H$ + ($10_H$ × j) | RSCANn global |
| | Receive Rule Pointer 1 register j | RSCFDnCFDGAFLP1_j | <RSCANn_base> + $100C_H$ + ($10_H$ × j) | RSCANn global |
| **Receive buffer-related registers** | | | | |
| RSCFDn | Receive Buffer Number register | RSCFDnCFDRMNB | <RSCANn_base> + $00A4_H$ | RSCANn global |
| | Receive Buffer New Data register y | RSCFDnCFDRMNDy | <RSCANn_base> + $00A8_H$ + ($04_H$ × y) | RSCANn global |
| | Receive Buffer ID register q | RSCFDnCFDRMIDq | <RSCANn_base> + $2000_H$ + ($20_H$ × q) | RSCANn global |

Table 21.90 Registers (2/3)

| Module Name | Register | Symbol | Address | Guard Group |
|---|---|---|---|---|
| RSCFDn | Receive Buffer Pointer register q | RSCFDnCFDRMPTRq | <RSCANn_base> + $2004_H$ + ($20_H$ × q) | RSCANn global |
| | Receive buffer CAN FD status register q | RSCFDnCFDRMFDSTSq | <RSCANn_base> + $2008_H$ + ($20_H$ × q) | RSCANn global |
| | Receive Buffer Data Field b register q | RSCFDnCFDRMDFb_q | <RSCANn_base> + $200C_H$ + ($04_H$ × b) + ($20_H$ × q) | RSCANn global |
| **Receive FIFO buffer-related registers** | | | | |
| RSCFDn | Receive FIFO Buffer Configuration and Control register x | RSCFDnCFDRFCCx | <RSCANn_base> + $00B8_H$ + ($04_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Status register x | RSCFDnCFDRFSTSx | <RSCANn_base> + $00D8_H$ + ($04_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Pointer Control register x | RSCFDnCFDRFPCTRx | <RSCANn_base> + $00F8_H$ + ($04_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Access ID register x | RSCFDnCFDRFIDx | <RSCANn_base> + $3000_H$ + ($80_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Access Pointer register x | RSCFDnCFDRFPTRx | <RSCANn_base> + $3004_H$ + ($80_H$ × x) | RSCANn global |
| | Receive FIFO CAN FD status register x | RSCFDnCFDRFFDSTSx | <RSCANn_base> + $3008_H$ + ($80_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Access Data Field d register x | RSCFDnCFDRFDFd_x | <RSCANn_base> + $300C_H$ + ($04_H$ × d) + ($80_H$ × x) | RSCANn global |
| **Transmit/Receive FIFO buffer related registers** | | | | |
| RSCFDn | Transmit/receive FIFO Buffer Configuration and Control register k | RSCFDnCFDCFCCk | <RSCANn_base> + $0118_H$ + ($04_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Status register k | RSCFDnCFDCFSTSk | <RSCANn_base> + $0178_H$ + ($04_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Pointer Control register k | RSCFDnCFDCFPCTRk | <RSCANn_base> + $01D8_H$ + ($04_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Access ID register k | RSCFDnCFDCFIDk | <RSCANn_base> + $3400_H$ + ($80_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Access Pointer register k | RSCFDnCFDCFPTRk | <RSCANn_base> + $3404_H$ + ($80_H$ × k) | RSCANn global |
| | Transmit/receive FIFO CAN FD configuration/status register k | RSCFDnCFDCFFDCSTSk | <RSCANn_base> + $3408_H$ + ($80_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Access Data Field d register k | RSCFDnCFDCFDFd_k | <RSCANn_base> + $340C_H$ + ($04_H$ × d) + ($80_H$ × k) | RSCANn global |
| **FIFO status-related registers** | | | | |
| RSCFDn | FIFO Empty Status register | RSCFDnCFDFESTS | <RSCANn_base> + $0238_H$ | RSCANn global |
| | FIFO Full Status register | RSCFDnCFDFFSTS | <RSCANn_base> + $023C_H$ | RSCANn global |
| | FIFO Message Lost Status register | RSCFDnCFDFMSTS | <RSCANn_base> + $0240_H$ | RSCANn global |
| | Receive FIFO Buffer Interrupt Flag Status register | RSCFDnCFDRFISTS | <RSCANn_base> + $0244_H$ | RSCANn global |
| | Transmit/receive FIFO Buffer Receive Interrupt Flag Status register | RSCFDnCFDCFRISTS | <RSCANn_base> + $0248_H$ | RSCANn global |
| | Transmit/receive FIFO Buffer Transmit Interrupt Flag Status register | RSCFDnCFDCFTISTS | <RSCANn_base> + $024C_H$ | RSCANn global |
| **FIFO DMA-related registers** | | | | |
| RSCFDn | DMA enable register | RSCFDnCFDCDTCT | <RSCANn_base> + $0490_H$ | RSCANn global |
| | DMA status register | RSCFDnCFDCDTSTS | <RSCANn_base> + $0494_H$ | RSCANn global |
| **Transmit buffer-related registers** | | | | |
| RSCFDn | Transmit Buffer Control register p | RSCFDnCFDTMCp | <RSCANn_base> + $0250_H$ + ($01_H$ × p) | RSCANn global |
| | Transmit Buffer Status register p | RSCFDnCFDTMSTSp | <RSCANn_base> + $02D0_H$ + ($01_H$ × p) | RSCANn global |
| | Transmit Buffer ID register p | RSCFDnCFDTMIDp | <RSCANn_base> + $4000_H$ + ($20_H$ × p) | RSCANn global |
| | Transmit Buffer Pointer register p | RSCFDnCFDTMPTRp | <RSCANn_base> + $4004_H$ + ($20_H$ × p) | RSCANn global |
| | Transmit buffer CAN FD configuration register p | RSCFDnCFDTMFDCTRp | <RSCANn_base> + $4008_H$ + ($20_H$ × p) | RSCANn global |
| | Transmit Buffer Data Field b register p | RSCFDnCFDTMDFb_p | <RSCANn_base> + $400C_H$ + ($04_H$ × b) + ($20_H$ × p) | RSCANn global |
| | Transmit Buffer Interrupt Enable Configuration register y | RSCFDnCFDTMIECy | <RSCANn_base> + $0390_H$ + ($04_H$ × y) | RSCANn global |

Table 21.90 Registers (3/3)

| Module Name | Register | Symbol | Address | Guard Group |
|---|---|---|---|---|
| **Transmit buffer status-related registers** | | | | |
| RSCFDn | Transmit Buffer Transmit Request Status register y | RSCFDnCFDTMTRSTSy | <RSCANn_base> + $0350_H$ + ($04_H$ × y) | RSCANn global |
| | Transmit Buffer Transmit Abort Request Status register y | RSCFDnCFDTMTARSTSy | <RSCANn_base> + $0360_H$ + ($04_H$ × y) | RSCANn global |
| | Transmit Buffer Transmit Complete Status register y | RSCFDnCFDTMTCSTSy | <RSCANn_base> + $0370_H$ + ($04_H$ × y) | RSCANn global |
| | Transmit Buffer Transmit Abort Status register y | RSCFDnCFDTMTASTSy | <RSCANn_base> + $0380_H$ + ($04_H$ × y) | RSCANn global |
| **Transmit queue-related registers** | | | | |
| RSCFDn | Transmit Queue Configuration and Control register m | RSCFDnCFDTXQCCm | <RSCANn_base> + $03A0_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit Queue Status register m | RSCFDnCFDTXQSTSm | <RSCANn_base> + $03C0_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit Queue Pointer Control register m | RSCFDnCFDTXQPCTRm | <RSCANn_base> + $03E0_H$ + ($04_H$ × m) | RSCANn Chm |
| **Transmit history-related registers** | | | | |
| RSCFDn | Transmit History Configuration and Control register m | RSCFDnCFDTHLCCm | <RSCANn_base> + $0400_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit History Status register m | RSCFDnCFDTHLSTSm | <RSCANn_base> + $0420_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit History Pointer Control register m | RSCFDnCFDTHLPCTRm | <RSCANn_base> + $0440_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit History Access register m | RSCFDnCFDTHLACCm | <RSCANn_base> + $6000_H$ + ($04_H$ × m) | RSCANn Chm |
| **Test-related registers** | | | | |
| RSCFDn | Global Test Configuration register | RSCFDnCFDGTSTCFG | <RSCANn_base> + $0468_H$ | RSCANn global |
| | Global Test Control register | RSCFDnCFDGTSTCTR | <RSCANn_base> + $046C_H$ | RSCANn global |
| | Global Lock Key register | RSCFDnCFDGLOCKK | <RSCANn_base> + $047C_H$ | RSCANn global |
| | RAM Test Page Access register r | RSCFDnCFDRPGACCr | <RSCANn_base> + $6400_H$ + ($04_H$ × r) | RSCANn global |

**Note:** For details on the guard group, see **Section 33, Functional Safety**.

**Table 21.91 Transmit Buffer p Allocated to Each Channel**

| | CANm |
|---|---|
| Transmit buffer p | Transmit buffer 16 × m + 0 |
| | Transmit buffer 16 × m + 1 |
| | Transmit buffer 16 × m + 2 |
| | Transmit buffer 16 × m + 3 |
| | Transmit buffer 16 × m + 4 |
| | Transmit buffer 16 × m + 5 |
| | Transmit buffer 16 × m + 6 |
| | Transmit buffer 16 × m + 7 |
| | Transmit buffer 16 × m + 8 |
| | Transmit buffer 16 × m + 9 |
| | Transmit buffer 16 × m + 10 |
| | Transmit buffer 16 × m + 11 |
| | Transmit buffer 16 × m + 12 |
| | Transmit buffer 16 × m + 13 |
| | Transmit buffer 16 × m + 14 |
| | Transmit buffer 16 × m + 15 |

**Table 21.92 Transmit/Receive FIFO Buffer k Allocated to Each Channel**

| | CANm |
|---|---|
| Transmit/receive FIFO buffer k | Transmit/receive FIFO buffer 3 × m + 0 |
| | Transmit/receive FIFO buffer 3 × m + 1 |
| | Transmit/receive FIFO buffer 3 × m + 2 |

**Table 21.93 Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer by the Setting of Bits CFTML[3:0]**

| Setting of Bits CFTML[3:0] | Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer |
|---|---|
| $0000_B$ | Transmit buffer 16 × m + 0 |
| $0001_B$ | Transmit buffer 16 × m + 1 |
| $0010_B$ | Transmit buffer 16 × m + 2 |
| $0011_B$ | Transmit buffer 16 × m + 3 |
| $0100_B$ | Transmit buffer 16 × m + 4 |
| $0101_B$ | Transmit buffer 16 × m + 5 |
| $0110_B$ | Transmit buffer 16 × m + 6 |
| $0111_B$ | Transmit buffer 16 × m + 7 |
| $1000_B$ | Transmit buffer 16 × m + 8 |
| $1001_B$ | Transmit buffer 16 × m + 9 |
| $1010_B$ | Transmit buffer 16 × m + 10 |
| $1011_B$ | Transmit buffer 16 × m + 11 |
| $1100_B$ | Transmit buffer 16 × m + 12 |
| $1101_B$ | Transmit buffer 16 × m + 13 |
| $1110_B$ | Transmit buffer 16 × m + 14 |

**Table 21.94 Transmit Buffer p Allocated to the Transmit Queue of Each Channel**

| Setting of Bits TXQDC[3:0] | Transmit Buffer p Allocated to the Transmit Queue |
|---|---|
| $0000_B$ | Setting prohibited |
| $0001_B$ | Setting prohibited |
| $0010_B$ | Transmit buffer 16 × m + 15 to 16 × m + 13 |
| $0011_B$ | Transmit buffer 16 × m + 15 to 16 × m + 12 |
| $0100_B$ | Transmit buffer 16 × m + 15 to 16 × m + 11 |
| $0101_B$ | Transmit buffer 16 × m + 15 to 16 × m + 10 |
| $0110_B$ | Transmit buffer 16 × m + 15 to 16 × m + 9 |
| $0111_B$ | Transmit buffer 16 × m + 15 to 16 × m + 8 |
| $1000_B$ | Transmit buffer 16 × m + 15 to 16 × m + 7 |
| $1001_B$ | Transmit buffer 16 × m + 15 to 16 × m + 6 |
| $1010_B$ | Transmit buffer 16 × m + 15 to 16 × m + 5 |
| $1011_B$ | Transmit buffer 16 × m + 15 to 16 × m + 4 |
| $1100_B$ | Transmit buffer 16 × m + 15 to 16 × m + 3 |
| $1101_B$ | Transmit buffer 16 × m + 15 to 16 × m + 2 |
| $1110_B$ | Transmit buffer 16 × m + 15 to 16 × m + 1 |
| $1111_B$ | Transmit buffer 16 × m + 15 to 16 × m + 0 |

## 21.5.2 Details of Interface Mode-Related Registers

### 21.5.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register

**Access:** RSCFDnCFDGRMCFG register can be read or written in 32-bit units
RSCFDnCFDGRMCFGL register can be read or written in 16-bit units
RSCFDnCFDGRMCFGLL register can be read or written in 8-bit units

**Address:** RSCFDnCFDGRMCFG: <RSCANn_base> + $04FC_H$

RSCFDnCFDGRMCFGL: <RSCANn_base> + $04FC_H$

RSCFDnCFDGRMCFGLL: <RSCANn_base> + $04FC_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RCMC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 21.95 RSCFDnCFDGRMCFG Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | RCMC | Interface Mode Select<br>0: Classical CAN mode<br>1: CAN FD mode (PREMIUM only) |

**Note:** CAN FD mode for PREMIUM only. Even if RCMC bit is set to 1, CANFD mode does not work in ECO and ADVANCED products. Set RCMC = 0 in ECO and ADVANCED products.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

#### RCMC Bit

Setting this bit to 0 makes classical CAN mode available. To switch CAN FD mode to classical CAN mode, set the value after reset to all registers and bits allocated to the register map of CAN FD mode and then modify the RSCFDnCFDGRMCFG register.

## 21.5.3 Details of Channel-Related Registers

### 21.5.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0 to 5)

**Access:** RSCFDnCFDCmNCFG register can be read or written in 32-bit units
RSCFDnCFDCmNCFGL, RSCFDnCFDCmNCFGH registers can be read or written in 16-bit units
RSCFDnCFDCmNCFGLL, RSCFDnCFDCmNCFGLH, RSCFDnCFDCmNCFGHL,
RSCFDnCFDCmNCFGHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDCmNCFG: <RSCANn_base> + $0000_H$ + ($10_H$ × m)

RSCFDnCFDCmNCFGL: <RSCANn_base> + $0000_H$ + ($10_H$ × m),
RSCFDnCFDCmNCFGH: <RSCANn_base> + $0002_H$ + ($10_H$ × m)

RSCFDnCFDCmNCFGLL: <RSCANn_base> + $0000_H$ + ($10_H$ × m),

| 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 to 0 | NBRP[9:0] | Nominal Bit Rate Prescaler Division Ratio Setting<br>When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1). |

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings of bit timing parameters, see **Section 21.11.1, Initial Settings**.

#### NTSEG2[4:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.

Allowed values are 2 Tq to 32 Tq, inclusive.

Set a value smaller than the value of the NTSEG1[6:0] bits.

#### NTSEG1[6:0] Bits

These bits are used to specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

A value of 4 to 128 Tq can be set.

#### NSJW[4:0] Bits

These bits are used to specify the resynchronization jump width of nominal bit rate as a Tq value. A value of 1 to 32 Tq can be set. Specify a value equal to or smaller than the NTSEG2[4:0] value.

#### NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

The NBRP[9:0] bit value and the DBRP[7:0] bit value in RSCFDnCFDCmDCFG register should be equal and the two bit rate values be different according to the respective segment values.

### 21.5.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0 to 5)

**Access:** RSCFDnCFDCmCTR register can be read or written in 32-bit units
RSCFDnCFDCmCTRL, RSCFDnCFDCmCTRH registers can be read or written in 16-bit units
RSCFDnCFDCmCTRLL, RSCFDnCFDCmCTRLH, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDCmCTR: <RSCANn_base> + $0004_H$ + ($10_H$ × m)

RSCFDnCFDCmCTRL: <RSCANn_base> + $0004_H$ + ($10_H$ × m),
RSCFDnCFDCmCTRH: <RSCANn_base> + $0006_H$ + ($10_H$ × m)

RSCFDnCFDCmCTRLL: <RSCANn_base> + $0004_H$ + ($10_H$ × m),
RSCFDnCFDCmCTRLH: <RSCANn_base> + $0005_H$ + ($10_H$ × m),
RSCFDnCFDCmCTRHL: <RSCANn_base> + $0006_H$ + ($10_H$ × m),
RSCFDnCFDCmCTRHH: <RSCANn_base> + $0007_H$ + ($10_H$ × m)

**Value after reset:** $0000\ 0005_H$

### ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is $00_B$ (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

#### CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

#### CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

#### CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

#### ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register. When this bit is cleared to 0, if any error is detected while the flags of bits 14 to 8 in the RSCFDnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

#### BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to $00_B$, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to $10_B$ (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to $01_B$, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 5) are set to $10_B$ and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to $00_H$.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to $10_B$, the CHMDC[1:0] bits are set to $10_B$ and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_H$.

When the BOM[1:0] bits are set to $11_B$ and the CHMDC[1:0] bits are set to $10_B$ while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_H$. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to $10_B$, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01B or at bus off end when the BOM[1:0] bits are $10_B$), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

#### TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

#### SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

#### EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

#### TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

#### ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BLIE Bit

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### OLIE Bit

When the OVLF flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BORIE Bit

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BOEIE Bit

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EPIE Bit

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EWIE Bit

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BEIE Bit

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to $00_H$ and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are $00_B$ (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

#### CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

#### CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 21.7.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to $11_B$. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become $10_B$.

### 21.5.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0 to 5)

**Access:** RSCFDnCFDCmSTS register can be read or written in 32-bit units
RSCFDnCFDCmSTSL register can be read or written in 16-bit units
RSCFDnCFDCmSTSH register is a read-only register that can be read in 16-bit units
RSCFDnCFDCmSTSLL register is a read-only register that can be read in 8-bit units
RSCFDnCFDCmSTSLH register can be read or written in 8-bit units
RSCFDnCFDCmSTSHL, RSCFDnCFDCmSTSHH registers are the read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDCmSTS: <RSCANn_base> + $0008_H$ + ($10_H$ × m)

RSCFDnCFDCmSTSL: <RSCANn_base> + $0008_H$ + ($10_H$ × m),
RSCFDnCFDCmSTSH: <RSCANn_base> + $000A_H$ + ($10_H$ × m)

RSCFDnCFDCmSTSLL: <RSCANn_base> + $0008_H$ + ($10_H$ × m),
RSCFDnCFDCmSTSLH: <RSCANn_base> + $0009_H$ + ($10_H$ × m),
RSCFDnCFDCmSTSHL: <RSCANn_base> + $000A_H$ + ($10_H$ × m),
RSCFDnCFDCmSTSHH: <RSCANn_base> + $000B_H$ + ($10_H$ × m)

**Value after reset:** $0000\ 0005_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R/W*1 | R | R | R | R | R | R | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.98 RSCFDnCFDCmSTS Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | TEC[7:0] | The transmit error counter (TEC) can be read. |
| 23 to 16 | REC[7:0] | The receive error counter (REC) can be read. |
| 15 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | ESIF | Error State Indication Flag<br>0: No CAN FD message whose ESI bit is recessive has been received.<br>1: At least one CAN FD message whose ESI bit is recessive has been received. |
| 7 | COMSTS | Communication Status Flag<br>0: Communication is not ready.<br>1: Communication is ready. |
| 6 | RECSTS | Receive Status Flag<br>0: Bus idle, in transmission or bus off state<br>1: In reception |
| 5 | TRMSTS | Transmit Status Flag<br>0: Bus idle or in reception<br>1: In transmission or bus off state |
| 4 | BOSTS | Bus Off Status Flag<br>0: Not in bus off state<br>1: In bus off state |
| 3 | EPSTS | Error Passive Status Flag<br>0: Not in error passive state<br>1: In error passive state |

Table 21.98 RSCFDnCFDCmSTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 2 | CSLPSTS | Channel Stop Status Flag<br>0: Not in channel stop mode<br>1: In channel stop mode |
| 1 | CHLTSTS | Channel Halt Status Flag<br>0: Not in channel halt mode<br>1: In channel halt mode |
| 0 | CRSTSTS | Channel Reset Status Flag<br>0: Not in channel reset mode<br>1: In channel reset mode |

### TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

### REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

### ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is 0 in channel reset mode.

### COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

### RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

### TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

### BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

### EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])). It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

### CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

### CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

### CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

### 21.5.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0 to 5)

**Access:** RSCFDnCFDCmERFL register can be read or written in 32-bit units
RSCFDnCFDCmERFLL register can be read or written in 16-bit units
RSCFDnCFDCmERFLH register is a read-only register that can be read in 16-bit units
RSCFDnCFDCmERFLLL, RSCFDnCFDCmERFLLH registers can be read or written in 8-bit units
RSCFDnCFDCmERFLHL, RSCFDnCFDCmERFLHH registers are the read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDCmERFL: <RSCANn_base> + $000C_H$ + ($10_H$ × m)

RSCFDnCFDCmERFLL: <RSCANn_base> + $000C_H$ + ($10_H$ × m),
RSCFDnCFDCmERFLH: <RSCANn_base> + $000E_H$ + ($10_H$ × m)

RSCFDnCFDCmERFLLL: <RSCANn_base> + $000C_H$ + ($10_H$ × m),
RSCFDnCFDCmERFLLH: <RSCANn_base> + $000D_H$ + ($10_H$ × m),
RSCFDnCFDCmERFLHL: <RSCANn_base> + $000E_H$ + ($10_H$ × m),
RSCFDnCFDCmERFLHH: <RSCANn_base> + $000F_H$ + ($10_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.99 RSCFDnCFDCmERFL Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 30 to 16 | CRCREG[14:0] | CRC Calculation Data (CRC length:15 bits)<br>A CRC value calculated based on the transmit message or receive message is indicated. |
| 15 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 | ADERR | ACK Delimiter Error Flag<br>0: No ACK delimiter error is detected.<br>1: ACK delimiter error is detected. |
| 13 | B0ERR | Dominant Bit Error Flag<br>0: No dominant bit error is detected.<br>1: Dominant bit error is detected. |
| 12 | B1ERR | Recessive Bit Error Flag<br>0: No recessive bit error is detected.<br>1: Recessive bit error is detected. |
| 11 | CERR | CRC Error Flag<br>0: No CRC error is detected.<br>1: CRC error is detected. |
| 10 | AERR | ACK Error Flag<br>0: No ACK error is detected.<br>1: ACK error is detected. |
| 9 | FERR | Form Error Flag<br>0: No form error is detected.<br>1: Form error is detected. |

Table 21.99 RSCFDnCFDCmERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 8 | SERR | Stuff Error Flag<br>0: No stuff error is detected.<br>1: Stuff error is detected. |
| 7 | ALF | Arbitration-lost Flag<br>0: No arbitration-lost is detected.<br>1: Arbitration-lost is detected. |
| 6 | BLF | Bus Lock Flag<br>0: No channel bus lock is detected.<br>1: Channel bus lock is detected. |
| 5 | OVLF | Overload Flag<br>0: No overload is detected.<br>1: Overload is detected. |
| 4 | BORF | Bus Off Recovery Flag<br>0: No bus off recovery is detected.<br>1: Bus off recovery is detected. |
| 3 | BOEF | Bus Off Entry Flag<br>0: No bus off entry is detected.<br>1: Bus off entry is detected. |
| 2 | EPF | Error Passive Flag<br>0: No error passive is detected.<br>1: Error passive is detected. |
| 1 | EWF | Error Warning Flag<br>0: No error warning is detected.<br>1: Error warning is detected. |
| 0 | BEF | Bus Error Flag<br>0: No channel bus error is detected.<br>1: Channel bus error is detected. |

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

### CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CAN FD frame is transmitted or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated.

### ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

### B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

#### B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

#### CERR Flag

This flag is set to 1 when a CRC error has been detected.

#### AERR Flag

This flag is set to 1 when an ACK error has been detected.

#### FERR Flag

This flag is set to 1 when a form error has been detected.

#### SERR Flag

This flag is set to 1 when a stuff error has been detected.

#### ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

#### BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a bus lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

#### OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

#### BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to $01_B$ (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to $01_B$ (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to $10_B$ (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to $11_B$ (transition to channel halt mode upon a request from the program during bus off).

### BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 5) are set to $01_B$ (transition to channel halt mode at bus off entry).

### EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

### EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

### BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.

**NOTE**

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to other flags.

### 21.5.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration register (m = 0 to 5)

**Access:** RSCFDnCFDCmDCFG register can be read or written in 32-bit units
RSCFDnCFDCmDCFGL, RSCFDnCFDCmDCFGH registers can be read or written in 16-bit units
RSCFDnCFDCmDCFGLL, RSCFDnCFDCmDCFGHL, RSCFDnCFDCmDCFGHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDCmDCFG: <RSCANn_base> + $0500_H$ + ($20_H$ × m)

RSCFDnCFDCmDCFGL: <RSCANn_base> + $0500_H$ + ($20_H$ × m),
RSCFDnCFDCmDCFGH: <RSCANn_base> + $0502_H$ + ($20_H$ × m)

RSCFDnCFDCmDCFGLL: <RSCANn_base> + $0500_H$ + ($20_H$ × m),
RSCFDnCFDCmDCFGHL: <RSCANn_base> + $0502_H$ + ($20_H$ × m),
RSCFDnCFDCmDCFGHH: <RSCANn_base> + $0503_H$ + ($20_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.100 RSCFDnCFDCmDCFG Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 19 to 16 | DTSEG1[3:0] | Data Bit Rate Time Segment 1 Control<br>b19 b18 b17 b16<br>0 0 0 0: Setting prohibited<br>0 0 0 1: 2 Tq<br>0 0 1 0: 3 Tq<br>0 0 1 1: 4 Tq<br>0 1 0 0: 5 Tq<br>0 1 0 1: 6 Tq<br>0 1 1 0: 7 Tq<br>0 1 1 1: 8 Tq<br>1 0 0 0: 9 Tq<br>1 0 0 1: 10 Tq<br>1 0 1 0: 11 Tq<br>1 0 1 1: 12 Tq<br>1 1 0 0: 13 Tq<br>1 1 0 1: 14 Tq<br>1 1 1 0: 15 Tq<br>1 1 1 1: 16 Tq |
| 15 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | DBRP[7:0] | Data Bit Rate Prescaler Division Ratio Setting<br>When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1). |

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see **Section 21.11.1, Initial Settings**.

### DSJW[2:0] Bits

These bits are used to specify the resynchronization jump width of data bit rate as a Tq value. A value of 1 to 8 Tq can be set. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

### DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of the data bit rate.

Allowed values are 2 Tq to 8 Tq, inclusive.

Set a value smaller than the value of the DTSEG1[3:0] bits.

### DTSEG1[3:0] Bits

These bits are used to specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

A value from 2 to 16 Tq can be set.

**DBRP[7:0] Bits**

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).

The NBRP[9:0] bit value in RSCFDnCFDCmNCFG register and the DBRP[7:0] bit value should be equal and the two bit rate values be different according to the respective segment values.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

### 21.5.3.6 RSCFDnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 to 5)

**Access:** RSCFDnCFDCmFDCFG register can be read or written in 32-bit units
RSCFDnCFDCmFDCFGL, RSCFDnCFDCmFDCFGH registers can be read or written in 16-bit units
RSCFDnCFDCmFDCFGLL, RSCFDnCFDCmFDCFGLH, RSCFDnCFDCmFDCFGHL,
RSCFDnCFDCmFDCFGHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDCmFDCFG: <RSCANn_base> + $0504_H$ + ($20_H$ × m)

RSCFDnCFDCmFDCFGL: <RSCANn_base> + $0504_H$ + ($20_H$ × m),
RSCFDnCFDCmFDCFGH: <RSCANn_base> + $0506_H$ + ($20_H$ × m)

RSCFDnCFDCmFDCFGLL: <RSCANn_base> + $0504_H$ + ($20_H$ × m),
RSCFDnCFDCmFDCFGLH: <RSCANn_base> + $0505_H$ + ($20_H$ × m),
RSCFDnCFDCmFDCFGHL: <RSCANn_base> + $0506_H$ + ($20_H$ × m),
RSCFDnCFDCmFDCFGHH: <RSCANn_base> + $0507_H$ + ($20_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### REFE bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge.

Modify this bit only in channel reset mode.

### FDOE bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CAN FD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

### TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

### GWBRS Bit

When the GWEN bit is 1, the BRS bit in a CAN FD frame to be transmitted by the gateway function is set. Write 0 to this bit to clear the GWBRS bit to 0. Modify this bit only in channel reset mode.

### GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CAN FD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

### GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCk register set to $10_B$ (gateway mode).

Setting this bit to 1 enables the CAN-CAN FD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is $1001_B$ or more and the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with $1000_B$.

While this bit is 1, do not perform routing for the following frames by using the gateway function.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is 1, only the following frame should be transmitted from the corresponding channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frame should be transmitted.
- When GWFDF bit is set to 1, only CAN FD frame should be transmitted.

**Table 21.102** shows the settings and formats of transmit frame and receive frame while the CAN-CAN FD gateway is enabled.

**Table 21.102 Operation when the CAN-CAN FD Gateway is Enabled**

| Receive Frame | | | | Transmit Frame | | |
|---|---|---|---|---|---|---|
| Format | BRS Bit | Received DLC Value | GWFDF Bit | Format | BRS Bit | DLC Value to be Transmitted |
| Classical CAN | None | DLC ≤ $1000_B$ | 0 | Classical CAN | None | Not replaced |
| | | DLC > $1000_B$ | | | | |
| CAN FD | Arbitrary | DLC ≤ $1000_B$ | | | | |
| Classical CAN | None | DLC ≤ $1000_B$ | 1 | CAN FD | According to GWBRS bit setting | Not replaced |
| | | DLC >$1000_B$ | | | | Replaced with $1000_B$ |
| CAN FD | Arbitrary | DLC ≤ $1000_B$ | | | | Not replaced |

### TDCO[6:0] Bits

These bits are set to the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded to the nearest integer Tq).

When the TDCOC bit is 1, the transmitter delay compensation result equals to the TDCO[6:0] value.

The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

### ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDRSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

**Table 21.103 ESI Value to Be Transmitted**

| ESIC Value | Channel Status | ESI Value to be Transmitted |
|---|---|---|
| 0 | Error active | 0 (error active node) |
| | Error passive | 1 (error passive node) |
| 1 | Error active | ESI value set in the transmit/receive FIFO buffer or transmit buffer (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) |
| | Error passive | 1 (error passive node) |

### TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

### TDCOC Bit

When this bit is 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is 1, the SSP position is defined only by the SSP offset value.

Modify this bit only in channel reset mode or channel halt mode.

### EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

### 21.5.3.7 RSCFDnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 5)

**Access:** RSCFDnCFDCmFDCTR register can be read or written in 32-bit units
RSCFDnCFDCmFDCTRL register can be read or written in 16-bit units
RSCFDnCFDCmFDCTRLL register can be read or written in 8-bit units

**Address:** RSCFDnCFDCmFDCTR: <RSCANn_base> + $0508_H$ + ($20_H$ × m)

RSCFDnCFDCmFDCTRL: <RSCANn_base> + $0508_H$ + ($20_H$ × m)

RSCFDnCFDCmFDCTRLL: <RSCANn_base> + $0508_H$ + ($20_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 21.104 RSCFDnCFDCmFDCTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SOCCLR | Successful Communication Occurrence Counter Clear<br>Setting the SOCCLR bit to 1 clears the successful communication occurrence counter. This bit is always read as 0. |
| 0 | EOCCLR | Error Occurrence Counter Clear<br>Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0. |

#### SOCCLR Bit

Setting this bit to 1 clears the successful communication occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

#### EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

### 21.5.3.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 5)

**Access:** RSCFDnCFDCmFDSTS register can be read or written in 32-bit units
RSCFDnCFDCmFDSTSL register can be read or written in 16-bit units
RSCFDnCFDCmFDSTSH register is a read-only register that can be read in 16-bit units
RSCFDnCFDCmFDSTSLL, RSCFDnCFDCmFDSTSLH registers can be read or written in 8-bit units
RSCFDnCFDCmFDSTSHL, RSCFDnCFDCmFDSTSHH registers are the read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDCmFDSTS: <RSCANn_base> + $050C_H$ + ($20_H$ × m)

RSCFDnCFDCmFDSTSL: <RSCANn_base> + $050C_H$ + ($20_H$ × m),
RSCFDnCFDCmFDSTSH: <RSCANn_base> + $050E_H$ + ($20_H$ × m)

RSCFDnCFDCmFDSTSLL: <RSCANn_base> + $050C_H$ + ($20_H$ × m),
RSCFDnCFDCmFDSTSLH: <RSCANn_base> + $050D_H$ + ($20_H$ × m),
RSCFDnCFDCmFDSTSHL: <RSCANn_base> + $050E_H$ + ($20_H$ × m),
RSCFDnCFDCmFDSTSHH: <RSCANn_base> + $050F_H$ + ($20_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SOC[7:0] | | | | | | | | EOC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | SOCO | EOCO | TDCVF | TDCR[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 | R | R | R | R | R | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.105 RSCFDnCFDCmFDSTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | SOC[7:0] | Successful Communication Occurrence Counter<br>The successful communication occurrence counter value can be read. |
| 23 to 16 | EOC[7:0] | Error Occurrence Counter<br>The error occurrence counter value can be read. |
| 15 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | SOCO | Successful Communication Occurrence Counter Overflow Flag<br>0: The successful communication occurrence counter does not overflow.<br>1: The successful communication occurrence counter has overflowed. |
| 8 | EOCO | Error Occurrence Counter Overflow Flag<br>0: The error occurrence counter does not overflow.<br>1: The error occurrence counter has overflowed. |
| 7 | TDCVF | Transmitter Delay Compensation Violation Flag<br>0: No transmitter delay compensation violation is present.<br>1: A transmitter delay compensation violation is present. |
| 6 to 0 | TDCR[6:0] | Transmitter Delay Compensation Result Status<br>The transmitter delay compensation result can be read. |

#### SOC[7:0] Bits

These bits show the successful communication occurrence counter value. The successful communication occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches $FF_H$. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmFDCTR register. These bits are 0 in channel reset mode.

#### EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches $FF_H$.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmFDCTR register. These bits are 0 in channel reset mode.

#### SOCO Flag

This bit indicates that successful communication occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached $FF_H$. This flag is 0 in channel reset mode.

#### EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached $FF_H$. This flag is 0 in channel reset mode.

#### TDCVF Flag

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 fCAN (CANm bit time is the value of data bit rate).

This flag is 0 in channel reset mode.

#### TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

This flag is updated at a falling edge between the FDF bit and res bit when the TDCE bit (transmitter delay compensation enable) in the RSCFDnCFDCmFDCFG register is set to 1 and also the TDCOC bit (transmitter delay compensation measurement select) in the RSCFDnCFDCmFDCFG register is set to 0.

This flag is 0 in channel reset mode.

### 21.5.3.9 RSCFDnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 to 5)

**Access:** RSCFDnCFDCmFDCRC register is a read-only register that can be read in 32-bit units
RSCFDnCFDCmFDCRCL, RSCFDnCFDCmFDCRCH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDCmFDCRCLL, RSCFDnCFDCmFDCRCLH, RSCFDnCFDCmFDCRCHL, RSCFDnCFDCmFDCRCHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDCmFDCRC: <RSCANn_base> + $0510_H$ + ($20_H$ × m)

RSCFDnCFDCmFDCRCL: <RSCANn_base> + $0510_H$ + ($20_H$ × m),
RSCFDnCFDCmFDCRCH: <RSCANn_base> + $0512_H$ + ($20_H$ × m)

RSCFDnCFDCmFDCRCLL: <RSCANn_base> + $0510_H$ + ($20_H$ × m),
RSCFDnCFDCmFDCRCLH: <RSCANn_base> + $0511_H$ + ($20_H$ × m),
RSCFDnCFDCmFDCRCHL: <RSCANn_base> + $0512_H$ + ($20_H$ × m),
RSCFDnCFDCmFDCRCHH: <RSCANn_base> + $0513_H$ + ($20_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | SCNT[3:0] | | | | — | — | — | CRCREG[20:16] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRCREG[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.106 RSCFDnCFDCmFDCRC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | Reserved | When read, the value after reset is returned. |
| 27 to 24 | SCNT[3:0] | Stuff count bit<br>Indicate a value of the stuff count in a CAN FD frame.<br>Bits 27 to 25 indicate the Gray-coded value of the stuff bit count module 8 in the transmitted/received frames.<br>Bit 24 indicates an even parity value of bits 27 to 25. |
| 23 to 21 | Reserved | When read, the value after reset is returned. |
| 20 to 0 | CRCREG[20:0] | CRC Calculation Data (CRC Length:17 Bit or 21 Bit)<br>These bits show the CRC value calculated based on the transmit message or receive message.<br>When the CRC length is 17 bits, bits b20 to b17 are read as 0. |

#### SCNT[3:0] Flags

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CAN FD frame can be read if a message transmitted/received is a CAN FD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. This flag is updated at the first bit in the CRC field of the CAN FD frame. These bits are cleared to 0 in channel reset mode.

**CRCREG[20:0] Flag**

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CAN FD frame (CRC length = 17 or 21 bits), these flags are updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

## 21.5.4 Details of Global-Related Registers

### 21.5.4.1 RSCFDnCFDGCFG — Global Configuration Register

**Access:** RSCFDnCFDGCFG register can be read or written in 32-bit units
RSCFDnCFDGCFGL, RSCFDnCFDGCFGH registers can be read or written in 16-bit units
RSCFDnCFDGCFGLL, RSCFDnCFDGCFGLH, RSCFDnCFDGCFGHL, RSCFDnCFDGCFGHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGCFG: <RSCANn_base> + $0084_H$

RSCFDnCFDGCFGL: <RSCANn_base> + $0084_H$,
RSCFDnCFDGCFGH: <RSCANn_base> + $0086_H$

RSCFDnCFDGCFGLL: <RSCANn_base> + $0084_H$,
RSCFDnCFDGCFGLH: <RSCANn_base> + $0085_H$,
RSCFDnCFDGCFGHL: <RSCANn_base> + $0086_H$,
RSCFDnCFDGCFGHH: <RSCANn_base> + $0087_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 0 | TPRI | Transmit Priority Select<br>0: ID priority<br>1: Transmit buffer number priority |

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to $000_B$.

Note 2. For the CAN clock frequency settings, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

Modify the RSCFDnCFDGCFG register only in global reset mode.

### ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. For details, see **Section 21.9.3.1, Interval Transmission Function**.

### TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CAN FD frames.

#### TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

#### TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit by the TSP[3:0] bits is used as the timestamp counter count source.

#### CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer’s payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

#### DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

#### MME Bit

Setting this bit to 1 makes the mirror function available.

#### DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of $00_H$ is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

#### DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to $0000_B$ before clearing the DCE bit in the RSCFDnCFDGCFG register to 0.

**TPRI Bit**

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

### 21.5.4.2 RSCFDnCFDGCTR — Global Control Register

**Access:** RSCFDnCFDGCTR register can be read or written in 32-bit units
RSCFDnCFDGCTRL, RSCFDnCFDGCTRH registers can be read or written in 16-bit units
RSCFDnCFDGCTRLL, RSCFDnCFDGCTRLH, RSCFDnCFDGCTRHL registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGCTR: <RSCANn_base> + $0088_H$

RSCFDnCFDGCTRL: <RSCANn_base> + $0088_H$,
RSCFDnCFDGCTRH: <RSCANn_base> + $008A_H$

RSCFDnCFDGCTRLL: <RSCANn_base> + $0088_H$,
RSCFDnCFDGCTRLH: <RSCANn_base> + $0089_H$,
RSCFDnCFDGCTRHL: <RSCANn_base> + $008A_H$

**Value after reset:** $0000\ 0005_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.108 RSCFDnCFDGCTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 17 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TSRST | Timestamp Counter Reset<br>Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0. |
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | CMPOFIE | Payload Overflow Interrupt Enable<br>0: A payload overflow interrupt is disabled.<br>1: A payload overflow interrupt is enabled. |
| 10 | THLEIE | Transmit History Buffer Overflow Interrupt Enable<br>0: Transmit history buffer overflow interrupt is disabled.<br>1: Transmit history buffer overflow interrupt is enabled. |
| 9 | MEIE | FIFO Message Lost Interrupt Enable<br>0: FIFO message lost interrupt is disabled.<br>1: FIFO message lost interrupt is enabled. |
| 8 | DEIE | DLC Error Interrupt Enable<br>0: DLC error interrupt is disabled.<br>1: DLC error interrupt is enabled. |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | GSLPR | Global Stop Mode<br>0: Other than global stop mode<br>1: Global stop mode |
| 1, 0 | GMDC[1:0] | Global Mode Select<br>b1 b0<br>0 0: Global operating mode<br>0 1: Global reset mode<br>1 0: Global test mode<br>1 1: Setting prohibited |

#### TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCFDnCFDGTSC register is cleared to $0000_H$.

#### CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.
Clearing this bit to 0 makes the RS-CANFD module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

#### GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 21.7.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

### 21.5.4.3 RSCFDnCFDGSTS — Global Status Register

**Access:** RSCFDnCFDGSTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDGSTSL register is a read-only register that can be read in 16-bit units
RSCFDnCFDGSTSLL register is a read-only register that can be read in 8-bit units

**Address:** RSCFDnCFDGSTS: <RSCANn_base> + $008C_H$

RSCFDnCFDGSTSL: <RSCANn_base> + $008C_H$

RSCFDnCFDGSTSLL: <RSCANn_base> + $008C_H$

**Value after reset:** $0000\ 000D_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | GRAMINIT | GSLPSTS | GHLTSTS | GRSTSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.109 RSCFDnCFDGSTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is returned. |
| 3 | GRAMINIT | CAN RAM Initialization Status Flag<br>0: CAN RAM initialization is completed.<br>1: CAN RAM initialization is ongoing. |
| 2 | GSLPSTS | Global Stop Status Flag<br>0: Not in global stop mode<br>1: In global stop mode |
| 1 | GHLTSTS | Global Test Status Flag<br>0: Not in global test mode<br>1: In global test mode |
| 0 | GRSTSTS | Global Reset Status Flag<br>0: Not in global reset mode<br>1: In global reset mode |

#### GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

#### GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

#### GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

**GRSTSTS Flag**

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

### 21.5.4.4 RSCFDnCFDGERFL — Global Error Flag Register

**Access:** RSCFDnCFDGERFL register can be read or written in 32-bit units
RSCFDnCFDGERFLL, RSCFDnCFDGERFLH registers can be read or written in 16-bit units
RSCFDnCFDGERFLLL, RSCFDnCFDGERFLHL registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGERFL: <RSCANn_base> + $0090_H$

RSCFDnCFDGERFLL: <RSCANn_base> + $0090_H$,
RSCFDnCFDGERFLH: <RSCANn_base> + $0092_H$

RSCFDnCFDGERFLLL: <RSCANn_base> + $0090_H$,
RSCFDnCFDGERFLHL: <RSCANn_base> + $0092_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | EEF5 | EEF4 | EEF3 | EEF2 | EEF1 | EEF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CMPOF | THLES | MES | DEF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R | R/W*1 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.110 RSCFDnCFDGERFL Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 | EEF5 | ECC Error Flag for Channel 5<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 20 | EEF4 | ECC Error Flag for Channel 4<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 19 | EEF3 | ECC Error Flag for Channel 3<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 18 | EEF2 | ECC Error Flag for Channel 2<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 17 | EEF1 | ECC Error Flag for Channel 1<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 16 | EEF0 | ECC Error Flag for Channel 0<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 15, 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 to 8 | Reserved | When read, the undefined value is returned. When writing, write the value after reset. |
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | Reserved | When read, the undefined value is returned. When writing, write the value after reset. |

Table 21.110 RSCFDnCFDGERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | CMPOF | Payload Overflow Flag<br>0: No payload overflow has occurred.<br>1: A payload overflow has occurred. |
| 2 | THLES | Transmit History Buffer Overflow Status Flag<br>0: No transmit history buffer overflow has occurred.<br>1: A transmit history buffer overflow has occurred. |
| 1 | MES | FIFO Message Lost Status Flag<br>0: No FIFO message lost error has occurred.<br>1: A FIFO message lost error has occurred. |
| 0 | DEF | DLC Error Flag<br>0: No DLC error has occurred.<br>1: A DLC error has occurred. |

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

### EEFm Flag

When a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 5), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

### CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0 to 5), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

### THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0 to 5) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

### MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 17) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

### DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

**NOTE**

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

### 21.5.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register

**Access:** RSCFDnCFDGTSC register is a read-only register that can be read in 32-bit units.
RSCFDnCFDGTSCL register is a read-only register that can be read in 16-bit units.

**Address:** RSCFDnCFDGTSC: <RSCANn_base> + $0094_H$

RSCFDnCFDGTSCL: <RSCANn_base> + $0094_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TS[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.111 RSCFDnCFDGTSC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 0 | TS[15:0] | Timestamp Value<br>The timestamp counter value can be read.<br>Counter Value: $0000_H$ to $FFFF_H$ |

#### TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm nominal bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

### 21.5.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

**Access:** RSCFDnCFDGTINTSTS0 register is a read-only register that can be read in 32-bit units
RSCFDnCFDGTINTSTS0L, RSCFDnCFDGTINTSTS0H registers are read-only registers that can be read in 16-bit units
RSCFDnCFDGTINTSTS0LL, RSCFDnCFDGTINTSTS0LH, RSCFDnCFDGTINTSTS0HL, RSCFDnCFDGTINTSTS0HH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDGTINTSTS0: <RSCANn_base> + $0460_H$

RSCFDnCFDGTINTSTS0L: <RSCANn_base> + $0460_H$,
RSCFDnCFDGTINTSTS0H: <RSCANn_base> + $0462_H$

RSCFDnCFDGTINTSTS0LL: <RSCANn_base> + $0460_H$,
RSCFDnCFDGTINTSTS0LH: <RSCANn_base> + $0461_H$,
RSCFDnCFDGTINTSTS0HL: <RSCANn_base> + $0462_H$,
RSCFDnCFDGTINTSTS0HH: <RSCANn_base> + $0463_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | THIF3 | CFTIF3 | TQIF3 | TAIF3 | TSIF3 | — | — | — | THIF2 | CFTIF2 | TQIF2 | TAIF2 | TSIF2 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | THIF1 | CFTIF1 | TQIF1 | TAIF1 | TSIF1 | — | — | — | THIF0 | CFTIF0 | TQIF0 | TAIF0 | TSIF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 |

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

**Table 21.112 RSCFDnCFDGTINTSTS0 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 29 | Reserved | When read, the value after reset is returned. |
| 28 | THIF3 | Channel 3 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 27 | CFTIF3 | Channel 3 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 26 | TQIF3 | Channel 3 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 25 | TAIF3 | Channel 3 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested |
| 24 | TSIF3 | Channel 3 Transmit Buffer Transmit Complete Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |
| 23 to 21 | Reserved | When read, the value after reset is returned. |
| 20 | THIF2 | Channel 2 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 19 | CFTIF2 | Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 18 | TQIF2 | Channel 2 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |

Table 21.112 RSCFDnCFDGTINTSTS0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 17 | TAIF2 | Channel 2 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 16 | TSIF2 | Channel 2 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | THIF1 | Channel 1 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 11 | CFTIF1 | Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 10 | TQIF1 | Channel 1 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 9 | TAIF1 | Channel 1 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 8 | TSIF1 | Channel 1 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |
| 7 to 5 | Reserved | When read, the value after reset is returned. |
| 4 | THIF0 | Channel 0 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 3 | CFTIF0 | Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF0 | Channel 0 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 1 | TAIF0 | Channel 0 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 0 | TSIF0 | Channel 0 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |

### TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to $10_B$ (transmit completed without abort request) or $11_B$ (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to $00_B$ under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

### TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to $01_B$ (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to $00_B$ after the transmit abort is completed.

### TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

### CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

### THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

### 21.5.4.7 RSCFDnCFDGTINTSTS1 — Global TX Interrupt Status Register 1

**Access:** RSCFDnCFDGTINTSTS1 register is a read-only register that can be read in 32-bit units
RSCFDnCFDGTINTSTS1L register is a read-only register that can be read in 16-bit units
RSCFDnCFDGTINTSTS1LL, RSCFDnCFDGTINTSTS1LH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDGTINTSTS1: <RSCANn_base> + $0464_H$

RSCFDnCFDGTINTSTS1L: <RSCANn_base> + $0464_H$

RSCFDnCFDGTINTSTS1LL: <RSCANn_base> + $0464_H$,
RSCFDnCFDGTINTSTS1LH: <RSCANn_base> + $0465_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 |

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

**Table 21.113 RSCFDnCFDGTINTSTS1 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | THIF5 | Channel 5 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 11 | CFTIF5 | Channel 5 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 10 | TQIF5 | Channel 5 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 9 | TAIF5 | Channel 5 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 8 | TSIF5 | Channel 5 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |
| 7 to 5 | Reserved | When read, the value after reset is returned. |
| 4 | THIF4 | Channel 4 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 3 | CFTIF4 | Channel 4 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF4 | Channel 4 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 1 | TAIF4 | Channel 4 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |

Table 21.113 RSCFDnCFDGTINTSTS1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | TSIF4 | Channel 4 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |

### TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to $10_B$ (transmit completed without abort request) or $11_B$ (transmit completed with abort request).

When all TMTRF[1:0] flags are cleared to $00_B$ under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

### TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is set to 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to $01_B$ (transmit abort completed).

This flag is cleared to 0 when all TMTRF[1:0] flags are cleared to $00_B$ after the transmit abort is completed.

### TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. Clearing the TXQIE bit to 0 also clears this flag to 0.

### CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

### THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0.

This flag is also cleared to 0 when the THLIE bit is cleared to 0.

### 21.5.4.8 RSCFDnCFDGFDCFG — Global FD Configuration Register

**Access:** RSCFDnCFDGFDCFG register can be read or written in 32-bit unit.
RSCFDnCFDGFDCFGL register can be read or written in 16-bit unit.
RSCFDnCFDGFDCFGLL, RSCFDnCFDGFDCFGLH registers can be read or written in 8-bit unit.

**Address:** RSCFDnCFDGFDCFG: <RSCANn_base> + $0474_H$

RSCFDnCFDGFDCFGL: <RSCANn_base> + $0474_H$

RSCFDnCFDGFDCFGLL: <RSCANn_base> + $0474_H$,
RSCFDnCFDGFDCFGLH: <RSCANn_base> + $0475_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TSCCFG[1:0] | | — | — | — | — | — | — | — | PRED |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R/W |

**Table 21.114 RSCFDnCFDGFDCFG Register Content**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 10 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 9, 8 | TSCCFG[1:0] | Timestamp Capture Setting<br>B9 b8<br>0 0: Captured at a sample point in the SOF bit.<br>0 1: Captured when a valid frame has been transmitted/received.<br>1 0: Captured at a sample point of the res bit.*1<br>1 1: Setting prohibited |
| 7 to 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | PRED | Protocol Exception Event Detection Disable<br>0: Protocol exception event detection enabled<br>1: Protocol exception event detection disabled |

Note 1. When a Classical CAN frame is transmitted/received, a timestamp value will be captured at the sample point in the SOF bit.

#### TSCCFG[1:0] Bits

Select a point where a timestamp value is captured. Modify this bit only in global reset mode.

#### PRED Bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame will be output. Modify this bit only in global reset mode.

## 21.5.5 Details of Receive Rule-related Registers

### 21.5.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register

**Access:** RSCFDnCFDGAFLECTR register can be read or written in 32-bit units
RSCFDnCFDGAFLECTRL register can be read or written in 16-bit units
RSCFDnCFDGAFLECTRLL, RSCFDnCFDGAFLECTRLH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGAFLECTR: <RSCANn_base> + $0098_H$

RSCFDnCFDGAFLECTRL: <RSCANn_base> + $0098_H$

RSCFDnCFDGAFLECTRLL: <RSCANn_base> + $0098_H$,
RSCFDnCFDGAFLECTRLH: <RSCANn_base> + $0099_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | AFLDAE | — | — | — | AFLPN[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

**Table 21.115 RSCFDnCFDGAFLECTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 9 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 8 | AFLDAE | Receive Rule Table Write Enable<br>0: Receive rule table write is disabled.<br>1: Receive rule table write is enabled. |
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 to 0 | AFLPN[4:0] | Receive Rule Table Page Number Configuration<br>A page number can be selected from the range of page 0 ($00000_B$) to page 23 ($10111_B$). |

#### AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

#### AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of $00000_B$ to $10111_B$.

### 21.5.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

**Access:** RSCFDnCFDGAFLCFG0 register can be read or written in 32-bit units
RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read or written in 16-bit units
RSCFDnCFDGAFLCFG0LL, RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL,
RSCFDnCFDGAFLCFG0HH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGAFLCFG0: <RSCANn_base> + $009C_H$

RSCFDnCFDGAFLCFG0L: <RSCANn_base> + $009C_H$,
RSCFDnCFDGAFLCFG0H: <RSCANn_base> + $009E_H$

RSCFDnCFDGAFLCFG0LL: <RSCANn_base> + $009C_H$,
RSCFDnCFDGAFLCFG0LH: <RSCANn_base> + $009D_H$,
RSCFDnCFDGAFLCFG0HL: <RSCANn_base> + $009E_H$,
RSCFDnCFDGAFLCFG0HH: <RSCANn_base> + $009F_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RNC0[7:0] | | | | | | | | RNC1[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RNC2[7:0] | | | | | | | | RNC3[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.116 RSCFDnCFDGAFLCFG0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RNC0[7:0] | Number of Rules for Channel 0<br>Set the number of receive rules exclusively used for channel 0. |
| 23 to 16 | RNC1[7:0] | Number of Rules for Channel 1<br>Set the number of receive rules exclusively used for channel 1. |
| 15 to 8 | RNC2[7:0] | Number of Rules for Channel 2<br>Set the number of receive rules exclusively used for channel 2. |
| 7 to 0 | RNC3[7:0] | Number of Rules for Channel 3<br>Set the number of receive rules exclusively used for channel 3. |

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

#### RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

#### RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

**RNC2[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

**RNC3[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 3 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

### 21.5.5.3 RSCFDnCFDGAFLCFG1 — Receive Rule Configuration Register 1

**Access:** RSCFDnCFDGAFLCFG1 register can be read or written in 32-bit units
RSCFDnCFDGAFLCFG1H register can be read or written in 16-bit units
RSCFDnCFDGAFLCFG1HL, RSCFDnCFDGAFLCFG1HH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGAFLCFG1: <RSCANn_base> + $00A0_H$

RSCFDnCFDGAFLCFG1H: <RSCANn_base> + $00A2_H$

RSCFDnCFDGAFLCFG1HL: <RSCANn_base> + $00A2_H$,
RSCFDnCFDGAFLCFG1HH: <RSCANn_base> + $00A3_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RNC4[7:0] | | | | | | | | RNC5[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.117 RSCFDnCFDGAFLCFG1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RNC4[7:0] | Number of Rules for Channel 4<br>Set the number of receive rules exclusively used for channel 4. |
| 23 to 16 | RNC5[7:0] | Number of Rules for Channel 5<br>Set the number of receive rules exclusively used for channel 5. |
| 15 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Modify the RSCFDnCFDGAFLCFG1 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

#### RNC4[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 4 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

#### RNC5[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 5 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

### 21.5.5.4 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)

**Access:** RSCFDnCFDGAFLIDj register can be read or written in 32-bit units
RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read or written in 16-bit units
RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGAFLIDj: <RSCANn_base> + $1000_H$ + ($10_H$ × j)

RSCFDnCFDGAFLIDjL: <RSCANn_base> + $1000_H$ + ($10_H$ × j),
RSCFDnCFDGAFLIDjH: <RSCANn_base> + $1002_H$ + ($10_H$ × j)

RSCFDnCFDGAFLIDjLL: <RSCANn_base> + $1000_H$ + ($10_H$ × j),
RSCFDnCFDGAFLIDjLH: <RSCANn_base> + $1001_H$ + ($10_H$ × j),
RSCFDnCFDGAFLIDjHL: <RSCANn_base> + $1002_H$ + ($10_H$ × j),
RSCFDnCFDGAFLIDjHH: <RSCANn_base> + $1003_H$ + ($10_H$ × j)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDE | GAFLRTR | GAFLLB | GAFLID[28:16] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLID[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.118 RSCFDnCFDGAFLIDj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | GAFLIDE | IDE Select<br>0: Standard ID<br>1: Extended ID |
| 30 | GAFLRTR | RTR Select<br>0: Data frame<br>1: Remote frame |
| 29 | GAFLLB | Receive Rule Target Message Select<br>0: When a message transmitted from another CAN node is received<br>1: When the own transmitted message is received |
| 28 to 0 | GAFLID[28:0] | ID<br>Set the ID of the receive rule.<br>For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0. |

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

#### GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

#### GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

#### GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

### 21.5.5.5 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)

**Access:** RSCFDnCFDGAFLMj register can be read or written in 32-bit units
RSCFDnCFDGAFLMjL, RSCFDnCFDGAFLMjH registers can be read or written in 16-bit units
RSCFDnCFDGAFLMjLL, RSCFDnCFDGAFLMjLH, RSCFDnCFDGAFLMjHL, RSCFDnCFDGAFLMjHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGAFLMj: <RSCANn_base> + $1004_H$ + ($10_H$ × j)

RSCFDnCFDGAFLMjL: <RSCANn_base> + $1004_H$ + ($10_H$ × j),
RSCFDnCFDGAFLMjH: <RSCANn_base> + $1006_H$ + ($10_H$ × j)

RSCFDnCFDGAFLMjLL: <RSCANn_base> + $1004_H$ + ($10_H$ × j),
RSCFDnCFDGAFLMjLH: <RSCANn_base> + $1005_H$ + ($10_H$ × j),
RSCFDnCFDGAFLMjHL: <RSCANn_base> + $1006_H$ + ($10_H$ × j),
RSCFDnCFDGAFLMjHH: <RSCANn_base> + $1007_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.119 RSCFDnCFDGAFLMj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | GAFLIDEM | IDE Mask<br>0: The IDE bit is not compared.<br>1: The IDE bit is compared. |
| 30 | GAFLRTRM | RTR Mask<br>0: The RTR bit is not compared.<br>1: The RTR bit is compared |
| 29 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 28 to 0 | GAFLIDM[28:0] | ID Mask<br>0: The corresponding ID bit is not compared.<br>1: The corresponding ID bit is compared. |

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

#### GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

#### GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

### 21.5.5.6 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

**Access:** RSCFDnCFDGAFLP0_j register can be read or written in 32-bit units
RSCFDnCFDGAFLP0_jL, RSCFDnCFDGAFLP0_jH registers can be read or written in 16-bit units
RSCFDnCFDGAFLP0_jLH, RSCFDnCFDGAFLP0_jHL, RSCFDnCFDGAFLP0_jHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGAFLP0_j: <RSCANn_base> + $1008_H$ + ($10_H$ × j)

RSCFDnCFDGAFLP0_jL: <RSCANn_base> + $1008_H$ + ($10_H$ × j),
RSCFDnCFDGAFLP0_jH: <RSCANn_base> + $100A_H$ + ($10_H$ × j)

RSCFDnCFDGAFLP0_jLH: <RSCANn_base> + $1009_H$ + ($10_H$ × j),
RSCFDnCFDGAFLP0_jHL: <RSCANn_base> + $100A_H$ + ($10_H$ × j),
RSCFDnCFDGAFLP0_jHH: <RSCANn_base> + $100B_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 14 to 8 | GAFLRMDP[6:0] | Receive Buffer Number Select<br>Set the receive buffer number to store receive messages. |

Table 21.120 RSCFDnCFDGAFLP0_j Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

### GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to $0000_B$ disables the DLC check function allowing messages with any data length to pass the DLC check.

### GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

### GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

### GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

### 21.5.5.7 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)

**Access:** RSCFDnCFDGAFLP1_j register can be read or written in 32-bit units
RSCFDnCFDGAFLP1_jL, RSCFDnCFDGAFLP1_jH registers can be read or written in 16-bit units
RSCFDnCFDGAFLP1_jLL, RSCFDnCFDGAFLP1_jLH, RSCFDnCFDGAFLP1_jHL,
RSCFDnCFDGAFLP1_jHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGAFLP1_j: <RSCANn_base> + $100C_H$ + ($10_H$ × j)

RSCFDnCFDGAFLP1_jL: <RSCANn_base> +$100C_H$ + ($10_H$ × j),
RSCFDnCFDGAFLP1_jH: <RSCANn_base> + $100E_H$ + ($10_H$ × j)

RSCFDnCFDGAFLP1_jLL: <RSCANn_base> + $100C_H$ + ($10_H$ × j),
RSCFDnCFDGAFLP1_jLH: <RSCANn_base> + $100D_H$ + ($10_H$ × j),
RSCFDnCFDGAFLP1_jHL: <RSCANn_base> + $100E_H$ + ($10_H$ × j),
RSCFDnCFDGAFLP1_jHH: <RSCANn_base> + $100F_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.121 RSCFDnCFDGAFLP1_j Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 26 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 25 to 8 | GAFLFDP[25:8] | Transmit/Receive FIFO Buffer k Select<br>(Bit position –8 = target transmit/receive FIFO buffer number k)<br>0: Transmit/receive FIFO buffer is not selected.<br>1: Transmit/receive FIFO buffer is selected. |
| 7 to 0 | GAFLFDP[7:0] | Receive FIFO Buffer x Select<br>(Bit position = target receive FIFO buffer number x)<br>0: Receive FIFO buffer is not selected.<br>1: Receive FIFO buffer is selected. |

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLFDP[25:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register are set to $00_B$ (receive mode) or $10_B$ (gateway mode) can be selected.

## 21.5.6 Details of Receive Buffer-related Registers

### 21.5.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register

**Access:** RSCFDnCFDRMNB register can be read or written in 32-bit units
RSCFDnCFDRMNBL register can be read or written in 16-bit units
RSCFDnCFDRMNBLL, RSCFDnCFDRMNBLH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDRMNB: <RSCANn_base> + $00A4_H$

RSCFDnCFDRMNBL: <RSCANn_base> + $00A4_H$

RSCFDnCFDRMNBLL: <RSCANn_base> + $00A4_H$,
RSCFDnCFDRMNBLH: <RSCANn_base> + $00A5_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.122 RSCFDnCFDRMNB Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 10 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 9, 8 | RMPLS[1:0] | Receive Buffer Payload Storage Size Select<br>b9 b8<br>0 0: 8 bytes<br>0 1: 12 bytes<br>1 0: 16 bytes<br>1 1: 20 bytes |
| 7 to 0 | NRXMB[7:0] | Receive Buffer Number Configuration<br>Set the number of receive buffers.<br>Set a value of 0 to 96. |

Modify the RSCFDnCFDRMNB register only in global reset mode.

#### RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

#### NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

### 21.5.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0 to 2)

**Access:** RSCFDnCFDRMNDy register can be read or written in 32-bit units
RSCFDnCFDRMNDyL, RSCFDnCFDRMNDyH registers can be read or written in 16-bit units
RSCFDnCFDRMNDyLL, RSCFDnCFDRMNDyLH, RSCFDnCFDRMNDyHL, RSCFDnCFDRMNDyHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDRMNDy: <RSCANn_base> + $00A8_H$ + ($04_H$ × y)

RSCFDnCFDRMNDyL: <RSCANn_base> + $00A8_H$ + ($04_H$ × y),
RSCFDnCFDRMNDyH: <RSCANn_base> + $00AA_H$ + ($04_H$ × y)

RSCFDnCFDRMNDyLL: <RSCANn_base> + $00A8_H$ + ($04_H$ × y),
RSCFDnCFDRMNDyLH: <RSCANn_base> + $00A9_H$ + ($04_H$ × y),
RSCFDnCFDRMNDyHL: <RSCANn_base> + $00AA_H$ + ($04_H$ × y),
RSCFDnCFDRMNDyHH: <RSCANn_base> + $00AB_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMNSq (q = y × 32 + 31 to y × 32 + 16 (y = 0, 1, 2)) | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMNSq (q = y × 32 + 15 to y × 32 + 0 (y = 0, 1, 2)) | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.123 RSCFDnCFDRMNDy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | RMNSq | Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16)<br>0: There is no new message in receive buffer q.<br>1: There is a new message in receive buffer q. |
| 15 to 0 | RMNSq | Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0)<br>0: There is no new message in receive buffer q.<br>1: There is a new message in receive buffer q. |

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

#### RMNSq Flags (q = 0 to 95)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is $00_B$ (8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is $11_B$ (20 bytes), the message storing time is 18 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size).

These flags are cleared to 0 in global reset mode.

### 21.5.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 95)

**Access:** RSCFDnCFDRMIDq register is a read-only register that can be read in 32-bit units
RSCFDnCFDRMIDqL, RSCFDnCFDRMIDqH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRMIDqLL, RSCFDnCFDRMIDqLH, RSCFDnCFDRMIDqHL, RSCFDnCFDRMIDqHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDRMIDq: <RSCANn_base> + $2000_H$ + ($20_H$ × q)

RSCFDnCFDRMIDqL: <RSCANn_base> + $2000_H$ + ($20_H$ × q),
RSCFDnCFDRMIDqH: <RSCANn_base> + $2002_H$ + ($20_H$ × q)

RSCFDnCFDRMIDqLL: <RSCANn_base> + $2000_H$ + ($20_H$ × q),
RSCFDnCFDRMIDqLH: <RSCANn_base> + $2001_H$ + ($20_H$ × q),
RSCFDnCFDRMIDqHL: <RSCANn_base> + $2002_H$ + ($20_H$ × q),
RSCFDnCFDRMIDqHH: <RSCANn_base> + $2003_H$ + ($20_H$ × q)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.124 RSCFDnCFDRMIDq Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | RMIDE | Receive Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | RMRTR | Receive Buffer RTR/RRS<br>• When the received message is a classical CAN frame<br>0: Data frame<br>1: Remote frame<br>• When the received message is a CAN FD frame<br>The RRS bit value of the received message can be read. |
| 29 | Reserved | When read, the value after reset is returned. |
| 28 to 0 | RMID[28:0] | Receive Buffer ID Data<br>These bits contain the standard ID or extended ID of the received message.<br>Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

#### RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

#### RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

#### RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

### 21.5.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 95)

**Access:** RSCFDnCFDRMPTRq register is a read-only register that can be read in 32-bit units
RSCFDnCFDRMPTRqL, RSCFDnCFDRMPTRqH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRMPTRqLL, RSCFDnCFDRMPTRqLH, RSCFDnCFDRMPTRqHL, RSCFDnCFDRMPTRqHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDRMPTRq: <RSCANn_base> + $2004_H$ + ($20_H$ × q)

RSCFDnCFDRMPTRqL: <RSCANn_base> + $2004_H$ + ($20_H$ × q),
RSCFDnCFDRMPTRqH: <RSCANn_base> + $2006_H$ + ($20_H$ × q)

RSCFDnCFDRMPTRqLL: <RSCANn_base> + $2004_H$ + ($20_H$ × q),
RSCFDnCFDRMPTRqLH: <RSCANn_base> + $2005_H$ + ($20_H$ × q),
RSCFDnCFDRMPTRqHL: <RSCANn_base> + $2006_H$ + ($20_H$ × q),
RSCFDnCFDRMPTRqHH: <RSCANn_base> + $2007_H$ + ($20_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|
| 31 to 28 | RMDLC[3:0] | Receive Buffer DLC Data |
| 27 to 16 | RMPTR[11:0] | Receive Buffer Label Data<br>Label information of the received message. |
| 15 to 0 | RMTS[15:0] | Receive Buffer Timestamp Data<br>Timestamp value of the received message. |

| b31 | b30 | b29 | b28 | Classical CAN Frame | CAN FD Frame |
|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 data bytes | |
| 0 | 0 | 0 | 1 | 1 data byte | |
| 0 | 0 | 1 | 0 | 2 data bytes | |
| 0 | 0 | 1 | 1 | 3 data bytes | |
| 0 | 1 | 0 | 0 | 4 data bytes | |
| 0 | 1 | 0 | 1 | 5 data bytes | |
| 0 | 1 | 1 | 0 | 6 data bytes | |
| 0 | 1 | 1 | 1 | 7 data bytes | |
| 1 | 0 | 0 | 0 | 8 data bytes | |
| 1 | 0 | 0 | 1 | 8 data bytes | 12 data bytes |
| 1 | 0 | 1 | 0 | | 16 data bytes |
| 1 | 0 | 1 | 1 | | 20 data bytes |
| 1 | 1 | 0 | 0 | | 24 data bytes |
| 1 | 1 | 0 | 1 | | 32 data bytes |
| 1 | 1 | 1 | 0 | | 48 data bytes |
| 1 | 1 | 1 | 1 | | 64 data bytes |

#### RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

#### RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

#### RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

### 21.5.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 95)

**Access:** RSCFDnCFDRMFDSTSq register is a read-only register that can be read in 32-bit units
RSCFDnCFDRMFDSTSqL register is a read-only register that can be read in 16-bit units
RSCFDnCFDRMFDSTSqLL register is a read-only register that can be read in 8-bit units

**Address:** RSCFDnCFDRMFDSTSq: <RSCANn_base> + $2008_H$ + ($20_H$ × q)

RSCFDnCFDRMFDSTSqL: <RSCANn_base> + $2008_H$ + ($20_H$ × q)

RSCFDnCFDRMFDSTSqLL: <RSCANn_base> + $2008_H$ + ($20_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.126 RSCFDnCFDRMFDSTSq Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | RMFDF | FDF<br>0: Classical CAN frame<br>1: CAN FD frame |
| 1 | RMBRS | BRS<br>0: The bit rate in the data area does not change.<br>1: The bit rate in the data area changes. |
| 0 | RMESI | ESI<br>0: Error active node<br>1: Error passive node |

#### RMFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive buffer.

#### RMBRS Bit

When the RMFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

#### RMESI Bit

When the RMFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

### 21.5.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 95)

**Access:** RSCFDnCFDRMDFb_q register is a read-only register that can be read in 32-bit units
RSCFDnCFDRMDFb_qL, RSCFDnCFDRMDFb_qH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRMDFb_qLL, RSCFDnCFDRMDFb_qLH, RSCFDnCFDRMDFb_qHL, RSCFDnCFDRMDFb_qHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDRMDFb_q: <RSCANn_base> + $200C_H$ + ($04_H$ × b) + ($20_H$ × q)

RSCFDnCFDRMDFb_qL: <RSCANn_base> + $200C_H$ + ($04_H$ × b) + ($20_H$ × q),
RSCFDnCFDRMDFb_qH: <RSCANn_base> + $200E_H$ + ($04_H$ × b) + ($20_H$ × q)

RSCFDnCFDRMDFb_qLL: <RSCANn_base> + $200C_H$ + ($04_H$ × b) + ($20_H$ × q),
RSCFDnCFDRMDFb_qLH: <RSCANn_base> + $200D_H$ + ($04_H$ × b) + ($20_H$ × q),
RSCFDnCFDRMDFb_qHL: <RSCANn_base> + $200E_H$ + ($04_H$ × b) + ($20_H$ × q),
RSCFDnCFDRMDFb_qHH: <RSCANn_base> + $200F_H$ + ($04_H$ × b) + ($20_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.127 RSCFDnCFDRMDFb_q Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RMDB4 × b + 3 [7:0] | Receive Buffer Data Byte 4 × b + 3<br>Receive Buffer Data Byte 4 × b + 2<br>Receive Buffer Data Byte 4 × b + 1<br>Receive Buffer Data Byte 4 × b + 0 |
| 23 to 16 | RMDB4 × b + 2 [7:0] | |
| 15 to 8 | RMDB4 × b + 1 [7:0] | Data for a message stored in the receive buffer can be read. |
| 7 to 0 | RMDB4 × b + 0 [7:0] | |

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as $00_H$.

Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read the RSCFDnCFDRMDFb_q register corresponding to an area larger than the specified size.

## 21.5.7 Details of Receive FIFO Buffer-related Registers

### 21.5.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

**Access:** RSCFDnCFDRFCCx register can be read or written in 32-bit units
RSCFDnCFDRFCCxL register can be read or written in 16-bit units
RSCFDnCFDRFCCxLL, RSCFDnCFDRFCCxLH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDRFCCx: <RSCANn_base> + $00B8_H$ + ($04_H$ × x)

RSCFDnCFDRFCCxL: <RSCANn_base> + $00B8_H$ + ($04_H$ × x)

RSCFDnCFDRFCCxLL: <RSCANn_base> + $00B8_H$ + ($04_H$ × x),
RSCFDnCFDRFCCxLH: <RSCANn_base> + $00B9_H$ + ($04_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Table 21.128 RSCFDnCFDRFCCx Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 6 to 4 | RFPLS[2:0] | Receive FIFO Buffer Payload Storage Size Select<br>b6 b5 b4<br>0 0 0: 8 bytes<br>0 0 1: 12 bytes<br>0 1 0: 16 bytes<br>0 1 1: 20 bytes<br>1 0 0: 24 bytes<br>1 0 1: 32 bytes<br>1 1 0: 48 bytes<br>1 1 1: 64 bytes |
| 3, 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | RFIE | Receive FIFO Interrupt Enable<br>0: Receive FIFO interrupt is disabled.<br>1: Receive FIFO interrupt is enabled. |
| 0 | RFE | Receive FIFO Buffer Enable<br>0: No receive FIFO buffer is used.<br>1: Receive FIFO buffers are used. |

### RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to $001_B$ (4 messages), set the RFIGCV[2:0] bits to $001_B$, $011_B$, $101_B$, or $111_B$. Modify these bits only in global reset mode.

### RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

### RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to $000_B$, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

### RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

### RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit is set to 0 (no receive FIFO buffer is used).

### RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

### 21.5.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

**Access:** RSCFDnCFDRFSTSx register can be read or written in 32-bit units
RSCFDnCFDRFSTSxL register can be read or written in 16-bit units
RSCFDnCFDRFSTSxLL register can be read or written in 8-bit units
RSCFDnCFDRFSTSxLH register is a read-only register that can be read in 8-bit units

**Address:** RSCFDnCFDRFSTSx: <RSCANn_base> + $00D8_H$ + ($04_H$ × x)

RSCFDnCFDRFSTSxL: <RSCANn_base> + $00D8_H$ + ($04_H$ × x)

RSCFDnCFDRFSTSxLL: <RSCANn_base> + $00D8_H$ + ($04_H$ × x),
RSCFDnCFDRFSTSxLH: <RSCANn_base> + $00D9_H$ + ($04_H$ × x)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFMC[7:0] | | | | | | | | — | — | — | — | RFIF | RFMLT | RFFLL | RFEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.129 RSCFDnCFDRFSTSx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 to 8 | RFMC[7:0] | Receive FIFO Unread Message Counter<br>The number of unread messages stored in the receive FIFO buffer is displayed. |
| 7 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | RFIF | Receive FIFO Interrupt Request Flag<br>0: No receive FIFO interrupt request is present.<br>1: A receive FIFO interrupt request is present. |
| 2 | RFMLT | Receive FIFO Message Lost Flag<br>0: No receive FIFO message is lost.<br>1: A receive FIFO message is lost. |
| 1 | RFFLL | Receive FIFO Buffer Full Status Flag<br>0: The receive FIFO buffer is not full.<br>1: The receive FIFO buffer is full. |
| 0 | RFEMP | Receive FIFO Buffer Empty Status Flag<br>0: The receive FIFO buffer contains unread message.<br>1: The receive FIFO buffer contains no unread message (buffer empty). |

#### RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes $00_H$ when the RFE bit in the RSCFDnCFDRFCCx register is set to 0.

This flag is 00H in global reset mode.

### RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

### RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

**NOTE**

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to other flags.

### 21.5.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

**Access:** RSCFDnCFDRFPCTRx register is a write-only register that can be written in 32-bit units
RSCFDnCFDRFPCTRxL register is a write-only register that can be written in 16-bit units
RSCFDnCFDRFPCTRxLL register is a write-only register that can be written in 8-bit units

**Address:** RSCFDnCFDRFPCTRx: <RSCANn_base> + $00F8_H$ + ($04_H$ × x)

RSCFDnCFDRFPCTRxL: <RSCANn_base> + $00F8_H$ + ($04_H$ × x)

RSCFDnCFDRFPCTRxLL: <RSCANn_base> + $00F8_H$ + ($04_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | RFPC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.130 RSCFDnCFDRFPCTRx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | RFPC[7:0] | Receive FIFO Pointer Control<br>When these bits are set to $FF_H$, the read pointer moves to the next unread message in the receive FIFO buffer. |

When the RFDMAEx value in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

#### RFPC[7:0] Bits

When the RFPC[7:0] bits are set to $FF_H$, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSx register is decremented. Read the RSCFDnCFDRFIDx, RSCFDnCFDRFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write $FF_H$ to the RFPC[7:0] bits.

When writing $FF_H$ to these bits, make sure that the RFE bit in the RSCFDnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

### 21.5.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

**Access:** RSCFDnCFDRFIDx register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFIDxL, RSCFDnCFDRFIDxH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRFIDxLL, RSCFDnCFDRFIDxLH, RSCFDnCFDRFIDxHL, RSCFDnCFDRFIDxHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDRFIDx: <RSCANn_base> + $3000_H$ + ($80_H$ × x)

RSCFDnCFDRFIDxL: <RSCANn_base> + $3000_H$ + ($80_H$ × x),
RSCFDnCFDRFIDxH: <RSCANn_base> + $3002_H$ + ($80_H$ × x)

RSCFDnCFDRFIDxLL: <RSCANn_base> + $3000_H$ + ($80_H$ × x),
RSCFDnCFDRFIDxLH: <RSCANn_base> + $3001_H$ + ($80_H$ × x),
RSCFDnCFDRFIDxHL: <RSCANn_base> + $3002_H$ + ($80_H$ × x),
RSCFDnCFDRFIDxHH: <RSCANn_base> + $3003_H$ + ($80_H$ × x)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.131 RSCFDnCFDRFIDx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | RFIDE | Receive FIFO Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | RFRTR | Receive FIFO Buffer RTR/RRS<br>• When the received message is a classical CAN frame<br>0: Data frame<br>1: Remote frame<br>• When the received message is a CAN FD frame<br>The RRS bit value of the received message can be read. |
| 29 | Reserved | When read, the value after reset is returned. |
| 28 to 0 | RFID[28:0] | Receive FIFO Buffer ID Data<br>The standard ID or extended ID of received message can be read.<br>Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

#### RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

#### RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

#### RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

### 21.5.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

**Access:** RSCFDnCFDRFPTRx register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFPTRxL, RSCFDnCFDRFPTRxH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRFPTRxLL, RSCFDnCFDRFPTRxLH, RSCFDnCFDRFPTRxHL, RSCFDnCFDRFPTRxHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDRFPTRx: <RSCANn_base> + $3004_H$ + ($80_H$ × x)

RSCFDnCFDRFPTRxL: <RSCANn_base> + $3004_H$ + ($80_H$ × x),
RSCFDnCFDRFPTRxH: <RSCANn_base> + $3006_H$ + ($80_H$ × x)

RSCFDnCFDRFPTRxLL: <RSCANn_base> + $3004_H$ + ($80_H$ × x),
RSCFDnCFDRFPTRxLH: <RSCANn_base> + $3005_H$ + ($80_H$ × x),
RSCFDnCFDRFPTRxHL: <RSCANn_base> + $3006_H$ + ($80_H$ × x),
RSCFDnCFDRFPTRxHH: <RSCANn_base> + $3007_H$ + ($80_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

#### RFDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive FIFO buffer.

#### RFPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive FIFO buffer.

#### RFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive FIFO buffer.

### 21.5.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7)

**Access:** RSCFDnCFDRFFDSTSx register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFFDSTSxL register is a read-only register that can be read in 16-bit units
RSCFDnCFDRFFDSTSxLL register is a read-only register that can be read in 8-bit units

**Address:** RSCFDnCFDRFFDSTSx: <RSCANn_base> + $3008_H$ + ($80_H$ × x)

RSCFDnCFDRFFDSTSxL: <RSCANn_base> + $3008_H$ + ($80_H$ × x)

RSCFDnCFDRFFDSTSxLL: <RSCANn_base> + $3008_H$ + ($80_H$ × x)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.133 RSCFDnCFDRFFDSTSx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | RFFDF | FDF<br>0: Classical CAN frame<br>1: CAN FD frame |
| 1 | RFBRS | BRS<br>0: The bit rate in the data area does not change.<br>1: The bit rate in the data area changes. |
| 0 | RFESI | ESI<br>0: Error active node<br>1: Error passive node |

#### RFFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive FIFO buffer.

#### RFBRS Bit

When the RFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

#### RFESI Bit

When the RFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

### 21.5.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7)

**Access:** RSCFDnCFDRFDFd_x register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFDFd_xL, RSCFDnCFDRFDFd_xH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRFDFd_xLL, RSCFDnCFDRFDFd_xLH, RSCFDnCFDRFDFd_xHL, RSCFDnCFDRFDFd_xHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDRFDFd_x: <RSCANn_base> + $300C_H$ + ($04_H$ × d) + ($80_H$ × x)

RSCFDnCFDRFDFd_xL: <RSCANn_base> + $300C_H$ + ($04_H$ × d) + ($80_H$ × x),
RSCFDnCFDRFDFd_xH: <RSCANn_base> + $300E_H$ + ($04_H$ × d) + ($80_H$ × x)

RSCFDnCFDRFDFd_xLL: <RSCANn_base> + $300C_H$ + ($04_H$ × d) + ($80_H$ × x),
RSCFDnCFDRFDFd_xLH: <RSCANn_base> + $300D_H$ + ($04_H$ × d) + ($80_H$ × x),
RSCFDnCFDRFDFd_xHL: <RSCANn_base> + $300E_H$ + ($04_H$ × d) + ($80_H$ × x),
RSCFDnCFDRFDFd_xHH: <RSCANn_base> + $300F_H$ + ($04_H$ × d) + ($80_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.134 RSCFDnCFDRFDFd_x Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RFDB4 × d + 3 [7:0] | Receive Buffer Data Byte 4 × d + 3<br>Receive Buffer Data Byte 4 × d + 2<br>Receive Buffer Data Byte 4 × d + 1<br>Receive Buffer Data Byte 4 × d + 0 |
| 23 to 16 | RFDB4 × d + 2 [7:0] | |
| 15 to 8 | RFDB4 × d + 1 [7:0] | Data for a message stored in the receive buffer can be read. |
| 7 to 0 | RFDB4 × d + 0 [7:0] | |

When the RFDLC[3:0] value in the RSCFDnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as $00_H$.

Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register. Do not read or write the RSCFDnCFDRFDFd_x register corresponding to an area larger than the specified size.

## 21.5.8 Transmit/Receive FIFO Buffer Related Registers

### 21.5.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 17)

**Access:** RSCFDnCFDCFCCk register can be read or written in 32-bit units
RSCFDnCFDCFCCkL, RSCFDnCFDCFCCkH registers can be read or written in 16-bit units
RSCFDnCFDCFCCkLL, RSCFDnCFDCFCCkLH, RSCFDnCFDCFCCkHL, RSCFDnCFDCFCCkHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDCFCCk: <RSCANn_base> + $0118_H$ + ($04_H$ × k)

RSCFDnCFDCFCCkL: <RSCANn_base> + $0118_H$ + ($04_H$ × k),
RSCFDnCFDCFCCkH: <RSCANn_base> + $011A_H$ + ($04_H$ × k)

RSCFDnCFDCFCCkLL: <RSCANn_base> + $0118_H$ + ($04_H$ × k),
RSCFDnCFDCFCCkLH: <RSCANn_base> + $0119_H$ + ($04_H$ × k),
RSCFDnCFDCFCCkHL: <RSCANn_base> + $011A_H$ + ($04_H$ × k),
RSCFDnCFDCFCCkHH: <RSCANn_base> + $011B_H$ + ($04_H$ × k)

**Value after reset:** $0000\ 0000_H$

| 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 | CFTXIE | Transmit/Receive FIFO Transmit Interrupt Enable<br>0: Transmit/receive FIFO transmit interrupt is disabled.<br>1: Transmit/receive FIFO transmit interrupt is enabled. |
| 1 | CFRXIE | Transmit/Receive FIFO Receive Interrupt Enable<br>0: Transmit/receive FIFO receive interrupt is disabled.<br>1: Transmit/receive FIFO receive interrupt is enabled. |
| 0 | CFE | Transmit/Receive FIFO Buffer Enable<br>0: No transmit/receive FIFO buffer is used.<br>1: Transmit/receive FIFO buffers are used. |

### CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to $01_B$ (transmit mode) or $10_B$ (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

#### CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to $01_B$ (transmit mode) or $10_B$ (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 21.91** and **Table 21.92**, for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to $001_B$ or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register × 10.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel does not handle the CAN FD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

#### CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to $00_B$ (receive mode) or $10_B$ (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to $001_B$ (4 messages), set the CFIGCV[2:0] bits to $001_B$, $011_B$, $101_B$, or $111_B$.

Modify these bits only in global reset mode.

#### CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

#### CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to $000_B$, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

#### CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

#### CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCFDnCFDCFCCk register have been set, set this bit to 1 by using other instructions.

### 21.5.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 17)

**Access:** RSCFDnCFDCFSTSk register can be read or written in 32-bit units
RSCFDnCFDCFSTSkL register can be read or written in 16-bit units
RSCFDnCFDCFSTSkLL register can be read or written in 8-bit units
RSCFDnCFDCFSTSkLH register is a read-only register that can be read in 8-bit units

**Address:** RSCFDnCFDCFSTSk: <RSCANn_base> + $0178_H$ + ($04_H$ × k)

RSCFDnCFDCFSTSkL: <RSCANn_base> + $0178_H$ + ($04_H$ × k)

RSCFDnCFDCFSTSkLL: <RSCANn_base> + $0178_H$ + ($04_H$ × k),
RSCFDnCFDCFSTSkLH: <RSCANn_base> + $0179_H$ + ($04_H$ × k)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.136 RSCFDnCFDCFSTSk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 to 8 | CFMC[7:0] | Transmit/Receive FIFO Message Counter<br>The number of messages stored in the transmit/receive FIFO buffer. |
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | CFTXIF | Transmit/Receive FIFO Transmit Interrupt Request Flag<br>0: No transmit/receive FIFO transmit interrupt request is present.<br>1: A transmit/receive FIFO transmit interrupt request is present. |
| 3 | CFRXIF | Transmit/Receive FIFO Receive Interrupt Request Flag<br>0: No transmit/receive FIFO receive interrupt request is present.<br>1: A transmit/receive FIFO receive interrupt request is present. |
| 2 | CFMLT | Transmit/Receive FIFO Message Lost Flag<br>0: No transmit/receive FIFO message is lost.<br>1: A transmit/receive FIFO message is lost. |
| 1 | CFFLL | Transmit/Receive FIFO Buffer Full Status Flag<br>0: The transmit/receive FIFO buffer is not full.<br>1: The transmit/receive FIFO buffer is full. |
| 0 | CFEMP | Transmit/Receive FIFO Buffer Empty Status Flag<br>0: The transmit/receive FIFO buffer contains messages.<br>1: The transmit/receive FIFO buffer contains no message (buffer empty). |

#### CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCFDnCFDCFCCk register.

- When CFM[1:0] value is $01_B$ (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is $00_B$ (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is $10_B$ (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is $00_B$: In global reset mode
- When CFM[1:0] value is $01_B$ or $10_B$: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

#### CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $01_B$ or $10_B$, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_B$ or $10_B$, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCFDnCFDCFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCFDnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not performing transmit abort
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

### CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_B$: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): When not performing transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_B$ or $10_B$: When at least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to $01_B$: When a value of $FF_H$ has been written to the RSCFDnCFDCFPCTRk register after data was written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers.

**NOTE**

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction, write “0” to the given flag and “1” to other flags.

### 21.5.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 17)

**Access:** RSCFDnCFDCFPCTRk register is a write-only register that can be written in 32-bit units
RSCFDnCFDCFPCTRkL register is a write-only register that can be written in 16-bit units
RSCFDnCFDCFPCTRkLL register is a write-only register that can be written in 8-bit units

**Address:** RSCFDnCFDCFPCTRk: <RSCANn_base> + $01D8_H$ + ($04_H$ × k)

RSCFDnCFDCFPCTRkL: <RSCANn_base> + $01D8_H$ + ($04_H$ × k)

RSCFDnCFDCFPCTRkLL: <RSCANn_base> + $01D8_H$ + ($04_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CFPC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.137 RSCFDnCFDCFPCTRk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | CFPC[7:0] | Transmit/Receive FIFO Pointer Control<br>• Receive mode:<br>Writing $FF_H$ to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer.<br>• Transmit mode:<br>Writing $FF_H$ to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer.<br>• Gateway mode:<br>Setting prohibited |

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer (k = 3 × m) allocated to channel m and when the CFDMAEm bit in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

#### CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is $00_B$):
  Writing $FF_H$ to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCFDnCFDCFSTSk register is decremented. Read the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write $FF_H$ to the CFPC[7:0] bits.
  When writing $FF_H$ to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is $01_B$):
  Writing $FF_H$ to the CFPC[7:0] bits stores the data written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers before writing $FF_H$ to the CFPC[7:0] bits.
  When writing $FF_H$ to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 and the CFFLL flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is $10_B$):
  Setting prohibited

### 21.5.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 17)

**Access:** RSCFDnCFDCFIDk register can be read or written in 32-bit units
RSCFDnCFDCFIDkL, RSCFDnCFDCFIDkH registers can be read or written in 16-bit units
RSCFDnCFDCFIDkLL, RSCFDnCFDCFIDkLH, RSCFDnCFDCFIDkHL, RSCFDnCFDCFIDkHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDCFIDk: <RSCANn_base> + $3400_H$ + ($80_H$ × k)

RSCFDnCFDCFIDkL: <RSCANn_base> + $3400_H$ + ($80_H$ × k),
RSCFDnCFDCFIDkH: <RSCANn_base> + $3402_H$ + ($80_H$ × k)

RSCFDnCFDCFIDkLL: <RSCANn_base> + $3400_H$ + ($80_H$ × k),
RSCFDnCFDCFIDkLH: <RSCANn_base> + $3401_H$ + ($80_H$ × k),
RSCFDnCFDCFIDkHL: <RSCANn_base> + $3402_H$ + ($80_H$ × k),
RSCFDnCFDCFIDkHH: <RSCANn_base> + $3403_H$ + ($80_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.138 RSCFDnCFDCFIDk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | CFIDE | Transmit/Receive FIFO Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | CFRTR | Transmit/Receive FIFO Buffer RTR/RRS<br>• When the CFM[1:0] value is $01_B$ (transmit mode)<br>– When the transmit message is a classical CAN frame<br>0: Data frame<br>1: Remote frame<br>– When the transmit message is a CAN FD frame<br>Write 0 to this bit.<br>• When the CFM[1:0] value is $00_B$ (receive mode)<br>– When the received message is a classical CAN frame<br>0: Data frame<br>1: Remote frame<br>– When the received message is a CAN FD frame<br>The RRS bit value of the received message can be read. |
| 29 | THLEN | Transmit History Data Store Enable<br>This bit is valid only when the CFM[1:0] value is $01_B$ (transmit mode).<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |
| 28 to 0 | CFID[28:0] | Transmit/Receive FIFO Buffer ID Data<br>• When CFM[1:0] value is $01_B$ (transmit mode):<br>Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.<br>• When CFM[1:0] value is $00_B$ (receive mode):<br>Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0. |

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is $01_B$ (transmit mode). This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). This RSCFDnCFDCFIDk register should not be read or written when the CFM[1:0] value is $10_B$ (gateway mode).

#### CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

#### CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. If the received message is a CAN FD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is $01_B$, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 1 (CAN FD frame), set this bit to 0.

#### THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is $01_B$ (transmit mode).

#### CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$.

When the CFM[1:0] value is $01_B$, these bits are used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

### 21.5.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 17)

**Access:** RSCFDnCFDCFPTRk register can be read or written in 32-bit units
RSCFDnCFDCFPTRkL, RSCFDnCFDCFPTRkH registers can be read or written in 16-bit units
RSCFDnCFDCFPTRkLL, RSCFDnCFDCFPTRkLH, RSCFDnCFDCFPTRkHL, RSCFDnCFDCFPTRkHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDCFPTRk: <RSCANn_base> + $3404_H$ + ($80_H$ × k)

RSCFDnCFDCFPTRkL: <RSCANn_base> + $3404_H$ + ($80_H$ × k),
RSCFDnCFDCFPTRkH: <RSCANn_base> + $3406_H$ + ($80_H$ × k)

RSCFDnCFDCFPTRkLL: <RSCANn_base> + $3404_H$ + ($80_H$ × k),
RSCFDnCFDCFPTRkLH: <RSCANn_base> + $3405_H$ + ($80_H$ × k),
RSCFDnCFDCFPTRkHL: <RSCANn_base> + $3406_H$ + ($80_H$ × k),
RSCFDnCFDCFPTRkHH: <RSCANn_base> + $3407_H$ + ($80_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | |
|---|---|---|
| 27 to 16 | CFPTR[11:0] | Transmit/Receive FIFO Buffer Label Data<br>• When CFM[1:0] value is $01_B$ (transmit mode):<br>Set the label information to be stored in the transmit history buffer.<br>Only bits CFPTR[7:0] are valid.<br>• When CFM[1:0] value is $00_B$ (receive mode):<br>The label information of the received message can be read. |

Table 21.139 RSCFDnCFDCFPTRk Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | CFTS[15:0] | Transmit/Receive FIFO Buffer Timestamp Data<br>These bits are valid only when the CFM[1:0] value is $00_B$ (receive mode).<br>The timestamp value of the received message can be read. |

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is $01_B$ (transmit mode). This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). This register should not be read or written when the CFM[1:0] value is $10_B$ (gateway mode).

### CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$.

When the CFM[1:0] value is $01_B$, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to $1001_B$ or more while the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 0 (CAN frame), 8-byte data is transmitted actually. When the CFFDF bit is 1 (CAN FD frame), the settable value range varies depending on the settings of the TMME bit in the RSCFDnCFDCmFDCFG register and the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

- When TMME bit = 0 (transmit buffer merge mode disabled):
  A value of $0000_B$ to $1111_B$ is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by CCH.
- When TMME bit = 1 (transmit buffer merge mode enabled):
  Set the data length within the payload storage size specified by the CFPLS[2:0] bits.

### CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

### CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is $00_B$.

### 21.5.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CAN FD Configuration/Status Register (k = 0 to 17)

**Access:** RSCFDnCFDCFFDCSTSk register can be read or written in 32-bit units
RSCFDnCFDCFFDCSTSkL register can be read or written in 16-bit units
RSCFDnCFDCFFDCSTSkLL register can be read or written in 8-bit units

**Address:** RSCFDnCFDCFFDCSTSk: <RSCANn_base> + $3408_H$ + ($80_H$ × k)

RSCFDnCFDCFFDCSTSkL: <RSCANn_base> + $3408_H$ + ($80_H$ × k)

RSCFDnCFDCFFDCSTSkLL: <RSCANn_base> + $3408_H$ + ($80_H$ × k)

**Value after reset:** $0000\ 0000_H$

**Table 21.140 RSCFDnCFDCFFDCSTSk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | CFFDF | FDF<br>0: Classical CAN frame<br>1: CAN FD frame |
| 1 | CFBRS | BRS<br>0: The bit rate in the data area does not change.<br>1: The bit rate in the data area changes. |
| 0 | CFESI | ESI<br>0: Error active node<br>1: Error passive node |

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is $01_B$ (transmit mode). This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). Do not read or write this register when the CFM[1:0] value is $10_B$ (gateway mode).

#### CFFDF Bit

When the CFM[1:0] value is $00_B$, this bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is $01_B$, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

#### CFBRS Bit

When the CFM[1:0] value is $00_B$, if the CFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is $01_B$, if the CFFDF bit is 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is 0, write 0 to this bit.

**CFESI Bit**

When the CFM[1:0] value is $00_B$, if the CFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is $01_B$, if the CFFDF bit is 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is 0, write 0 to this bit.

### 21.5.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 17)

**Access:** RSCFDnCFDCFDFd_k register can be read or written in 32-bit units
RSCFDnCFDCFDFd_kL, RSCFDnCFDCFDFd_kH registers can be read or written in 16-bit units
RSCFDnCFDCFDFd_kLL, RSCFDnCFDCFDFd_kLH, RSCFDnCFDCFDFd_kHL, RSCFDnCFDCFDFd_kHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDCFDFd_k: <RSCANn_base> + $340C_H$ + ($04_H$ × d) + ($80_H$ × k)

RSCFDnCFDCFDFd_kL: <RSCANn_base> + $340C_H$ + ($04_H$ × d) + ($80_H$ × k),
RSCFDnCFDCFDFd_kH: <RSCANn_base> + $340E_H$ + ($04_H$ × d) + ($80_H$ × k)

RSCFDnCFDCFDFd_kLL: <RSCANn_base> + $340C_H$ + ($04_H$ × d) + ($80_H$ × k),
RSCFDnCFDCFDFd_kLH: <RSCANn_base> + $340D_H$ + ($04_H$ × d) + ($80_H$ × k),
RSCFDnCFDCFDFd_kHL: <RSCANn_base> + $340E_H$ + ($04_H$ × d) + ($80_H$ × k),
RSCFDnCFDCFDFd_kHH: <RSCANn_base> + $340F_H$ + ($04_H$ × d) + ($80_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CFDB4 × d + 1 [7:0] | | | | | | | | CFDB4 × d + 0 [7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.141 RSCFDnCFDCFDFd_k Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | CFDB4 × d + 3 [7:0] | Transmit/Receive FIFO Buffer Data Byte 4 × d + 3<br>Transmit/Receive FIFO Buffer Data Byte 4 × d + 2<br>Transmit/Receive FIFO Buffer Data Byte 4 × d + 1<br>Transmit/Receive FIFO Buffer Data Byte 4 × d + 0<br>• When CFM[1:0] value is $01_B$ (transmit mode): Set the transmit/receive FIFO buffer data.<br>• When CFM[1:0] value is $00_B$ (receive mode): The message data stored in the transmit/receive FIFO buffer can be read. |
| 23 to 16 | CFDB4 × d + 2 [7:0] | |
| 15 to 8 | CFDB4 × d + 1 [7:0] | |
| 7 to 0 | CFDB4 × d + 0 [7:0] | |

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is $01_B$ (transmit mode).

This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). When the CFDLC[3:0] value in the RSCFDnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as $00_H$.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register. Do not read or write the RSCFDnCFDCFDFd_k register corresponding to an area larger than the specified size.

This register should not be read or written when the CFM[1:0] value is $10_B$ (gateway mode).

## 21.5.9 Details of FIFO Status-related Registers

### 21.5.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register

**Access:** RSCFDnCFDFESTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDFESTSL, RSCFDnCFDFESTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDFESTSLL, RSCFDnCFDFESTSLH, RSCFDnCFDFESTSHL, RSCFDnCFDFESTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDFESTS: <RSCANn_base> + $0238_H$

RSCFDnCFDFESTSL: <RSCANn_base> + $0238_H$,
RSCFDnCFDFESTSH: <RSCANn_base> + $023A_H$

RSCFDnCFDFESTSLL: <RSCANn_base> + $0238_H$,
RSCFDnCFDFESTSLH: <RSCANn_base> + $0239_H$,
RSCFDnCFDFESTSHL: <RSCANn_base> + $023A_H$,
RSCFDnCFDFESTSHH: <RSCANn_base> + $023B_H$

**Value after reset:** $03FF\ FFFF_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | CF17EMP | CF16EMP | CF15EMP | CF14EMP | CF13EMP | CF12EMP | CF11EMP | CF10EMP | CF9EMP | CF8EMP |

| 12 | CF4EMP | |
| 11 | CF3EMP | |
| 10 | CF2EMP | |
| 9 | CF1EMP | |
| 8 | CF0EMP | |

Table 21.142 RSCFDnCFDFESTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | RF7EMP | Receive FIFO Buffer Empty Status Flag<br>0: Receive FIFO buffer x contains an unread message.<br>1: Receive FIFO buffer x contains no unread message (buffer empty).<br>(x = 0 to 7) |
| 6 | RF6EMP | |
| 5 | RF5EMP | |
| 4 | RF4EMP | |
| 3 | RF3EMP | |
| 2 | RF2EMP | |
| 1 | RF1EMP | |
| 0 | RF0EMP | |

The RSCFDnCFDFESTS register is set to 03FF $FFFF_H$ in global reset mode.

### CFkEMP Flag (k = 0 to 17)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains message), the CFkEMP flag is cleared to 0.

### RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread message), the RFxEMP flag is cleared to 0.

### 21.5.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register

**Access:** RSCFDnCFDFFSTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDFFSTSL, RSCFDnCFDFFSTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDFFSTSLL, RSCFDnCFDFFSTSLH, RSCFDnCFDFFSTSHL, RSCFDnCFDFFSTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDFFSTS: <RSCANn_base> + $023C_H$

RSCFDnCFDFFSTSL: <RSCANn_base> + $023C_H$,
RSCFDnCFDFFSTSH: <RSCANn_base> + $023E_H$

RSCFDnCFDFFSTSLL: <RSCANn_base> + $023C_H$,
RSCFDnCFDFFSTSLH: <RSCANn_base> + $023D_H$,
RSCFDnCFDFFSTSHL: <RSCANn_base> + $023E_H$,
RSCFDnCFDFFSTSHH: <RSCANn_base> + $023F_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 21.143 RSCFDnCFDFFSTS Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 26 | Reserved | When read, the value after reset is returned. |
| 25 | CF17FLL | Transmit/Receive FIFO Buffer Full Status Flag<br>0: Transmit/receive buffer k is not full.<br>1: Transmit/receive buffer k is full.<br>(k = 0 to 17) |
| 24 | CF16FLL | |
| 23 | CF15FLL | |
| 22 | CF14FLL | |
| 21 | CF13FLL | |
| 20 | CF12FLL | |
| 19 | CF11FLL | |
| 18 | CF10FLL | |
| 17 | CF9FLL | |
| 16 | CF8FLL | |
| 15 | CF7FLL | |
| 14 | CF6FLL | |
| 13 | CF5FLL | |
| 12 | CF4FLL | |
| 11 | CF3FLL | |
| 10 | CF2FLL | |
| 9 | CF1FLL | |
| 8 | CF0FLL | |

Table 21.143 RSCFDnCFDFFSTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | RF7FLL | Receive FIFO Buffer Full Status Flag<br>0: Receive FIFO buffer x is not full.<br>1: Receive FIFO buffer x is full.<br>(x = 0 to 7) |
| 6 | RF6FLL | |
| 5 | RF5FLL | |
| 4 | RF4FLL | |
| 3 | RF3FLL | |
| 2 | RF2FLL | |
| 1 | RF1FLL | |
| 0 | RF0FLL | |

The RSCFDnCFDFFSTS register is cleared to 0000 $0000_H$ in global reset mode.

### CFkFLL Flag (k = 0 to 17)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

### RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

### 21.5.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register

**Access:** RSCFDnCFDFMSTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDFMSTSL, RSCFDnCFDFMSTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDFMSTSLL, RSCFDnCFDFMSTSLH, RSCFDnCFDFMSTSHL, RSCFDnCFDFMSTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDFMSTS: <RSCANn_base> + $0240_H$

RSCFDnCFDFMSTSL: <RSCANn_base> + $0240_H$,
RSCFDnCFDFMSTSH: <RSCANn_base> + $0242_H$

RSCFDnCFDFMSTSLL: <RSCANn_base> + $0240_H$,
RSCFDnCFDFMSTSLH: <RSCANn_base> + $0241_H$,
RSCFDnCFDFMSTSHL: <RSCANn_base> + $0242_H$,
RSCFDnCFDFMSTSHH: <RSCANn_base> + $0243_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 4 | RF4MLT | |
| 3 | RF3MLT | |
| 2 | RF2MLT | |
| 1 | RF1MLT | |
| 0 | RF0MLT | |

The RSCFDnCFDFMSTS register is cleared to 0000 $0000_H$ in global reset mode.

### CFkMLT Flag (k = 0 to 17)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

### RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

### 21.5.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

**Access:** RSCFDnCFDRFISTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFISTSL register is a read-only register that can be read in 16-bit units
RSCFDnCFDRFISTSLL register is a read-only register that can be read in 8-bit units

**Address:** RSCFDnCFDRFISTS: <RSCANn_base> + $0244_H$

RSCFDnCFDRFISTSL: <RSCANn_base> + $0244_H$

RSCFDnCFDRFISTSLL: <RSCANn_base> + $0244_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.145 RSCFDnCFDRFISTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned. |
| 7 | RF7IF | Receive FIFO Buffer Interrupt Request Status Flag<br>0: No receive FIFO buffer x interrupt request is present.<br>1: A receive FIFO buffer x interrupt request is present.<br>(x = 0 to 7) |
| 6 | RF6IF | |
| 5 | RF5IF | |
| 4 | RF4IF | |
| 3 | RF3IF | |
| 2 | RF2IF | |
| 1 | RF1IF | |
| 0 | RF0IF | |

The RSCFDnCFDRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

#### RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

### 21.5.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

**Access:** RSCFDnCFDCFRISTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDCFRISTSL, RSCFDnCFDCFRISTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDCFRISTSLL, RSCFDnCFDCFRISTSLH, RSCFDnCFDCFRISTSHL registers are read-only registers that can be ready in 8-bit units

**Address:** RSCFDnCFDCFRISTS: <RSCANn_base> + $0248_H$

RSCFDnCFDCFRISTSL: <RSCANn_base> + $0248_H$,
RSCFDnCFDCFRISTSH: <RSCANn_base> + $024A_H$

RSCFDnCFDCFRISTSLL: <RSCANn_base> + $0248_H$,
RSCFDnCFDCFRISTSLH: <RSCANn_base> + $0249_H$,
RSCFDnCFDCFRISTSHL: <RSCANn_base> + $024A_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 4 | CF4RXIF | |
| 3 | CF3RXIF | |
| 2 | CF2RXIF | |
| 1 | CF1RXIF | |
| 0 | CF0RXIF | |

The RSCFDnCFDCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

**CFkRXIF Flag (k = 0 to 17)**

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

### 21.5.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

**Access:** RSCFDnCFDCFTISTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDCFTISTSL, RSCFDnCFDCFTISTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDCFTISTSLL, RSCFDnCFDCFTISTSLH, RSCFDnCFDCFTISTSHL registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDCFTISTS: <RSCANn_base> + $024C_H$

RSCFDnCFDCFTISTSL: <RSCANn_base> + $024C_H$,
RSCFDnCFDCFTISTSH: <RSCANn_base> + $024E_H$

RSCFDnCFDCFTISTSLL: <RSCANn_base> + $024C_H$,
RSCFDnCFDCFTISTSLH: <RSCANn_base> + $024D_H$,
RSCFDnCFDCFTISTSHL: <RSCANn_base> + $024E_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 5 | CF5TXIF | |
| 4 | CF4TXIF | |
| 3 | CF3TXIF | |
| 2 | CF2TXIF | |
| 1 | CF1TXIF | |
| 0 | CF0TXIF | |

The RSCFDnCFDCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

**CFkTXIF Flag (k = 0 to 17)**

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

## 21.5.10 Details of FIFO DMA-Related Registers

### 21.5.10.1 RSCFDnCFDCDTCT — DMA Enable Register

**Access:** RSCFDnCFDCDTCT register can be read or written in 32-bit units
RSCFDnCFDCDTCTL register can be read or written in 16-bit units
RSCFDnCFDCDTCTLL, RSCFDnCFDCDTCTLH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDCDTCT: <RSCANn_base> + $0490_H$

RSCFDnCFDCDTCTL: <RSCANn_base> + $0490_H$

RSCFDnCFDCDTCTLL: <RSCANn_base> + $0490_H$,
RSCFDnCFDCDTCTLH: <RSCANn_base> + $0491_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 5 | RFDMAE5 | |
| 4 | RFDMAE4 | |
| 3 | RFDMAE3 | |
| 2 | RFDMAE2 | |
| 1 | RFDMAE1 | |
| 0 | RFDMAE0 | |

Modify the RSCFDnCFDCDTCT register in global operating mode or global test mode.

### CFDMAEm Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register is set to $00_B$ (receive mode). Set this bit to 0 when the CFM[1:0] value is $01_B$ (transmit mode) or $10_B$ (gateway mode).

### RFDMAEx Bit

This bit is used to enable DMA transfer for receive FIFO buffer x.

### 21.5.10.2 RSCFDnCFDCDTSTS — DMA Status Register

**Access:** RSCFDnCFDCDTSTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDCDTSTSL register is a read-only register that can be read in 16-bit units
RSCFDnCFDCDTSTSLL, RSCFDnCFDCDTSTSLH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDCDTSTS: <RSCANn_base> + $0494_H$

RSCFDnCFDCDTSTSL: <RSCANn_base> + $0494_H$

RSCFDnCFDCDTSTSLL: <RSCANn_base> + $0494_H$,
RSCFDnCFDCDTSTSLH: <RSCANn_base> + $0495_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.149 RSCFDnCFDCDTSTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 14 | Reserved | When read, the value after reset is returned. |
| 13 | CFDMASTS5 | Transmit/Receive FIFO Buffer 15 DMA Status<br>0: DMA transfer of transmit/receive FIFO buffer 15 is not in progress.<br>1: DMA transfer of transmit/receive FIFO buffer 15 is in progress. |
| 12 | CFDMASTS4 | Transmit/Receive FIFO Buffer 12 DMA Status<br>0: DMA transfer of transmit/receive FIFO buffer 12 is not in progress.<br>1: DMA transfer of transmit/receive FIFO buffer 12 is in progress. |
| 11 | CFDMASTS3 | Transmit/Receive FIFO Buffer 9 DMA Status<br>0: DMA transfer of transmit/receive FIFO buffer 9 is not in progress.<br>1: DMA transfer of transmit/receive FIFO buffer 9 is in progress. |
| 10 | CFDMASTS2 | Transmit/Receive FIFO Buffer 6 DMA Status<br>0: DMA transfer of transmit/receive FIFO buffer 6 is not in progress.<br>1: DMA transfer of transmit/receive FIFO buffer 6 is in progress. |
| 9 | CFDMASTS1 | Transmit/Receive FIFO Buffer 3 DMA Status<br>0: DMA transfer of transmit/receive FIFO buffer 3 is not in progress.<br>1: DMA transfer of transmit/receive FIFO buffer 3 is in progress. |
| 8 | CFDMASTS0 | Transmit/Receive FIFO Buffer 0 DMA Status<br>0: DMA transfer of transmit/receive FIFO buffer 0 is not in progress.<br>1: DMA transfer of transmit/receive FIFO buffer 0 is in progress. |
| 7 | RFDMASTS7 | Receive FIFO Buffer x DMA Status<br>0: DMA transfer of receive FIFO buffer x is not in progress.<br>1: DMA transfer of receive FIFO buffer x is in progress.<br>(x = 0 to 7) |
| 6 | RFDMASTS6 | |
| 5 | RFDMASTS5 | |
| 4 | RFDMASTS4 | |
| 3 | RFDMASTS3 | |
| 2 | RFDMASTS2 | |
| 1 | RFDMASTS1 | |
| 0 | RFDMASTS0 | |

#### CFDMASTSm Bit

When DMA transfer is enabled (CFDMAEm bit in the RSCFDnCFDCDTCT register is 1) for the transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTSm bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0), the CFDMASTSm bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTSm bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

#### RFDMASTSx Bit

When DMA transfer is enabled (corresponding RFDMAEx bit in the RSCFDnCFDCDTCT register is 1) for the receive FIFO buffer x and the receive FIFO buffer contains one of more messages, the RFDMAEx bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the receive FIFO buffer x have been transferred or DMA transfer is disabled (RFDMAEx bit = 0), the RFDMASTSx bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTSx bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

## 21.5.11 Details of Transmit Buffer-related Registers

### 21.5.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 95)

**Access:** RSCFDnCFDTMCp register can be read or written in 8-bit units

**Address:** RSCFDnCFDTMCp: <RSCANn_base> + $0250_H$ + ($01_H$ × p)

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TMOM | TMTAR | TMTR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W*1 | R/W*1 |

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.150 RSCFDnCFDTMCp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 | TMOM | One-Shot Transmission Enable<br>0: One-shot transmission is disabled.<br>1: One-shot transmission is enabled. |
| 1 | TMTAR | Transmit Abort Request<br>0: Transmit abort is not requested.<br>1: Transmit abort is requested. |
| 0 | TMTR | Transmit Request<br>0: Transmission is not requested.<br>1: Transmission is requested. |

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to $00_H$.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm (m = 0 to 5) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).
- RSCFDnCFDTMCp register (p = (m × 16) + 1, (m × 16) + 2, (m × 16) + 4, or (m × 16) + 5) corresponding to the transmit buffer allocated as a payload storage area when the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode)

Bits in the RSCFDnCFDTMCp register are all cleared to 0 in channel reset mode. Modify the RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

#### TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

#### TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or the one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

#### TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is $00_B$.

### 21.5.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 95)

**Access:** RSCFDnCFDTMSTSp register can be read or written in 8-bit units

**Address:** RSCFDnCFDTMSTSp: <RSCANn_base> + $02D0_H$ + ($01_H$ × p)

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | TMTARM | TMTRM | TMTRF[1:0] | | TMTSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R |

**Table 21.151 RSCFDnCFDTMSTSp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | TMTARM | Transmit Buffer Transmit Abort Request Status Flag<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |
| 3 | TMTRM | Transmit Buffer Transmit Request Status Flag<br>0: No transmit request is present.<br>1: A transmit request is present. |
| 2, 1 | TMTRF[1:0] | Transmit Buffer Transmit Result Status Flag<br>b2 b1<br>0 0: Transmission is in progress or no transmit request is present.<br>0 1: Transmit abort has been completed.<br>1 0: Transmission has been completed (without transmit abort request).<br>1 1: Transmission has been completed (with transmit abort request). |
| 0 | TMTSTS | Transmit Buffer Transmit Status Flag<br>0: Transmission is not in progress.<br>1: Transmission is in progress. |

The RSCFDnCFDTMSTSp register is cleared to all 0 in channel reset mode.

#### TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 0.

#### TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnCFDTMCp register is set to 0.

#### TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

$00_B$: Transmission is in progress or no transmit request is present.

$01_B$: Transmission from the transmit buffer was aborted.

$10_B$: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 0 (transmit abort is not requested).

$11_B$: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 1 (transmit abort is requested).

Write $00_B$ to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than $00_B$ to this flag.

#### TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

### 21.5.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 95)

**Access:** RSCFDnCFDTMIDp register can be read or written in 32-bit units
RSCFDnCFDTMIDpL, RSCFDnCFDTMIDpH registers can be read or written in 16-bit units
RSCFDnCFDTMIDpLL, RSCFDnCFDTMIDpLH, RSCFDnCFDTMIDpHL, RSCFDnCFDTMIDpHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDTMIDp: <RSCANn_base> + $4000_H$ + ($20_H$ × p)

RSCFDnCFDTMIDpL: <RSCANn_base> + $4000_H$ + ($20_H$ × p),
RSCFDnCFDTMIDpH: <RSCANn_base> + $4002_H$ + ($20_H$ × p)

RSCFDnCFDTMIDpLL: <RSCANn_base> + $4000_H$ + ($20_H$ × p),
RSCFDnCFDTMIDpLH: <RSCANn_base> + $4001_H$ + ($20_H$ × p),
RSCFDnCFDTMIDpHL: <RSCANn_base> + $4002_H$ + ($20_H$ × p),
RSCFDnCFDTMIDpHH: <RSCANn_base> + $4003_H$ + ($20_H$ × p)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMIDE | TMRTR | THLEN | TMID[28:16] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 21.152 RSCFDnCFDTMIDp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | TMIDE | Transmit Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | TMRTR | Transmit Buffer RTR/RRS<br>• When the transmit message is a classical CAN frame<br>0: Data frame<br>1: Remote frame<br>• When the transmit message is a CAN FD frame<br>Write 0 to this bit. |
| 29 | THLEN | Transmit History Data Store Enable<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |
| 28 to 0 | TMID[28:0] | Transmit Buffer ID Data<br>Set standard ID or extended ID.<br>For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

#### TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

#### TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

Set this bit to 0 when the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 1 (CAN FD frame).

#### THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

#### TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

### 21.5.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 95)

**Access:** RSCFDnCFDTMPTRp register can be read or written in 32-bit units
RSCFDnCFDTMPTRpH register can be read or written in 16-bit units
RSCFDnCFDTMPTRpHL, RSCFDnCFDTMPTRpHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDTMPTRp: <RSCANn_base> + $4004_H$ + ($20_H$ × p)

RSCFDnCFDTMPTRpH: <RSCANn_base> + $4006_H$ + ($20_H$ × p)

RSCFDnCFDTMPTRpHL: <RSCANn_base> + $4006_H$ + ($20_H$ × p),
RSCFDnCFDTMPTRpHH: <RSCANn_base> + $4007_H$ + ($20_H$ × p)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.153 RSCFDnCFDTMPTRp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | TMDLC[3:0] | Transmit Buffer DLC Data |
| 27 to 24 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 to 16 | TMPTR[7:0] | Transmit Buffer Label Data<br>Set the label information to be stored in the transmit history buffer. |
| 15 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

| b31 | b30 | b29 | b28 | Classical CAN Frame | CAN FD Frame |
|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 data bytes | |
| 0 | 0 | 0 | 1 | 1 data byte | |
| 0 | 0 | 1 | 0 | 2 data bytes | |
| 0 | 0 | 1 | 1 | 3 data bytes | |
| 0 | 1 | 0 | 0 | 4 data bytes | |
| 0 | 1 | 0 | 1 | 5 data bytes | |
| 0 | 1 | 1 | 0 | 6 data bytes | |
| 0 | 1 | 1 | 1 | 7 data bytes | |
| 1 | 0 | 0 | 0 | 8 data bytes | |
| 1 | 0 | 0 | 1 | 8 data bytes | 12 data bytes |
| 1 | 0 | 1 | 0 | | 16 data bytes |
| 1 | 0 | 1 | 1 | | 20 data bytes |
| 1 | 1 | 0 | 0 | | 24 data bytes |
| 1 | 1 | 0 | 1 | | 32 data bytes |
| 1 | 1 | 1 | 0 | | 48 data bytes |
| 1 | 1 | 1 | 1 | | 64 data bytes |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

#### TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCFDnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to $1001_B$ or more while the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the TMFDF bit is 1 (CAN FD frame), the settable value range varies depending on the setting of the TMME bit in the RSCFDnCFDCmFDCFG register.

- When the TMME bit = 0 (transmit buffer merge mode disabled):
  A value of $0000_B$ to $1111_B$ is settable. If a value larger than $1100_B$ is set, payloads exceeding 20 bytes are padded by CCH.
- When the TMME bit = 1 (transmit buffer merge mode enabled):
  When the corresponding transmit buffer number p = (m × 16) + 0 or (m × 16) + 3, a value of $0000_B$ to $1111_B$ is settable. In other cases, set a value of $0000_B$ to $1011_B$ (20 data bytes).

When the TMRTR bit is 1 (remote frame), set the data length of a message to be requested.

#### TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

### 21.5.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 95)

**Access:** RSCFDnCFDTMFDCTRp register can be read or written in 32-bit units
RSCFDnCFDTMFDCTRpL register can be read or written in 16-bit units
RSCFDnCFDTMFDCTRpLL register can be read or written in 8-bit units

**Address:** RSCFDnCFDTMFDCTRp: <RSCANn_base> + $4008_H$ + ($20_H$ × p)

RSCFDnCFDTMFDCTRpL: <RSCANn_base> + $4008_H$ + ($20_H$ × p)

RSCFDnCFDTMFDCTRpLL: <RSCANn_base> + $4008_H$ + ($20_H$ × p)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | TMFDF | TMBRS | TMESI |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

**Table 21.154 RSCFDnCFDTMFDCTRp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | TMFDF | FDF<br>0: Classical CAN frame<br>1: CAN FD frame |
| 1 | TMBRS | BRS<br>0: The bit rate in the data area does not change.<br>1: The bit rate in the data area changes. |
| 0 | TMESI | ESI<br>0: Error active node<br>1: Error passive node |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer p (p = m × 16 + 15) of the corresponding channel.

#### TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

#### TMBRS Bit

When this bit is set to 1 while the TMFDF bit is 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is 0, write 0 to this bit.

**TMESI Bit**

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is 1. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is 0, write 0 to this bit.

### 21.5.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 95)

**Access:** RSCFDnCFDTMDFb_p register can be read or written in 32-bit units
RSCFDnCFDTMDFb_pL, RSCFDnCFDTMDFb_pH registers can be read or written in 16-bit units
RSCFDnCFDTMDFb_pLL, RSCFDnCFDTMDFb_pLH, RSCFDnCFDTMDFb_pHL, RSCFDnCFDTMDFb_pHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDTMDFb_p: <RSCANn_base> + $400C_H$ + ($04_H$ × b) + ($20_H$ × p)

RSCFDnCFDTMDFb_pL: <RSCANn_base> + $400C_H$ + ($04_H$ × b) + ($20_H$ × p),
RSCFDnCFDTMDFb_pH: <RSCANn_base> + $400E_H$ + ($04_H$ × b) + ($20_H$ × p)

RSCFDnCFDTMDFb_pLL: <RSCANn_base> + $400C_H$ + ($04_H$ × b) + ($20_H$ × p),
RSCFDnCFDTMDFb_pLH: <RSCANn_base> + $400D_H$ + ($04_H$ × b) + ($20_H$ × p),
RSCFDnCFDTMDFb_pHL: <RSCANn_base> + $400E_H$ + ($04_H$ × b) + ($20_H$ × p),
RSCFDnCFDTMDFb_pHH: <RSCANn_base> + $400F_H$ + ($04_H$ × b) + ($20_H$ × p)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMDB4 × b + 3 [7:0] | | | | | | | | TMDB4 × b + 2 [7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMDB4 × b + 1 [7:0] | | | | | | | | TMDB4 × b + 0 [7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.155 RSCFDnCFDTMDFb_p Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | TMDB4 × b + 3 [7:0] | Transmit Buffer Data Byte 4 × b + 3<br>Transmit Buffer Data Byte 4 × b + 2<br>Transmit Buffer Data Byte 4 × b + 1<br>Transmit Buffer Data Byte 4 × b + 0<br><br>Set the transmit buffer data. |
| 23 to 16 | TMDB4 × b + 2 [7:0] | |
| 15 to 8 | TMDB4 × b + 1 [7:0] | |
| 7 to 0 | TMDB4 × b + 0 [7:0] | |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

### 21.5.11.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0 to 2)

**Access:** RSCFDnCFDTMIECy register can be read or written in 32-bit units
RSCFDnCFDTMIECyL, RSCFDnCFDTMIECyH registers can be read or written in 16-bit units
RSCFDnCFDTMIECyLL, RSCFDnCFDTMIECyLH, RSCFDnCFDTMIECyHL, RSCFDnCFDTMIECyHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDTMIECy: <RSCANn_base> + $0390_H$ + ($04_H$ × y)

RSCFDnCFDTMIECyL: <RSCANn_base> + $0390_H$ + ($04_H$ × y),
RSCFDnCFDTMIECyH: <RSCANn_base> + $0392_H$ + ($04_H$ × y)

RSCFDnCFDTMIECyLL: <RSCANn_base> + $0390_H$ + ($04_H$ × y),
RSCFDnCFDTMIECyLH: <RSCANn_base> + $0391_H$ + ($04_H$ × y),
RSCFDnCFDTMIECyHL: <RSCANn_base> + $0392_H$ + ($04_H$ × y),
RSCFDnCFDTMIECyHH: <RSCANn_base> + $0393_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMIEp (p = y × 32 + 31 to y × 32 + 16 (y = 0, 1, 2)) | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 21.156 RSCFDnCFDTMIECy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | TMIEp | Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16)<br>0: Transmit buffer interrupt is disabled<br>1: Transmit buffer interrupt is enabled |
| 15 to 0 | TMIEp | Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmit buffer interrupt is disabled.<br>1: Transmit buffer interrupt is enabled. |

#### TMIEp Bits (p = 0 to 95)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode enable), set the bit corresponding to the transmit buffer allocated as a payload storage area to 0.

**Table 21.157** shows the bit assignment.

**Table 21.157 TMIEp Bit Assignment**

| Bit Position | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| . . | . . | . . |

## 21.5.12 Details of Transmit Buffer Status-related Registers

### 21.5.12.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0 to 2)

**Access:** RSCFDnCFDTMTRSTSy register is a read-only register that can be read in 32-bit units
RSCFDnCFDTMTRSTSyL, RSCFDnCFDTMTRSTSyH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDTMTRSTSyLL, RSCFDnCFDTMTRSTSyLH, RSCFDnCFDTMTRSTSyHL, RSCFDnCFDTMTRSTSyHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDTMTRSTSy: <RSCANn_base> + $0350_H$ + ($04_H$ × y)

RSCFDnCFDTMTRSTSyL: <RSCANn_base> + $0350_H$ + ($04_H$ × y),
RSCFDnCFDTMTRSTSyH: <RSCANn_base> + $0352_H$ + ($04_H$ × y)

RSCFDnCFDTMTRSTSyLL: <RSCANn_base> + $0350_H$ + ($04_H$ × y),
RSCFDnCFDTMTRSTSyLH: <RSCANn_base> + $0351_H$ + ($04_H$ × y),
RSCFDnCFDTMTRSTSyHL: <RSCANn_base> + $0352_H$ + ($04_H$ × y),
RSCFDnCFDTMTRSTSyHH: <RSCANn_base> + $0353_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTRSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0, 1, 2)) | | | | | | | | | | | | | | | |

**Table 21.158 RSCFDnCFDTMTRSTSy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | TMTRSTSp | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: No transmit request is present.<br>1: A transmit request is present. |
| 15 to 0 | TMTRSTSp | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit request is present.<br>1: A transmit request is present. |

#### TMTRSTSp Flags (p = 0 to 95)

These flags indicate the status of the TMTR bit in the RSCFDnCFDTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

**Table 21.159** shows the bit assignment.

**Table 21.159 TMTRSTSp Bit Assignment**

| Bit Position | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |

### 21.5.12.2 RSCFDnCFDTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0 to 2)

**Access:** RSCFDnCFDTMTARSTSy register is a read-only register that can be read in 32-bit units
RSCFDnCFDTMTARSTSyL, RSCFDnCFDTMTARSTSyH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDTMTARSTSyLL, RSCFDnCFDTMTARSTSyLH, RSCFDnCFDTMTARSTSyHL, RSCFDnCFDTMTARSTSyHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDTMTARSTSy: <RSCANn_base> + $0360_H$ + ($04_H$ × y)

RSCFDnCFDTMTARSTSyL: <RSCANn_base> + $0360_H$ + ($04_H$ × y),
RSCFDnCFDTMTARSTSyH: <RSCANn_base> + $0362_H$ + ($04_H$ × y)

RSCFDnCFDTMTARSTSyLL: <RSCANn_base> + $0360_H$ + ($04_H$ × y),
RSCFDnCFDTMTARSTSyLH: <RSCANn_base> + $0361_H$ + ($04_H$ × y),
RSCFDnCFDTMTARSTSyHL: <RSCANn_base> + $0362_H$ + ($04_H$ × y),
RSCFDnCFDTMTARSTSyHH: <RSCANn_base> + $0363_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | TMTARSTSp | Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |
| 15 to 0 | TMTARSTSp | Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |

#### TMTARSTSp Flags (p = 0 to 95)

These flags indicate the status of the TMTAR bit in the RSCFDnCFDTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

**Table 21.161** shows the bit assignment.

### 21.5.12.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0 to 2)

**Access:** RSCFDnCFDTMTCSTSy register is a read-only register that can be read in 32-bit units
RSCFDnCFDTMTCSTSyL, RSCFDnCFDTMTCSTSyH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDTMTCSTSyLL, RSCFDnCFDTMTCSTSyLH, RSCFDnCFDTMTCSTSyHL, RSCFDnCFDTMTCSTSyHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDTMTCSTSy: <RSCANn_base> + $0370_H$ + ($04_H$ × y)

RSCFDnCFDTMTCSTSyL: <RSCANn_base> + $0370_H$ + ($04_H$ × y),
RSCFDnCFDTMTCSTSyH: <RSCANn_base> + $0372_H$ + ($04_H$ × y)

RSCFDnCFDTMTCSTSyLL: <RSCANn_base> + $0370_H$ + ($04_H$ × y),
RSCFDnCFDTMTCSTSyLH: <RSCANn_base> + $0371_H$ + ($04_H$ × y),
RSCFDnCFDTMTCSTSyHL: <RSCANn_base> + $0372_H$ + ($04_H$ × y),
RSCFDnCFDTMTCSTSyHH: <RSCANn_base> + $0373_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

|---|---|---|
| 31 to 16 | TMTCSTSp | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: Transmission has not been completed.<br>1: Transmission has been completed. |
| 15 to 0 | TMTCSTSp | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmission has not been completed.<br>1: Transmission has been completed. |

#### TMTCSTSp Flags (p = 0 to 95)

When the TMTRF[1:0] flag in the RSCFDnCFDTMSTSp register is set to $10_B$ (transmission has been completed (without transmit abort request)) or $11_B$ (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1.

A TMTCSTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to $00_B$ or in channel reset mode.

**Table 21.163** shows the bit assignment.

**Table 21.163 TMTCSTSp Bit Assignment**

| Bit Position | Channel | Transmit Buffer Number |
|---|---|---|

### 21.5.12.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0 to 2)

**Access:** RSCFDnCFDTMTASTSy register is a read-only register that can be read in 32-bit units
RSCFDnCFDTMTASTSyL, RSCFDnCFDTMTASTSyH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDTMTASTSyLL, RSCFDnCFDTMTASTSyLH, RSCFDnCFDTMTASTSyHL, RSCFDnCFDTMTASTSyHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDTMTASTSy: <RSCANn_base> + $0380_H$ + ($04_H$ × y)

RSCFDnCFDTMTASTSyL: <RSCANn_base> + $0380_H$ + ($04_H$ × y),
RSCFDnCFDTMTASTSyH: <RSCANn_base> + $0382_H$ + ($04_H$ × y)

RSCFDnCFDTMTASTSyLL: <RSCANn_base> + $0380_H$ + ($04_H$ × y),
RSCFDnCFDTMTASTSyLH: <RSCANn_base> + $0381_H$ + ($04_H$ × y),
RSCFDnCFDTMTASTSyHL: <RSCANn_base> + $0382_H$ + ($04_H$ × y),
RSCFDnCFDTMTASTSyHH: <RSCANn_base> + $0383_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.164 RSCFDnCFDTMTASTSy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | TMTASTSp | Transmit Buffer Transmit Abort Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: Transmission is not aborted<br>1: Transmission is aborted |
| 15 to 0 | TMTASTSp | Transmit Buffer Transmit Abort Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmission is not aborted.<br>1: Transmission is aborted. |

#### TMTASTSp Flags (p = 0 to 95)

When the TMTRF[1:0] flag in the RSCFDnCFDTMSTSp register is set to $01_B$ (transmit abort has been completed), the corresponding TMTASTSp flag is set to 1.

A TMTASTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to $00_B$ or in channel reset mode.

**Table 21.165** shows the bit assignment.

**Table 21.165 TMTASTSp Bit Assignment**

| Bit Position | Channel | Transmit Buffer Number |
|---|---|---|

## 21.5.13 Details of Transmit Queue-related Registers

### 21.5.13.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 5)

**Access:** RSCFDnCFDTXQCCm register can be read or written in 32-bit units
RSCFDnCFDTXQCCmL register can be read or written in 16-bit units
RSCFDnCFDTXQCCmLL, RSCFDnCFDTXQCCmLH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDTXQCCm: <RSCANn_base> + $03A0_H$ + ($04_H$ × m)

RSCFDnCFDTXQCCmL: <RSCANn_base> + $03A0_H$ + ($04_H$ × m)

RSCFDnCFDTXQCCmLL: <RSCANn_base> + $03A0_H$ + ($04_H$ × m),
RSCFDnCFDTXQCCmLH: <RSCANn_base> + $03A1_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R/W |

**Table 21.166 RSCFDnCFDTXQCCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | TXQIM | Transmit Queue Interrupt Source Select<br>0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated.<br>1: A transmit queue interrupt request is generated each time a message has been transmitted. |
| 12 | TXQIE | Transmit Queue Interrupt Enable<br>0: Transmit queue interrupt is disabled.<br>1: Transmit queue interrupt is enabled. |
| 11 to 8 | TXQDC[3:0] | Transmit Queue Depth Configuration<br>Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available.<br>Setting these bits to 0 disables the transmit queue.<br>Setting these bits to 1 is prohibited.<br>For transmit buffer merge mode, set g to 2 to 9. |
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TXQE | Transmit Queue Enable<br>0: The transmit queue is not used.<br>1: The transmit queue is used. |

#### TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

#### TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

#### TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 21.9**.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode), transmit buffers (m × 16 + 5) to (m × 16 + 0) are merged and cannot be allocated to the transmit queue. Therefore, do not set TXQDC[3:0] bits to 10 to 15.

Modify these bits only in channel reset mode.

#### TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to $0010_B$ or more.

### 21.5.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 5)

**Access:** RSCFDnCFDTXQSTSm register can be read or written in 32-bit units
RSCFDnCFDTXQSTSmL register can be read or written in 16-bit units
RSCFDnCFDTXQSTSmLL register can be read or written in 8-bit units

**Address:** RSCFDnCFDTXQSTSm: <RSCANn_base> + $03C0_H$ + ($04_H$ × m)

RSCFDnCFDTXQSTSmL: <RSCANn_base> + $03C0_H$ + ($04_H$ × m)

RSCFDnCFDTXQSTSmLL: <RSCANn_base> + $03C0_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | TXQIF | TXQFLL | TXQEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.167 RSCFDnCFDTXQSTSm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | Reserved | When read, the undefined value is returned. When writing, write the value after reset. |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | TXQIF | Transmit Queue Interrupt Request Flag<br>0: No transmit queue interrupt request is present.<br>1: A transmit queue interrupt request is present. |
| 1 | TXQFLL | Transmit Queue Full Status Flag<br>0: The transmit queue is not full.<br>1: The transmit queue is full. |
| 0 | TXQEMP | Transmit Queue Empty Status Flag<br>0: The transmit queue contains messages.<br>1: The transmit queue contains no message (transmit queue empty). |

#### TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCFDnCFDTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCFDnCFDTXQCCm register to 0 (the transmit queue is not used).

### TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

### TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

### 21.5.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 5)

**Access:** RSCFDnCFDTXQPCTRm register is a write-only register that can be written in 32-bit units
RSCFDnCFDTXQPCTRmL register is a write-only register that can be written in 16-bit units
RSCFDnCFDTXQPCTRmLL register is a write-only register that can be written in 8-bit units

**Address:** RSCFDnCFDTXQPCTRm: <RSCANn_base> + $03E0_H$ + ($04_H$ × m)

RSCFDnCFDTXQPCTRmL: <RSCANn_base> + $03E0_H$ + ($04_H$ × m)

RSCFDnCFDTXQPCTRmLL: <RSCANn_base> + $03E0_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TXQPC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.168 RSCFDnCFDTXQPCTRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | TXQPC[7:0] | Transmit Queue Pointer Control<br>Writing $FF_H$ to these bits moves the write pointer of the transmit queue to the next queue buffer. |

#### TXQPC[7:0] Bits

Writing $FF_H$ to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDnCFDTMDFb_p registers (p = 15, 31, 47, 63, 79, and 95) before writing $FF_H$ to the TXQPC[7:0] bits.

When writing $FF_H$ to these bits, make sure that the TXQE bit in the RSCFDnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCFDnCFDTXQSTSm register is 0 (the transmit queue is not full).

## 21.5.14 Details of Transmit History-related Registers

### 21.5.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 5)

**Access:** RSCFDnCFDTHLCCm register can be read or written in 32-bit units
RSCFDnCFDTHLCCmL register can be read or written in 16-bit units
RSCFDnCFDTHLCCmLL, RSCFDnCFDTHLCCmLH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDTHLCCm: <RSCANn_base> + $0400_H$ + ($04_H$ × m)

RSCFDnCFDTHLCCmL: <RSCANn_base> + $0400_H$ + ($04_H$ × m)

RSCFDnCFDTHLCCmLL: <RSCANn_base> + $0400_H$ + ($04_H$ × m),
RSCFDnCFDTHLCCmLH: <RSCANn_base> + $0401_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | THLDTE | THLIM | THLIE | — | — | — | — | — | — | — | THLE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R | R | R | R | R | R | R | R/W |

**Table 21.169 RSCFDnCFDTHLCCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | THLDTE | Transmit History Target Buffer Select<br>0: Entry from transmit/receive FIFO buffers and transmit queue<br>1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue |
| 9 | THLIM | Transmit History Interrupt Source Select<br>0: When 12 sets of data have been stored in the transmit history buffer<br>1: When a single set of transmit history data has been stored |
| 8 | THLIE | Transmit History Interrupt Enable<br>0: Transmit history interrupt is disabled.<br>1: Transmit history interrupt is enabled. |
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | THLE | Transmit History Buffer Enable<br>0: Transmit history buffer is not used.<br>1: Transmit history buffer is used. |

#### THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

#### THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

#### THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

#### THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

### 21.5.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0 to 5)

**Access:** RSCFDnCFDTHLSTSm register can be read or written in 32-bit units
RSCFDnCFDTHLSTSmL register can be read or written in 16-bit units
RSCFDnCFDTHLSTSmLL register can be read or written in 8-bit units
RSCFDnCFDTHLSTSmLH register is a read-only register that can be read in 8-bit units

**Address:** RSCFDnCFDTHLSTSm: <RSCANn_base> + $0420_H$ + ($04_H$ × m)

RSCFDnCFDTHLSTSmL: <RSCANn_base> + $0420_H$ + ($04_H$ × m)

RSCFDnCFDTHLSTSmLL: <RSCANn_base> + $0420_H$ + ($04_H$ × m),
RSCFDnCFDTHLSTSmLH: <RSCANn_base> + $0421_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | THLMC[4:0] | | | | | — | — | — | — | THLIF | THLELT | THLFLL | THLEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.170 RSCFDnCFDTHLSTSm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | THLMC[4:0] | Transmit History Buffer Unread Data Counter<br>These bits indicate the number of unread data sets stored in the transmit history buffer. |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | THLIF | Transmit History Interrupt Request Flag<br>0: No transmit history interrupt request is present.<br>1: A transmit history interrupt request is present. |
| 2 | THLELT | Transmit History Buffer Overflow Flag<br>0: Transmit history buffer overflow has not occurred.<br>1: Transmit history buffer overflow has occurred. |
| 1 | THLFLL | Transmit history Buffer Full Status Flag<br>0: Transmit history buffer is not full.<br>1: Transmit history buffer is full. |
| 0 | THLEMP | Transmit History Buffer Empty Status Flag<br>0: Transmit history buffer contains unread data.<br>1: Transmit history buffer contains no unread data (buffer empty). |

#### THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

### THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

### THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

**NOTE**

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

### 21.5.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 5)

**Access:** RSCFDnCFDTHLPCTRm register is a write-only register that can be written in 32-bit units
RSCFDnCFDTHLPCTRmL register is a write-only register that can be written in 16-bit units
RSCFDnCFDTHLPCTRmLL register is a write-only register that can be written in 8-bit units

**Address:** RSCFDnCFDTHLPCTRm: <RSCANn_base> + $0440_H$ + ($04_H$ × m)

RSCFDnCFDTHLPCTRmL: <RSCANn_base> + $0440_H$ + ($04_H$ × m)

RSCFDnCFDTHLPCTRmLL: <RSCANn_base> + $0440_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | THLPC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.171 RSCFDnCFDTHLPCTRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | THLPC[7:0] | Transmit History List Pointer Control<br>Writing $FF_H$ to these bits moves the read pointer to the next unread data in the transmit history buffer. |

#### THLPC[7:0] Bits

When the THLPC[7:0] bits are set to $FF_H$, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCFDnCFDTHLSTSm register is decremented. Write $FF_H$ to the THLPC[7:0] bits after reading from the RSCFDnCFDTHLACCm register.

When writing $FF_H$ to these bits, make sure that the THLE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCFDnCFDTHLSTSm register is 0.

### 21.5.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0 to 5)

**Access:** RSCFDnCFDTHLACCm register is a read-only register that can be read in 32-bit units
RSCFDnCFDTHLACCmL, RSCFDnCFDTHLACCmH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDTHLACCmLL, RSCFDnCFDTHLACCmLH, RSCFDnCFDTHLACCmHL, RSCFDnCFDTHLACCmHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCFDnCFDTHLACCm: <RSCANn_base> + $6000_H$ + ($04_H$ × m)

RSCFDnCFDTHLACCmL: <RSCANn_base> + $6000_H$ + ($04_H$ × m),
RSCFDnCFDTHLACCmH: <RSCANn_base> + $6002_H$ + ($04_H$ × m)

RSCFDnCFDTHLACCmLL: <RSCANn_base> + $6000_H$ + ($04_H$ × m),
RSCFDnCFDTHLACCmLH: <RSCANn_base> + $6001_H$ + ($04_H$ × m),
RSCFDnCFDTHLACCmHL: <RSCANn_base> + $6002_H$ + ($04_H$ × m),
RSCFDnCFDTHLACCmHH: <RSCANn_base> + $6003_H$ + ($04_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTS[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TID[7:0] | | | | | | | | — | BN[3:0] | | | | BT[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.172 RSCFDnCFDTHLACCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | TMTS[15:0] | Timestamp Data<br>The timestamp data of stored data can be read. |
| 15 to 8 | TID[7:0] | Label Data<br>The label information of stored data can be read. |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 3 | BN[3:0] | Buffer Number Data<br>The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read. |
| 2 to 0 | BT[2:0] | Buffer Type Data<br>b2 b1 b0<br>0 0 1: Transmit buffer<br>0 1 0: Transmit/receive FIFO buffer<br>1 0 0: Transmit queue |

#### TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer are displayed.

#### TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

#### BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

**BT[2:0] Bits**

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

## 21.5.15 Details of Test-related Registers

### 21.5.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register

**Access:** RSCFDnCFDGTSTCFG register can be read or written in 32-bit units
RSCFDnCFDGTSTCFGL, RSCFDnCFDGTSTCFGH registers can be read or written in 16-bit units
RSCFDnCFDGTSTCFGLL, RSCFDnCFDGTSTCFGHL registers can be read or written in 8-bit units

**Address:** RSCFDnCFDGTSTCFG: <RSCANn_base> + $0468_H$

RSCFDnCFDGTSTCFGL: <RSCANn_base> + $0468_H$,
RSCFDnCFDGTSTCFGH: <RSCANn_base> + $046A_H$

RSCFDnCFDGTSTCFGLL: <RSCANn_base> + $0468_H$,
RSCFDnCFDGTSTCFGHL: <RSCANn_base> + $046A_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | RTMPS[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.173 RSCFDnCFDGTSTCFG Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | RTMPS[6:0] | RAM Test Page Configuration<br>Set a value within the range of page 0 ($00_H$) to page 83 ($53_H$). |
| 15 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | C5ICBCE | CAN5 Inter-channel Communication Test Enable<br>0: CAN5 inter-channel communication test is disabled<br>1: CAN5 inter-channel communication test is enabled. |
| 4 | C4ICBCE | CAN4 Inter-channel Communication Test Enable<br>0: CAN4 inter-channel communication test is disabled<br>1: CAN4 inter-channel communication test is enabled. |
| 3 | C3ICBCE | CAN3 Inter-channel Communication Test Enable<br>0: CAN3 inter-channel communication test is disabled<br>1: CAN3 inter-channel communication test is enabled. |
| 2 | C2ICBCE | CAN2 Inter-channel Communication Test Enable<br>0: CAN2 inter-channel communication test is disabled<br>1: CAN2 inter-channel communication test is enabled. |
| 1 | C1ICBCE | CAN1 Inter-Channel Communication Test Enable<br>0: CAN1 inter-channel communication test is disabled.<br>1: CAN1 inter-channel communication test is enabled. |
| 0 | C0ICBCE | CAN0 Inter-Channel Communication Test Enable<br>0: CAN0 inter-channel communication test is disabled.<br>1: CAN0 inter-channel communication test is enabled. |

Modify the RSCFDnCFDGTSTCFG register only in global test mode.

#### RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of $00_H$ to $53_H$, inclusive.

In CAN FD mode, do not access more than 64 bytes in the last page (RTMPS = $53_H$) during RAM test.

#### C5ICBCE Bit

Setting this bit to 1 enables the channel 5 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C4ICBCE Bit

Setting this bit to 1 enables the channel 4 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C3ICBCE Bit

Setting this bit to 1 enables the channel 3 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

#### C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

### 21.5.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register

**Access:** RSCFDnCFDGTSTCTR register can be read or written in 32-bit units
RSCFDnCFDGTSTCTRL register can be read or written in 16-bit units
RSCFDnCFDGTSTCTRLL register can be read or written in 8-bit units

**Address:** RSCFDnCFDGTSTCTR: <RSCANn_base> + $046C_H$

RSCFDnCFDGTSTCTRL: <RSCANn_base> + $046C_H$

RSCFDnCFDGTSTCTRLL: <RSCANn_base> + $046C_H$

**Table 21.174 RSCFDnCFDGTSTCTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | RTME | RAM Test Enable<br>0: RAM test is disabled.<br>1: RAM test is enabled. |
| 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ICBCTME | Communication Test between Channels Enable<br>0: Communication test between channels disabled<br>1: Communication test between channels enabled |

#### RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCFDnCFDGCTR register to $10_B$ (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

#### ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 5) in the RSCFDnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

### 21.5.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register

**Access:** RSCFDnCFDGLOCKK register is a write-only register that can be written in 32-bit units.
RSCFDnCFDGLOCKKL register is a write-only register that can be written in 16-bit units.

**Address:** RSCFDnCFDGLOCKK: <RSCANn_base> + $047C_H$

RSCFDnCFDGLOCKKL: <RSCANn_base> + $047C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LOCK[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 |

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

**Table 21.175 RSCFDnCFDGLOCKK Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When writing, write the value after reset. |
| 15 to 0 | LOCK[15:0] | Lock Key<br>These bits are key bits to release protection of test mode. |

The RSCFDnCFDGLOCKK register is used to release the protection of special test bits and is write only.

For the protection release data, see **Section 21.11.4.2, Procedure for Releasing the Protection**.

#### LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCANn_base> + $0000_H$ to <RSCANn_base> + $0FFF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

### 21.5.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63)

**Access:** RSCFDnCFDRPGACCr register can be read or written in 32-bit units
RSCFDnCFDRPGACCrL, RSCFDnCFDRPGACCrH registers can be read or written in 16-bit units
RSCFDnCFDRPGACCrLL, RSCFDnCFDRPGACCrLH, RSCFDnCFDRPGACCrHL,
RSCFDnCFDRPGACCrHH registers can be read or written in 8-bit units

**Address:** RSCFDnCFDRPGACCr: <RSCANn_base> + $6400_H$ + ($04_H$ × r)

RSCFDnCFDRPGACCrL: <RSCANn_base> + $6400_H$ + ($04_H$ × r),
RSCFDnCFDRPGACCrH: <RSCANn_base> + $6402_H$ + ($04_H$ × r)

RSCFDnCFDRPGACCrLL: <RSCANn_base> + $6400_H$ + ($04_H$ × r),
RSCFDnCFDRPGACCrLH: <RSCANn_base> + $6401_H$ + ($04_H$ × r),
RSCFDnCFDRPGACCrHL: <RSCANn_base> + $6402_H$ + ($04_H$ × r),
RSCFDnCFDRPGACCrHH: <RSCANn_base> + $6403_H$ + ($04_H$ × r)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RDTA[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.176 RSCFDnCFDRPGACCr Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | RDTA[31:0] | RAM Data Test Access<br>Data can be read and written in RSCAN RAM. |

Modify the RSCFDnCFDRPGACCr register in global test mode with the RTME bit in the RSCFDnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RSCFDnCFDRPGACCr register is readable and writable when the RTME bit is set to 1.

## 21.6 Interrupt Sources and DMA Trigger

### 21.6.1 Interrupt Sources

The RS-CANFD module has 20 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources):
  Receive FIFO interrupt
  Global error interrupt
- Channel interrupts (3 sources/channel):
  CANm transmit interrupt (m = 0 to 5)
  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)
  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

**Table 21.177** lists the CAN interrupt sources. **Figure 21.2** shows the CAN global interrupt block diagram. **Figure 21.3** shows the CAN channel interrupt block diagram.

**Table 21.177 List of CAN Interrupt Sources**

| Interrupt Source | | | Corresponding Interrupt Request Flag | Corresponding Interrupt Enable Bit |
|---|---|---|---|---|
| Global interrupts | Receive FIFO | Receive FIFO 0 | RFIF in the RSCANn(CFD)RFSTS0 register | RFIE in the RSCANn(CFD)RFCC0 register |
| | | Receive FIFO 1 | RFIF in the RSCANn(CFD)RFSTS1 register | RFIE in the RSCANn(CFD)RFCC1 register |
| | | Receive FIFO 2 | RFIF in the RSCANn(CFD)RFSTS2 register | RFIE in the RSCANn(CFD)RFCC2 register |
| | | Receive FIFO 3 | RFIF in the RSCANn(CFD)RFSTS3 register | RFIE in the RSCANn(CFD)RFCC3 register |
| | | Receive FIFO 4 | RFIF in the RSCANn(CFD)RFSTS4 register | RFIE in the RSCANn(CFD)RFCC4 register |
| | | Receive FIFO 5 | RFIF in the RSCANn(CFD)RFSTS5 register | RFIE in the RSCANn(CFD)RFCC5 register |
| | | Receive FIFO 6 | RFIF in the RSCANn(CFD)RFSTS6 register | RFIE in the RSCANn(CFD)RFCC6 register |
| | | Receive FIFO 7 | RFIF in the RSCANn(CFD)RFSTS7 register | RFIE in the RSCANn(CFD)RFCC7 register |
| | Global error | | • DEF in the RSCANn(CFD)GERFL register<br>• MES in the RSCANn(CFD)GERFL register<br>• THLES in the RSCANn(CFD)GERFL register<br>• CMPOF in the RSCFDnCFDGERFL register | • DEIE in the RSCANn(CFD)GCTR register<br>• MEIE in the RSCANn(CFD)GCTR register<br>• THLEIE in the RSCANn(CFD)GCTR register<br>• CMPOFIE in the RSCFDnCFDGCTR register |
| Channel interrupts (m = 0 to 5) | CANm transmit | CANm transmit complete | TMTRF[1:0] in the RSCANn(CFD)TMSTSp register | TMIEp in the RSCANn(CFD)TMIECy register |
| | | CANm transmit abort | TMTRF[1:0] in the RSCANn(CFD)TMSTSp register | TAIE in the RSCANn(CFD)CmCTR register |
| | | CANm transmit/ receive FIFO transmit complete | CFTXIF in the RSCANn(CFD)CFSTSk register | CFTXIE in the RSCANn(CFD)CFCCk register |
| | | CANm transmit queue | TXQIF in the RSCANn(CFD)TXQSTSm register | TXQIE in the RSCANn(CFD)TXQCCm register |
| | | CANm transmit history | THLIF in the RSCANn(CFD)THLSTSm register | THLIE in the RSCANn(CFD)THLCCm register |
| | CANm transmit/receive FIFO receive complete | | CFRXIF in the RSCANn(CFD)CFSTSk register | CFRXIE in the RSCANn(CFD)CFCCk register |
| | CANm error | | • BEF in the RSCANn(CFD)CmERFL register<br>• ALF in the RSCANn(CFD)CmERFL register<br>• BLF in the RSCANn(CFD)CmERFL register<br>• OVLF in the RSCANn(CFD)CmERFL register<br>• BORF in the RSCANn(CFD)CmERFL register<br>• BOEF in the RSCANn(CFD)CmERFL register<br>• EPF in the RSCANn(CFD)CmERFL register<br>• EWF in the RSCANn(CFD)CmERFL register<br>• SOCO in the RSCFDnCFDCmFDSTS register<br>• EOCO in the RSCFDnCFDCmFDSTS register<br>• TDCVF in the RSCFDnCFDCmFDSTS register | • BEIE in the RSCANn(CFD)CmCTR register<br>• ALIE in the RSCANn(CFD)CmCTR register<br>• BLIE in the RSCANn(CFD)CmCTR register<br>• OLIE in the RSCANn(CFD)CmCTR register<br>• BORIE in the RSCANn(CFD)CmCTR register<br>• BOEIE in the RSCANn(CFD)CmCTR register<br>• EPIE in the RSCANn(CFD)CmCTR register<br>• EWIE in the RSCANn(CFD)CmCTR register<br>• SOCOIE in the RSCFDnCFDCmCTR register<br>• EOCOIE in the RSCFDnCFDCmCTR register<br>• TDCVFIE in the RSCFDnCFDCmCTR register |

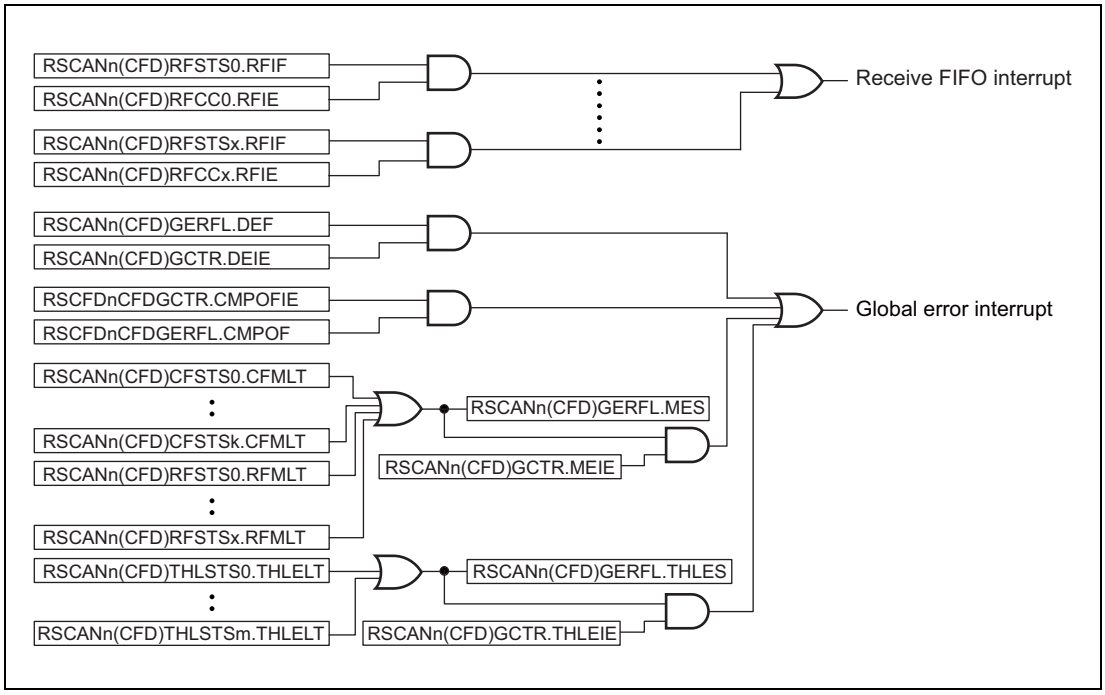

**Figure 21.2 CAN Global Interrupt Block Diagram**

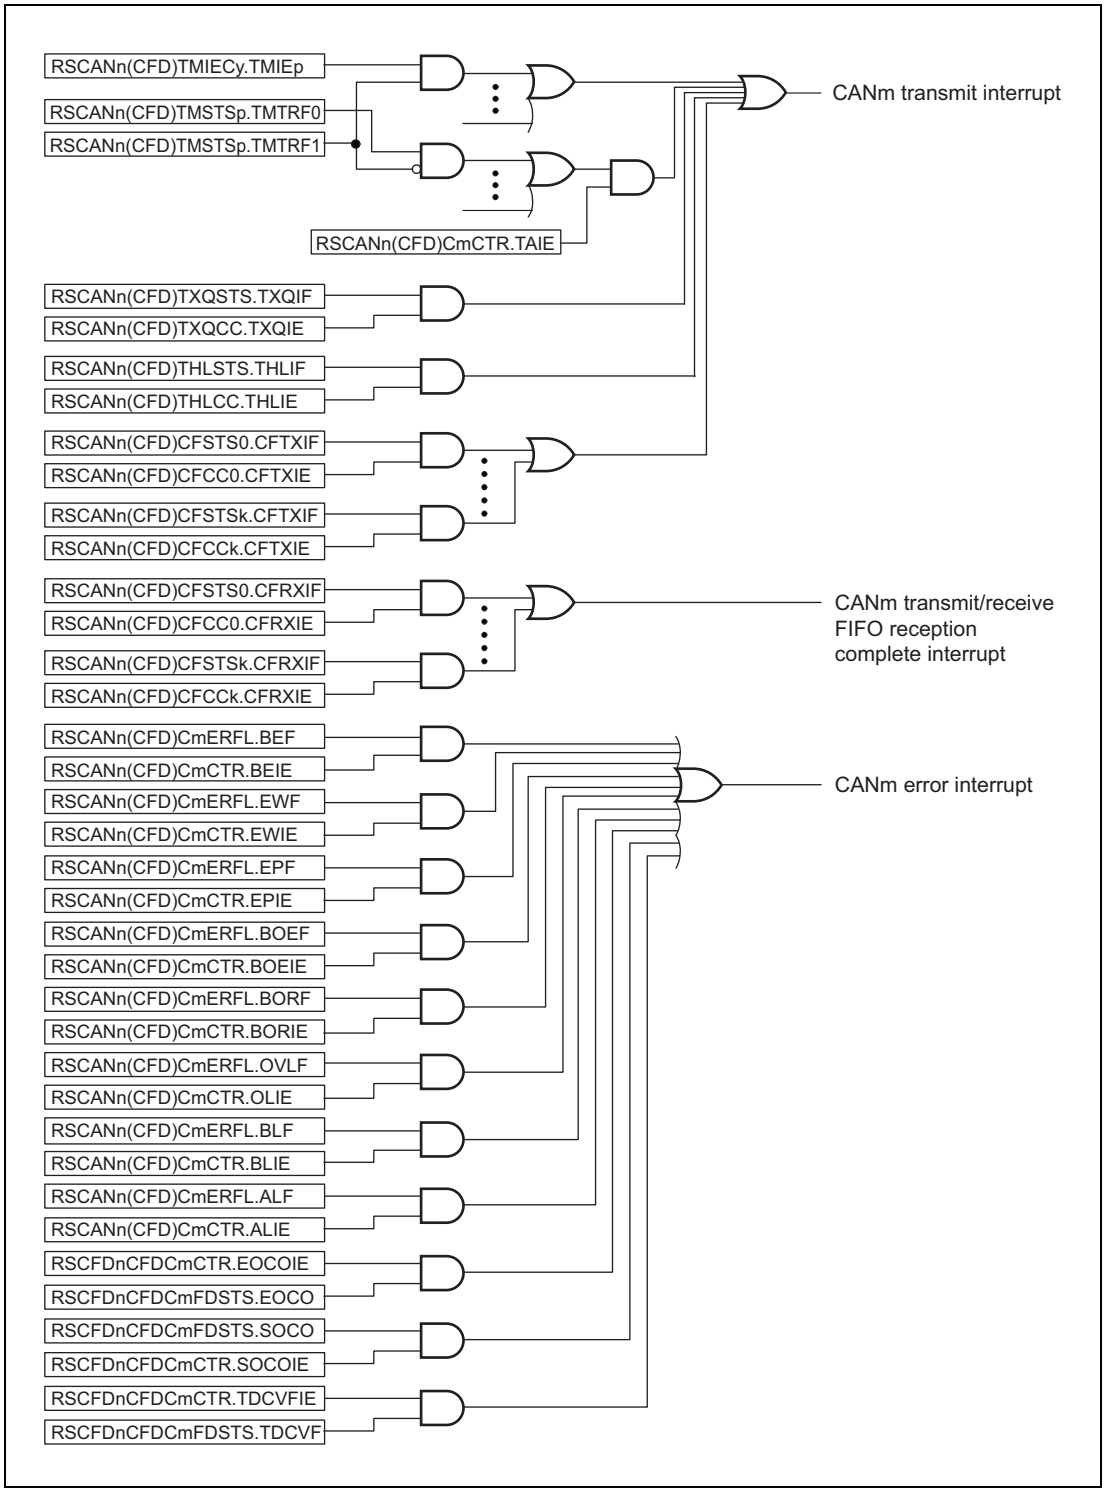

**Figure 21.3 CAN Channel Interrupt Block Diagram**

### 21.6.2 DMA Trigger (Only in CAN FD Mode)

In CAN FD mode, receive FIFO buffers can be related to DMA channels. The following 14 FIFO buffers can be related.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k (k = 3 × m, m = 0 to 5) allocated to channel m

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

## 21.7 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in **Section 21.7.1, Global Modes**, and details of channel modes are described in **Section 21.7.2, Channel Modes**.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

### 21.7.1 Global Modes

**Figure 21.4** shows the transitions of global modes.

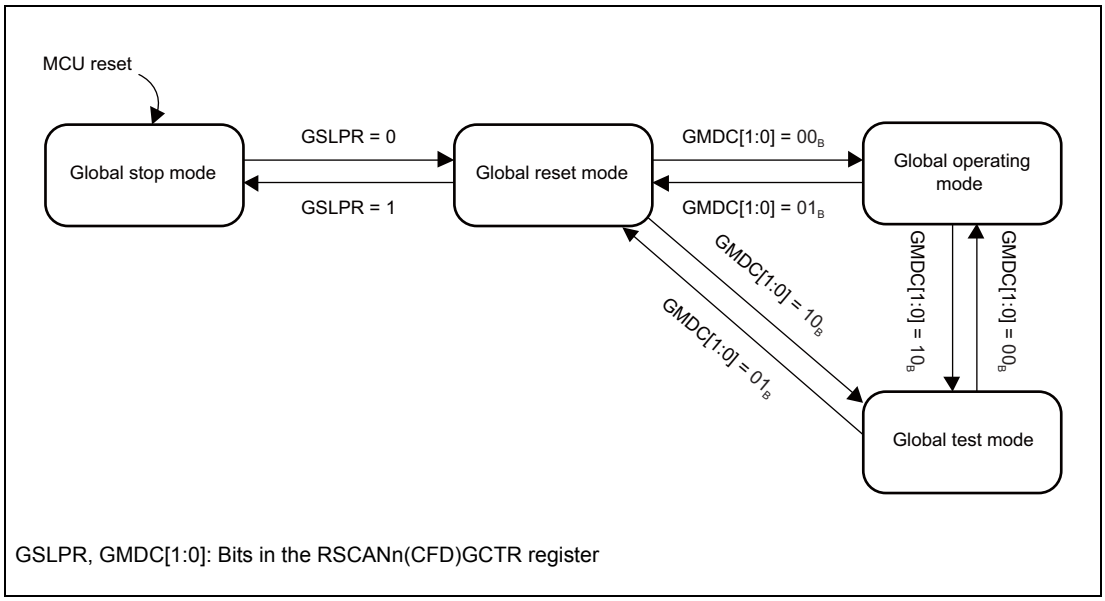

**Figure 21.4 Transitions of Global Modes**

In some cases, global mode transitions also force channel mode transitions. **Table 21.178** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

**Table 21.178 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)**

| Channel Mode before Setting | Channel Mode after Setting | | | |
|---|---|---|---|---|
| | **GMDC[1:0] = $00_B$ GSLPR = 0 (Global Operation)** | **GMDC[1:0] = $10_B$ GSLPR = 0 (Global Test)** | **GMDC[1:0] = $01_B$ GSLPR = 0 (Global Reset)** | **GMDC[1:0] = $01_B$ GSLPR = 1 (Global Stop)** |
| Channel communication | Channel communication | Channel halt | Channel reset | Transition prohibited |
| Channel halt | Channel halt | Channel halt | Channel reset | Transition prohibited |
| Channel reset | Channel reset | Channel reset | Channel reset | Channel stop |
| Channel stop | Channel stop | Channel stop | Channel stop | Channel stop |

**Note:** GMDC[1:0], GSLPR: Bits in the RSCANn(CFD)GCTR register

**Table 21.179** shows the global mode transition time.

**Table 21.179 Global Mode Transition Time**

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|---|---|---|
| Global stop | Global reset | Three pclk cycles |
| Global reset | Global stop | Three pclk cycles |
| Global reset | Global test | Ten pclk cycles |
| Global reset | Global operating | Ten pclk cycles |
| Global test | Global reset | Two CAN bit times*1,*2 |
| Global test | Global operating | Three pclk cycles |
| Global operating | Global reset | Two CAN bit times*1,*2 |
| Global operating | Global test | Two CAN frames*1 |

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use

Note 2. In CAN FD mode, this time value is the CAN bit time of the nominal bit rate.

#### 21.7.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the RS-CANFD module transitions to global stop mode. Setting the GSLPR bit in the RSCANn(CFD)GCTR register to 1 (global stop mode) in global reset mode sets the CSLPR bit in each of the RSCANn(CFD)CmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the RS-CANFD module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

#### 21.7.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see **Table 21.182, Registers Initialized in Global Reset Mode and Channel Reset Mode** and **Table 21.183, Registers Initialized Only in Global Reset Mode**.

Setting the GMDC[1:0] bits in the RSCANn(CFD)GCTR register to $01_B$ sets the CHMDC[1:0] bits in each of the RSCANn(CFD)CmCTR registers (m = 0 to 5) to $01_B$ (channel reset mode). If all channels are forced to transition to channel reset mode, the RS-CANFD module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to $01_B$).

#### 21.7.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the RS-CANFD module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCANn(CFD)GCTR register to $10_B$ sets the CHMDC[1:0] bits in each of the RSCANn(CFD)CmCTR register to $10_B$ (channel halt mode). If all channels are forced to transition to channel halt mode, the RS-CANFDmodule transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

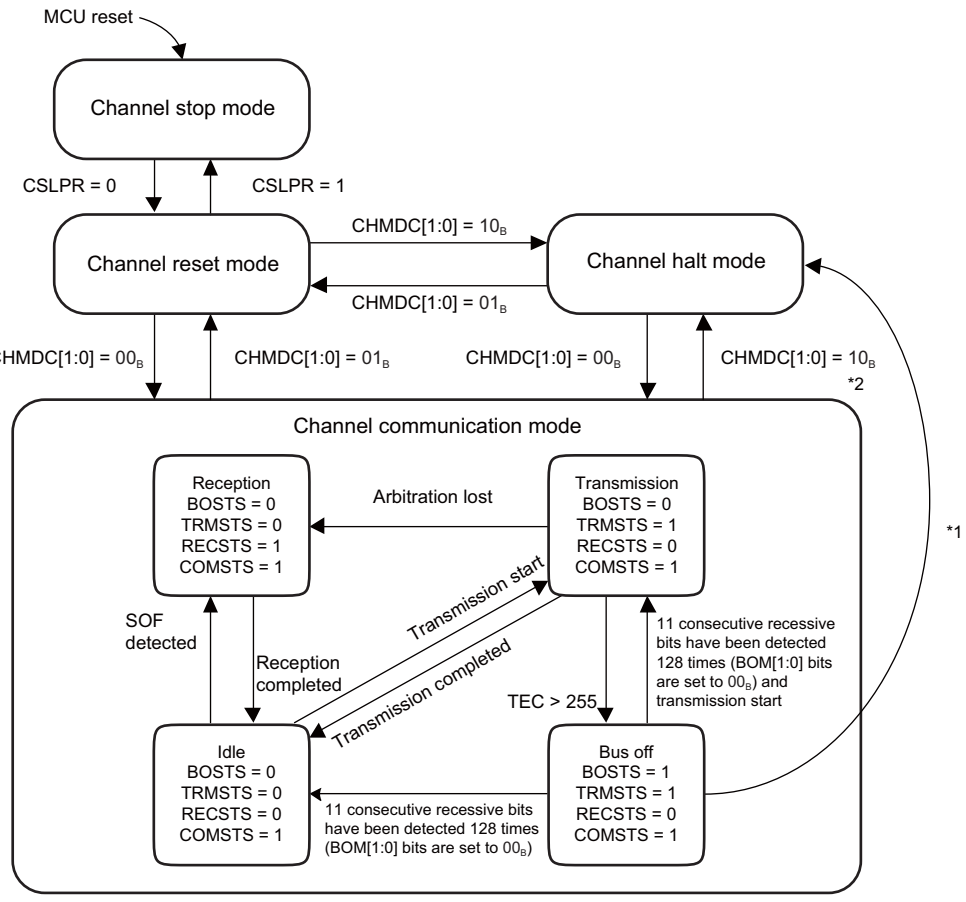
#### 21.7.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RSCANn(CFD)GCTR register are set to $00_B$, the RS-CANFD module transitions to global operating mode.

## 21.7.2 Channel Modes

**Figure 21.5** shows a channel mode state transition chart. **Table 21.180** shows the channel mode transition time.



**Note:** CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCANn(CFD)CmCTR register (m = 0 to 5)
BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCANn(CFD)CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = $01_B$: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = $10_B$: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = $11_B$: Transition to channel halt mode when the CHMDC[1:0] bits are set to $10_B$

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

**Figure 21.5 Channel Mode State Transition Chart**

Table 21.180 Channel Mode Transition Time

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|---|---|---|
| Channel stop | Channel reset | Three pclk cycles |
| Channel reset | Channel stop | Three pclk cycles |
| Channel reset | Channel halt | Three CANm bit times*1 |
| Channel reset | Channel communication | Four CANm bit times*1 |
| Channel halt | Channel reset | Two CANm bit times*1 |
| Channel halt | Channel communication | Four CANm bit times*1 |
| Channel communication | Channel reset | Two CANm bit times*1 |
| Channel communication | Channel halt | Two CANm frames |

Note 1. In CAN FD mode, this time value is the CANm bit time of the nominal bit rate.

#### 21.7.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RSCANn(CFD)CmCTR register (m = 0 to 5) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

#### 21.7.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. For registers to be initialized, see **Table 21.182, Registers Initialized in Global Reset Mode and Channel Reset Mode**.

When the CHMDC[1:0] bits in the RSCANn(CFD)CmCTR register are set to $01_B$ (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 21.181** shows the operation when the CHMDC[1:0] bits are set to $01_B$ (channel reset mode) during CAN communication.

### 21.7.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

**Table 21.181** shows operation when the CHMDC[1:0] bits are set to $10_B$ (channel halt mode) during CAN communication.

**Table 21.181 Operation when a Channel Transitions to Channel Reset Mode/Channel Halt Mode**

| Mode | During Reception | During Transmission | Bus Off State |
|---|---|---|---|
| Channel reset (CHMDC[1:0] = $01_B$) | Transitions to channel reset mode before reception is completed.*1 | Transitions to channel reset mode before transmission is completed.*1 | Transitions to channel reset mode before bus off recovery. |
| Channel halt*3 (CHMDC[1:0] = $10_B$) | Transitions to channel halt mode after reception is completed.*2 | Transitions to channel halt mode after transmission is completed. | [When BOM[1:0] = $00_B$] Transitions to channel halt mode (CHMDC[1:0] = $10_B$) only after bus off recovery. [When BOM[1:0] = $01_B$] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = $10_B$] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = $11_B$] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to $10_B$ before bus off recovery. |

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to $10_B$ and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to $01_B$.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCANn(CFD)CmERFL register that becomes 1 when bus dominant lock is detected.

Note 3. In classical CAN mode, when the transition from channel reset mode to channel halt mode is to be made, set the RSCANnCmCFG register in channel reset mode and then shift to channel halt mode. In CAN FD mode, set the RSCFDnCFDCmNCFG register and the RSCFDnCFDCmDCFG register, and then make a transition.

### 21.7.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCANn(CFD)CmCTR register are set to $00_B$, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCANn(CFD)CmSTS register (m = 0 to 5) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

#### 21.7.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/ decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCANn(CFD)CmCTR register.

- When BOM[1:0] = $00_B$:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCANn(CFD)CmSTS register are initialized to $00_H$, the BORF flag in the RSCANn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCANn(CFD)CmCTR register are set to $10_B$ (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = $01_B$:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to $10_B$ and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to $00_H$. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.
- When BOM[1:0] = $10_B$:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to $10_B$. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to $00_H$, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.
- When BOM[1:0] = $11_B$:
  When the CHMDC[1:0] bits are set to $10_B$ in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to $00_H$, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a RS-CANFD module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to $10_B$.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to $01_B$ or $10_B$ is made only when the CHMDC[1:0] bits are $00_B$ (channel communication mode).

Furthermore, setting the RTBO bit in the RSCANn(CFD)CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the RS-CANFD module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to $00_H$. Write 1 to the RTBO bit only when the BOM[1:0] value is $00_B$. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

### 21.7.3 Initializing Registers by Transition to CAN Mode

**Table 21.182** lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, **Table 21.183** lists bits and flags to be initialized only by a transition to global reset mode.

**Table 21.182 Registers Initialized in Global Reset Mode and Channel Reset Mode**

| Register | Bit / Flag |
|---|---|
| RSCANn(CFD)CmCTR register | (ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0] |
| RSCANn(CFD)CmSTS register | CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0] |
| RSCANn(CFD)CmERFL register | CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF |
| RSCFDnCFDCmFDCTR register | EOCCLR, SOCCLR |
| RSCFDnCFDCmFDSTS register | SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0] |
| RSCFDnCFDCmFDCRC register | CRCREG[20:0] |
| RSCANn(CFD)CFCCk register | When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE |
| RSCANn(CFD)CFSTSk register | When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF |
| RSCANn(CFD)CFTISTS register | CFkTXIF |
| RSCANn(CFD)TMCp register | TMOM, TMTAR, TMTR |
| RSCANn(CFD)TMSTSp register | TMTARM, TMTRM, TMTRF[1:0], TMTSTS |
| RSCANn(CFD)TMTRSTSy register | TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCANn(CFD)TMTARSTSy register | TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCANn(CFD)TMTCSTSy register | TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCANn(CFD)TMTASTSy register | TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCANn(CFD)TXQCCm register | TXQE |
| RSCANn(CFD)TXQSTSm register | TXQIF, TXQFLL, TXQEMP |
| RSCANn(CFD)THLCCm register | THLE |
| RSCANn(CFD)THLSTSm register | THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP |
| RSCANn(CFD)GTINTSTS0 register | TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 0 to 3) |
| RSCANn(CFD)GTINTSTS1 register | TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 4, 5) |

**Note:** Bits and flags in parentheses exist only in registers in CAN FD mode.

**Table 21.183 Registers Initialized Only in Global Reset Mode**

| Register | Bit / Flag |
|---|---|
| RSCANn(CFD)GSTS register | GHLTSTS |
| RSCANn(CFD)GERFL register | EEF0, EEF1, EEF2, EEF3, EEF4, EEF5, (CMPOF), THLES, MES, DEF |
| RSCANn(CFD)GTSC register | TS[15:0] |
| RSCANn(CFD)RMNDy register | RMNSq |
| RSCANn(CFD)RFCCx register | RFE |
| RSCANn(CFD)RFSTSx register | RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP |
| RSCANn(CFD)CFCCk register | When transmit/receive FIFO buffer is in receive mode: CFE |
| RSCANn(CFD)CFSTSk register | When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT |
| RSCANn(CFD)FESTS register | CFkEMP, RFxEMP |
| RSCANn(CFD)FFSTS register | CFkFLL, RFxFLL |
| RSCANn(CFD)FMSTS register | CFkMLT, RFxMLT |
| RSCANn(CFD)RFISTS register | RFxIF |
| RSCANn(CFD)CFRISTS register | CFkRXIF |

| RSCFDnCFDCDTSTS register | CFDMASTSm, RFDMASTSx |
| RSCANn(CFD)GTSTCFG register | RTMPS[6:0], C0ICBCE, C1ICBCE, C2ICBCE, C3ICBCE, C4ICBCE, C5ICBCE |
| RSCANn(CFD)GTSTCTR register | RTME, ICBCTME |

**Note:** Bits and flags in parentheses exist only in registers in CAN FD mode.

## 21.8 Reception Function

There are two reception types.

- Reception by receive buffers:
  Zero to 96 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

### 21.8.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 384 receive rules can be registered in this module that has six channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 21.6** illustrates how receive rules are registered.

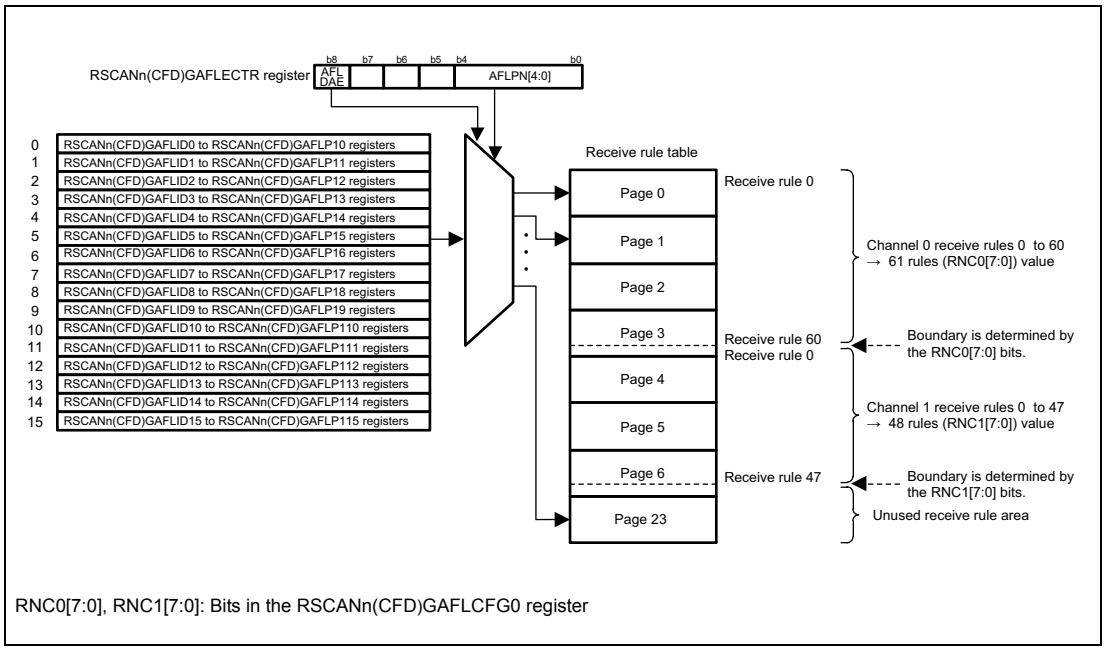

**Figure 21.6 Entry of Receive Rules (for Setting Channel 0 and 1)**

**CAUTION**

**Receive rules for each channel must be set in contiguous blocks.**
**Channel 1 rules and channel 0 rules must be set separately.**

Each receive rule consists of 16 bytes in the RSCANn(CFD)GAFLIDj, RSCANn(CFD)GAFLMj, RSCANn(CFD)GAFLP0j, and RSCANn(CFD)GAFLP1j registers (j = 0 to 15). The RSCANn(CFD)GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCANn(CFD)GAFLMj register is used to set mask, the RSCANn(CFD)GAFLP0j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCANn(CFD)GAFLP1j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

### 21.8.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCANn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

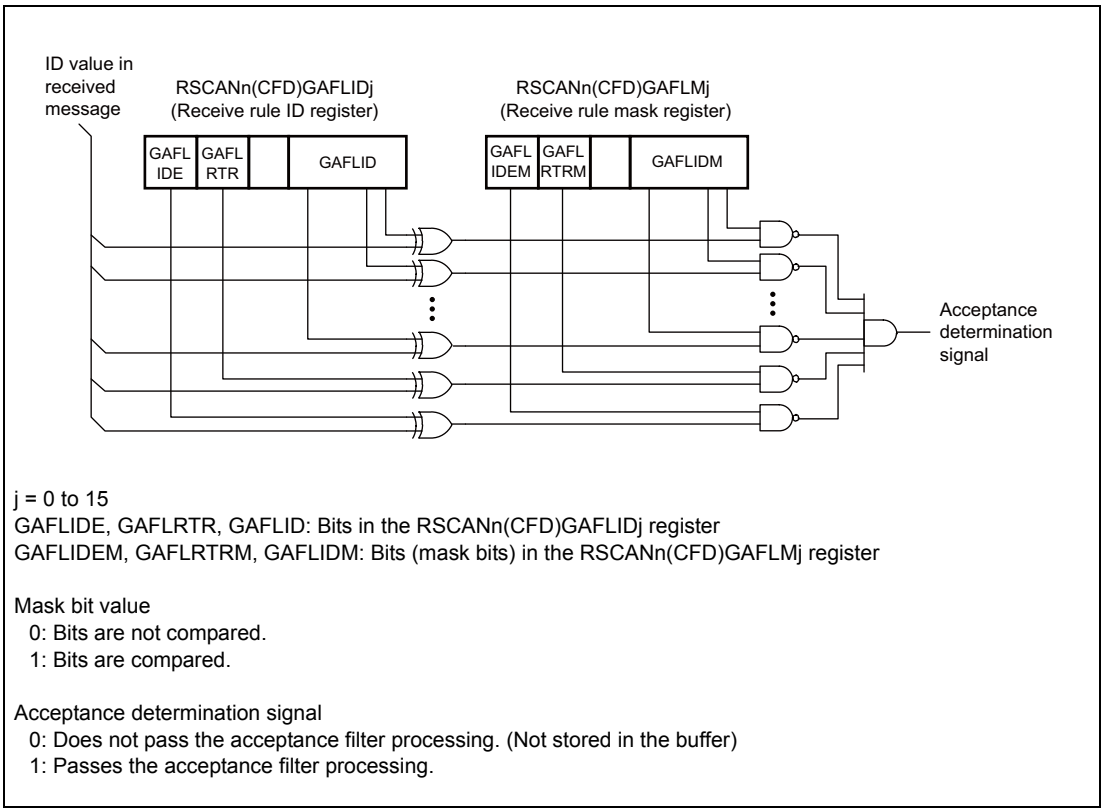

**Figure 21.7 Acceptance Filter Function**

#### 21.8.1.2 DLC Filter Processing

When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCANn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCANn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of $00_H$ is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCANn(CFD)GERFL register is set to 1 (a DLC error is present).

#### 21.8.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCANn(CFD)GAFLP0j register (j = 0 to 15) and by the RSCANn(CFD)GAFLP1j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

In CAN FD mode, if the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0, the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1, the received message is stored in the buffer with payloads exceeding the storage size being discarded.

#### 21.8.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCANn(CFD)GAFLP0j register.

#### 21.8.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCANn(CFD)GCFG register to 1 (mirror function is enabled).

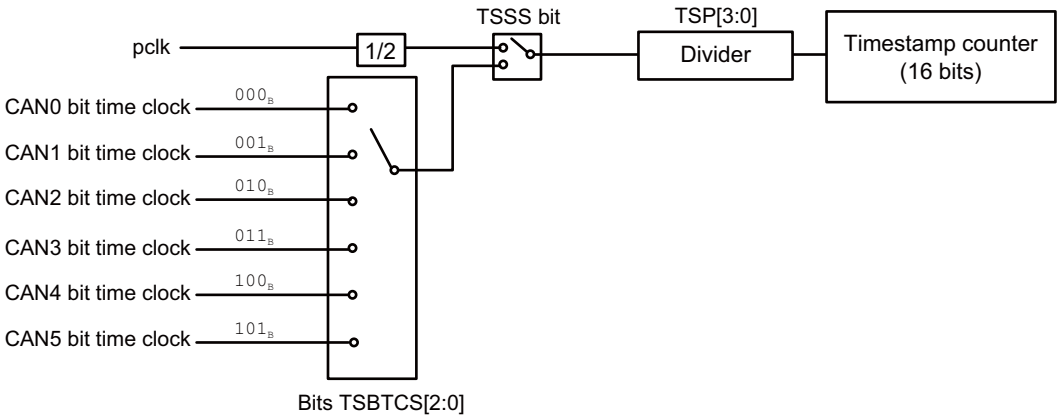
When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCANn(CFD)GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

### 21.8.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time and transmission time. The timestamp counter value is fetched at the start-of-frame (SOF) timing of a message and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCANn(CFD)GCFG register. In classical CAN mode, either pclk/2 or the CANm bit time clock (m = 0 to 5). In CAN FD mode, the clock source is selectable from pclk/2 or nominal CANm bit time clock. However, do not select the nominal CANm bit time clock of channels that handle CAN FD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCANn(CFD)GCFG register.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to $0000_H$ by setting the TSRST bit in the RSCANn(CFD)GCTR register to 1.



TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RSCANn(CFD)GCFG register

**Note:** When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to $000_B$.

**Figure 21.8 Timestamp Function Block Diagram**

## 21.9 Transmission Functions

There are three types of transmission. In classical CAN mode, transmittable payload length is 8 bytes in every transmission type. In CAN FD mode, transmittable payload length varies with transmission types.

- Transmission using transmit buffers:
  Each channel has 16 buffers. Transmittable payload length in CAN FD mode is 20 bytes. However, when transmit buffer merge mode is used, four buffers out of 16 buffers are allocated as a payload-only storage area and two buffers are able to transmit payloads with a length of more than 20 bytes.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Transmittable payload length in CAN FD mode is 64 bytes. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmittable payload length in CAN FD mode is 20 bytes. Transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

**Figure 21.9** shows the allocation of transmit queues and transmit/receive FIFO buffer links.

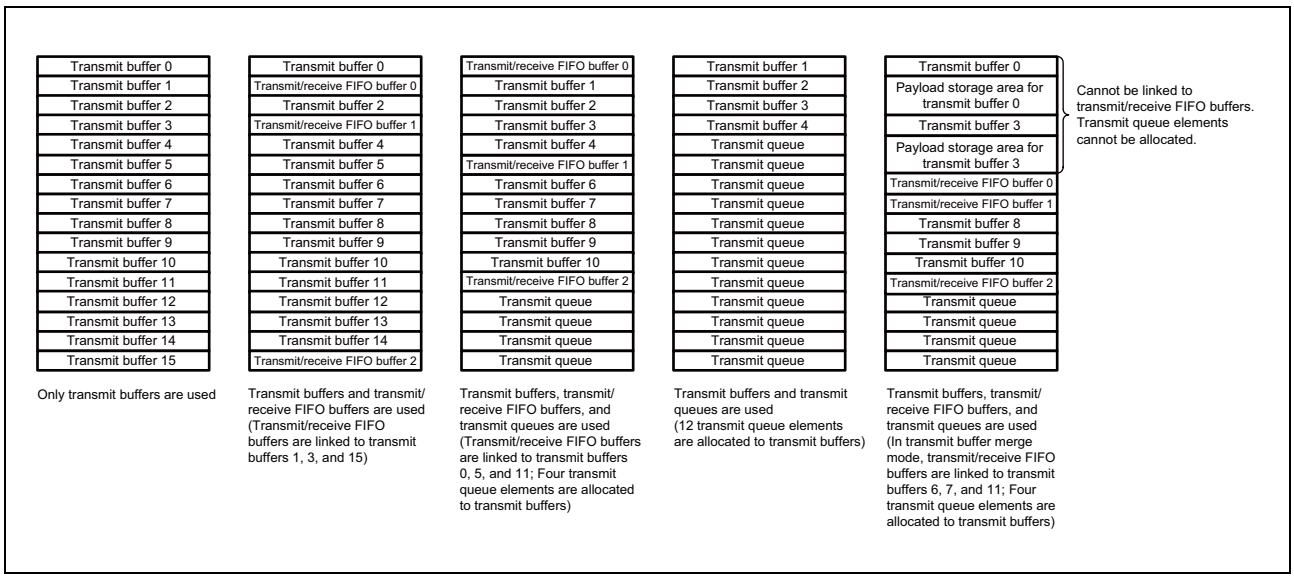


**Figure 21.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links**

### 21.9.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

The priority is determined by using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCANn(CFD)GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit. When a 2-bit ECC error is detected in the priority determination processing, no message is transmitted (only when the EEFE bit in the RSCANnGCFG register is 1 in classical CAN mode).

### 21.9.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCANn(CFD)TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCANn(CFD)TMSTSp register (p = 0 to 95). When transmit completes successfully, the TMTRF[1:0] flag is set to $10_B$ (transmission has been completed (without transmit abort request)) or $11_B$ (transmission has been completed (with transmit abort request)).

#### 21.9.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCANn(CFD)TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCANn(CFD)TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCANn(CFD)TMSTSp register is set to $01_B$ (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

#### 21.9.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCANn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCANn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to $10_B$ or $11_B$. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to $01_B$ (transmit abort has been completed).

#### 21.9.2.3 Transmit Buffer Merge Mode (Only in CAN FD Mode)

Transmit buffers can transmit messages with a payload length of 20 bytes, but can transmit messages with a payload length of up to 64 bytes by merging three transmit buffers in transmit buffer merge mode.

Setting the TMME bit to 1 in the RSCFDnCFDCmFDCFG register enables transmit buffer merge mode. In this mode, six buffers per channel become a merge area and two sets of transmit buffers (16 × m) + 0 to (16 × m) + 2 and transmit buffers (16 × m) + 3 to (16 × m) + 5 are merged. A transmission request is made by the first transmit buffer, and subsequent two buffers are used as a payload storage area. Do not set the transmission request bit (TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (TMTAR bit in the RSCFDnCFDTMCp register) to 1 for transmit buffers except for the first buffer.

While transmit buffer merge mode is enabled, do not link the transmit/receive FIFO buffer to six merged buffers or allocate it to the transmit queue.

### 21.9.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCANn(CFD)CFCCk register (k = 0 to 17). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCANn(CFD)CFCCk register. When the CFE bit in the RSCANn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

#### 21.9.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCANn(CFD)CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCANn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to $00_H$.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCANn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to $00_H$. Select an interval timer count source using the CFITR bit in the RSCANn(CFD)CFCCk register and the CFITSS bit in the RSCANnCFCCk register. When the CFITR and CFITSS bits are set to $00_B$, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to $10_B$, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock becomes a count source in classical CAN mode and the nominal CANm bit time clock becomes a count source in CAN FD mode.

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = $00_B$:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = $10_B$:

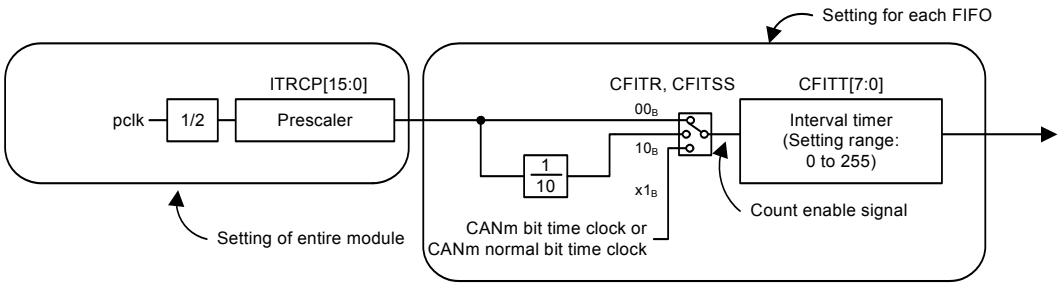
$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$:

$$\text{Classical CAN mode: } \frac{1}{\text{CANm bit time clock frequency}} \times N$$

$$\text{CAN FD mode: } \frac{1}{\text{Nominal CANm bit time clock frequency}} \times N$$

**Figure 21.10** shows the interval timer block diagram.

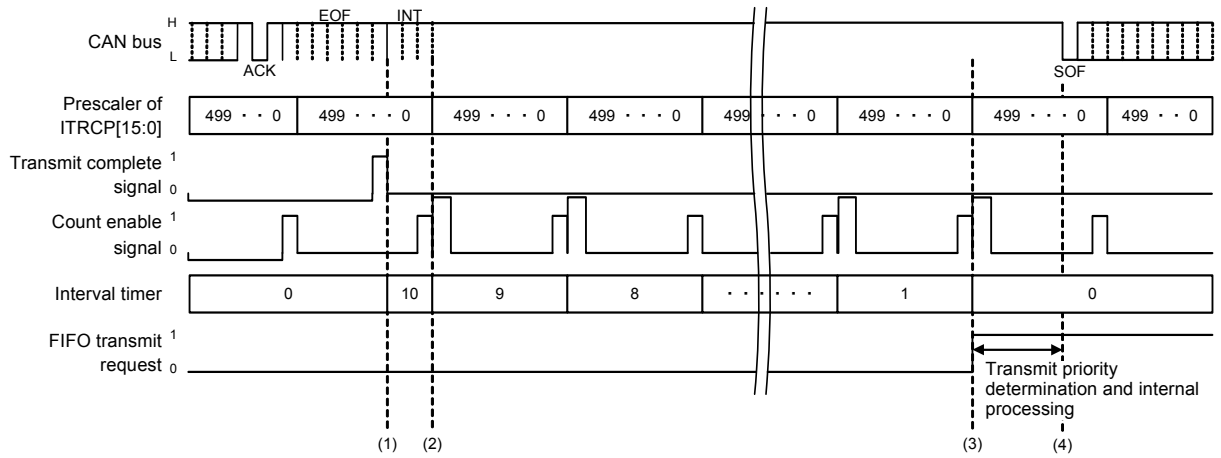


ITRCP[15:0]: Bits in the RSCANn(CFD)GCFG register
CFITR, CFITSS, CFITT[7:0] : Bits in the RSCANn(CFD)CFCCk register

**Note:** m = 0 to 5, k = 0 to 17

**Figure 21.10 Interval Timer Block Diagram**

**Figure 21.11** shows the interval timer timing chart.



$$\text{Interval time (logical value)} = \frac{2}{\text{pclk frequency}} \times (\text{ITRCP[15:0] setting value}) \times \text{CFITT[7:0] setting value}$$

- ITRCP[15:0]: Bits in the RSCANn(CFD)GCFG register (The set value is 500 in this figure.)
- CFITT[7:0]: Bits in the RSCANn(CFD)CFCCk register (The set value is 10 in this figure.)

**Figure 21.11 Interval Timer Timing Chart**

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 1164 cycles of the pclk may be generated.

### 21.9.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to 10 buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCANn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCANn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

### 21.9.5 Transmit Data Padding (Only in CAN FD Mode)

When the payload length indicated by the DLC setting value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by $CC_H$.

This processing is performed in the following cases when the transmit buffer merge mode is disabled (TMME bit in the RSCFDnCFDCmFDCFG register is 0).

- Transmit/receive FIFO set to transmission or gateway mode:
  When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register
- Transmit buffer (including transmit queue):
  When the payload length of the transmit DLC exceeds 20 bytes

When the transmit buffer merge mode is enabled, no transmit data is padded in any transmission using a transmit buffer, transmit/receive FIFO buffer, or transmit queue. At this time, do not set a payload length more than the payload storage size of the buffer for transmitting as the DLC value in the transmit message.

### 21.9.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCANn(CFD)THLCCm register. The THLEN bit in the RSCANn(CFD)CFIDk register (k = 0 to 17) determines whether transmit history data is stored for each message.

In classical CAN mode, the TMTSCE bit in the RSCANnGCFG register can be used to set whether to include a timestamp value in the transmit history data. In CAN FD mode, a timestamp value is always included.

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 152 cycles of pclk in classical CAN mode or 420 cycles of pclk in CAN FD mode.

- Buffer type — $001_B$: Transmit buffer<br>$010_B$: Transmit/receive FIFO buffer<br>$100_B$: Transmit queue
- Buffer number — Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 21.184**.
- Label data — Label information of the transmit message
- Timestamp — Timestamp value of the transmit message<br>(When the TMTSCE bit is 1 in classical CAN mode)

**Table 21.184 Transmit History Data Buffer Numbers**

| Buffer No. / Buffer type | $001_B$ | $010_B$ | $100_B$ |
|---|---|---|---|
| $0000_B$ | Transmit buffer 16 × m + 0 | Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCANn(CFD)CFCCk register<br>(k = 0 to 17) | Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission |
| $0001_B$ | Transmit buffer 16 × m + 1 | | |
| $0010_B$ | Transmit buffer 16 × m + 2 | | |
| $0011_B$ | Transmit buffer 16 × m + 3 | | |
| $0100_B$ | Transmit buffer 16 × m + 4 | | |
| $0101_B$ | Transmit buffer 16 × m + 5 | | |
| $0110_B$ | Transmit buffer 16 × m + 6 | | |
| $0111_B$ | Transmit buffer 16 × m + 7 | | |
| $1000_B$ | Transmit buffer 16 × m + 8 | | |
| $1001_B$ | Transmit buffer 16 × m + 9 | | |
| $1010_B$ | Transmit buffer 16 × m + 10 | | |
| $1011_B$ | Transmit buffer 16 × m + 11 | | |
| $1100_B$ | Transmit buffer 16 × m + 12 | | |
| $1101_B$ | Transmit buffer 16 × m + 13 | | |
| $1110_B$ | Transmit buffer 16 × m + 14 | | |
| $1111_B$ | Transmit buffer 16 × m + 15 | | |

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see **Section 21.8.1.6, Timestamp**.

Transmit history data can be read from the RSCANn(CFD)THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

## 21.10 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode (only in CAN FD mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

### 21.10.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RSCANn(CFD)CmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is a CAN FD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see **Section 21.10.6.1, CRC Error Test**.

### 21.10.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

**Figure 21.12** shows the connection when listen-only mode is selected.

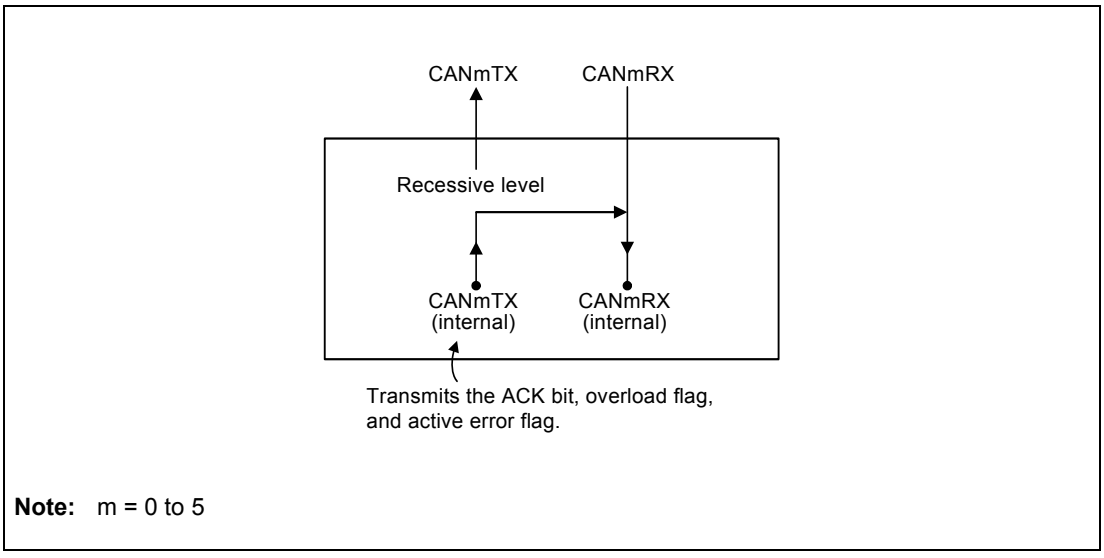


**Figure 21.12 Connection when Listen-Only Mode is Selected**

### 21.10.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCANn(CFD)GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).

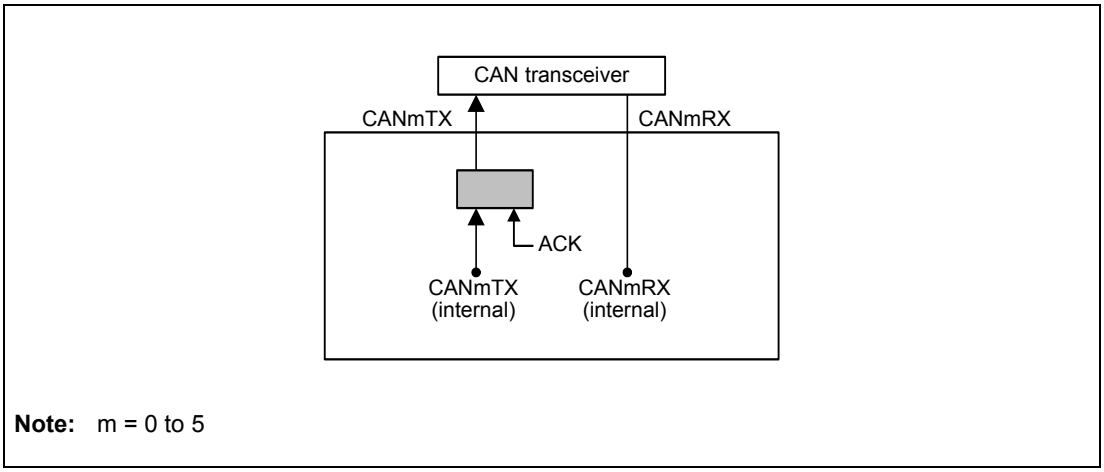
If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

#### 21.10.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

**Figure 21.13** shows the connection when self-test mode 0 is selected.



**Note:** m = 0 to 5

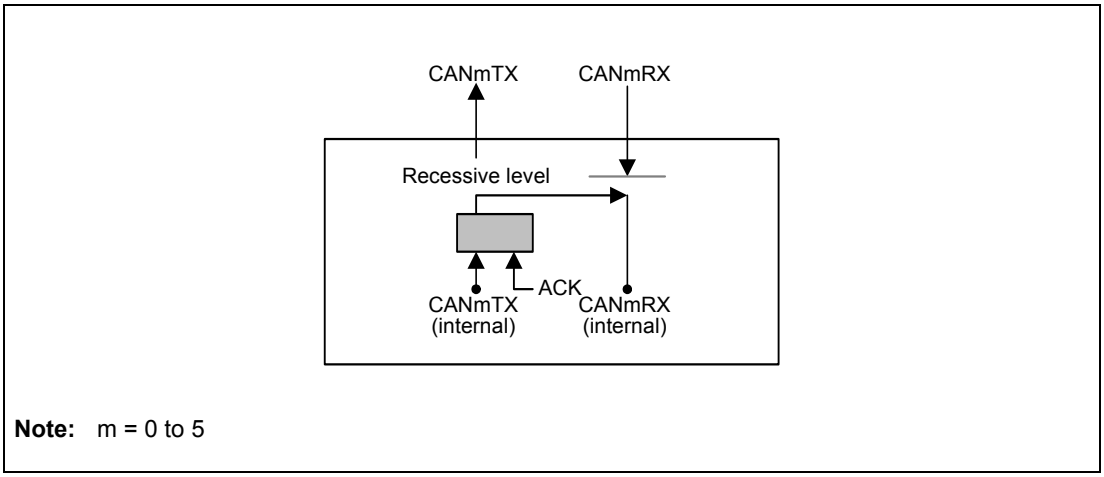
**Figure 21.13 Connection when Self-Test Mode 0 is Selected**

#### 21.10.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin (m = 0 to 5) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

**Figure 21.14** shows the connection when self-test mode 1 is selected.



**Note:** m = 0 to 5

**Figure 21.14 Connection when Self-Test Mode 1 is Selected**

### 21.10.4 Restricted Operation Mode (Only in CAN FD Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the state becomes bus idle for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error.

A desired transmission request can be made for transmission without restrictions.

### 21.10.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCANn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCANn(CFD)RPGACCr register (r = 0 to 63). The available total RAM size is 15360 bytes ($3C00_H$) in classical CAN mode or 21312 bytes ($5340_H$) in CAN FD mode.

In CAN FD mode, RAM addresses after the first 64 bytes of the last page (the page specified by RTMPS = $53_H$) cannot be accessed.

### 21.10.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

**Figure 21.15** shows the connection for inter-channel communication test.

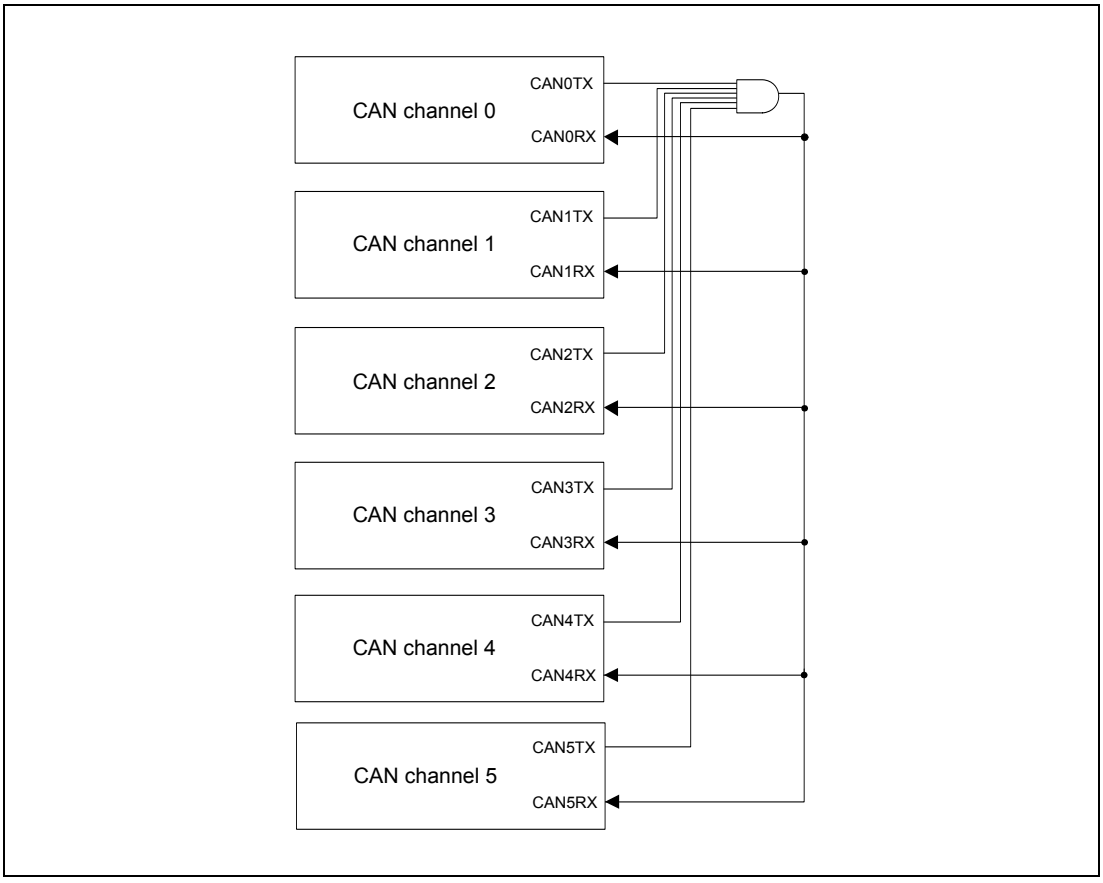


**Figure 21.15 Connection for Inter-Channel Communication Test**

### 21.10.6.1 CRC Error Test

A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

#### Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

#### Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RSCANn(CFD)C0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RSCANn(CFD)TMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RSCANn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RSCANm(CFD)C0ERFL register is 1 (CRC error detected).

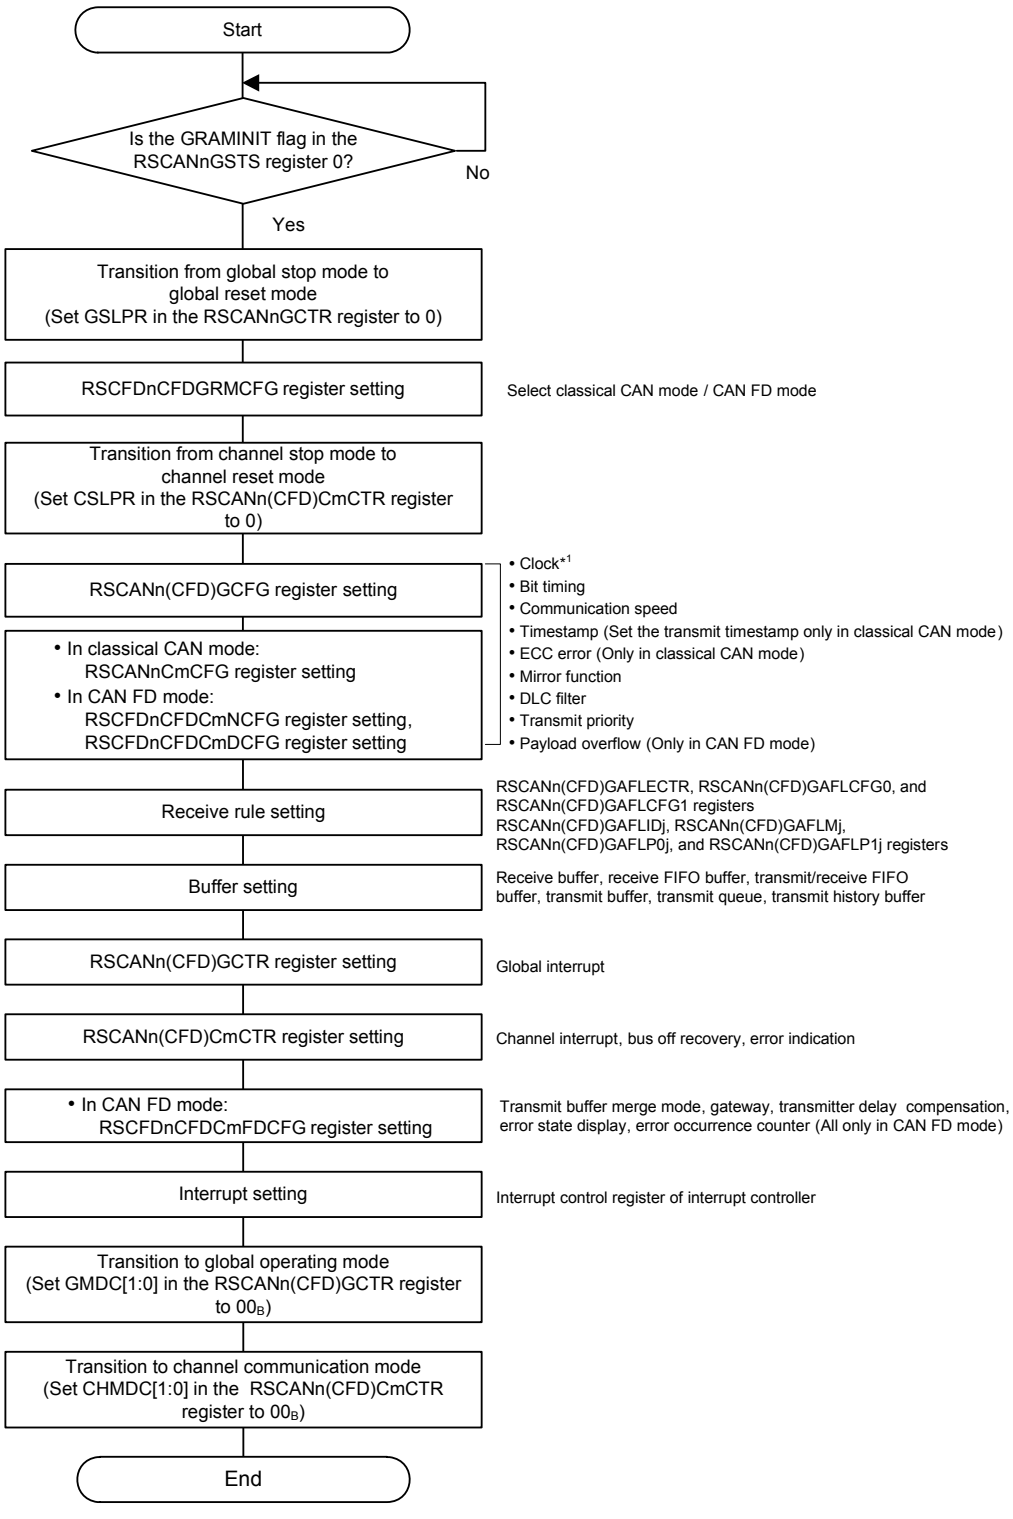
The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID's upper 5-bit value is $10000_B$ or ID's upper 6-bit value is $011111_B$ is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

# 21.11 RS-CANFD Setting Procedure

## 21.11.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 7586 cycles of the pclk. The GRAMINIT flag in the RSCANn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 21.16** shows the CAN setting procedure after the MCU is reset.



Note 1. For the setting of CAN clock frequency, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

**Note:** m = 0 to 5, j = 0 to 15

**Figure 21.16 CAN Setting Procedure after the MCU is Reset**

### 21.11.1.1 Clock Setting

Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clkc using the DCS bit in the RSCANn(CFD)GCFG register.

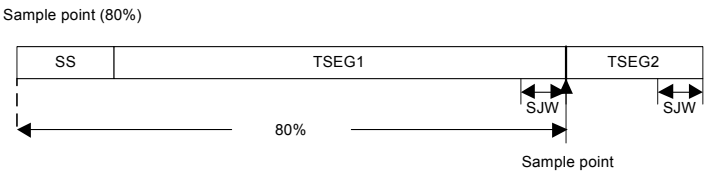
### 21.11.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. In classical CAN mode, set these two segments in the RSCANnCmCFG register. Two bit rates (nominal bit rate and data bit rate) are provided for CAN FD mode. Set the nominal bit rate in the RSCFDnCFDCmNCFG register and set the data bit rate in the RSCFDnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RSCANnGCFG register. Set a division ratio by the BRP[9:0] bits in the RSCANnCmCFG register in classical CAN mode (CANmTq clock), and by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register in CAN FD mode (CANmTq(N) clock and CANmTq(D) clock).

The NBRP[9:0] value and the DBRP[7:0] value should be equal and the two bit rate values be different according to the respective segment values.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0]

**Figure 21.17** shows the bit timing chart. **Table 21.185** shows an example of bit timing setting.



| | | |
|---|---|---|
| Classical CAN mode: | SS = 1 Tq fixed<br>Set TSEG1 to the range of 4 Tq to 16 Tq<br>Set TSEG2 to the range of 2 Tq to 8 Tq<br>Set SJW to the range of 1 Tq to 4 Tq<br>Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq<br>TSEG1 > TSEG2 ≥ SJW | |
| CAN FD mode: | <Nominal bit rate><br>SS = 1 Tq fixed<br>Set TSEG1 to the range of 4 Tq to 128 Tq<br>Set TSEG2 to the range of 2 Tq to 32 Tq<br>Set SJW to the range of 1 Tq to 32 Tq<br>Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 161 Tq<br>TSEG1 > TSEG2 ≥ SJW | <Data bit rate><br>SS = 1 Tq fixed<br>Set TSEG1 to the range of 2 Tq to 16 Tq<br>Set TSEG2 to the range of 2 Tq to 8 Tq<br>Set SJW to the range of 1 Tq to 8 Tq<br>Set SS + TSEG1 + TSEG2 to a range of 5 Tq to 25 Tq<br>TSEG1 ≥ TSEG2 ≥ SJW |

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space. Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (Time segment 1):
  TSEG1 is a segment that absorbs physical delays on the CAN network. The physical delay on the network is the doubled value of the total of a CAN bus delay, input converter delay, and output driver delay on the CAN bus.
- TSEG2 (Time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (Resynchronization jump width):
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

**Figure 21.17 Bit Timing Chart**

**Table 21.185 Example of Bit Timing Setting**

| 1 Bit | Set Value (Tq) | | | | Sample Point (%) Note: See Figure 21.17. |
|---|---|---|---|---|---|
| | SS | TSEG1 | TSEG2 | SJW | |
| 5 Tq*1 | 1 | 2 | 2 | 1 | 60.00 |
| 8 Tq | 1 | 4 | 3 | 1 | 62.50 |
| | 1 | 5 | 2 | 1 | 75.00 |
| 10 Tq | 1 | 6 | 3 | 1 | 70.00 |
| | 1 | 7 | 2 | 1 | 80.00 |
| 16 Tq | 1 | 10 | 5 | 1 | 68.75 |
| | 1 | 11 | 4 | 1 | 75.00 |
| 20 Tq | 1 | 12 | 7 | 1 | 65.00 |
| | 1 | 13 | 6 | 1 | 70.00 |
| 50 Tq*1 | 1 | 39 | 10 | 4 | 80.00 |

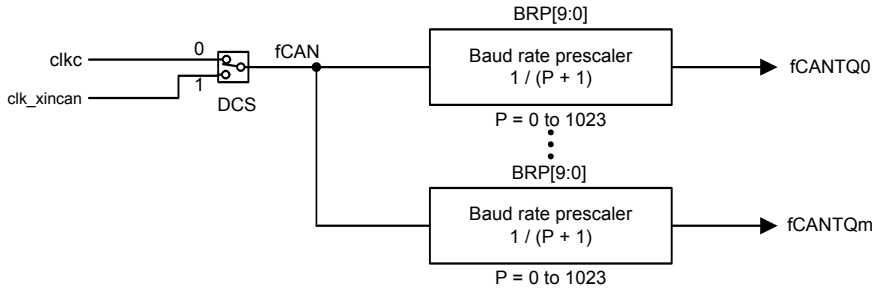
Note 1. Only in CAN FD mode

### 21.11.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. For CAN FD mode, set two types of transmission rate (arbitration phase and data phase) for each channel.

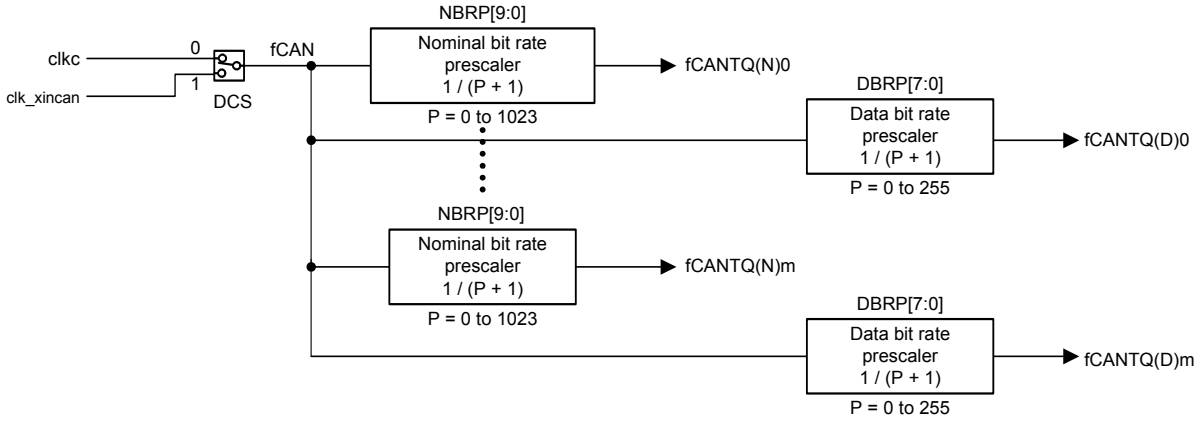
**Figure 21.18** shows the CAN clock control block diagram, and **Table 21.186** and **Table 21.187** show examples of the communication speed setting.

- Classical CAN mode



$$\text{Communication speed} = \frac{\text{fCAN}}{\text{Baud rate prescaler division value} \times (\text{Tq count of 1 bit time})}$$

- CAN FD mode



$$\text{Nominal bit rate} = \frac{\text{fCAN}}{\text{Nominal bit rate prescaler division value} \times (\text{Tq count of 1 nominal bit time})}$$

$$\text{Data bit rate} = \frac{\text{fCAN}}{\text{Data bit rate prescaler division value} \times (\text{Tq count of 1 data bit time})}$$

**Note:** m = 0 to 5
DCS: Bit in the RSCANn(CFD)GCFG register
BRP[9:0]: Bits in the RSCANnCmCFG register
NBRP[9:0]: Bits in the RSCFDnCFDCmNCFG register
DBRP[7:0]: Bits in the RSCFDnCFDCmDCFG register

| Nominal bit rate 1 Mbps<br>Data bit rate 5 Mbps | Nominal bit rate 40 Tq (1)<br>Data bit rate 8 Tq (1) | None |
| Nominal bit rate 500 kbps<br>Data bit rate 2 Mbps | Nominal bit rate 80 Tq (1)<br>Data bit rate 20 Tq (1) | Nominal bit rate 40 Tq (1)<br>Data bit rate 10 Tq (1) |

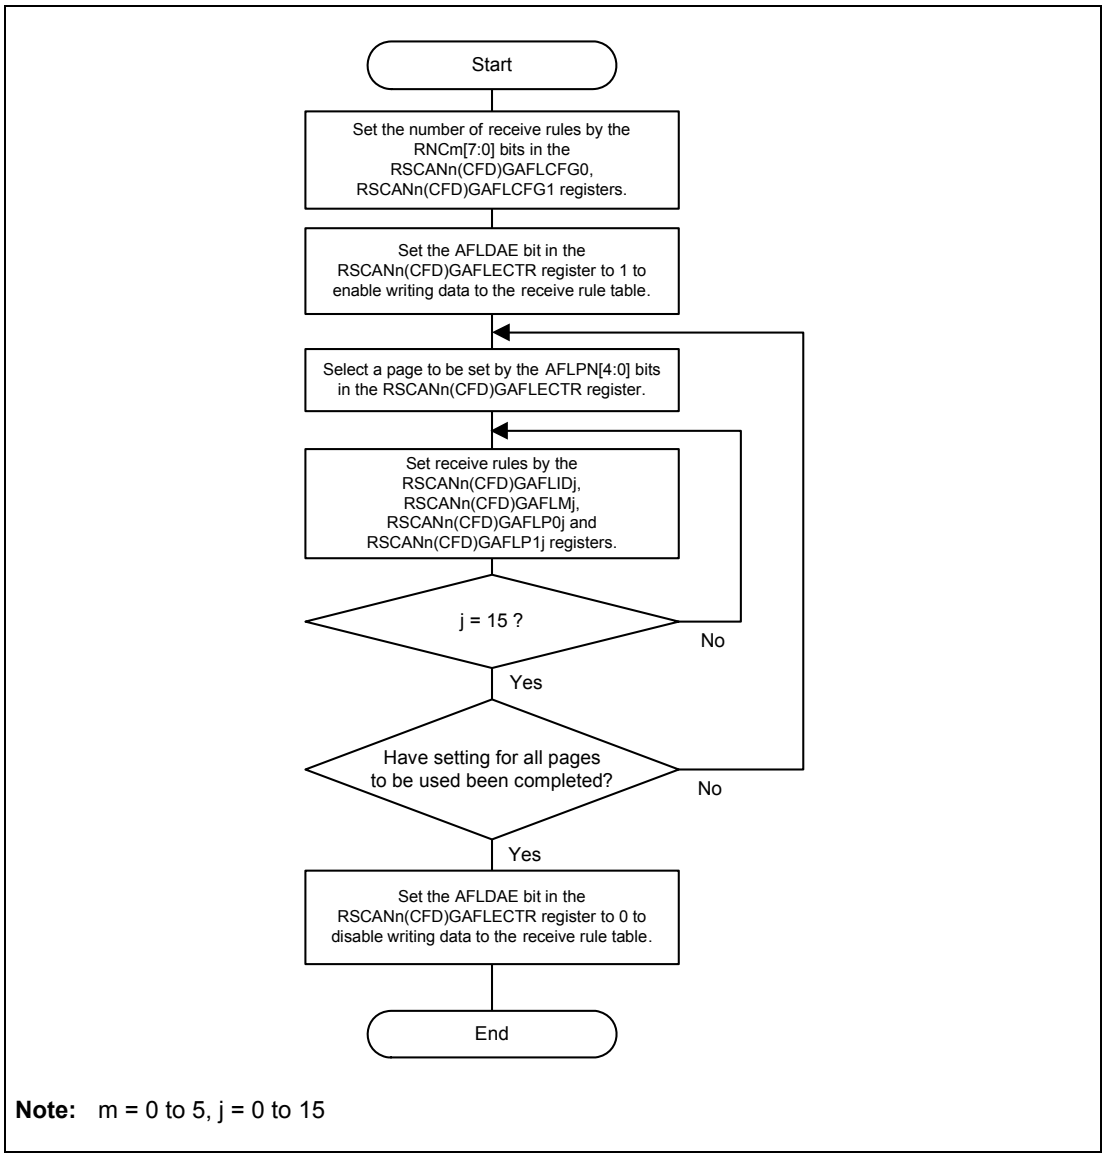
**Note:** Values in ( ) are baud rate prescaler division values.

### 21.11.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 23 (for 6-channel unit) by the AFLPN[4:0] bits in the RSCANn(CFD)GAFLECTR register. Set receive rule table write enable/ disable using the AFLDAE bit.

**Figure 21.19** shows the receive rule setting procedure.



**Note:** m = 0 to 5, j = 0 to 15

**Figure 21.19 Receive Rule Setting Procedure**

### 21.11.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. Also set the payload storage size for CAN FD mode. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

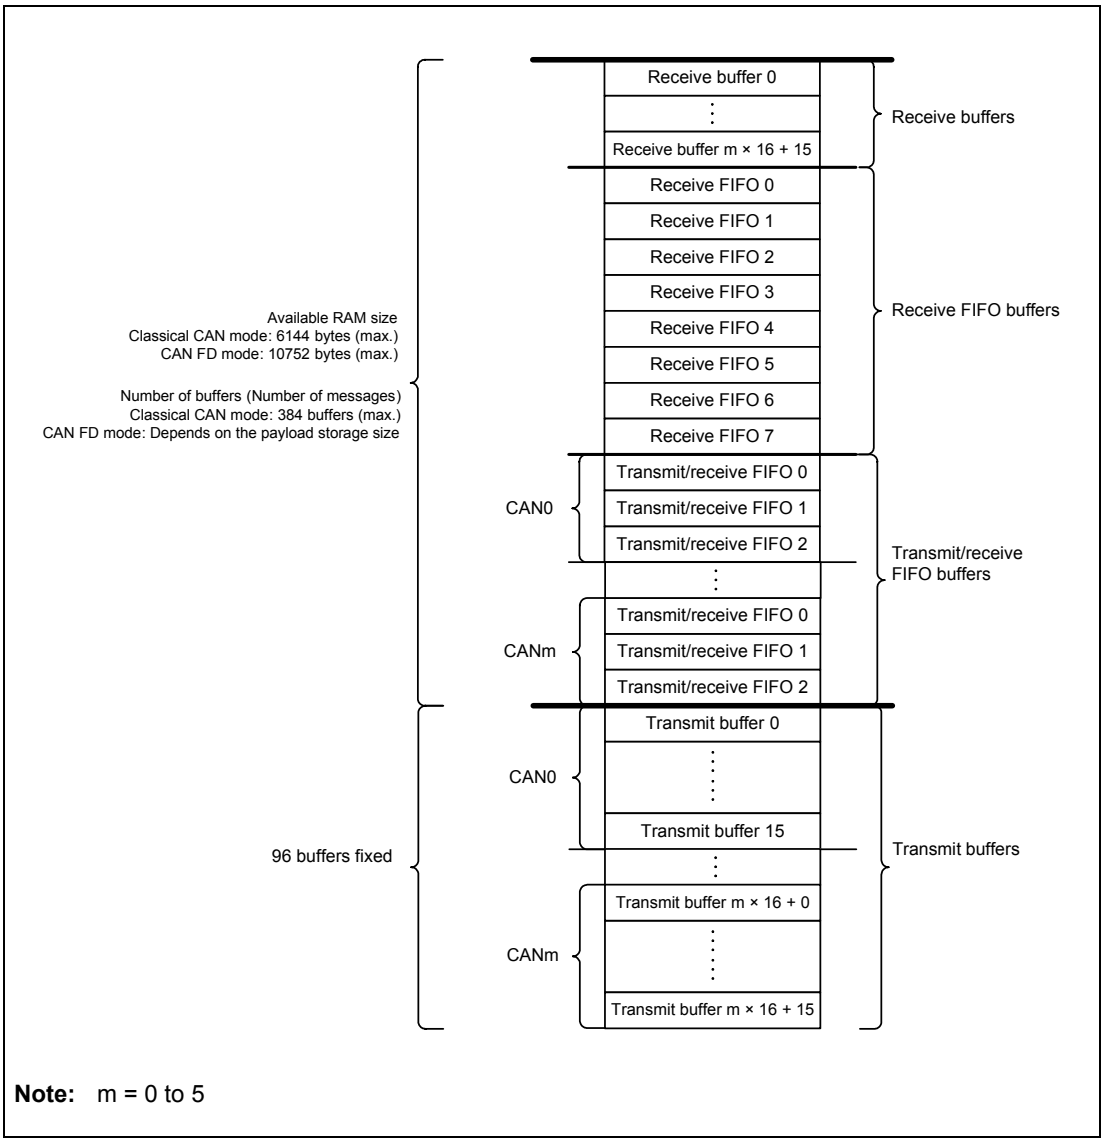
In classical CAN mode, up to 6144 bytes of the RAM can be used in receive buffers and FIFO buffers. Up to 384 buffers are available, and 16 bytes are used per buffer. Configure the buffers so that the following conditions are met.

Number of receive buffers + total number of depth of receive FIFO buffers x + total number of depth of transmit/receive FIFO buffers k ≤ 384 buffers

In CAN FD mode, up to 10752 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the buffers so that the following conditions are met.

Number of receive buffers × (12 + payload storage size) + total of (number of depth × (12 + payload storage size)) of receive FIFO buffers x + total of (number of depth × (12 + payload storage size)) of transmit/receive FIFO buffers k ≤ 10752 bytes

**Figure 21.20** shows the buffer configuration. **Figure 21.21** shows the buffer setting procedure.

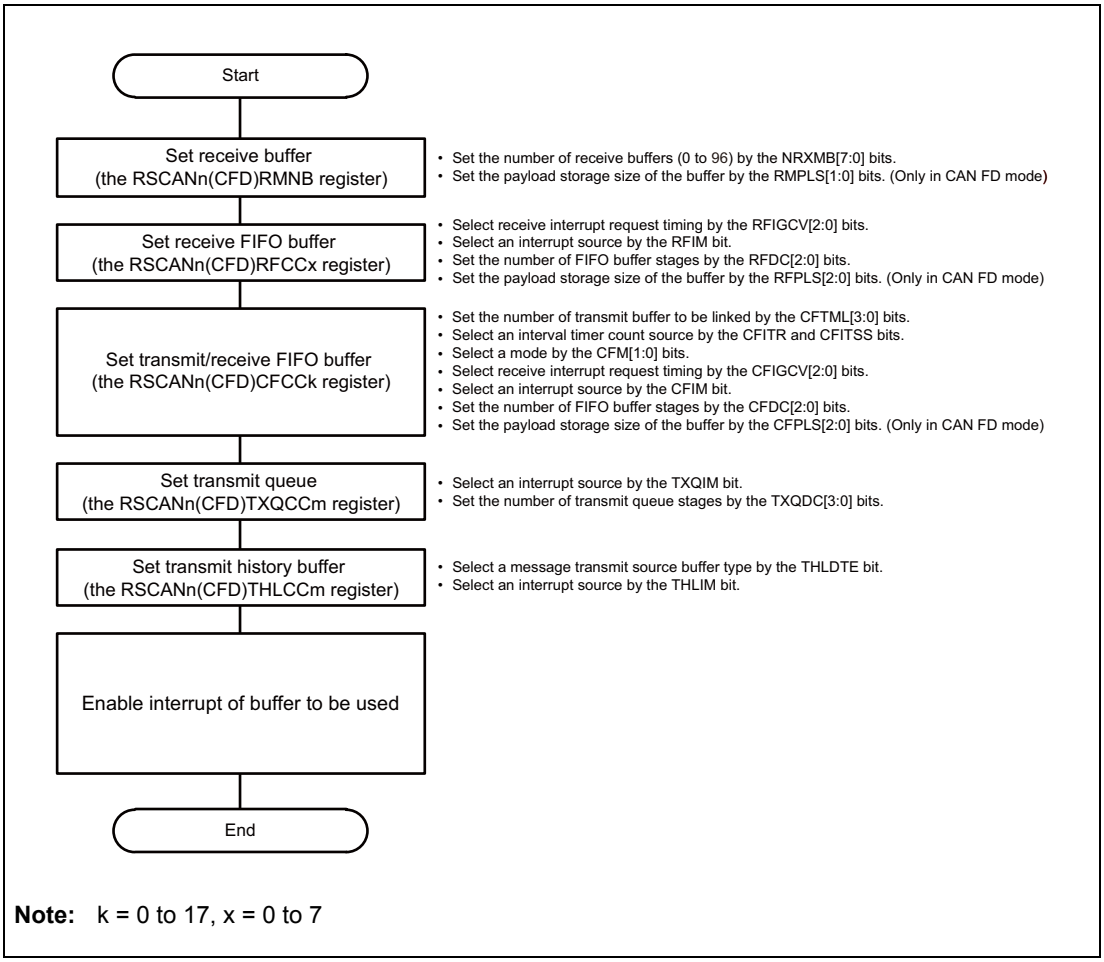


**Note:** m = 0 to 5

**Figure 21.20 Buffer Configuration**

**CAUTION**

**Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.**



**Note:** k = 0 to 17, x = 0 to 7

**Figure 21.21 Buffer Setting Procedure**

### 21.11.1.6 Transmitter Delay Compensation (Only in CAN FD Mode)

A high baud rate is used in CAN FD mode. Transmitter delay compensation is provided as a function to accept propagation delay in this case.

To use this function, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS-CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.) Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing.

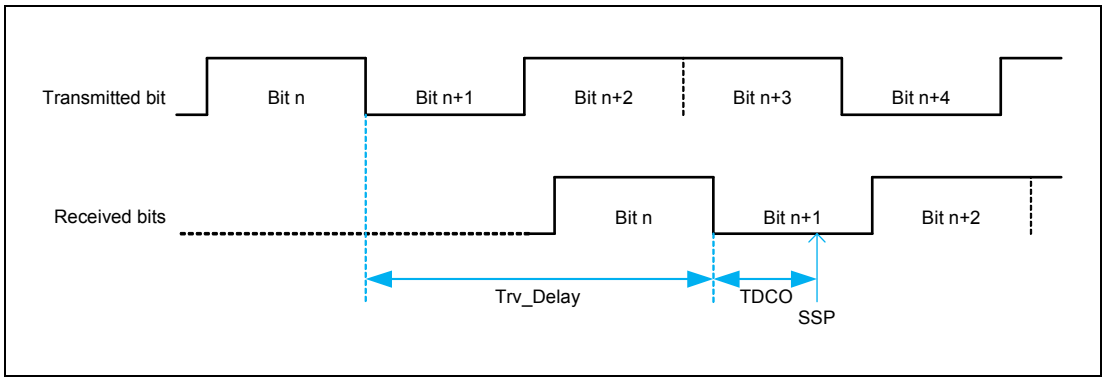


**Figure 21.22 SSP timing**

When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RSCFDnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)

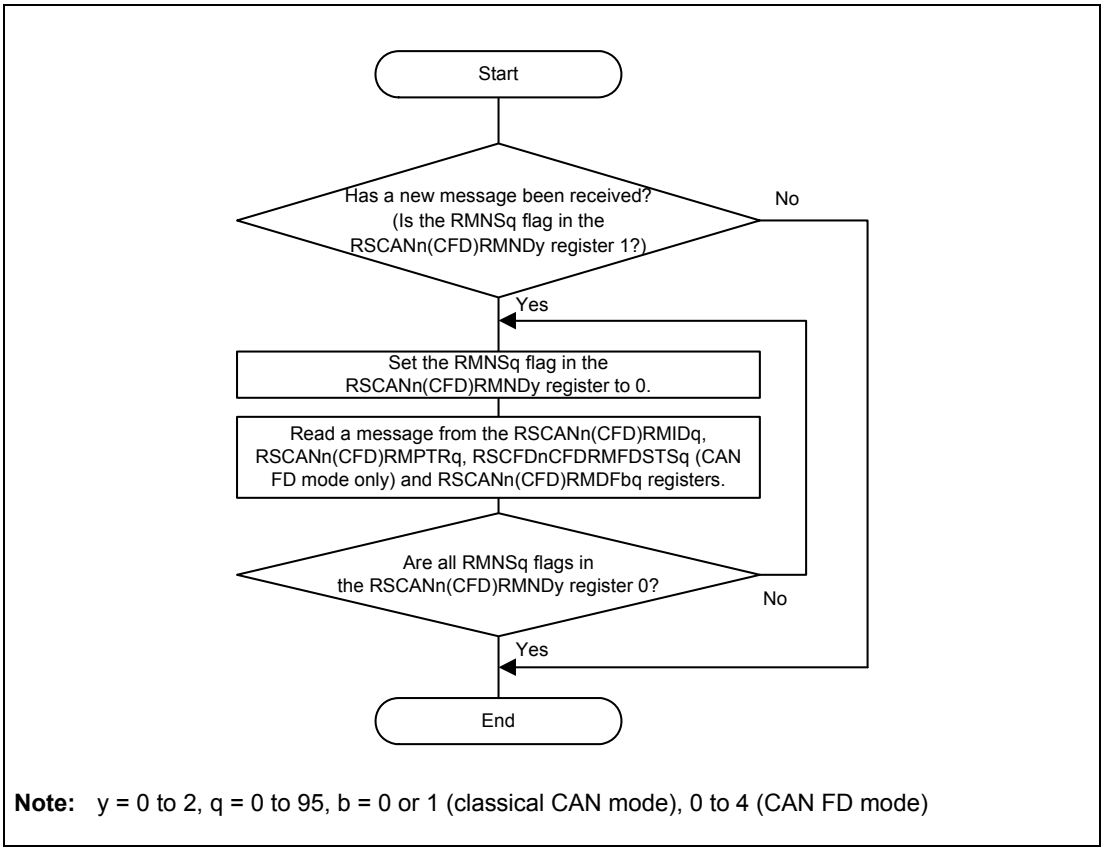
The RS-CANFD module compensates a delay up to (3 CANm bit time - 2 Tq). (CANm bit time is data bit rate values.)

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

## 21.11.2 Reception Procedure

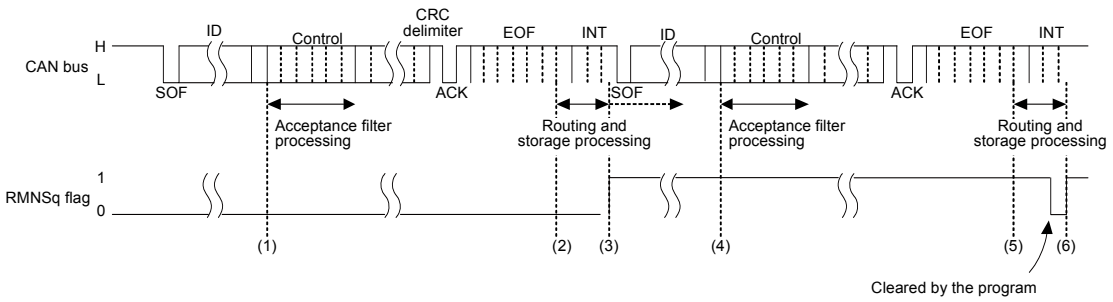
### 21.11.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCANn(CFD)RMNDy register (y = 0 to 2, q = 0 to 95) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RSCANn(CFD)RMIDq, RSCANn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq (only in CAN FD mode), and RSCANn(CFD)RMDFbq (b = 0 or 1 in classical CAN mode, b = 0 to 4 in CAN FD mode). **Figure 21.23** shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RSCANn(CFD)RMIDq, RSCANn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCANn(CFD)RMDFbq.



**Note:** y = 0 to 2, q = 0 to 95, b = 0 or 1 (classical CAN mode), 0 to 4 (CAN FD mode)

**Figure 21.23 Receive Buffer Reading Procedure**



**Note:** y = 0 to 2, q = 0 to 95
RMNSq: Flag in the RSCANn(CFD)RMNDy register

**Figure 21.24 Receive Buffer Reception Timing Chart**

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCANn(CFD)RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.

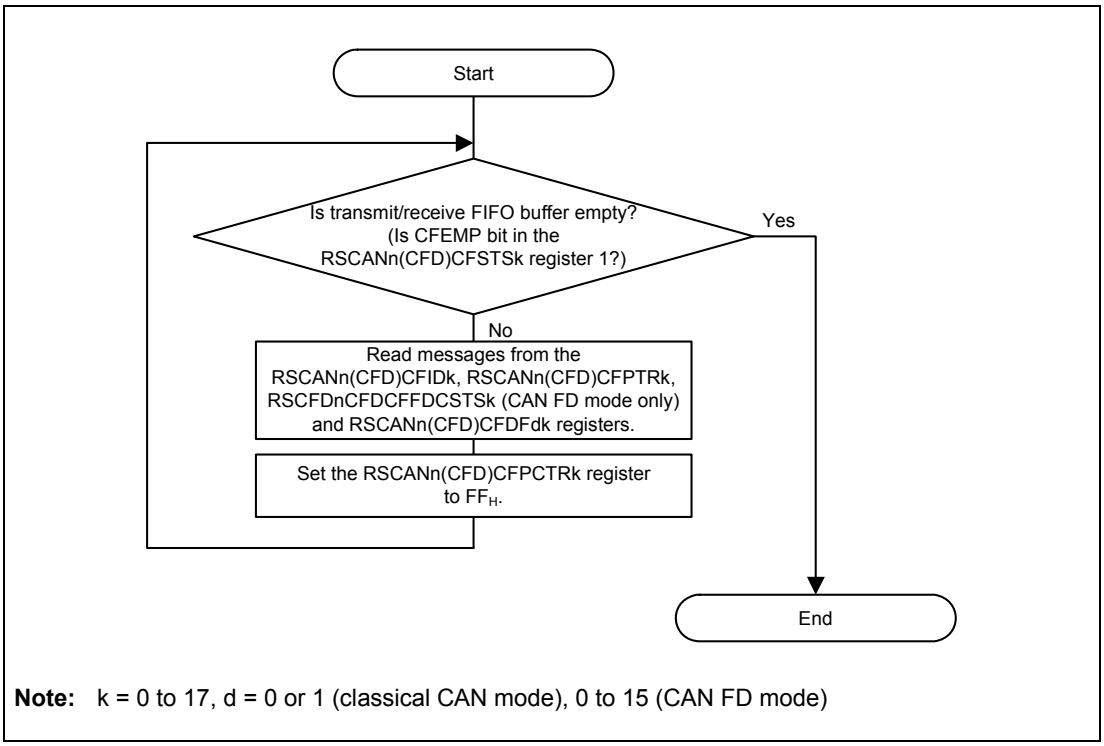
### 21.11.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCANn(CFD)RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCANn(CFD)CFSTSk register (k = 0 to 17)) is incremented. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCANn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCANn(CFD)CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCANn(CFD)RFIDx, RSCANn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx (only in CAN FD mode), and RSCANn(CFD)RFDFdx (d = 0 or 1 in classical CAN mode, d = 0 to 15 in CAN FD mode) registers for receive FIFO buffers, or from the RSCANn(CFD)CFIDk, RSCANn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk (only in CAN FD mode), and RSCANn(CFD)CFDFdk registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCANn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCANn(CFD)CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCANn(CFD)RFSTSx register or the CFEMP flag in the RSCANn(CFD)CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCANn(CFD)RFSTSx register or CFRXIF flag in the RSCANn(CFD)CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.



**Note:** k = 0 to 17, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

**Figure 21.25 Transmit/Receive FIFO Buffer Reading Procedure**

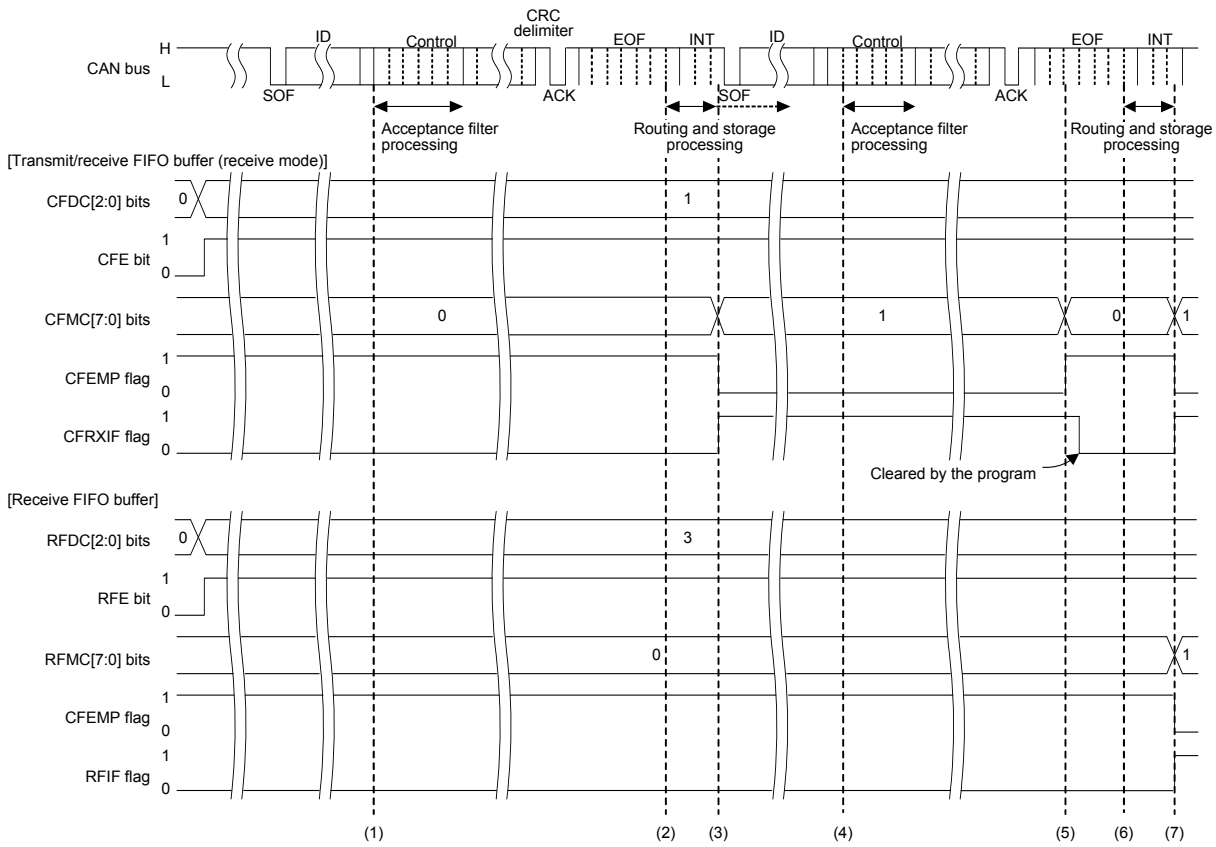
When reading a message in CAN FD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

**Table 21.188 Payload Storage Area of Receive FIFO Buffer**

| RFPLS[2:0] Setting Value | Payload Storage Size | Corresponding Data Field Registers |
|---|---|---|
| $000_B$ | 8 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x |
| $001_B$ | 12 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x |
| $010_B$ | 16 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x |
| $011_B$ | 20 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x |
| $100_B$ | 24 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x |
| $101_B$ | 32 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x |
| $110_B$ | 48 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x |
| $111_B$ | 64 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x |

**Table 21.189 Payload Storage Area of Transmit/Receive FIFO Buffer**

| CFPLS[2:0] Setting Value | Payload Storage Size | Corresponding Data Field Registers |
|---|---|---|
| $000_B$ | 8 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k |
| $001_B$ | 12 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k |
| $010_B$ | 16 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k |
| $011_B$ | 20 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k |
| $100_B$ | 24 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k |
| $101_B$ | 32 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k |
| $110_B$ | 48 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k |
| $111_B$ | 64 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k |



CFDC[2:0], CFE: Bits in the RSCANn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFRXIF: Flags in the RSCANn(CFD)CFSTSk register
RFDC[2:0], RFE: Bits in the RSCANn(CFD)RFCCx register
RFMC[7:0], CFEMP, RFIF: Flags in the RSCANn(CFD)RFSTSx register

**Note:** k = 0 to 17, x = 0 to 7

**Figure 21.26 FIFO Buffer Reception Timing Chart**

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCANn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCANn(CFD)CFCCk register is $001_B$ or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCANn(CFD)CFSTSk register is incremented and becomes $01_H$. When the CFIM bit in the RSCANn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCANn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCANn(CFD)CFIDk, RSCANn(CFD)CFPTRk, and RSCANn(CFD)CFDFdk registers and write $FF_H$ to the RSCANn(CFD)CFPCTRk register. This causes the CFMC[7:0] bits in the RSCANn(CFD)CFSTSk register to be decremented. When CFMC[7:0] becomes $00_H$, the CFEMP flag in the RSCANn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to $001_B$ or more. The CFMC[7:0] bit value is incremented by 1 to be $01_H$. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCANn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCANn(CFD)RFCCx register are set to $001_B$ or more. The RFMC[7:0] bits in the RSCANn(CFD)RFSTSx register are set to $01_H$ by being incremented by 1. When the RFIM bit in the RSCANn(CFD)RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCANn(CFD)RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

### 21.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer

In CAN FD mode, the following FIFO buffers can be read by DMA transfer.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k allocated to channel m (k = 3 × m, m = 0 to 5)

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTC register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RSCFDnCFDRFCCx register or CFRXIE bit in the RSCFDnCFDCFCCk register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RSCFDnCFDRFCCx register or RSCFDnCFDCFCCk register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the FIFO access register address for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RSCFDnCFDRFSTSx register or the CFMC[7:0] value in the RSCFDnCFDCFSTSk register is automatically decremented. After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSm bit in the RSCFDnCFDCDTSTS register) is cleared to 0 (not in DMA transfer processing), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.

## 21.11.3 Transmission Procedure

### 21.11.3.1 Procedure for Transmission from Transmit Buffers

**Figure 21.27** shows the procedure for transmission from transmit buffers.

**Figure 21.28** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 21.29** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.

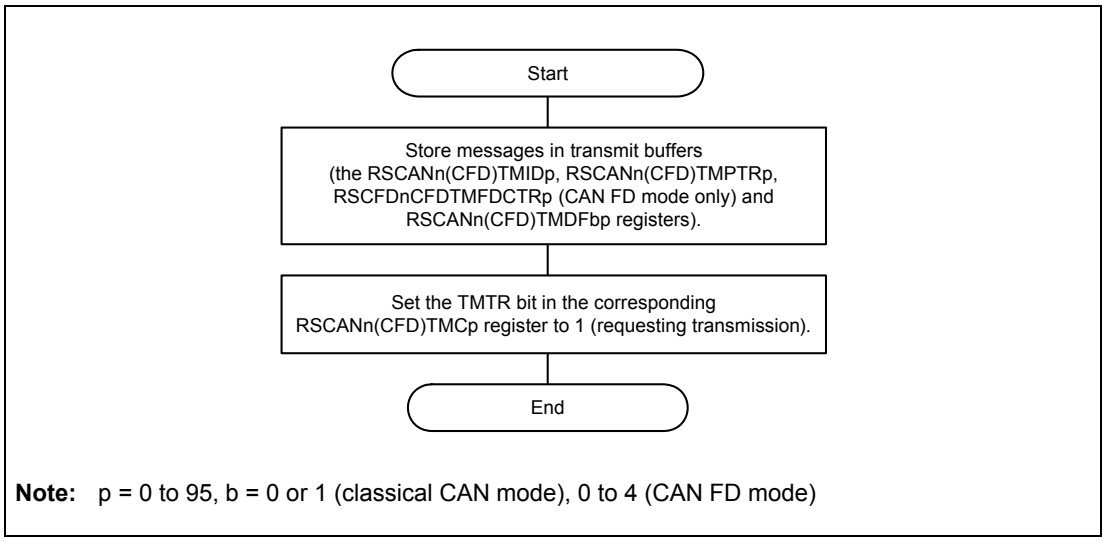


**Figure 21.27 Procedure for Transmission from Transmit Buffers**

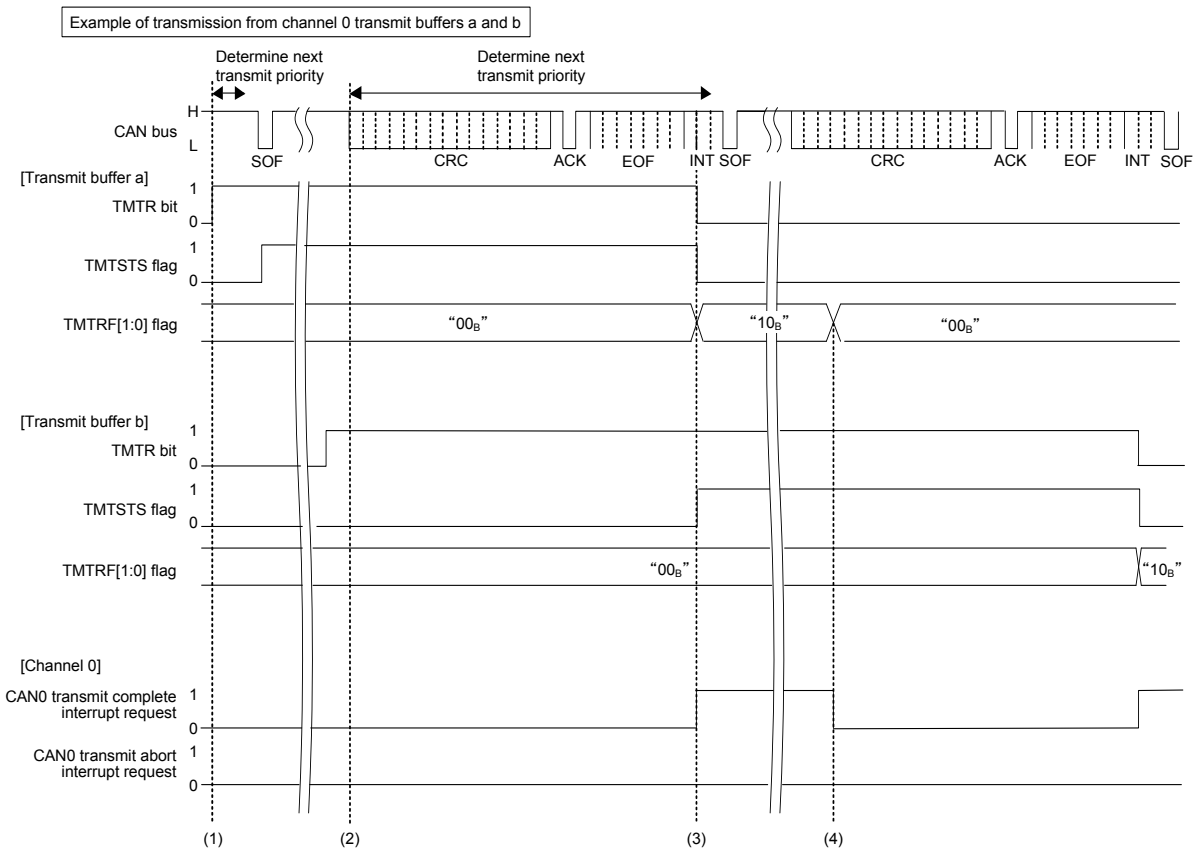
In CAN FD mode and transmit buffer merge mode, messages with a payload size of more than 20 bytes can be transmitted from transmit buffers (16 × m) + 0 and transmit buffers (16 × m) + 3. At this time, transmit buffers (16 × m) + 1 to (16 × m) + 2 and transmit buffers (16 × m) + 4 to (16 × m) + 5 are allocated as a payload storage area. Registers RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp corresponding to these buffers can be used as data field registers that can store 4-byte data bytes (payload) like the RSCFDnCFDTMDFb_p register. **Table 21.190** shows message storage registers when transmitting a message with a payload size of more than 20 bytes from transmit buffer 0.

**Table 21.190 Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)**

| Transmit Buffer | Offset from Base Address | Symbol | Register Function in Transmit Buffer Merge Mode |
|---|---|---|---|
| Transmit buffer 0 | $4000_H$ | RSCFDnCFDTMID0 | Transmit buffer 0 ID data, transmit history data store enable bit, RTR bit,and IDE bit |
| | $4004_H$ | RSCFDnCFDTMPTR0 | Transmit buffer 0 label data and DLC data |
| | $4008_H$ | RSCFDnCFDTMFDCTR0 | Transmit buffer 0 ESI bit, BRS bit, and FDF bit |
| | $400C_H$ to $401C_H$ | RSCFDnCFDTMDF0_0 to RSCFDnCFDTMDF4_0 | Transmit buffer 0 data bytes 0, 1, 2, and 3 to transmit buffer 0 data bytes 16, 17, 18, and 19 |
| Transmit buffer 1 | $4020_H$ | RSCFDnCFDTMID1 | Transmit buffer 0 data bytes 20, 21, 22, and 23 |
| | $4024_H$ | RSCFDnCFDTMPTR1 | Transmit buffer 0 data bytes 24, 25, 26, and 27 |
| | $4028_H$ | RSCFDnCFDTMFDCTR1 | Transmit buffer 0 data bytes 28, 29, 30, and 31 |
| | $402C_H$ to $403C_H$ | RSCFDnCFDTMDF0_1 to RSCFDnCFDTMDF4_1 | Transmit buffer 0 data bytes 32, 33, 34, and 35 to transmit buffer 0 data bytes 48, 49, 50, and 51 |
| Transmit buffer 2 | $4040_H$ | RSCFDnCFDTMID2 | Transmit buffer 0 data bytes 52, 53, 54, and 55 |
| | $4044_H$ | RSCFDnCFDTMPTR2 | Transmit buffer 0 data bytes 56, 57, 58, and 59 |
| | $4048_H$ | RSCFDnCFDTMFDCTR2 | Transmit buffer 0 data bytes 60, 61, 62, and 63 |
| | $404C_H$ to $405C_H$ | RSCFDnCFDTMDF0_2 to RSCFDnCFDTMDF4_2 | Not used |



**Note:** a = 0 to 15, b = 0 to 15
TMTR: Bit in the RSCANn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCANn(CFD)TMSTSp registers

**Figure 21.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)**

(1) When the TMTR bit in the RSCANn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCANn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

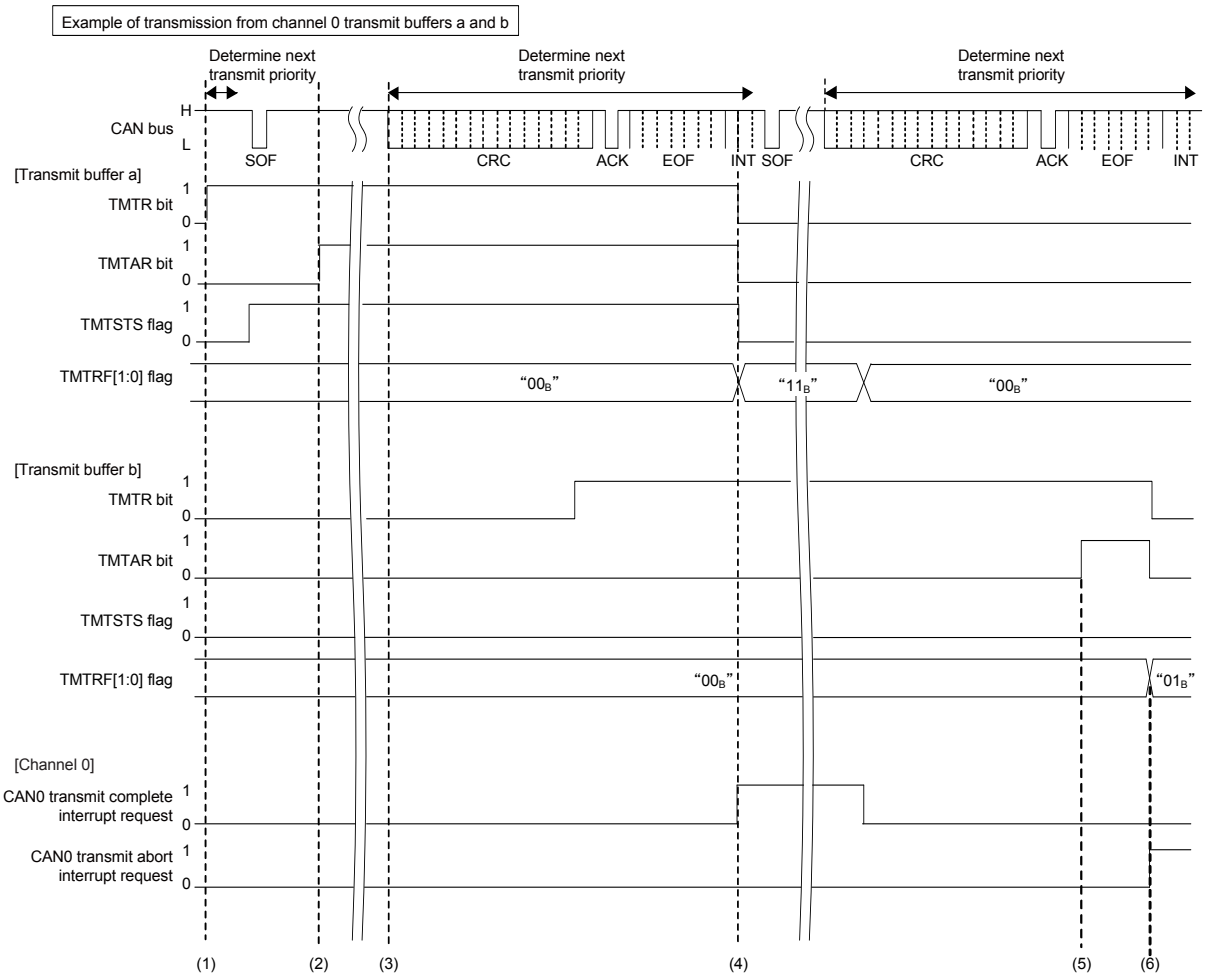
(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCANn(CFD)TMSTSa register is set to $10_B$ (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCANn(CFD)TMCa register are cleared to 0. When the TMIEa bit in the RSCANn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to $00_B$ (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to $00_B$. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is $00_B$.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).



**Note:** a = 0 to 15, b = 0 to 15
TMTR, TMTAR: Bits in the RSCANn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCANn(CFD)TMSTSp register

**Figure 21.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)**

(1) When the TMTR bit in the RSCANn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCANn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCANn(CFD)TMSTSa register is set to $11_B$ (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCANn(CFD)TMCa register are cleared to 0. When the TMIEa value in the RSCANn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to $00_B$ (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to $01_B$. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to $01_B$. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCANn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to $00_B$.

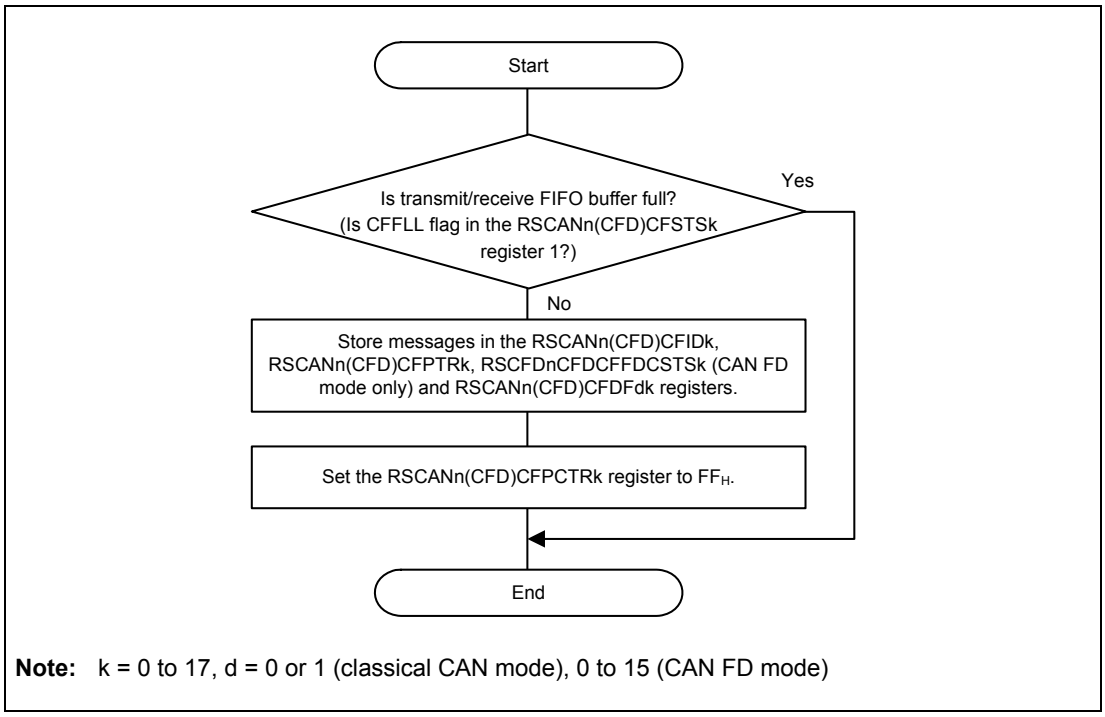
If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).

### 21.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

**Figure 21.30** shows the procedure for transmission from transmit/receive FIFO buffers.

**Figure 21.31** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 21.32** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.



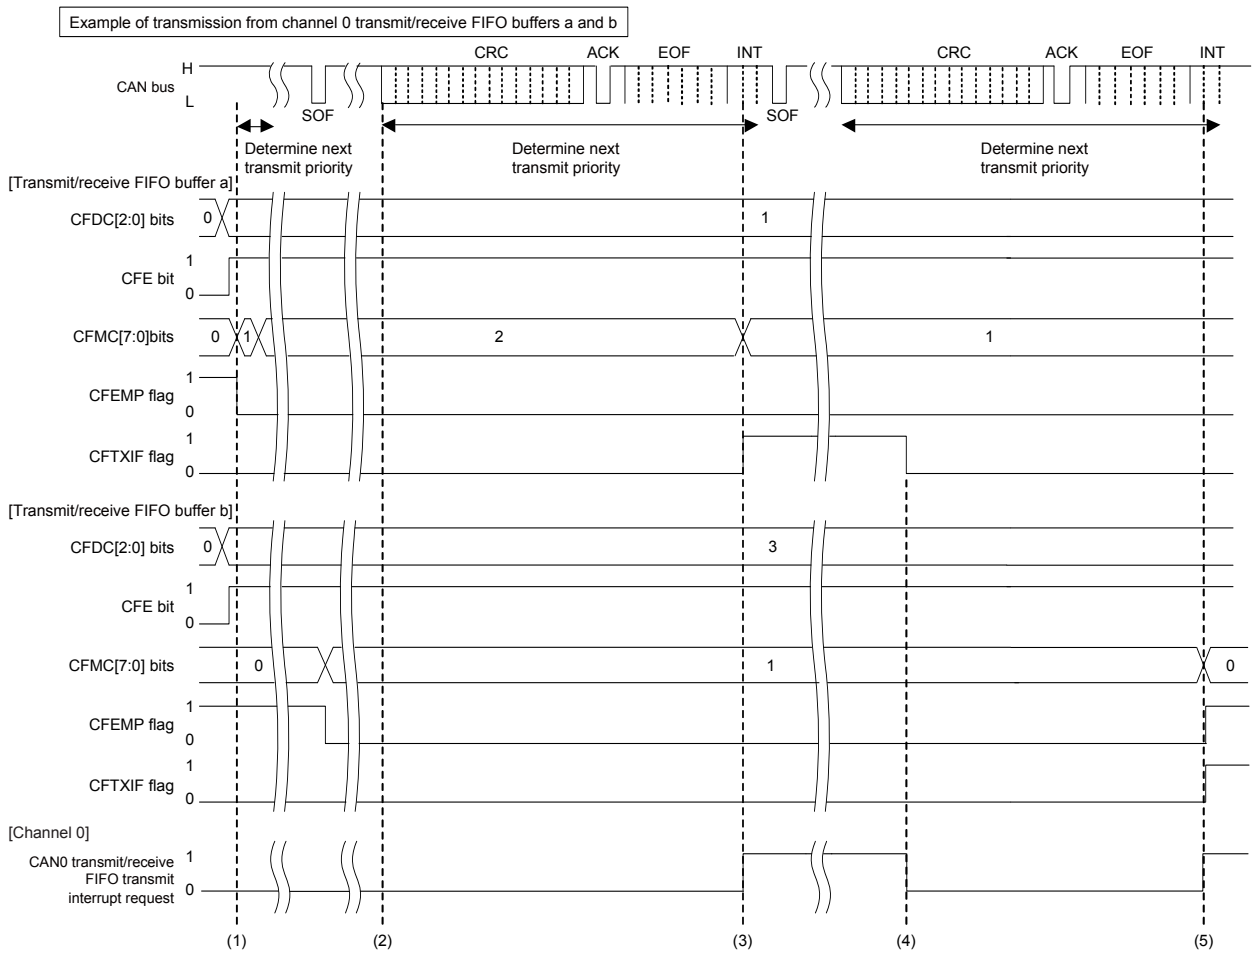
**Note:** k = 0 to 17, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

**Figure 21.30 Procedure for Transmission from Transmit/Receive FIFO Buffers**

When storing a message, do not write a value to the RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

**Table 21.191 Payload Storage Area of Transmit/Receive FIFO Buffer**

| CFPLS[2:0] Setting Value | Payload Storage Size | Corresponding Data Field Registers |
|---|---|---|
| $000_B$ | 8 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k |
| $001_B$ | 12 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k |
| $010_B$ | 16 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k |
| $011_B$ | 20 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k |
| $100_B$ | 24 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k |
| $101_B$ | 32 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k |
| $110_B$ | 48 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k |
| $111_B$ | 64 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k |



**Note:** a = 0 to 2, b = 0 to 2
CFDC[2:0],CFE: Bits in the RSCANn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCANn(CFD)CFSTSk register

**Figure 21.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)**

(1) While the CAN bus is idle, when the CFE bit in the RSCANn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCANn(CFD)CFCCa register is $001_B$ (4 messages) or more and the CFMC[7:0] value in the RSCANn(CFD)CFSTSa register is $01_H$ or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

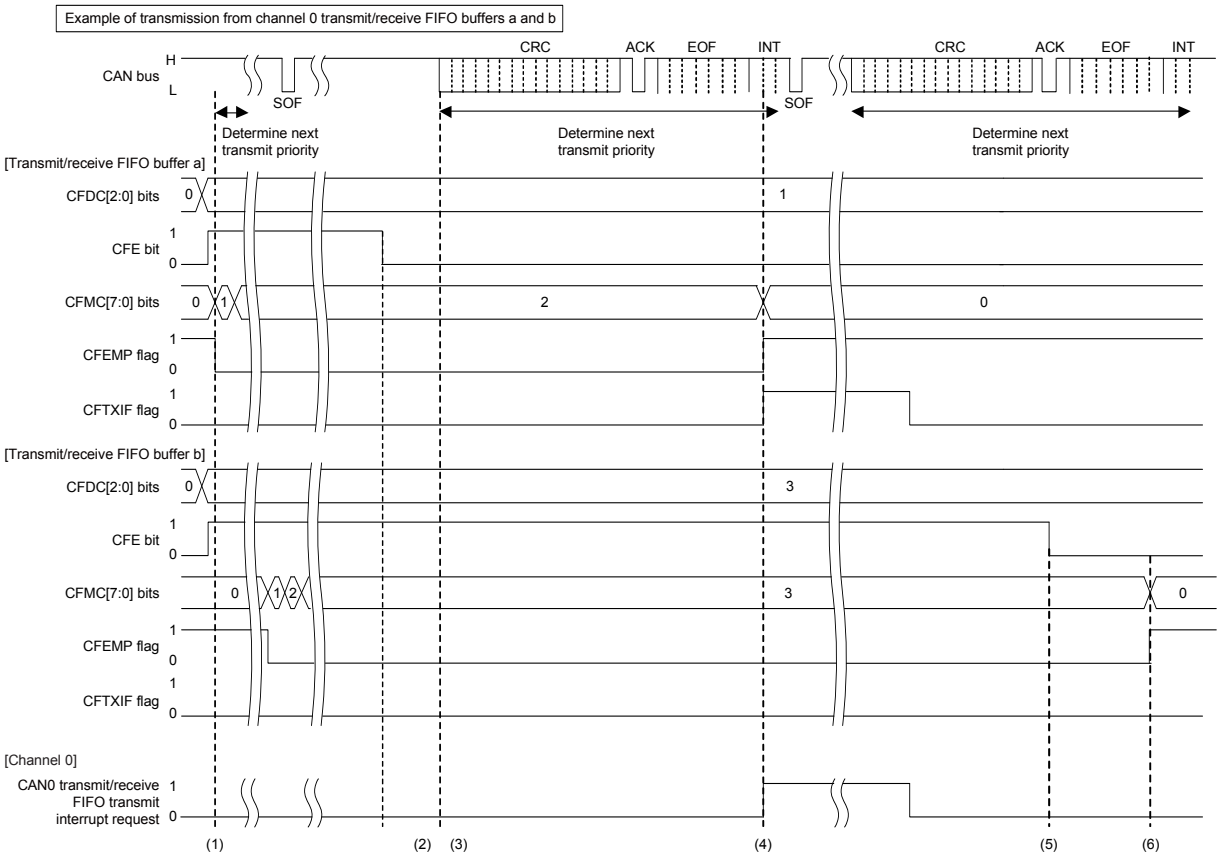
(3) When transmission completes successfully, the CFMC[7:0] value in the RSCANn(CFD)CFSTSa register is decremented. Setting the CFIM bit in the RSCANn(CFD)CFCCa register to 1 (a FIFO

transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCANn(CFD)CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCANn(CFD)CFSTSb register is decremented. The CFMC[7:0] bits are cleared to $00_H$ and therefore the CFEMP flag in the RSCANn(CFD)CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCANn(CFD)CFSTSa and RSCANn(CFD)CFSTSb register is set to 1 (the transmit/receive FIFO buffer is full).



**Note:** a = 0 to 2, b = 0 to 2
CFDC[2:0], CFE: Bits in the RSCANn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCANn(CFD)CFSTSk register

**Figure 21.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)**

(1) While the CAN bus is idle, when the CFE bit in the RSCANn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCANn(CFD)CFCCa register is $001_B$ (4 messages) or more and the CFMC[7:0] value in the RSCANn(CFD)CFSTSa register is $01_H$ or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmit completes successfully, the CFMC[7:0] value is cleared to $00_H$. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCANn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCANn(CFD)CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCANn(CFD)CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCANn(CFD)CFSTSb register are cleared to $00_H$ and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to $00_H$ and the CFEMP flag is set to 1.)

### 21.11.3.3 Procedure for Transmission from the Transmit Queue

**Figure 21.33** shows the procedure for transmission from the transmit queue.

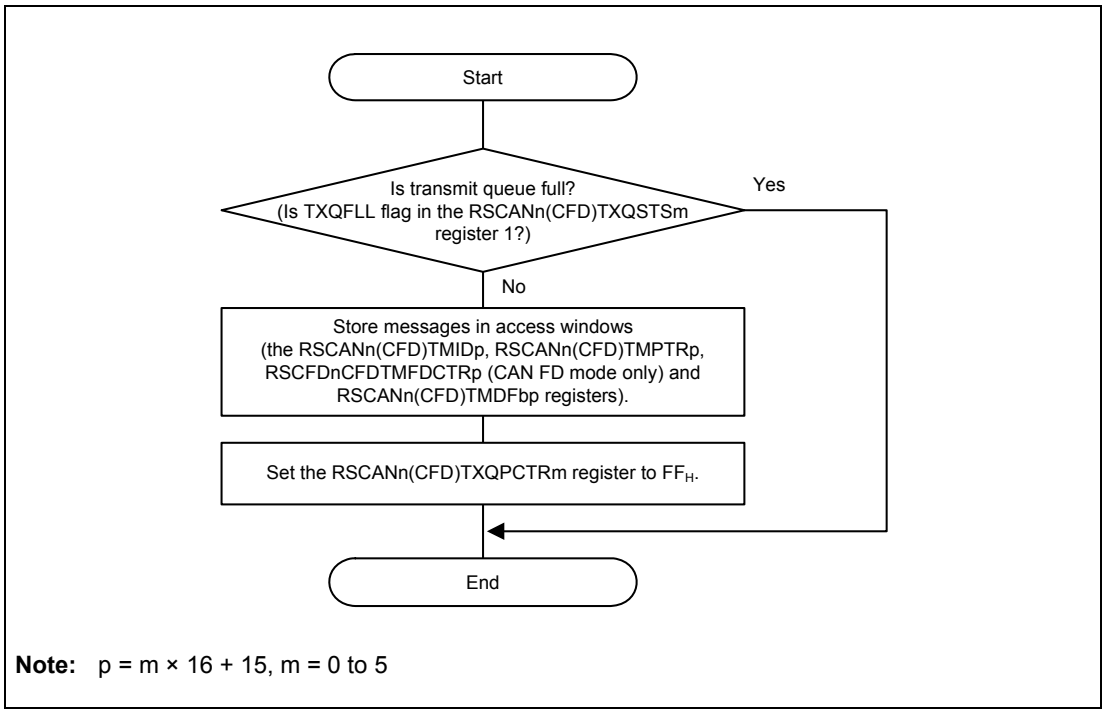


**Figure 21.33 Procedure for Transmission from the Transmit Queue**

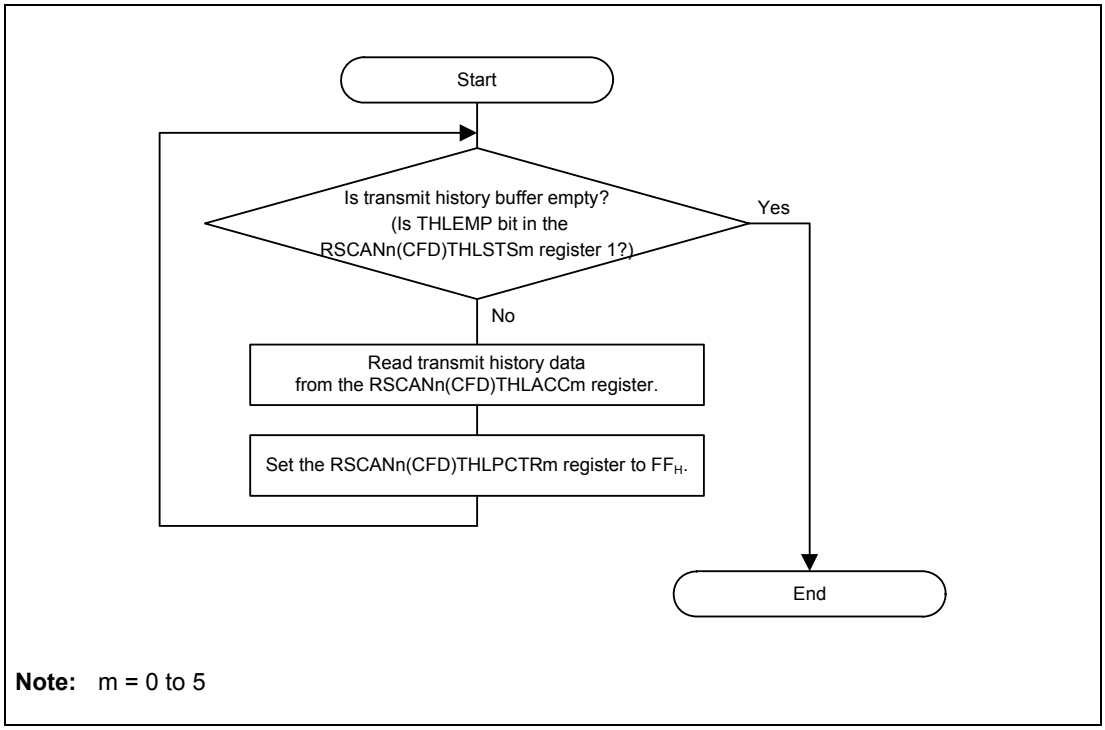
### 21.11.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCANn(CFD)THLACCm register. The next data can be accessed by writing $FF_H$ to the corresponding RSCANn(CFD)THLPCTRm register (m = 0 to 5) after reading a set of data. **Figure 21.34** shows the transmit history buffer reading procedure.



**Note:** m = 0 to 5

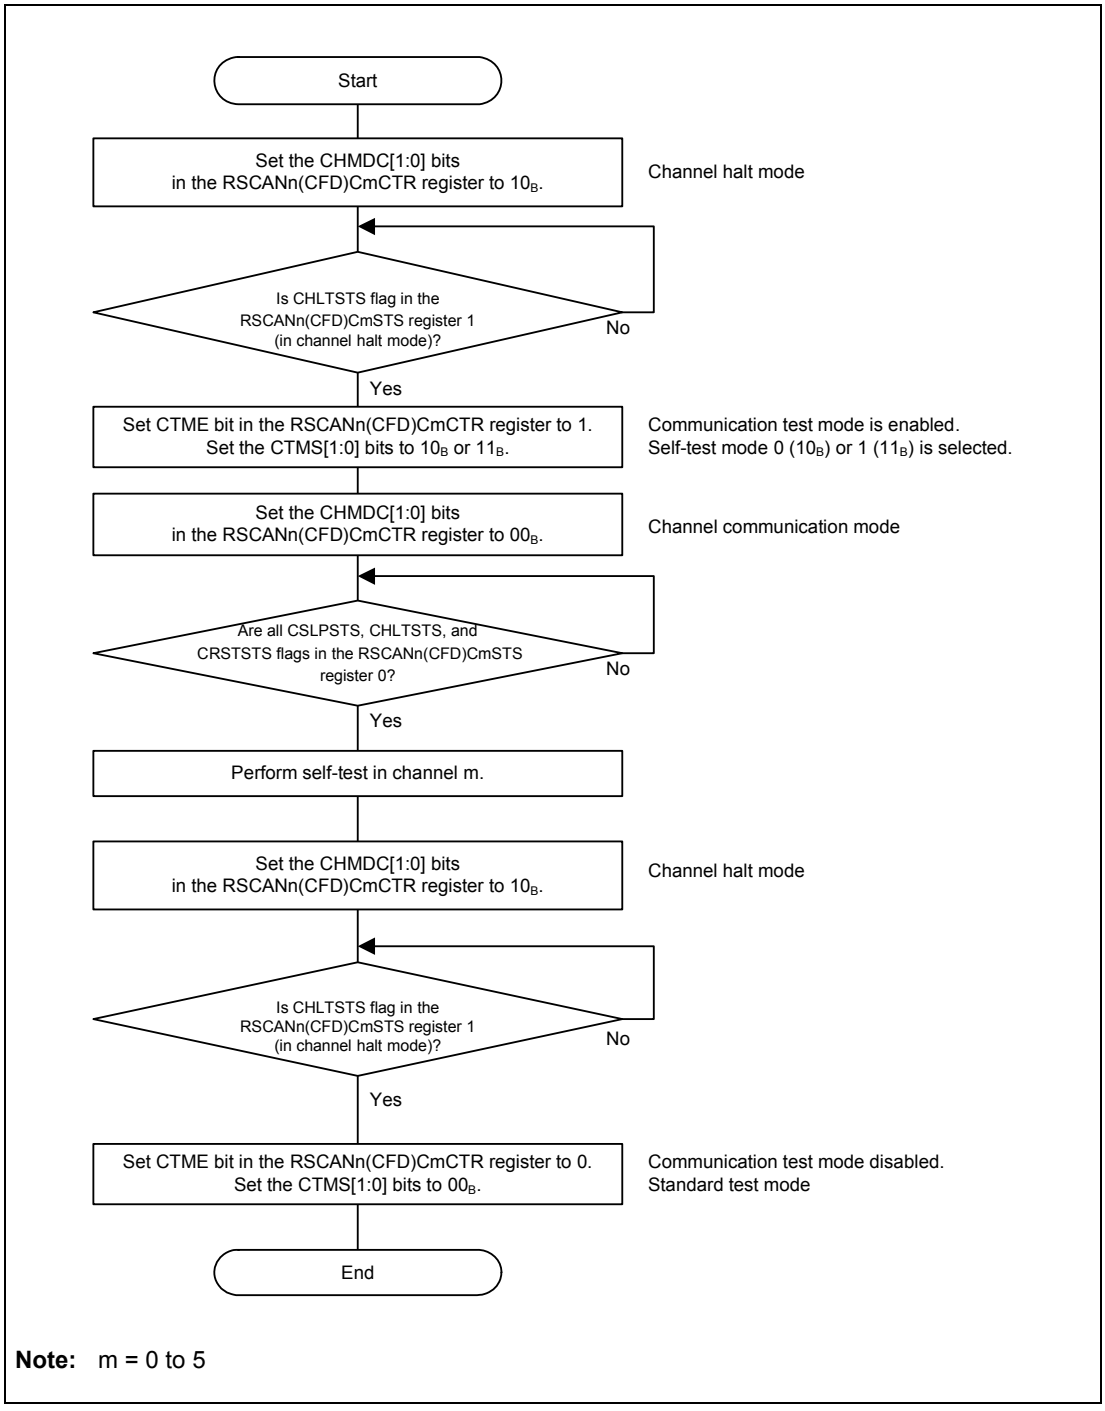
**Figure 21.34 Transmit History Buffer Reading Procedure**

## 21.11.4 Test Settings

### 21.11.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

**Figure 21.35** shows the self-test mode setting procedure.



**Note:** m = 0 to 5

**Figure 21.35 Self-Test Mode Setting Procedure**

### 21.11.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 21.192** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCANn(CFD)GLOCKK register, then set the target test function bit to 1.

**Table 21.192 Protection Release Data for Test Function**

| Test Function | Protection Release Data 1 | Protection Release Data 2 | Target Bit |
|---|---|---|---|
| RAM test | $7575_H$ | $8A8A_H$ | RTME bit in the RSCANn(CFD)GTSTCTR register |

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 21.36** shows the procedure for releasing the protection.

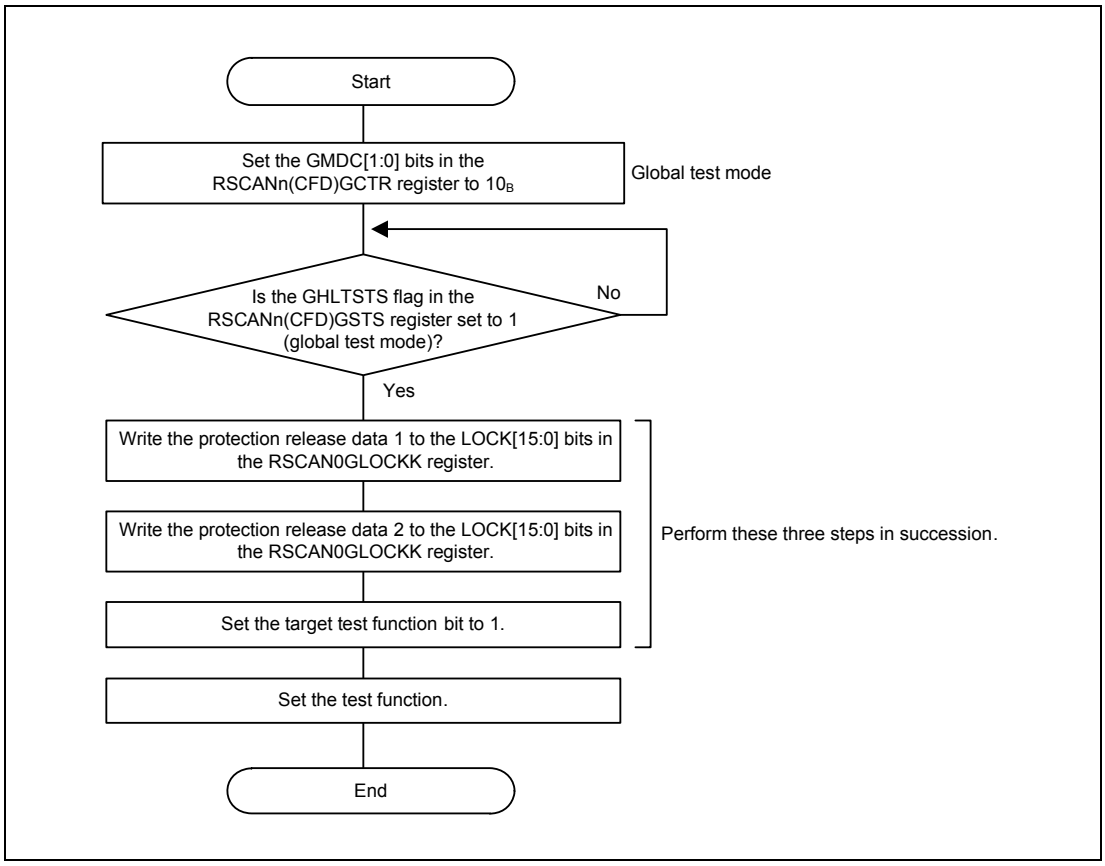


**Figure 21.36 Protection Release Procedure**

### 21.11.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write 0000 $0000_H$ to all pages of the CAN RAM.

**Figure 21.37** shows the RAM test setting procedure.

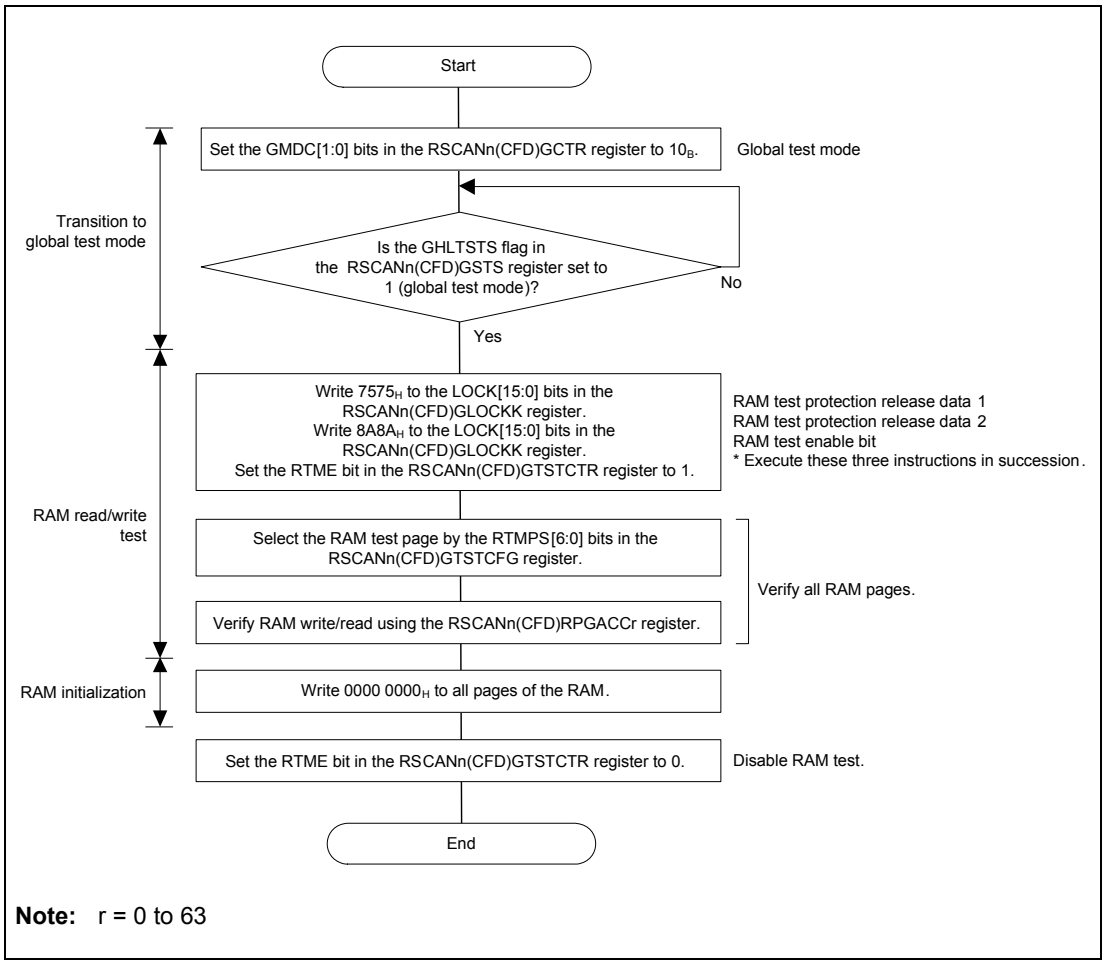

**Figure 21.37 RAM Test Setting Procedure**

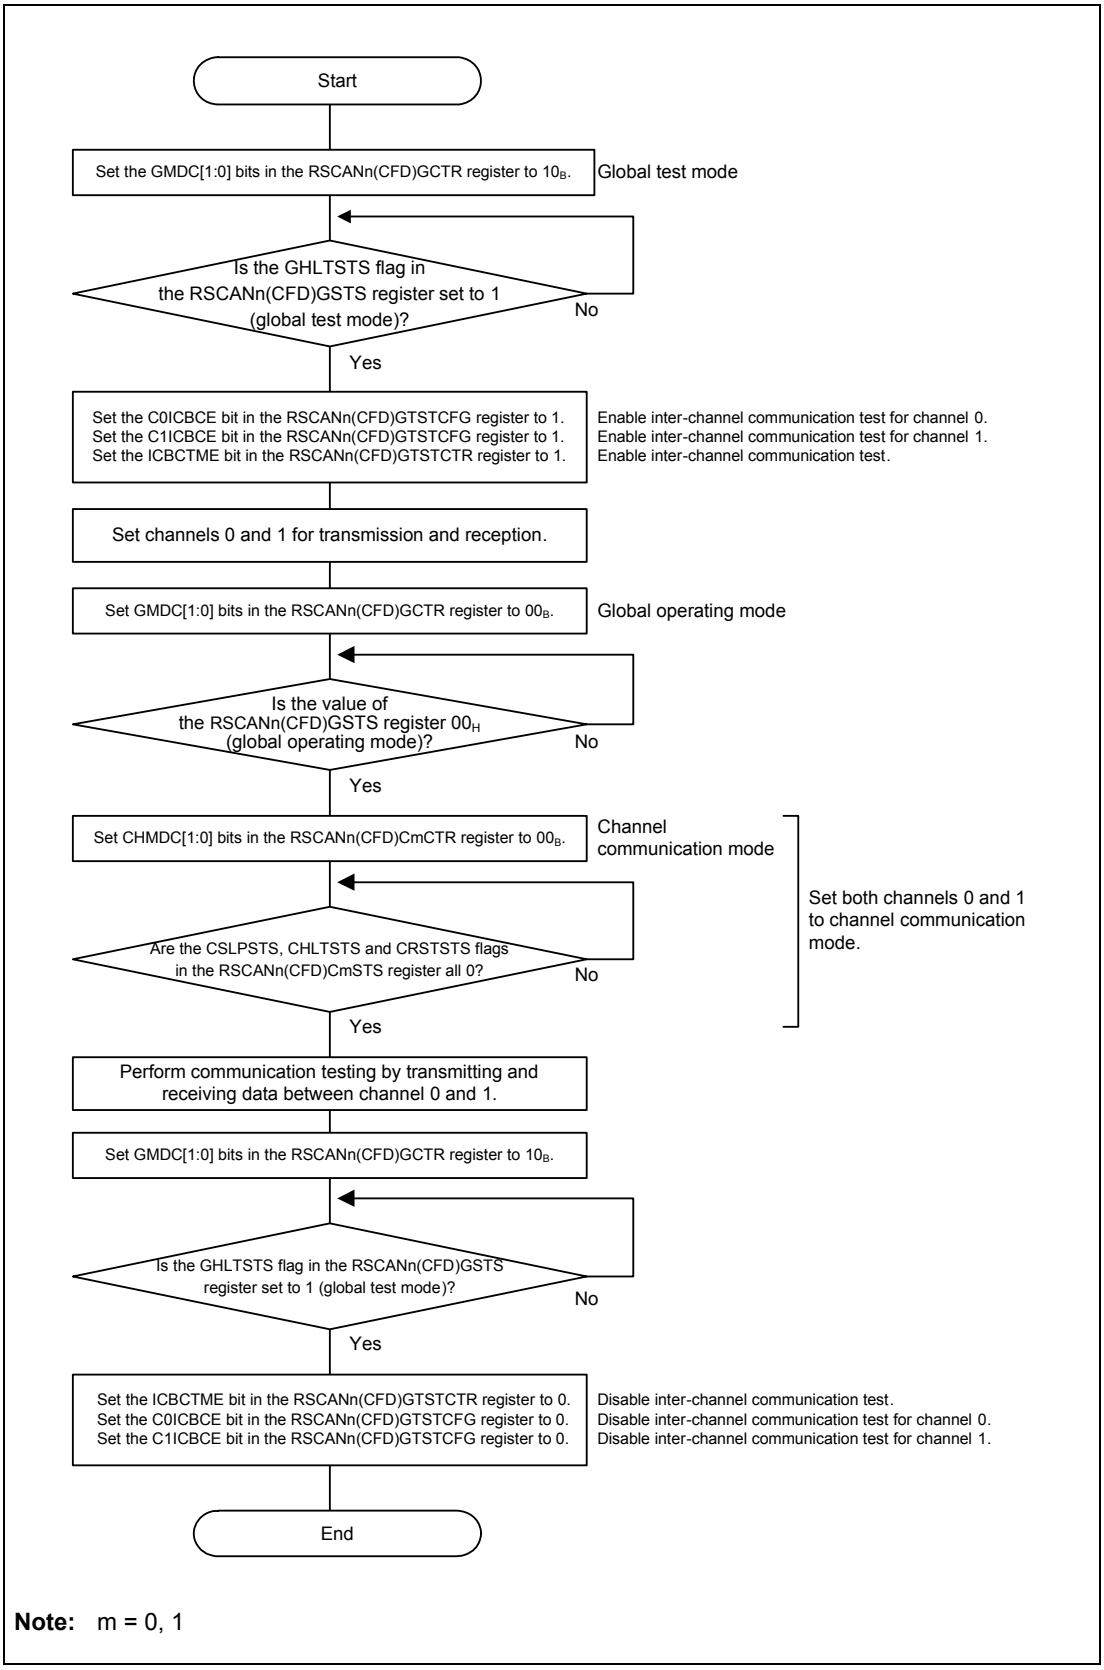
#### 21.11.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

**Figure 21.38** shows the inter-channel communication test setting procedure.



**Note:** m = 0, 1

**Figure 21.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)**

# 21.12 Detection and Correction of Errors in RS-CAN0 RAM

## 21.12.1 ECC for the RSCAN0 RAM

**Table 21.193** gives an outline of the ECC functions for the RSCAN0 RAM.

**Table 21.193 List of the ECC Functions for the RSCAN0 RAM**

| Item | Outline of Functions |
|---|---|
| ECC error detection/correction | The RAM is checked for ECC errors. The following options can be selected.<br>• 2-bit error detection and 1-bit error detection/correction<br>• 2-bit error detection and 1-bit error detection<br>The ECC error detection/correction can be disabled by using through mode. With the initial settings, error detection/correction is enabled. |
| Error notification | When an ECC error has occurred, the error is notified.<br>• Error notification can be enabled or disabled when an ECC 2-bit error is detected.<br>• Error notification can be enabled or disabled when an ECC 1-bit error is detected.<br>In the initial setting, 2-bit error notification is enabled and 1-bit error notification is disabled. However, when the interrupt is masked by the FEINTFMSK register, interrupt processing is not performed. |
| Error status | Monitoring for the detection of two-bit ECC errors and for the detection of one-bit ECC errors is available.<br>A register for clearing the error status is provided. |
| Address capture | Only one address at which an ECC error has occurred can be captured.<br>A signal is generated upon detection of ECC 2-bit or 1-bit error , and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared). |

**CAUTION**

**When ECC error detection/correction is performed, confirm initialization of the RSCAN0 RAM (RSCAN0(CFD)GSTS.GRAMINIT = 0) before it is used.**

## 21.12.2 Interrupt Request

**Table 21.194** lists the ECC interrupt request of RSCANn RAM.

**Table 21.194 RS-CAN0 ECC Interrupt Request (FE-Level Maskable Interrupt)**

| Unit Interrupt Bit Name | Outline | Name | DMA Trigger Number |
|---|---|---|---|
| ECCDCNRAM0FEIF | RS-CAN0 ECC error interrupt | INTECCDCNRAM0 | — |

## 21.12.3 List of ECC Registers

Table 21.195 ECC Registers

| Module | Register | Symbol | Address | Guard Group |
|---|---|---|---|---|
| RS-CAN0 ECC Register (for MB RAM) | | | | |
| ECCCAN00 | ECC Control Register | ECCRCAN0CTL_PHY1 | <ECCCAN0_base > + $00_H$ | ECCCAN0 PHY1 |
| | ECC Test Mode Control Register | ECCRCAN0TMC_PHY1 | <ECCCAN0_base > + $04_H$ | ECCCAN0 PHY1 |
| | ECC Encode/Decode Input/Output Replacement Test Register | ECCRCAN0TED_PHY1 | <ECCCAN0_base > + $0C_H$ | ECCCAN0 PHY1 |
| | ECC Redundant Bit Data Control Test Register | ECCRCAN0TRC_PHY1 | <ECCCAN0_base > + $08_H$ | ECCCAN0 PHY1 |
| | ECC Decode Syndrome Data Register in ECCRCAN0TRC | ECCRCAN0SYND_PHY1 | <ECCCAN0_base > + $0B_H$ | ECCCAN0 PHY1 |
| | ECC 7-Bit Redundant Bit Data Hold Test Register in ECCRCAN0TRC | ECCRCAN0HORD_PHY1 | <ECCCAN0_base > + $0A_H$ | ECCCAN0 PHY1 |
| | ECC Encode Test Register in ECCRCAN0TRC | ECCRCAN0ECRD_PHY1 | <ECCCAN0_base > + $09_H$ | ECCCAN0 PHY1 |
| | ECC Redundant Bit Input/Output Replacement Register in ECCRCAN0TRC | ECCRCAN0ERDB_PHY1 | <ECCCAN0_base > + $08_H$ | ECCCAN0 PHY1 |
| | ECC Error Address Register 0 | ECCRCAN0AD0_PHY1 | <ECCCAN0_base> + $10_H$ | ECCCAN0 PHY1 |
| RS-CAN0 ECC Register (for AFL RAM) | | | | |
| ECCCAN01 | ECC Control Register | ECCRCANFD0CTL_PHY2 | <ECCCANFD0_base > + $00_H$ | ECCCAN0 PHY2 |
| | ECC Test Mode Control Register | ECCRCANFD0TMC_PHY2 | <ECCCANFD0_base > + $04_H$ | ECCCAN0 PHY2 |

**Note:** For details about Guard Group, see **Section 33, Functional Safety**.

## 21.12.4 ECCRCAN0CTL_PHY1/ECCRCANFD0CTL_PHY2 — RSCANn ECC Control Register

The ECCRCAN0CTL_PHY1/ECCRCANFD0CTL_PHY2 register controls the mode of the ECC and the status for RSCAN0.

Bits 7, 5 and 4 should be set (written) while the RSCAN0 operation is stopped. In addition, when writing to bit 7, EMCA1 and EMCA0 need to be $01_B$.

**Access:** This register can be read or written in 16-bit units.

**Address:** <ECCCAN0_base > + $00_H$
<ECCCANFD0_base > + $00_H$

**Value after reset:** Undefined

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | EMCA1 | EMCA0 | — | — | ECCOVFF | ECER2C | ECER1C | — | ECTHM | — | EC1ECP | EC2EDIC | EC1EDIC | ECER2F | ECER1F | ECEMF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | — |
| R/W | R/W*1 | R/W*1 | R | R | R | R/W*1 | R/W*1 | R | R/W | R | R/W | R/W | R/W | R | R | R |

Note 1. These bits are always read as 0.

**Table 21.196 ECCRCAN0CTL_PHY1/ECCRCANFD0CTL_PHY2 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | EMCA1 | Access control bits 1 and 0 to ECC mode selection bit<br>These bits specify whether modifying the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.<br>When these bits are $01_B$, writing to bit 7 is enabled. |
| 14 | EMCA0 | |
| 13, 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | ECCOVFF | By detecting an error while the error status is set and the new error has an address different from the one that already latched (not cleared or reset is not issued), this bit is set and error notification is generated. |

| ECCOVFF | Operation description |
|---|---|
| 0 | Overflow has not occurred after reset of clearing ECER2F and ECER1F.<br>Clearing at<br>(1) Reset<br>(2) Writing ECER2C = 1 or ECER1C = 1<br>(3) Selecting through mode enable (ECTHM = 1) |
| 1 | Error address register overflowed. |

| | | |
|---|---|---|
| 10 | ECER2C | 2-bit ECC error detection flag clear bit<br>This bit is used to clear the 2 bit error detection flag of ECER2F (bit 2).<br>This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. |
| 9 | ECER1C | 1-bit ECC error correction accumulation flag clear bit<br>This bit is used to clear the 1 bit error detection/correction flag of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. |
| 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 21.196 ECCRCAN0CTL_PHY1/ECCRCANFD0CTL_PHY2 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | ECTHM | ECC function through mode selection bit<br>This bit is used to set enabling and disabling of ECC.<br>Setting this bit to 1 disables ECC function.<br>When writing to this bit, (0, 1) must be written to (EMCA1, EMCA0) at the same time.<br>0: Through mode is disabled (normal operation mode).<br>1: Through mode is enabled. (ECC function disable) |
| 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | EC1ECP | 1-bit error correction enable bit<br>This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled.<br>0: When 1-bit error is detected, the error will be corrected.<br>1: When 1-bit error is detected, the error will not be corrected. |
| 4 | EC2EDIC | 2-bit error detection interrupt control bit<br>This bit controls whether to generate an interrupt when 2-bit error is detected.<br>0: When 2-bit error is detected, a INTECCDCNRAMn interrupt will not be generated.<br>1: When 2-bit error is detected, a INTECCDCNRAMn interrupt will be generated. |
| 3 | EC1EDIC | 1-bit error detection interrupt control bit<br>This bit controls whether to generate an interrupt when 1-bit error is detected.<br>0: When 1-bit error is detected, a INTECCDCNRAMn interrupt will not be generated.<br>1: When 1-bit error is detected, a INTECCDCNRAMn interrupt will be generated. |
| 2 | ECER2F | 2-bit error detection flag bit<br>This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (INTECCDCNRAMn) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). If 2-bit error is detected again while this bit is set, an interrupt signal will not be generated.<br>0: 2-bit error has not occurred since this bit was cleared.<br>1: 2-bit error has occurred. |
| 1 | ECER1F | 1-bit error detection/correction flag bit<br>This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1).<br>0: 1-bit error has not occurred since this bit was cleared.<br>1: 1-bit error has occurred. |
| 0 | ECEMF | ECC error message flag<br>This flag indicates whether an error exists in the current read data. This bit is updated whenever the RAM reads data. This bit might be set if it is read before initialization of the RAM. This bit is cleared at the time of through mode enable selection (ECTHM = 1) and when there is no 1 bit error in the decode circuit input data.<br>0: The currently-read RAM data does not have bit errors.<br>1: The currently-read RAM data have bit errors. |

**CAUTION**

**Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.**

**We recommend initializing the RAM before clearing bits 2 and 1.**

## 21.12.5 ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2 — RSCANn ECC Test Mode Control Register

The ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2 register switches to and controls the test mode.

This register can be used when RS-CAN is not accessed to RAM.

**Access:** This register can be read or written in 16-bit units.

**Address:** <ECCCAN0_base > + $04_H$
<ECCCANFD0_base > + $04_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ETMA1 | ETMA0 | — | — | — | — | — | — | ECTMCE | — | — | ECTRRS | ECREOS | ECENS | ECDCS | ECREIS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W*1 | R/W*1 | R | R | R | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W |

Note 1. These bits are always read as 0.

**Table 21.197 ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | ETMA1 | Access control bits 1 and 0 to ECC test mode bit<br>These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.<br>When these bits are $10_B$, writing to bit 7 is enabled. |
| 14 | ETMA0 | |
| 13 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ECTMCE | ECC test mode enable bit<br>This bit specifies whether to enable access to the test registers and test control bits. When writing to this bit, (1, 0) should be written to (ETMA1, ETMA0) at the same time.<br>0: Access to the test mode registers and bits is disabled.<br>1: Access to the test mode registers and bits is enabled.<br>Test registers: ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2, ECCRCAN0TRC_PHY1/ECCRCANFD0TRC_PHY2, ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2, ECCRCAN0HORD_PHY1/ECCRCANFD0HORD_PHY2, ECCRCAN0ECRD_PHY1/ECCRCANFD0ECRD_PHY2, ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2<br>Test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS |
| 6, 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | ECTRRS | ECC RAM read test mode selection bit<br>Select reading destination when reading ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register and reading destination when reading ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0:The read value of the ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 register is the write value of the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register. The read value of the ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register is the write value of the ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register.<br>1: The read value of the ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 register can read RAM data. The read value of the ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register is the ECC data to be written to RAM. |

**Table 21.197 ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 | ECREOS | ECC redundant bit output data selection bit<br>This bit is used to identify and select the ECC data to be stored in RAM as ECC data generated for write data or the value of the ECCRCAN0ERDB_PHY1/ ECCRCANFD0ERDB_PHY2 register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously).<br>This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: Store ECC data generated for write data to RAM.<br>1: Store the value of ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register to RAM. |
| 2 | ECENS | ECC encoder input selection bit<br>This bit is used to identify the targeted data for ECC data generation as write data to RAM or the value of the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously).<br>This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: Generate ECC data from the write data to RAM.<br>1: Generate ECC data from the value of the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register. |
| 1 | ECDCS | ECC decoder input selection bit<br>This bit is used to indetifyand select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: Generate syndrome code from RAM data and detect errors.<br>1: Generate syndrome code from the value of the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register and detect errors. |
| 0 | ECREIS | ECC redundant bit input data selection bit<br>This bit is used to indetifyand select the targeted data for sy nd rom code generation and error detection as RAM data or the value of the ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: Generate syndrome code from ECC data stored in RAM and detect errors.<br>1: Generate syndrome code from the value of the ECCRCAN0ERDB_PHY1/ ECCRCANFD0ERDB_PHY2 register and detect errors. |

## 21.12.6 ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 — RSCAN0 ECC Encode/ Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

The value of the register can be used to generate ECC data or syndrome code.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), it is accesible. When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 0, writing to this register is ignored and 0000 $0000_H$ is read. This register can be used when RS-CAN is not accessed to RAM.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ECCCAN0_base > + $0C_H$
<ECCCANFD0_base > + $0C_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | ECEDB[31:0] | When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM.<br>When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECDCS = 1, the value of this register is used to generate syndrome code and the value of this register is stored in ECC decode syndrome data register (ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2).<br>In addition, when ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2. ECTRRS = 1, RAM data [31:0], instead of written data, is read for the value of this register. |

## 21.12.7 ECCRCAN0TRC_PHY1/ECCRCANFD0TRC_PHY2 — RSCAN0 ECC Redundant Bit Data Control Test Register

In ECC test mode, this test register, for ECC data, consists of four 8-bit registers, ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2, ECCRCAN0HORD_PHY1/ ECCRCANFD0HORD_PHY2, ECCRCAN0ECRD_PHY1/ECCRCANFD0ECRD_PHY2, and ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register can be accessed. When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2. ECTMCE = 0, writing to this register is ignored and 0000 $0000_H$ is read. This register can be used when RS-CAN is not accessed to RAM.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ECCCAN0_base > + $08_H$
<ECCCANFD0_base > + $08_H$

**Value after reset:** 0000 $0000_H$

## 21.12.8 ECCRCAN0AD0_PHY1/ECCRCANFD0AD0_PHY2 — RSCAN0 ECC Error Address Register 0

This is a read-only register to hold the ECC error occurring address.

When ECC error is detected while ECC error judgment is enabled, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ECCCAN0_base > + $10_H$
<ECCCANFD0_base > + $10_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset is returned. |
| 30 to 0 | ECEAD[30:0] | ECEAD0 is a read-only register to hold the address at which an ECC error has occurred.<br>If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECEAD0 as the address at which the ECC error has occurred.<br>The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored.<br>Only one address can be held in ECEAD0 |

## 21.12.9 ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2 — RSCAN0 ECC Decode Syndrome Data Register

In ECC test mode, this is a read-only register for storing generated syndrome code.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECTMCE = 0), $00_H$ is read.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ECCCAN0_base > + $0B_H$
<ECCCANFD0_base > + $0B_H$

**Value after reset:** $00_H$

| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | SYND[6:0] | The generated syndrome code is stored as needed. |

## 21.12.10 ECCRCAN0HORD_PHY1/ECCRCANFD0HORD_PHY2 — RSCAN0 ECC 7-Bit Redundant Bit Data Hold Test Register

In ECC test mode, this register is used to store ECC data for read RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECTMCE = 0), $00_H$ is read.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ECCCAN0_base > + $0A_H$
<ECCCANFD0_base > + $0A_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | HORD[6:0] | ECC code for read RAM data is stored as needed.<br>When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTRRS = 1 and ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 register is read, ECC code is stored. |

## 21.12.11 ECCRCAN0ECRD_PHY1/ECCRCANFD0ECRD_PHY2 — RSCAN0 ECC Encode Test Register

In ECC test mode, this is a read-only register for storing ECC data generated for write RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECTMCE = 0), $00_H$ is read.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ECCCAN0_base > + $09_H$
<ECCCANFD0_base > + $09_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 21.202 ECCRCAN0ECRD_PHY1/ECCRCANFD0ECRD_PHY2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | ECRD[6:0] | These bits can read ECC data generated at the time of RAM data writing, and can read ECC data for the data written to the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register when ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECENS = 1. |

## 21.12.12 ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 — RSCAN0 ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles ECC data.

The value of this register can be used as ECC data generated at the time of RAM writing or ECC data read at the time of RAM data reading.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECTMCE = 0), $00_H$ is read.

**Access:** This register can be read or written in 8-bit units.

**Address:** <ECCCAN0_base > + $08_H$
<ECCCANFD0_base > + $08_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | ERDB6 | ERDB5 | ERDB4 | ERDB3 | ERDB2 | ERDB1 | ERDB0 |

| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.203 ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ERDB[6:0] | When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECREOS = 1, these bits store the value of this register as ECC data to RAM.<br>When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECREIS = 1, the value of this register is read as ECC data read from RAM.<br>When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTRRS = 1, ECC data to be stored in RAM is read instead of the write data for the read value of this register. |

## 21.12.13 SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the CSIHn ECC registers and the RSCAN0 and the RSCAN1 ECC registers. For details, see **Section 17.7.14, SELB_READTEST — ECCREAD Test Select Register**.

## 21.13 Notes on the RS-CANFD Module

- When changing interface mode without resetting the RS-CANFD, write the value after reset to all registers and bits that are not allocated to the register map after change and then modify the RSCFDnCFDGRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCANn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCANn(CFD)CmSTS register (m = 0 to 5) for transitions.
- When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the RSCFDnCFDCmNCFG register setting value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCANn(CFD)TMCp) of the corresponding transmit buffer to $00_H$. The status register (RSCANn(CFD)TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCANn(CFD)TMTRSTS0 to RSCANn(CFD)TMTRSTS2, RSCANn(CFD)TMTARSTS0 to RSCANn(CFD)TMTARSTS2, RSCANn(CFD)TMTCSTS0 to RSCANn(CFD)TMTCSTS2, and RSCANn(CFD)TMTASTS0 to RSCANn(CFD)TMTASTS2), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCANn(CFD)TMIEC0 to RSCANn(CFD)TMIEC2) to 0 (transmit buffer interrupt is disabled).
- When using transmit buffer merge mode (in CAN FD mode), write 00H to the control register (RSCANn(CFD)TMCp) of the transmit buffer corresponding to the transmit buffer allocated as a payload storage area. Set the enable bit of corresponding interrupt enable registers (RSCANn(CFD)TMIEC0 to RSCANn(CFD)TMIEC2) to 0 (to disable interrupts).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not be allocated to transmit queues. Do not allocate a transmit buffer allocated as a payload storage area in transmit buffer merge mode (in CAN FD mode) to the transmit queue either.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- In the case of registers that access the RAM, the value after reset shown in **Section 21.4, Registers (Classical CAN Mode)** and **Section 21.5, Registers (CAN FD Mode)** indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The following registers apply.

  - Receive rule (RSCANn(CFD)GAFLIDj, RSCANn(CFD)GAFLMj, RSCANn(CFD)GAFLP0j, RSCANn(CFD)GAFLP1j registers)
  - Receive buffers (RSCANn(CFD)RMIDq, RSCANn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, RSCANn(CFD)RMDFbq registers)
  - Receive FIFO buffer access registers (RSCANn(CFD)RFIDx, RSCANn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCANn(CFD)RFDFdx registers)
  - Transmit/receive FIFO buffer access registers (RSCANn(CFD)CFIDk, RSCANn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCANn(CFD)CFDFdk registers)
  - Transmit buffers (RSCANn(CFD)TMIDp, RSCANn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, and RSCANn(CFD)TMDFbp registers)
  - Transmit history access register (RSCANn(CFD)THLACCm registers)
  - RAM test page access register (RSCANn(CFD)RPGACCr registers)

- The values of unused receive buffers (RSCANn(CFD)RMIDq, RSCANn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCANn(CFD)RMDFbq registers), receive FIFO buffer access registers (RSCANn(CFD)RFIDx, RSCANn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCANn(CFD)RFDFdx registers) and transmit/receive FIFO buffer access registers (RSCANn(CFD)CFIDk, RSCANn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCANn(CFD)CFDFdk registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

## 21.14 RS-CAN

This section describes the functions and registers of RS-CAN.

**Table 21.204 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual RS-CAN units are generically indicated by the index “n” (n = 1); for example, RSCANnGCTR is the global control register of the RSCANn unit. |
| m | Throughout this section, the individual channels of RS-CAN units are generically indicated by the index “m” (m = 6); for example, RSCAN1CmSTS is the channel m status register. |
| i | The individual channels of RSCAN1 module are generically indicated by the index “i” (i = 0); for example, THIFi bit is the transmit history interrupt status flag of the global TX interrupt status register 0 (RSCAN1GTINTSTS0). |
| j | The individual registers associated with receive rule table are generically indicated by the index “j” (j = 0 to 15); for example, RSCAN1GAFLIDj is the receive rule ID register. |
| k | The individual transmit/receive FIFO buffers are generically indicated by the index “k” (k = 0 to [channel i × 3 + 2]); for example, RSCAN1CFCCk is the transmit/receive FIFO buffer configuration/control register. |
| x | The individual receive FIFO buffers in the RS-CAN units are identified by the index “x” (x = 0 to 7): for example, RSCAN1RFSTSx is the receive FIFO buffer status register. |
| q | The individual receive buffers are generically indicated by the index “q” (q = 0 to [channel i × 16 + 15]); for example, RSCAN1RMIDq is the receive buffer ID register. |
| p | The individual transmit buffers are generically indicated by the index “p” (q = 0 to [channel i × 16 + 15]; for example, RSCAN1TMCp is the transmit buffer control register. |
| r | The individual RAM tests for CAN are generically indicated by the index “r” (r = 0 to 63); for example, RSCAN1RPGACCr is the RAM test page access register. |
| y | The registers not covered above are indicated by the letter “y” (y = 0); for example, RSCAN1RMNDy is a receive buffer new data register. |

**Note:** The descriptions of functions and registers in this section are for the RS-CANs that has one channel (m = 6). When referring to information with indices, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

The following table lists the values of indices for individual products.

**Table 21.205 Indices for Individual Products**

| Indices for Individual Products |
|---|
| **176 pins** |
| i = 0 |
| j = 0 to 15 |
| k = 0 to 2 |
| x = 0 to 7 |
| q = 0 to 15 |
| p = 0 to 15 |
| r = 0 to 63 |
| y = 0 |

### 21.14.1 Register Base Address

RSCAN1 base addresses are listed in the following table.

RSCAN1 register addresses are given as offsets from the base addresses.

**Table 21.206 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <RSCAN1_base> | FFD0 $8000_H$ |
| <ECCCAN1_base> | FFC7 $1020_H$ |

### 21.14.2 Clock Supply

The RSCAN1 clock supply is shown in the following table.

**Table 21.207 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| RSCAN1 | clk_xincan | CKSCLK_ICANOSC | Communicatiaon clock from osc clock |
| | clkc | CKSCLK_IPERI2 | Communication clock |
| | pclk | CKSCLK_ICAN | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_ICAN | |

The operating frequency of the RSCAN1 depends on the transfer rate and the number of channels in use. Use the RSCAN1 within the frequency range shown in **Table 21.208**.

**Table 21.208 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**

| Condition | | Range of Operating Frequency | | |
|---|---|---|---|---|
| Transfer Rate | No. of Channels in Use | pclk | clk_xincan*1, *3 | clkc*1, *2 |
| 1 Mbps | 1ch | pclk ≥ 18MHz | 8 MHz ≤ clk_xincan ≤ pclk/2 | 12.5 MHz ≤ clkc ≤ pclk/2 |
| 500 kbps | 1ch | pclk ≥ 8MHz | 4 MHz ≤ clk_xincan ≤ pclk/2 | 12.5 MHz ≤ clkc ≤ pclk/2 |
| 125 kbps | 1ch | pclk ≥ 8MHz | 4 MHz ≤ clk_xincan ≤ pclk/2 | 12.5 MHz ≤ clkc ≤ pclk/2 |

Note 1. Setting the DCS bit in RSCAN1GCFG enables to select either clk_xincan or clkc. Set clocks less than or equal to pclk/2 (up to 40 MHz).

Note 2. Select clk_xincan when pclk < 25 MHz.

Note 3. The maximum frequency of clk_xincan is 24 MHz.

**CAUTION**

**When the RS-CAN module is used in stop mode, set the MainOSC as the clock source of the RS-CAN module. For details about how to set the clock source, see Section 12.4.3.10, RS-CAN Clock Domains C_ISO_CAN and C_ISO_CANOSC.**

### 21.14.3 Interrupt Request

RSCAN1 interrupt requests are listed in the following table.

**Table 21.209 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **RSCAN1** | | | |
| INTRCANGERR1 | CAN global error interrupt | 319 | — |
| INTRCANGRECC1 | CAN receive FIFO interrupt | 320 | — |
| **CAN6** | | | |
| INTRCANmERR (m = 6) | CAN6 error interrupt | 321 | — |
| INTRCANmREC (m = 6) | CAN6 transmit/receive FIFO receive completion interrupt | 322 | — |
| INTRCANmTRX (m = 6) | CAN6 transmit interrupt | 323 | — |

**NOTE**

For the wake-up factors from standby mode, see **Section 14.1.2.1, Wake-Up Factors for Stand-By Modes**.

### 21.14.4 Reset Sources

RSCAN1 reset sources are listed in the following table. RSCAN1 is initialized by these reset sources.

**Table 21.210 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| RSCAN1 | All reset sources (ISORES) |

### 21.14.5 External Input/Output Signals

External input/output signals of RSCAN1 are listed below.

**Table 21.211 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **CAN6** | | |
| CANmRX (m = 6) | CAN6 receive data input | CAN6RX |
| CANmTX (m = 6) | CAN6 transmit data output | CAN6TX |

# 21.15 Overview

## 21.15.1 Functional Overview

The RH850/F1K incorporates one CAN interface unit (RSCAN1) which consists of one channel (CAN6). **Table 21.212** shows the RS-CAN module specifications. **Figure 21.39** shows the RS-CAN module block diagram.

**Table 21.212 RS-CAN Module Specifications (1/2)**

| Item | Specification |
|---|---|
| Number of channels | 1 |
| Protocol | ISO11898-1 compliant |
| Communication speed | • Maximum 1 Mbps<br>Communication speed (CANm bit time clock) = $\frac{1}{\text{CANm bit time}}$<br>CANm bit time = CANmTq × Tq count per bit<br>CANmTq = $\frac{\text{(BRP[9:0] bits in the RSCAN1CmCFG register + 1)}}{\text{fCAN}}$<br>m = 6 (n = 1)<br>Tq: Time quantum<br>fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCAN1GCFG register) |
| Buffer | 80 buffers (n = 1) in total<br>• Channel-dedicated: 16 buffers (16 buffers × 1 channel) (n = 1)<br>Transmit buffer: 16 buffers per channel<br>Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable)<br>• Shared between channels: 64 buffers (n = 1)<br>Receive buffer: 16 buffers (n = 1)<br>Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each)<br>Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each)<br>• ECC included |
| Reception function | • Receives data frames and remote frames.<br>• Selects ID format (standard ID, extended ID, or both IDs) to be received.<br>• Sets interrupt enable/disable for each FIFO.<br>• Mirror function (reception of messages transmitted from the own CAN node)<br>• Timestamp function (to record message reception time as a 16-bit timer value) |
| Reception filter function | • Selects receive messages according to 64 (n = 1) receive rules.<br>• Sets the number of receive rules (0 to 128) for each channel.<br>• Acceptance filter processing: Sets ID and mask for each receive rule.<br>• DLC filter processing: Enables DLC filter check for each acceptance rule. |
| Receive message transfer function | • Routing function<br>Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers)<br>Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer<br>• Labeling function<br>Stores label information together with a message in a receive buffer and FIFO buffer. |
| Transmission function | • Transmits data frames and remote frames.<br>• Selects ID format (standard ID, extended ID, or both IDs) to be transmitted.<br>• Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer.<br>• Selects ID priority transmission or transmit buffer number priority transmission.<br>• Transmission can be aborted (possible to confirm with a flag)<br>• One-shot transmission function |
| Interval transmission function | Transmits messages at configurable intervals<br>(transmit mode of transmit/receive FIFO buffers) |

Table 21.212 RS-CAN Module Specifications (2/2)

| Item | Specification |
|---|---|
| Transmit queue function | Transmits all stored messages according to the ID priority. |
| Transmit history function | Stores the history information of transmission-completed messages |
| Gateway function | Not supported. |
| Bus off recovery mode selection | Selects the method for returning from bus off state.<br>• ISO11898-1 compliant<br>• Automatic entry to channel halt mode at bus-off entry<br>• Automatic entry to channel halt mode at bus-off end<br>• Transition to channel halt mode by program request<br>• Transition to the error-active state by program request (forcible return from the bus off state) |
| Error status monitoring | • Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock).<br>• Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery)<br>• Reads the error counter.<br>• Monitors DLC errors. |
| Interrupt source | 5 sources<br>• Global interrupts (2 sources/unit)<br>Receive FIFO interrupt (1 source/unit)<br>Global error interrupt (1 source/unit)<br>• Channel interrupts (3 sources/channel)<br>CANm transmit interrupt (m = 6)<br>– CANm transmit complete interrupt<br>– CANm transmit abort interrupt<br>– CANm transmit/receive FIFO transmit complete interrupt (in transmit mode)<br>– CANm transmit history interrupt<br>– CANm transmit queue interrupt<br>CANm transmit/receive FIFO receive complete interrupt (in receive mode)<br>CANm error interrupt |
| CAN stop mode | Reduces power consumption by stopping clock supply to the RS-CAN module. |
| CAN clock source | Selects the clkc or the clk_xincan.<br>For the operating frequency range, see **Table 21.208**. |
| Test function | Test function for user evaluation<br>• Listen-only mode<br>• Self-test mode 0 (external loopback)<br>• Self-test mode 1 (internal loopback)<br>• RAM test (read/write test) |

## 21.15.2 Block Diagram

BRP[9:0]: Bits in the RSCAN1CmCFG register
DCS: Bits in the RSCAN1GCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

**Figure 21.39 RS-CAN Module Block Diagram**

# 21.16 Registers

## 21.16.1 List of Registers

RS-CAN registers are listed in the following table.

For details about <RSCAN1_base>, see **Section 21.14.1, Register Base Address**.

**Table 21.213 Registers (1/9)**

| Module | Register | Symbol | Address | Guard Group |
|---|---|---|---|---|
| RSCAN1 | Channel m configuration register | RSCAN1CmCFG | <RSCAN1_base> + $0000_H$ | RSCAN1 Ch0 |
| | Channel m control register | RSCAN1CmCTR | <RSCAN1_base> + $0004_H$ | RSCAN1 Ch0 |
| | Channel m status register | RSCAN1CmSTS | <RSCAN1_base> + $0008_H$ | RSCAN1 Ch0 |
| | Channel m error flag register | RSCAN1CmERFL | <RSCAN1_base> + $000C_H$ | RSCAN1 Ch0 |
| | Global configuration register | RSCAN1GCFG | <RSCAN1_base> + $0084_H$ | RSCAN1 Global |
| | Global control register | RSCAN1GCTR | <RSCAN1_base> + $0088_H$ | RSCAN1 Global |
| | Global status register | RSCAN1GSTS | <RSCAN1_base> + $008C_H$ | RSCAN1 Global |
| | Global error flag register | RSCAN1GERFL | <RSCAN1_base> + $0090_H$ | RSCAN1 Global |
| | Global timestamp counter register | RSCAN1GTSC | <RSCAN1_base> + $0094_H$ | RSCAN1 Global |
| | Receive rule entry control register | RSCAN1GAFLECTR | <RSCAN1_base> + $0098_H$ | RSCAN1 Global |
| | Receive rule configuration register 0 | RSCAN1GAFLCFG0 | <RSCAN1_base> + $009C_H$ | RSCAN1 Global |
| | Receive buffer number register | RSCAN1RMNB | <RSCAN1_base> + $00A4_H$ | RSCAN1 Global |
| | Receive buffer new data register 0 | RSCAN1RMND0 | <RSCAN1_base> + $00A8_H$ | RSCAN1 Global |
| | Receive FIFO buffer configuration and control register 0 | RSCAN1RFCC0 | <RSCAN1_base> + $00B8_H$ | RSCAN1 Global |
| | Receive FIFO buffer configuration and control register 1 | RSCAN1RFCC1 | <RSCAN1_base> + $00BC_H$ | RSCAN1 Global |
| | Receive FIFO buffer configuration and control register 2 | RSCAN1RFCC2 | <RSCAN1_base> + $00C0_H$ | RSCAN1 Global |
| | Receive FIFO buffer configuration and control register 3 | RSCAN1RFCC3 | <RSCAN1_base> + $00C4_H$ | RSCAN1 Global |
| | Receive FIFO buffer configuration and control register 4 | RSCAN1RFCC4 | <RSCAN1_base> + $00C8_H$ | RSCAN1 Global |
| | Receive FIFO buffer configuration and control register 5 | RSCAN1RFCC5 | <RSCAN1_base> + $00CC_H$ | RSCAN1 Global |
| | Receive FIFO buffer configuration and control register 6 | RSCAN1RFCC6 | <RSCAN1_base> + $00D0_H$ | RSCAN1 Global |
| | Receive FIFO buffer configuration and control register 7 | RSCAN1RFCC7 | <RSCAN1_base> + $00D4_H$ | RSCAN1 Global |
| | Receive FIFO buffer status register 0 | RSCAN1RFSTS0 | <RSCAN1_base> + $00D8_H$ | RSCAN1 Global |
| | Receive FIFO buffer status register 1 | RSCAN1RFSTS1 | <RSCAN1_base> + $00DC_H$ | RSCAN1 Global |
| | Receive FIFO buffer status register 2 | RSCAN1RFSTS2 | <RSCAN1_base> + $00E0_H$ | RSCAN1 Global |
| | Receive FIFO buffer status register 3 | RSCAN1RFSTS3 | <RSCAN1_base> + $00E4_H$ | RSCAN1 Global |
| | Receive FIFO buffer status register 4 | RSCAN1RFSTS4 | <RSCAN1_base> + $00E8_H$ | RSCAN1 Global |
| | Receive FIFO buffer status register 5 | RSCAN1RFSTS5 | <RSCAN1_base> + $00EC_H$ | RSCAN1 Global |
| | Receive FIFO buffer status register 6 | RSCAN1RFSTS6 | <RSCAN1_base> + $00F0_H$ | RSCAN1 Global |
| | Receive FIFO buffer status register 7 | RSCAN1RFSTS7 | <RSCAN1_base> + $00F4_H$ | RSCAN1 Global |
| | Receive FIFO buffer pointer control register 0 | RSCAN1RFPCTR0 | <RSCAN1_base> + $00F8_H$ | RSCAN1 Global |
| | Receive FIFO buffer pointer control register 1 | RSCAN1RFPCTR1 | <RSCAN1_base> + $00FC_H$ | RSCAN1 Global |
| | Receive FIFO buffer pointer control register 2 | RSCAN1RFPCTR2 | <RSCAN1_base> + $0100_H$ | RSCAN1 Global |
| | Receive FIFO buffer pointer control register 3 | RSCAN1RFPCTR3 | <RSCAN1_base> + $0104_H$ | RSCAN1 Global |
| | Receive FIFO buffer pointer control register 4 | RSCAN1RFPCTR4 | <RSCAN1_base> + $0108_H$ | RSCAN1 Global |
| | Receive FIFO buffer pointer control register 5 | RSCAN1RFPCTR5 | <RSCAN1_base> + $010C_H$ | RSCAN1 Global |
| | Receive FIFO buffer pointer control register 6 | RSCAN1RFPCTR6 | <RSCAN1_base> + $0110_H$ | RSCAN1 Global |
| | Receive FIFO buffer pointer control register 7 | RSCAN1RFPCTR7 | <RSCAN1_base> + $0114_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer configuration and control register 0 | RSCAN1CFCC0 | <RSCAN1_base> + $0118_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer configuration and control register 1 | RSCAN1CFCC1 | <RSCAN1_base> + $011C_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer configuration and control register 2 | RSCAN1CFCC2 | <RSCAN1_base> + $0120_H$ | RSCAN1 Global |

Table 21.213 Registers (2/9)

| Module | Register | Symbol | Address | Guard Group |
|---|---|---|---|---|
| RSCAN1 | Transmit/receive FIFO buffer status register 0 | RSCAN1CFSTS0 | <RSCAN1_base> + $0178_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer status register 1 | RSCAN1CFSTS1 | <RSCAN1_base> + $017C_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer status register 2 | RSCAN1CFSTS2 | <RSCAN1_base> + $0180_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer pointer control register 0 | RSCAN1CFPCTR0 | <RSCAN1_base> + $01D8_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer pointer control register 1 | RSCAN1CFPCTR1 | <RSCAN1_base> + $01DC_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer pointer control register 2 | RSCAN1CFPCTR2 | <RSCAN1_base> + $01E0_H$ | RSCAN1 Global |
| | FIFO empty status register | RSCAN1FESTS | <RSCAN1_base> + $0238_H$ | RSCAN1 Global |
| | FIFO full status register | RSCAN1FFSTS | <RSCAN1_base> + $023C_H$ | RSCAN1 Global |
| | FIFO Msg lost status register | RSCAN1FMSTS | <RSCAN1_base> + $0240_H$ | RSCAN1 Global |
| | Receive FIFO buffer interrupt flag status register | RSCAN1RFISTS | <RSCAN1_base> + $0244_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer RX interrupt flag status register | RSCAN1CFRISTS | <RSCAN1_base> + $0248_H$ | RSCAN1 Global |
| | Transmit/receive FIFO buffer TX interrupt flag status register | RSCAN1CFTISTS | <RSCAN1_base> + $024C_H$ | RSCAN1 Global |
| | Transmit buffer control register 0 | RSCAN1TMC0 | <RSCAN1_base> + $0250_H$ | RSCAN1 Global |
| | Transmit buffer control register 1 | RSCAN1TMC1 | <RSCAN1_base> + $0251_H$ | RSCAN1 Global |
| | Transmit buffer control register 2 | RSCAN1TMC2 | <RSCAN1_base> + $0252_H$ | RSCAN1 Global |
| | Transmit buffer control register 3 | RSCAN1TMC3 | <RSCAN1_base> + $0253_H$ | RSCAN1 Global |

| | RAM test page access register 62 | RSCAN1RPGACC62 | <RSCAN1_base> + $19F8_H$ | RSCAN1 Global |
| | RAM test page access register 63 | RSCAN1RPGACC63 | <RSCAN1_base> + $19FC_H$ | RSCAN1 Global |

**Note:** For details on the guard group, see **Section 33, Functional Safety**.

**Table 21.214 Transmit Buffer p Allocated to Each Channel**

| | CANm |
|---|---|
| Transmit buffer p | Transmit buffer 16 × i + 0 |
| | Transmit buffer 16 × i + 1 |
| | Transmit buffer 16 × i + 2 |
| | Transmit buffer 16 × i + 3 |
| | Transmit buffer 16 × i + 4 |
| | Transmit buffer 16 × i + 5 |
| | Transmit buffer 16 × i + 6 |
| | Transmit buffer 16 × i + 7 |
| | Transmit buffer 16 × i + 8 |
| | Transmit buffer 16 × i + 9 |
| | Transmit buffer 16 × i + 10 |
| | Transmit buffer 16 × i + 11 |
| | Transmit buffer 16 × i + 12 |
| | Transmit buffer 16 × i + 13 |
| | Transmit buffer 16 × i + 14 |
| | Transmit buffer 16 × i + 15 |

**Table 21.215 Transmit/Receive FIFO Buffer k Allocated to Each Channel**

| | CANm |
|---|---|
| Transmit/receive FIFO buffer k | Transmit/receive FIFO buffer 3 × i + 0 |
| | Transmit/receive FIFO buffer 3 × i + 1 |
| | Transmit/receive FIFO buffer 3 × i + 2 |

**Table 21.216 Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer by the Setting of Bits CFTML[3:0]**

| Setting of Bits CFTML[3:0] | Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer |
|---|---|
| $0000_B$ | Transmit buffer 16 × i + 0 |
| $0001_B$ | Transmit buffer 16 × i + 1 |
| $0010_B$ | Transmit buffer 16 × i + 2 |
| $0011_B$ | Transmit buffer 16 × i + 3 |
| $0100_B$ | Transmit buffer 16 × i + 4 |
| $0101_B$ | Transmit buffer 16 × i + 5 |
| $0110_B$ | Transmit buffer 16 × i + 6 |
| $0111_B$ | Transmit buffer 16 × i + 7 |
| $1000_B$ | Transmit buffer 16 × i + 8 |
| $1001_B$ | Transmit buffer 16 × i + 9 |
| $1010_B$ | Transmit buffer 16 × i + 10 |
| $1011_B$ | Transmit buffer 16 × i + 11 |
| $1100_B$ | Transmit buffer 16 × i + 12 |
| $1101_B$ | Transmit buffer 16 × i + 13 |
| $1110_B$ | Transmit buffer 16 × i + 14 |
| $1111_B$ | Transmit buffer 16 × i + 15 |

**Table 21.217 Transmit Buffer p Allocated to the Transmit Queue of Each Channel**

| Setting of Bits TXQDC[3:0] | Transmit Buffer p Allocated to the Transmit Queue |
|---|---|
| $0000_B$ | Setting prohibited |
| $0001_B$ | Setting prohibited |
| $0010_B$ | Transmit buffer 16 × i + 15 to 16 × i + 13 |
| $0011_B$ | Transmit buffer 16 × i + 15 to 16 × i + 12 |
| $0100_B$ | Transmit buffer 16 × i + 15 to 16 × i + 11 |
| $0101_B$ | Transmit buffer 16 × i + 15 to 16 × i + 10 |
| $0110_B$ | Transmit buffer 16 × i + 15 to 16 × i + 9 |
| $0111_B$ | Transmit buffer 16 × i + 15 to 16 × i + 8 |
| $1000_B$ | Transmit buffer 16 × i + 15 to 16 × i + 7 |
| $1001_B$ | Transmit buffer 16 × i + 15 to 16 × i + 6 |
| $1010_B$ | Transmit buffer 16 × i + 15 to 16 × i + 5 |
| $1011_B$ | Transmit buffer 16 × i + 15 to 16 × i + 4 |
| $1100_B$ | Transmit buffer 16 × i + 15 to 16 × i + 3 |

| $1110_B$ | Transmit buffer 16 × i + 15 to 16 × i + 1 |
| $1111_B$ | Transmit buffer 16 × i + 15 to 16 × i + 0 |

## 21.16.2 RSCAN1CmCFG — Channel Configuration Register (m = 6)

**Access:** RSCAN1CmCFG register can be read or written in 32-bit units.
RSCAN1CmCFGL, RSCAN1CmCFGH registers can be read or written in 16-bit units.
RSCAN1CmCFGLL, RSCAN1CmCFGLH, RSCAN1CmCFGHL, RSCAN1CmCFGHH registers can be read or written in 8-bit units.

**Address:** RSCAN1CmCFG: <RSCAN1_base> + $0000_H$ + ($10_H$ × i)

RSCAN1CmCFGL: <RSCAN1_base> + $0000_H$ + ($10_H$ × i),
RSCAN1CmCFGH: <RSCAN1_base> + $0002_H$ + ($10_H$ × i)

RSCAN1CmCFGLL: <RSCAN1_base> + $0000_H$ + ($10_H$ × i),
RSCAN1CmCFGLH: <RSCAN1_base> + $0001_H$ + ($10_H$ × i),
RSCAN1CmCFGHL: <RSCAN1_base> + $0002_H$ + ($10_H$ × i),
RSCAN1CmCFGHH: <RSCAN1_base> + $0003_H$ + ($10_H$ × i)

**Value after reset:** $0000\ 0000_H$

| 9 to 0 | BRP[9:0] | Prescaler Division Ratio Setting<br>When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1. |

Modify the RSCAN1CmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before transitioning to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see **Section 21.22.1, Initial Settings**.

### SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width.Values from 1Tq to 4Tq can be specified.
Set a value less than or equal to the value of the TSEG2 bits.

### TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).
Values from 2Tq to 8Tq can be specified.
Set a value smaller than the value of the TSEG1 bits.

### TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).
Values from 4Tq to 16Tq can be specified.

### BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

## 21.16.3 RSCAN1CmCTR — Channel Control Register (m = 6)

**Access:** RSCAN1CmCTR register can be read or written in 32-bit units.
RSCAN1CmCTRL, RSCAN1CmCTRH registers can be read or written in 16-bit units.
RSCAN1CmCTRLL, RSCAN1CmCTRLH, RSCAN1CmCTRHL, RSCAN1CmCTRHH registers can be read or written in 8-bit units.

**Address:** RSCAN1CmCTR: <RSCAN1_base> + $0004_H$ + ($10_H$ × i)

RSCAN1CmCTRL: <RSCAN1_base> + $0004_H$ + ($10_H$ × i),
RSCAN1CmCTRH: <RSCAN1_base> + $0006_H$ + ($10_H$ × i)

RSCAN1CmCTRLL: <RSCAN1_base> + $0004_H$ + ($10_H$ × i),
RSCAN1CmCTRLH: <RSCAN1_base> + $0005_H$ + ($10_H$ × i),
RSCAN1CmCTRHL: <RSCAN1_base> + $0006_H$ + ($10_H$ × i),
RSCAN1CmCTRHH: <RSCAN1_base> + $0007_H$ + ($10_H$ × i)

**Value after reset:** $0000\ 0005_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

### CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

### ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCAN1CmERFL register.
When this bit is cleared to 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

#### BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CAN module.

When the BOM[1:0] bits are set to $00_B$, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CAN module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to $10_B$ (channel halt mode) before recessive bits are detected 128 times, the RS-CAN module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CAN module reaches the bus off state when the BOM[1:0] bits are set to $01_B$, the CHMDC[1:0] bits in the RSCAN1CmCTR register (m = 6) are set to $10_B$ and the RS-CAN module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits in the RSCAN1CmSTS register are cleared to $00_H$.

When the RS-CAN module reaches the bus off state when the BOM[1:0] bits are set to $10_B$, the CHMDC[1:0] bits are set to $10_B$ and the RS-CAN module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_H$.

When the BOM[1:0] bits are set to $11_B$ and the CHMDC[1:0] bits are set to $10_B$ while the RS-CAN module is in the bus off state, the RS-CAN module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_H$. However, if 11 consecutive recessive bits are detected 128 times and the RS-CAN module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to $10_B$, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CAN module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are $01_B$ or at bus off end when the BOM[1:0] bits are $10_B$), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

#### TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

#### ALIE Bit

When the ALF flag in the RSCAN1CmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BLIE Bit

When the BLF flag in the RSCAN1CmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### OLIE Bit

When the OVLF flag in the RSCAN1CmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BORIE Bit

When the BORF flag in the RSCAN1CmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BOEIE Bit

When the BOEF flag in the RSCAN1CmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EPIE Bit

When the EPF flag in the RSCAN1CmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EWIE Bit

When the EWF flag in the RSCAN1CmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BEIE Bit

When the BEF flag in the RSCAN1CmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel halt mode.

#### RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCAN1CmSTS register to $00_H$ and also clears the BOSTS flag in the RSCAN1CmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCAN1CmCTR register are $00_B$ (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

#### CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

#### CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 21.18.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to $11_B$. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become $10_B$.

## 21.16.4 RSCAN1CmSTS — Channel Status Register (m = 6)

**Access:** RSCAN1CmSTS register is a read-only register that can be read in 32-bit units.
RSCAN1CmSTSL, RSCAN1CmSTSH registers are read-only registers that can be read in 16-bit units.
RSCAN1CmSTSLL, RSCAN1CmSTSHL, RSCAN1CmSTSHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1CmSTS: <RSCAN1_base> + $0008_H$ + ($10_H$ × i)

RSCAN1CmSTSL: <RSCAN1_base> + $0008_H$ + ($10_H$ × i),
RSCAN1CmSTSH: <RSCAN1_base> + $000A_H$ + ($10_H$ × i)

RSCAN1CmSTSLL: <RSCAN1_base> + $0008_H$ + ($10_H$ × i),
RSCAN1CmSTSHL: <RSCAN1_base> + $000A_H$ + ($10_H$ × i),
RSCAN1CmSTSHH: <RSCAN1_base> + $000B_H$ + ($10_H$ × i)

**Value after reset:** $0000\ 0005_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.220 RSCAN1CmSTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | TEC[7:0] | The transmit error counter (TEC) can be read. |
| 23 to 16 | REC[7:0] | The receive error counter (REC) can be read. |
| 15 to 8 | Reserved | When read, the value after reset is returned. |
| 7 | COMSTS | Communication Status Flag<br>0: Communication is not ready.<br>1: Communication is ready. |
| 6 | RECSTS | Receive Status Flag<br>0: Bus idle, in transmission or bus off state<br>1: In reception |
| 5 | TRMSTS | Transmit Status Flag<br>0: Bus idle or in reception<br>1: In transmission or bus off state |
| 4 | BOSTS | Bus Off Status Flag<br>0: Not in bus off state<br>1: In bus off state |
| 3 | EPSTS | Error Passive Status Flag<br>0: Not in error passive state<br>1: In error passive state |
| 2 | CSLPSTS | Channel Stop Status Flag<br>0: Not in channel stop mode<br>1: In channel stop mode |
| 1 | CHLTSTS | Channel Halt Status Flag<br>0: Not in channel halt mode<br>1: In channel halt mode |
| 0 | CRSTSTS | Channel Reset Status Flag<br>0: Not in channel reset mode<br>1: In channel reset mode |

#### TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

#### REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

#### COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

#### RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

#### TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

#### BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

#### EPSTS Flag

This flag is set to 1 when the RS-CAN module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])). It is cleared to 0 when the RS-CAN module has exited the error passive state or has entered channel reset mode.

#### CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

#### CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

#### CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

## 21.16.5 RSCAN1CmERFL — Channel Error Flag Register (m = 6)

**Access:** RSCAN1CmERFL register can be read or written in 32-bit units.
RSCAN1CmERFLL register can be read or written in 16-bit units.
RSCAN1CmERFLH register is a read-only register that can be read in 16-bit units.
RSCAN1CmERFLLL, RSCAN1CmERFLLH registers can be read or written in 8-bit units.
RSCAN1CmERFLHL, RSCAN1CmERFLHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1CmERFL: <RSCAN1_base> + $000C_H$ + ($10_H$ × i)

RSCAN1CmERFLL: <RSCAN1_base> + $000C_H$ + ($10_H$ × i),
RSCAN1CmERFLH: <RSCAN1_base> + $000E_H$ + ($10_H$ × i)

RSCAN1CmERFLLL: <RSCAN1_base> + $000C_H$ + ($10_H$ × i),
RSCAN1CmERFLLH: <RSCAN1_base> + $000D_H$ + ($10_H$ × i),
RSCAN1CmERFLHL: <RSCAN1_base> + $000E_H$ + ($10_H$ × i),
RSCAN1CmERFLHH: <RSCAN1_base> + $000F_H$ + ($10_H$ × i)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.221 RSCAN1CmERFL Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 30 to 16 | CRCREG[14:0] | CRC Calculation Data<br>A CRC value calculated based on the transmit message or receive message is indicated. |
| 15 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 | ADERR | ACK Delimiter Error Flag<br>0: No ACK delimiter error is detected.<br>1: ACK delimiter error is detected. |
| 13 | B0ERR | Dominant Bit Error Flag<br>0: No dominant bit error is detected.<br>1: Dominant bit error is detected. |
| 12 | B1ERR | Recessive Bit Error Flag<br>0: No recessive bit error is detected.<br>1: Recessive bit error is detected. |
| 11 | CERR | CRC Error Flag<br>0: No CRC error is detected.<br>1: CRC error is detected. |
| 10 | AERR | ACK Error Flag<br>0: No ACK error is detected.<br>1: ACK error is detected. |
| 9 | FERR | Form Error Flag<br>0: No form error is detected.<br>1: Form error is detected. |

Table 21.221 RSCAN1CmERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 8 | SERR | Stuff Error Flag<br>0: No stuff error is detected.<br>1: Stuff error is detected. |
| 7 | ALF | Arbitration-lost Flag<br>0: No arbitration-lost is detected.<br>1: Arbitration-lost is detected. |
| 6 | BLF | Bus Lock Flag<br>0: No channel bus is detected.<br>1: Channel bus is detected. |
| 5 | OVLF | Overload Flag<br>0: No overload is detected.<br>1: Overload is detected. |
| 4 | BORF | Bus Off Recovery Flag<br>0: No bus off recovery is detected.<br>1: Bus off recovery is detected. |
| 3 | BOEF | Bus Off Entry Flag<br>0: No bus off entry is detected.<br>1: Bus off entry is detected. |
| 2 | EPF | Error Passive Flag<br>0: No error passive is detected.<br>1: Error passive is detected. |
| 1 | EWF | Error Warning Flag<br>0: No error warning is detected.<br>1: Error warning is detected. |
| 0 | BEF | Bus Error Flag<br>0: No channel bus error is detected.<br>1: Channel bus error is detected. |

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCAN1CmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCAN1CmERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

#### CRCREG[14:0] Flags

When the CTME bit in the RSCAN1CmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

#### ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

#### B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

#### B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

#### CERR Flag

This flag is set to 1 when a CRC error has been detected.

#### AERR Flag

This flag is set to 1 when an ACK error has been detected.

#### FERR Flag

This flag is set to 1 when a form error has been detected.

#### SERR Flag

This flag is set to 1 when a stuff error has been detected.

#### ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

#### BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

#### OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

#### BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCAN1CmCTR register are set to $01_B$ (channel reset mode).
- The RTBO bit in the RSCAN1CmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCAN1CmCTR register are set to $01_B$ (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCAN1CmCTR register are set to $10_B$ (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to $11_B$ (transition to channel halt mode upon a request from the program during bus off).

### BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCAN1CmCTR register (m = 6) set to $01_B$ (transition to channel halt mode at bus off entry).

### EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

### EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

### BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCAN1CmERFL register is set to 1.

**NOTE**

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

## 21.16.6 RSCAN1GCFG — Global Configuration Register

**Access:** RSCAN1GCFG register can be read or written in 32-bit units.
RSCAN1GCFGL, RSCAN1GCFGH registers can be read or written in 16-bit units.
RSCAN1GCFGLL, RSCAN1GCFGLH, RSCAN1GCFGHL, RSCAN1GCFGHH registers can be read or written in 8-bit units.

**Address:** RSCAN1GCFG: <RSCAN1_base> + $0084_H$

RSCAN1GCFGL: <RSCAN1_base> + $0084_H$,
RSCAN1GCFGH: <RSCAN1_base> + $0086_H$

RSCAN1GCFGLL: <RSCAN1_base> + $0084_H$,
RSCAN1GCFGLH: <RSCAN1_base> + $0085_H$,
RSCAN1GCFGHL: <RSCAN1_base> + $0086_H$,
RSCAN1GCFGHH: <RSCAN1_base> + $0087_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 4 | DCS | CAN Clock Source Select*2<br>0: clkc<br>1: clk_xincan |
| 3 | MME | Mirror Function Enable<br>0: Mirror function is disabled.<br>1: Mirror function is enabled. |
| 2 | DRE | DLC Replacement Enable<br>0: DLC replacement is disabled.<br>1: DLC replacement is enabled. |
| 1 | DCE | DLC Check Enable<br>0: DLC check is disabled.<br>1: DLC check is enabled. |
| 0 | TPRI | Transmit Priority Select<br>0: ID priority<br>1: Transmit buffer number priority |

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to $000_B$.

Note 2. For the CAN clock frequency settings, see **Table 21.208, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

Modify the RSCAN1GCFG register only in global reset mode.

### ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 21.20.3.1, Interval Transmission Function**.

### TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

### TSSS Bit

This bit is used to select a clock source of the timestamp counter.

#### TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

#### DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 21.208, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

#### MME Bit

Setting this bit to 1 makes the mirror function available.

#### DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of $00_H$ is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

#### DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCAN1GAFLP0j register to $0000_B$ before clearing the DCE bit in the RSCAN1GCFG register to 0.

#### TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

## 21.16.7 RSCAN1GCTR — Global Control Register

**Access:** RSCAN1GCTR register can be read or written in 32-bit units.
RSCAN1GCTRL, RSCAN1GCTRH registers can be read or written in 16-bit units.
RSCAN1GCTRLL, RSCAN1GCTRLH, RSCAN1GCTRHL registers can be read or written in 8-bit units.

**Address:** RSCAN1GCTR: <RSCAN1_base> + $0088_H$

RSCAN1GCTRL: <RSCAN1_base> + $0088_H$,
RSCAN1GCTRH: <RSCAN1_base> + $008A_H$

RSCAN1GCTRLL: <RSCAN1_base> + $0088_H$,
RSCAN1GCTRLH: <RSCAN1_base> + $0089_H$,
RSCAN1GCTRHL: <RSCAN1_base> + $008A_H$

**Value after reset:** $0000\ 0005_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TSRST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R | R | R | R | R | R/W | R/W | R/W |

**Table 21.223 RSCAN1GCTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 17 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TSRST | Timestamp Counter Reset<br>Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0. |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | THLEIE | Transmit History Buffer Overflow Interrupt Enable<br>0: Transmit history buffer overflow interrupt is disabled.<br>1: Transmit history buffer overflow interrupt is enabled. |
| 9 | MEIE | FIFO Message Lost Interrupt Enable<br>0: FIFO message lost interrupt is disabled.<br>1: FIFO message lost interrupt is enabled. |
| 8 | DEIE | DLC Error Interrupt Enable<br>0: DLC error interrupt is disabled.<br>1: DLC error interrupt is enabled. |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | GSLPR | Global Stop Mode<br>0: Other than global stop mode<br>1: Global stop mode |
| 1, 0 | GMDC[1:0] | Global Mode Select<br>b1 b0<br>0 0: Global operating mode<br>0 1: Global reset mode<br>1 0: Global test mode<br>1 1: Setting prohibited |

#### TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCAN1GTSC register is cleared to $0000_H$.

#### THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCAN1GERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCAN1GERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCAN1GERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.
Clearing this bit to 0 makes the RSCAN module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

#### GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CAN module (global operating mode, global reset mode, or global test mode). For details, see **Section 21.18.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CAN module into global stop mode.

## 21.16.8 RSCAN1GSTS — Global Status Register

**Access:** RSCAN1GSTS register is a read-only register that can be read in 32-bit units.
RSCAN1GSTSL register is a read-only register that can be read in 16-bit units.
RSCAN1GSTSLL register is a read-only register that can be read in 8-bit units.

**Address:** RSCAN1GSTS: <RSCAN1_base> + $008C_H$

RSCAN1GSTSL: <RSCAN1_base> + $008C_H$

RSCAN1GSTSLL: <RSCAN1_base> + $008C_H$

**Value after reset:** $0000\ 000D_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | GRAMINIT | GSLPSTS | GHLTSTS | GRSTSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.224 RSCAN1GSTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is returned. |
| 3 | GRAMINIT | CAN RAM Initialization Status Flag<br>0: CAN RAM initialization is completed.<br>1: CAN RAM initialization is ongoing. |
| 2 | GSLPSTS | Global Stop Status Flag<br>0: Not in global stop mode<br>1: In global stop mode |
| 1 | GHLTSTS | Global Test Status Flag<br>0: Not in global test mode<br>1: In global test mode |
| 0 | GRSTSTS | Global Reset Status Flag<br>0: Not in global reset mode<br>1: In global reset mode |

### GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialisation is completed.

### GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

### GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

**GRSTSTS Flag**

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

## 21.16.9 RSCAN1GERFL — Global Error Flag Register

**Access:** RSCAN1GERFL register can be read or written in 32-bit units.
RSCAN1GERFLL register can be read or written in 16-bit units.
RSCAN1GERFLLL register can be read or written in 8-bit units.

**Address:** RSCAN1GERFL: <RSCAN1_base> + $0090_H$

RSCAN1GERFLL: <RSCAN1_base> + $0090_H$

RSCAN1GERFLLL: <RSCAN1_base> + $0090_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | THLES | MES | DEF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.225 RSCAN1GERFL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 to 8 | Reserved | When read, the undefined value is returned. When writing, write the value after reset. |
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5, 4 | Reserved | When read, the undefined value is returned. When writing, write the value after reset. |
| 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | THLES | Transmit History Buffer Overflow Status Flag<br>0: No transmit history buffer overflow has occurred.<br>1: A transmit history buffer overflow has occurred. |
| 1 | MES | FIFO Message Lost Status Flag<br>0: No FIFO message lost error has occurred.<br>1: A FIFO message lost error has occurred. |
| 0 | DEF | DLC Error Flag<br>0: No DLC error has occurred.<br>1: A DLC error has occurred. |

All flags in the RSCAN1GERFL register are cleared to 0 in global reset mode.

### THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCAN1THLSTSm register (m = 6) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

### MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCAN1RFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCAN1CFSTSk register (k = 0 to 2) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

### DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

**NOTE**

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

## 21.16.10 RSCAN1GTINTSTS0 — Global TX Interrupt Status Register 0

**Access:** RSCAN1GTINTSTS0 register is a read-only register that can be read in 32-bit units.
RSCAN1GTINTSTS0L register is a read-only register that can be read in 16-bit units.
RSCAN1GTINTSTS0LL register is a read-only register that can be read in 8-bit units.

**Address:** RSCAN1GTINTSTS0: <RSCAN1_base> + $0460_H$

RSCAN1GTINTSTS0L: <RSCAN1_base> + $0460_H$

RSCAN1GTINTSTS0LL: <RSCAN1_base> + $0460_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | THIF0 | CFTIF0 | TQIF0 | TAIF0 | TSIF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 |

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

**Table 21.226 RSCAN1GTINTSTS0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 5 | Reserved | When read, the value after reset is returned. |
| 4 | THIF0 | Unit Channel Number 0 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 3 | CFTIF0 | Unit Channel Number 0 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF0 | Unit Channel Number 0 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 1 | TAIF0 | Unit Channel Number 0 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 0 | TSIF0 | Unit Channel Number 0 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |

### TSIFi Bits

The TSIFi bit is set to 1 when the TMIEp bit in the RSCAN1TMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCAN1TMSTSp register are set to $10_B$ (transmit completed without abort request) or $11_B$ (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to $00_B$ under the condition that the TSIFi bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

#### TAIFi Bits

The TAIFi bit is set to 1 when the TAIE bit in the RSCAN1CmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCAN1TMSTSp register are set to $01_B$ (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to $00_B$ after the transmit abort is completed.

#### TQIFi Bits

When the TXQIE bit in the RSCAN1TXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCAN1TXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFi bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCAN1TXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

#### CFTIFi Bits

When the CFTXIE bit in the RSCAN1CFCCk register is set to 1 (transmit/receive FIFO buffer transmit interrupt enabled) and the CFTXIF bit in the RSCAN1CFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFi bit is set to 1.

When the CFTIFi bit is cleared to 0 under the conditions that the CFTIFi bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

#### THIFi Bits

When the THLIE bit in the RSCAN1THLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCAN1THLSTSm register is set to 1 (transmit history interrupt request), the THIFi bit is set to 1.

When the THLIF bit in the RSCAN1THLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

## 21.16.11 RSCAN1GTSC — Global Timestamp Counter Register

**Access:** RSCAN1GTSC register is a read-only register that can be read in 32-bit units.
RSCAN1GTSCL register is a read-only register that can be read in 16-bit units.

**Address:** RSCAN1GTSC: <RSCAN1_base> + $0094_H$

RSCAN1GTSCL: <RSCAN1_base> + $0094_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TS[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.227 RSCAN1GTSC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 0 | TS[15:0] | Timestamp Value<br>The timestamp counter value can be read.<br>Counter Value: $0000_H$ to $FFFF_H$ |

### TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCAN1GCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

## 21.16.12 RSCAN1GAFLECTR — Receive Rule Entry Control Register

**Access:** RSCAN1GAFLECTR register can be read or written in 32-bit units.
RSCAN1GAFLECTRL register can be read or written in 16-bit units.
RSCAN1GAFLECTRLL, RSCAN1GAFLECTRLH registers can be read or written in 8-bit units.

**Address:** RSCAN1GAFLECTR: <RSCAN1_base> + $0098_H$

RSCAN1GAFLECTRL: <RSCAN1_base> + $0098_H$

RSCAN1GAFLECTRLL: <RSCAN1_base> + $0098_H$,
RSCAN1GAFLECTRLH: <RSCAN1_base> + $0099_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | AFLDAE | — | — | — | AFLPN[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

**Table 21.228 RSCAN1GAFLECTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 9 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 8 | AFLDAE | Receive Rule Table Write Enable<br>0: Receive rule table write is disabled.<br>1: Receive rule table write is enabled. |
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 to 0 | AFLPN[4:0] | Receive Rule Table Page Number Configuration<br>A page number can be selected from a range of page 0 ($00000_B$) to page 23 ($10111_B$). |

### AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

### AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of $00000_B$ to $10111_B$.

## 21.16.13 RSCAN1GAFLCFG0 — Receive Rule Configuration Register 0

**Access:** RSCAN1GAFLCFG0 register can be read or written in 32-bit units.
RSCAN1GAFLCFG0H register can be read or written in 16-bit units.
RSCAN1GAFLCFG0HH register can be read or written in 8-bit units.

**Address:** RSCAN1GAFLCFG0: <RSCAN1_base> + $009C_H$

RSCAN1GAFLCFG0H: <RSCAN1_base> + $009E_H$

RSCAN1GAFLCFG0HH: <RSCAN1_base> + $009F_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RNC0[7:0] | | | | | | | | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.229 RSCAN1GAFLCFG0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RNC0[7:0] | Number of Rules for Unit Channel Number 0<br>Set the number of receive rules exclusively used for Unit Channel Number 0. |
| 23 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Modify the RSCAN1GAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules for each channel of the units should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

### RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the receive rule table for unit channel number 0.

Set these bits to a value within the range of $00_H$ to $80_H$.

## 21.16.14 RSCAN1GAFLIDj — Receive Rule ID Register (j = 0 to 15)

**Access:** RSCAN1GAFLIDj register can be read or written in 32-bit units.
RSCAN1GAFLIDjL, RSCAN1GAFLIDjH registers can be read or written in 16-bit units.
RSCAN1GAFLIDjLL, RSCAN1GAFLIDjLH, RSCAN1GAFLIDjHL, RSCAN1GAFLIDjHH registers can be read or written in 8-bit units.

**Address:** RSCAN1GAFLIDj: <RSCAN1_base> + $0500_H$ + ($10_H$ × j)

RSCAN1GAFLIDjL: <RSCAN1_base> + $0500_H$ + ($10_H$ × j),
RSCAN1GAFLIDjH: <RSCAN1_base> + $0502_H$ + ($10_H$ × j)

RSCAN1GAFLIDjLL: <RSCAN1_base> + $0500_H$ + ($10_H$ × j),
RSCAN1GAFLIDjLH: <RSCAN1_base> + $0501_H$ + ($10_H$ × j),
RSCAN1GAFLIDjHL: <RSCAN1_base> + $0502_H$ + ($10_H$ × j),
RSCAN1GAFLIDjHH: <RSCAN1_base> + $0503_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDE | GAFLRTR | GAFLLB | GAFLID[28:16] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLID[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.230 RSCAN1GAFLIDj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | GAFLIDE | IDE Select<br>0: Standard ID<br>1: Extended ID |
| 30 | GAFLRTR | RTR Select<br>0: Data frame<br>1: Remote frame |
| 29 | GAFLLB | Receive Rule Target Message Select<br>0: When a message transmitted from another CAN node is received<br>1: When the own transmitted message is received |
| 28 to 0 | GAFLID[28:0] | ID Set<br>Set the ID of the receive rule.<br>For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0. |

Modify the RSCAN1GAFLIDj register when the AFLDAE bit in the RSCAN1GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

### GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

### GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

#### GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

#### GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

## 21.16.15 RSCAN1GAFLMj — Receive Rule Mask Register (j = 0 to 15)

**Access:** RSCAN1GAFLMj register can be read or written in 32-bit units.
RSCAN1GAFLMjL, RSCAN1GAFLMjH registers can be read or written in 16-bit units.
RSCAN1GAFLMjLL, RSCAN1GAFLMjLH, RSCAN1GAFLMjHL, RSCAN1GAFLMjHH registers can be read or written in 8-bit units.

**Address:** RSCAN1GAFLMj: <RSCAN1_base> + $0504_H$ + ($10_H$ × j)

RSCAN1GAFLMjL: <RSCAN1_base> + $0504_H$ + ($10_H$ × j),
RSCAN1GAFLMjH: <RSCAN1_base> + $0506_H$ + ($10_H$ × j)

RSCAN1GAFLMjLL: <RSCAN1_base> + $0504_H$ + ($10_H$ × j),
RSCAN1GAFLMjLH: <RSCAN1_base> + $0505_H$ + ($10_H$ × j),
RSCAN1GAFLMjHL: <RSCAN1_base> + $0506_H$ + ($10_H$ × j),
RSCAN1GAFLMjHH: <RSCAN1_base> + $0507_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDEM | GAFLRTRM | — | GAFLIDM[28:16] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDM[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.231 RSCAN1GAFLMj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | GAFLIDEM | IDE Mask<br>0: The IDE bit is not compared.<br>1: The IDE bit is compared. |
| 30 | GAFLRTRM | RTR Mask<br>0: The RTR bit is not compared.<br>1: The RTR bit is compared |
| 29 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 28 to 0 | GAFLIDM[28:0] | ID Mask<br>0: The corresponding ID bit is not compared.<br>1: The corresponding ID bit is compared. |

Modify the RSCAN1GAFLMj register when the AFLDAE bit in the RSCAN1GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

### GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCAN1GAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

### GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

### GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

## 21.16.16 RSCAN1GAFLP0j — Receive Rule Pointer 0 Register (j = 0 to 15)

**Access:** RSCAN1GAFLP0j register can be read or written in 32-bit units.
RSCAN1GAFLP0jL, RSCAN1GAFLP0jH registers can be read or written in 16-bit units.
RSCAN1GAFLP0jLH, RSCAN1GAFLP0jHL, RSCAN1GAFLP0jHH registers can be read or written in 8-bit units.

**Address:** RSCAN1GAFLP0j: <RSCAN1_base> + $0508_H$ + ($10_H$ × j)

RSCAN1GAFLP0jL: <RSCAN1_base> + $0508_H$ + ($10_H$ × j),
RSCAN1GAFLP0jH: <RSCAN1_base> + $050A_H$ + ($10_H$ × j)

RSCAN1GAFLP0jLH: <RSCAN1_base> + $0509_H$ + ($10_H$ × j),
RSCAN1GAFLP0jHL: <RSCAN1_base> + $050A_H$ + ($10_H$ × j),
RSCAN1GAFLP0jHH: <RSCAN1_base> + $050B_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.232 RSCAN1GAFLP0j Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | GAFLDLC[3:0] | Receive Rule DLC<br>b31 b30 b29 b28<br>0 0 0 0: DLC check is disabled.<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 16 | GAFLPTR[11:0] | Receive Rule Label<br>Set the 12-bit label information. |
| 15 | GAFLRMV | Receive Buffer Enable<br>0: No receive buffer is used.<br>1: A receive buffer is used. |
| 14 to 8 | GAFLRMDP[6:0] | Receive Buffer Number Select<br>Set the receive buffer number to store receive messages. |
| 7 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Modify the RSCAN1GAFLP0j register when the AFLDAE bit in the RSCAN1GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

### GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to $0000_B$ disables the DLC check function allowing messages with any data length to pass the DLC check.

#### GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

#### GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

#### GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCAN1RMNB register.

## 21.16.17 RSCAN1GAFLP1j — Receive Rule Pointer 1 Register (j = 0 to 15)

**Access:** RSCAN1GAFLP1j register can be read or written in 32-bit units.
RSCAN1GAFLP1jL register can be read or written in 16-bit units.
RSCAN1GAFLP1jLL, RSCAN1GAFLP1jLH registers can be read or written in 8-bit units.

**Address:** RSCAN1GAFLP1j: <RSCAN1_base> + $050C_H$ + ($10_H$ × j)

RSCAN1GAFLP1jL: <RSCAN1_base> + $050C_H$ + ($10_H$ × j)

RSCAN1GAFLP1jLL: <RSCAN1_base> + $050C_H$ + ($10_H$ × j),
RSCAN1GAFLP1jLH: <RSCAN1_base> + $050D_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.233 RSCAN1GAFLP1j Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 10 to 8 | GAFLFDP[10:8] | Transmit/Receive FIFO Buffer k Select<br>(Bit position –8 = target transmit/receive FIFO buffer number k)<br>0: Transmit/receive FIFO buffer is not selected.<br>1: Transmit/receive FIFO buffer is selected. |
| 7 to 0 | GAFLFDP[7:0] | Receive FIFO Buffer x Select<br>(Bit position = target receive FIFO buffer number x)<br>0: Receive FIFO buffer is not selected.<br>1: Receive FIFO buffer is selected. |

Modify the RSCAN1GAFLP1j register when the AFLDAE bit in the RSCAN1GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

### GAFLFDP [10:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCAN1GAFLP0j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCAN1CFCCk register are set to $00_B$ (receive mode) can be selected.

## 21.16.18 RSCAN1RMNB — Receive Buffer Number Register

**Access:** RSCAN1RMNB register can be read or written in 32-bit units.
RSCAN1RMNBL register can be read or written in 16-bit units.
RSCAN1RMNBLL register can be read or written in 8-bit units.

**Address:** RSCAN1RMNB: <RSCAN1_base> + $00A4_H$

RSCAN1RMNBL: <RSCAN1_base> + $00A4_H$

RSCAN1RMNBLL: <RSCAN1_base> + $00A4_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | NRXMB[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.234 RSCAN1RMNB Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 7 to 0 | NRXMB[7:0] | Receive Buffer Number Configuration<br>Set the number of receive buffers.<br>Set a value of 0 to 16. |

Modify the RSCAN1RMNB register only in global reset mode.

### NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CAN module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

## 21.16.19 RSCAN1RMNDy — Receive Buffer New Data Register (y = 0)

**Access:** RSCAN1RMNDy register can be read or written in 32-bit units.
RSCAN1RMNDyL register can be read or written in 16-bit units.
RSCAN1RMNDyLL, RSCAN1RMNDyLH registers can be read or written in 8-bit units.

**Address:** RSCAN1RMNDy: <RSCAN1_base> + $00A8_H$ + ($04_H$ × y)

RSCAN1RMNDyL: <RSCAN1_base> + $00A8_H$ + ($04_H$ × y)

RSCAN1RMNDyLL: <RSCAN1_base> + $00A8_H$ + ($04_H$ × y),
RSCAN1RMNDyLH: <RSCAN1_base> + $00A9_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMNSq (q = y × 32 + 15 to y × 32 + 0 (y = 0)) | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.235 RSCAN1RMNDy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | RMNSq | Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0)<br>0: There is no new message in receive buffer q.<br>1: There is a new message in receive buffer q. |

Write 0 to the RSCAN1RMNDy register in global operating mode or global test mode.

### RMNSq Flags (q = 0 to i × 16 + 15)

Each RMNS flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message.

These flags are cleared to 0 in global reset mode.

## 21.16.20 RSCAN1RMIDq — Receive Buffer ID Register (q = 0 to 15)

**Access:** RSCAN1RMIDq register is a read-only register that can be read in 32-bit units.
RSCAN1RMIDqL, RSCAN1RMIDqH registers are read-only registers that can be read in 16-bit units.
RSCAN1RMIDqLL, RSCAN1RMIDqLH, RSCAN1RMIDqHL, RSCAN1RMIDqHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1RMIDq: <RSCAN1_base> + $0600_H$ + ($10_H$ × q)

RSCAN1RMIDqL: <RSCAN1_base> + $0600_H$ + ($10_H$ × q),
RSCAN1RMIDqH: <RSCAN1_base> + $0602_H$ + ($10_H$ × q)

RSCAN1RMIDqLL: <RSCAN1_base> + $0600_H$ + ($10_H$ × q),
RSCAN1RMIDqLH: <RSCAN1_base> + $0601_H$ + ($10_H$ × q),
RSCAN1RMIDqHL: <RSCAN1_base> + $0602_H$ + ($10_H$ × q),
RSCAN1RMIDqHH: <RSCAN1_base> + $0603_H$ + ($10_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.236 RSCAN1RMIDq Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | RMIDE | Receive Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | RMRTR | Receive Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | Reserved | When read, the value after reset is returned. |
| 28 to 0 | RMID[28:0] | Receive Buffer ID Data<br>These bits contain the standard ID or extended ID of the received message.<br>Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

### RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

### RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

### RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

## 21.16.21 RSCAN1RMPTRq — Receive Buffer Pointer Register (q = 0 to 15)

**Access:** RSCAN1RMPTRq register is a read-only register that can be read in 32-bit units.
RSCAN1RMPTRqL, RSCAN1RMPTRqH registers are read-only registers that can be read in 16-bit units.
RSCAN1RMPTRqLL, RSCAN1RMPTRqLH, RSCAN1RMPTRqHL, RSCAN1RMPTRqHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1RMPTRq: <RSCAN1_base> + $0604_H$ + ($10_H$ × q)

RSCAN1RMPTRqL: <RSCAN1_base> + $0604_H$ + ($10_H$ × q),
RSCAN1RMPTRqH: <RSCAN1_base> + $0606_H$ + ($10_H$ × q)

RSCAN1RMPTRqLL: <RSCAN1_base> + $0604_H$ + ($10_H$ × q),
RSCAN1RMPTRqLH: <RSCAN1_base> + $0605_H$ + ($10_H$ × q),
RSCAN1RMPTRqHL: <RSCAN1_base> + $0606_H$ + ($10_H$ × q),
RSCAN1RMPTRqHH: <RSCAN1_base> + $0607_H$ + ($10_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.237 RSCAN1RMPTRq Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | RMDLC[3:0] | Receive Buffer DLC Data<br>b31 b30 b29 b28<br>0 0 0 0: No data byte<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 16 | RMPTR[11:0] | Receive Buffer Label Data<br>Label information of the received message. |
| 15 to 0 | RMTS[15:0] | Receive Buffer Timestamp Data<br>Timestamp value of the received message. |

### RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

### RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

### RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

## 21.16.22 RSCAN1RMDF0q — Receive Buffer Data Field 0 Register (q = 0 to 15)

**Access:** RSCAN1RMDF0q register is a read-only register that can be read in 32-bit units.
RSCAN1RMDF0qL, RSCAN1RMDF0qH registers are read-only registers that can be read in 16-bit units.
RSCAN1RMDF0qLL, RSCAN1RMDF0qLH, RSCAN1RMDF0qHL, RSCAN1RMDF0qHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1RMDF0q: <RSCAN1_base> + $0608_H$ + ($10_H$ × q)

RSCAN1RMDF0qL: <RSCAN1_base> + $0608_H$ + ($10_H$ × q),
RSCAN1RMDF0qH: <RSCAN1_base> + $060A_H$ + ($10_H$ × q)

RSCAN1RMDF0qLL: <RSCAN1_base> + $0608_H$ + ($10_H$ × q),
RSCAN1RMDF0qLH: <RSCAN1_base> + $0609_H$ + ($10_H$ × q),
RSCAN1RMDF0qHL: <RSCAN1_base> + $060A_H$ + ($10_H$ × q),
RSCAN1RMDF0qHH: <RSCAN1_base> + $060B_H$ + ($10_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMDB3[7:0] | | | | | | | | RMDB2[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.238 RSCAN1RMDF0q Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RMDB3[7:0] | Receive Buffer Data Byte 3 |
| 23 to 16 | RMDB2[7:0] | Receive Buffer Data Byte 2 |
| 15 to 8 | RMDB1[7:0] | Receive Buffer Data Byte 1 |
| 7 to 0 | RMDB0[7:0] | Receive Buffer Data Byte 0<br>Data for a message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCAN1RMPTRq register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

## 21.16.23 RSCAN1RMDF1q — Receive Buffer Data Field 1 Register (q = 0 to 15)

**Access:** RSCAN1RMDF1q register is a read-only register that can be read in 32-bit units.
RSCAN1RMDF1qL, RSCAN1RMDF1qH registers are read-only registers that can be read in 16-bit units.
RSCAN1RMDF1qLL, RSCAN1RMDF1qLH, RSCAN1RMDF1qHL, RSCAN1RMDF1qHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1RMDF1q: <RSCAN1_base> + $060C_H$ + ($10_H$ × q)

RSCAN1RMDF1qL: <RSCAN1_base> + $060C_H$ + ($10_H$ × q),
RSCAN1RMDF1qH: <RSCAN1_base> + $060E_H$ + ($10_H$ × q)

RSCAN1RMDF1qLL: <RSCAN1_base> + $060C_H$ + ($10_H$ × q),
RSCAN1RMDF1qLH: <RSCAN1_base> + $060D_H$ + ($10_H$ × q),
RSCAN1RMDF1qHL: <RSCAN1_base> + $060E_H$ + ($10_H$ × q),
RSCAN1RMDF1qHH: <RSCAN1_base> + $060F_H$ + ($10_H$ × q)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 23 to 16 | RMDB6[7:0] | Receive Buffer Data Byte 6 |
| 15 to 8 | RMDB5[7:0] | Receive Buffer Data Byte 5 |
| 7 to 0 | RMDB4[7:0] | Receive Buffer Data Byte 4<br>Data for a message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCAN1RMPTRq register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

## 21.16.24 RSCAN1RFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

**Access:** RSCAN1RFCCx register can be read or written in 32-bit units.
RSCAN1RFCCxL register can be read or written in 16-bit units.
RSCAN1RFCCxLL, RSCAN1RFCCxLH registers can be read or written in 8-bit units.

**Address:** RSCAN1RFCCx: <RSCAN1_base> + $00B8_H$ + ($04_H$ × x)

RSCAN1RFCCxL: <RSCAN1_base> + $00B8_H$ + ($04_H$ × x)

RSCAN1RFCCxLL: <RSCAN1_base> + $00B8_H$ + ($04_H$ × x),
RSCAN1RFCCxLH: <RSCAN1_base> + $00B9_H$ + ($04_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | RFIE | Receive FIFO Interrupt Enable<br>0: Receive FIFO interrupt is disabled.<br>1: Receive FIFO interrupt is enabled. |

Table 21.240 RSCAN1RFCCx Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | RFE | Receive FIFO Buffer Enable<br>0: No receive FIFO buffer is used.<br>1: Receive FIFO buffers are used. |

### RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to $001_B$ (4 messages), set the RFIGCV[2:0] bits to $001_B$, $011_B$, $101_B$, or $111_B$. Modify these bits only in global reset mode.

### RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

### RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to $000_B$, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

### RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

### RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCAN1RFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

## 21.16.25 RSCAN1RFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

**Access:** RSCAN1RFSTSx register can be read or written in 32-bit units.
RSCAN1RFSTSxL register can be read or written in 16-bit units.
RSCAN1RFSTSxLL register can be read or written in 8-bit units.
RSCAN1RFSTSxLH register is a read-only register that can be read in 8-bit units.

**Address:** RSCAN1RFSTSx: <RSCAN1_base> + $00D8_H$ + ($04_H$ × x)

RSCAN1RFSTSxL: <RSCAN1_base> + $00D8_H$ + ($04_H$ × x)

RSCAN1RFSTSxLL: <RSCAN1_base> + $00D8_H$ + ($04_H$ × x),
RSCAN1RFSTSxLH: <RSCAN1_base> + $00D9_H$ + ($04_H$ × x)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFMC[7:0] | | | | | | | | — | — | — | — | RFIF | RFMLT | RFFLL | RFEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.241 RSCAN1RFSTSx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 to 8 | RFMC[7:0] | Receive FIFO Unread Message Counter<br>The number of unread messages stored in the receive FIFO buffer is displayed. |
| 7 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | RFIF | Receive FIFO Interrupt Request Flag<br>0: No receive FIFO interrupt request is present.<br>1: A receive FIFO interrupt request is present. |
| 2 | RFMLT | Receive FIFO Message Lost Flag<br>0: No receive FIFO message is lost.<br>1: A receive FIFO message is lost. |
| 1 | RFFLL | Receive FIFO Buffer Full Status Flag<br>0: The receive FIFO buffer is not full.<br>1: The receive FIFO buffer is full. |
| 0 | RFEMP | Receive FIFO Buffer Empty Status Flag<br>0: The receive FIFO buffer contains unread message.<br>1: The receive FIFO buffer contains no unread message (buffer empty). |

### RFMC[7:0] Flags

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes $00_H$ when the RFE bit in the RSCAN1RFCCx register is set to 0.

### RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCAN1RFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCAN1RFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCAN1RFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

### RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCAN1RFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

**NOTE**

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

## 21.16.26 RSCAN1RFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

**Access:** RSCAN1RFPCTRx register is a write-only register that can be written in 32-bit units.
RSCAN1RFPCTRxL register is a write-only register that can be written in 16-bit units.
RSCAN1RFPCTRxLL register is a write-only register that can be written in 8-bit units.

**Address:** RSCAN1RFPCTRx: <RSCAN1_base> + $00F8_H$ + ($04_H$ × x)

RSCAN1RFPCTRxL: <RSCAN1_base> + $00F8_H$ + ($04_H$ × x)

RSCAN1RFPCTRxLL: <RSCAN1_base> + $00F8_H$ + ($04_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | RFPC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.242 RSCAN1RFPCTRx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | RFPC[7:0] | Receive FIFO Pointer Control<br>When these bits are set to $FF_H$, the read pointer moves to the next unread message in the receive FIFO buffer. |

### RFPC[7:0] Bits

When the RFPC[7:0] bits are set to $FF_H$, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCAN1RFSTSx register is decremented. Read the RSCAN1RFIDx, RSCAN1RFPTRx, RSCAN1RFDF0x, and RSCAN1RFDF1x registers to read messages in the receive FIFO buffer, and then write $FF_H$ to the RFPC[7:0] bits.

When writing $FF_H$ to these bits, make sure that the RFE bit in the RSCAN1RFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCAN1RFSTSx register is 0 (the receive FIFO buffer contains unread messages).

## 21.16.27 RSCAN1RFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

**Access:** RSCAN1RFIDx register is a read-only register that can be read in 32-bit units.
RSCAN1RFIDxL, RSCAN1RFIDxH registers are read-only registers that can be read in 16-bit units.
RSCAN1RFIDxLL, RSCAN1RFIDxLH, RSCAN1RFIDxHL, RSCAN1RFIDxHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1RFIDx: <RSCAN1_base> + $0E00_H$ + ($10_H$ × x)

RSCAN1RFIDxL: <RSCAN1_base> + $0E00_H$ + ($10_H$ × x),
RSCAN1RFIDxH: <RSCAN1_base> + $0E02_H$ + ($10_H$ × x)

RSCAN1RFIDxLL: <RSCAN1_base> + $0E00_H$ + ($10_H$ × x),
RSCAN1RFIDxLH: <RSCAN1_base> + $0E01_H$ + ($10_H$ × x),
RSCAN1RFIDxHL: <RSCAN1_base> + $0E02_H$ + ($10_H$ × x),
RSCAN1RFIDxHH: <RSCAN1_base> + $0E03_H$ + ($10_H$ × x)

**Value after reset:** $0000\ 0000_H$

**Table 21.243 RSCAN1RFIDx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | RFIDE | Receive FIFO Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | RFRTR | Receive FIFO Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | Reserved | When read, the value after reset is returned. |
| 28 to 0 | RFID[28:0] | Receive FIFO Buffer ID Data<br>The standard ID or extended ID of received message can be read.<br>Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

### RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

### RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

### RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

## 21.16.28 RSCAN1RFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

**Access:** RSCAN1RFPTRx register is a read-only register that can be read in 32-bit units.
RSCAN1RFPTRxL, RSCAN1RFPTRxH registers are read-only registers that can be read in 16-bit units.
RSCAN1RFPTRxLL, RSCAN1RFPTRxLH, RSCAN1RFPTRxHL, RSCAN1RFPTRxHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1RFPTRx: <RSCAN1_base> + $0E04_H$ + ($10_H$ × x)

RSCAN1RFPTRxL: <RSCAN1_base> + $0E04_H$ + ($10_H$ × x),
RSCAN1RFPTRxH: <RSCAN1_base> + $0E06_H$ + ($10_H$ × x)

RSCAN1RFPTRxLL: <RSCAN1_base> + $0E04_H$ + ($10_H$ × x),
RSCAN1RFPTRxLH: <RSCAN1_base> + $0E05_H$ + ($10_H$ × x),
RSCAN1RFPTRxHL: <RSCAN1_base> + $0E06_H$ + ($10_H$ × x),

| 15 to 0 | RFTS[15:0] | Receive FIFO Buffer Timestamp Data<br>Timestamp value of the received message can be read. |

### RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

### RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

### RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

## 21.16.29 RSCAN1RFDF0x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)

**Access:** RSCAN1RFDF0x register is a read-only register that can be read in 32-bit units.
RSCAN1RFDF0xL, RSCAN1RFDF0xH registers are read-only registers that can be read in 16-bit units.
RSCAN1RFDF0xLL, RSCAN1RFDF0xLH, RSCAN1RFDF0xHL, RSCAN1RFDF0xHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1RFDF0x: <RSCAN1_base> + $0E08_H$ + ($10_H$ × x)

RSCAN1RFDF0xL: <RSCAN1_base> + $0E08_H$ + ($10_H$ × x),
RSCAN1RFDF0xH: <RSCAN1_base> + $0E0A_H$ + ($10_H$ × x)

**Table 21.245 RSCAN1RFDF0x Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RFDB3[7:0] | Receive FIFO Buffer Data Byte 3 |
| 23 to 16 | RFDB2[7:0] | Receive FIFO Buffer Data Byte 2 |
| 15 to 8 | RFDB1[7:0] | Receive FIFO Buffer Data Byte 1 |
| 7 to 0 | RFDB0[7:0] | Receive FIFO Buffer Data Byte 0<br>Data for a message stored in the receive FIFO buffer can be read. |

When the RFDLC[3:0] value in the RSCAN1RFPTRx register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

## 21.16.30 RSCAN1RFDF1x — Receive FIFO Buffer Access Data Field 1 Register (x = 0 to 7)

**Access:** RSCAN1RFDF1x register is a read-only register that can be read in 32-bit units.
RSCAN1RFDF1xL, RSCAN1RFDF1xH registers are read-only registers that can be read in 16-bit units.
RSCAN1RFDF1xLL, RSCAN1RFDF1xLH, RSCAN1RFDF1xHL, RSCAN1RFDF1xHH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1RFDF1x: <RSCAN1_base> + $0E0C_H$ + ($10_H$ × x)

RSCAN1RFDF1xL: <RSCAN1_base> + $0E0C_H$ + ($10_H$ × x),
RSCAN1RFDF1xH: <RSCAN1_base> + $0E0E_H$ + ($10_H$ × x)

RSCAN1RFDF1xLL: <RSCAN1_base> + $0E0C_H$ + ($10_H$ × x),
RSCAN1RFDF1xLH: <RSCAN1_base> + $0E0D_H$ + ($10_H$ × x),
RSCAN1RFDF1xHL: <RSCAN1_base> + $0E0E_H$ + ($10_H$ × x),

| 15 to 8 | RFDB5[7:0] | Receive FIFO Buffer Data Byte 5 |
| 7 to 0 | RFDB4[7:0] | Receive FIFO Buffer Data Byte 4<br>Data for a message stored in the receive FIFO buffer can be read. |

When the RFDLC[3:0] value in the RSCAN1RFPTRx register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

## 21.16.31 RSCAN1CFCCk — Transmit/receive FIFO Buffer Configuration and Control Register (k = 0 to 2)

**Access:** RSCAN1CFCCk register can be read or written in 32-bit units.
RSCAN1CFCCkL, RSCAN1CFCCkH registers can be read or written in 16-bit units.
RSCAN1CFCCkLL, RSCAN1CFCCkLH, RSCAN1CFCCkHL, RSCAN1CFCCkHH registers can be read or written in 8-bit units.

**Address:** RSCAN1CFCCk: <RSCAN1_base> + $0118_H$ + ($04_H$ × k)

RSCAN1CFCCkL: <RSCAN1_base> + $0118_H$ + ($04_H$ × k),
RSCAN1CFCCkH: <RSCAN1_base> + $011A_H$ + ($04_H$ × k)

RSCAN1CFCCkLL: <RSCAN1_base> + $0118_H$ + ($04_H$ × k),
RSCAN1CFCCkLH: <RSCAN1_base> + $0119_H$ + ($04_H$ × k),

| 1 | CFRXIE | Transmit/Receive FIFO Receive Interrupt Enable<br>0: Transmit/receive FIFO receive interrupt is disabled.<br>1: Transmit/receive FIFO receive interrupt is enabled. |
| 0 | CFE | Transmit/Receive FIFO Buffer Enable<br>0: No transmit/receive FIFO buffer is used.<br>1: Transmit/receive FIFO buffers are used. |

### CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to $01_B$ (transmit mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

### CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to $01_B$ (transmit mode). There are three transmit/receive FIFO buffers per channel, so channel number i of FIFO buffer k is calculated as i = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer p will be ((16 × i) + CFTML[3:0]).

See **Table 21.214** and **Table 21.215**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to $001_B$ or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCAN1GCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCAN1GCFG register × 10.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

#### CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to $00_B$ (receive mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to $001_B$ (4 messages), set the CFIGCV[2:0] bits to $001_B$, $011_B$, $101_B$, or $111_B$.

Modify these bits only in global reset mode.

#### CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

#### CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to $000_B$, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCAN1CFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

### CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCAN1CFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

### CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode: Channel communication mode or channel halt mode

## 21.16.32 RSCAN1CFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 2)

**Access:** RSCAN1CFSTSk register can be read or written in 32-bit units.
RSCAN1CFSTSkL register can be read or written in 16-bit units.
RSCAN1CFSTSkLL register can be read or written in 8-bit units.
RSCAN1CFSTSkLH register is a read-only register that can be read in 8-bit units.

**Address:** RSCAN1CFSTSk: <RSCAN1_base> + $0178_H$ + ($04_H$ × k)

RSCAN1CFSTSkL: <RSCAN1_base> + $0178_H$ + ($04_H$ × k)

RSCAN1CFSTSkLL: <RSCAN1_base> + $0178_H$ + ($04_H$ × k),
RSCAN1CFSTSkLH: <RSCAN1_base> + $0179_H$ + ($04_H$ × k)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CFMC[7:0] | | | | | | | | — | — | — | CFTXIF | CFRXIF | CFMLT | CFFLL | CFEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.248 RSCAN1CFSTSk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 to 8 | CFMC[7:0] | Transmit/Receive FIFO Message Counter<br>The number of messages stored in the transmit/receive FIFO buffer. |
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | CFTXIF | Transmit/Receive FIFO Transmit Interrupt Request Flag<br>0: No transmit/receive FIFO transmit interrupt request is present.<br>1: A transmit/receive FIFO transmit interrupt request is present. |
| 3 | CFRXIF | Transmit/Receive FIFO Receive Interrupt Request Flag<br>0: No transmit/receive FIFO receive interrupt request is present.<br>1: A transmit/receive FIFO receive interrupt request is present. |
| 2 | CFMLT | Transmit/Receive FIFO Message Lost Flag<br>0: No transmit/receive FIFO message is lost.<br>1: A transmit/receive FIFO message is lost. |
| 1 | CFFLL | Transmit/Receive FIFO Buffer Full Status Flag<br>0: The transmit/receive FIFO buffer is not full.<br>1: The transmit/receive FIFO buffer is full. |
| 0 | CFEMP | Transmit/Receive FIFO Buffer Empty Status Flag<br>0: The transmit/receive FIFO buffer contains messages.<br>1: The transmit/receive FIFO buffer contains no message (buffer empty). |

### CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCAN1CFCCk register.

- When CFM[1:0] value is $01_B$ (transmit mode): Number of untransmitted messages in the buffer

- When CFM[1:0] value is $00_B$ (receive mode): Number of unread received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is $00_B$: In global reset mode
- When CFM[1:0] value is $01_B$: In channel reset mode

#### CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $01_B$ or $10_B$, and the factor selected by the CFIM bit in the RSCAN1CFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_B$ or $10_B$, and the factor selected by the CFIM bit in the RSCAN1CFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCAN1CFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCAN1CFCCk register is 0 (no transmit/receive FIFO buffer is used): When not performing transmit abort
- When the CFM[1:0] bits are set to $00_B$: In global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: In channel reset mode

### CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_B$: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to $01_B$ or $10_B$: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): When not performing transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_B$ or $10_B$: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to $01_B$: A value of $FF_H$ has been written to the RSCAN1CFPCTRk register after data was written to the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers.

**NOTE**

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

## 21.16.33 RSCAN1CFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 2)

**Access:** RSCAN1CFPCTRk register is a write-only register that can be written in 32-bit units.
RSCAN1CFPCTRkL register is a write-only register that can be written in 16-bit units.
RSCAN1CFPCTRkLL register is a write-only register that can be written in 8-bit units.

**Address:** RSCAN1CFPCTRk: <RSCAN1_base> + $01D8_H$ + ($04_H$ × k)

RSCAN1CFPCTRkL: <RSCAN1_base> + $01D8_H$ + ($04_H$ × k)

RSCAN1CFPCTRkLL: <RSCAN1_base> + $01D8_H$ + ($04_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.249 RSCAN1CFPCTRk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | CFPC[7:0] | Transmit/Receive FIFO Pointer Control<br>• Receive mode:<br>Writing $FF_H$ to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer.<br>• Transmit mode:<br>Writing $FF_H$ to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. |

### CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCAN1CFCCk register is $00_B$):
  Writing $FF_H$ to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCAN1CFSTSk register is decremented. Read the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers to read messages from the transmit/receive FIFO buffer, and then write $FF_H$ to the CFPC[7:0] bits.
  When writing $FF_H$ to these bits, make sure that the CFE bit in the RSCAN1CFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCAN1CFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCAN1CFCCk register is $01_B$):
  Writing $FF_H$ to the CFPC[7:0] bits stores the data written to the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers before writing $FF_H$ to the CFPC[7:0] bits.
  When writing $FF_H$ to these bits, make sure that the CFE bit in the RSCAN1CFCCk register is set to 1 and the CFFLL flag in the RSCAN1CFSTSk register is 0 (the transmit/receive FIFO buffer is not full).

## 21.16.34 RSCAN1CFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 2)

**Access:** RSCAN1CFIDk register can be read or written in 32-bit units.
RSCAN1CFIDkL, RSCAN1CFIDkH registers can be read or written in 16-bit units.
RSCAN1CFIDkLL, RSCAN1CFIDkLH, RSCAN1CFIDkHL, RSCAN1CFIDkHH registers can be read or written in 8-bit units.

**Address:** RSCAN1CFIDk: <RSCAN1_base> + $0E80_H$ + ($10_H$ × k)

RSCAN1CFIDkL: <RSCAN1_base> + $0E80_H$ + ($10_H$ × k),
RSCAN1CFIDkH: <RSCAN1_base> + $0E82_H$ + ($10_H$ × k)

RSCAN1CFIDkLL: <RSCAN1_base> + $0E80_H$ + ($10_H$ × k),
RSCAN1CFIDkLH: <RSCAN1_base> + $0E81_H$ + ($10_H$ × k),
RSCAN1CFIDkHL: <RSCAN1_base> + $0E82_H$ + ($10_H$ × k),
RSCAN1CFIDkHH: <RSCAN1_base> + $0E83_H$ + ($10_H$ × k)

**Value after reset:** $0000\ 0000_H$

**Table 21.250 RSCAN1CFIDk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | CFIDE | Transmit/Receive FIFO Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | CFRTR | Transmit/Receive FIFO Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | THLEN | Transmit History Data Store Enable<br>This bit is valid only when the CFM[1:0] value is $01_B$ (transmit mode).<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |
| 28 to 0 | CFID[28:0] | Transmit/Receive FIFO Buffer ID Data<br>• When CFM[1:0] value is $01_B$ (transmit mode):<br>Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.<br>• When CFM[1:0] value is $00_B$ (receive mode):<br>Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0. |

This register is writable only when the CFM[1:0] value in the RSCAN1CFCCk register is $01_B$ (transmit mode). This register is readable only when the CFM[1:0] value is $00_B$ (receive mode).

#### CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

#### CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

#### THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is $01_B$ (transmit mode).

#### CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$.

When the CFM[1:0] value is $01_B$, these bits are used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

## 21.16.35 RSCAN1CFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 2)

**Access:** RSCAN1CFPTRk register can be read or written in 32-bit units.
RSCAN1CFPTRkL, RSCAN1CFPTRkH registers can be read or written in 16-bit units.
RSCAN1CFPTRkLL, RSCAN1CFPTRkLH, RSCAN1CFPTRkHL, RSCAN1CFPTRkHH registers can be read or written in 8-bit units.

**Address:** RSCAN1CFPTRk: <RSCAN1_base> + $0E84_H$ + ($10_H$ × k)

RSCAN1CFPTRkL: <RSCAN1_base> + $0E84_H$ + ($10_H$ × k),
RSCAN1CFPTRkH: <RSCAN1_base> + $0E86_H$ + ($10_H$ × k)

RSCAN1CFPTRkLL: <RSCAN1_base> + $0E84_H$ + ($10_H$ × k),
RSCAN1CFPTRkLH: <RSCAN1_base> + $0E85_H$ + ($10_H$ × k),
RSCAN1CFPTRkHL: <RSCAN1_base> + $0E86_H$ + ($10_H$ × k),
RSCAN1CFPTRkHH: <RSCAN1_base> + $0E87_H$ + ($10_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.251 RSCAN1CFPTRk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | CFDLC[3:0] | Transmit/Receive FIFO Buffer DLC Data<br>b31 b30 b29 b28<br>0 0 0 0: 0 data bytes<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 16 | CFPTR[11:0] | Transmit/Receive FIFO Buffer Label Data<br>• When CFM[1:0] value is $01_B$ (transmit mode):<br>Set the label information to be stored in the transmit history buffer.<br>Only bits CFPTR[7:0] are valid.<br>• When CFM[1:0] value is $00_B$ (receive mode):<br>The label information of the received message can be read. |
| 15 to 0 | CFTS[15:0] | Transmit/Receive FIFO Buffer Timestamp Data<br>These bits are valid only when the CFM[1:0] value is $00_B$ (receive mode).<br>The timestamp value of the received message can be read. |

This register is writable only when the CFM[1:0] value in the RSCAN1CFCCk register is $01_B$ (transmit mode). This register is readable only when the CFM[1:0] value is $00_B$ (receive mode).

#### CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 9 bytes or more, the actual transmit data defaults to 8 bytes.

#### CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_B$. When the CFM[1:0] value is $01_B$, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

#### CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is $00_B$.

## 21.16.36 RSCAN1CFDF0k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 2)

**Access:** RSCAN1CFDF0k register can be read or written in 32-bit units.
RSCAN1CFDF0kL, RSCAN1CFDF0kH registers can be read or written in 16-bit units.
RSCAN1CFDF0kLL, RSCAN1CFDF0kLH, RSCAN1CFDF0kHL, RSCAN1CFDF0kHH registers can be read or written in 8-bit units.

**Address:** RSCAN1CFDF0k: <RSCAN1_base> + $0E88_H$ + ($10_H$ × k)

RSCAN1CFDF0kL: <RSCAN1_base> + $0E88_H$ + ($10_H$ × k),
RSCAN1CFDF0kH: <RSCAN1_base> + $0E8A_H$ + ($10_H$ × k)

RSCAN1CFDF0kLL: <RSCAN1_base> + $0E88_H$ + ($10_H$ × k),
RSCAN1CFDF0kLH: <RSCAN1_base> + $0E89_H$ + ($10_H$ × k),
RSCAN1CFDF0kHL: <RSCAN1_base> + $0E8A_H$ + ($10_H$ × k),
RSCAN1CFDF0kHH: <RSCAN1_base> + $0E8B_H$ + ($10_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.252 RSCAN1CFDF0k Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | CFDB3[7:0] | Transmit/Receive FIFO Buffer Data Byte 3<br>Transmit/Receive FIFO Buffer Data Byte 2<br>Transmit/Receive FIFO Buffer Data Byte 1<br>Transmit/Receive FIFO Buffer Data Byte 0<br>• When CFM[1:0] value is $01_B$ (transmit mode): Set the transmit/receive FIFO buffer data.<br>• When CFM[1:0] value is $00_B$ (receive mode): The message data stored in the transmit/receive FIFO buffer can be read. |
| 23 to 16 | CFDB2[7:0] | |
| 15 to 8 | CFDB1[7:0] | |
| 7 to 0 | CFDB0[7:0] | |

This register is writable only when the CFM[1:0] value in the RSCAN1CFCCk register is $01_B$ (transmit mode).

This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). When the CFDLC[3:0] value in the RSCAN1CFPTRk register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

## 21.16.37 RSCAN1CFDF1k — Transmit/receive FIFO Buffer Access Data Field 1 Register (k = 0 to 2)

**Access:** RSCAN1CFDF1k register can be read or written in 32-bit units.
RSCAN1CFDF1kL, RSCAN1CFDF1kH registers can be read or written in 16-bit units.
RSCAN1CFDF1kLL, RSCAN1CFDF1kLH, RSCAN1CFDF1kHL, RSCAN1CFDF1kHH registers can be read or written in 8-bit units.

**Address:** RSCAN1CFDF1k: <RSCAN1_base> + $0E8C_H$ + ($10_H$ × k)

RSCAN1CFDF1kL: <RSCAN1_base> + $0E8C_H$ + ($10_H$ × k),
RSCAN1CFDF1kH: <RSCAN1_base> + $0E8E_H$ + ($10_H$ × k)

RSCAN1CFDF1kLL: <RSCAN1_base> + $0E8C_H$ + ($10_H$ × k),
RSCAN1CFDF1kLH: <RSCAN1_base> + $0E8D_H$ + ($10_H$ × k),
RSCAN1CFDF1kHL: <RSCAN1_base> + $0E8E_H$ + ($10_H$ × k),
RSCAN1CFDF1kHH: <RSCAN1_base> + $0E8F_H$ + ($10_H$ × k)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.253 RSCAN1CFDF1k Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | CFDB7[7:0] | Transmit/Receive FIFO Buffer Data Byte 7 |
| 23 to 16 | CFDB6[7:0] | Transmit/Receive FIFO Buffer Data Byte 6 |
| 15 to 8 | CFDB5[7:0] | Transmit/Receive FIFO Buffer Data Byte 5 |
| 7 to 0 | CFDB4[7:0] | Transmit/Receive FIFO Buffer Data Byte 4<br>• When CFM[1:0] value is $01_B$ (transmit mode): Set the transmit/receive FIFO buffer data.<br>• When CFM[1:0] value is $00_B$ (receive mode): The message data stored in the transmit/receive FIFO buffer can be read. |

This register is writable only when the CFM[1:0] value in the RSCAN1CFCCk register is $01_B$ (transmit mode).

This register is readable only when the CFM[1:0] value is $00_B$ (receive mode). When the CFDLC[3:0] value in the RSCAN1CFPTRk register is smaller than $1000_B$, data bytes for which no data is set are read as $00_H$.

## 21.16.38 RSCAN1FESTS — FIFO Empty Status Register

**Access:** RSCAN1FESTS register is a read-only register that can be read in 32-bit units.
RSCAN1FESTSL register is a read-only register that can be read in 16-bit units.
RSCAN1FESTSLL, RSCAN1FESTSLH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1FESTS: <RSCAN1_base> + $0238_H$

RSCAN1FESTSL: <RSCAN1_base> + $0238_H$

RSCAN1FESTSLL: <RSCAN1_base> + $0238_H$,
RSCAN1FESTSLH: <RSCAN1_base> + $0239_H$

**Value after reset:** $0001\ FFFF_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.254 RSCAN1FESTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is returned. |
| 10 | CF2EMP | Transmit/Receive FIFO Buffer Empty Status Flag<br>0: Transmit/receive FIFO buffer k contains a message.<br>1: Transmit/receive FIFO buffer k contains no message.<br>(k = 0 to 2) |
| 9 | CF1EMP | |
| 8 | CF0EMP | |
| 7 | RF7EMP | Receive FIFO Buffer Empty Status Flag<br>0: Receive FIFO buffer x contains an unread message.<br>1: Receive FIFO buffer x contains no unread message (buffer empty).<br>(x = 0 to 7) |
| 6 | RF6EMP | |
| 5 | RF5EMP | |
| 4 | RF4EMP | |
| 3 | RF3EMP | |
| 2 | RF2EMP | |
| 1 | RF1EMP | |
| 0 | RF0EMP | |

The RSCAN1FESTS register is set to $0001\ FFFF_H$ in global reset mode.

### CFkEMP Flag (k = 0 to 2)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCAN1CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

### RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCAN1RFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

## 21.16.39 RSCAN1FFSTS — FIFO Full Status Register

**Access:** RSCAN1FFSTS register is a read-only register that can be read in 32-bit units.
RSCAN1FFSTSL register is a read-only register that can be read in 16-bit units.
RSCAN1FFSTSLL, RSCAN1FFSTSLH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1FFSTS: <RSCAN1_base> + $023C_H$

RSCAN1FFSTSL: <RSCAN1_base> + $023C_H$

RSCAN1FFSTSLL: <RSCAN1_base> + $023C_H$,
RSCAN1FFSTSLH: <RSCAN1_base> + $023D_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.255 RSCAN1FFSTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is returned. |
| 10 | CF2FLL | Transmit/Receive FIFO Buffer Full Status Flag<br>0: Transmit/receive buffer k is not full.<br>1: Transmit/receive buffer k is full.<br>(k = 0 to 2) |
| 9 | CF1FLL | |
| 8 | CF0FLL | |
| 7 | RF7FLL | Receive FIFO Buffer Full Status Flag<br>0: Receive FIFO buffer x is not full.<br>1: Receive FIFO buffer x is full.<br>(x = 0 to 7) |
| 6 | RF6FLL | |
| 5 | RF5FLL | |
| 4 | RF4FLL | |
| 3 | RF3FLL | |
| 2 | RF2FLL | |
| 1 | RF1FLL | |
| 0 | RF0FLL | |

The RSCAN1FFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

### CFkFLL Flag (k = 0 to 2)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCAN1CFSTSk register is set to 1 (the transmit/receive FIFO buffer is full). When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

### RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCAN1RFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

## 21.16.40 RSCAN1FMSTS — FIFO Message Lost Status Register

**Access:** RSCAN1FMSTS register is a read-only register that can be read in 32-bit units.
RSCAN1FMSTSL register is a read-only register that can be read in 16-bit units.
RSCAN1FMSTSLL, RSCAN1FMSTSLH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1FMSTS: <RSCAN1_base> + $0240_H$

RSCAN1FMSTSL: <RSCAN1_base> + $0240_H$

RSCAN1FMSTSLL: <RSCAN1_base> + $0240_H$,
RSCAN1FMSTSLH: <RSCAN1_base> + $0241_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.256 RSCAN1FMSTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is returned. |
| 10 | CF2MLT | Transmit/Receive FIFO Buffer Message Lost Status Flag<br>0: No transmit/receive FIFO buffer k message is lost.<br>1: A transmit/receive FIFO buffer k message is lost.<br>(k = 0 to 2) |
| 9 | CF1MLT | |
| 8 | CF0MLT | |
| 7 | RF7MLT | Receive FIFO Buffer Message Lost Status Flag<br>0: No receive FIFO buffer x message is lost.<br>1: A receive FIFO buffer x message is lost.<br>(x = 0 to 7) |
| 6 | RF6MLT | |
| 5 | RF5MLT | |
| 4 | RF4MLT | |
| 3 | RF3MLT | |
| 2 | RF2MLT | |
| 1 | RF1MLT | |
| 0 | RF0MLT | |

The RSCAN1FMSTS register is cleared to $0000\ 0000_H$ in global reset mode.

### CFkMLT Flag (k = 0 to 2)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCAN1CFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

### RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCAN1RFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

## 21.16.41 RSCAN1RFISTS — Receive FIFO Buffer Interrupt Flag Status Register

**Access:** RSCAN1RFISTS register is a read-only register that can be read in 32-bit units.
RSCAN1RFISTSL register is a read-only register that can be read in 16-bit units.
RSCAN1RFISTSLL register is a read-only register that can be read in 8-bit units.

**Address:** RSCAN1RFISTS: <RSCAN1_base> + $0244_H$

RSCAN1RFISTSL: <RSCAN1_base> + $0244_H$

RSCAN1RFISTSLL: <RSCAN1_base> + $0244_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | RF7IF | RF6IF | RF5IF | RF4IF | RF3IF | RF2IF | RF1IF | RF0IF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.257 RSCAN1RFISTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned. |
| 7 | RF7IF | Receive FIFO Buffer Interrupt Request Status Flag<br>0: No receive FIFO buffer x interrupt request is present.<br>1: A receive FIFO buffer x interrupt request is present.<br>(x = 0 to 7) |
| 6 | RF6IF | |
| 5 | RF5IF | |
| 4 | RF4IF | |
| 3 | RF3IF | |
| 2 | RF2IF | |
| 1 | RF1IF | |
| 0 | RF0IF | |

The RSCAN1RFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

### RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCAN1RFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

## 21.16.42 RSCAN1CFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

**Access:** RSCAN1CFRISTS register is a read-only register that can be read in 32-bit units.
RSCAN1CFRISTSL register is a read-only register that can be read in 16-bit units.
RSCAN1CFRISTSLL register is a read-only register that can be read in 8-bit units.

**Address:** RSCAN1CFRISTS: <RSCAN1_base> + $0248_H$

RSCAN1CFRISTSL: <RSCAN1_base> + $0248_H$

RSCAN1CFRISTSLL: <RSCAN1_base> + $0248_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | CF2RXIF | CF1RXIF | CF0RXIF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.258 RSCAN1CFRISTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | CF2RXIF | Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag<br>0: No transmit/receive FIFO buffer k receive interrupt request is present.<br>1: A transmit/receive FIFO buffer k receive interrupt request is present.<br>(k = 0 to 2) |
| 1 | CF1RXIF | |
| 0 | CF0RXIF | |

The RSCAN1CFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

### CFkRXIF Flag (k = 0 to 2)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCAN1CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

## 21.16.43 RSCAN1CFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

**Access:** RSCAN1CFTISTS register is a read-only register that can be read in 32-bit units.
RSCAN1CFTISTSL register is a read-only register that can be read in 16-bit units.
RSCAN1CFTISTSLL register is a read-only register that can be read in 8-bit units.

**Address:** RSCAN1CFTISTS: <RSCAN1_base> + $024C_H$

RSCAN1CFTISTSL: <RSCAN1_base> + $024C_H$

RSCAN1CFTISTSLL: <RSCAN1_base> + $024C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | CF2TXIF | CF1TXIF | CF0TXIF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.259 RSCAN1CFTISTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | CF2TXIF | Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag<br>0: No transmit/receive FIFO buffer k transmit interrupt request is present.<br>1: A transmit/receive FIFO buffer k transmit interrupt request is present.<br>(k = 0 to 2) |
| 1 | CF1TXIF | |
| 0 | CF0TXIF | |

The RSCAN1CFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

### CFkTXIF Flag (k = 0 to 2)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCAN1CFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

## 21.16.44 RSCAN1TMCp — Transmit Buffer Control Register (p = 0 to i × 16 + 15)

**Access:** RSCAN1TMCp register can be read or written in 8-bit units.

**Address:** RSCAN1TMCp: <RSCAN1_base> + $0250_H$ + ($01_H$ × p)

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TMOM | TMTAR | TMTR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W*1 | R/W*1 |

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.260 RSCAN1TMCp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 | TMOM | One-Shot Transmission Enable<br>0: One-shot transmission is disabled.<br>1: One-shot transmission is enabled. |
| 1 | TMTAR | Transmit Abort Request<br>0: Transmit abort is not requested.<br>1: Transmit abort is requested. |
| 0 | TMTR | Transmit Request<br>0: Transmission is not requested.<br>1: Transmission is requested. |

When the RSCAN1TMCp register meets any of the following conditions, set it to $00_H$.

- The RSCAN1TMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCAN1CFCCk register (p = i × 16 + the value of CFTML[3:0] bits).
- The RSCAN1TMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCAN1TXQCCm (m = 6) register. (p = (i × 16 + 15) to (i × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCAN1TMCp register are all cleared to 0 in channel reset mode. Modify the RSCAN1TMCp register in channel communication mode or channel halt mode.

### TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCAN1TMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

### TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

### TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCAN1TMSTSp register is $00_B$.

## 21.16.45 RSCAN1TMSTSp — Transmit Buffer Status Register (p = 0 to 15)

**Access:** RSCAN1TMSTSp register can be read or written in 8-bit units.

**Address:** RSCAN1TMSTSp: <RSCAN1_base> + $02D0_H$ + ($01_H$ × p)

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | TMTARM | TMTRM | TMTRF[1:0] | | TMTSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R |

**Table 21.261 RSCAN1TMSTSp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | TMTARM | Transmit Buffer Transmit Abort Request Status Flag<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |
| 3 | TMTRM | Transmit Buffer Transmit Request Status Flag<br>0: No transmit request is present.<br>1: A transmit request is present. |
| 2, 1 | TMTRF[1:0] | Transmit Buffer Transmit Result Status Flag<br>b2 b1<br>0 0: Transmission is in progress or no transmit request is present.<br>0 1: Transmit abort has been completed.<br>1 0: Transmission has been completed (without transmit abort request).<br>1 1: Transmission has been completed (with transmit abort request). |
| 0 | TMTSTS | Transmit Buffer Transmit Status Flag<br>0: Transmission is not in progress.<br>1: Transmission is in progress. |

The RSCAN1TMSTSp register is cleared to all 0 in channel reset mode.

### TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCAN1TMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCAN1TMCp register is set to 0.

### TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCAN1TMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCAN1TMCp register is set to 0.

### TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

$00_B$: Transmission is in progress or no transmit request is present.

$01_B$: Transmission from the transmit buffer was aborted.

$10_B$: Transmission has been completed with the TMTAR bit in the RSCAN1TMCp register set to 0 (transmit abort is not requested).

$11_B$: Transmission has been completed with the TMTAR bit in the RSCAN1TMCp register set to 1 (transmit abort is requested).

Write $00_B$ to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than $00_B$ to this flag.

#### TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

## 21.16.46 RSCAN1TMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0)

**Access:** RSCAN1TMTRSTSy register is a read-only register that can be read in 32-bit units.
RSCAN1TMTRSTSyL register is a read-only register that can be read in 16-bit units.
RSCAN1TMTRSTSyLL, RSCAN1TMTRSTSyLH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1TMTRSTSy: <RSCAN1_base> + $0350_H$ + ($04_H$ × y)

RSCAN1TMTRSTSyL: <RSCAN1_base> + $0350_H$ + ($04_H$ × y)

RSCAN1TMTRSTSyLL: <RSCAN1_base> + $0350_H$ + ($04_H$ × y),
RSCAN1TMTRSTSyLH: <RSCAN1_base> + $0351_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.262 RSCAN1TMTRSTSy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 0 | TMTRSTSp | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit request is present.<br>1: A transmit request is present. |

### TMTRSTSp Flags (p = 0 to 15)

These flags indicate the status of the TMTR bit in the RSCAN1TMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

**Table 21.263** shows the bit assignment.

**Table 21.263 TMTRSTSp Bit Assignment**

| Bit | Unit Channel Number | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| .<br>. | .<br>. | .<br>. |
| 15 | 0 | 15 |

## 21.16.47 RSCAN1TMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0)

**Access:** RSCAN1TMTARSTSy register is a read-only register that can be read in 32-bit units.
RSCAN1TMTARSTSyL register is a read-only register that can be read in 16-bit units.
RSCAN1TMTARSTSyLL, RSCAN1TMTARSTSyLH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1TMTARSTSy: <RSCAN1_base> + $0360_H$ + ($04_H$ × y)

RSCAN1TMTARSTSyL: <RSCAN1_base> + $0360_H$ + ($04_H$ × y)

RSCAN1TMTARSTSyLL: <RSCAN1_base> + $0360_H$ + ($04_H$ × y),
RSCAN1TMTARSTSyLH: <RSCAN1_base> + $0361_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTARSTSp (p = y × 32 + 15 to y × 32 + 0 (y = 0)) | | | | | | | | | | | | | | | |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.264 RSCAN1TMTARSTSy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 0 | TMTARSTSp | Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |

### TMTARSTSp Flags (p = 0 to 15)

These flags indicate the status of the TMTAR bit in the RSCAN1TMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

**Table 21.265** shows the bit assignment.

**Table 21.265 TMTARSTSp Bit Assignment**

| Bit | Unit Channel Number | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| .<br>. | .<br>. | .<br>. |
| 15 | 0 | 15 |

## 21.16.48 RSCAN1TMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0)

**Access:** RSCAN1TMTCSTSy register is a read-only register that can be read in 32-bit units.
RSCAN1TMTCSTSyL register is a read-only register that can be read in 16-bit units.
RSCAN1TMTCSTSyLL, RSCAN1TMTCSTSyLH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1TMTCSTSy: <RSCAN1_base> + $0370_H$ + ($04_H$ × y)

RSCAN1TMTCSTSyL: <RSCAN1_base> + $0370_H$ + ($04_H$ × y)

RSCAN1TMTCSTSyLL: <RSCAN1_base> + $0370_H$ + ($04_H$ × y),
RSCAN1TMTCSTSyLH: <RSCAN1_base> + $0371_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 21.266 RSCAN1TMTCSTSy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 0 | TMTCSTSp | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmission has not been completed.<br>1: Transmission has been completed. |

### TMTCSTSp Flags (p = 0 to 15)

When the TMTRF[1:0] flag in the RSCAN1TMSTSp register is set to $10_B$ (transmission has been completed (without transmit abort request)) or $11_B$ (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1.

A TMTCSTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to $00_B$ or in channel reset mode.

**Table 21.267** shows the bit assignment.

**Table 21.267 TMTCSTSp Bit Assignment**

| Bit | Unit Channel Number | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| .<br>. | .<br>. | .<br>. |
| 15 | 0 | 15 |

## 21.16.49 RSCAN1TMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0)

**Access:** RSCAN1TMTASTSy register is a read-only register that can be read in 32-bit units.
RSCAN1TMTASTSyL register is a read-only register that can be read in 16-bit units.
RSCAN1TMTASTSyLL, RSCAN1TMTASTSyLH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1TMTASTSy: <RSCAN1_base> + $0380_H$ + ($04_H$ × y)

RSCAN1TMTASTSyL: <RSCAN1_base> + $0380_H$ + ($04_H$ × y)

RSCAN1TMTASTSyLL: <RSCAN1_base> + $0380_H$ + ($04_H$ × y),
RSCAN1TMTASTSyLH: <RSCAN1_base> + $0381_H$ + ($04_H$ × y)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.268 RSCAN1TMTASTSy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 0 | TMTASTSp | Transmit Buffer Transmit Abort Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmission is not aborted.<br>1: Transmission is aborted. |

### TMTASTSp Flags (p = 0 to 15)

When the TMTRF[1:0] flag in the RSCAN1TMSTSp register is set to $01_B$ (transmit abort has been completed), the corresponding TMTASTSp flag is set to 1.

A TMTASTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to $00_B$ or in channel reset mode.

**Table 21.269** shows the bit assignment.

**Table 21.269 TMTASTSp Bit Assignment**

| Bit | Unit Channel Number | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| .<br>. | .<br>. | .<br>. |
| 15 | 0 | 15 |

## 21.16.50 RSCAN1TMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0)

**Access:** RSCAN1TMIECy register can be read or written in 32-bit units.
RSCAN1TMIECyL register can be read or written in 16-bit units.
RSCAN1TMIECyLL, RSCAN1TMIECyLH registers can be read or written in 8-bit units.

**Address:** RSCAN1TMIECy: <RSCAN1_base> + $0390_H$ + ($04_H$ × y)

RSCAN1TMIECyL: <RSCAN1_base> + $0390_H$ + ($04_H$ × y)

RSCAN1TMIECyLL: <RSCAN1_base> + $0390_H$ + ($04_H$ × y),
RSCAN1TMIECyLH: <RSCAN1_base> + $0391_H$ + ($04_H$ × y)

**Value after reset:** 0000 $0000_H$

**Table 21.270 RSCAN1TMIECy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 to 0 | TMIEp | Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmit buffer interrupt is disabled.<br>1: Transmit buffer interrupt is enabled. |

### TMIEp Bits (p = 0 to 15)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCAN1TMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

**Table 21.271** shows the bit assignment.

**Table 21.271 TMIEp Bit Assignment**

| Bit | Unit Channel Number | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| .<br>. | .<br>. | .<br>. |
| 15 | 0 | 15 |

## 21.16.51 RSCAN1TMIDp — Transmit Buffer ID Register (p = 0 to 15)

**Access:** RSCAN1TMIDp register can be read or written in 32-bit units.
RSCAN1TMIDpL, RSCAN1TMIDpH registers can be read or written in 16-bit units.
RSCAN1TMIDpLL, RSCAN1TMIDpLH, RSCAN1TMIDpHL, RSCAN1TMIDpHH registers can be read or written in 8-bit units.

**Address:** RSCAN1TMIDp: <RSCAN1_base> + $1000_H$ + ($10_H$ × p)

RSCAN1TMIDpL: <RSCAN1_base> + $1000_H$ + ($10_H$ × p),
RSCAN1TMIDpH: <RSCAN1_base> + $1002_H$ + ($10_H$ × p)

RSCAN1TMIDpLL: <RSCAN1_base> + $1000_H$ + ($10_H$ × p),
RSCAN1TMIDpLH: <RSCAN1_base> + $1001_H$ + ($10_H$ × p),
RSCAN1TMIDpHL: <RSCAN1_base> + $1002_H$ + ($10_H$ × p),
RSCAN1TMIDpHH: <RSCAN1_base> + $1003_H$ + ($10_H$ × p)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.272 RSCAN1TMIDp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | TMIDE | Transmit Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | TMRTR | Transmit Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | THLEN | Transmit History Data Store Enable<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |
| 28 to 0 | TMID[28:0] | Transmit Buffer ID Data<br>Set standard ID or extended ID.<br>For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. |

Modify this register when the TMTRM bit in the corresponding RSCAN1TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = i × 16 + 15) for the corresponding channel.

### TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

### TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

#### THLEN Bit

With this bit set to 1, the transmit history data of the message transmitted (label information and the number and type) are stored in the transmit history buffer after transmission is completed.

#### TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

## 21.16.52 RSCAN1TMPTRp — Transmit Buffer Pointer Register (p = 0 to 15)

**Access:** RSCAN1TMPTRp register can be read or written in 32-bit units.
RSCAN1TMPTRpH register can be read or written in 16-bit units.
RSCAN1TMPTRpHL, RSCAN1TMPTRpHH registers can be read or written in 8-bit units.

**Address:** RSCAN1TMPTRp: <RSCAN1_base> + $1004_H$ + ($10_H$ × p)

RSCAN1TMPTRpH: <RSCAN1_base> + $1006_H$ + ($10_H$ × p)

RSCAN1TMPTRpHL: <RSCAN1_base> + $1006_H$ + ($10_H$ × p),
RSCAN1TMPTRpHH: <RSCAN1_base> + $1007_H$ + ($10_H$ × p)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.273 RSCAN1TMPTRp Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | TMDLC[3:0] | Transmit Buffer DLC Data<br>b31 b30 b29 b28<br>0 0 0 0: 0 data bytes<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 24 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 to 16 | TMPTR[7:0] | Transmit Buffer Label Data<br>Set the label information to be stored in the transmit history buffer. |
| 15 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Modify this register when the TMTRM bit in the corresponding RSCAN1TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = i × 16 + 15) for the corresponding channel.

### TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCAN1TMIDp register is set to 0 (data frame). If the data length is set to 9 bytes or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

**TMPTR[7:0] Bits**

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

## 21.16.53 RSCAN1TMDF0p — Transmit Buffer Data Field 0 Register (p = 0 to 15)

**Access:** RSCAN1TMDF0p register can be read or written in 32-bit units.
RSCAN1TMDF0pL, RSCAN1TMDF0pH registers can be read or written in 16-bit units.
RSCAN1TMDF0pLL, RSCAN1TMDF0pLH, RSCAN1TMDF0pHL, RSCAN1TMDF0pHH registers can be read or written in 8-bit units.

**Address:** RSCAN1TMDF0p: <RSCAN1_base> + $1008_H$ + ($10_H$ × p)

RSCAN1TMDF0pL: <RSCAN1_base> + $1008_H$ + ($10_H$ × p),
RSCAN1TMDF0pH: <RSCAN1_base> + $100A_H$ + ($10_H$ × p)

RSCAN1TMDF0pLL: <RSCAN1_base> + $1008_H$ + ($10_H$ × p),
RSCAN1TMDF0pLH: <RSCAN1_base> + $1009_H$ + ($10_H$ × p),
RSCAN1TMDF0pHL: <RSCAN1_base> + $100A_H$ + ($10_H$ × p),
RSCAN1TMDF0pHH: <RSCAN1_base> + $100B_H$ + ($10_H$ × p)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 21.274 RSCAN1TMDF0p Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | TMDB3[7:0] | Transmit Buffer Data Byte 3<br>Transmit Buffer Data Byte 2<br>Transmit Buffer Data Byte 1<br>Transmit Buffer Data Byte 0<br>Set the transmit buffer data. |
| 23 to 16 | TMDB2[7:0] | |
| 15 to 8 | TMDB1[7:0] | |
| 7 to 0 | TMDB0[7:0] | |

Modify this register when the TMTRM bit in the corresponding RSCAN1TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = i × 16 + 15) for the corresponding channel.

## 21.16.54 RSCAN1TMDF1p — Transmit Buffer Data Field 1 Register (p = 0 to 15)

**Access:** RSCAN1TMDF1p register can be read or written in 32-bit units.
RSCAN1TMDF1pL, RSCAN1TMDF1pH registers can be read or written in 16-bit units.
RSCAN1TMDF1pLL, RSCAN1TMDF1pLH, RSCAN1TMDF1pHL, RSCAN1TMDF1pHH registers can be read or written in 8-bit units.

**Address:** RSCAN1TMDF1p: <RSCAN1_base> + $100C_H$ + ($10_H$ × p)

RSCAN1TMDF1pL: <RSCAN1_base> + $100C_H$ + ($10_H$ × p),
RSCAN1TMDF1pH: <RSCAN1_base> + $100E_H$ + ($10_H$ × p)

**Table 21.276 RSCAN1TXQCCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | TXQIM | Transmit Queue Interrupt Source Select<br>0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated.<br>1: A transmit queue interrupt request is generated each time a message has been transmitted. |
| 12 | TXQIE | Transmit Queue Interrupt Enable<br>0: Transmit queue interrupt is disabled.<br>1: Transmit queue interrupt is enabled. |
| 11 to 8 | TXQDC[3:0] | Transmit Queue Depth Configuration<br>Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available.<br>Setting these bits to 0 disables the transmit queue.<br>Setting these bits to 1 is prohibited. |
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TXQE | Transmit Queue Enable<br>0: The transmit queue is not used.<br>1: The transmit queue is used. |

### TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

### TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

#### TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (i × 16 + 15) to (i × 16 + 0). For examples of how buffer allocation is done, see **Figure 21.47**. Modify these bits only in channel reset mode.

#### TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to $0010_B$ or more.

## 21.16.56 RSCAN1TXQSTSm — Transmit Queue Status Register (m = 6)

**Access:** RSCAN1TXQSTSm register can be read or written in 32-bit units.
RSCAN1TXQSTSmL register can be read or written in 16-bit units.
RSCAN1TXQSTSmLL register can be read or written in 8-bit units.

**Address:** RSCAN1TXQSTSm: <RSCAN1_base> + $03C0_H$ + ($04_H$ × i)

RSCAN1TXQSTSmL: <RSCAN1_base> + $03C0_H$ + ($04_H$ × i)

RSCAN1TXQSTSmLL: <RSCAN1_base> + $03C0_H$ + ($04_H$ × i)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | TXQIF | TXQFLL | TXQEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.277 RSCAN1TXQSTSm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | Reserved | When read, the undefined value is returned. When writing, write “0”. |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | TXQIF | Transmit Queue Interrupt Request Flag<br>0: No transmit queue interrupt request is present.<br>1: A transmit queue interrupt request is present. |
| 1 | TXQFLL | Transmit Queue Full Status Flag<br>0: The transmit queue is not full.<br>1: The transmit queue is full. |
| 0 | TXQEMP | Transmit Queue Empty Status Flag<br>0: The transmit queue contains messages.<br>1: The transmit queue contains no message (transmit queue empty). |

### TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCAN1TXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCAN1TXQCCm register to 0 (the transmit queue is not used).

### TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCAN1TXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

#### TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

## 21.16.57 RSCAN1TXQPCTRm — Transmit Queue Pointer Control Register (m = 6)

**Access:** RSCAN1TXQPCTRm register is a write-only register that can be written in 32-bit units.
RSCAN1TXQPCTRmL register is a write-only register that can be written in 16-bit units.
RSCAN1TXQPCTRmLL register is a write-only register that can be written in 8-bit units.

**Address:** RSCAN1TXQPCTRm: <RSCAN1_base> + $03E0_H$ + ($04_H$ × i)

RSCAN1TXQPCTRmL: <RSCAN1_base> + $03E0_H$ + ($04_H$ × i)

RSCAN1TXQPCTRmLL: <RSCAN1_base> + $03E0_H$ + ($04_H$ × i)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TXQPC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.278 RSCAN1TXQPCTRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | TXQPC[7:0] | Transmit Queue Pointer Control<br>Writing $FF_H$ to these bits moves the write pointer of the transmit queue to the next queue buffer. |

### TXQPC[7:0] Bits

Writing $FF_H$ to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCAN1TMIDp, RSCAN1TMPTRp, RSCAN1TMDF0p, and RSCAN1TMDF1p registers (p = 15, 31, 47, 63, 79, and 95) before writing $FF_H$ to the TXQPC[7:0] bits.

When writing $FF_H$ to these bits, make sure that the TXQE bit in the RSCAN1TXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCAN1TXQSTSm register is 0 (the transmit queue is not full).

## 21.16.58 RSCAN1THLCCm — Transmit History Configuration and Control Register (m = 6)

**Access:** RSCAN1THLCCm register can be read or written in 32-bit units.
RSCAN1THLCCmL register can be read or written in 16-bit units.
RSCAN1THLCCmLL, RSCAN1THLCCmLH registers can be read or written in 8-bit units.

**Address:** RSCAN1THLCCm: <RSCAN1_base> + $0400_H$ + ($04_H$ × i)

RSCAN1THLCCmL: <RSCAN1_base> + $0400_H$ + ($04_H$ × i)

RSCAN1THLCCmLL: <RSCAN1_base> + $0400_H$ + ($04_H$ × i),
RSCAN1THLCCmLH: <RSCAN1_base> + $0401_H$ + ($04_H$ × i)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | THLDTE | THLIM | THLIE | — | — | — | — | — | — | — | THLE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R | R | R | R | R | R | R | R/W |

**Table 21.279 RSCAN1THLCCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | THLDTE | Transmit History Target Buffer Select<br>0: Entry from transmit/receive FIFO buffers and transmit queue<br>1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue |
| 9 | THLIM | Transmit History Interrupt Source Select<br>0: When 12 sets of data have been stored in the transmit history buffer<br>1: When a single set of transmit history data has been stored |
| 8 | THLIE | Transmit History Interrupt Enable<br>0: Transmit history interrupt is disabled.<br>1: Transmit history interrupt is enabled. |
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | THLE | Transmit History Buffer Enable<br>0: Transmit history buffer is not used.<br>1: Transmit history buffer is used. |

### THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

#### THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

#### THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

#### THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

## 21.16.59 RSCAN1THLSTSm — Transmit History Status Register (m = 6)

**Access:** RSCAN1THLSTSm register can be read or written in 32-bit units.
RSCAN1THLSTSmL register can be read or written in 16-bit units.
RSCAN1THLSTSmLL register can be read or written in 8-bit units.
RSCAN1THLSTSmLH register is a read-only register that can be read in 8-bit units.

**Address:** RSCAN1THLSTSm: <RSCAN1_base> + $0420_H$ + ($04_H$ × i)

RSCAN1THLSTSmL: <RSCAN1_base> + $0420_H$ + ($04_H$ × i)

RSCAN1THLSTSmLL: <RSCAN1_base> + $0420_H$ + ($04_H$ × i),
RSCAN1THLSTSmLH: <RSCAN1_base> + $0421_H$ + ($04_H$ × i)

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | THLMC[4:0] | | | | | — | — | — | — | THLIF | THLELT | THLFLL | THLEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.280 RSCAN1THLSTSm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | THLMC[4:0] | Transmit History Buffer Unread Data Counter<br>These bits indicate the number of unread data sets stored in the transmit history buffer. |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | THLIF | Transmit History Interrupt Request Flag<br>0: No transmit history interrupt request is present.<br>1: A transmit history interrupt request is present. |
| 2 | THLELT | Transmit History Buffer Overflow Flag<br>0: Transmit history buffer overflow has not occurred.<br>1: Transmit history buffer overflow has occurred. |
| 1 | THLFLL | Transmit history Buffer Full Status Flag<br>0: Transmit history buffer is not full.<br>1: Transmit history buffer is full. |
| 0 | THLEMP | Transmit History Buffer Empty Status Flag<br>0: Transmit history buffer contains unread data.<br>1: Transmit history buffer contains no unread data (buffer empty). |

### THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

### THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCAN1THLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCAN1THLCCm register is set to 0 (transmit history buffer is not used).

### THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCAN1THLCCm register is set to 0 (transmit history buffer is not used).

**NOTE**

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

## 21.16.60 RSCAN1THLACCm — Transmit History Access Register (m = 6)

**Access:** RSCAN1THLACCm register is a read-only register that can be read in 32-bit units.
RSCAN1THLACCmL register is a read-only register that can be read in 16-bit units.
RSCAN1THLACCmLL, RSCAN1THLACCmLH registers are read-only registers that can be read in 8-bit units.

**Address:** RSCAN1THLACCm: <RSCAN1_base> + $1800_H$ + ($04_H$ × i)

RSCAN1THLACCmL: <RSCAN1_base> + $1800_H$ + ($04_H$ × i)

RSCAN1THLACCmLL: <RSCAN1_base> + $1800_H$ + ($04_H$ × i),
RSCAN1THLACCmLH: <RSCAN1_base> + $1801_H$ + ($04_H$ × i)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.281 RSCAN1THLACCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 8 | TID[7:0] | Label Data<br>The label information of stored data can be read. |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 3 | BN[3:0] | Buffer Number Data<br>The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read. |
| 2 to 0 | BT[2:0] | Buffer Type Data<br>b2 b1 b0<br>0 0 1: Transmit buffer<br>0 1 0: Transmit/receive FIFO buffer<br>1 0 0: Transmit queue |

### TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

### BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

### BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

## 21.16.61 RSCAN1THLPCTRm — Transmit History Pointer Control Register (m = 6)

**Access:** RSCAN1THLPCTRm register is a write-only register that can be written in 32-bit units.
RSCAN1THLPCTRmL register is a write-only register that can be written in 16-bit units.
RSCAN1THLPCTRmLL register is a write-only register that can be written in 8-bit units.

**Address:** RSCAN1THLPCTRm: <RSCAN1_base> + $0440_H$ + ($04_H$ × i)

RSCAN1THLPCTRmL: <RSCAN1_base> + $0440_H$ + ($04_H$ × i)

RSCAN1THLPCTRmLL: <RSCAN1_base> + $0440_H$ + ($04_H$ × i)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | THLPC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 21.282 RSCAN1THLPCTRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | THLPC[7:0] | Transmit History List Pointer Control<br>Writing $FF_H$ to these bits moves the read pointer to the next unread data in the transmit history buffer. |

### THLPC[7:0] Bits

When the THLPC[7:0] bits are set to $FF_H$, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCAN1THLSTSm register is decremented. Write $FF_H$ to the THLPC[7:0] bits after reading from the RSCAN1THLACCm register.

When writing $FF_H$ to these bits, make sure that the THLE bit in the RSCAN1THLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCAN1THLSTSm register is 0.

## 21.16.62 RSCAN1GTSTCFG — Global Test Configuration Register

**Access:** RSCAN1GTSTCFG register can be read or written in 32-bit units.
RSCAN1GTSTCFGH register can be read or written in 16-bit units.
RSCAN1GTSTCFGHL register can be read or written in 8-bit units.

**Address:** RSCAN1GTSTCFG: <RSCAN1_base> + $0468_H$

RSCAN1GTSTCFGH: <RSCAN1_base> + $046A_H$

RSCAN1GTSTCFGHL: <RSCAN1_base> + $046A_H$

**Value after reset:** $0000\ 0000_H$

**Table 21.283 RSCAN1GTSTCFG Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | RTMPS[6:0] | RAM Test Page Configuration<br>Set a value within a range of page 0 ($00_H$) to page 56 ($38_H$). |
| 15 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Modify the RSCAN1GTSTCFG register only in global test mode.

### RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of $00_H$ to $38_H$, inclusive.

## 21.16.63 RSCAN1GTSTCTR — Global Test Control Register

**Access:** RSCAN1GTSTCTR register can be read or written in 32-bit units.
RSCAN1GTSTCTRL register can be read or written in 16-bit units.
RSCAN1GTSTCTRLL register can be read or written in 8-bit units.

**Address:** RSCAN1GTSTCTR: <RSCAN1_base> + $046C_H$

RSCAN1GTSTCTRL: <RSCAN1_base> + $046C_H$

RSCAN1GTSTCTRLL: <RSCAN1_base> + $046C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.284 RSCAN1GTSTCTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | RTME | RAM Test Enable<br>0: RAM test is disabled.<br>1: RAM test is enabled. |
| 1, 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

1. Set the GMDC[1:0] bits in the RSCAN1GCTR register to $10_B$ (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

## 21.16.64 RSCAN1GLOCKK — Global Lock Key Register

**Access:** RSCAN1GLOCKK register is a write-only register that can be written in 32-bit units.
RSCAN1GLOCKKL register is a write-only register that can be written in 16-bit units.

**Address:** RSCAN1GLOCKK: <RSCAN1_base> + $047C_H$

RSCAN1GLOCKKL: <RSCAN1_base> + $047C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LOCK[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 |

Note 1. Writing to these bits is effective only when the RS-CAN module is in global test mode.

**Table 21.285 RSCAN1GLOCKK Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When writing, write the value after reset. |
| 15 to 0 | LOCK[15:0] | Lock Key<br>These bits are key bits to release protection of test mode. |

The RSCAN1GLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 21.22.4.2, Procedure for Releasing the Protection**.

### LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCAN1GTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCAN1_base> + $0000_H$ to <RSCAN1_base> + $04FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/wring to other areas does not enable the protection.

## 21.16.65 RSCAN1RPGACCr — RAM Test Page Access Register (r = 0 to 63)

**Access:** RSCAN1RPGACCr register can be read or written in 32-bit units.
RSCAN1RPGACCrL, RSCAN1RPGACCrH registers can be read or written in 16-bit units.
RSCAN1RPGACCrLL, RSCAN1RPGACCrLH, RSCAN1RPGACCrHL, RSCAN1RPGACCrHH registers can be read or written in 8-bit units.

**Address:** RSCAN1RPGACCr: <RSCAN1_base> + $1900_H$ + ($04_H$ × r)

RSCAN1RPGACCrL: <RSCAN1_base> + $1900_H$ + ($04_H$ × r),
RSCAN1RPGACCrH: <RSCAN1_base> + $1902_H$ + ($04_H$ × r)

RSCAN1RPGACCrLL: <RSCAN1_base> + $1900_H$ + ($04_H$ × r),
RSCAN1RPGACCrLH: <RSCAN1_base> + $1901_H$ + ($04_H$ × r),
RSCAN1RPGACCrHL: <RSCAN1_base> + $1902_H$ + ($04_H$ × r),
RSCAN1RPGACCrHH: <RSCAN1_base> + $1903_H$ + ($04_H$ × r)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.286 RSCAN1RPGACCr Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | RDTA [31:0] | RAM Data Test Access<br>Data can be read and written in RSCAN RAM. |

Modify the RSCAN1RPGACCr register in global test mode with the RTME bit in the RSCAN1GTSTCTR register set to 1 (RAM test is enabled).

The RSCAN1RPGACCr register is readable and writable when the RTME bit is set to 1.

## 21.17 Interrupt Sources

The RS-CAN module has 5 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources/unit)
  Receive FIFO interrupt (1 source/unit)
  Global error interrupt (1 source/unit)
- Channel interrupts (3 sources/channel):
  CANm transmit interrupt (m = 6)
  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in receive mode)
  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CAN module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

**Table 21.287** lists the CAN interrupt sources. **Figure 21.40** shows the CAN global interrupt block diagram. **Figure 21.41** shows the CAN channel interrupt block diagram.

**Table 21.287 List of CAN Interrupt Sources**

| Interrupt Source | | | Corresponding Interrupt Request Flag | Corresponding Interrupt Enable Bit |
|---|---|---|---|---|
| Global interrupts | Receive FIFO | Receive FIFO 0 | RFIF in the RSCAN1RFSTS0 register | RFIE in the RSCAN1RFCC0 register |
| | | Receive FIFO 1 | RFIF in the RSCAN1RFSTS1 register | RFIE in the RSCAN1RFCC1 register |
| | | Receive FIFO 2 | RFIF in the RSCAN1RFSTS2 register | RFIE in the RSCAN1RFCC2 register |
| | | Receive FIFO 3 | RFIF in the RSCAN1RFSTS3 register | RFIE in the RSCAN1RFCC3 register |
| | | Receive FIFO 4 | RFIF in the RSCAN1RFSTS4 register | RFIE in the RSCAN1RFCC4 register |
| | | Receive FIFO 5 | RFIF in the RSCAN1RFSTS5 register | RFIE in the RSCAN1RFCC5 register |
| | | Receive FIFO 6 | RFIF in the RSCAN1RFSTS6 register | RFIE in the RSCAN1RFCC6 register |
| | | Receive FIFO 7 | RFIF in the RSCAN1RFSTS7 register | RFIE in the RSCAN1RFCC7 register |
| | Global error | | • DEF in the RSCAN1GERFL register<br>• MES in the RSCAN1GERFL register<br>• THLES in the RSCAN1GERFL register | • DEIE in the RSCAN1GCTR register<br>• MEIE in the RSCAN1GCTR register<br>• THLEIE in the RSCAN1GCTR register |
| Channel interrupts (m = 6) | CANm transmit | CANm transmit complete | TMTRF[1:0] in the RSCAN1TMSTSp register | TMIEp in the RSCAN1TMIECy register |
| | | CANm transmit abort | TMTRF[1:0] in the RSCAN1TMSTSp register | TAIE in the RSCAN1CmCTR register |
| | | CANm transmit/receive FIFO transmit complete | CFTXIF in the RSCAN1CFSTSk register | CFTXIE in the RSCAN1CFCCk register |
| | | CANm transmit queue | TXQIF in the RSCAN1TXQSTSm register | TXQIE in the RSCAN1TXQCCm register |
| | | CANm transmit history | THLIF in the RSCAN1THLSTSm register | THLIE in the RSCAN1THLCCm register |
| | CANm transmit/receive FIFO receive complete | | CFRXIF in the RSCAN1CFSTSk register | CFRXIE in the RSCAN1CFCCk register |
| | CANm error | | • BEF in the RSCAN1CmERFL register<br>• ALF in the RSCAN1CmERFL register<br>• BLF in the RSCAN1CmERFL register<br>• OVLF in the RSCAN1CmERFL register<br>• BORF in the RSCAN1CmERFL register<br>• BOEF in the RSCAN1CmERFL register<br>• EPF in the RSCAN1CmERFL register<br>• EWF in the RSCAN1CmERFL register | • BEIE in the RSCAN1CmCTR register<br>• ALIE in the RSCAN1CmCTR register<br>• BLIE in the RSCAN1CmCTR register<br>• OLIE in the RSCAN1CmCTR register<br>• BORIE in the RSCAN1CmCTR register<br>• BOEIE in the RSCAN1CmCTR register<br>• EPIE in the RSCAN1CmCTR register<br>• EWIE in the RSCAN1CmCTR register |

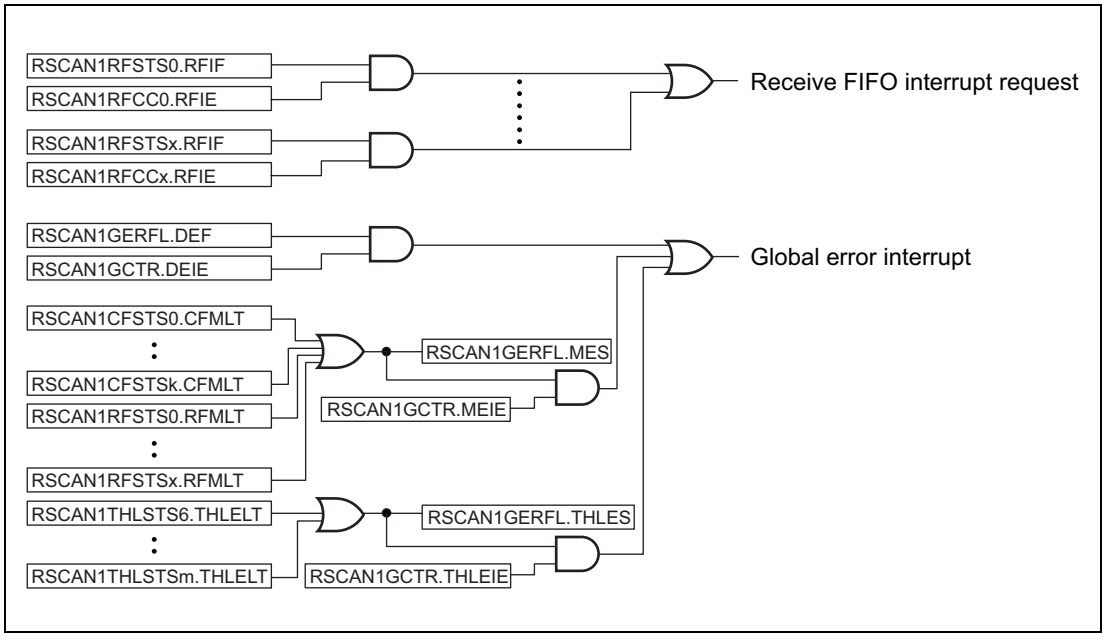

**Figure 21.40 CAN Global Interrupt Block Diagram**

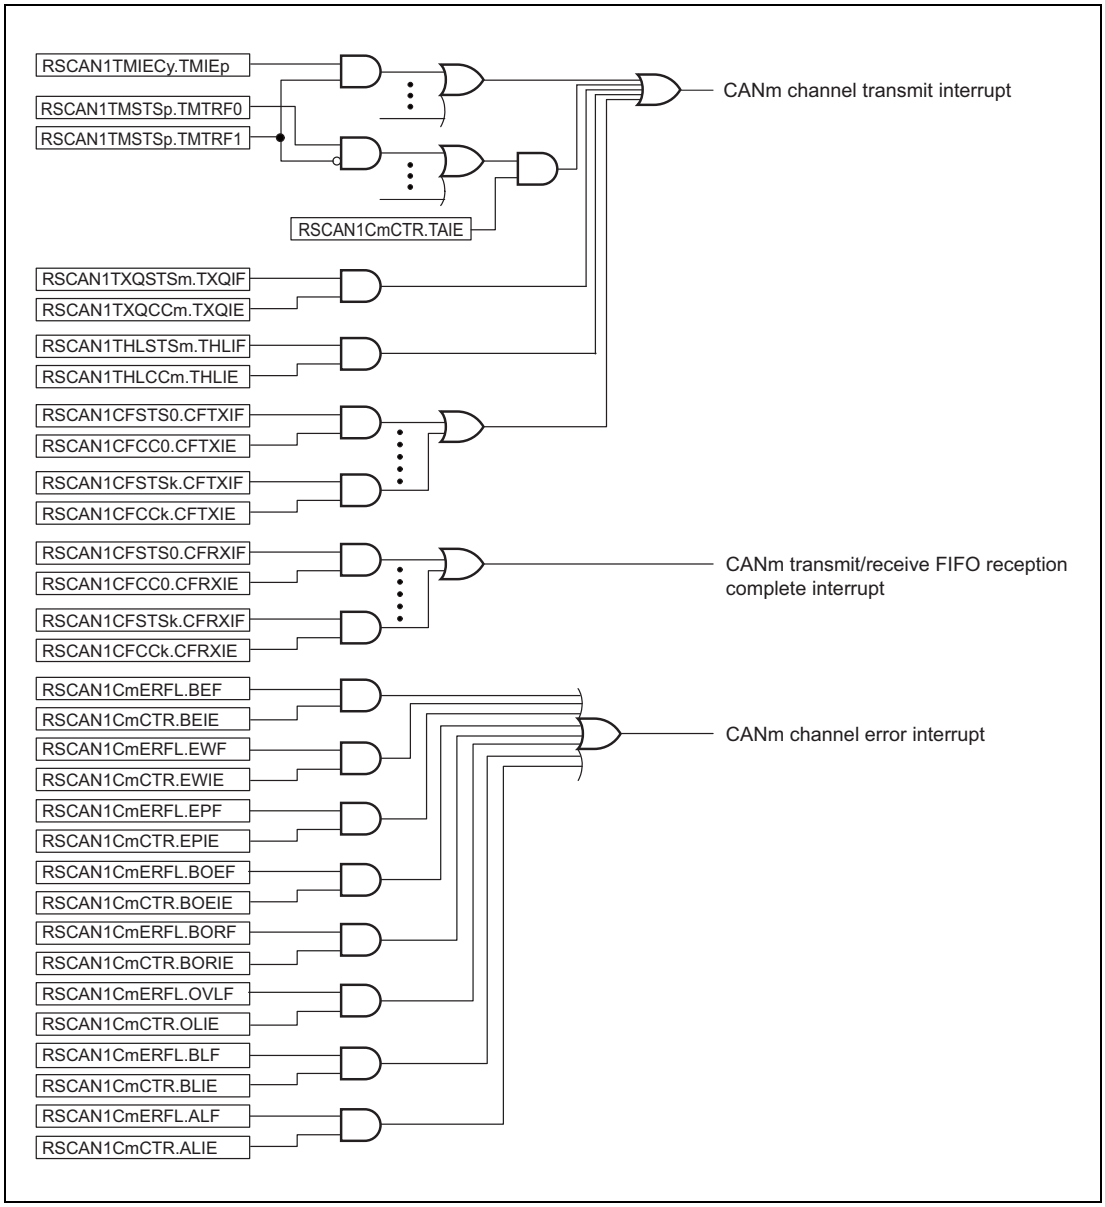

**Figure 21.41 CAN Channel Interrupt Block Diagram**

# 21.18 CAN Modes

The RS-CAN module has four global modes to control the entire RS-CAN module status and four channel modes to control individual channel status. Details of global modes are described in **Section 21.18.1, Global Modes**, and details of channel modes are described in **Section 21.18.2, Channel Modes**.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

## 21.18.1 Global Modes

**Figure 21.42** shows the transitions of global modes.

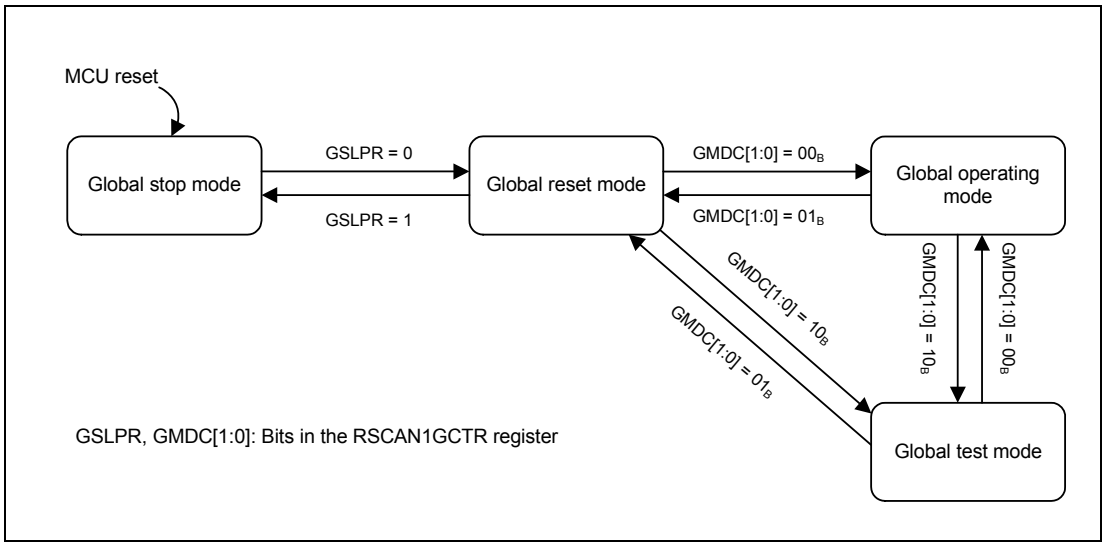

**Figure 21.42 Transitions of Global Modes**

In some cases, global mode transitions also force channel mode transitions. **Table 21.288** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

**Table 21.288 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)**

| Channel Mode before Setting | Channel Mode after Setting | | | |
|---|---|---|---|---|
| | GMDC[1:0] = $00_B$ GSLPR = 0 (Global Operation) | GMDC[1:0] = $10_B$ GSLPR = 0 (Global Test) | GMDC[1:0] = $01_B$ GSLPR = 0 (Global Reset) | GMDC[1:0] = $01_B$ GSLPR = 1 (Global Stop) |
| Channel communication | Channel communication | Channel halt | Channel reset | Transition prohibited |
| Channel halt | Channel halt | Channel halt | Channel reset | Transition prohibited |
| Channel reset | Channel reset | Channel reset | Channel reset | Channel stop |
| Channel stop | Channel stop | Channel stop | Channel stop | Channel stop |

**Note:** GMDC[1:0], GSLPR: Bits in the RSCAN1GCTR register

**Table 21.289** shows the global mode transition time.

**Table 21.289 Global Mode Transition Time**

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|---|---|---|
| Global stop | Global reset | Three pclk cycles |
| Global reset | Global stop | Three pclk cycles |
| Global reset | Global test | Ten pclk cycles |
| Global reset | Global operating | Ten pclk cycles |
| Global test | Global reset | Three pclk cycles |
| Global test | Global operating | Three pclk cycles |
| Global operating | Global reset | Three pclk cycles |
| Global operating | Global test | Two CAN frames*1 |

Note 1. CAN frame time of the lowest communication speed of the channels in use

#### 21.18.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RSCAN1GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each of the RSCAN1CmCTR register to 1 (channel stop mode). If all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

#### 21.18.1.2 Global Reset Mode

In global reset mode, RS-CAN module settings are performed. When the RS-CAN module transitions to global reset mode, some registers are initialized. **Table 21.292** and **Table 21.293** list the registers to be initialized.

Setting the GMDC[1:0] bits in the RSCAN1GCTR register to $01_B$ sets the CHMDC[1:0] bits in each of the RSCAN1CmCTR registers (m = 6) to $01_B$ (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to $01_B$).

#### 21.18.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCAN1GCTR register to $10_B$ sets the CHMDC[1:0] bits in each of the RSCAN1CmCTR register to $10_B$ (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

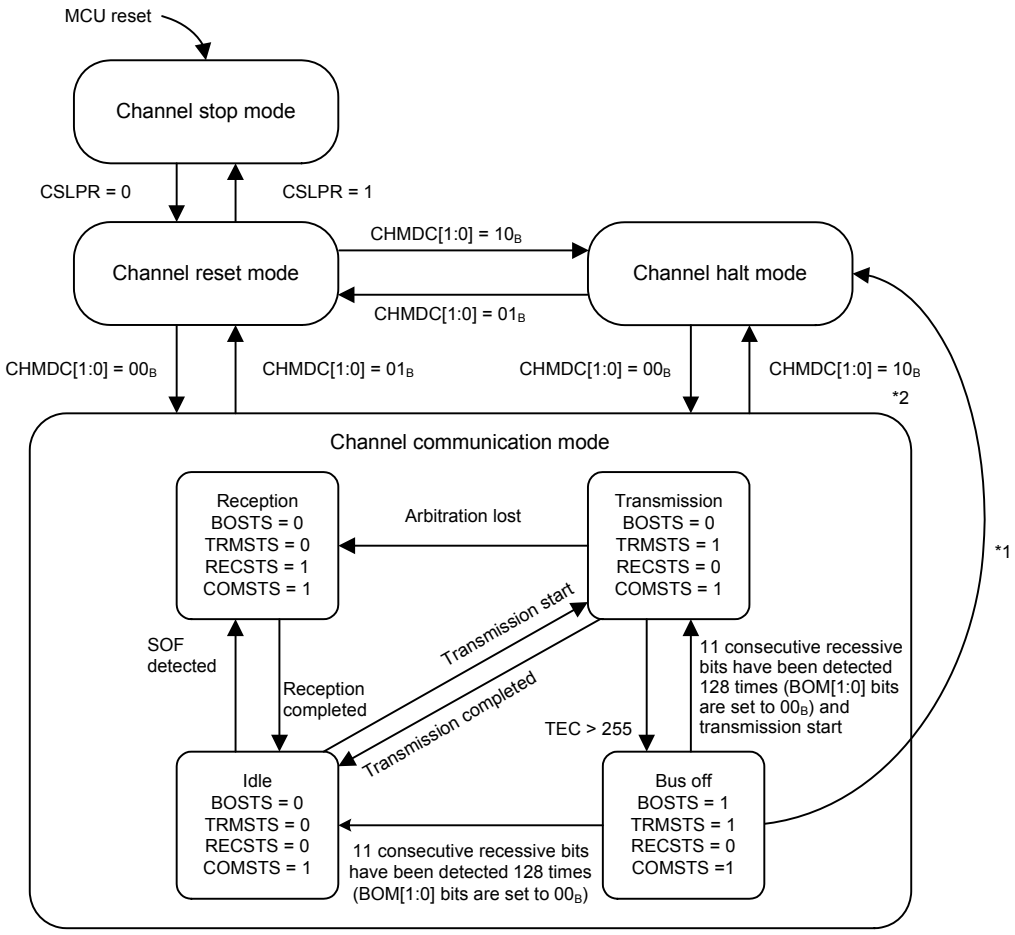
#### 21.18.1.4 Global Operating Mode

The RS-CAN module operates in global operating mode.

When the GMDC[1:0] bits in the RSCAN1GCTR register are set to $00_B$, the RS-CAN module transitions to global operating mode.

## 21.18.2 Channel Modes

**Figure 21.43** shows a channel mode state transition chart. **Table 21.290** shows the channel mode transition time.



**Note:** CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCAN1CmCTR register (m = 6)
BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCAN1CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = $01_B$: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = $10_B$: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = $11_B$: Transition to channel halt mode when the CHMDC[1:0] bits are set to $10_B$

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

**Figure 21.43 Channel Mode State Transition Chart**

**Table 21.290 Channel Mode Transition Time (1/2)**

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|---|---|---|
| Channel stop | Channel reset | Three pclk cycles |
| Channel reset | Channel stop | Three pclk cycles |
| Channel reset | Channel halt | Three CANm bit times |
| Channel reset | Channel communication | Two CANm bit times |

Table 21.290 Channel Mode Transition Time (2/2)

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|---|---|---|
| Channel halt | Channel reset | Three pclk cycles |
| Channel halt | Channel communication | Three CANm bit times |
| Channel communication | Channel reset | Three pclk cycles |
| Channel communication | Channel halt | Two CANm frames |

### 21.18.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RSCAN1CmCTR register (m = 6) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

### 21.18.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. **Table 21.292** lists the registers to be initialized.

When the CHMDC[1:0] bits in the RSCAN1CmCTR register are set to $01_B$ (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 21.291** shows the operation when the CHMDC[1:0] bits are set to $01_B$ (channel reset mode) during CAN communication.

### 21.18.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

**Table 21.291** shows operation when the CHMDC[1:0] bits are set to $10_B$ (channel halt mode) during CAN communication.

Table 21.291 Operation a Channel Transitions to Channel Reset Mode/Channel Halt Mode

| Mode | During Reception | During Transmission | Bus Off State |
|---|---|---|---|
| Channel reset (CHMDC[1:0] = $01_B$) | Transitions to channel reset mode before reception is completed.*1 | Transitions to channel reset mode before transmission is completed.*1 | Transitions to channel reset mode before bus off recovery. |
| Channel halt*3 (CHMDC[1:0] = $10_B$) | Transitions to channel halt mode after reception is completed.*2 | Transitions to channel halt mode after transmission is completed. | [When BOM[1:0] = $00_B$] Transitions to channel halt mode (CHMDC[1:0] = $10_B$) only after bus off recovery. [When BOM[1:0] = $01_B$] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = $10_B$] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = $11_B$] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to $10_B$ before bus off recovery. |

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to $10_B$ and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to $01_B$.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCAN1CmERFL register that becomes 1 when dominant lock is detected.

Note 3. When the transition from channel reset mode to channel halt mode is to be made, set the RSCAN1CmCFG register in channel reset mode and then shift to channel halt mode.

### 21.18.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCAN1CmCTR register are set to $00_B$, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCAN1CmSTS register (m = 6) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

### 21.18.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/ decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCAN1CmCTR register.

- When BOM[1:0] = $00_B$:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCAN1CmSTS register are initialized to $00_H$, the BORF flag in the RSCAN1CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCAN1CmCTR register are set to $10_B$ (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = $01_B$:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to $10_B$ and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to $00_H$, but the BORF flag is not set to 1. Also, a bus off recovery interrupt request is not generated.
- When BOM[1:0] = $10_B$:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to $10_B$. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to $00_H$, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.

- When BOM[1:0] = $11_B$:
  When the CHMDC[1:0] bits are set to $10_B$ in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to $00_H$, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to $10_B$.

If the RS-CAN module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to $01_B$ or $10_B$ is made only when the CHMDC[1:0] bits are $00_B$ (channel communication mode).

Furthermore, setting the RTBO bit in the RSCAN1CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to $00_H$. Write 1 to the RTBO bit only when the BOM[1:0] value is $00_B$. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

**Table 21.292 Registers Initialized in Global Reset Mode or Channel Reset Mode**

| Register | Bit / Flag |
|---|---|
| RSCAN1CmCTR register | CTMS[1:0], CTME, CHMDC[1:0] |
| RSCAN1CmSTS register | CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, REC[7:0], TEC[7:0] |
| RSCAN1CmERFL register | CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF |
| RSCAN1CFCCk register | When transmit/receive FIFO buffer is in transmit mode: CFE |
| RSCAN1CFSTSk register | When transmit/receive FIFO buffer is in transmit mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF |
| RSCAN1CFTISTS register | CFkTXIF |
| RSCAN1TMCp register | TMOM, TMTAR, TMTR |
| RSCAN1TMSTSp register | TMTARM, TMTRM, TMTRF[1:0], TMTSTS |
| RSCAN1TMTRSTSy register | TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCAN1TMTARSTSy register | TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCAN1TMTCSTSy register | TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCAN1TMTASTSy register | TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCAN1TXQCCm register | TXQE |
| RSCAN1TXQSTSm register | TXQIF, TXQFLL, TXQEMP |
| RSCAN1THLCCm register | THLE |
| RSCAN1THLSTSm register | THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP |
| RSCAN1GTINTSTS0 register | TSIFi, TAIFi, TQIFi, CFTIFi, THIFi (i = 0) |

Table 21.293 Registers Initialized Only in Global Reset Mode

| Register | Bit / Flag |
|---|---|
| RSCAN1GSTS register | GHLTSTS |
| RSCAN1GERFL register | THLES, MES, DEF |
| RSCAN1GTSC register | TS[15:0] |
| RSCAN1RMNDy register | RMNSq |
| RSCAN1RFCCx register | RFE |
| RSCAN1RFSTSx register | RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP |
| RSCAN1CFCCk register | When transmit/receive FIFO buffer is in receive mode: CFE |
| RSCAN1CFSTSk register | When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT |
| RSCAN1FESTS register | CFkEMP, RFxEMP |
| RSCAN1FFSTS register | CFkFLL, RFxFLL |
| RSCAN1FMSTS register | CFkMLT, RFxMLT |
| RSCAN1RFISTS register | RFxIF |
| RSCAN1CFRISTS register | CFkRXIF |
| RSCAN1GTSTCFG register | RTMPS[6:0], C0ICBCE, C1ICBCE, C2ICBCE, C3ICBCE, C4ICBCE, C5ICBCE |
| RSCAN1GTSTCTR register | RTME, ICBCTME |

# 21.19 Reception Function

There are two reception types.

- Reception by receive buffers:
  Zero to 16 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

## 21.19.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module (up to 64 receive rules can be registered in this module that has one channel.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 21.44** illustrates how receive rules are registered.

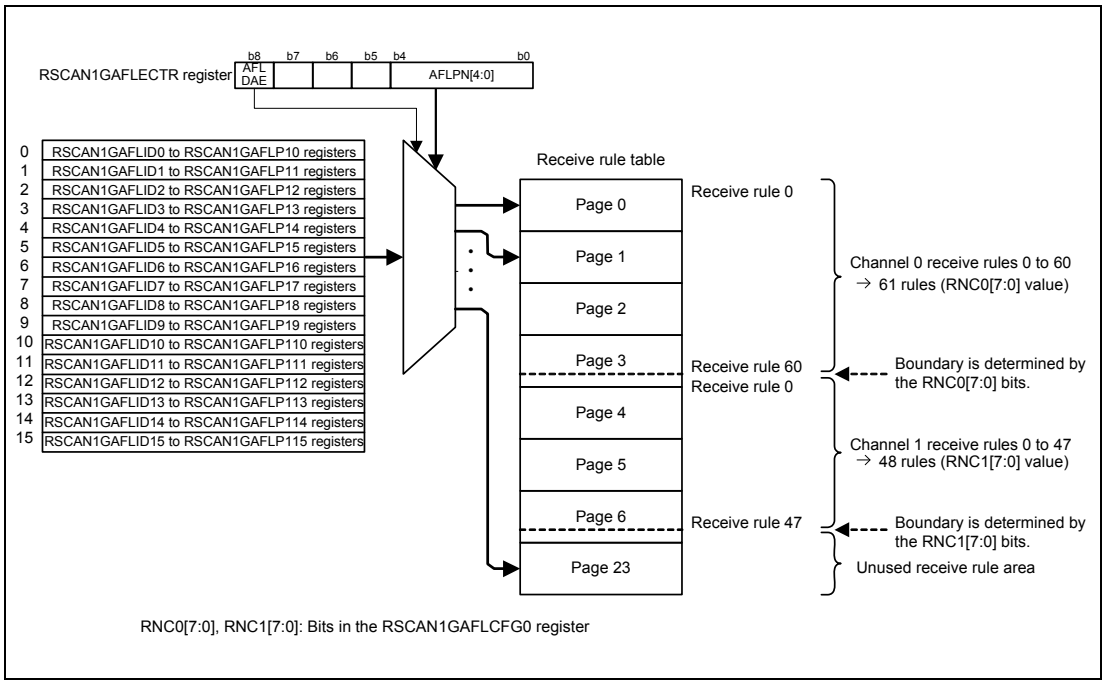


**Figure 21.44 Entry of Receive Rules (for Setting Channel 0 and 1)**

**CAUTION**

Receive rules for each channel must be set in contiguous blocks.
Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCAN1GAFLIDj, RSCAN1GAFLMj, RSCAN1GAFLP0j, and RSCAN1GAFLP1j registers (j = 0 to 15). The RSCAN1GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCAN1GAFLMj register is used to set mask, the RSCAN1GAFLP0j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCAN1GAFLP1j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

### 21.19.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCAN1GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

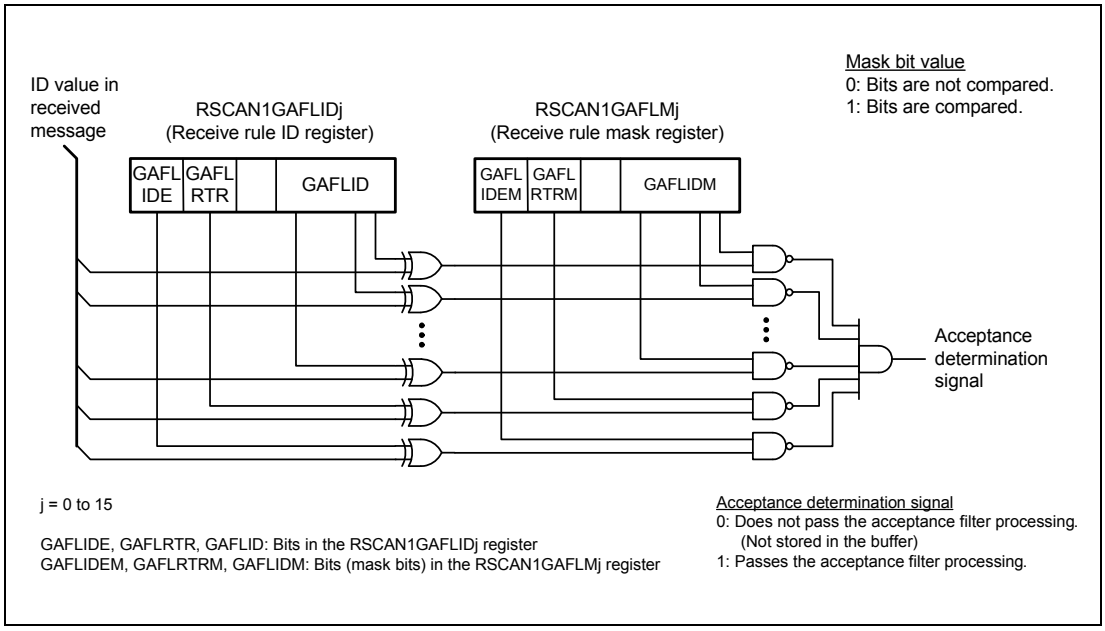

**Figure 21.45 Acceptance Filter Function**

#### 21.19.1.2 DLC Filter Processing

When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCAN1GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCAN1GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of $00_H$ is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCAN1GERFL register is set to 1 (a DLC error is present).

#### 21.19.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCAN1GAFLP0j register (j = 0 to 15) and by the RSCAN1GAFLP1j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

#### 21.19.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCAN1GAFLP0j register.

#### 21.19.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCAN1GCFG register to 1 (mirror function is enabled).

When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCAN1GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

### 21.19.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time. The timestamp counter value is fetched at the start-of-frame (SOF) timing of a message and is then stored in a receive buffer or a FIFO buffer together with the message ID and data. Either pclk/2 or the CANm bit time clock (m = 6) may be selected as a timestamp counter clock source using the TSBTCS[2:0] and TSSS bits in the RSCAN1GCFG register. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCAN1GCFG register.

When the CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to $0000_H$ by setting the TSRST bit in the RSCAN1GCTR register to 1.

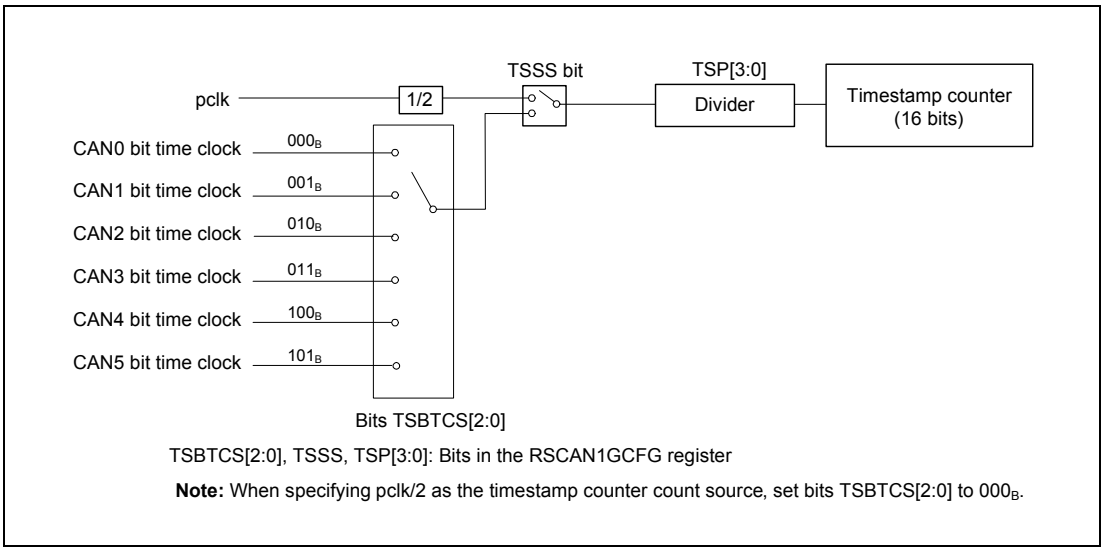

**Figure 21.46 Timestamp Function Block Diagram**

## 21.20 Transmission Functions

There are three types of transmission.

- Transmission using transmit buffers:
  Each channel has 16 buffers.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmit buffer ((16 × i) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

**Figure 21.47** shows the allocation of transmit queues and transmit/receive FIFO buffer link.

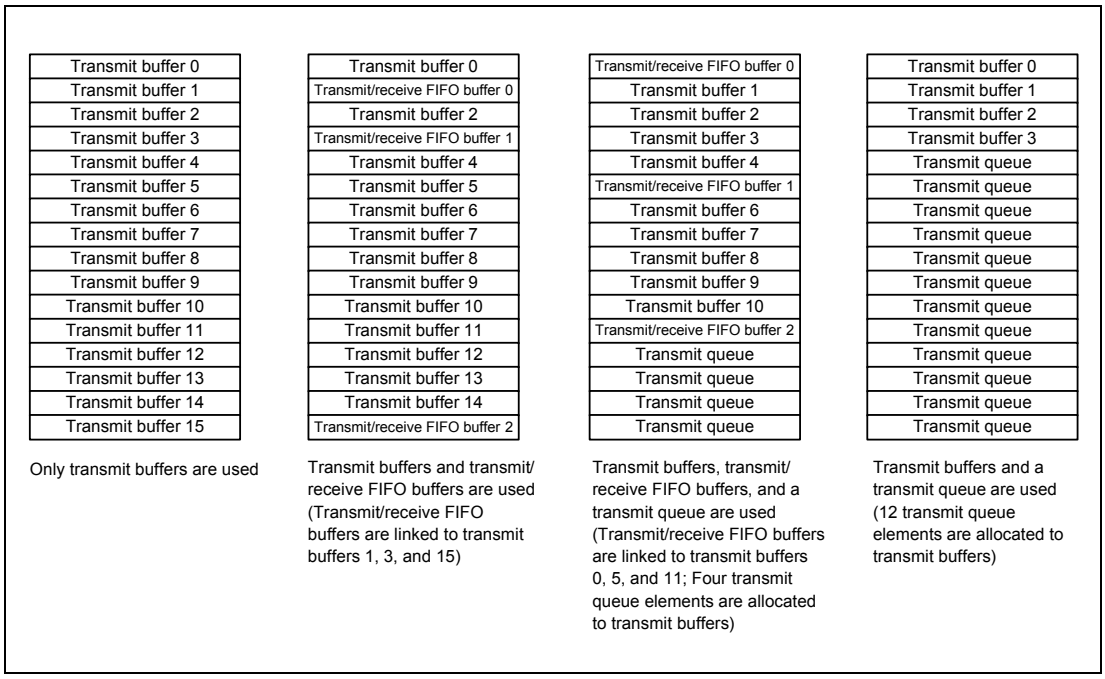

**Figure 21.47 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links**

### 21.20.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

The priority is determined by using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCAN1GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again according to the TPRI bit.

### 21.20.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCAN1TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCAN1TMSTSp register (p = 0 to i × 16 + 15). When transmit completes successfully, the TMTRF[1:0] flag is set to $10_B$ (transmission has been completed (without transmit abort request)) or $11_B$ (transmission has been completed (with transmit abort request)).

#### 21.20.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCAN1TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCAN1TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCAN1TMSTSp register is set to $01_B$ (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

#### 21.20.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCAN1TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCAN1TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to $10_B$ or $11_B$. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to $01_B$ (transmit abort has been completed).

### 21.20.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCAN1CFCCk register (k = 0 to i × 3 + 2). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCAN1CFCCk register. When the CFE bit in the RSCAN1CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

### 21.20.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCAN1CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCAN1CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to $00_H$.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCAN1CFCCk register. When the CFITR and CFITSS bits are set to $00_B$, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits in the RSCAN1GCFG register. When the CFITR and CFITSS bits are set to $10_B$, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock is used as a count source.

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = $00_B$ (fPBA is the frequency of pclk):

$$\frac{1}{f_{PBA}} \times 2 \times M \times N$$

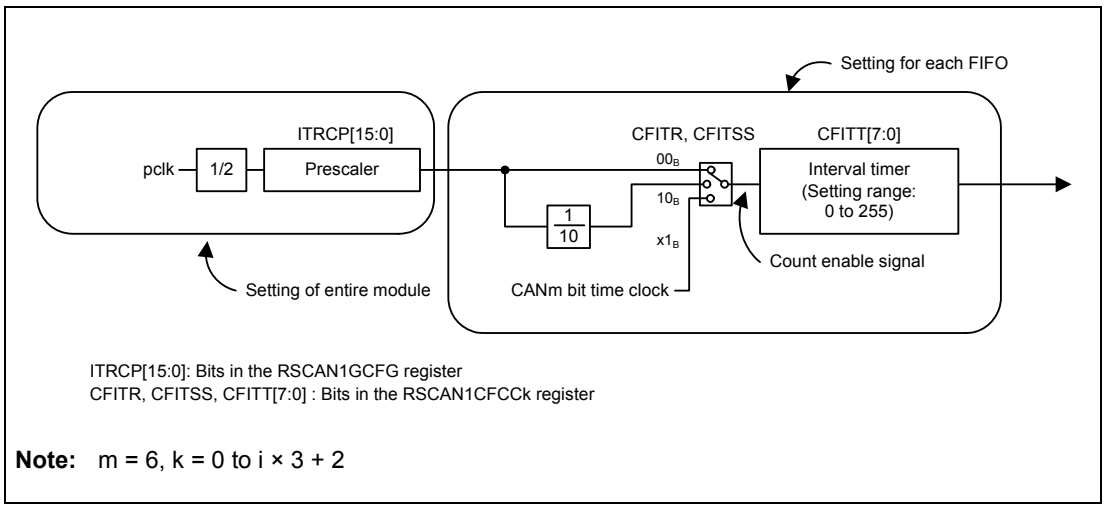
- When CFITR and CFITSS = $10_B$:

$$\frac{1}{f_{PBA}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$ (fCANBIT is the frequency of CANm bit time clock):

$$\frac{1}{f_{CANBIT}} \times N$$

**Figure 21.48** shows the interval timer block diagram.



**Note:** m = 6, k = 0 to i × 3 + 2

**Figure 21.48 Interval Timer Block Diagram**

**Figure 21.49** shows the interval timer timing diagram.

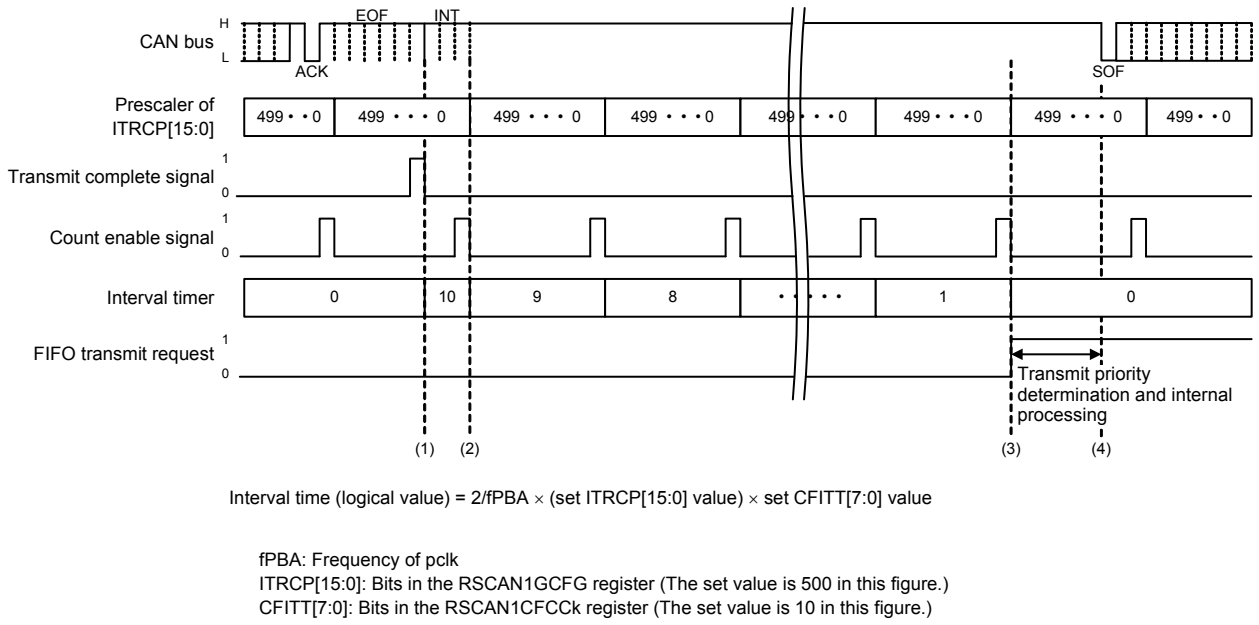


**Figure 21.49 Interval Timer Timing Chart**

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 348 cycles of the pclk may be generated.

### 21.20.4 Transmission Using Transmit Queues

Three to sixteen buffers are allocated to a transmit queue for each channel, and transmit buffer ((16 × i) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCAN1TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCAN1TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

### 21.20.5 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCAN1THLCCm register. The THLEN bit in the RSCAN1CFIDk register (k = 0 to i × 3 + 2) determines whether transmit history data is stored for each message.

The following information on a transmitted message will be stored in the transmission history buffer after the successful completion of transmission.

Storage of the transmission history data after the successful completion of transmission may take up to 123 cycles of pclk.

- Buffer type — $001_B$: Transmit buffer<br>$010_B$: Transmit/receive FIFO buffer<br>$100_B$: Transmit queue
- Buffer number — Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 21.294**.
- Label data — Label information of the transmit message

Table 21.294 Transmit History Data Buffer Numbers

| Buffer No. / Buffer type | $001_B$ | $010_B$ | $100_B$ |
|---|---|---|---|
| $0000_B$ | Transmit buffer 16 × i + 0 | Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCAN1CFCCk register (k = 0 to i × 3 + 2) | Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission |
| $0001_B$ | Transmit buffer 16 × i + 1 | | |
| $0010_B$ | Transmit buffer 16 × i + 2 | | |
| $0011_B$ | Transmit buffer 16 × i + 3 | | |
| $0100_B$ | Transmit buffer 16 × i + 4 | | |
| $0101_B$ | Transmit buffer 16 × i + 5 | | |
| $0110_B$ | Transmit buffer 16 × i + 6 | | |
| $0111_B$ | Transmit buffer 16 × i + 7 | | |
| $1000_B$ | Transmit buffer 16 × i + 8 | | |
| $1001_B$ | Transmit buffer 16 × i + 9 | | |
| $1010_B$ | Transmit buffer 16 × i + 10 | | |
| $1011_B$ | Transmit buffer 16 × i + 11 | | |
| $1100_B$ | Transmit buffer 16 × i + 12 | | |
| $1101_B$ | Transmit buffer 16 × i + 13 | | |
| $1110_B$ | Transmit buffer 16 × i + 14 | | |
| $1111_B$ | Transmit buffer 16 × i + 15 | | |

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

Transmit history data can be read from the RSCAN1THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

## 21.21 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)

### 21.21.1 Standard Test Mode

Standard test mode allows CRC test.

### 21.21.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

**Figure 21.50** shows the connection when listen-only mode is selected.

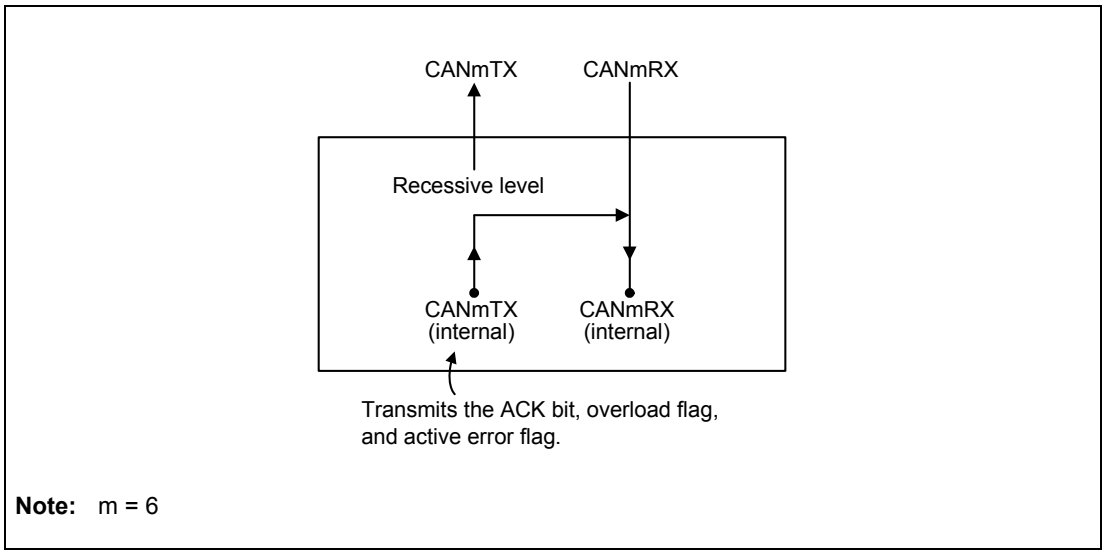

**Figure 21.50 Connection when Listen-Only Mode is Selected**

### 21.21.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCAN1GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).

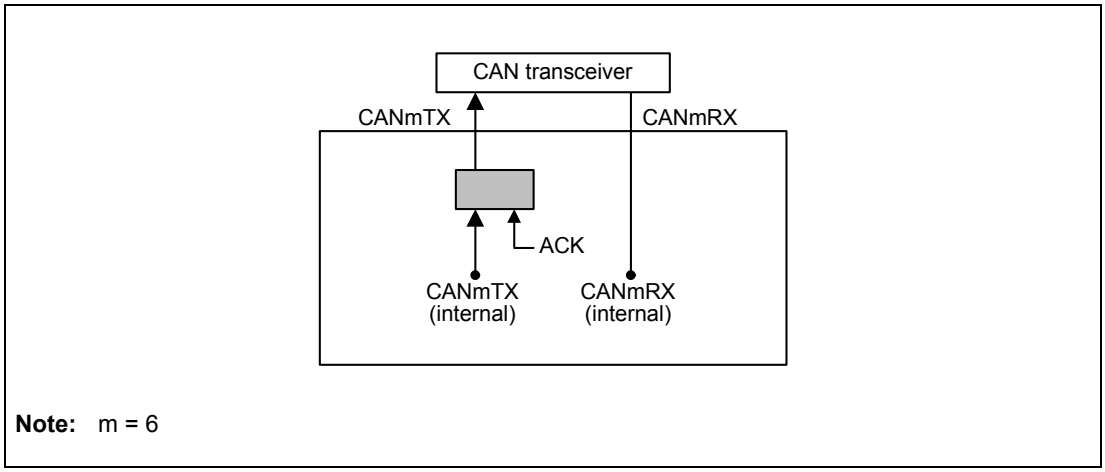
If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

#### 21.21.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

**Figure 21.51** shows the connection when self-test mode 0 is selected.



**Note:** m = 6

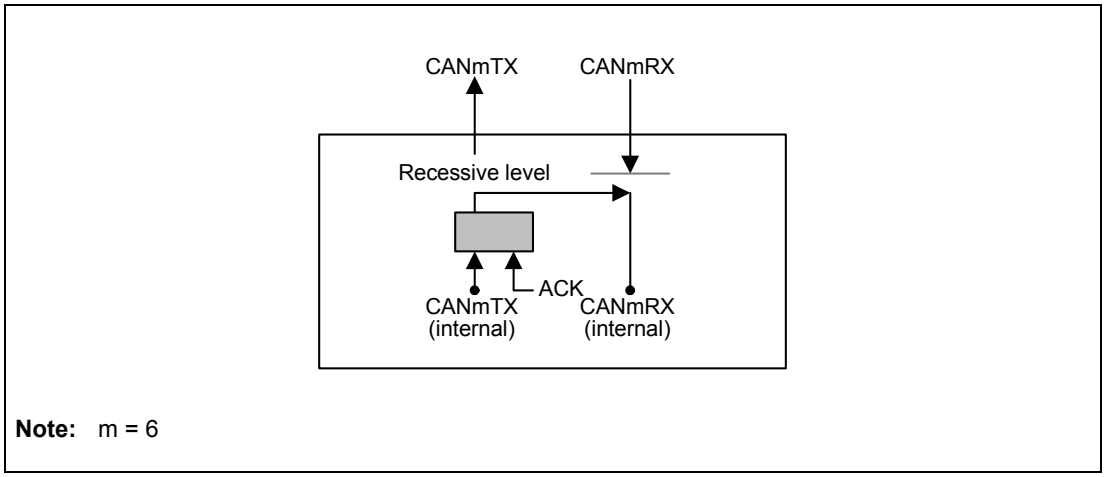
**Figure 21.51 Connection when Self-Test Mode 0 is Selected**

### 21.21.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin (m = 6) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

**Figure 21.52** shows the connection when self-test mode 1 is selected.



**Note:** m = 6

**Figure 21.52 Connection when Self-Test Mode 1 is Selected**

## 21.21.4 RAM Test

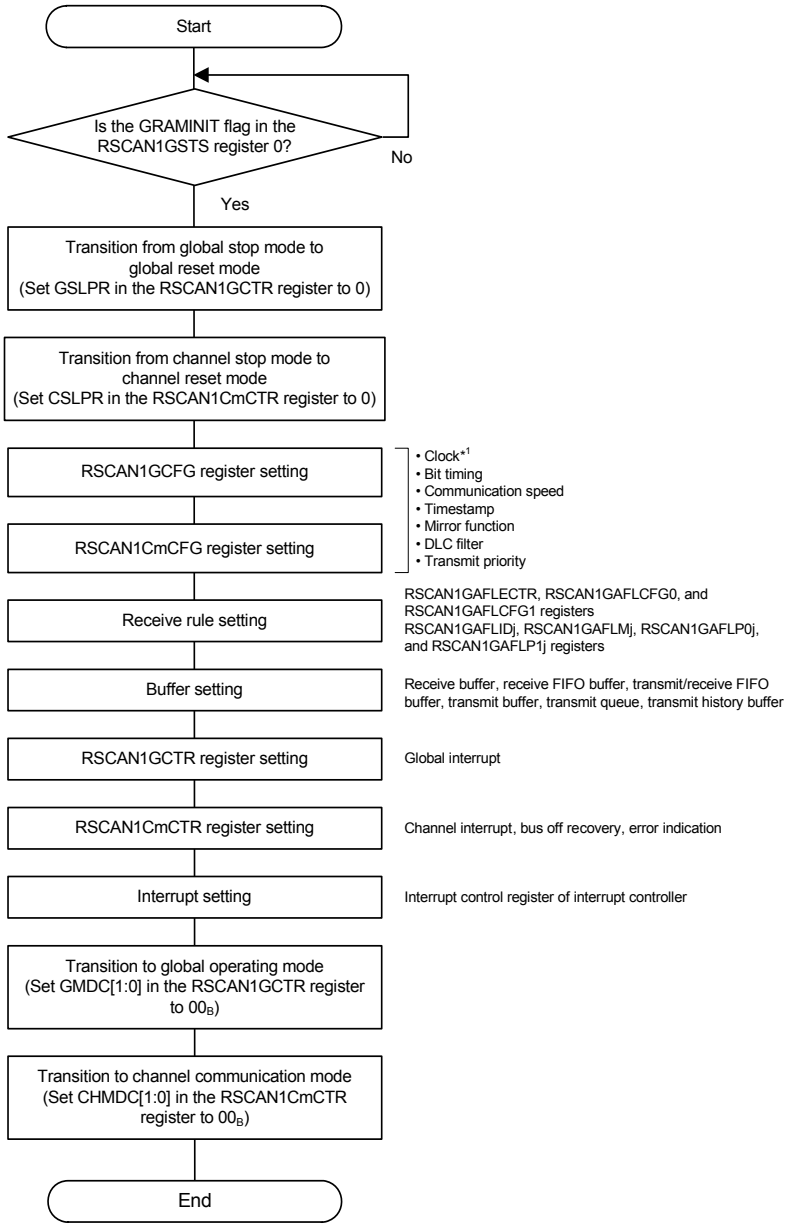
The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCAN1GTSTCFG register. Data in the set page can be read from and written to the RSCAN1RPGACCr register (r = 0 to 63). The available total RAM size is 7296 bytes ($1C80_H$).

# 21.22 RS-CAN Setting Procedure

## 21.22.1 Initial Settings

The RS-CAN module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 3650 cycles of the pclk. The GRAMINIT flag in the RSCAN1GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 21.53** shows the CAN setting procedure after the MCU is reset.



Note 1. For the setting of CAN clock frequency, see the **Table 21.208, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

**Note:** m = 6, j = 0 to 15

**Figure 21.53 CAN Setting Procedure after the MCU is Reset**

### 21.22.1.1 Clock Setting

Set the CAN clock (fCAN) as a clock source of the RS-CAN module. Select the clk_xincan or clkc using the DCS bit in the RSCAN1GCFG register.

### 21.22.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the RSCAN1CmCFG register for each channel. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). 1 Tq is equal to one CANmTq clock cycle. The CANmTq clock is obtained by selecting the clock source with the DCS bit in the RSCAN1GCFG register and selecting the clock division ratio with the BRP[9:0] bits in the RSCAN1CmCFG register.

**Figure 21.54** shows the bit timing chart. **Table 21.295** shows an example of bit timing setting.

SS = 1 Tq fixed
Set TSEG1 to a range of 4 Tq to 16 Tq
Set TSEG2 to a range of 2 Tq to 8 Tq
Set SJW to a range of 1 Tq to 4 Tq
Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
TSEG1 > TSEG2 ≥ SJW

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space.
  Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (Time segment 1):
  TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.
- TSEG2 (Time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (Resynchronization jump width)
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

**Figure 21.54 Bit Timing Chart**

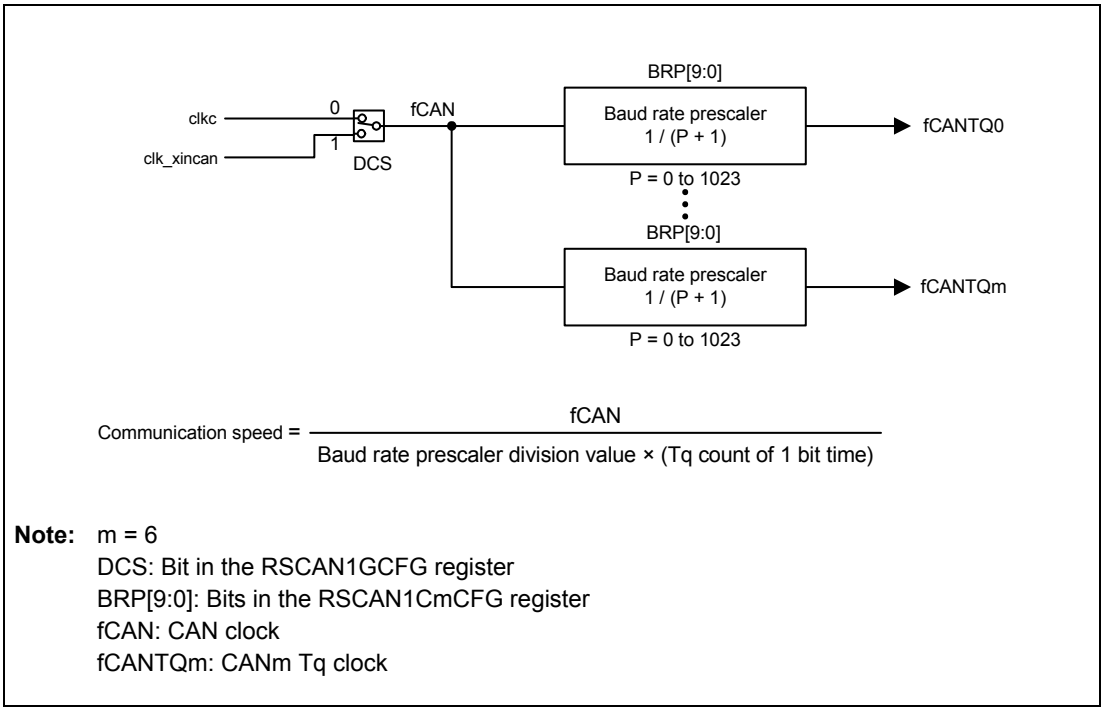
**Table 21.295 Example of Bit Timing Setting**

| 1 Bit | Set Value (Tq) | | | | Sample Point (%) Note: See Figure 21.54. |
|---|---|---|---|---|---|
| | SS | TSEG1 | TSEG2 | SJW | |
| 8 Tq | 1 | 4 | 3 | 1 | 62.50 |
| | 1 | 5 | 2 | 1 | 75.00 |
| 10 Tq | 1 | 6 | 3 | 1 | 70.00 |
| | 1 | 7 | 2 | 1 | 80.00 |
| 16 Tq | 1 | 10 | 5 | 1 | 68.75 |
| | 1 | 11 | 4 | 1 | 75.00 |
| 20 Tq | 1 | 12 | 7 | 1 | 65.00 |
| | 1 | 13 | 6 | 1 | 70.00 |

### 21.22.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value (BRP[9:0] bits in the RSCAN1CmCFG register), and Tq count per bit time.

**Figure 21.55** shows the CAN clock control block diagram, and **Table 21.296** shows an example of the communication speed setting.



**Note:** m = 6
DCS: Bit in the RSCAN1GCFG register
BRP[9:0]: Bits in the RSCAN1CmCFG register
fCAN: CAN clock
fCANTQm: CANm Tq clock

**Figure 21.55 CAN Clock Control Block Diagram**

**Table 21.296 Example of Communication Speed Setting**

| fCAN / Communication speed | 40 MHz | 32 MHz | 24 MHz | 16 MHz | 8 MHz |
|---|---|---|---|---|---|
| 1 Mbps | 8 Tq (5)<br>20 Tq (2) | 8 Tq (4)<br>16 Tq (2) | 8 Tq (3)<br>12 Tq (2)<br>24 Tq (1) | 8 Tq (2)<br>16 Tq (1) | 8 Tq (1) |

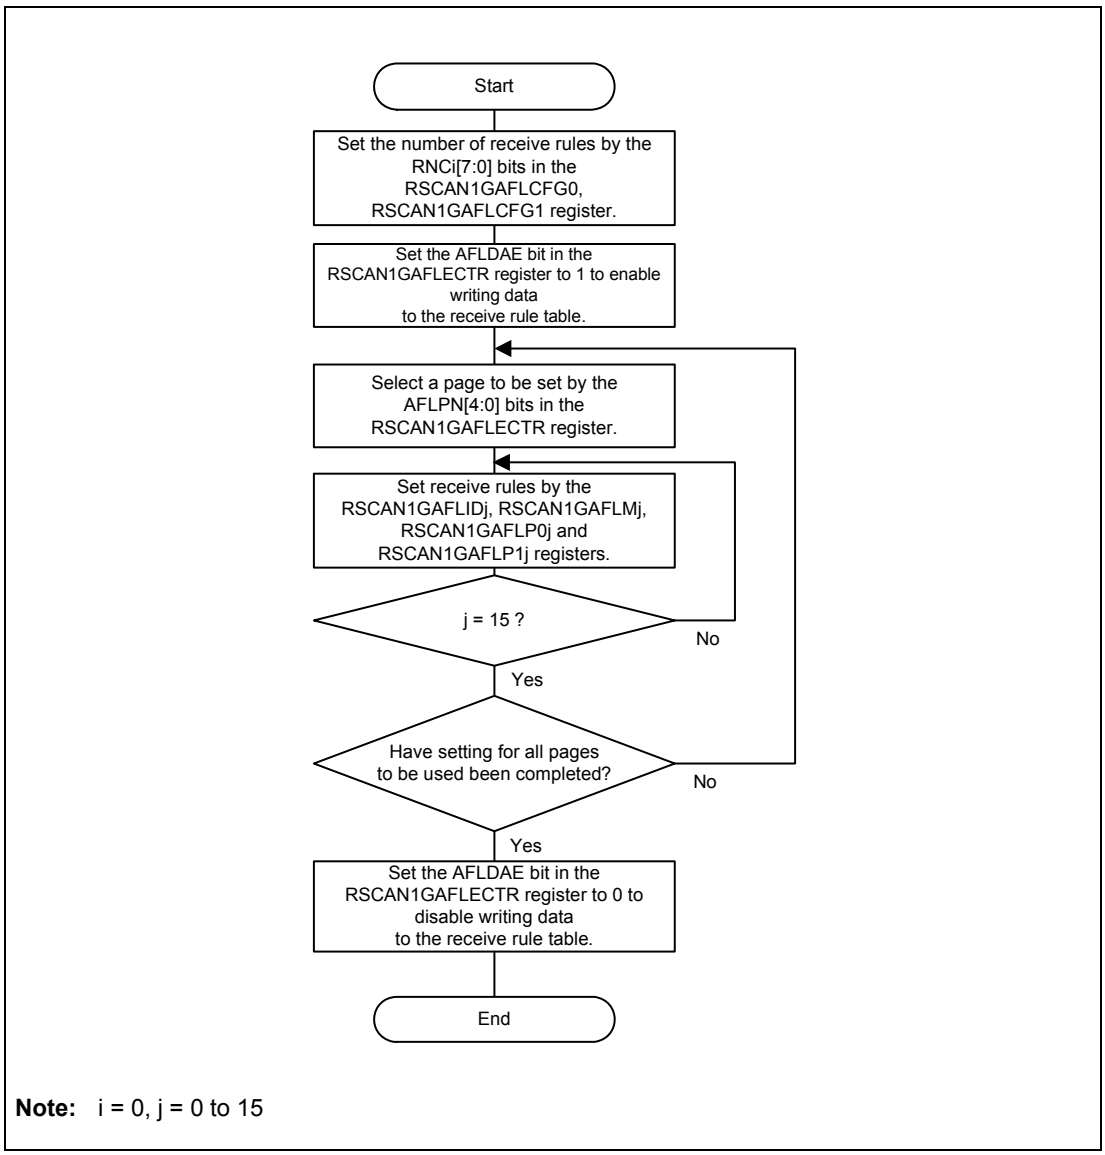
**Note:** Values in ( ) are baud rate prescaler division values.

### 21.22.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 23 by the AFLPN[4:0] bits in the RSCAN1GAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

**Figure 21.56** shows the receive rule setting procedure.



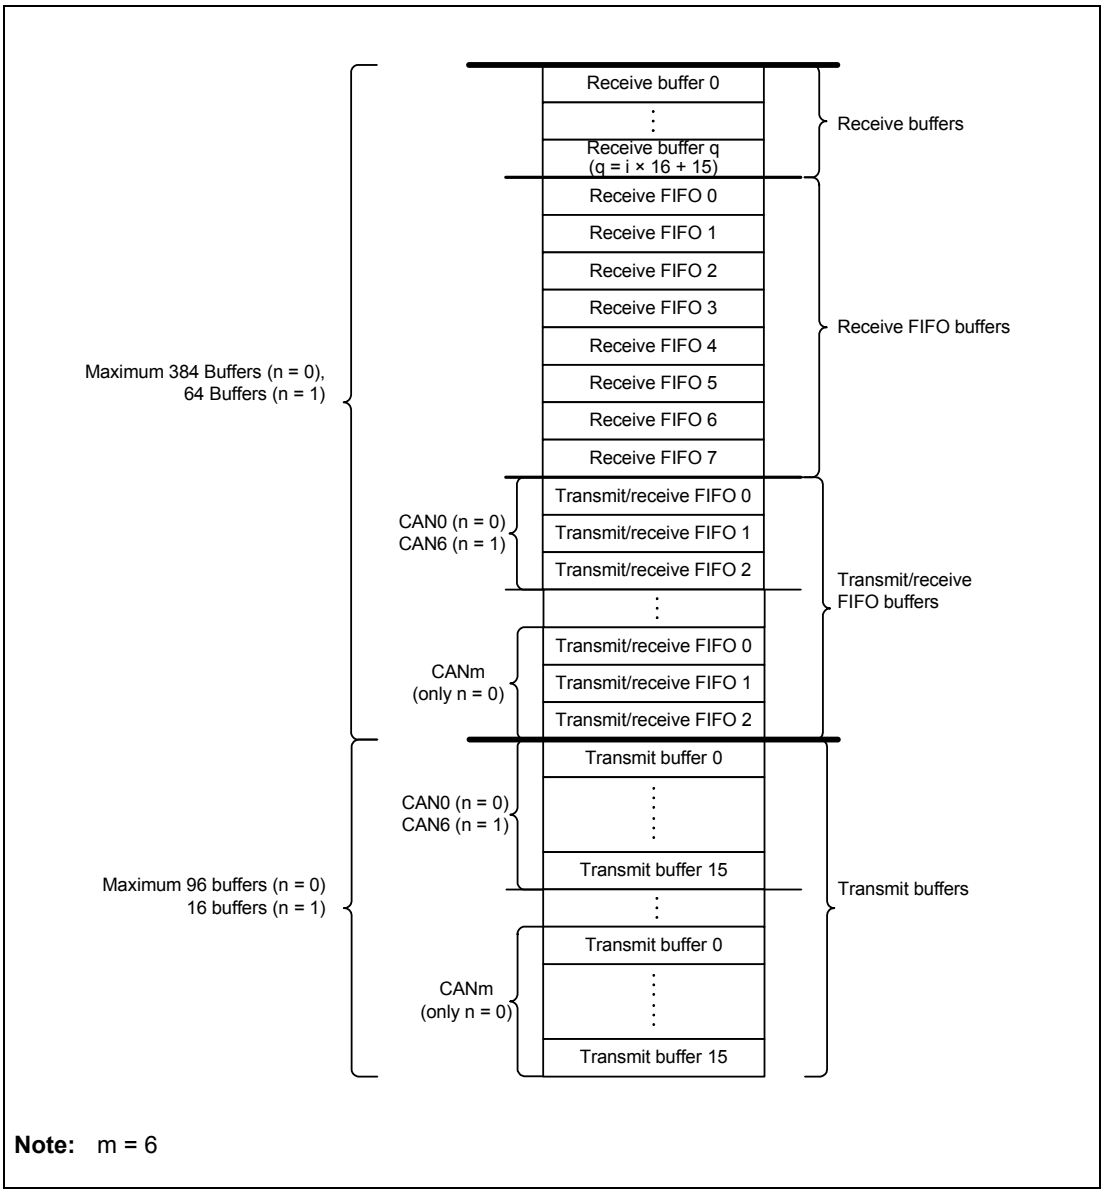
**Note:** i = 0, j = 0 to 15

**Figure 21.56 Receive Rule Setting Procedure**

### 21.22.1.5 Buffer Setting

Set sizes and interrupt sources of buffers. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

**Figure 21.57** shows the buffer configuration. **Figure 21.58** shows the buffer setting procedure.



**Note:** m = 6

**Figure 21.57 Buffer Configuration**

**CAUTION**

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.

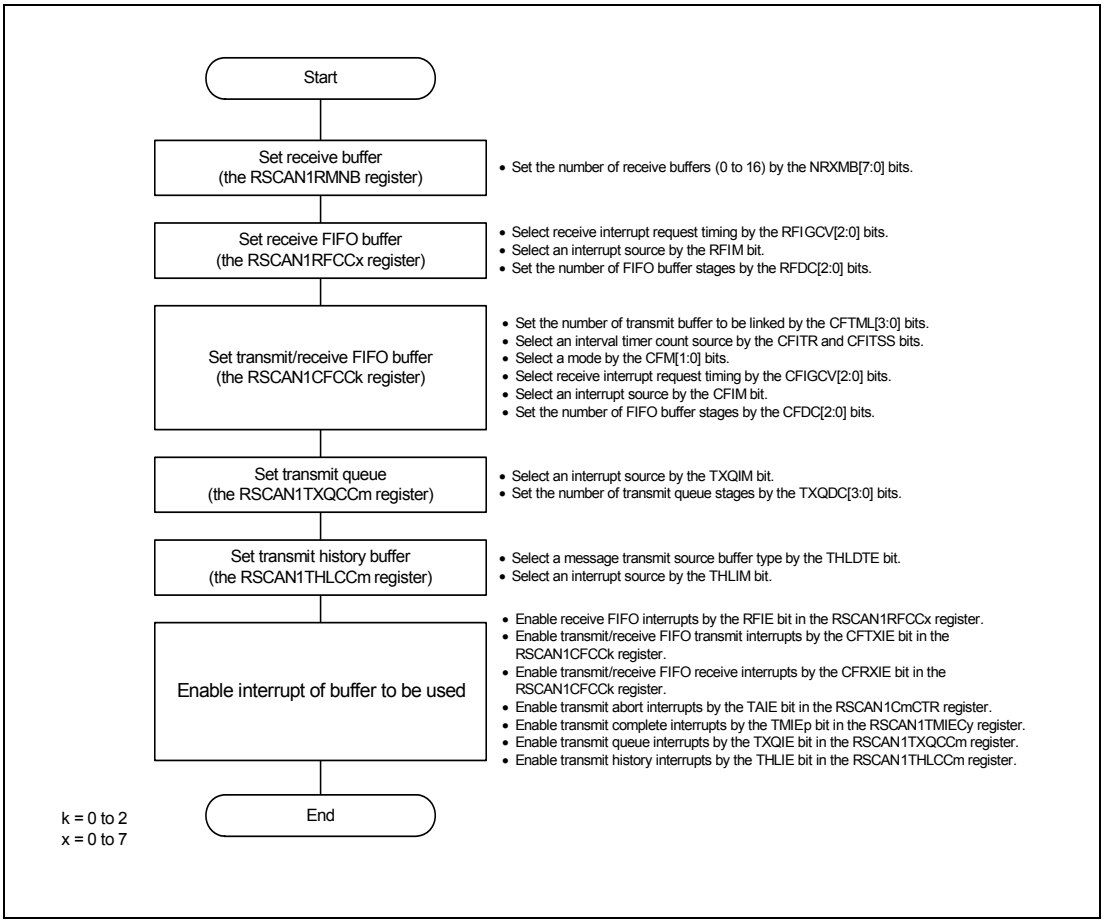


**Figure 21.58 Buffer Setting Procedure**

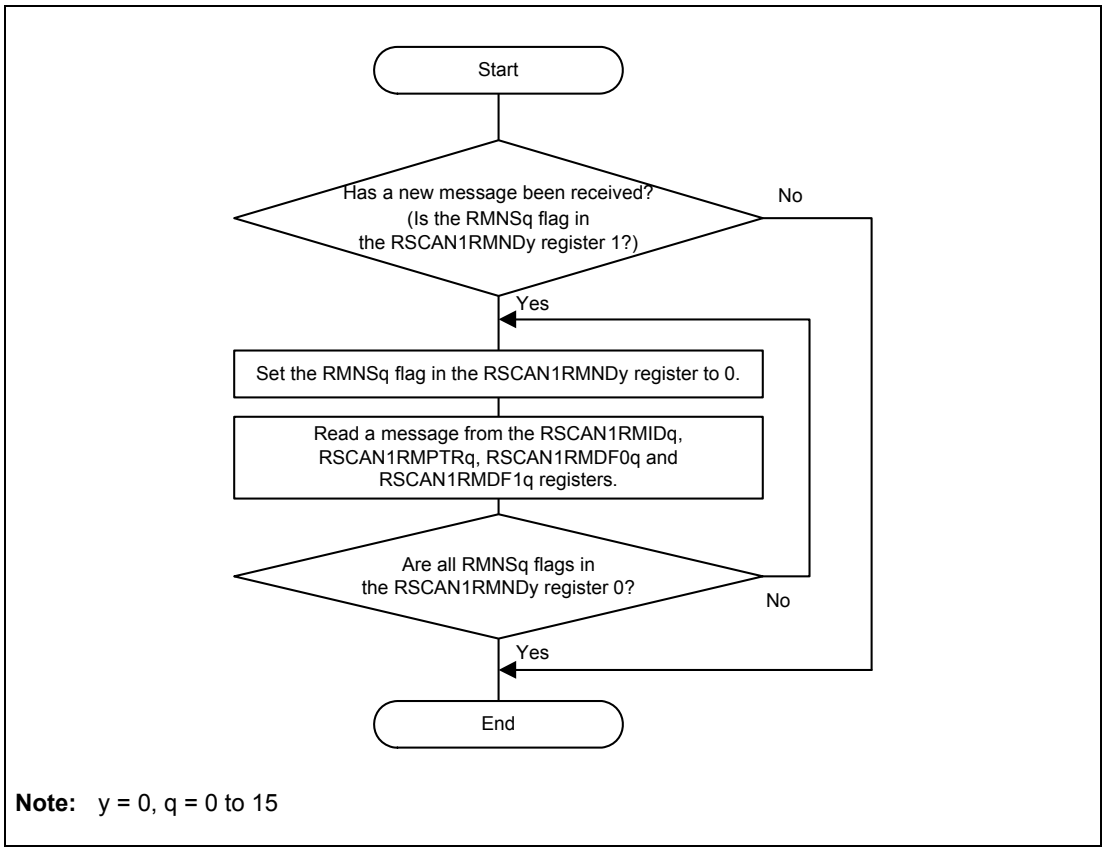
## 21.22.2 Reception Procedure

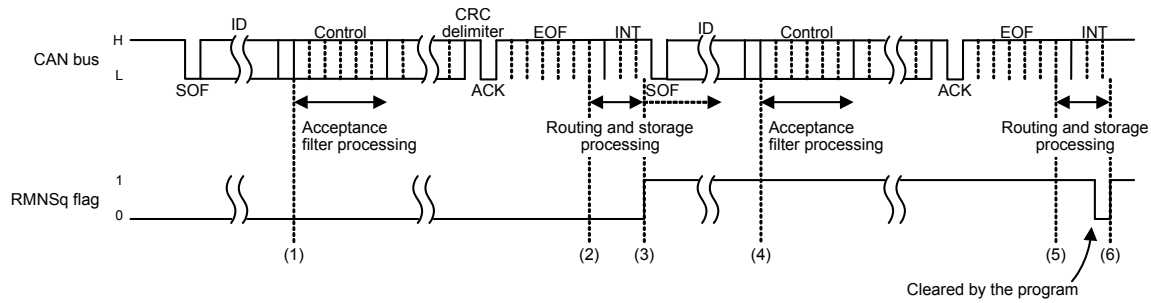
### 21.22.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCAN1RMNDy register ((y = 0, q = 0 to 15) is set to 1 (receive buffer q contains a new message). Messages can be read from the RSCAN1RMIDq, RSCAN1RMPTRq, RSCAN1RMDF0q, and RSCAN1RMDF1q registers. If the next message has been received before the current message is read from the receive buffer, the message is overwritten. **Figure 21.59** shows the receive buffer reading procedure.



**Note:** y = 0, q = 0 to 15

**Figure 21.59 Receive Buffer Reading Procedure**



**Note:** y = 0, q = 0 to 15
RMNSq: Flag in the RSCAN1RMNDy register

**Figure 21.60 Receive Buffer Reception Timing Chart**

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCAN1RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.

### 21.22.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCAN1RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCAN1CFSTSk register (k = 0 to 2)) is incremented. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCAN1RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCAN1CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCAN1RFIDx, RSCAN1RFPTRx, RSCAN1RFDF0x, and RSCAN1RFDF1x registers for receive FIFO buffers, or from the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCAN1RFCCx register or the CFDC[2:0] bits in the RSCAN1CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCAN1RFSTSx register or the CFEMP flag in the RSCAN1CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCAN1RFSTSx register or CFRXIF flag in the RSCAN1CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.

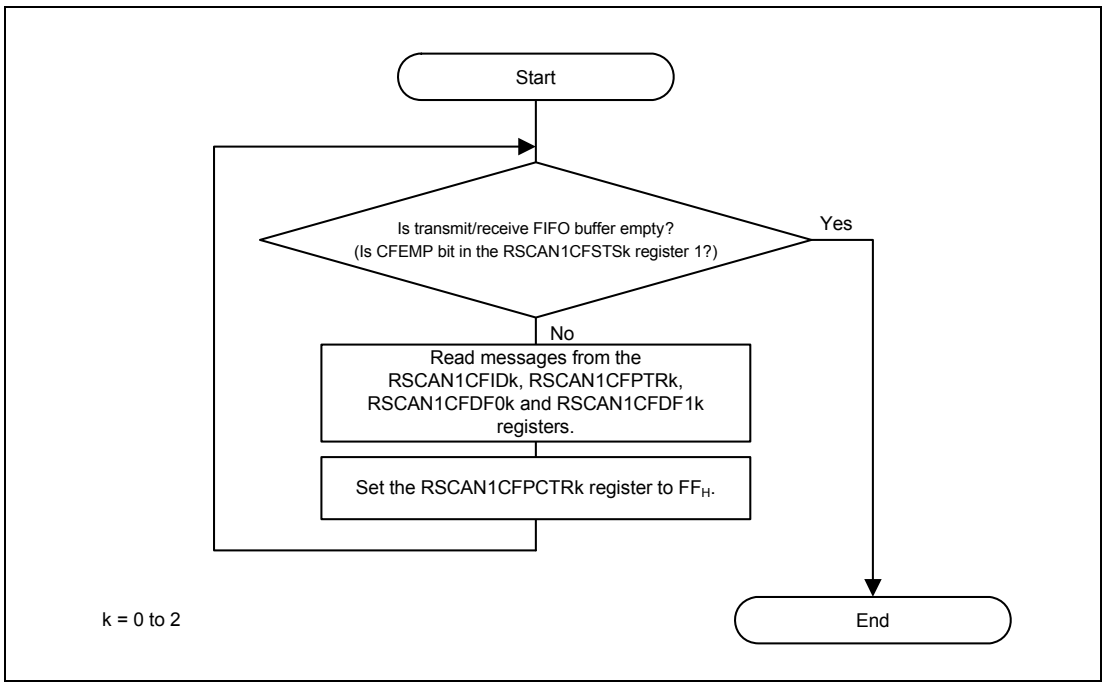


**Figure 21.61 Transmit/Receive FIFO Buffer Reading Procedure**

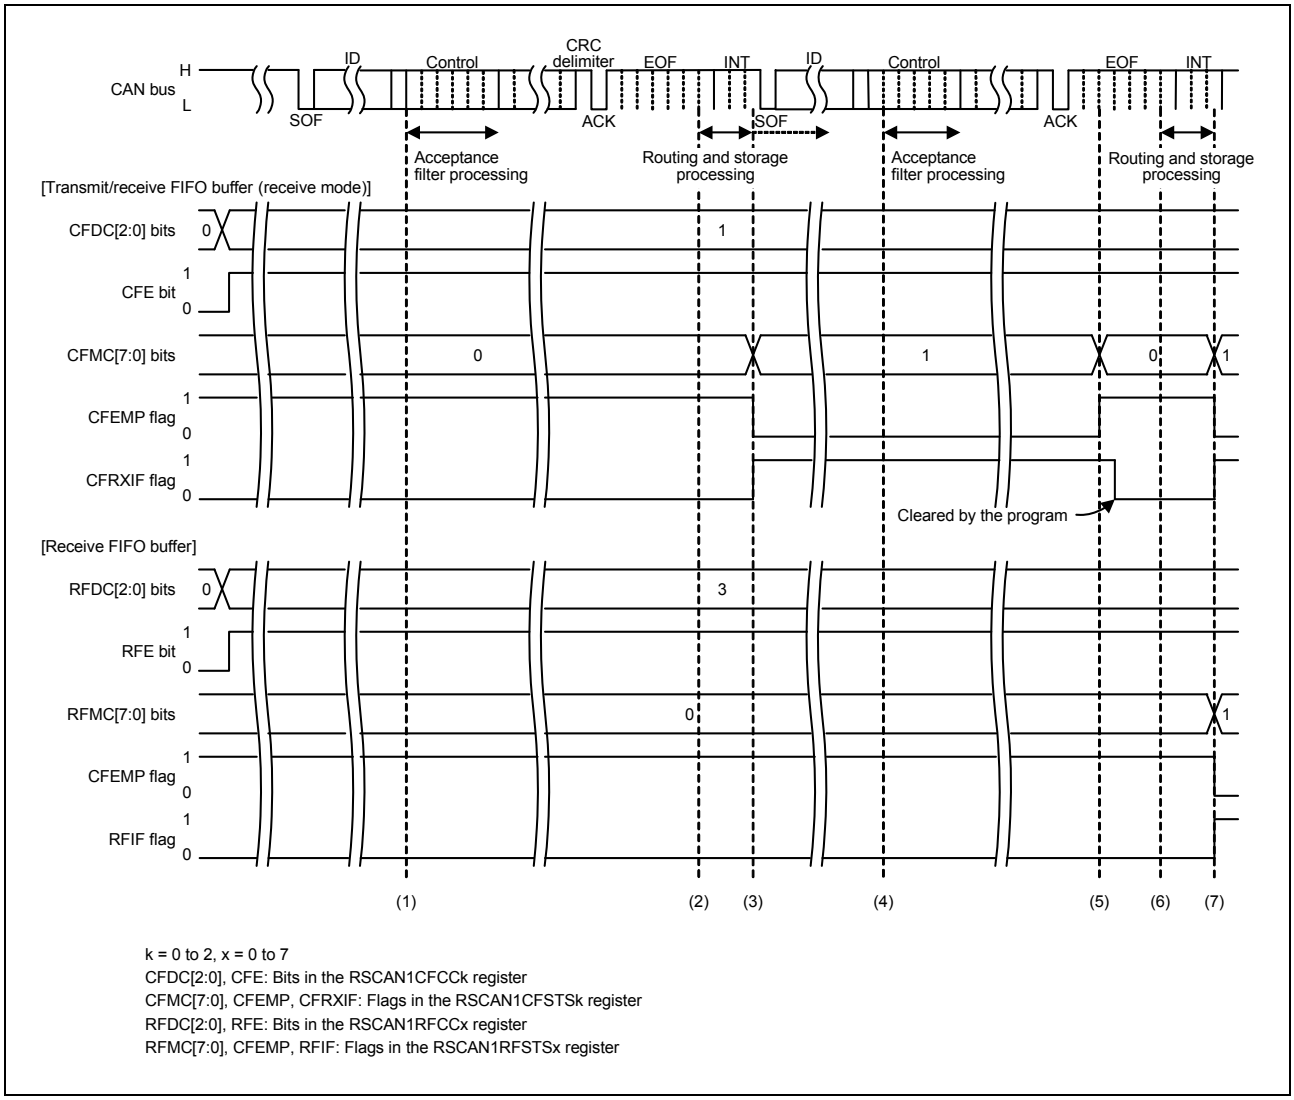

**Figure 21.62 FIFO Buffer Reception Timing Chart**

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCAN1CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCAN1CFCCk register is $001_B$ or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCAN1CFSTSk register is incremented and becomes $01_H$. When the CFIM bit in the RSCAN1CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCAN1CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers and write $FF_H$ to the RSCAN1CFPCTRk register. This causes the

CFMC[7:0] bits in the RSCAN1CFSTSk register to be decremented. When CFMC[7:0] becomes $00_H$, the CFEMP flag in the RSCAN1CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to $001_B$ or more. The CFMC[7:0] bit value is incremented by 1 to be $01_H$. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCAN1RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCAN1RFCCx register are set to $001_B$ or more. The RFMC[7:0] bits in the RSCAN1RFSTSx register are set to $01_H$ by being incremented by 1. When the RFIM bit in the RSCAN1RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCAN1RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

## 21.22.3 Transmission Procedure

### 21.22.3.1 Procedure for Transmission from Transmit Buffers

**Figure 21.63** shows the procedure for transmission from transmit buffers.

**Figure 21.64** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 21.65** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.

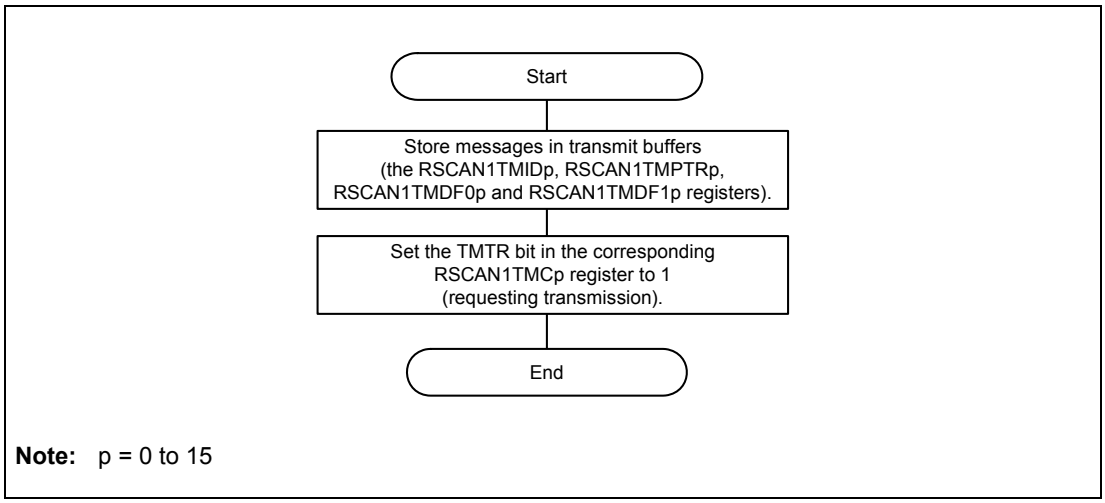

**Figure 21.63 Procedure for Transmission from Transmit Buffers**

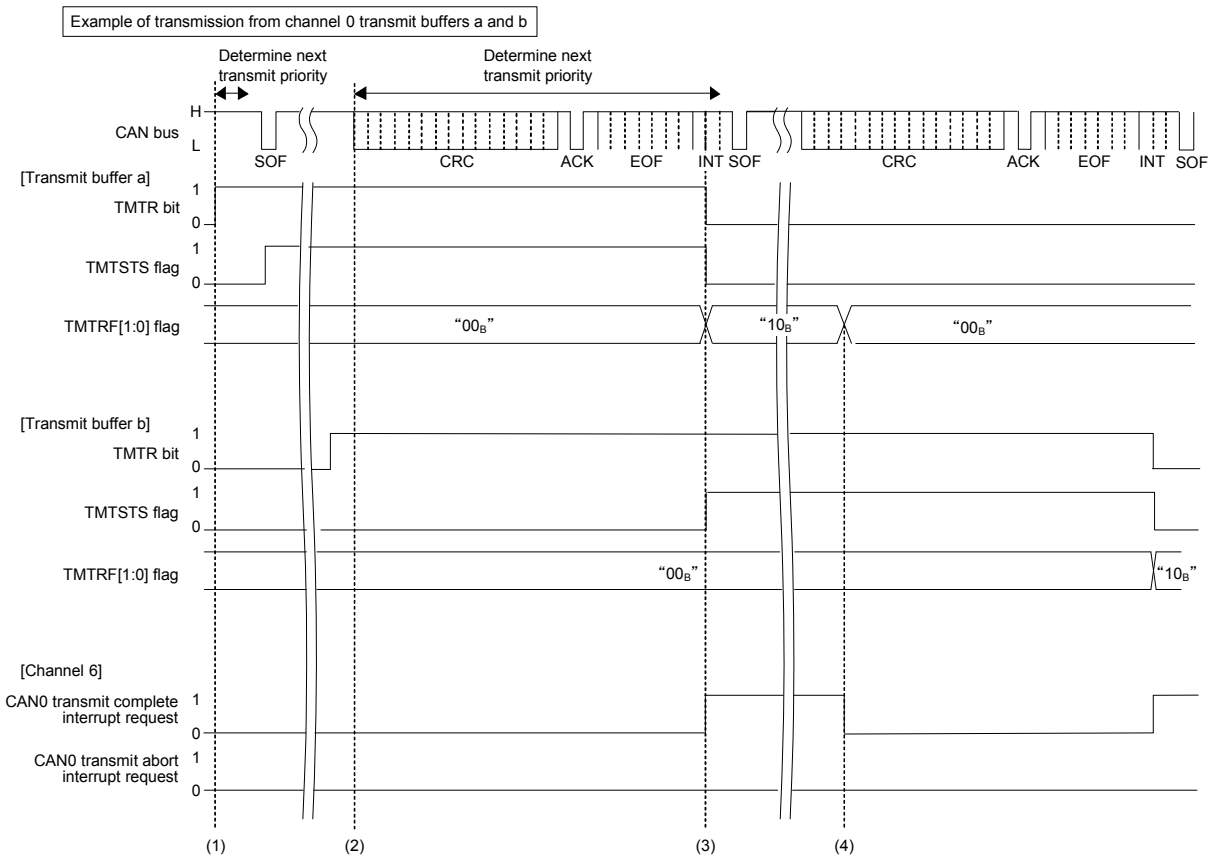


**Note:** a = 0 to 15, b = 0 to 15
TMTR: Bit in the RSCAN1TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCAN1TMSTSp registers

**Figure 21.64 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)**

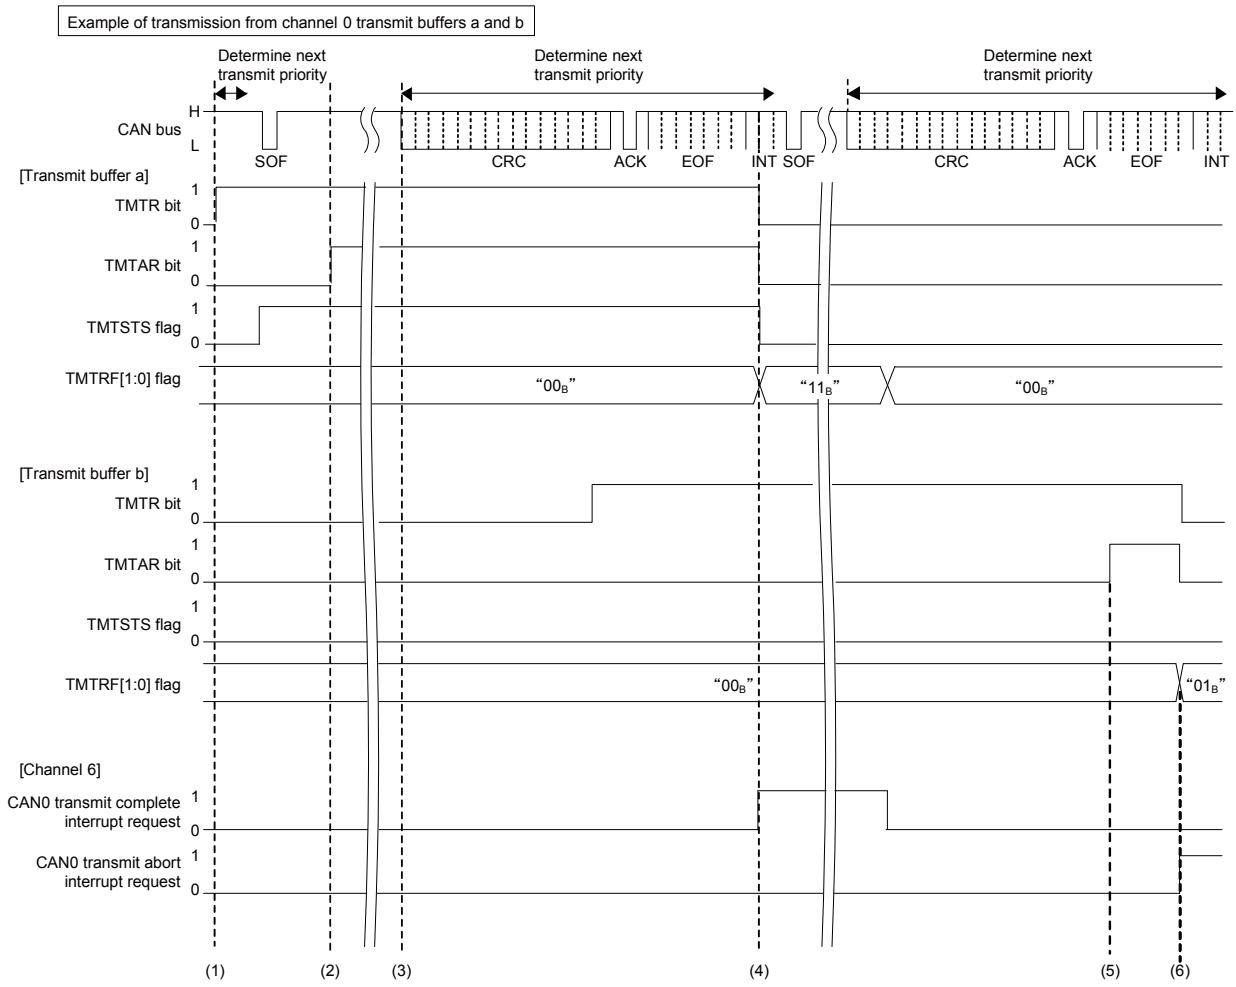
(1) When the TMTR bit in the RSCAN1TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCAN1TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCAN1TMSTSa register is set to $10_B$ (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCAN1TMCa register are cleared to 0. When the TMIEa bit in the RSCAN1TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to $00_B$ (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to $00_B$. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is $00_B$.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC delimiter to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.



**Note:** a = 0 to 15, b = 0 to 15
TMTR, TMTAR: Bits in the RSCAN1TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCAN1TMSTSp register

**Figure 21.65 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)**

(1) When the TMTR bit in the RSCAN1TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCAN1TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2)When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts with the CRC delimiter for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCAN1TMSTSa register is set to $11_B$ (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCAN1TMCa register are cleared to 0. When the TMIEa value in the RSCAN1TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to $00_B$ (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to $01_B$. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to $01_B$. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCAN1CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to $00_B$.

If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC delimiter to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

### 21.22.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

**Figure 21.66** shows the procedure for transmission from transmit/receive FIFO buffers.

**Figure 21.67** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 21.68** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.

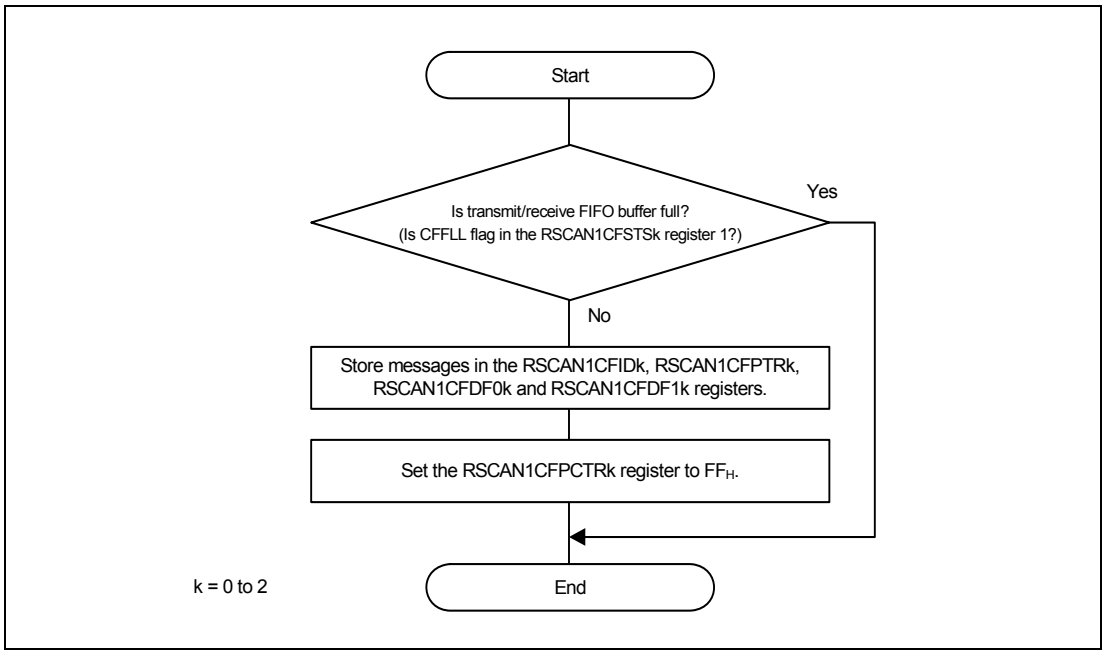


**Figure 21.66 Procedure for Transmission from Transmit/Receive FIFO Buffers**

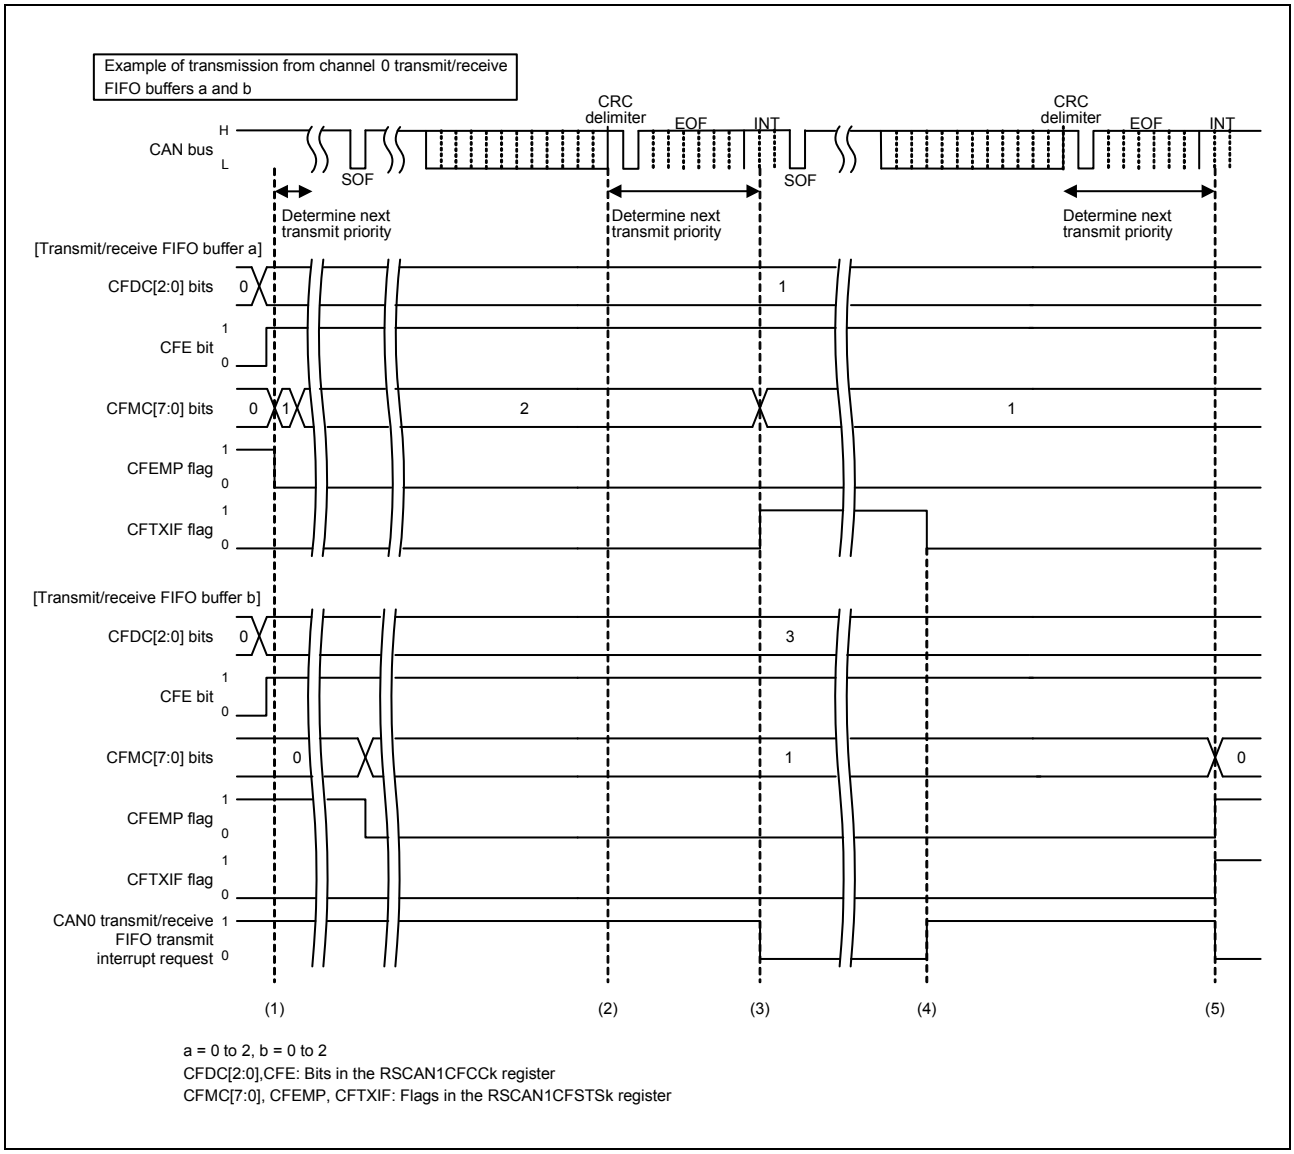

**Figure 21.67 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)**

(1) While the CAN bus is idle, when the CFE bit in the RSCA0CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCAN1CFCCa register is $001_B$ (4 messages) or more and the CFMC[7:0] value in the RSCAN1CFSTSa register is $01_H$ or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the CFMC[7:0] value in the RSCAN1CFSTSa register is decremented. Setting the CFIM bit in the RSCAN1CFCCa register to 1 (a FIFO transmit

interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCAN1CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCAN1CFSTSb register is decremented. The CFMC[7:0] bits are cleared to $00_H$ and therefore the CFEMP flag in the RSCAN1CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCAN1CFSTSa and RSCAN1CFSTSb register is set to 1 (the transmit/receive FIFO buffer is full).

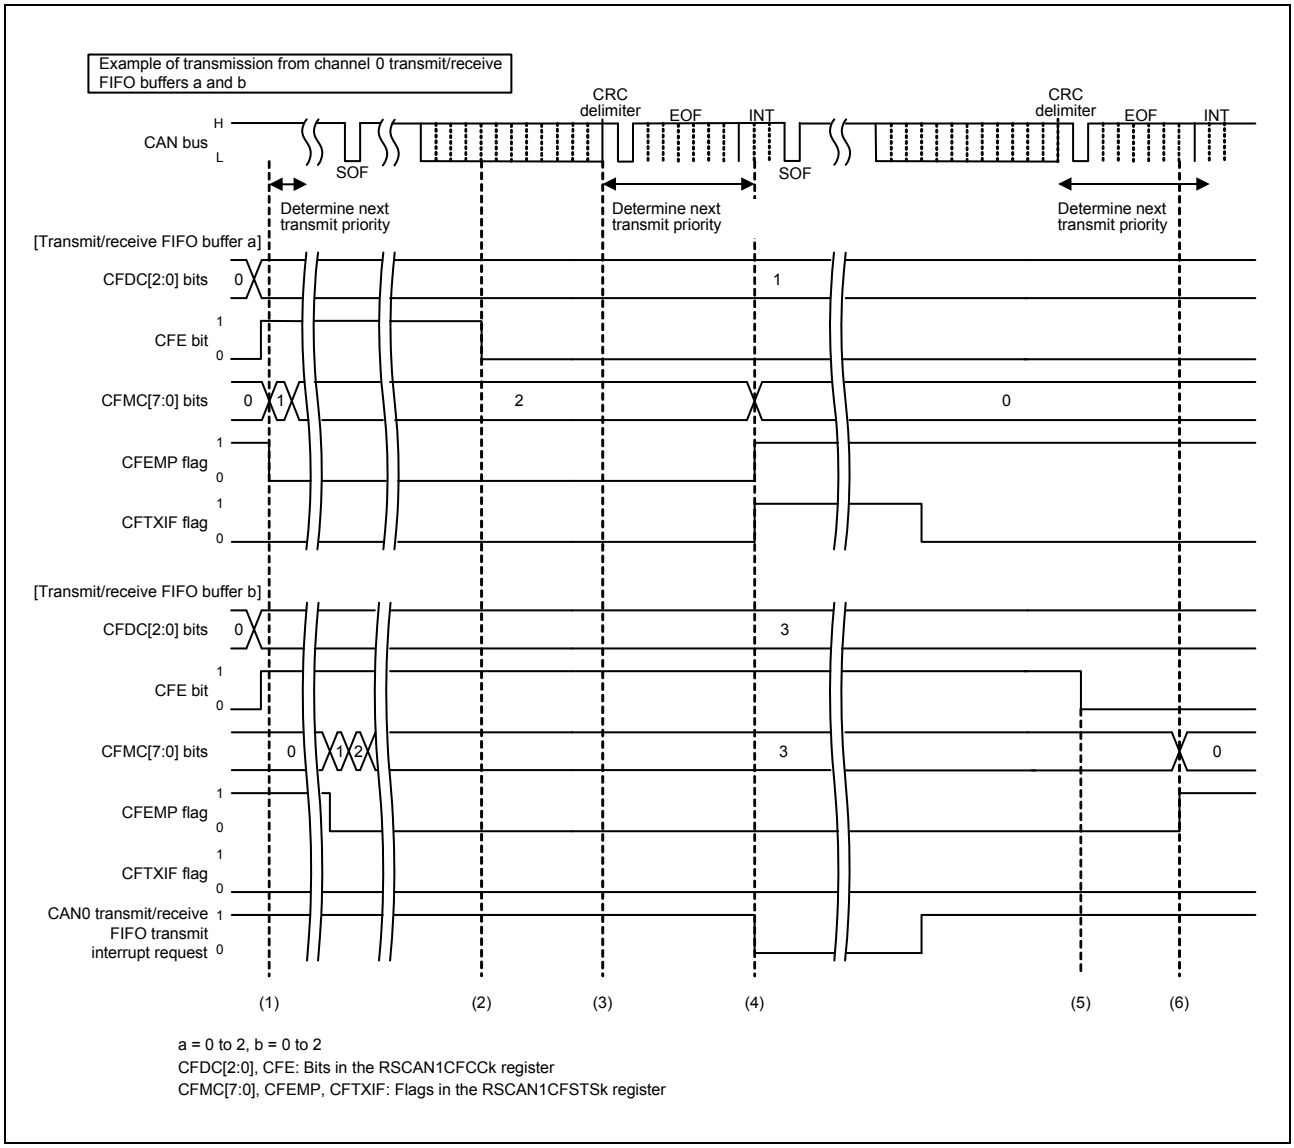

**Figure 21.68 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)**

(1) While the CAN bus is idle, when the CFE bit in the RSCAN1CFCCa register (a = 0 to 17) is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCAN1CFCCa register is $001_B$ (4 messages) or more and the CFMC[7:0] value in the RSCAN1CFSTSa register is $01_H$ or more, the priority determination processing starts to determine the highest-priority transmit

message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmit completes successfully, the CFMC[7:0] value is cleared to $00_H$. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCAN1CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCAN1CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCAN1CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCAN1CFSTSb register are cleared to $00_H$ and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to $00_H$ and the CFEMP flag is set to 1.)

### 21.22.3.3 Procedure for Transmission from the Transmit Queue

**Figure 21.69** shows the procedure for transmission from the transmit queue.

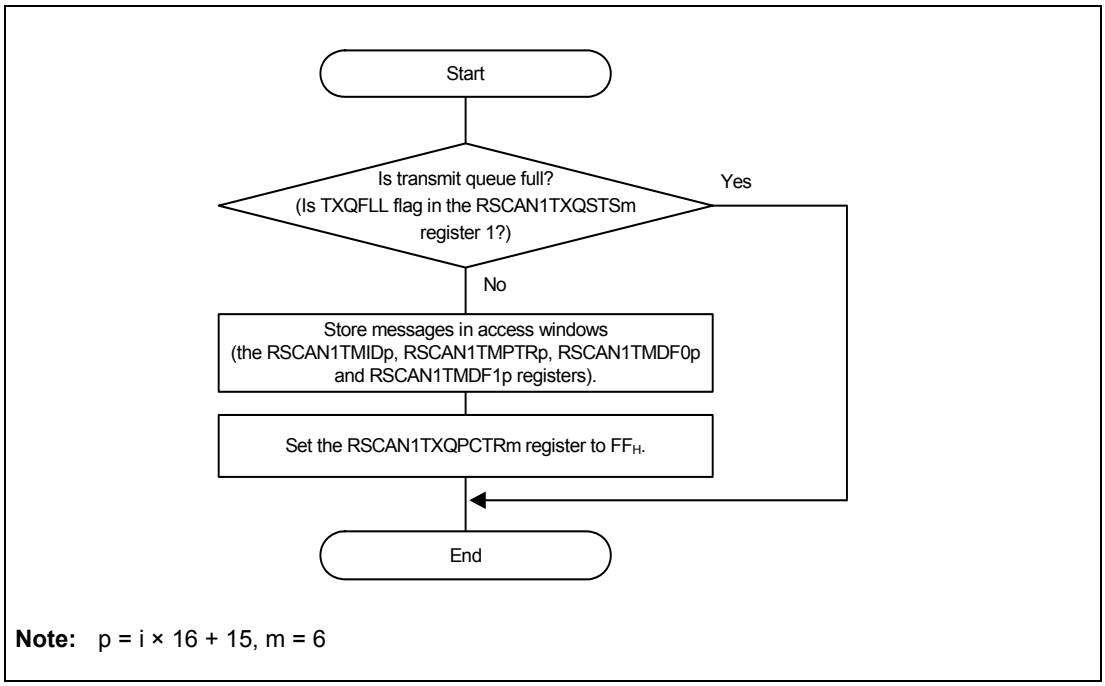

**Figure 21.69 Procedure for Transmission from the Transmit Queue**

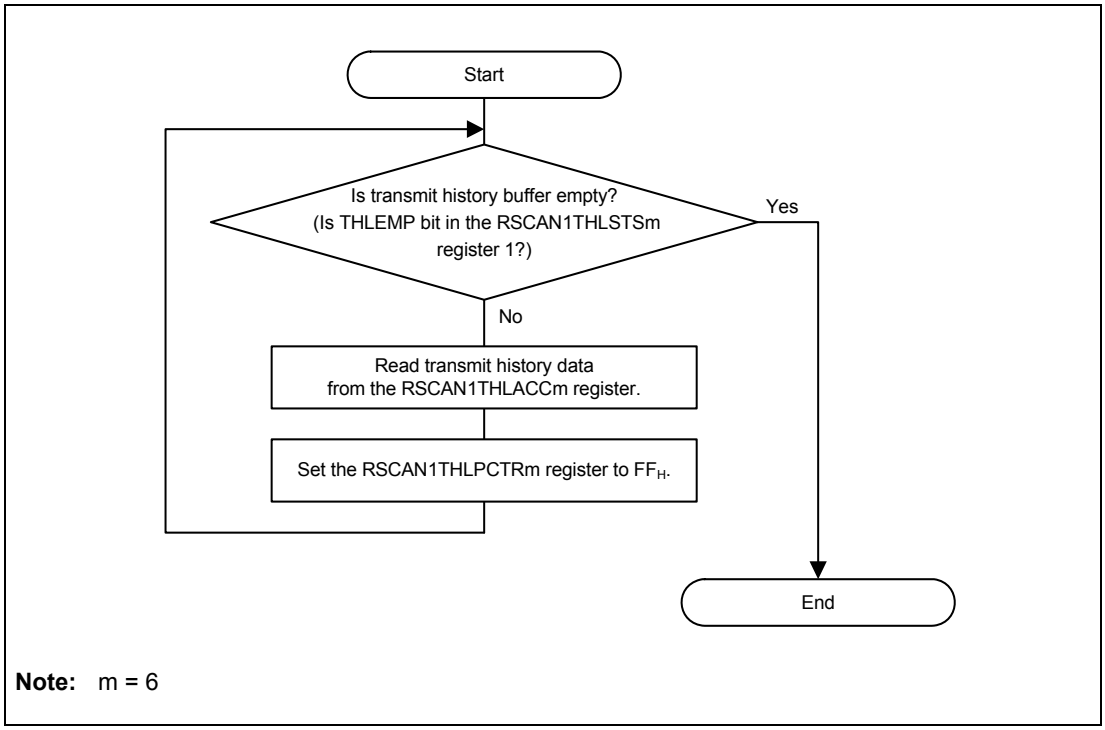
### 21.22.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCAN1THLACCm register. The next data can be accessed by writing $FF_H$ to the corresponding RSCAN1THLPCTRm register (m = 6) after reading a set of data. **Figure 21.70** shows the transmit history buffer reading procedure.



**Note:** m = 6

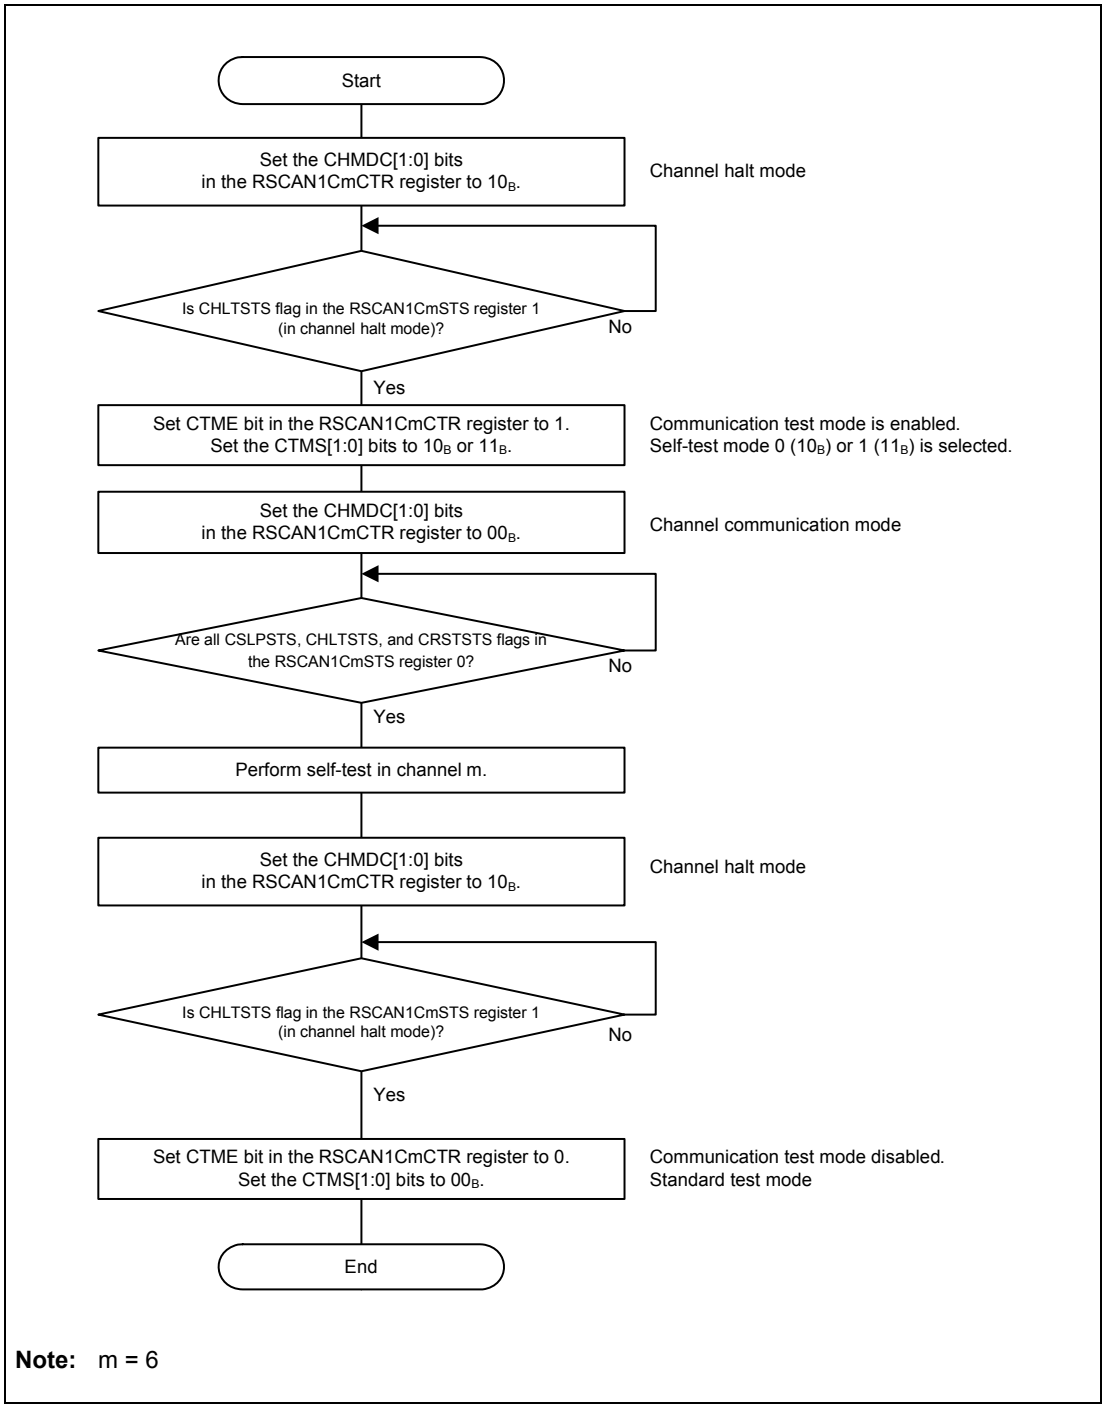
**Figure 21.70 Transmit History Buffer Reading Procedure**

## 21.22.4 Test Settings

### 21.22.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

**Figure 21.71** shows the self-test mode setting procedure.



**Note:** m = 6

**Figure 21.71 Self-Test Mode Setting Procedure**

### 21.22.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 21.297** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCAN1GLOCKK register, then set the target test bit to 1.

**Table 21.297 Protection Release Data for Test Function**

| Test Function | Protection Release Data 1 | Protection Release Data 2 | Target Bit |
|---|---|---|---|
| RAM test | $7575_H$ | $8A8A_H$ | RTME bit in the RSCAN1GTSTCTR register |

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 21.72** shows the procedure for releasing the protection.

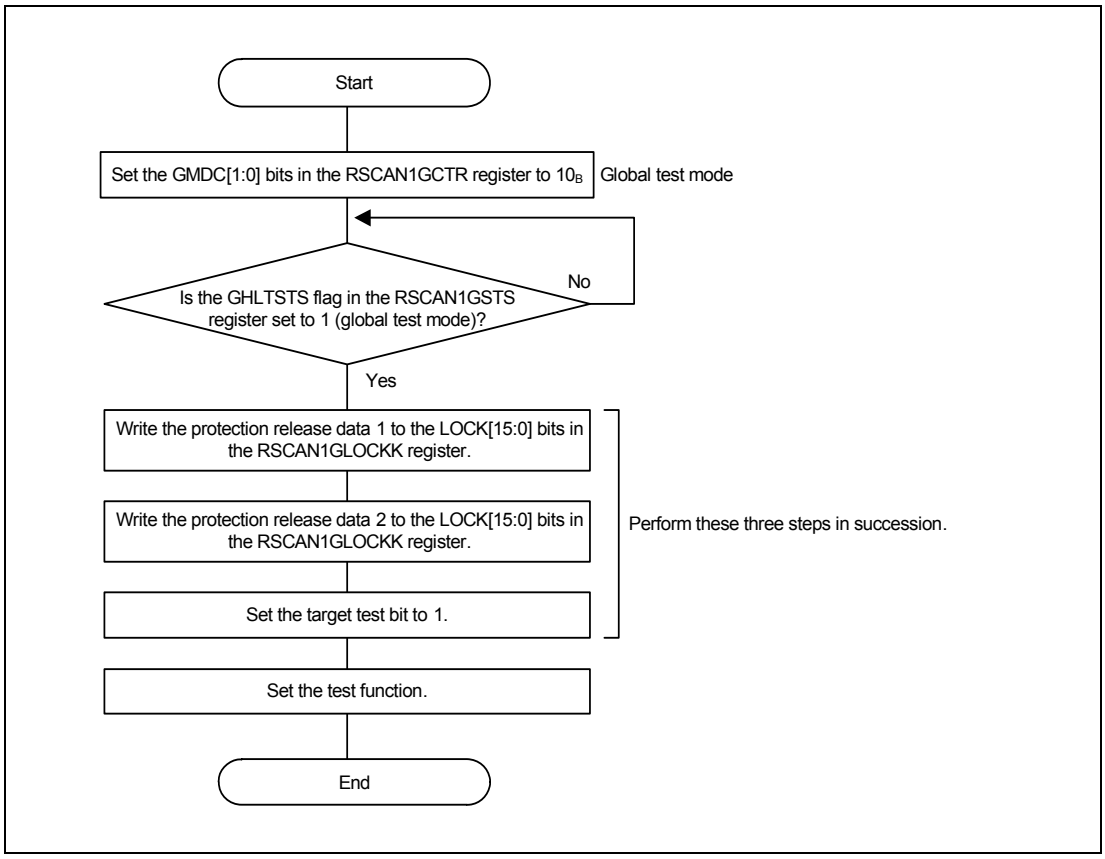


**Figure 21.72 Protection Release Procedure**

### 21.22.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write 0000 $0000_H$ to all pages of the CAN RAM.

**Figure 21.73** shows the RAM test setting procedure.

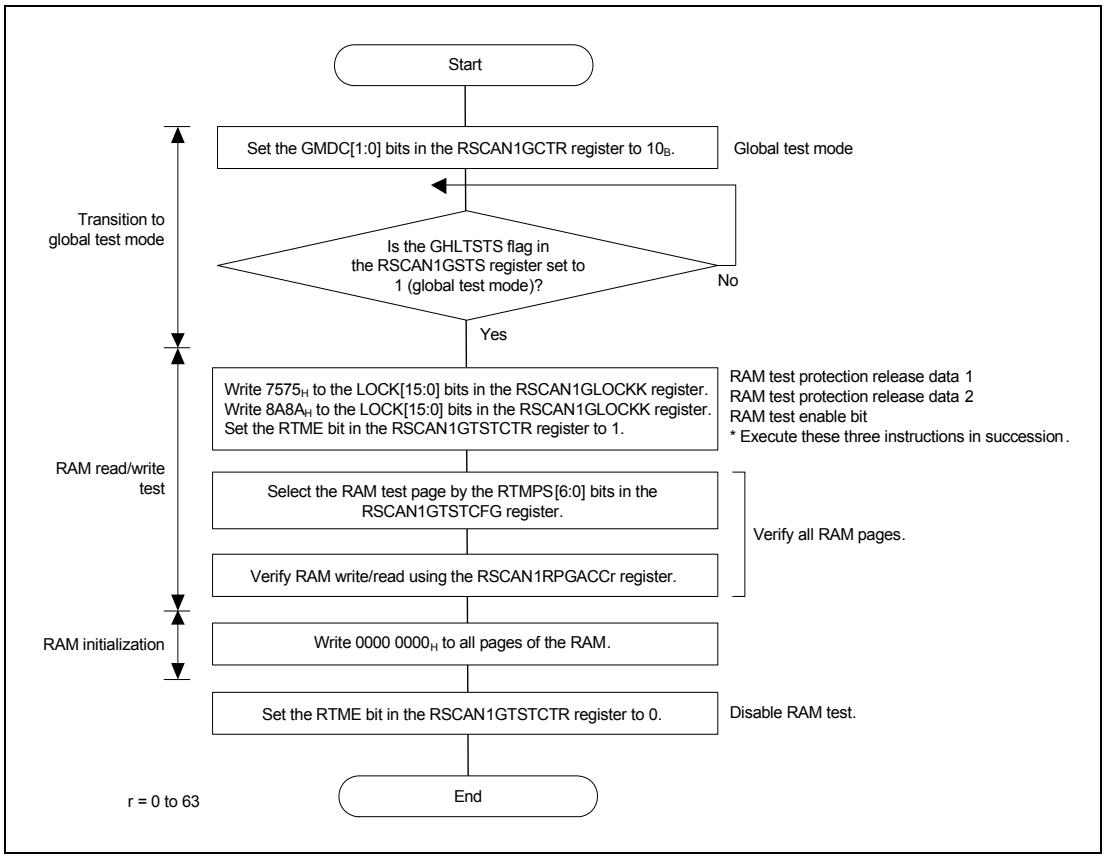

**Figure 21.73 RAM Test Setting Procedure**

# 21.23 Detection and Correction of Errors in RS-CAN RAM

## 21.23.1 ECC for the RSCAN1 RAM

**Table 21.298** gives an outline of the ECC functions for the RSCAN1 RAM.

**Table 21.298 List of the ECC Functions for the RSCAN1 RAM**

| Item | Outline of Functions |
|---|---|
| ECC error detection/ correction | The RAM is checked for ECC errors. The following options can be selected.<br>• 2-bit error detection and 1-bit error detection/correction<br>• 2-bit error detection and 1-bit error detection<br>The ECC error detection/correction can be disabled by using through mode. With the initial settings, error detection/correction is enabled. |
| Error notification | When an ECC error has occurred, the error is notified.<br>• Error notification can be enabled or disabled when an ECC 2-bit error is detected.<br>• Error notification can be enabled or disabled when an ECC 1-bit error is detected.<br>In the initial setting, 2-bit error notification is enabled and 1-bit error notification is disabled. However, when the interrupt is masked by the FEINTFMSK register, interrupt processing is not performed. |
| Error status | Monitoring for the detection of ECC 2-bit errors and for the detection of ECC 1-bit errors is available.<br>A register for clearing the error status is provided. |
| Address capture | Only one address at which an ECC error has occurred can be captured.<br>A signal is generated upon detection of ECC 2-bit or 1-bit error , and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared). |

**CAUTION**

**When ECC error detection/correction is performed, confirm initialization of the RSCAN1 RAM (RSCAN1GSTS.GRAMINIT = 0) before it is used.**

## 21.23.2 Interrupt Request

**Table 21.299** lists the ECC interrupt request of RSCAN1 RAM.

**Table 21.299 RS-CAN ECC Interrupt Request (FE-Level Maskable Interrupt)**

| Unit Interrupt Signal Name | Outline | Name | DMA Trigger Number |
|---|---|---|---|
| ECCDCNRAM1FEIF | RSCAN ECC bit error interrupt | INTECCDCNRAM1 | — |

### 21.23.3 List of Registers

The registers for RSCAN1 are listed in the following table.

**Table 21.300 Registers**

| Module | Register | Abbreviation | Address |
|---|---|---|---|
| ECCCAN1 | RSCAN1 ECC Control Register | ECCRCAN1CTL | FFC7 $1020_H$ |
| ECCCAN1 | RSCAN1 ECC Test Mode Control Register | ECCRCAN1TMC | FFC7 $1024_H$ |
| ECCCAN1 | RSCAN1 ECC Encode/Decode Input/Output Replacement Register | ECCRCAN1TED | FFC7 $102C_H$ |
| ECCCAN1 | RSCAN1 ECC Redundant Bit Data Control Test Register | ECCRCAN1TRC | FFC7 $1028_H$ |
| ECCCAN1 | RSCAN1 ECC Redundant Bit Input/Output Replacement Buffer Register | ECCRCAN1ERDB | FFC7 $1028_H$ |
| ECCCAN1 | RSCAN1 ECC Encode Test Register | ECCRCAN1ECRD | FFC7 $1029_H$ |
| ECCCAN1 | RSCAN1 ECC 7-Bit Redundant Bit Data Hold Test Register | ECCRCAN1HORD | FFC7 $102A_H$ |
| ECCCAN1 | RSCAN1 ECC Decode Syndrome Data Register | ECCRCAN1SYND | FFC7 $102B_H$ |
| ECCCAN1 | RSCAN1 ECC Error Address Register 0 | ECCRCAN1AD0 | FFC7 $1030_H$ |

## 21.23.4 ECCRCANnCTL — RSCAN1 ECC Control Register

The ECCRCANnCTL register controls the mode of the ECC and the status for RSCAN1.

Bits 7, 5 and 4 should be set (written) while the RSCAN1 operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be $01_B$.

**Access:** This register can be read or written in 16-bit units.

**Address:** See **Table 21.300, Registers**.

**Value after reset:** Undefined

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | EMCA1 | EMCA0 | — | — | ECCOVFF | ECER2C | ECER1C | — | ECTHM | — | EC1ECP | EC2EDIC | EC1EDIC | ECER2F | ECER1F | ECEMF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | Undefined |
| R/W | R/W*1 | R/W*1 | R | R | R | R/W*1 | R/W*1 | R | R/W | R | R/W | R/W | R/W | R | R | R |

Note 1. These bits are always read as 0.

**Table 21.301 ECCRCANnCTL Register Contents (1/2)**

| Bit position | Bit Name | Function |
|---|---|---|
| 15 | EMCA1 | Access control bits 1 and 0 to ECC mode selection bit<br>These bits specify whether modifying the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are $01_B$, writing to bit 7 is enabled. |
| 14 | EMCA0 | |
| 13, 12 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 11 | ECCOVFF | By detecting an error while the error status is set and the new error has anotheraddress than the already latched (not cleared or reset is not issued), this bit is set and error notification is generated. |

| ECCOVFF | Operation explanation |
|---|---|
| 0 | Overflow has not occurred after reset of clearing ECER2F and ECER1F.<br>Clearing at<br>(1) Reset<br>(2) Writing ECER2C = 1 or ECER1C = 1<br>(3) Selecting through mode enable (ECTHM = 1) |
| 1 | Error address register overflowed. |

| | | |
|---|---|---|
| 10 | ECER2C | 2-bit ECC error detection flag clear bit<br>This bit is used to clear the 2 bit error detection flag of ECER2F (bit 2).<br>This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. |
| 9 | ECER1C | 1-bit ECC error correction accumulation flag clear bit<br>This bit is used to clear the 1 bit error detection/correction flag of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. |
| 8 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 7 | ECTHM | ECC function through mode selection bit<br>This bit is used to set enabling and disabling of ECC.<br><br>Setting this bit to 1 disables ECC function.<br>When writing to this bit, (0, 1) must be written to (EMCA1, EMCA0) at the same time.<br>0: Through mode is disabled (normal operation mode).<br>1: Through mode is enabled. (ECC function disable) |

**Table 21.301 ECCRCANnCTL Register Contents (2/2)**

| Bit position | Bit Name | Function |
|---|---|---|
| 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | EC1ECP | 1-bit error correction enable bit<br>This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled.<br>0: When 1-bit error is detected, the error will be corrected.<br>1: When 1-bit error is detected, the error will not be corrected. |
| 4 | EC2EDIC | 2-bit error detection interrupt control bit<br>This bit controls whether to generate an interrupt when 2-bit error is detected.<br>0: When 2-bit error is detected, a INTECCDCNRAMn interrupt will not be generated.<br>1: When 2-bit error is detected, a INTECCDCNRAMn interrupt will be generated. |
| 3 | EC1EDIC | 1-bit error detection interrupt control bit<br>This bit controls whether to generate an interrupt when 1-bit error is detected.<br>0: When 1-bit error is detected, a INTECCDCNRAMn interrupt will not be generated.<br>1: When 1-bit error is detected, a INTECCDCNRAMn interrupt will be generated. |
| 2 | ECER2F | 2-bit error detection flag bit<br>This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (INTECCDCNRAMn) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). If 2-bit error is detected again while this bit is set, an interrupt signal will not be generated.<br>0: 2-bit error has not occurred since this bit was cleared.<br>1: 2-bit error has occurred. |
| 1 | ECER1F | 1-bit error detection/correction flag bit<br>This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1).<br>0: 1-bit error has not occurred since this bit was cleared.<br>1: 1-bit error has occurred. |
| 0 | ECEMF | ECC error message flag<br>This flag indicates whether an error exists in the current read data. This bit is updated whenever the RAM reads data. This bit might be set if it is read before initialization of the RAM. This bit is cleared at the time of through mode enable selection (ECTHM = 1) and when there is no 1 bit error in the decode circuit input data.<br>0: The currently-read RAM data does not have bit errors.<br>1: The currently-read RAM data have bit errors. |

**CAUTION**

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

We recommend initializing the RAM before clearing bits 2 and 1.

## 21.23.5 ECCRCANnTMC — RSCAN1 ECC Test Mode Control Register

The ECCRCANnTMC register switches to and controls the test mode.

This register can be used when RS-CAN is not accessed to RAM.

**Access:** This register can be read or written in 16-bit units.

**Address:** See **Table 21.300, Registers**.

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ETMA1 | ETMA0 | — | — | — | — | — | — | ECTMCE | — | — | ECTRRS | ECREOS | ECENS | ECDCS | ECREIS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W*1 | R/W*1 | R | R | R | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W |

Note 1. These bits are always read as 0.

**Table 21.302 ECCRCANnTMC Register Contents (1/2)**

| Bit position | Bit Name | Function |
|---|---|---|
| 15 | ETMA1 | Access control bits 1 and 0 to ECC test mode bit<br>These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.<br>When these bits are $10_B$, writing to bit 7 is enabled. |
| 14 | ETMA0 | |
| 13 to 8 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 7 | ECTMCE | ECC test mode enable bit<br>This bit specifies whether to enable access to the test registers and test control bits. When writing to this bit, (1, 0) should be written to (ETMA1, ETMA0) at the same time.<br>0: Access to the test mode registers and bits is disabled.<br>1: Access to the test mode registers and bits is enabled.<br>Test registers: ECCRCANnTED, ECCRCANnTRC, ECCRCANnSYND, ECCRCANnHORD, ECCRCANnECRD, ECCRCANnERDB<br>Register test control bit: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS |
| 6, 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | ECTRRS | ECC RAM read test mode selection bit<br>Select reading destination when reading ECCRCANnTED register and reading destination when reading ECCRCANnERDB register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0:The read value of the ECCRCANnTED register is the write value of the ECCRCANnTED register.<br>The read value of the ECCRCANnERDB register is the write value of the ECCRCANnERDB register.<br>1: The read value of the ECCRCANnTED register can read RAM data.<br>The read value of the ECCRCANnERDB register is the ECC data to be written to RAM. |
| 3 | ECREOS | ECC redundant bit output data selection bit<br>This bit is used to identifyand select the ECC data to be stored in RAM as ECC data generated for write data or the value of the ECCRCANnERDB register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously).<br>This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: Store ECC data generated for write data to RAM.<br>1: Store the value of ECCRCANnERDB register to RAM. |

**Table 21.302 ECCRCANnTMC Register Contents (2/2)**

| Bit position | Bit Name | Function |
|---|---|---|
| 2 | ECENS | ECC encoder input selection bit<br>This bit is used to identify the targeted data for ECC data generation as write data to RAM or the value of the ECCRCANnTED register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously).<br>This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: Generate ECC data from the write data to RAM.<br>1: Generate ECC data from the value of the ECCRCANnTED register. |
| 1 | ECDCS | ECC decoder input selection bit<br>This bit is used to indetifyand select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCANnTED register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: Generate syndrome code from RAM data and detect errors.<br>1: Generate syndrome code from the value of the ECCRCANnTED register and detect errors. |
| 0 | ECREIS | ECC redundant bit input data selection bit<br>This bit is used to indetify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCANnERDB register.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: Generate syndrome code from ECC data stored in RAM and detect errors.<br>1: Generate syndrome code from the value of the ECCRCANnERDB register and detect errors. |

## 21.23.6 ECCRCANnTED — RSCAN1 ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

The value of the register can be used to generate ECC data or syndrome code.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), it is accessible. When ECCRCANnTMC.ECTMCE = 0, writing to this register is ignored and 0000 $0000_H$ is read.

This register can be used when RS-CAN is not accessed to RAM.

**Access:** This register can be read or written in 32-bit units.

**Address:** See **Table 21.300, Registers**.

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ECEDB[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 21.303 ECCRCANnTED Register Contents**

| Bit position | Bit Name | Function |
|---|---|---|
| 31 to 0 | ECEDB[31:0] | When ECCRCANnTMC.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM.<br>When ECCRCANnTMC.ECDCS = 1, the value of this register is used to generate syndrome code and the value of this register is stored in ECC decode syndrome data register (ECCRCANnSYND).<br>In addition, when ECCRCANnTMC.ECTRRS = 1, RAM data [31:0], instead of written data, is read for the value of this register. |

## 21.23.7 ECCRCANnTRC — RSCAN1 ECC Redundant Bit Data Control Test Register

In ECC test mode, this test register, for ECC data, consists of four 8-bit registers, ECCRCANnSYND, ECCRCANnHORD, ECCRCANnECRD, and ECCRSCAN1ERDB.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register can be accessed. When ECCRCANnTMC.ECTMCE = 0, writing to this register is ignored and 0000 $0000_H$ is read.

This register can be used when RS-CAN is not accessed to RAM.

**Access:** This register can be read or written in 32-bit units.

**Address:** See **Table 21.300, Registers**.

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ECCRCANnSYND (See **Section 21.23.8**) | | | | | | | | ECCRCANnHORD (See **Section 21.23.9**) | | | | | | | |

## 21.23.8 ECCRCANnSYND — RSCAN1 ECC Decode Syndrome Data Register

In ECC test mode, this is a read-only register for storing generated syndrome code.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCANnTMC.ECTMCE = 0), $00_H$ is read.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** See **Table 21.300, Registers**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | SYND6 | SYND5 | SYND4 | SYND3 | SYND2 | SYND1 | SYND0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 21.304 ECCRCANnSYND Register Contents**

| Bit position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | SYND[6:0] | The generated syndrome code is stored as needed. |

## 21.23.9 ECCRCANnHORD — RSCAN1 ECC 7-Bit Redundant Bit Data Hold Test Register

In ECC test mode, this register is used to store ECC data for read RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCANnTMC.ECTMCE = 0), $00_H$ is read.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** See **Table 21.300, Registers**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | HORD6 | HORD5 | HORD4 | HORD3 | HORD2 | HORD1 | HORD0 |

| R/W | R | R | R | R | R | R | R | R |

**Table 21.305 ECCRCANnHORD Register Contents**

| Bit position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | HORD[6:0] | ECC code for read RAM data is stored as needed.<br>When ECCRCANnTMC.ECTRRS = 1 and ECCRCANnTED register is read, ECC code is stored. |

## 21.23.10 ECCRCANnECRD — RSCAN1 ECC Encode Test Register

In ECC test mode, this is a read-only register for storing ECC data generated for write RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCANnTMC.ECTMCE = 0), $00_H$ is read.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** See **Table 21.300, Registers**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | ECRD6 | ECRD5 | ECRD4 | ECRD3 | ECRD2 | ECRD1 | ECRD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 21.306 ECCRCANnECRD Register Contents**

| Bit position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | ECRD[6:0] | These bits can read ECC data generated at the time of RAM data writing, and can read ECC data for the data written to the ECCRCANnTED register when ECCRCANnTMC.ECENS = 1. |

## 21.23.11 ECCRCANnERDB — RSCAN1 ECC Redundant Bit Input/Output Replacement Buffer Register

In ECC test mode, this register handles ECC data.

The value of this register can be used as ECC data generated at the time of RAM writing or ECC data read at the time of RAM data reading.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCANnTMC.ECTMCE = 0), $00_H$ is read.

**Access:** This register can be read or written in 8-bit units.

**Address:** See **Table 21.300, Registers**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | ERDB6 | ERDB5 | ERDB4 | ERDB3 | ERDB2 | ERDB1 | ERDB0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 21.307 ECCRCANnERDB Register Contents**

| Bit position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ERDB[6:0] | When ECCRCANnTMC.ECREOS = 1, these bits store the value of this register as ECC data to RAM.<br>When ECCRCANnTMC.ECREIS = 1, the value of this register is read as ECC data read from RAM.<br>When ECCRCANnTMC.ECTRRS = 1, ECC data to be stored in RAM is read instead of the write data for the read value of this register. |

## 21.23.12 ECCRCAN1AD0 — RSCAN1 ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ECCCAN1_base > + $10_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | ECEAD[30:16] | | | | | | | | | | | | | | |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.308 ECCRCAN1AD0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset is returned. |
| 30 to 0 | ECEAD[30:0] | ECEAD0 is a read-only register to hold the address at which an ECC error has occurred.<br>If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECEAD0 as the address at which the ECC error has occurred.<br>The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored.<br>Only one address can be held in ECEAD0 |

## 21.23.13 SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the CSIHn ECC registers and the RSCAN1 ECC registers. For detail, see **Section 17.7.14, SELB_READTEST — ECCREAD Test Select Register**.

## 21.24 Notes on the RS-CAN Module

- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCAN1GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCAN1CmSTS register (m = 6) for transitions.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCAN1TMCp) of the corresponding transmit buffer to $00_H$. The status register (RSCAN1TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCAN1TMTRSTSy, RSCAN1TMTARSTSy, RSCAN1TMTCSTSy, and RSCAN1TMTASTSy), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (register RSCAN1TMIECy) to 0 (transmit buffer interrupt is disabled).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not be allocated to transmit queues.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- The values of unused receive buffers (RSCAN1RMIDq, RSCAN1RMPTRq, RSCAN1RMDF0q, and RSCAN1RMDF1q registers), receive FIFO buffer access registers (RSCAN1RFIDx, RSCAN1RFPTRx, RSCAN1RFDF0x, and RSCAN1RFDF1x registers), and transmit/receive FIFO buffer access registers (RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers) are undefined when the RS-CAN module transitions to global operation mode or global test mode after exiting from global reset mode.

# Section 22 Window Watchdog Timer (WDTA)

This section contains a generic description of the Window Watchdog Timer (WDTA).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of WDTA.

## 22.1 Features of RH850/F1K WDTA

### 22.1.1 Number of Units and Channels

This microcontroller has the following number of WDTA units.

**Table 22.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 2 | | |
| Name | WDTAn (n = 0, 1) | | |

**Table 22.2 Index**

| Index | Description |
|---|---|
| n | Throughout this section, the individual window watchdog timer units are identified by the index “n”: for example, WDTAnWDTE (n = 0, 1) is the WDTAn enable register. |

### 22.1.2 Register Base Address

WDTAn base addresses are listed in the following table.

WDTAn register addresses are given as offsets from the base addresses.

**Table 22.3 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <WDTA0_base> | FFED $0000_H$ |
| <WDTA1_base> | FFED $1000_H$ |

### 22.1.3 Clock Supply

The WDTAn clock supply is shown in the following table.

**Table 22.4 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| WDTA0 | WDTATCKI | CKSCLK_AWDTA | Timer count clock |
| | Register access clock | CPUCLK2 | Bus clock |
| WDTA1 | WDTATCKI | LS IntOSC | Timer count clock |
| | Register access clock | CPUCLK2 | Bus clock |

### 22.1.4 Interrupt Request

WDTAn interrupt requests are listed in the following table.

**Table 22.5 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **WDTA0** | | | |
| INTWDTAn | WDTA0 75% interrupt | 40 | — |
| **WDTA1** | | | |
| INTWDTAn | WDTA1 75% interrupt | 41 | — |

**Table 22.6 Interrupt Request (FE Level Non-Maskable Interrupt)**

| Unit Interrupt Signal | Description | Interrupt Name | DMA Trigger Number |
|---|---|---|---|
| **WDTA0** | | | |
| WDTAnTNMI | WDTA0 FENMI interrupt<br>(in WDTA error detection mode with an NMI request) | WDTA0NMI | — |
| **WDTA1** | | | |
| WDTAnTNMI | WDTA1 FENMI interrupt<br>(in the WDTA error detection mode with an NMI request) | WDTA1NMI | — |

### 22.1.5 Reset Sources

WDTAn reset sources are listed in the following table. WDTAn is initialized by these reset sources.

**Table 22.7 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| WDTA0 | Reset sources (AWORES) |
| WDTA1 | All reset sources (ISORES) |

**Note:** WDTA1 is stopped in STOP mode.

## 22.2 Overview

### 22.2.1 Functional Overview

WDTA has the following functions:

- Selection of the operation mode after reset, by using the option bytes

Enabling/disabling of WDTA, starting/stopping of the counter after reset, setting of the counter overflow time, and enabling/disabling of the VAC function can be selected. WDTA startup options to be set by the option bytes are described in **Table 22.8**.

- WDTA trigger function

Writing an activation code to the WDTA trigger register starts WDTA and restarts the counter. Activation codes include fixed activation codes and variable activation codes (VAC function). In a variable activation code, a different value from the previous time (variable value) is written to the WDTA trigger register, which causes the counter to be restarted.

- 75% interrupt request signal

An interrupt request signal can be generated when the WDTA counter reaches 75% of the overflow interval time (this function can be enabled or disabled by the setting of WDTAnMD.WDTAnWIE).

- Window function

The period during which writing to the WDTA trigger register is valid (window-open period) can be set. Writing to the WDTA trigger register during a period other than the window-open period causes an error.

- WDTA error detection function

When an error is detected, a non-maskable interrupt request or an internal reset is generated.

For details about the error sources, see **Section 22.5.3, WDTA Error Detection**.

**Table 22.8 WDTA Start-Up Options**

| Start-Up Option | Function | Description | Option Byte |
|---|---|---|---|
| OPWDEN | WDTA setting | Enables/disables the WDTA.<br>0: WDTA is disabled<br>1: WDTA is enabled | • WDTA0: OPBT0.WDT0_0<br>• WDTA1: OPBT0.WDT1_0 |
| OPWDOVF[2:0] | Overflow interval time reset value setting | Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0]. | • WDTA0/WDTA1: OPBT0.WDT_[2:0] |
| OPWDRUN | Start mode setting | Specifies the start mode.<br>0: Software trigger start mode<br>1: Default start mode<br><br>For details, see **Section 22.5.1, WDTA after Reset Release**. | • WDTA0: OPBT0.WDT0_1<br>• WDTA1: OPBT0.WDT1_1 |
| OPWDVAC | Variable activation code selection | Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing.<br>0: WDTAnWDTE (fixed)<br>1: WDTAnEVAC (variable)<br><br>When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed (ACH). When WDTAnEVAC is selected, the activation code to be written to the register is variable. For details, see **Section 22.5.2, WDTA Trigger** and **22.5.2.1, Calculating an Activation Code when the VAC Function is Used**. | • WDTA0: OPBT0.WDT0_3<br>• WDTA1: OPBT0.WDT1_3 |

**NOTE**

For the option byte settings, see **Section 37.9, Option Bytes**.

### 22.2.2 Block Diagram

**Figure 22.1** shows the main components of the WDTA.

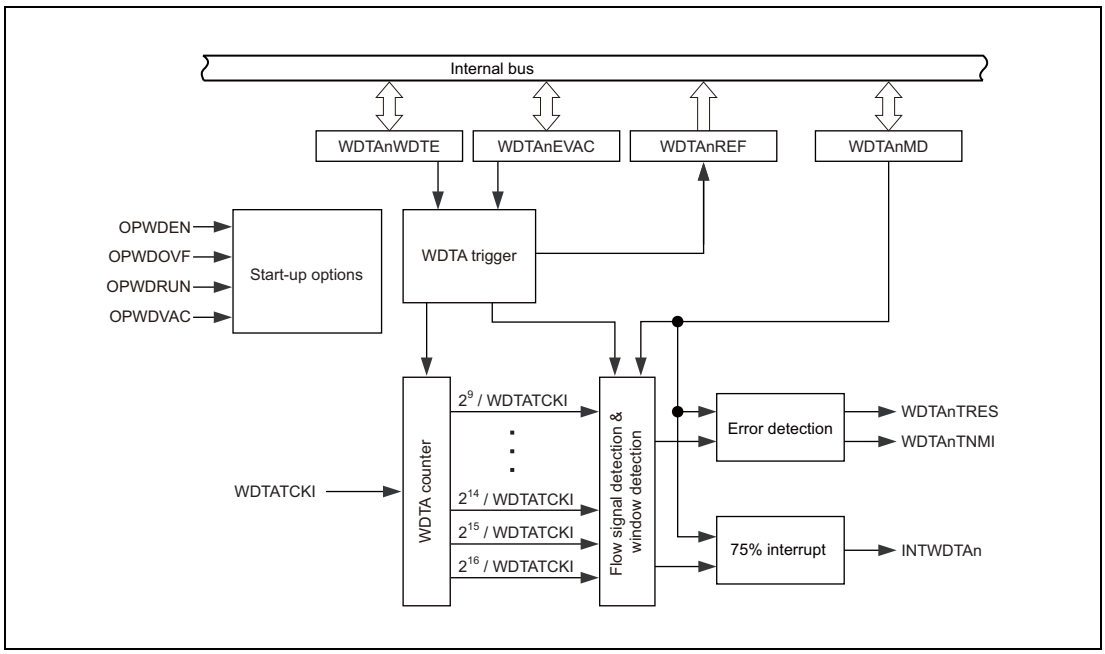

**Figure 22.1 Block Diagram of the Window Watchdog Timer A**

## 22.3 Registers

### 22.3.1 List of Registers

WDTA registers are listed in the following table.

For details about <WDTAn_base>, see **Section 22.1.2, Register Base Address**.

**Table 22.9 List of Registers**

| Module | Register | Symbol | Address |
|---|---|---|---|
| WDTAn | WDTA enable register | WDTAnWDTE | <WDTAn_base> + $0000_H$ |
| | WDTA enable VAC register | WDTAnEVAC | <WDTAn_base> + $0004_H$ |
| | WDTA reference value register | WDTAnREF | <WDTAn_base> + $0008_H$ |
| | WDTA mode register | WDTAnMD | <WDTAn_base> + $000C_H$ |

### 22.3.2 WDTAnWDTE — WDTA Enable Register

This register is the WDTA trigger register when the VAC function is not used (start-up option OPWDVAC = 0).

Writing $AC_H$ to this register generates a WDTA trigger and starts or restarts the WDTA counter. See **Section 22.5.2, WDTA Trigger**, for details.

The behavior of this register depends on the setting of the start-up option (OPWDVAC), see **Table 22.12, WDTAnWDTE Behavior**.

WDTA0 is initialized by AWORES.

WDTA1 is initialized by a reset of any type.

**Access:** This register can be read or written in 8-bit units.

**Address:** <WDTAn_base> + $0000_H$

**Value after reset:** The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See **Table 22.11, Values of WDTAnRUN7 after Reset**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WDTAnRUN[7:0] | | | | | | | |
| Value after reset | 0/1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 22.10 WDTAnWDTE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | WDTAnRUN [7:0] | Writing the fixed activation code ($AC_H$) generates the WDTA trigger and starts/ restarts the WDTAn counter. Writing a value other than $AC_H$ generates an error. The WDTAn cannot be stopped once it is started. See **Table 22.12, WDTAnWDTE Behavior**, when reading from or writing to these bits. |

The WDTAnRUN7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is disabled (OPWDVAC = 0). **Table 22.11** lists the values of the WDTAnRUN7 bit after reset according to the start-up options.

**Table 22.11 Values of WDTAnRUN7 after Reset**

| Start-Up Options | | | Start Mode | Value of WDTAnRUN7 after Reset |
|---|---|---|---|---|
| OPWDEN | OPWDVAC | OPWDRUN | | |
| 1 | 0 | 1 | Default start | 1 |
| | | 0 | Software trigger start | 0 |

The behavior of WDTAnWDTE during read/write accesses depends on the OPWDVAC setting, as shown in **Table 22.12, WDTAnWDTE Behavior**.

**Table 22.12 WDTAnWDTE Behavior**

| OPWDVAC | Description | WDTAnWDTE | |
|---|---|---|---|
| | | Read | Write |
| 0 | The VAC function is disabled.<br>WDTAnWDTE is enabled. | $2C_H$ is returned (in software trigger start mode, before the activation of WDTAn).<br>$AC_H$ is returned (after the activation of WDTAn). | WDTA trigger<br>Write $AC_H$ *1. |
| 1 | The VAC function is enabled.<br>WDTAnWDTE is disabled. | $2C_H$ is returned. | Writing is ignored. |

Note 1. Any other write value will cause an error.

### 22.3.3 WDTAnEVAC — WDTA Enable VAC Register

This register is the WDTA trigger register when the VAC function is used (start-up option OPWDVAC = 1).

Writing a correct activation code to this register generates a WDTA trigger and starts or restarts the WDTA counter. For details, see **Section 22.5.2, WDTA Trigger**. For details about the activation codes when the VAC function is used, see **Section 22.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

The behavior of this register depends on the setting of the start-up option (OPWDVAC). See **Table 22.15, WDTAnEVAC Behavior**.

WDTA0 is initialized by AWORES.

WDTA1 is initialized by a reset of any type.

**Access:** This register can be read or written in 8-bit units.

**Address:** <WDTAn_base> + $0004_H$

**Value after reset:** The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See **Table 22.14, Values of WDTAnEVAC7 after Reset**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WDTAnEVAC[7:0] | | | | | | | |
| Value after reset | 0/1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 22.13 WDTAnEVAC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | WDTAnEVAC [7:0] | Writing a variable activation code generates the WDTA trigger and starts/ restarts the WDTAn counter. Writing an incorrect activation code generates an error. The WDTAn cannot be stopped once it is started.<br>See **Table 22.15, WDTAnEVAC Behavior**, when reading from or writing to these bits. |

The WDTAnEVAC7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is enabled (OPWDVAC = 1). **Table 22.14** lists the values of the WDTAnEVAC7 bit after reset according to the start-up options.

**Table 22.14 Values of WDTAnEVAC7 after Reset**

| Start-Up Options | | | Start Mode | Value of WDTAnEVAC7 after Reset |
|---|---|---|---|---|
| OPWDEN | OPWDVAC | OPWDRUN | | |
| 1 | 1 | 1 | Default start | 1 |
| | | 0 | Software trigger start | 0 |

The behavior of WDTAnEVAC during read/write accesses depends on the OPWDVAC setting, as shown in **Table 22.15**.

**Table 22.15 WDTAnEVAC Behavior**

| OPWDVAC | Description | WDTAnEVAC | |
|---|---|---|---|
| | | Read | Write |
| 0 | The VAC function is disabled.<br>WDTAnEVAC is disabled. | $2C_H$ is returned. | Writing is ignored. |
| 1 | The VAC function is enabled.<br>WDTAnEVAC is enabled. | $2C_H$ is returned (in software trigger start mode, before the activation of WDTAn).<br>The variable activation code written last is read (after the activation of WDTAn). | Write the variable activation code*1<br>For details, see **Section 22.5.2.1, Calculating an Activation Code when the VAC Function is Used**. |

Note 1. Any other write value will cause an error.

## 22.3.4 WDTAnREF — WDTA Reference Value Register

This register contains the reference value for calculating the activation code of the VAC function. It is automatically updated after every trigger operation. See **Section 22.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

If the VAC function is disabled (OPWDVAC = 0), reading this register returns $00_H$.

WDTA0 is initialized by AWORES.

WDTA1 is initialized by a reset of any type.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <WDTAn_base> + $0008_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WDTAnREF[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 22.16 WDTAnREF Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | WDTAnREF[7:0] | Reference value for activation code calculation for the VAC function |

### 22.3.5 WDTAnMD — WDTA Mode Register

This register specifies the overflow interval time, 75% interrupt enable/disable, the error mode, and the window-open period.

The value of this register can be updated only once after reset release and before the first trigger is generated. The updated value will be effective after the WDTA trigger register is written to next.

Updating this register after the first WDTA trigger is generated generates an error, but an error does not occur if the same value has been written to it.

WDTA0 is initialized by AWORES.

WDTA1 is initialized by a reset of any type.

**Access:** This register can be read or written in 8-bit units.

**Address:** <WDTAn_base> + $000C_H$

**Value after reset:** The initial value depends on the start-up options (OPWDOVF[2:0]). See **Table 22.8, WDTA Start-Up Options**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | WDTAnOVF[2:0] | | | WDTAnWIE | WDTAnERM | WDTAnWS[1:0] | |
| Value after reset | 0 | *1 | *1 | *1 | 0 | 1 | 1 | 1 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The WDTAnOVF[2:0] value after reset can be set by the start-up options OPWDOVF[2:0].

**Table 22.17 WDTAnMD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 4 | WDTAnOVF[2:0] | Selects the overflow interval time |

| WDTAn OVF2 | WDTAn OVF1 | WDTAn OVF0 | Overflow Interval Time |
|---|---|---|---|
| 0 | 0 | 0 | $2^9$ / WDTATCKI |
| 0 | 0 | 1 | $2^{10}$ / WDTATCKI |
| 0 | 1 | 0 | $2^{11}$ / WDTATCKI |
| 0 | 1 | 1 | $2^{12}$ / WDTATCKI |
| 1 | 0 | 0 | $2^{13}$ / WDTATCKI |
| 1 | 0 | 1 | $2^{14}$ / WDTATCKI |
| 1 | 1 | 0 | $2^{15}$ / WDTATCKI |
| 1 | 1 | 1 | $2^{16}$ / WDTATCKI |

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 | WDTAnWIE | Enables/disables the 75% interrupt request INTWDTAn.<br>0: INTWDTAn is disabled.<br>1: INTWDTAn is enabled. |
| 2 | WDTAnERM | Specifies the error mode.<br>0: NMI request mode<br>1: Reset mode |
| 1, 0 | WDTAnWS[1:0] | Selects the window-open period. |

| WDTAn WS1 | WDTAn WS0 | Window-Open Period |
|---|---|---|
| 0 | 0 | 25% |
| 0 | 1 | 50% |
| 1 | 0 | 75% |
| 1 | 1 | 100% |

## 22.4 Interrupt Sources

WDTA checks the status of the WDTA counter value, detects illegal accesses to the WDTA-related registers, and generates an interrupt request. The following are WDTA interrupt requests:

(1) INTWDTAn (WDTA timer count 75% interrupt request)
An interrupt request signal is generated at 75% of the counter overflow time of the WDTA timer. An interrupt request signal can be enabled or disabled by using the WDTA mode register (WDTAnMD).

(2) WDTAnTNMI (WDTA error detection interrupt)
Detection of a WDTA error to generation of an NMI interrupt request. The WDTA mode register (WDTAnMD) can be used to switch between an NMI interrupt and a reset. For details about WDTA errors, see **Section 22.5.3, WDTA Error Detection**.

# 22.5 Functions

## 22.5.1 WDTA after Reset Release

### 22.5.1.1 Start Modes

There are two start modes (software start mode and default start mode) when WDTAn starts after reset release. The start mode can be selected by the start-up option.

The start mode selection is listed in **Table 22.18**.

**Table 22.18 Start Modes**

| Start-Up Option OPWDRUN | Start Mode | Description |
|---|---|---|
| 0 | Software trigger | • The WDTA counter stops ($0000_H$) after reset release.<br>• Writing an activation code to the WDTA trigger register starts WDTA. |
| 1 | Default | The WDTA counter starts after reset release. |

### 22.5.1.2 WDTA Settings after Reset Release

(1) **Table 22.19** shows the WDTA settings after reset release.

**Table 22.19 WDTA Settings after Reset Release**

| Function | Setting | Remark |
|---|---|---|
| WDTA enable/disable | Specified by start-up options | |
| Start mode | | |
| VAC function | | |
| WDTA overflow interval time | Specified by start-up options | Modification is possible only once by the setting of the WDTA mode register (WDTAnMD). |
| 75% interrupt mode | 75% interrupt disabled | |
| Behavior on error detection | Reset generation | |
| Window-open period | 100% | |

The setting of the WDTA mode register (WDTAnMD) is enabled when the first WDTA trigger is generated (writing an activation code to WDTAnWDTE and WDTAnEVAC). Perform the WDTAnMD register setting before a WDTA trigger is generated.

Setting of WDTA by using WDTAnMD is possible only once. If the value set to WDTAnMD is changed after a WDTA trigger is generated, an error occurs. However, an error does not occur if the same value is set.

### 22.5.1.3 Default Start Mode Timing

The default start mode timing and the changes to the WDTA settings are illustrated in **Figure 22.2**.

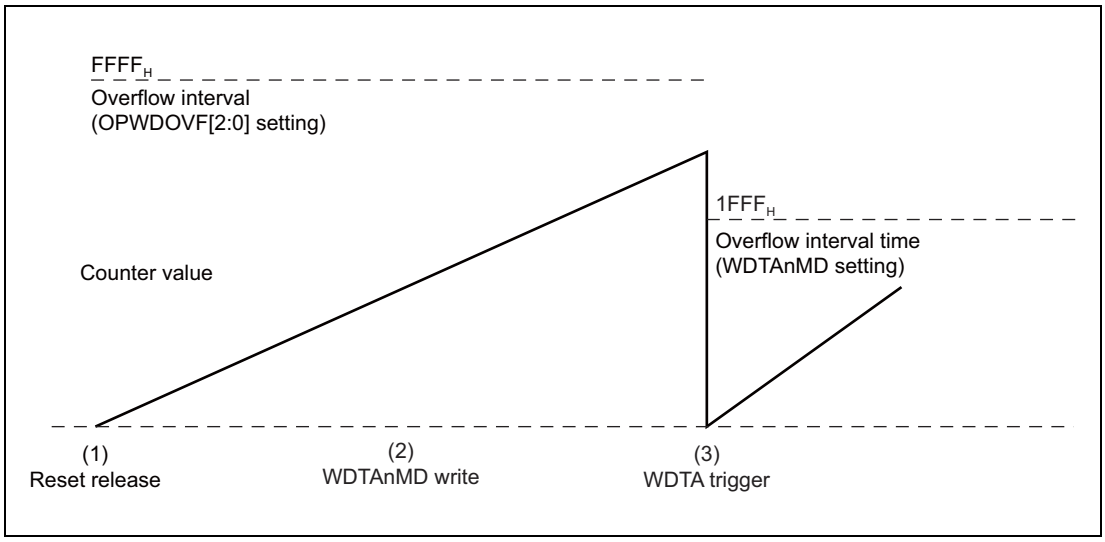

**Figure 22.2 Timing Diagram of WDTA Start in Default Start Mode**

The timing diagram shown in **Figure 22.2** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

Example: Overflow interval time after reset release
$= 2^{16}$/WDTATCKI (OPWDOVF[2:0] = $111_B$)

(2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.

(3) Write to the WDTA trigger register before the WDTA counter overflows.
The WDTAnMD setting is applied by the generation of a WDTA trigger.

Example: Overflow interval time after a WDTA trigger is generated
$= 2^{13}$/WDTATCKI

### 22.5.1.4 Software Trigger Start Mode Timing

The software trigger start mode timing and the changes to the WDTA settings are illustrated in **Figure 22.3**.

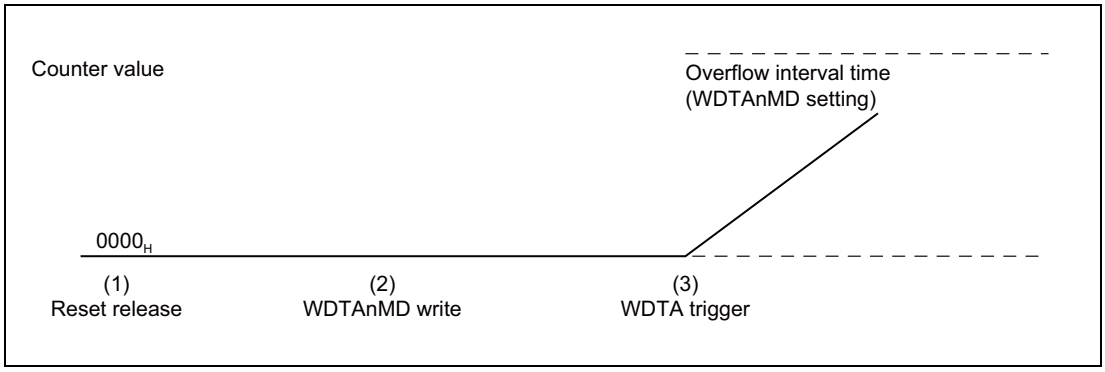

**Figure 22.3 Timing Diagram of WDTA Start in Software Trigger Start Mode**

The timing diagram shown in **Figure 22.3** shows the following behaviors:

(1) The WDTA counter value remains $0000_H$ until the first trigger is generated after reset release. The overflow interval time is set by start-up options, but this setting has no effect because the counter is not operating.

(2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.

(3) The WDTA counter starts by the generation of a WDTA trigger.
The overflow interval time specified in WDTAnMD and other settings are applied.

### 22.5.2 WDTA Trigger

Writing a special value called an activation code to the WDTA enable register (WDTAnWDTE) and the WDTA enable VAC register (WDTAnEVAC) leads to generation of a WDTA trigger.

The WDTA trigger has the following functions:

- Starting the WDTA counter in software trigger start mode
- Restarting the WDTA counter
- Setting the WDTA mode specified by the WDTAnMD register (only for the first WDTA trigger after reset release)

The WDTA trigger register, which generates a WDTA trigger, is specified by the start-up option OPWDVAC.

**Table 22.20** lists the WDTA trigger registers and activation codes.

**Table 22.20 WDTA Trigger Registers and Activation Codes**

| Type of Activation Code | Trigger Register | Activation Code |
|---|---|---|
| Fixed (OPWDVAC = 0) | WDTAnWDTE | $AC_H$ |
| Variable (OPWDVAC = 1) | WDTAnEVAC | For details, see **22.5.2.1, Calculating an Activation Code when the VAC Function is Used**. |

**CAUTION**

- **When writing the processing to clear WDTA successively, the clear processing below is not acknowledged for the following period:**
  **"12 × CPU clock*1 cycles + 6 × WDT clock*2 cycles"**
- **After writing the processing to clear WDTA and then changing to standby mode, the clear processing below is not acknowledged for the following period after return from stand-by mode:**
  **"6 × CPU clock*1 cycles + 3 × WDT clock*2 cycles"**

Note 1. CPU clock: Clock selected by CKSC_CPUCLKS_CTL and CKSC_CPUCLKD_CTL
Note 2. WDT clock: Clock selected by CKSC_AWDTAD_CTL in WDTA0.
LS IntOSC in WDTA1.

#### 22.5.2.1 Calculating an Activation Code when the VAC Function is Used

Use the following expression to calculate the variable activation code (ExpectWDTE) to be set in the WDTA trigger register (WDTAnEVAC) when the VAC function is used, by using the WDTA reference value register (WDTAnREF):

$$\text{ExpectWDTE} = AC_H - \text{WDTAnREF (previous)}$$

Note that the value in the WDTAnREF register is updated every time a start-code is written to the trigger register WDTAnEVAC. Use the following expression to calculate the updated value of the WDTAnREF register:

WDTAnREF (following) = (rotate the value of ExpectWDTE to the left by 1 bit)

**Table 22.21** lists the variable activation codes according to the number of WDTA triggers.

**Table 22.21 Expected Variable Activation Code Development**

| No*1 | WDTAnREF (Previous) | | ExpectWDTE ($AC_H$ - WDTAnREF) | | WDTAnREF (Following) | |
|---|---|---|---|---|---|---|
| 0 | 0000 0000 | $00_H$ | 1010 1100 | $AC_H$ | 0101 1001 | $59_H$ |
| 1 | 0101 1001 | $59_H$ | 0101 0011 | $53_H$ | 1010 0110 | $A6_H$ |
| 2 | 1010 0110 | $A6_H$ | 0000 0110 | $06_H$ | 0000 1100 | $0C_H$ |
| … | … | … | … | … | … | … |

Note 1. Number of triggers after reset

**NOTE**

Writing an incorrect activation code generates an error.

### 22.5.3 WDTA Error Detection

WDTA detects an error, including generation of the WDTA count overflow or illegal operations.

The following events are detected as errors:

- WDTA counter overflow
- Incorrect activation code is written to the WDTA trigger register
- Writing to the trigger register at a time outside the window-open period
- When the setting value in the WDTA mode register (WDTAnMD) is changed after the first WDTA trigger is generated
- When the value of the WDTA mode register (WDTAnMD) is changed twice before the first WDTA trigger is generated

#### 22.5.3.1 WDTA Error Mode

When a WDTA error is detected, either an NMI interrupt or a reset is generated according to the setting of the WDTA error mode bit (WDTAnMD.WDTAnERM). The error mode bit after reset release is set to the reset mode.

- WDTAnMD.WDTAnERM = 0: NMI mode
- WDTAnMD.WDTAnERM = 1: Reset mode

**Figure 22.4** shows the reset or NMI request generation when the counter overflows and default start mode is selected.

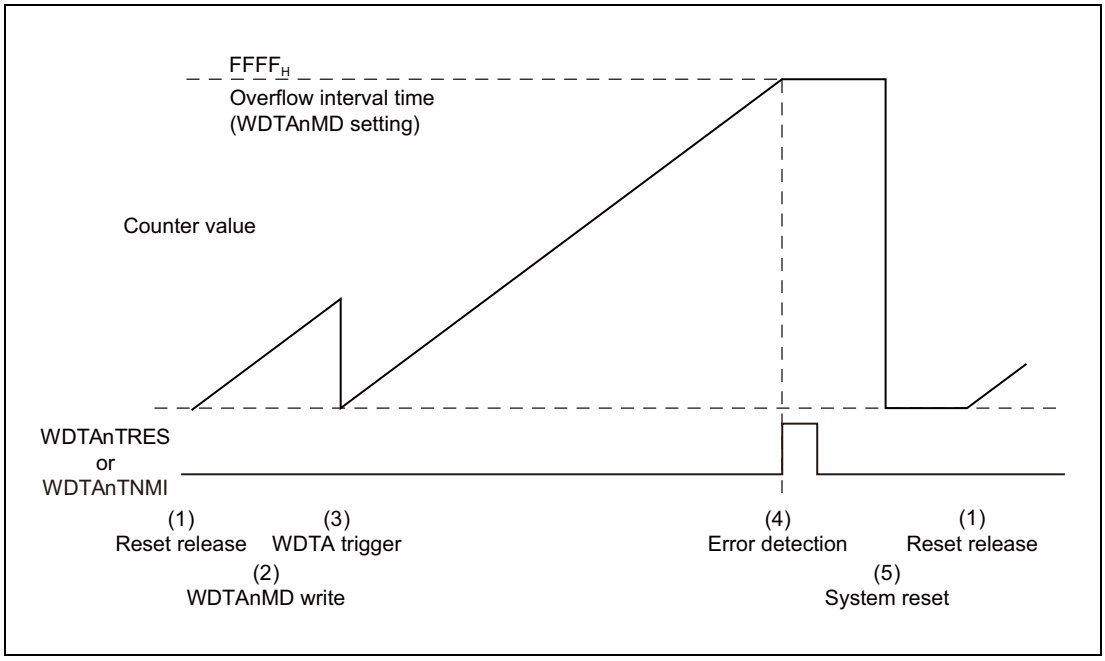

**Figure 22.4 Timing Diagram of WDTA NMI Request or Reset Generation**

The timing diagram shown in **Figure 22.4** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated.
In this case, $2^{16}$/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated.
The counter value remains until a system reset is performed.

(5) When the system is reset, the counter is cleared and stops until reset release.

### 22.5.4 75% Interrupt Request Signals

When the WDTA counter reaches 75% of the time set for the overflow interval, the interrupt request INTWDTAn is generated.

This function can be enabled or disabled by the WDTAnMD.WDTAnWIE register.

**Figure 22.5** shows the 75% interrupt request generated under following conditions:

- Default start mode is selected.
- 75% interrupt request is enabled after the first WDTA trigger is generated
- WDTA overflow interval time is $2^{16}$/WDTATCKI

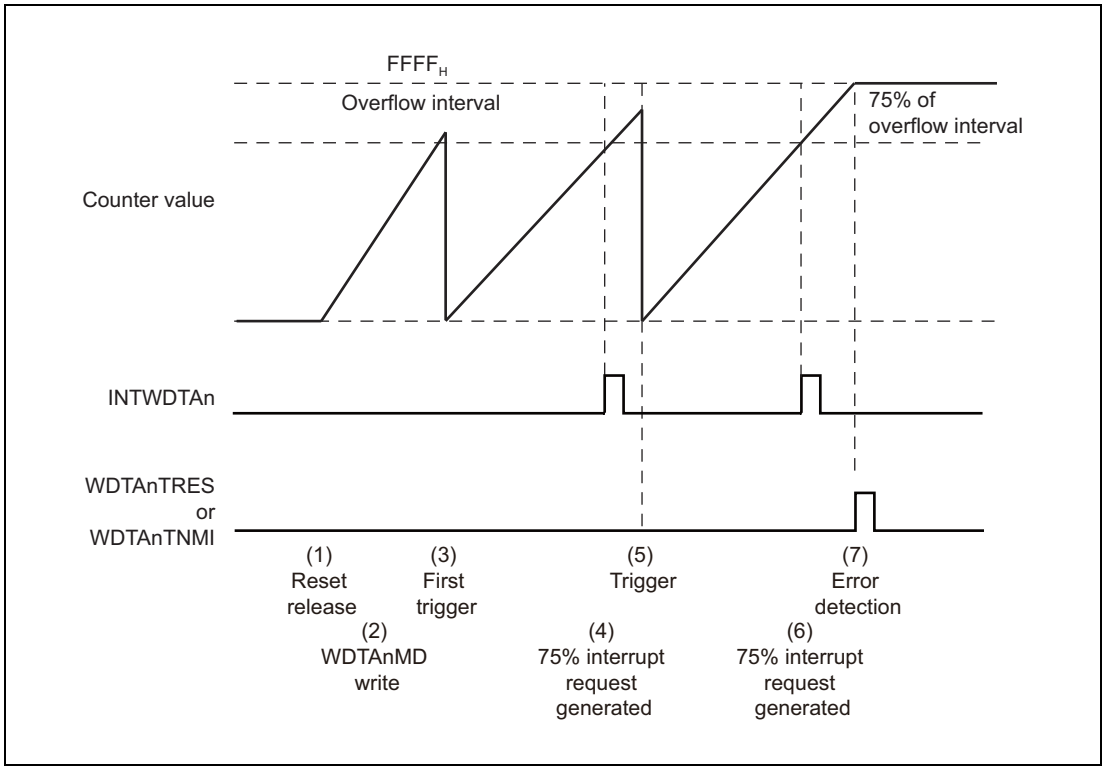

**Figure 22.5 Timing Diagram of WDTA 75% Interrupt Request Signals**

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated. In this case, $2^{16}$/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.

(5) The WDTA trigger restarts counting.

(6) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.

(7) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

### 22.5.5 Window Function

The period when a WDTA trigger is valid (window-open period) can be set. If the window-open period is set to the value less than 100%, the generation of a WDTA trigger not in the window-open period causes an error. The window-open period after reset release is 100%. The period is set to the value by the WDTAnMD.WDTAnWS[1:0] setting after the first WDTA trigger is generated.

**Figure 22.6** shows the behavior of the window function under the following conditions.

- Default start mode is selected.
- 25% window-open period is enabled after the first WDTA trigger is generated (WDTAnWS[1:0] = $00_B$)
- WDTA overflow interval time is $2^{16}$/WDTATCKI

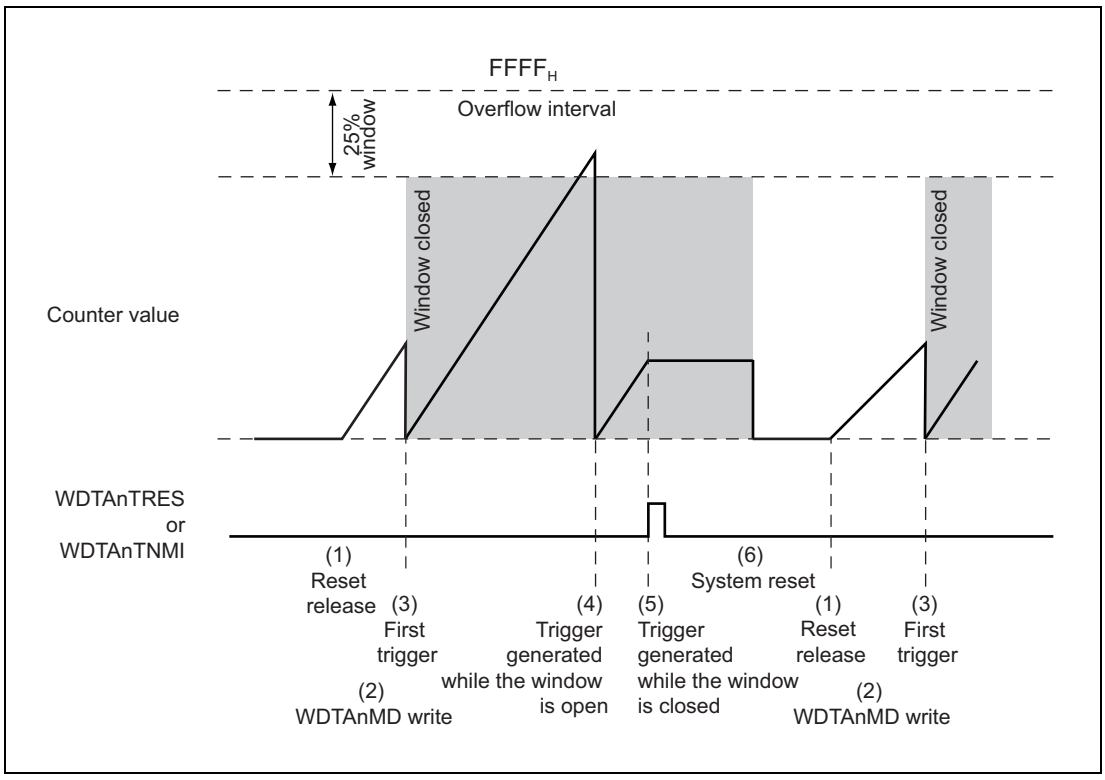

**Figure 22.6 Timing Diagram of WDTA Window Function**

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated. In this case, $2^{16}$/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) During the window-open period, the WDTA trigger restarts counting.

(5) During the window-closed period, an error is detected by the WDTA trigger. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

(6) When the system is reset, the counter is cleared and stops until reset release.

# Section 23 OS Timer (OSTM)

This section contains a generic description of the OS Timer (OSTM).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the OSTM.

## 23.1 Features of RH850/F1K OSTM

### 23.1.1 Number of Units

This microcontroller has the following number of units of the OSTM.

**Table 23.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 5 | | |
| Name | OSTMn (n = 0 to 4) | | |

**Table 23.2 Index**

| Index | Description |
|---|---|
| n | Throughout this section, the individual OSTM units are identified by the index “n”; for example, OSTMnCNT is the OSTM counter register. |

### 23.1.2 Register Base Address

OSTM base addresses are listed in the following table.

OSTM register addresses are given as offsets from the base addresses.

**Table 23.3 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <OSTM0_base> | FFD7 $0000_H$ |
| <OSTM1_base> | FFD7 $0100_H$ |
| <OSTM2_base> | FFD7 $0200_H$ |
| <OSTM3_base> | FFD7 $0300_H$ |
| <OSTM4_base> | FFD7 $0400_H$ |

### 23.1.3 Clock Supply

The OSTM clock supply is shown in the following table.

**Table 23.4 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| OSTMn (n = 0 to 4) | PCLK | CPUCLK2 | Timer count clock |
| | Register access clock | CPUCLK2 | Bus clock |

### 23.1.4 Interrupt Request

OSTM interrupt requests are listed in the following table.

**Table 23.5 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **OSTM0** | | | |
| OSTMTINT | OSTM0 interrupt | 84 (INTOSTM0) | — |

**Table 23.6 Interrupt Request (FE Level Maskable Interrupt Request)**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **OSTM0** | | | |
| OSTMTINT | OSTM0 interrupt | INTOSTM0_FE | — |
| **OSTM1** | | | |
| OSTMTINT | OSTM1 interrupt | INTOSTM1_FE | — |
| **OSTM2** | | | |
| OSTMTINT | OSTM2 interrupt | INTOSTM2_FE | — |
| **OSTM3** | | | |
| OSTMTINT | OSTM3 interrupt | INTOSTM3_FE | — |
| **OSTM4** | | | |
| OSTMTINT | OSTM4 interrupt | INTOSTM4_FE | — |

### 23.1.5 Reset Sources

OSTM reset sources are listed in the following table. OSTM is initialized by these reset sources.

**Table 23.7 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| OSTMn (n = 0 to 4) | All reset sources (ISORES) |

## 23.2 Overview

OSTM is a 32-bit timer/counter.

It can be used in interval timer mode or in free-run compare mode. The settings for operating mode specify the direction of counting (up or down) to control the generation of interrupt requests.

### 23.2.1 Functional Overview

OSTM has the following features.

- Two operating modes
  - Interval timer mode
  - Free-run compare mode
- OSTMTINT interrupt

### 23.2.2 Block Diagram

The following block diagram shows the main components of OSTM.

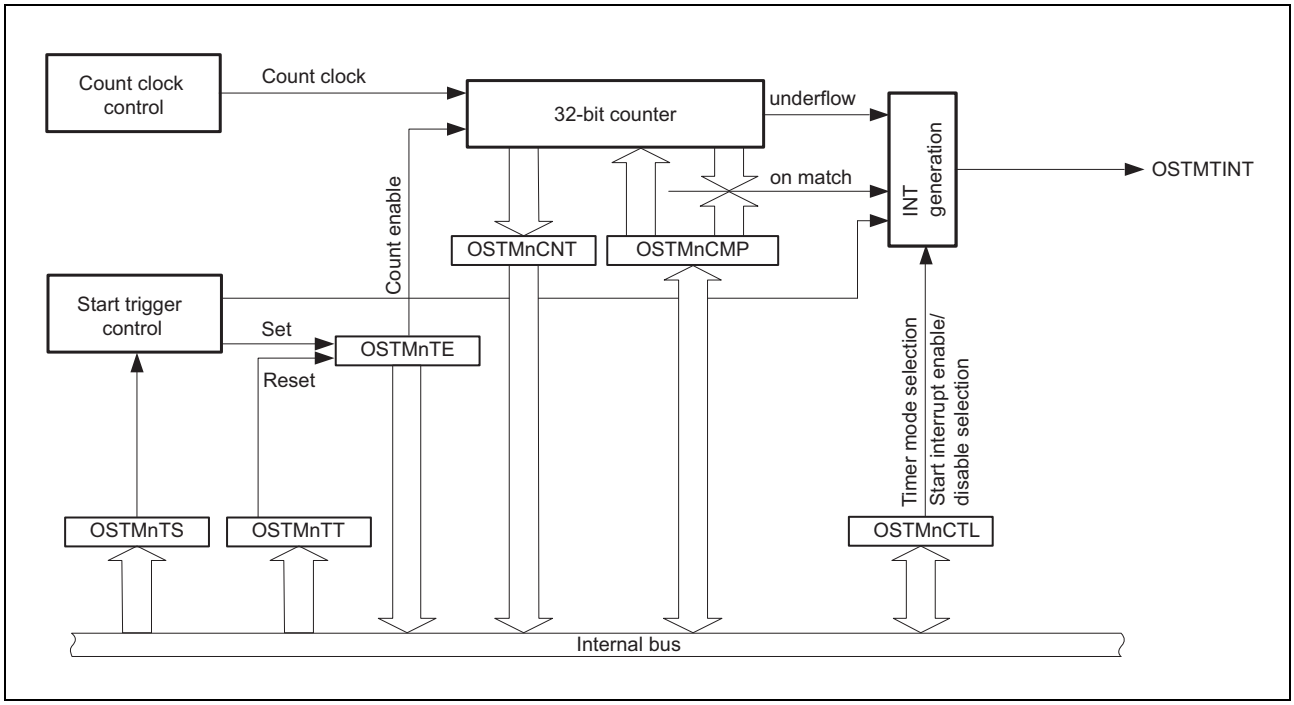

**Figure 23.1 Block Diagram of OSTM**

### 23.2.3 Count Clock

The count clock used by OSTM is PCLK.

### 23.2.4 Interrupt Sources (OSTMTINT)

An OSTMTINT interrupt request is generated on counter underflow (interval timer mode) or when the counter matches the compare value (free-run compare mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This is illustrated in the following figure.

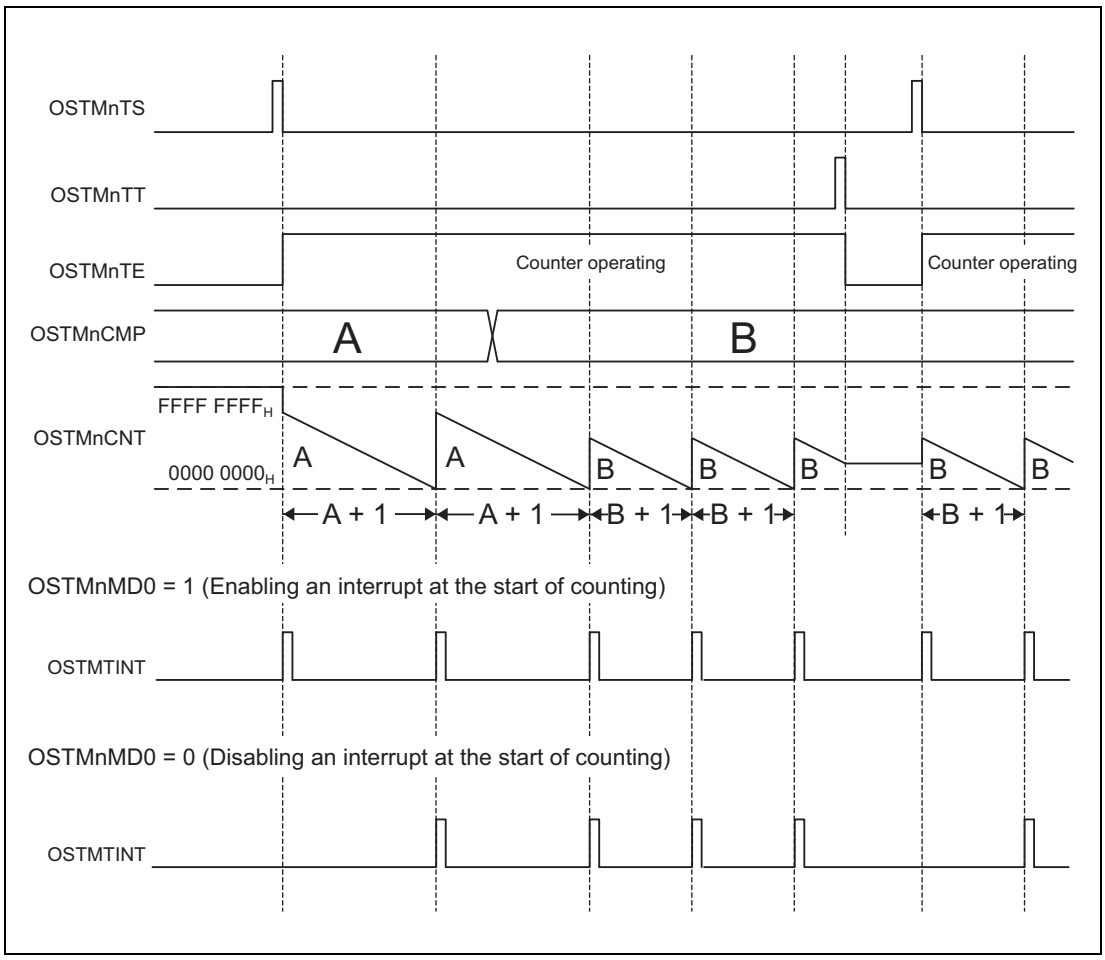

**Figure 23.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)**

## 23.3 Registers

### 23.3.1 List of Registers

OSTM registers are listed in the following table.

For details about <OSTMn_base>, see **Section 23.1.2, Register Base Address**.

**Table 23.8 Registers**

| Module | Register | Symbol | Address |
|---|---|---|---|
| OSTMn | OSTMn compare register | OSTMnCMP | <OSTMn_base> + $00_H$ |
| | OSTMn counter register | OSTMnCNT | <OSTMn_base> + $04_H$ |
| | OSTMn count enable status register | OSTMnTE | <OSTMn_base> + $10_H$ |
| | OSTMn count start trigger register | OSTMnTS | <OSTMn_base> + $14_H$ |
| | OSTMn count stop trigger register | OSTMnTT | <OSTMn_base> + $18_H$ |
| | OSTMn control register | OSTMnCTL | <OSTMn_base> + $20_H$ |
| | OSTMn emulation register | OSTMnEMU | <OSTMn_base> + $24_H$ |

### 23.3.2 OSTMnCMP — OSTMn Compare Register

This register stores the start value of the down-counter or the value with which the counter is compared, depending on the operation mode.

**Access:** This register can be read or written in 32-bit units.

**Address:** <OSTMn_base> + $00_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSTMnCMP[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSTMnCMP[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 23.9 OSTMnCMP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | OSTMnCMP [31:0] | • In interval timer mode: start value of the down-counter<br>• In free-run compare mode: compare value |

### 23.3.3 OSTMnCNT — OSTMn Counter Register

This register indicates the counter value of the timer.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <OSTMn_base> + $04_H$

**Value after reset:** FFFF $FFFF_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSTMnCNT[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSTMnCNT[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 23.10 OSTMnCNT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | OSTMnCNT [31:0] | Timer counter value |

**Table 23.11** lists the correspondence among the OSTM operating mode, counting direction, and start value. The start value indicates the value to be read after the operating mode is changed.

**Table 23.11 Correspondence among Operating Mode, Counting Direction, and Start Value**

| Timer Operating Mode | OSTMnCTL.OSTMnMD1 | Counting Direction | Start Value |
|---|---|---|---|
| Interval timer mode | 0*1 | Down | FFFF $FFFF_H$ |
| Free-run compare mode | 1 | Up | 0000 $0000_H$ |

Note 1. Value after reset.

### 23.3.4 OSTMnTE — OSTMn Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <OSTMn_base> + $10_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | OSTMnTE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 23.12 OSTMnTE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | OSTMnTE | Indicates whether the counter is enabled or disabled:<br>0: Counter disabled<br>1: Counter enabled<br>This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1.<br>Setting OSTMnTT.OSTMnTT to 1 resets this bit to 0. |

**NOTE**

If the counter is disabled, the counter value retains its value.

If the counter is restarted, it

- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
- restarts counting up from the counter value 0000 $0000_H$ if it is in free-run compare mode.

### 23.3.5 OSTMnTS — OSTMn Count Start Trigger Register

This register starts the counter.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <OSTMn_base> + $14_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | OSTMnTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 23.13 OSTMnTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | OSTMnTS | Starts the counter:<br>0: This setting is invalid.<br>1: Starts the counter and sets OSTMnTE.OSTMnTE = 1.<br>• In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1.<br>• In free-run compare mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1. |

### 23.3.6 OSTMnTT — OSTMn Count Stop Trigger Register

This register stops the counter.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <OSTMn_base> + $18_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | OSTMnTT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 23.14 OSTMnTT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | OSTMnTT | Stops the counter:<br>0: This setting is invalid.<br>1: Stops the counter and clears the OSTMnTE.OSTMnTE bit. |

### 23.3.7 OSTMnCTL — OSTMn Control Register

This register specifies the operating mode for the counter and controls the generation of OSTMTINT interrupt requests when counting starts.

Although this register is readable and writable, writing to it is only possible when OSTMnTE.OSTMnTE = 0; that is, the register becomes read only when OSTMnTE.OSTMnTE = 1.

**Access:** This register can be read or written in 8-bit units.

**Address:** <OSTMn_base> + $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | OSTMnMD1 | OSTMnMD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 23.15 OSTMnCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OSTMnMD1 | Specifies the operating mode for the counter:<br>0: Interval timer mode<br>1: Free-run compare mode |
| 0 | OSTMnMD0 | Controls the generation of OSTMTINT interrupt requests at the start of counting:<br>0: Interrupts when counting starts are disabled.<br>1: Interrupts when counting starts are enabled. |

### 23.3.8 OSTMnEMU — OSTMn Emulation Register

This register controls operation in combination with SVSTOP.

**Access:** This register can be read or written in 8-bit units.
Only proceed with writing while the counter is stopped (OSTMnTE.OSTMnTE = 0 and EPC.SVSTOP = 0).

**Address:** <OSTMn_base> + $24_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | OSTMnSVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 23.16 OSTMnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | OSTMnSVSDIS | When EPC.SVSTOP = 0<br>Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on) regardless of the value of this bit (0/1).<br>When EPC.SVSTOP = 1<br>0: The count clock is stopped when the debugger acquires control of the microcontroller (at breakpoints and so on).<br>1: Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

# 23.4 Operation

## 23.4.1 Starting and Stopping OSTM

OSTM is started and stopped as follows:

### Starting the timer

OSTM is started by the following setting.

- Setting the OSTMnTS.OSTMnTS bit to 1

The OSTMnTE.OSTMnTE status bit is set to 1.

The counter starts to count up or down in accordance with the settings for operating mode. For details, see **Section 23.4.2, Interval Timer Mode** and **Section 23.4.3, Free-Run Compare Mode**.

### Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops OSTM.

This also clears the OSTMnTE.OSTMnTE status bit.

## 23.4.2 Interval Timer Mode

In interval timer mode, OSTM can be used as a reference timer generating interrupt requests at fixed intervals.

### 23.4.2.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMTINT interrupt request is generated when the counter underflows (reaches 0000 $0000_H$).

To select interval timer mode, set OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next 0000 $0000_H$ is reached. Then the counter continues with the new value.

#### OSTMTINT period

The periods of OSTMTINT is:

- OSTMTINT generation period = count clock period × (OSTMnCMP + 1)

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

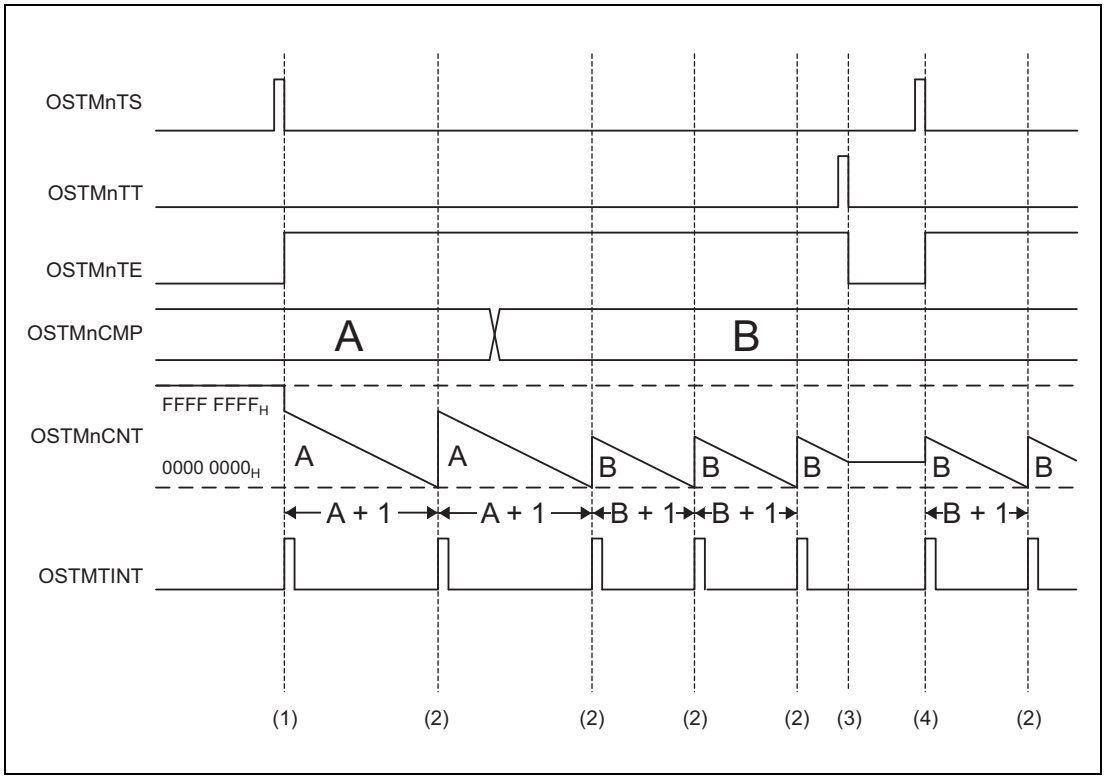

**Figure 23.3 Timing Diagram of OSTM in Interval Timer Mode**

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register indicates the counter value.

(2) When the counter reaches 0000 0000$_H$, an OSTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

### Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.

The counter loads the start value from the OSTMnCMP register and continues to count down.

The following figure shows the timing in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

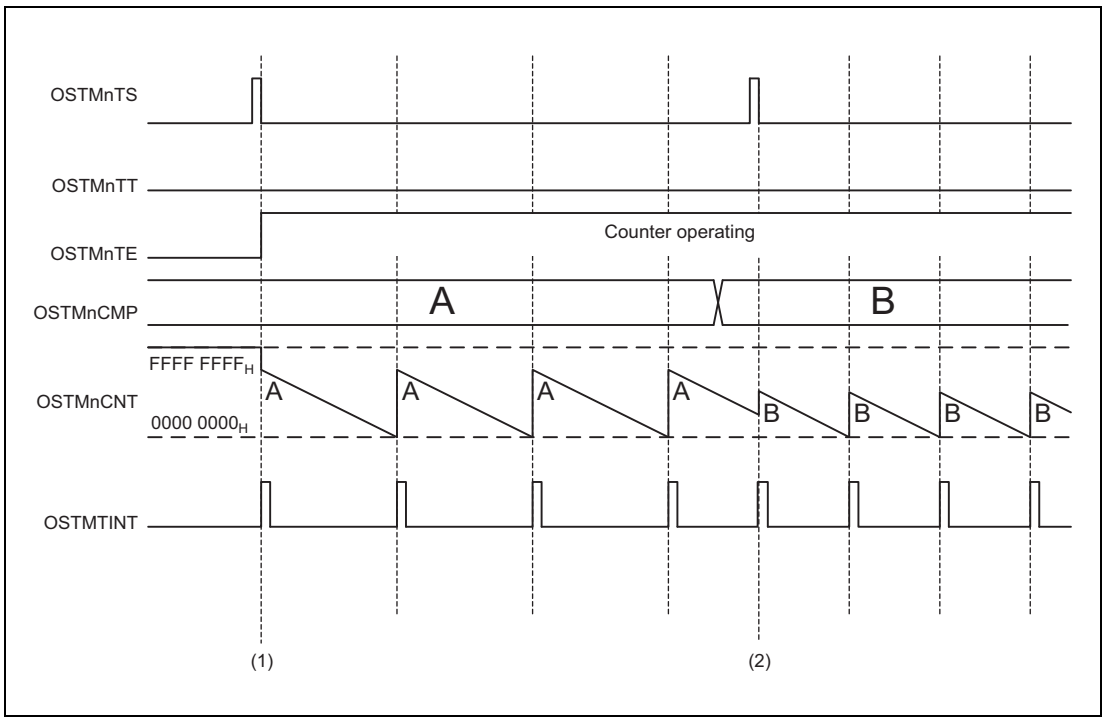

**Figure 23.4 Timing Diagram of Forced Restart in Interval Timer Mode**

The timing diagram above shows the following operations:

(1) The counter is started and stopped as described under **Figure 23.3, Timing Diagram of OSTM in Interval Timer Mode**.

(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated when counting starts.

### 23.4.2.2 Operation when OSTMnCMP = 0000 0000$_H$

When OSTMnCMP = 0000 0000$_H$, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1.

The following figure shows operations of OSTM when OSTMnCMP = 0000 0000$_H$, and counter-start interrupts are enabled.

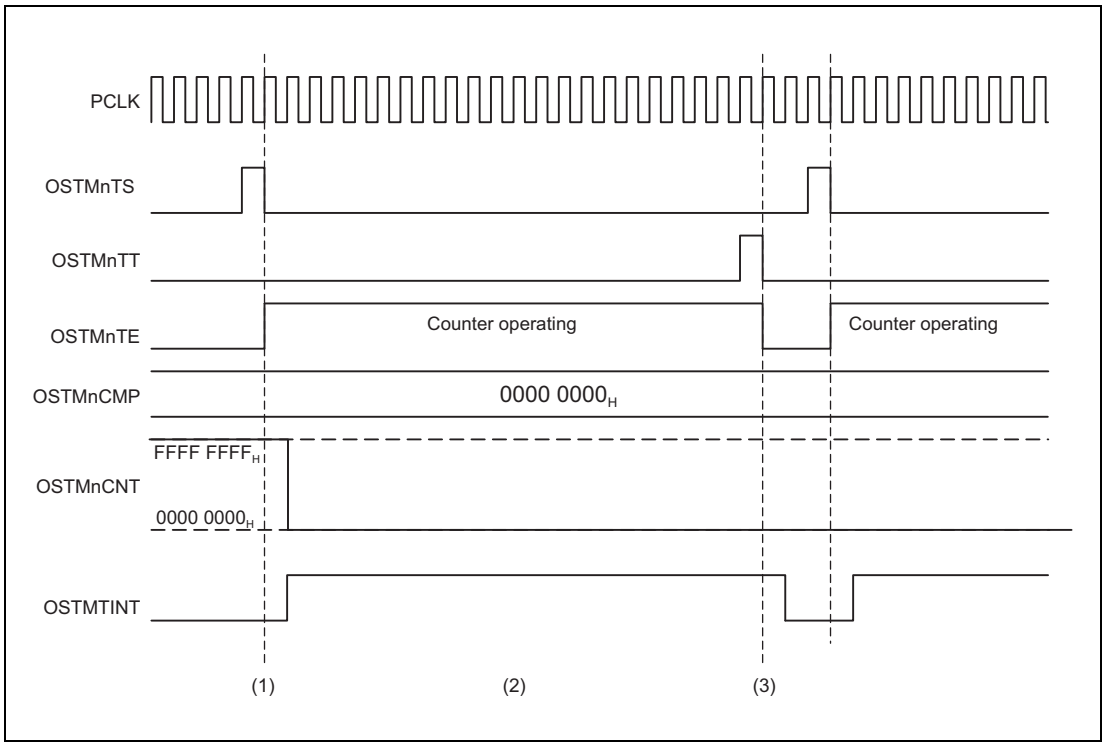

**Figure 23.5 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Interval Timer Mode**

The timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value 0000 0000$_H$ is retained in OSTMnCMP.

(2) The OSTMTINT interrupt request is continuously asserted.

(3) After the counter stops, the OSTMTINT interrupt request signal is deasserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

### 23.4.2.3 Setting Procedure for Interval Timer Mode

The setting procedure in interval timer mode after reset release is described below:

#### Setting procedure

(1) Set the start value of the counter in the OSTMnCMP register.

(2) Select interval timer mode by setting the OSTMnCTL.OSTMnMD1 bit to 0.

(3) Enable or disable interrupts when counting starts (OSTMnCTL.OSTMnMD0).

## 23.4.3 Free-Run Compare Mode

### 23.4.3.1 Basic Operation in Free-Run Compare Mode

In free-run compare mode, the counter counts up from 0000 $0000_H$ to FFFF $FFFF_H$. When the value of the OSTMnCMP register matches the current counter value, an OSTMTINT interrupt request is output.

In free-run compare mode, set OSTMnCTL.OSTMnMD1 = 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

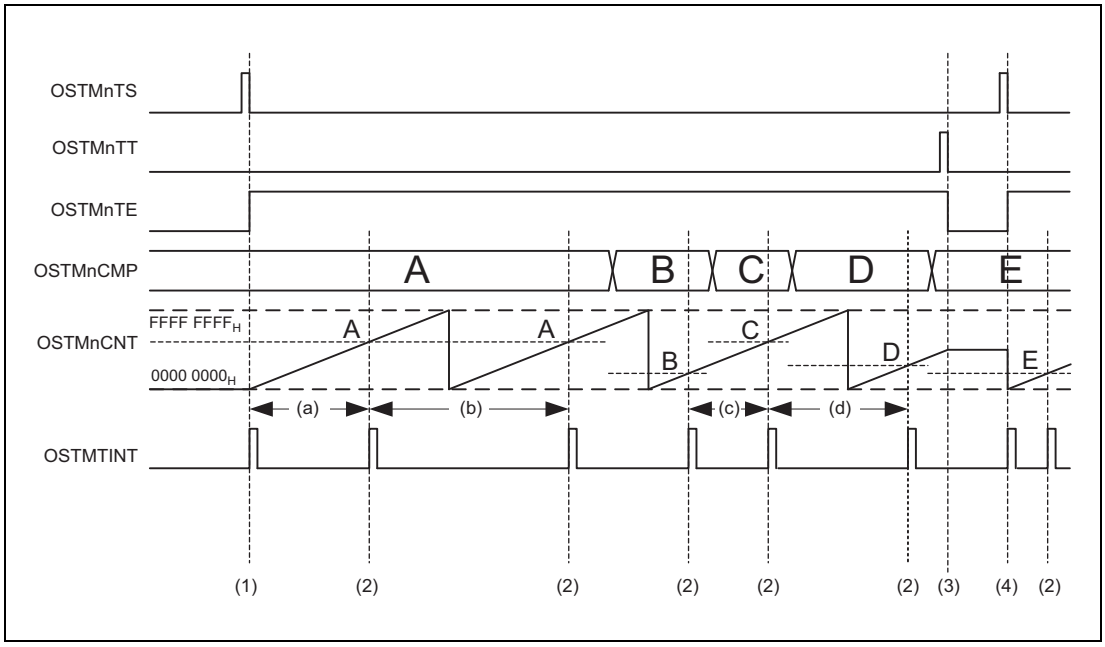

**Figure 23.6 Timing Diagram of OSTM in Free-Run Compare Mode**

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1.
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from 0000 $0000_H$ to FFFF $FFFF_H$. The OSTMnCNT register indicates the counter value.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated at the start of counting.

(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from 0000 $0000_H$ when OSTMnTS.OSTMnTS = 1.

### OSTMTINT period

The OSTMTINT generation period is different depending on the starting time. If OSTMnCMP is rewritten during operation, the period is changed according to the size of the new and old compare values.

**Table 23.17 OSTMTINT Generation Timing**

| Old Value for Comparison | New Value for Comparison | Counter Value at Time of Rewriting | Period of OSTMTINT Generation | Label in Timing Diagram |
|---|---|---|---|---|
| Counter starts | | | (A + 1) × count clock period | (a) |
| A | A | No rewriting | (FFFF FFFF$_H$ + 1) × count clock period | (b) |
| B | C > B | B < counter value < C | (C – B) × count clock period | (c) |
| C | D < C | Counter value > D,C | (FFFF FFFF$_H$ – C + D + 1) × count clock period | (d) |

### Forced restart

Forced restarting of the counter does not proceed if the OSTMnTS.OSTMnTS bit is set during counting. The counter ignores the attempted setting and continues counting.

## 23.4.3.2 Operation when OSTMnCMP = 0000 0000$_H$

The following figure shows the operation of OSTM when OSTMnCMP = 0000 0000$_H$, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

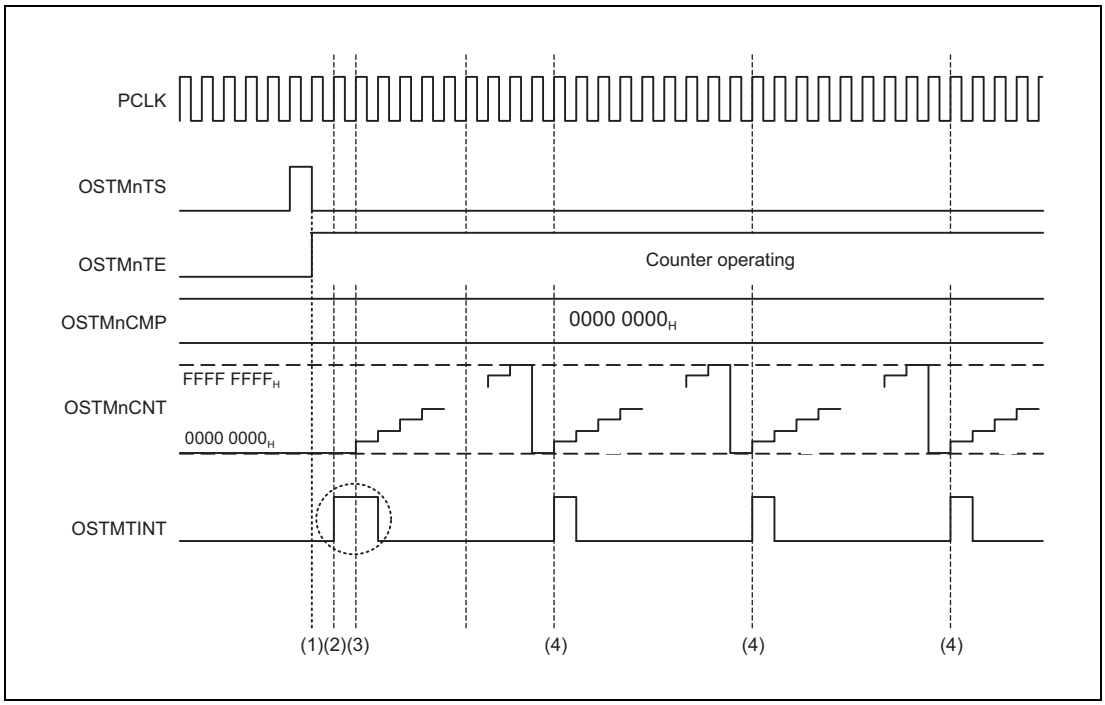

**Figure 23.7 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Free-Run Compare Mode**

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from 0000 0000$_H$ to FFFF FFFF$_H$.

(2) An OSTMTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated. If OSTMnCMP = 0000 $0000_H$ as shown above, OSTMTINT is generated over two clock cycles.

(4) An OSTMTINT interrupt request is generated for each clock cycle (FFFF $FFFF_H$ +1).

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

#### 23.4.3.3 Setting Procedure for Free-Run Compare Mode

The setting procedure in free-run compare mode after reset release is described below:

**Setting procedure**

(1) Set the compare value in the OSTMnCMP register.

(2) Select free-run compare mode by setting the OSTMnCTL.OSTMnMD1 bit to 1.

(3) Enable or disable interrupts when counting starts by the OSTMnCTL.OSTMnMD0 bit.

# Section 24 Timer Array Unit B (TAUB)

This section contains a generic description of the timer array unit B (TAUB).

The first part in this section describes the RH850/F1K specific features, such as the number of units and the register base addresses. The remainder of the section describes the functions and registers of the TAUB.

## 24.1 Features of RH850/F1K TAUB

### 24.1.1 Number of Units and Channels

This microcontroller has the following number of TAUB units.

**Table 24.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | 1 | 2 |
| Name | TAUBn (n = 0) | TAUBn (n = 0) | TAUBn (n = 0, 1) |

TAUBn has the following number of channels of timers.

**Table 24.2 TAUBn Unit Configurations and Channels**

| Unit Name (Channel Name) TAUBn | Channels per Unit | RH850/F1K 100 pins (16 ch) | RH850/F1K 144 pins (16 ch) | RH850/F1K 176 pins (32 ch) |
|---|---|---|---|---|
| TAUB0 | 16 | √ | √ | √ |
| TAUB1 | 16 | - | - | √ |

**Table 24.3 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual TAUB units are identified by the index “n”; for example, TAUBnTOM is the TAUBn channel output mode register. |
| m | The TAUB has 16 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 15), thus a certain channel is denoted as CHm.<br>The even numbered channels (m = 0, 2, 4, 6, 8, 10, 12, 14) are denoted as CHm_even.<br>The odd numbered channels (m = 1, 3, 5, 7, 9, 11, 13, 15) are denoted as CHm_odd. |

### 24.1.2 Register Base Addresses

TAUBn base addresses are listed in the following table.

TAUBn register addresses are given as offsets from the base addresses.

**Table 24.4 Register Base Addresses**

| Name | Base Address |
|---|---|
| <TAUB0_base> | FFE3 $0000_H$ |
| <TAUB1_base> | FFE3 $1000_H$ |

### 24.1.3 Clock Supply

The TAUBn clock supply is shown in the following table.

**Table 24.5 TAUBn Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| TAUBn | PCLK | CKSCLK_IPERI2 | Timer count clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_IPERI2 | |

### 24.1.4 Interrupt Requests

TAUBn interrupt requests are listed in the following table.

**Table 24.6 Interrupt Requests (1/2)**

| Unit Interrupt Name | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **TAUB0** | | | |
| INTTAUB0I0 | Channel 0 interrupt | 142 | 33 |
| INTTAUB0I1 | Channel 1 interrupt | 143 | 92 |
| INTTAUB0I2 | Channel 2 interrupt | 144 | 34 |
| INTTAUB0I3 | Channel 3 interrupt | 145 | 93 |
| INTTAUB0I4 | Channel 4 interrupt | 146 | 35 |
| INTTAUB0I5 | Channel 5 interrupt | 147 | 94 |
| INTTAUB0I6 | Channel 6 interrupt | 148 | 36 |
| INTTAUB0I7 | Channel 7 interrupt | 149 | 95 |
| INTTAUB0I8 | Channel 8 interrupt | 150 | 96 |
| INTTAUB0I9 | Channel 9 interrupt | 151 | 37 |
| INTTAUB0I10 | Channel 10 interrupt | 152 | 97 |
| INTTAUB0I11 | Channel 11 interrupt | 153 | 38 |
| INTTAUB0I12 | Channel 12 interrupt | 154 | 98 |
| INTTAUB0I13 | Channel 13 interrupt | 155 | 39 |
| INTTAUB0I14 | Channel 14 interrupt | 156 | 99 |
| INTTAUB0I15 | Channel 15 interrupt | 157 | 40 |
| **TAUB1** | | | |
| INTTAUB1I0 | Channel 0 interrupt | 256 | 52 |
| INTTAUB1I1 | Channel 1 interrupt | 257 | 115 |
| INTTAUB1I2 | Channel 2 interrupt | 258 | 53 |
| INTTAUB1I3 | Channel 3 interrupt | 259 | 116 |
| INTTAUB1I4 | Channel 4 interrupt | 260 | 54 |
| INTTAUB1I5 | Channel 5 interrupt | 261 | 117 |
| INTTAUB1I6 | Channel 6 interrupt | 262 | 55 |
| INTTAUB1I7 | Channel 7 interrupt | 263 | 118 |
| INTTAUB1I8 | Channel 8 interrupt | 264 | 119 |
| INTTAUB1I9 | Channel 9 interrupt | 265 | 56 |
| INTTAUB1I10 | Channel 10 interrupt | 266 | 120 |
| INTTAUB1I11 | Channel 11 interrupt | 267 | 57 |

Table 24.6 Interrupt Requests (2/2)

| Unit Interrupt Name | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| INTTAUB1I12 | Channel 12 interrupt | 268 | 121 |
| INTTAUB1I13 | Channel 13 interrupt | 269 | 58 |
| INTTAUB1I14 | Channel 14 interrupt | 270 | 122 |
| INTTAUB1I15 | Channel 15 interrupt | 271 | 59 |

### 24.1.5 Reset Sources

TAUBn reset sources are listed in the following table. TAUBn is initialized by these reset sources.

Table 24.7 Reset Sources

| Unit Name | Reset Source |
|---|---|
| TAUBn | All reset sources (ISORES) |

### 24.1.6 External input/output Signals

External input/output signals of TAUBn are listed below.

Table 24.8 External Input/Output Signals (1/2)

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **TAUB0** | | |
| TAUBTTIN0 | Channel 0 input*1 | TAUB0I0 |
| TAUBTTIN1 | Channel 1 input*1 | TAUB0I1 |
| TAUBTTIN2 | Channel 2 input*1 | TAUB0I2 |
| TAUBTTIN3 | Channel 3 input*1 | TAUB0I3 |
| TAUBTTIN4 | Channel 4 input*1 | TAUB0I4 |
| TAUBTTIN5 | Channel 5 input*1 | TAUB0I5 |
| TAUBTTIN6 | Channel 6 input*1 | TAUB0I6 |
| TAUBTTIN7 | Channel 7 input*1 | TAUB0I7 |
| TAUBTTIN8 | Channel 8 input*1 | TAUB0I8 |
| TAUBTTIN9 | Channel 9 input*1 | TAUB0I9 |
| TAUBTTIN10 | Channel 10 input*1 | TAUB0I10 |
| TAUBTTIN11 | Channel 11 input*1 | TAUB0I11 |
| TAUBTTIN12 | Channel 12 input*1 | TAUB0I12 |
| TAUBTTIN13 | Channel 13 input*1 | TAUB0I13 |
| TAUBTTIN14 | Channel 14 input*1 | TAUB0I14 |
| TAUBTTIN15 | Channel 15 input*1 | TAUB0I15 |
| TAUBTTOUT0 | Channel 0 output | TAUB0O0 |
| TAUBTTOUT1 | Channel 1 output | TAUB0O1 |
| TAUBTTOUT2 | Channel 2 output | TAUB0O2 |
| TAUBTTOUT3 | Channel 3 output | TAUB0O3 |
| TAUBTTOUT4 | Channel 4 output | TAUB0O4 |
| TAUBTTOUT5 | Channel 5 output | TAUB0O5 |

Table 24.8 External Input/Output Signals (2/2)

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| TAUBTTOUT6 | Channel 6 output | TAUB0O6 |
| TAUBTTOUT7 | Channel 7 output | TAUB0O7 |
| TAUBTTOUT8 | Channel 8 output | TAUB0O8 |
| TAUBTTOUT9 | Channel 9 output | TAUB0O9 |
| TAUBTTOUT10 | Channel 10 output | TAUB0O10 |
| TAUBTTOUT11 | Channel 11 output | TAUB0O11 |
| TAUBTTOUT12 | Channel 12 output | TAUB0O12 |
| TAUBTTOUT13 | Channel 13 output | TAUB0O13 |
| TAUBTTOUT14 | Channel 14 output | TAUB0O14 |
| TAUBTTOUT15 | Channel 15 output | TAUB0O15 |
| **TAUB1** | | |
| TAUBTTIN0 | Channel 0 input*1 | TAUB1I0 |
| TAUBTTIN1 | Channel 1 input*1 | TAUB1I1 |
| TAUBTTIN2 | Channel 2 input*1 | TAUB1I2 |
| TAUBTTIN3 | Channel 3 input*1 | TAUB1I3 |
| TAUBTTIN4 | Channel 4 input*1 | TAUB1I4 |
| TAUBTTIN5 | Channel 5 input*1 | TAUB1I5 |
| TAUBTTIN6 | Channel 6 input*1 | TAUB1I6 |
| TAUBTTIN7 | Channel 7 input*1 | TAUB1I7 |
| TAUBTTIN8 | Channel 8 input*1 | TAUB1I8 |
| TAUBTTIN9 | Channel 9 input*1 | TAUB1I9 |
| TAUBTTIN10 | Channel 10 input*1 | TAUB1I10 |
| TAUBTTIN11 | Channel 11 input*1 | TAUB1I11 |
| TAUBTTIN12 | Channel 12 input*1 | TAUB1I12 |
| TAUBTTIN13 | Channel 13 input*1 | TAUB1I13 |
| TAUBTTIN14 | Channel 14 input*1 | TAUB1I14 |
| TAUBTTIN15 | Channel 15 input*1 | TAUB1I15 |
| TAUBTTOUT0 | Channel 0 output | TAUB1O0 |
| TAUBTTOUT1 | Channel 1 output | TAUB1O1 |
| TAUBTTOUT2 | Channel 2 output | TAUB1O2 |
| TAUBTTOUT3 | Channel 3 output | TAUB1O3 |
| TAUBTTOUT4 | Channel 4 output | TAUB1O4 |
| TAUBTTOUT5 | Channel 5 output | TAUB1O5 |
| TAUBTTOUT6 | Channel 6 output | TAUB1O6 |
| TAUBTTOUT7 | Channel 7 output | TAUB1O7 |
| TAUBTTOUT8 | Channel 8 output | TAUB1O8 |
| TAUBTTOUT9 | Channel 9 output | TAUB1O9 |
| TAUBTTOUT10 | Channel 10 output | TAUB1O10 |
| TAUBTTOUT11 | Channel 11 output | TAUB1O11 |
| TAUBTTOUT12 | Channel 12 output | TAUB1O12 |
| TAUBTTOUT13 | Channel 13 output | TAUB1O13 |
| TAUBTTOUT14 | Channel 14 output | TAUB1O14 |
| TAUBTTOUT15 | Channel 15 output | TAUB1O15 |

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

## 24.2 Overview

### 24.2.1 Functional Overview

The TAUB has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUB is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUBnCNTm and a 16-bit data register TAUBnCDRm to hold the count start value and compare value.

It also contains several control and status registers.

#### Independent and synchronous operation

Every channel can operate either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels. The synchronous operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

## 24.2.2 Terms

In this section, the following terms are used:

### Independent channel operation function/synchronous channel operation function

TAUB has 16 channels, and provides an independent channel operation function whereby individual channels operate independently and a synchronous channel operation function whereby multiple channels operate in combination.

- The independent channel operation function can be used by any channel independently of all other channels.
- The synchronous channel operation function is implemented using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

### Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.
A channel group has one master channel and one or more slave channels.

### Upper/lower channel

Depending on the channel number m, a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:
For channel 5, channel 3 is an upper channel and channel 9 is a lower channel. Channel 0 is the highest channel and channel 15 is the lowest channel.

### 24.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

**Table 24.9 Functional List of TAUB Operations**

| Operation Function | | Setting Example |
|---|---|---|
| **Independent Channel Operation Functions** | | **Section 24.12** |
| | Interval Timer Function | **Section 24.12.1** |
| | TAUBTTINm Input Interval Timer Function | **Section 24.12.2** |
| | Clock Divide Function | **Section 24.12.3** |
| | External Event Count Function | **Section 24.12.4** |
| | One-Pulse Output Function | **Section 24.12.5** |
| | TAUBTTINm Input Pulse Interval Measurement Function | **Section 24.12.6** |
| | TAUBTTINm Input Signal Width Measurement Function | **Section 24.12.7** |
| | TAUBTTINm Input Position Detection Function | **Section 24.12.8** |
| | TAUBTTINm Input Period Count Detection Function | **Section 24.12.9** |
| | TAUBTTINm Input Pulse Interval Judgment Function | **Section 24.12.10** |
| | TAUBTTINm Input Signal Width Judgment Function | **Section 24.12.11** |
| | Overflow Interrupt Output Function (during TAUBTTINm Width Measurement) | **Section 24.12.12** |
| | Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection) | **Section 24.12.13** |
| **Independent Channel Simultaneous Rewrite Functions** | | **Section 24.13** |
| | Simultaneous Rewrite Trigger Generation Function Type 1 | **Section 24.13.1** |
| **Synchronous Channel Operation Functions** | | **Section 24.14** |
| | PWM Output Function | **Section 24.14.1** |
| | One-Shot Pulse Output Function | **Section 24.14.2** |
| | Delay Pulse Output Function | **Section 24.14.3** |
| | AD Conversion Trigger Output Function Type 1 | **Section 24.14.4** |
| | Triangle PWM Output Function | **Section 24.14.5** |
| | Triangle PWM Output Function with Dead Time | **Section 24.14.6** |
| | A/D Conversion Trigger Output Function Type 2 | **Section 24.14.7** |

### 24.2.4 Input/Output Interrupt Request Signals

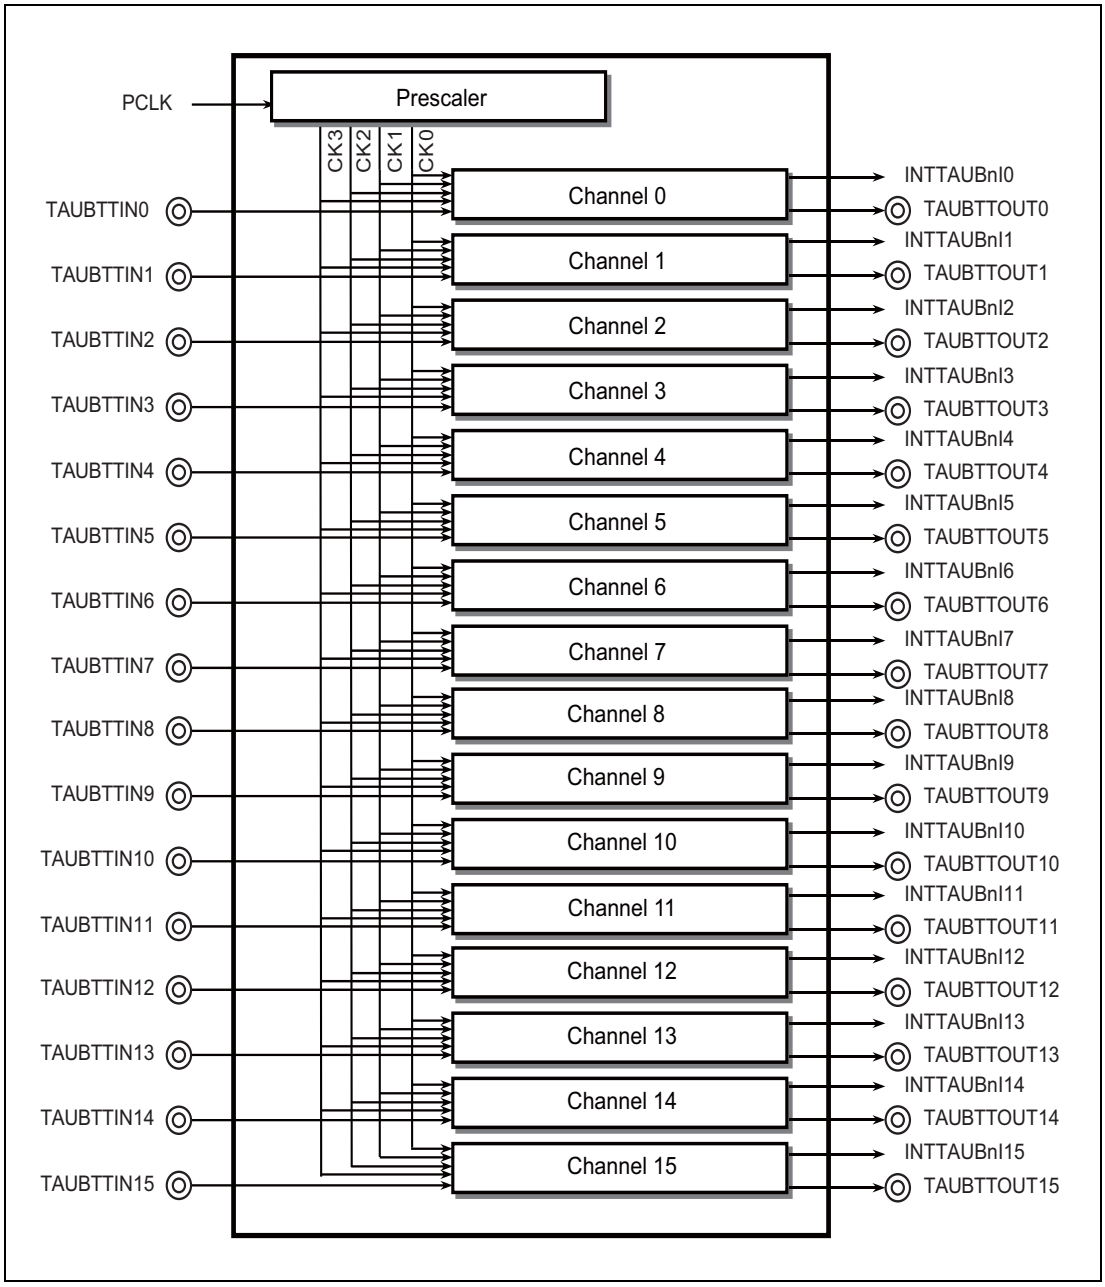

**Figure 24.1 TAUB Input/Output and Interrupt Request Signals**

### 24.2.5 Block Diagram

The following figure shows the main components of the TAUB.

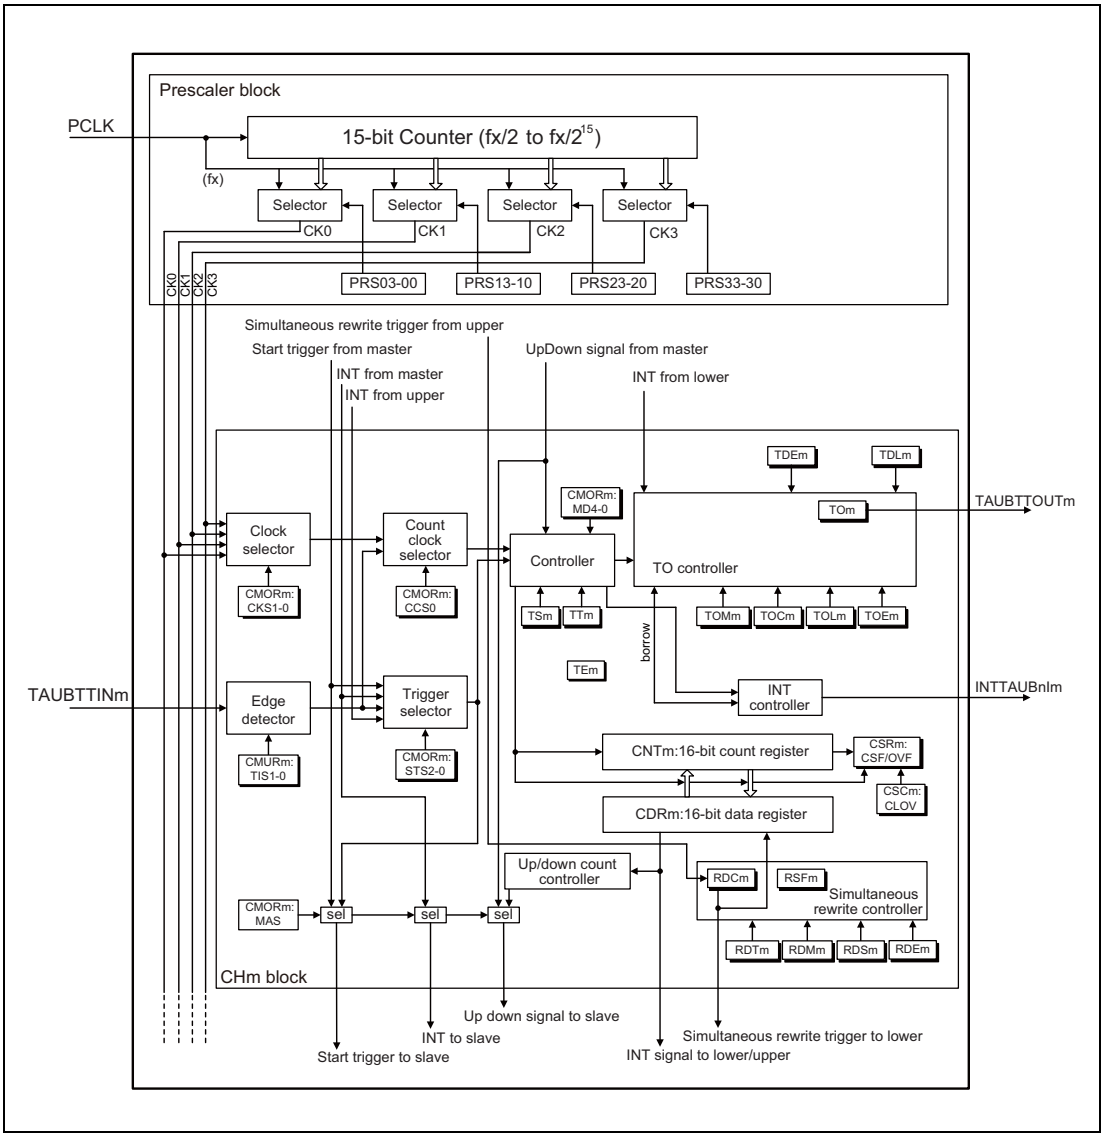

**Figure 24.2 Block Diagram of the TAUB**

The prefix “TAUBn” has been omitted from the register names for the sake of clarity in the above figure.

## 24.2.6 Description of Blocks

The following describes the functional blocks:

### Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of $2^0$ to $2^{15}$.

### Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTINm input signal valid edge

### Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUBnCMORm.TAUBnMD[4:0])
- Counter start enable (TAUBnTS.TAUBnTSm) and counter stop (TAUBnTT.TAUBnTTm)
  When counter start is enabled, status flag TAUBnTE.TAUBnTEm is set.
- Count direction (up/down) (can be controlled by the master channel)

### Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUBnTE.TAUBnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- Input of TAUBTTINm valid edge
- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit

### Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used if multiple cahnnels like synchronous operation functions are used. The data registers (TAUBnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

### TAUBnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

# 24.3 Registers

## 24.3.1 List of Registers

TAUB registers are listed in the following table.

For details about <TAUBn_base>, see **Section 24.1.2, Register Base Addresses**.

**Table 24.10 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| **TAUBn prescaler registers** | | | |
| TAUBn | TAUBn prescaler clock select register | TAUBnTPS | <TAUBn_base> + $240_H$ |
| **TAUBn control registers** | | | |
| TAUBn | TAUBn channel data register m | TAUBnCDRm | <TAUBn_base> + $0_H$ + m × $4_H$ |
| | TAUBn channel counter register m | TAUBnCNTm | <TAUBn_base> + $80_H$ + m × $4_H$ |
| | TAUBn channel mode OS register m | TAUBnCMORm | <TAUBn_base> + $200_H$ + m × $4_H$ |
| | TAUBn channel mode user register m | TAUBnCMURm | <TAUBn_base> + $C0_H$ + m × $4_H$ |
| | TAUBn channel status register m | TAUBnCSRm | <TAUBn_base> + $140_H$ + m × $4_H$ |
| | TAUBn channel status clear trigger register m | TAUBnCSCm | <TAUBn_base> + $180_H$ + m × $4_H$ |
| | TAUBn channel start trigger register | TAUBnTS | <TAUBn_base> + $1C4_H$ |
| | TAUBn channel enable status register | TAUBnTE | <TAUBn_base> + $1C0_H$ |
| | TAUBn channel stop trigger register | TAUBnTT | <TAUBn_base> + $1C8_H$ |
| **TAUBn output registers** | | | |
| TAUBn | TAUBn channel output enable register | TAUBnTOE | <TAUBn_base> + $5C_H$ |
| | TAUBn channel output register | TAUBnTO | <TAUBn_base> + $58_H$ |
| | TAUBn channel output mode register | TAUBnTOM | <TAUBn_base> + $248_H$ |
| | TAUBn channel output configuration register | TAUBnTOC | <TAUBn_base> + $24C_H$ |
| | TAUBn channel output active level register | TAUBnTOL | <TAUBn_base> + $040_H$ |
| | TAUBn channel dead time output enable register | TAUBnTDE | <TAUBn_base> + $250_H$ |
| | TAUBn channel dead time output level register | TAUBnTDL | <TAUBn_base> + $54_H$ |
| **TAUBn reload data registers** | | | |
| TAUBn | TAUBn channel reload data enable register | TAUBnRDE | <TAUBn_base> + $260_H$ |
| | TAUBn channel reload data mode register | TAUBnRDM | <TAUBn_base> + $264_H$ |
| | TAUBn channel reload data control CH select register | TAUBnRDS | <TAUBn_base> + $268_H$ |
| | TAUBn channel reload data control register | TAUBnRDC | <TAUBn_base> + $26C_H$ |
| | TAUBn channel reload data trigger register | TAUBnRDT | <TAUBn_base> + $44_H$ |
| | TAUBn channel reload status register | TAUBnRSF | <TAUBn_base> + $48_H$ |
| **TAUBn emulation register** | | | |
| TAUBn | TAUBn emulation register | TAUBnEMU | <TAUBn_base> + $290_H$ |

## 24.3.2 Details of TAUBn Prescaler Registers

### 24.3.2.1 TAUBnTPS — TAUBn Prescaler Clock Select Register

This register specifies the clocks CK0, CK1, CK2, and CK3 for all channels of the PCLK prescaler.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUBn_base> + $240_H$

**Value after reset:** $FFFF_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBnPRS3[3:0] | | | | TAUBnPRS2[3:0] | | | | TAUBnPRS1[3:0] | | | | TAUBnPRS0[3:0] | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.11 TAUBnTPS Register Contents (1/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | TAUBnPRS3 [3:0] | Specifies the CK3 clock. |

| TAUBnPRS3[3:0] | CK3 clock |
|---|---|
| $0000_B$ | PCLK/$2^0$ |
| $0001_B$ | PCLK/$2^1$ |
| $0010_B$ | PCLK/$2^2$ |
| $0011_B$ | PCLK/$2^3$ |
| $0100_B$ | PCLK/$2^4$ |
| $0101_B$ | PCLK/$2^5$ |
| $0110_B$ | PCLK/$2^6$ |
| $0111_B$ | PCLK/$2^7$ |
| $1000_B$ | PCLK/$2^8$ |
| $1001_B$ | PCLK/$2^9$ |
| $1010_B$ | PCLK/$2^{10}$ |
| $1011_B$ | PCLK/$2^{11}$ |
| $1100_B$ | PCLK/$2^{12}$ |
| $1101_B$ | PCLK/$2^{13}$ |
| $1110_B$ | PCLK/$2^{14}$ |
| $1111_B$ | PCLK/$2^{15}$ |

These bits can only be rewritten when all counters using CK3 are stopped (TAUBnTE.TAUBnTEm = 0).

**Table 24.11 TAUBnTPS Register Contents (2/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 11 to 8 | TAUBnPRS2 [3:0] | Specifies the CK2 clock. |

| TAUBnPRS2[3:0] | CK2 Clock |
|---|---|
| $0000_B$ | $PCLK/2^0$ |
| $0001_B$ | $PCLK/2^1$ |
| $0010_B$ | $PCLK/2^2$ |
| $0011_B$ | $PCLK/2^3$ |
| $0100_B$ | $PCLK/2^4$ |
| $0101_B$ | $PCLK/2^5$ |
| $0110_B$ | $PCLK/2^6$ |
| $0111_B$ | $PCLK/2^7$ |
| $1000_B$ | $PCLK/2^8$ |
| $1001_B$ | $PCLK/2^9$ |
| $1010_B$ | $PCLK/2^{10}$ |
| $1011_B$ | $PCLK/2^{11}$ |
| $1100_B$ | $PCLK/2^{12}$ |
| $1101_B$ | $PCLK/2^{13}$ |
| $1110_B$ | $PCLK/2^{14}$ |
| $1111_B$ | $PCLK/2^{15}$ |

These bits can only be rewritten when all counters using CK2 are stopped (TAUBnTE.TAUBnTEm = 0).

| | | |
|---|---|---|
| 7 to 4 | TAUBnPRS1 [3:0] | Specifies the CK1 clock. |

| TAUBnPRS1[3:0] | CK1 Clock |
|---|---|
| $0000_B$ | $PCLK/2^0$ |
| $0001_B$ | $PCLK/2^1$ |
| $0010_B$ | $PCLK/2^2$ |
| $0011_B$ | $PCLK/2^3$ |
| $0100_B$ | $PCLK/2^4$ |
| $0101_B$ | $PCLK/2^5$ |
| $0110_B$ | $PCLK/2^6$ |
| $0111_B$ | $PCLK/2^7$ |
| $1000_B$ | $PCLK/2^8$ |
| $1001_B$ | $PCLK/2^9$ |
| $1010_B$ | $PCLK/2^{10}$ |
| $1011_B$ | $PCLK/2^{11}$ |
| $1100_B$ | $PCLK/2^{12}$ |
| $1101_B$ | $PCLK/2^{13}$ |
| $1110_B$ | $PCLK/2^{14}$ |
| $1111_B$ | $PCLK/2^{15}$ |

These bits can only be rewritten when all counters using CK1 are stopped (TAUBnTE.TAUBnTEm = 0).

**Table 24.11 TAUBnTPS Register Contents (3/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 to 0 | TAUBnPRS0 [3:0] | Specifies the CK0 clock. |

| TAUBnPRS0[3:0] | CK0 Clock |
|---|---|
| $0000_B$ | $PCLK/2^0$ |
| $0001_B$ | $PCLK/2^1$ |
| $0010_B$ | $PCLK/2^2$ |
| $0011_B$ | $PCLK/2^3$ |
| $0100_B$ | $PCLK/2^4$ |
| $0101_B$ | $PCLK/2^5$ |
| $0110_B$ | $PCLK/2^6$ |
| $0111_B$ | $PCLK/2^7$ |
| $1000_B$ | $PCLK/2^8$ |
| $1001_B$ | $PCLK/2^9$ |
| $1010_B$ | $PCLK/2^{10}$ |
| $1011_B$ | $PCLK/2^{11}$ |
| $1100_B$ | $PCLK/2^{12}$ |
| $1101_B$ | $PCLK/2^{13}$ |
| $1110_B$ | $PCLK/2^{14}$ |
| $1111_B$ | $PCLK/2^{15}$ |

These bits can only be rewritten when all counters using CK0 are stopped (TAUBnTE.TAUBnTEm = 0).

**NOTE**

The TAUBn clock input PCLK is specified in the first part of this section, **Section 24.1.3, Clock Supply**.

## 24.3.3 Details of TAUBn Control Registers

### 24.3.3.1 TAUBnCDRm — TAUBn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operation mode specified in TAUBnCMORm.TAUBnMD[4:1].

**Access:** This register can be read or written in 16-bit units.
- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

**Address:** <TAUBn_base> + m × $4_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBnCDR[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.12 TAUBnCDRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnCDR [15:0] | Data register for the capture/compare value. |

### 24.3.3.2 TAUBnCNTm — TAUBn Channel Counter Register

This register is the channel m counter register.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUBn_base> + $80_H$ + m × $4_H$

**Value after reset:** $FFFF_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBnCNT[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 24.13 TAUBnCNTm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnCNT [15:0] | 16-bit counter value. |

The read value depends on the counter, the operation mode change, and the values of the TAUBnTS.TAUBnTSm and TAUBnTT.TAUBnTTm bits.

The initial counter read value depends on the operation mode and how the counter was stopped:

- by a reset
- by a counter stop trigger (TAUBnTT.TAUBnTTm = 1)

The following table lists the initial counter read values after the counter has stopped (TAUBnTE.TAUBnTEm = 0) and re-enabled (TAUBnTS.TAUBnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUBnTS.TAUBnTSm = 1) for modes where the counter waits for a start trigger.

**Table 24.14 TAUBnCNTm Read Values after Re-Enabling Counter**

| Mode Name | Count Method (Up/Down) | TAUBnCNTm | | |
|---|---|---|---|---|
| | | Start Value*1 | After Stop Trigger | After One Count |
| Interval timer mode | Count down | $FFFF_H$ | Stop value | — |
| Judge mode | Count down | $FFFF_H$ | Stop value | — |
| Capture mode | Count up | $0000_H$ | Stop value | — |
| Event count mode | Count down | $FFFF_H$ | Stop value | — |
| One-count mode | Count down | $FFFF_H$ | Stop value | Stop value |
| Capture and one-count mode | Count up | $0000_H$ | Stop value | Capture value + 1 (TAUBnCDRm) |
| Judge and one-count mode | Count down | $FFFF_H$ | Stop value | TAUBnCNTm value – 1 |
| Count-up/-down mode | Count up/down | $FFFF_H$ | Stop value | — |
| Pulse one-count mode | Count down | $FFFF_H$ | Stop value | $0000_H$ |
| Count capture mode | Count up | $0000_H$ | Stop value | — |
| Gate count mode | Count down | $FFFF_H$ | Stop value | Stop value |
| Capture and gate count mode | Count up | $0000_H$ | Stop value | Stop value |

Note 1. The value set for TAUBnCNTm when operation mode is changed after reset release

### 24.3.3.3 TAUBnCMORm — TAUBn Channel Mode OS Register

This register controls channel m operation.

**Access:** This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

**Address:** <TAUBn_base> + $200_H$ + m × $4_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 1 | 1 | 0 | 1 | 0 | Capture and gate count mode |

| Mode | Role of TAUBnMD0 Bit |
|---|---|
| Interval timer mode<br>Capture mode<br>Count capture mode | Specifies whether INTTAUBnIm is output at the beginning of count operation (when a start trigger is entered) or not.<br>0: INTTAUBnIm is not output.<br>1: INTTAUBnIm is output. |
| Event count mode<br>Count-up/-down mode | This bit should be set to 0 (INTTAUBnIm signal is not output at the beginning of count operation). |
| One-count mode<br>Pulse one-count mode | Enables/disables start trigger detection during counting.<br>0: Disables detection.<br>1: Enables detection.<br>**CAUTION**<br>• In one-count mode, INTTAUBnIm signal is not output at the beginning of count operation.<br>• In pulse one-count mode, INTTAUBnIm signal is output at the beginning of count operation. |
| Gate count mode | This bit should be set to 0 (start trigger detection during counting is disabled). |
| Capture and one-count mode<br>Capture and gate count mode | This bit should be set to 0.<br>**CAUTION**<br>INTTAUBnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled. |
| Judge mode<br>Judge and one-count mode | Specifies INTTAUBnIm output timing.<br>0: When TAUBnCNTm ≤ TAUBnCDRm<br>1: When TAUBnCNTm > TAUBnCDRm |

### 24.3.3.4 TAUBnCMURm — TAUBn Channel Mode User Register

This register specifies the type of valid edge detection used for the TAUBTTINm input.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUBn_base> + $C0_H$ + m × $4_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUBnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 24.16 TAUBnCMURm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS [1:0] | Specifies the valid edge of the TAUBTTINm input signal: |

| TAUBn TIS1 | TAUBn TIS0 | Description |
|---|---|---|
| 0 | 0 | Falling edge |
| 0 | 1 | Rising edge |
| 1 | 0 | Rising and falling edges (low-width measurement selection).<br>Start trigger: falling edge<br>Stop trigger (capture): rising edge |
| 1 | 1 | Rising and falling edges (high-width measurement selection).<br>Start trigger: rising edge<br>Stop trigger (capture): falling edge |

- Edge detection for TAUBTTINm input signals is performed based on the operation clock selected by TAUBnCMORm.TAUBnCKS[1:0].

### 24.3.3.5 TAUBnCSRm — TAUBn Channel Status Register

This register indicates the count direction and the overflow status of the counter for channel m.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUBn_base> + $140_H$ + m × $4_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUBnCSF | TAUBnOVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 24.17 TAUBnCSRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | TAUBnCSF | Indicates the count direction:<br>0: Counts up<br>1: Counts down<br>The read value of this bit is only valid in the following mode:<br>• Up/Down Count mode |
| 0 | TAUBnOVF | Indicates the counter overflow status:<br>0: No overflow occurred<br>1: Overflow occurred<br>This bit is used only in the following modes:<br>• Capture mode<br>• Capture and one-count mode<br>The function of this bit depends on the setting of control bits TAUBnCMORm.TAUBnCOS[1:0]. |

### 24.3.3.6 TAUBnCSCm — TAUBn Channel Status Clear Register

This register is a trigger register for clearing the overflow flag TAUBnCSRm.TAUBnOVF of channel m.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as $00_H$

**Address:** <TAUBn_base> + $180_H$ + m × $4_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TAUBnCLOV |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 24.18 TAUBnCSCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAUBnCLOV | 0: No function<br>1: Clears the overflow flag TAUBnCSRm.TAUBnOVF |

### 24.3.3.7 TAUBnTS — TAUBn Channel Start Trigger Register

This register enables the counter for each channel.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as $0000_H$

**Address:** <TAUBn_base> + $1C4_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBnTS15 | TAUBnTS14 | TAUBnTS13 | TAUBnTS12 | TAUBnTS11 | TAUBnTS10 | TAUBnTS09 | TAUBnTS08 | TAUBnTS07 | TAUBnTS06 | TAUBnTS05 | TAUBnTS04 | TAUBnTS03 | TAUBnTS02 | TAUBnTS01 | TAUBnTS00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

**Table 24.19 TAUBnTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTSm | Enables the counter for channel m:<br>0: No function<br>1: Enables the counter and sets TAUBnTE.TAUBnTEm = 1.<br>TAUBnTE.TAUBnTEm = 1 only enables the counter. Whether the counter starts depends on the selected operation mode. |

### 24.3.3.8 TAUBnTE — TAUBn Channel Enable Status Register

This register indicates whether counter is enabled or disabled.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUBn_base> + $1C0_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBnTE15 | TAUBnTE14 | TAUBnTE13 | TAUBnTE12 | TAUBnTE11 | TAUBnTE10 | TAUBnTE09 | TAUBnTE08 | TAUBnTE07 | TAUBnTE06 | TAUBnTE05 | TAUBnTE04 | TAUBnTE03 | TAUBnTE02 | TAUBnTE01 | TAUBnTE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 24.20 TAUBnTE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTEm | Indicates whether counter for channel m is enabled or disabled:<br>0: Counter disabled<br>1: Counter enabled<br>Setting TAUBnTS.TAUBnTSm to 1 sets this bit to 1.<br>Setting TAUBnTT.TAUBnTTm to 1 resets this bit to 0. |

### 24.3.3.9 TAUBnTT — TAUBn Channel Stop Trigger Register

This register stops the counter for each channel.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as $0000_H$.

**Address:** <TAUBn_base> + $1C8_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBn TT15 | TAUBn TT14 | TAUBn TT13 | TAUBn TT12 | TAUBn TT11 | TAUBn TT10 | TAUBn TT09 | TAUBn TT08 | TAUBn TT07 | TAUBn TT06 | TAUBn TT05 | TAUBn TT04 | TAUBn TT03 | TAUBn TT02 | TAUBn TT01 | TAUBn TT00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

**Table 24.21 TAUBnTT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTTm | Stops the counter of channel m:<br>0: No function<br>1: Stops the counter and resets TAUBnTE.TAUBnTEm.<br>TAUBnCNTm, TAUBnTO.TAUBnTOm, and TAUBTTOUTm all retain the values they had before the counter was stopped. |

## 24.3.4 Details of TAUBn Simultaneous Rewrite Registers

### 24.3.4.1 TAUBnRDE — TAUBn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUBnCDRm/ TAUBnTOLm.

**Access:** This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

**Address:** <TAUBn_base> + $260_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBn RDE15 | TAUBn RDE14 | TAUBn RDE13 | TAUBn RDE12 | TAUBn RDE11 | TAUBn RDE10 | TAUBn RDE09 | TAUBn RDE08 | TAUBn RDE07 | TAUBn RDE06 | TAUBn RDE05 | TAUBn RDE04 | TAUBn RDE03 | TAUBn RDE02 | TAUBn RDE01 | TAUBn RDE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.22 TAUBnRDE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnRDEm | Enables/disables simultaneous rewrite of the data register of channel m:<br>0: Disables simultaneous rewrite<br>1: Enabled simultaneous rewrite |

### 24.3.4.2 TAUBnRDS — TAUBn Channel Reload Data Control Channel Select Register

This register selects the control channel for simultaneous rewrite.

**Access:** This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

**Address:** <TAUBn_base> + $268_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBn RDS15 | TAUBn RDS14 | TAUBn RDS13 | TAUBn RDS12 | TAUBn RDS11 | TAUBn RDS10 | TAUBn RDS09 | TAUBn RDS08 | TAUBn RDS07 | TAUBn RDS06 | TAUBn RDS05 | TAUBn RDS04 | TAUBn RDS03 | TAUBn RDS02 | TAUBn RDS01 | TAUBn RDS00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.23 TAUBnRDS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnRDSm | Specifies which channel is controlled for the simultaneous rewrite trigger:<br>0: Master channel<br>1: Another upper channel |

### 24.3.4.3 TAUBnRDM — TAUBn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

**Access:** This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

**Address:** <TAUBn_base> + $264_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBn RDM15 | TAUBn RDM14 | TAUBn RDM13 | TAUBn RDM12 | TAUBn RDM11 | TAUBn RDM10 | TAUBn RDM09 | TAUBn RDM08 | TAUBn RDM07 | TAUBn RDM06 | TAUBn RDM05 | TAUBn RDM04 | TAUBn RDM03 | TAUBn RDM02 | TAUBn RDM01 | TAUBn RDM00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.24 TAUBnRDM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnRDMm | Selects when the signal that triggers simultaneous rewrite is generated:<br>0: When the master channel counter starts counting<br>1: At the top of a triangle wave cycle<br>These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 0. |

### 24.3.4.4 TAUBnRDC — TAUBn Channel Reload Data Control Register

This register specifies the channel that generates the INTTAUBnIm signal that triggers simultaneous rewrite.

**Access:** This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0

**Address:** <TAUBn_base> + $26C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 24.25 TAUBnRDC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnRDCm | Specifies whether the channel generates a simultaneous rewrite trigger signal or not.<br>0: Does not operate as a simultaneous rewrite trigger channel.<br>1: Operates as a simultaneous rewrite trigger channel.<br>These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 1. |

### 24.3.4.5 TAUBnRDT — TAUBn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as $0000_H$.

**Address:** <TAUBn_base> + $044_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBn RDT15 | TAUBn RDT14 | TAUBn RDT13 | TAUBn RDT12 | TAUBn RDT11 | TAUBn RDT10 | TAUBn RDT09 | TAUBn RDT08 | TAUBn RDT07 | TAUBn RDT06 | TAUBn RDT05 | TAUBn RDT04 | TAUBn RDT03 | TAUBn RDT02 | TAUBn RDT01 | TAUBn RDT00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

**Table 24.26 TAUBnRDT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnRDTm | Triggers the simultaneous rewrite enabling state:<br>0: No function. Writing 0 is ignored (the operation is not affected).<br>1: The simultaneous rewrite enabling flag (TAUBnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger.<br>These bits only apply when:<br>• TAUBnRDE.TAUBnRDEm = 1 |

### 24.3.4.6 TAUBnRSF — TAUBn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUBn_base> + $048_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 24.27 TAUBnRSF Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnRSFm | Indicates the simultaneous rewrite status:<br>0: Indicates simultaneous rewrite is completed due to the generation of the simultaneous rewrite trigger.<br>1: Indicates the simultaneous rewrite trigger waiting state when simultaneous rewrite is enabled (TAUBnRDTm = 1). |

## 24.3.5 Details of TAUBn Output Registers

### 24.3.5.1 TAUBnTOE — TAUBn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUBn_base> + $5C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.28 TAUBnTOE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTOEm | Enables/disables independent channel output mode:<br>0: Disables independent channel output mode (controlled by software)<br>1: Enables independent channel output mode |

### 24.3.5.2 TAUBnTO — TAUBn Channel Output Register

This register specifies and reads the level of TAUBTTOUTm.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUBn_base> + $58_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 24.29 TAUBnTO Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTOm | Specifies/reads the level of TAUBTTOUTm:<br>0: Low<br>1: High<br>Only TAUBnTOm bits for which Independent Channel Output function is disabled (TAUBnTOEm = 0) can be written. |

### 24.3.5.3 TAUBnTOM — TAUBn Channel Output Mode Register

This register specifies the output mode of each channel.

**Access:** This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

**Address:** <TAUBn_base> + $248_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTOMm | Specifies the channel output mode:<br>0: Independent channel output mode<br>1: Synchronous channel output mode |

### 24.3.5.4 TAUBnTOC — TAUBn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUBnTOMm.

**Access:** This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

**Address:** <TAUBn_base> + $24C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 24.31 TAUBnTOC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTOCm | Specifies the output mode:<br>0: Operation mode 1<br>1: Operation mode 2<br>The output mode also depends on TAUBnTOM.TAUBnTOMm, as can be seen in the following table. |

| TOMm | TOCm | Description |
|---|---|---|
| 0 | 0 | Toggle mode: Toggles when INTTAUBnIm occurs. |
| | 1 | Set/reset mode: Set when INTTAUBnIm occurs upon count start and reset when INTTAUBnIm occurs due to detection of a match between TAUBnCNTm and TAUBnCDRm. |
| 1 | 0 | Synchronous channel operation mode 1:<br>Set when INT occurs on the master channel and reset when INT occurs on the slave channel. |
| | 1 | Synchronous channel operation mode 2:<br>Set when INTTAUBnIm occurs while the slave channel is counting down and reset when INTTAUBnIm occurs while the slave channel is counting up. |

### 24.3.5.5 TAUBnTOL — TAUBn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUBnTO.TAUBnTOm).

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUBn_base> + $040_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 24.32 TAUBnTOL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTOLm | Specifies the output logic of the channel m output bit (TAUBnTO.TAUBnTOm):<br>0: Positive logic (active high)<br>1: Negative logic (active low)<br>The setting of these bits applies to all channel output modes other than independent channel output mode controlled by software. |

## 24.3.6 Details of TAUBn Dead Time Output Registers

### 24.3.6.1 TAUBnTDE — TAUBn Channel Dead Time Output Enable Register

This register enables/disables dead time operation for each channel.

**Access:** This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

**Address:** <TAUBn_base> + $250_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBn TDE15 | TAUBn TDE14 | TAUBn TDE13 | TAUBn TDE12 | TAUBn TDE11 | TAUBn TDE10 | TAUBn TDE09 | TAUBn TDE08 | TAUBn TDE07 | TAUBn TDE06 | TAUBn TDE05 | TAUBn TDE04 | TAUBn TDE03 | TAUBn TDE02 | TAUBn TDE01 | TAUBn TDE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.33 TAUBnTDE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTDEm | Enables/disables dead time control operation of channel m:<br>0: Disables dead time operation<br>1: Enables dead time operation<br>The same settings must be set for the even and the odd slave channel that comprise a set.<br>These bits only apply when:<br>• TAUBnTOE.TAUBnTOEm, TAUBnTOM.TAUBnTOMm, TAUBnTOC.TAUBnTOCm = 1 |

### 24.3.6.2 TAUBnTDL — TAUBn Channel Dead Time Output Level Register

This register selects the phase period to which dead time is added.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUBn_base> + $54_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.34 TAUBnTDL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUBnTDLm | Selects the phase period to which dead time is added:<br>0: Positive phase period<br>1: Negative phase period<br>These bits only apply when:<br>• TAUBnTOE.TAUBnTOEm, TAUBnTOM.TAUBnTOMm, TAUBnTOC.TAUBnTOCm, TAUBnTDE.TAUBnTDEm = 1 |

## 24.3.7 TAUBn Emulation Register

### 24.3.7.1 TAUBnEMU — TAUBn Emulation Register

This register controls SVSTOP operations.

**Access:** This register can be read or written in 8-bit units.
Write to this register only when the counter is stopped (TAUBnTE.TAUBnTEm = 0) and when EPC.SVSTOP = 0.

**Address:** <TAUBn_base> + $290_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TAUBnSVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 24.35 TAUBnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | TAUBnSVSDIS | (When EPC.SVSTOP = 0)<br>Regardless of the value of this bit (1/0), the count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint).<br><br>(When EPC.SVSTOP = 1)<br>0: The count clock stops when the debugger obtains the control of the microcontroller (e.g., at a breakpoint).<br>1: The count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## 24.4 General Operating Procedure

The following describes the general operation procedure for the TAUBn:

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUBTTOUTm is also initialized and outputs a low level.

1. Set the TAUBnTPS register to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUBn function:
   - Set the operation mode
   - Set the channel output mode
   - Set any other control bits
3. Enable the counter by setting the TAUBnTS.TAUBnTSm bit to 1.
   The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUBnTT.TAUBnTTm bit to 1. The counter can be forcibly restarted by setting the TAUBnTS.TAUBnTSm bit to 1.
5. Stop the function by setting the TAUBnTT.TAUBnTTm bit to 1.

**NOTE**

- A detailed description of the required control bits and the operation of the individual functions is given below.
  - **Section 24.12, Independent Channel Operation Functions**
  - **Section 24.14, Synchronous Channel Operation Functions**
- The function can be changed while the counter is stopped (TAUBnTE.TAUBnTEm=0).

## 24.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in **Section 24.5.1, Rules of Synchronous Channel Operation Function**.

Two special features for synchronous channel operation are detailed in the following:

- **Section 24.5.2, Simultaneous Start and Stop of Synchronous Channel Counters**
- **Section 24.6, Simultaneous Rewrite**

### 24.5.1 Rules of Synchronous Channel Operation Function

#### Number of master and slave channels

- Only even channels (CH0, CH2, CH4, …) can be set as master channels.
  Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 and the lower channels (CH3, CH4, CH5, …) can be set as slave channels.
- If multiple master channels are used, a range of slave channels that includes another master channel cannot be set for a given master channel.
  Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

#### Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the same value to the TAUBnCMORm.TAUBnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave channel usage and operation clocks are illustrated in **Figure 24.3**.

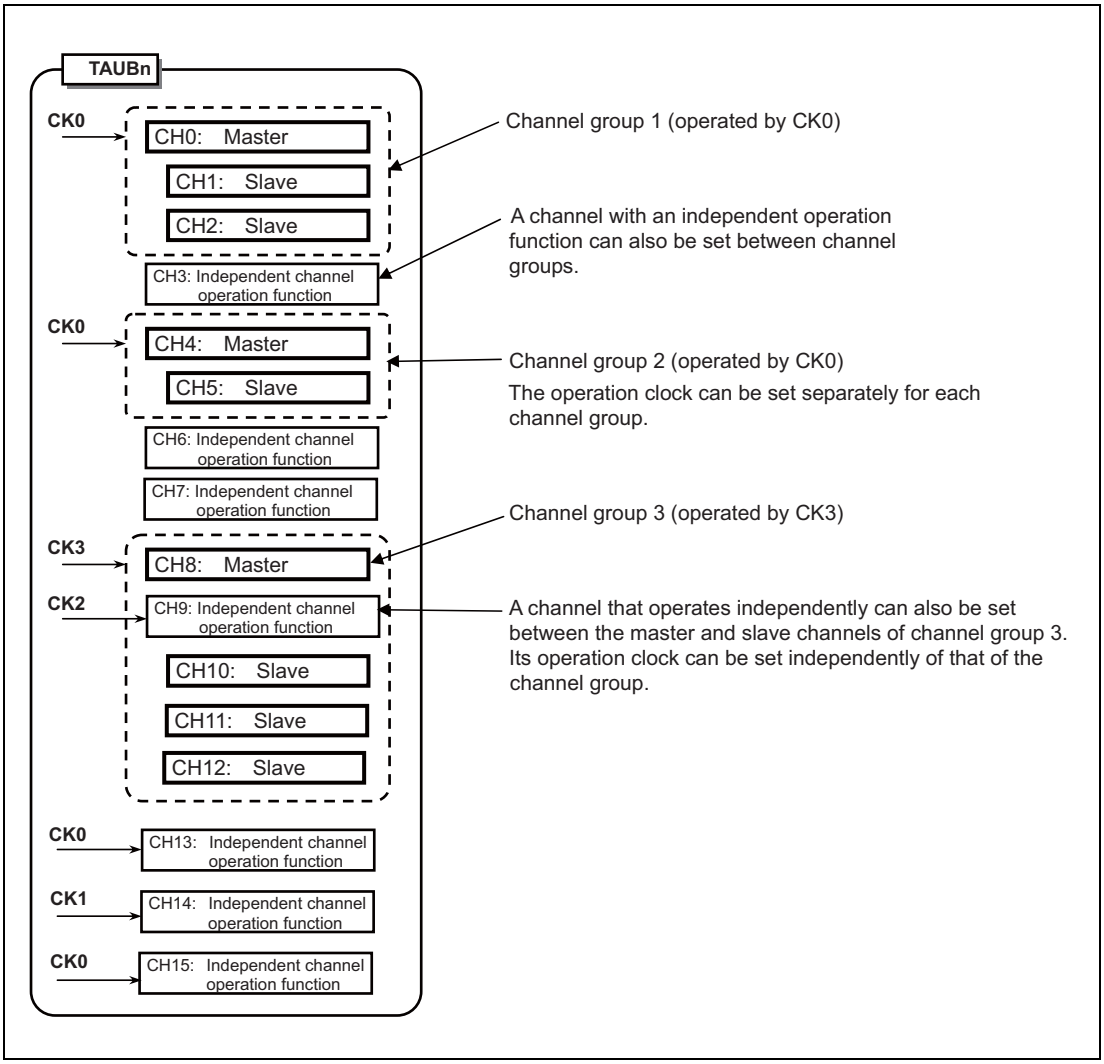

**Figure 24.3 Grouping of the Channels and Assignment of Operation Clocks**

### 24.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit.

#### 24.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUBnTS.TAUBnTSm bits of the channels must be set at the same time.
- To simultaneously stop synchronized channels, the TAUBnTT.TAUBnTTm bits of the channels must be set at the same time.

Setting the TAUBnTS.TAUBnTSm bits to 1 sets the corresponding TAUBnTE.TAUBnTEm bits to 1, enabling counting. The exact time that it starts depends on the operation mode.

## 24.6 Simultaneous Rewrite

### 24.6.1 Introduction

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUBnCDRm and TAUBnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUBnIm being issued on the upper channel specified by TAUBnRDC.TAUBnRDCm

There are three methods for simultaneous rewrite. These are listed in the following table, along with how to specify them and when they cause simultaneous rewrite to be triggered.

**Table 24.36 Simultaneous Rewrite Methods and when They are Triggered**

| Method | Trigger | TAUBnRDE.TAUBnRDEm | TAUBnRDS.TAUBnRDSm | TAUBnRDM.TAUBnRDMm |
|---|---|---|---|---|
| — | No simultaneous rewrite | 0 | 0 | 0 |
| A | The master channel (re)starts counting | 1 | 0 | 0 |
| B | Counting is started in the master channel. The master channel starts counting down at the peak of triangular wave of the corresponding slave channel. | 1 | 0 | 1 |
| C1 | INTTAUBnIm is generated on an upper channel specified by TAUBnRDC.TAUBnRDCm | 1 | 1 | 0/1 |

The following table lists which of these three methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 24.13, Independent Channel Simultaneous Rewrite Functions** and **Section 24.14, Synchronous Channel Operation Functions**.

**Table 24.37 Channel Functions and the Methods They Use for Simultaneous Rewrite**

| Descriptions | A | B | C1 | TAUBnTOL.TAUBnTOLm |
|---|---|---|---|---|
| Simultaneous Rewrite Trigger Output Function Type 1 | | | √ | |
| PWM Output Function | √ | | √ | √ |
| One-Shot Pulse Output Function | √ | | | |
| Delay Pulse Output Function | √ | | | |
| Triangle PWM Output Function | | √ | √ | √ |
| Triangle PWM Output Function with Dead Time | | √ | √ | |
| A/D Conversion Trigger Output Function Type 1 | √ | | √ | |
| A/D Conversion Trigger Output Function Type 2 | | √ | √ | |

**Note:** √: Available, (Blank): Unavailable

### 24.6.2 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite.
The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

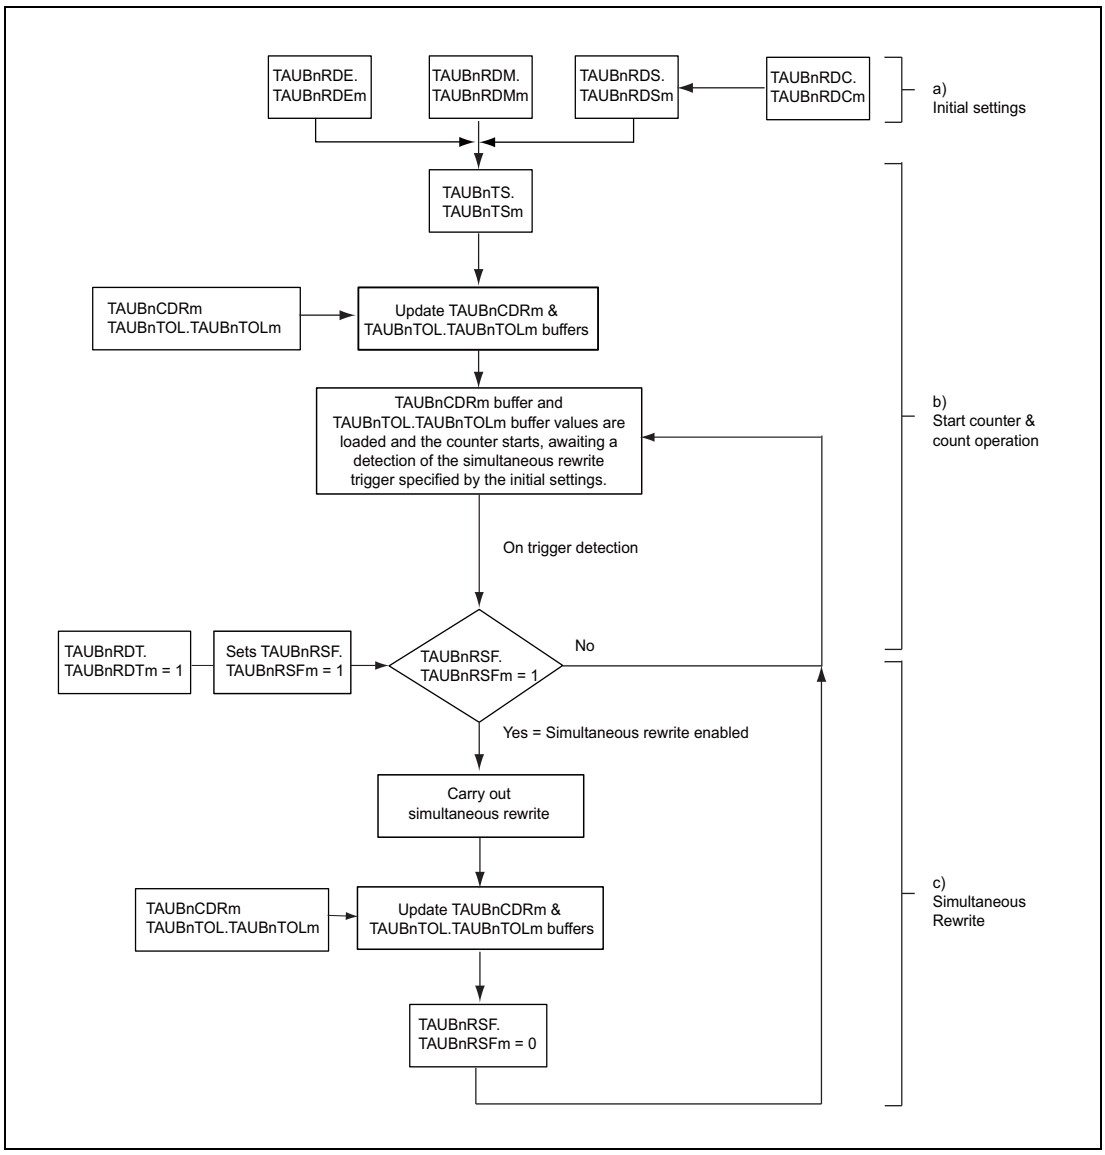

**Figure 24.4 General Procedure for Simultaneous Rewrite**

#### 24.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUBnRDE.TAUBnRDEm = 1.
- To select the type of simultaneous rewrite, set TAUBnRDM.TAUBnRDMm and TAUBnRDS.TAUBnRDSm according to the values in **Table 24.36, Simultaneous Rewrite Methods and when They are Triggered**.
- Specify a simultaneous rewrite trigger channel by using TAUBnRDC.TAUBnRDCm. (Prerequisite: TAUBnRDS.TAUBnRDSm has been set to the upper channel.)

#### 24.6.2.2 Start Counter and Count Operation

- To start all the TAUBnCNTm counters in the channel group, set the corresponding TAUBnTS.TAUBnTSm bits to 1. TAUBnTOL.TAUBnTOLm and the values in the data registers (TAUBnCDRm) are written to the corresponding TAUBnTOL.TAUBnTOLm buffer (TAUBnTOL.TAUBnTOLm buf) and data buffer registers (TAUBnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1 sets the reload flag (TAUBnRSF.TAUBnRSFm) to 1, enabling simultaneous rewrite. TAUBnRSF.TAUBnRSFm remains at 1 until simultaneous rewrite has taken place.
- When the specified trigger for simultaneous rewrite is detected, the TAUBnRSF.TAUBnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1). If it is, simultaneous rewrite is carried out.
  Otherwise, simultaneous rewrite is not carried out, and the system awaits the next simultaneous rewrite trigger detection.

#### 24.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then written to the corresponding counters and the values are applied the next time the counter starts or restarts.
- When simultaneous rewrite is finished, the TAUBnRSF.TAUBnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

### 24.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUBnRDE.TAUBnRDEm, TAUBnRDS.TAUBnRDSm, TAUBnRDM.TAUBnRDMm, and TAUBnRDC.TAUBnRDCm cannot be changed while the counter is in operation (TAUBnTE.TAUBnTEm = 1).
- TAUBnTOL.TAUBnTOLm can only be rewritten during operation in PWM output function or triangle PWM output function. For all other output functions, TAUBnTOL.TAUBnTOLm must be written before the counter starts. If it is rewritten in another function mode, TAUBTTOUTm outputs an invalid wave.
- When a simultaneous rewrite trigger is issued on an upper channel (TAUBnRDS.TAUBnRDSm = 1), the TAUBnRDC.TAUBnRDCm bit controls all the lower channels. This means that if the TAUBnRDC.TAUBnRDCm bits of CH2 and CH7 are set to 1 and the TAUBnRDC.TAUBnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger generation channel (TAUBnRDE.TAUBnRDEm and TAUBnRDS.TAUBnRDSm = 1) but no upper channel is set (TAUBnRDC.TAUBnRDC[15:0] = 0), simultaneous rewrite cannot take place.

### 24.6.4 Types of Simultaneous Rewrite

In the following section, the three simultaneous rewrite methods are explained using timing diagrams.

#### 24.6.4.1 Simultaneous Rewrite when the Master Channel (Re)Starts Counting (Method A)

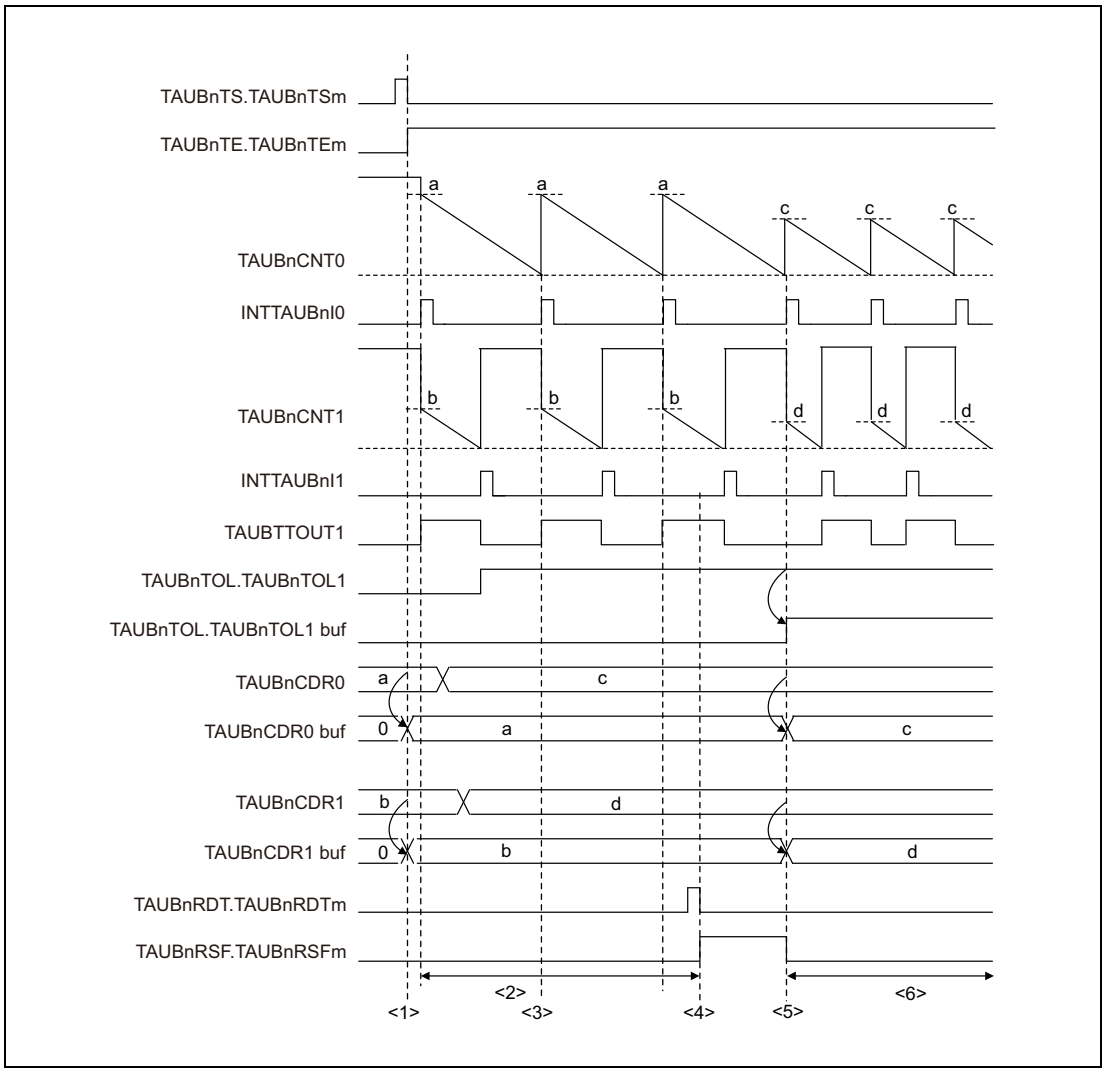

Figure 24.5 Simultaneous Rewrite when the Master Channel (Re)Starts Counting

**Setting:**

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

**Description:**

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer and the value of TAUBnTOL.TAUBnTOLm is copied to the TAUBnTOL.TAUBnTOLm buffer.

(2) The TAUBnCDRm and TAUBnTOL.TAUBnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm = 0)

(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.

(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

### 24.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel (Method B)

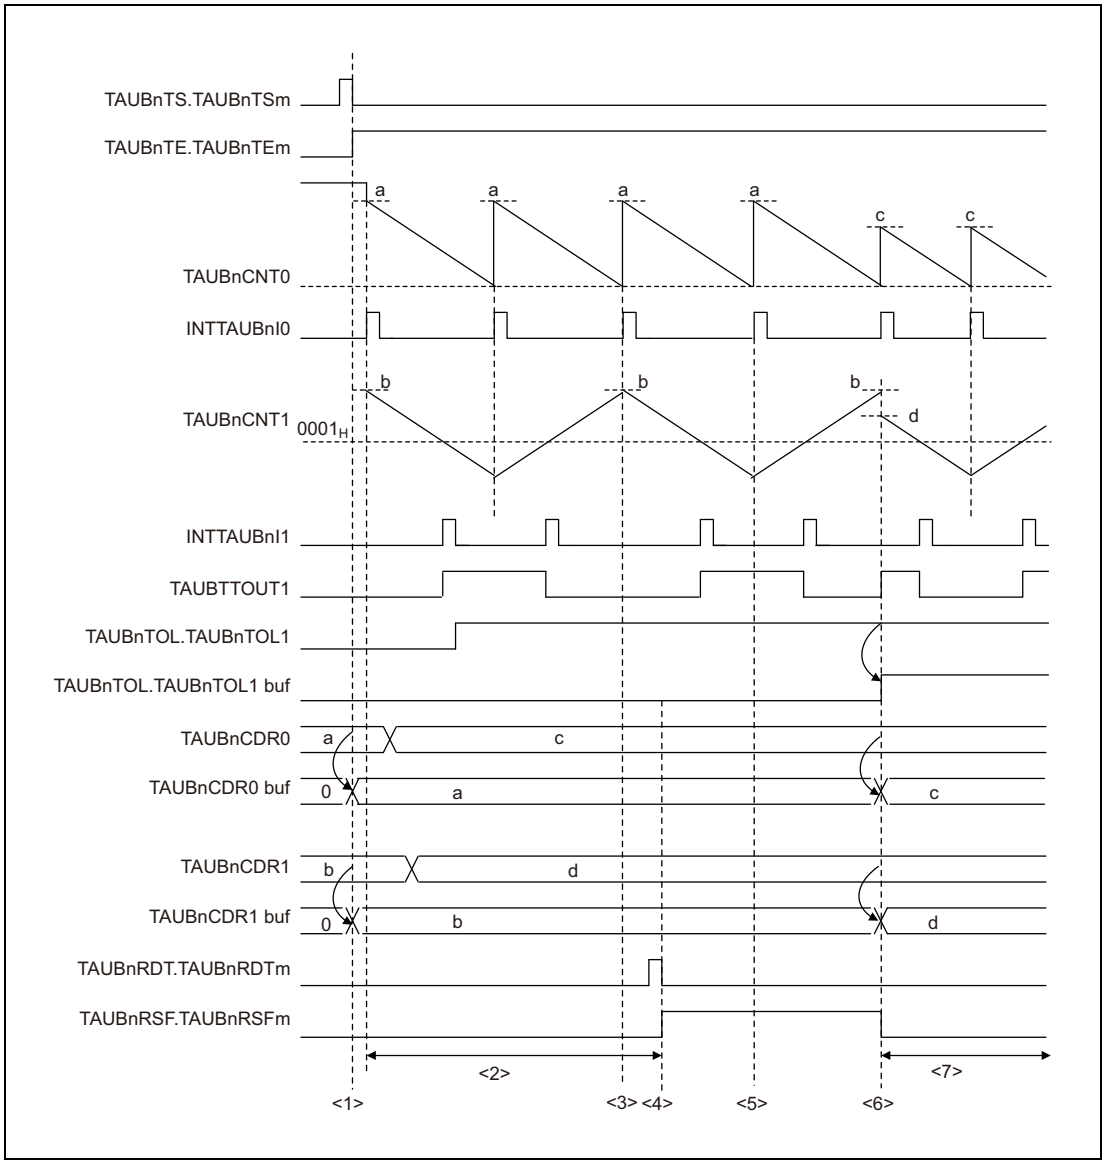

**Figure 24.6 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel**

**Setting:**

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

**Description:**

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer.

(2) The TAUBnCDRm and TAUBnTOL registers can be written at any time.

(3) Simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm = 0).

(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.

(6) Simultaneous rewrite takes place at the start timing of the top of the triangular cycle. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.

(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

### 24.6.4.3 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm (Method C1)

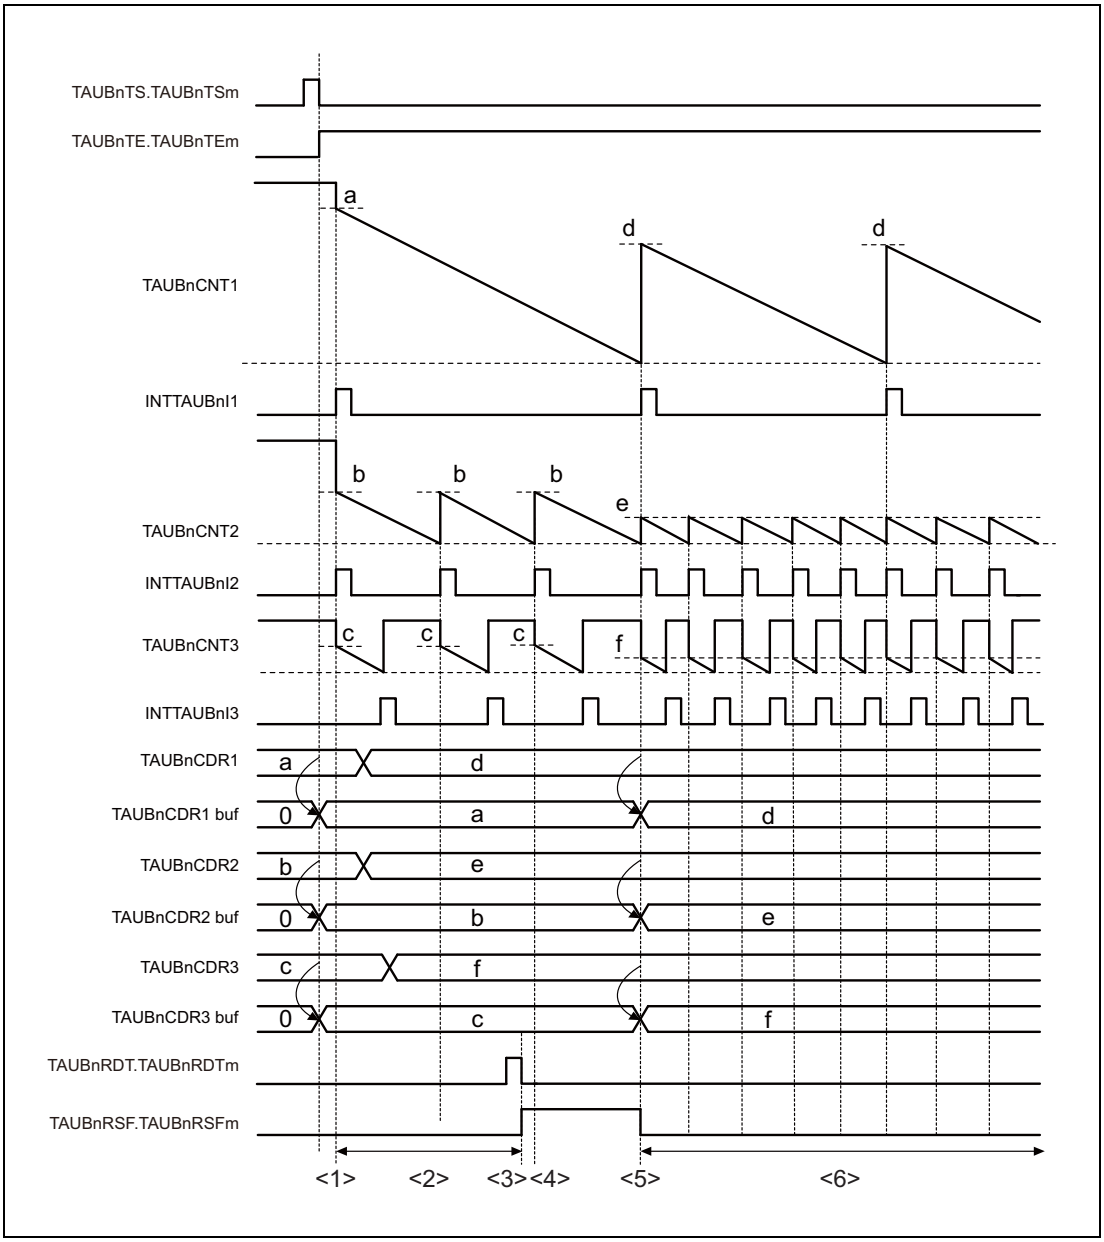

**Figure 24.7 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm**

**Setting:**

CH1 is an upper channel used counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUBnRDC register specifies a channel which generates simultaneous rewrite triggers.

**Description:**

(1) When TAUBnTS.TAUBnTSm is set to 1, the TAUBnCDRm value is copied to the TAUBnCDRm buffer.

(2) The TAUBnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1, the status flag is set (TAUBnRSF.TAUBnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches $0000_H$. The TAUBnCDRm values are loaded into the corresponding TAUBnCDRm buffers.

(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUBnCDRm register can be rechanged.

## 24.7 Channel Output Modes

The output of the TAUBTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUBnTOE.TAUBnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUBnTO.TAUBnTOm) is sent to the output pin (TAUBTTOUTm).
- By TAUB signals (TAUBnTOE.TAUBnTOEm = 1)
  When controlled by TAUB signals, the output level of TAUBTTOUTm is set or reset or toggled by internal signals. The value of TAUBnTO.TAUBnTOm is updated accordingly to reflect the value of TAUBTTOUTm.
  - Independently (TAUBnTOM.TAUBnTOMm = 0)
    In case of independent operation, the output of the TAUBTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUBnTOM.TAUBnTOMm = 0).
  - Synchronously (TAUBnTOM.TAUBnTOMm = 1)
    In case of synchronous operation, the output of the TAUBTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUBnTOM.TAUBnTOMm = 1).

The TAUBnTO.TAUBnTOm bit can always be read to determine the current value of TAUBTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

### Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 24.38, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 24.7.2, Channel Output Modes Controlled Independently by TAUBn Signals**
- **Section 24.7.3, Channel Output Modes Controlled Synchronously by TAUBn Signals**

### Batch operation of TAUBnTOm bit

Whether a set value is reflected to the TAUBnTOm bit or not is controlled by the TAUBnTOE.TAUBnTOEm bit.

The TAUBnTOm setting is written only to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 0 when a write to the TAUBnTO register is attempted. No TAUBnTOm setting is reflected to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 1.

**NOTE**

The TAUBnTO.TAUBnTOm bit is placed so that its bit number corresponds to a channel number.

### Output logic

Positive logic or negative logic of the output is specified by control bit TAUBnTOL.TAUBnTOLm.

The value of TAUBnTOL.TAUBnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. If TAUBnTOL.TAUBnTOLm is changed after the counter starts, the output of TAUBTTOUTm is undefined.

See **Section 24.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 24.38**.

**Table 24.38 Channel Output Modes**

| Channel Output Mode | TAUBnTOE. TAUBnTOEm | TAUBnTOM. TAUBnTOMm | TAUBnTOC. TAUBnTOCm | TAUBnTDE. TAUBnTDEm |
|---|---|---|---|---|
| **By software** | | | | |
| Independent channel output mode controlled by software | 0 | x | | |
| **By TAUB signals, independently** | | | | |
| Independent channel output mode 1 | 1 | 0 | 0 | 0 |
| Independent channel output mode 2 | | | 1 | |
| **By TAUB signals, synchronously** | | | | |
| Synchronous channel output mode 1 | 1 | 1 | 0 | 0 |
| Synchronous channel output mode 2 | | | 1 | 0 |
| Synchronous channel output mode 2 with dead time output | | | | 1 |

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

**NOTE**

The following bits cannot be changed during count operation (TAUBnTE.TAUBnTEm = 1):

- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

### 24.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUBTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUBnTOE.TAUBnTOEm = 0).

(1) Set TAUBnTO.TAUBnTOm to specify the initial level of the TAUBTTOUTm output.

(2) Set channel output mode according to **Table 24.38, Channel Output Modes**, and the output logic using the TAUBnTOL.TAUBnTOLm bit.

(3) Start the counter (TAUBnTS.TAUBnTSm = 1).

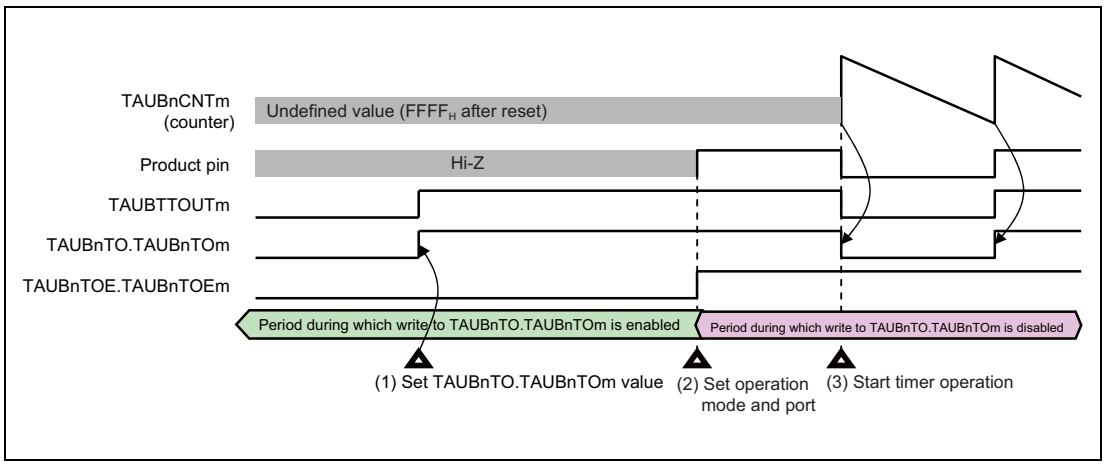

**Figure 24.8 General Procedure for Specifying a TAUBTTOUTm Channel Output Mode**

## 24.7.2 Channel Output Modes Controlled Independently by TAUBn Signals

This section lists the channel output modes that are controlled independently by TAUBn signals. The control bits used to specify a mode are listed in **Table 24.38, Channel Output Modes**.

### 24.7.2.1 Independent Channel Output Mode 1

#### Set/reset conditions

In this output mode, TAUBTTOUTm toggles when INTTAUBnIm is detected. The value of TAUBnTOL.TAUBnTOLm is ignored.

#### Prerequisites

There are no prerequisites other than those shown in **Table 24.38, Channel Output Modes**.

### 24.7.2.2 Independent Channel Output Mode 2

#### Set/reset conditions

In this output mode, TAUBTTOUTm is set when INTTAUBnIm occurs at the time of count start, and reset when INTTAUBnIm occurs due to a match between TAUBnCNTm and TAUBnCDRm.

#### Prerequisites

There are no prerequisites other than those shown in **Table 24.38, Channel Output Modes**.

## 24.7.3 Channel Output Modes Controlled Synchronously by TAUBn Signals

This section lists the channel output modes that are controlled synchronously by TAUBn signals. The control bits used to specify a mode are listed in **Table 24.38, Channel Output Modes**.

### 24.7.3.1 Synchronous Channel Output Mode 1

#### Set/reset conditions

In this output mode, INTTAUBnIm of master channel serves as a set signal and INTTAUBnIm of the slave channel as a reset signal. If INTTAUBnIm of the master channel and INTTAUBnIm of the slave channel are generated at the same time, INTTAUBnIm of the slave channel (reset signal) has priority over INTTAUBnIm (set signal) of the master channel, i.e., the master channel is ignored.

#### Prerequisites

There are no prerequisites other than those shown in **Table 24.38, Channel Output Modes**.

### 24.7.3.2 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is trianglular wave PWM output at TAUBTTOUTm. For details, see **Section 24.14.5, Triangle PWM Output Function**.

#### Set/reset conditions

TAUBnCNTm of the slave channel counts down and up alternatively. When it passes $0001_H$ it generates an interrupt, causing TAUBTTOUTm to toggle.

**Prerequisites**

A set of two channels is required to generate the triangle PWM output. TAUBTTOUTm should be set to 0 before the function starts.

### 24.7.3.3 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUBTTOUTm. The set/reset conditions are shown in **Figure 24.9**.

**Set/reset conditions**

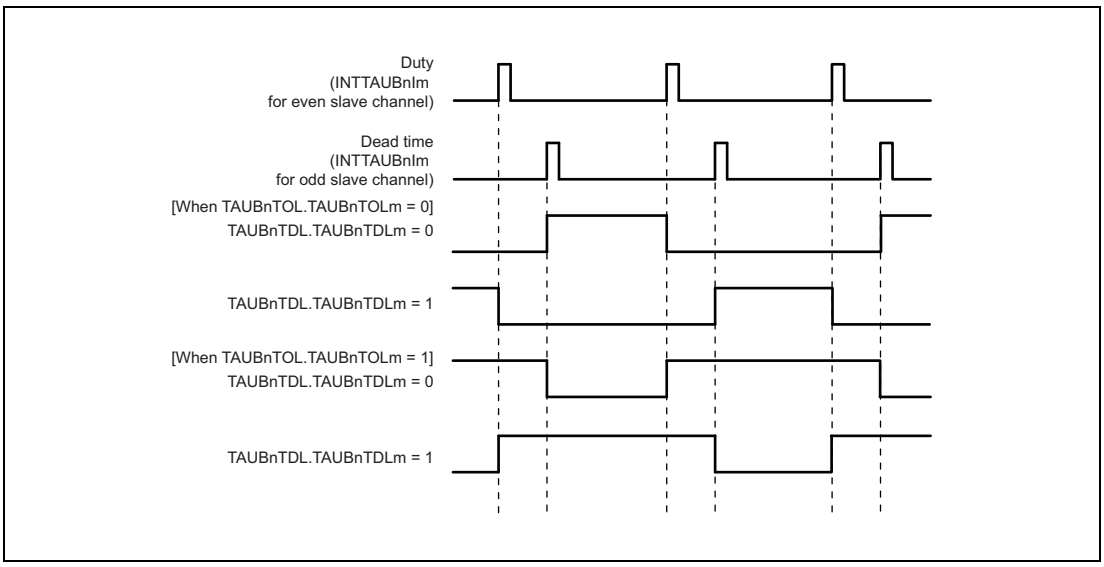

**Figure 24.9 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output**

With regard to the edge to which dead time is added, set TAUBnTDL.TAUBnTDLm = 0 for rising edges and TAUBnTDL.TAUBnTDLm = 1 for falling edges.

**Prerequisites**

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel
  The master channel should be set to interval timer mode.
- One even slave channel
  The even slave channel should be set to count-up/-down mode.
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUBnTOE.TAUBnTOEm
- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

## 24.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUBnTS.TAUBnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

**CAUTION**

**The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.**

### 24.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-Up/-Down Mode, and Count Capture Mode

The counter starts operating at the next count clock after TAUBnTS.TAUBnTSm is set to 1. The value of data register is also loaded when the counter starts.

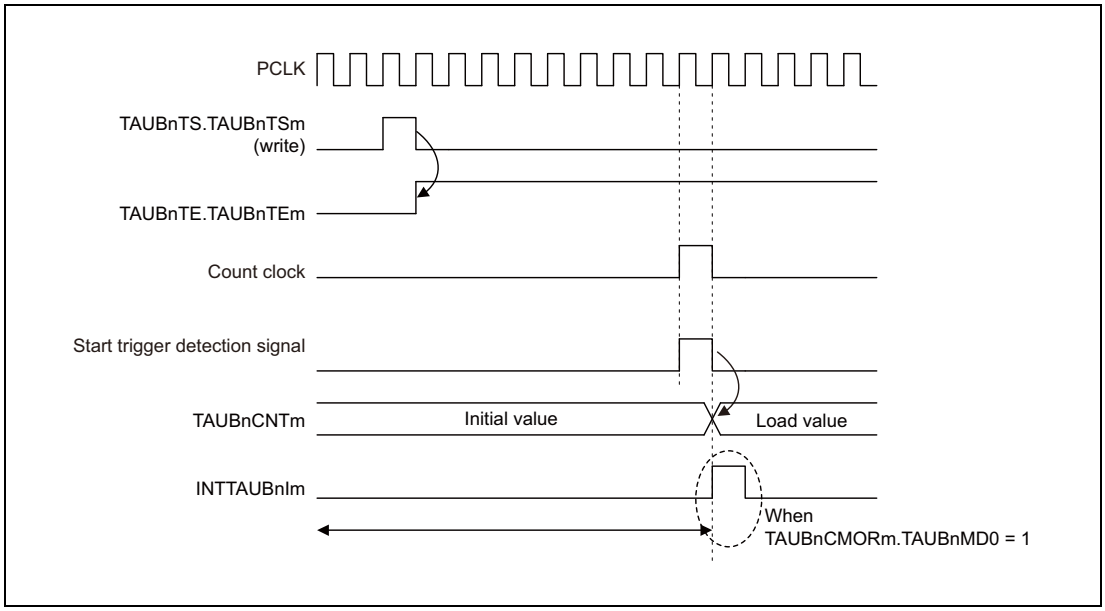

**Figure 24.10 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Up/Down Count Mode, and Count Capture Mode**

**NOTE**

Make sure to set TAUBnCMORm.TAUBnMD0 to 0 when using the count-up/-down mode.

### 24.8.2 Event Count Mode

The value of data register is loaded as soon as TAUBnTS.TAUBnTSm is set to 1. The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

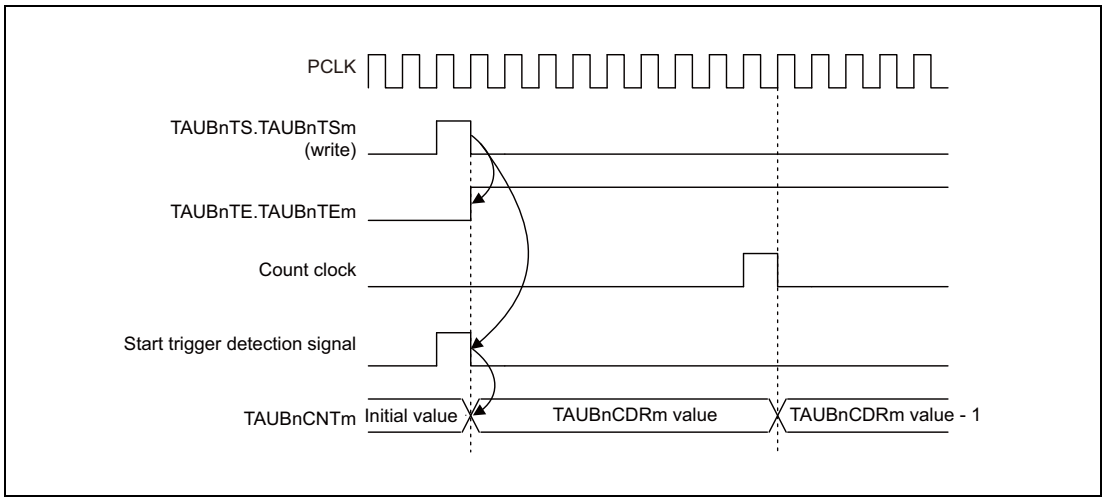

**Figure 24.11 Start Timing in Event Count Mode**

### 24.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUBTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

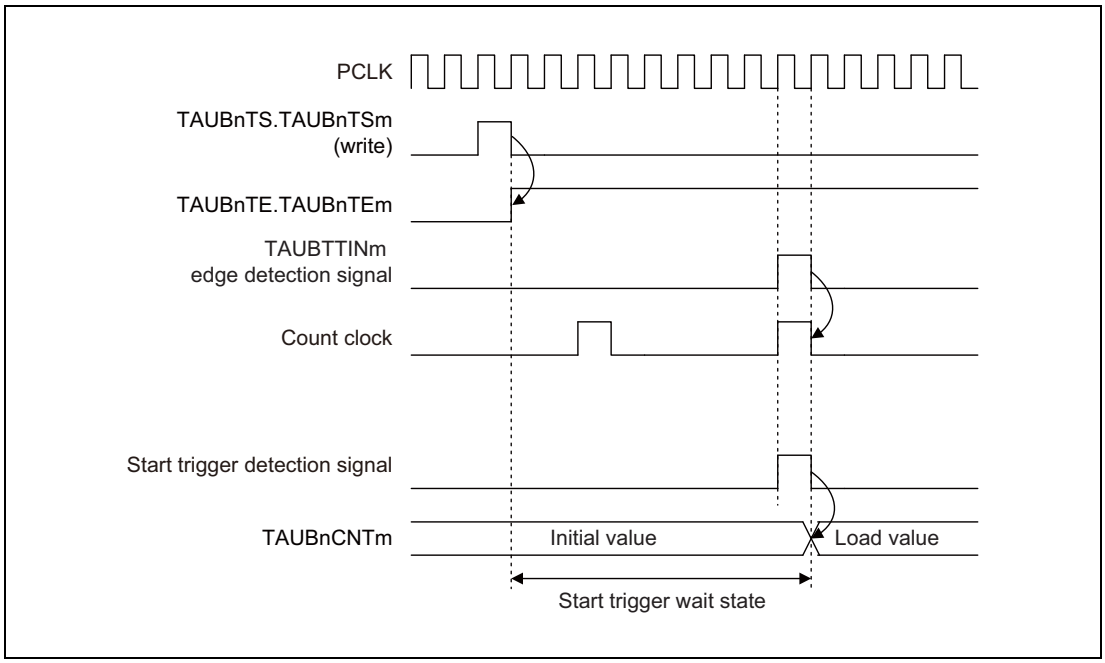

**Figure 24.12 Count Start Timing in Other Operating Modes**

## 24.9 TAUBTTOUTm Output and INTTAUBnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUBnIm is generated using the TAUBnCMORm.TAUBnMD0 bit. The generation of INTTAUBnIm when the TAUBnCMORm.TAUBnMD0 bit starts counting and the effect to TAUBTTOUTm depend on the selected function. For details, refer to the description of TAUBnCMORm.TAUBnMD0 of each function.

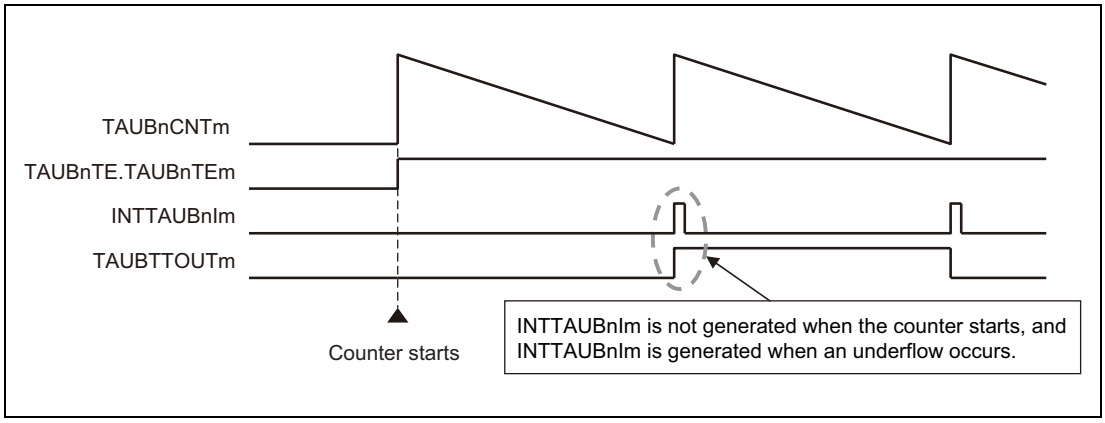

**Figure 24.13 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0=0)**

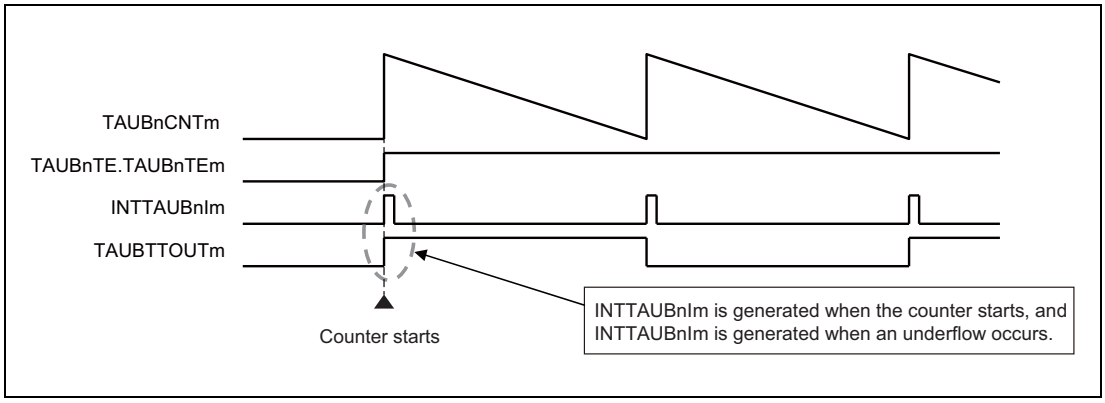

**Figure 24.14 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0=1)**

## 24.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches $FFFF_H$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches $0000_H$ at the same time as the first channel overflows (TAUBnCNTm = $FFFF_H$).
- Set TAUBnCDRm of the second channel to $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUBTTINm input.
- The trigger detection settings (TAUBnCMORm.TAUBnSTS[2:0] and TAUBnCMURm.TAUBnTIS[1:0]) must be identical for both channels.

**Result:**

The down-counter of the second channel reaches $0000_H$ at exactly the same time as the up-counter of the first channel overflows (TAUBnCNTm = $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

### 24.10.1 Example of Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the TAUBTTINm input interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input pulse interval measurement function exceeds $FFFF_H$.

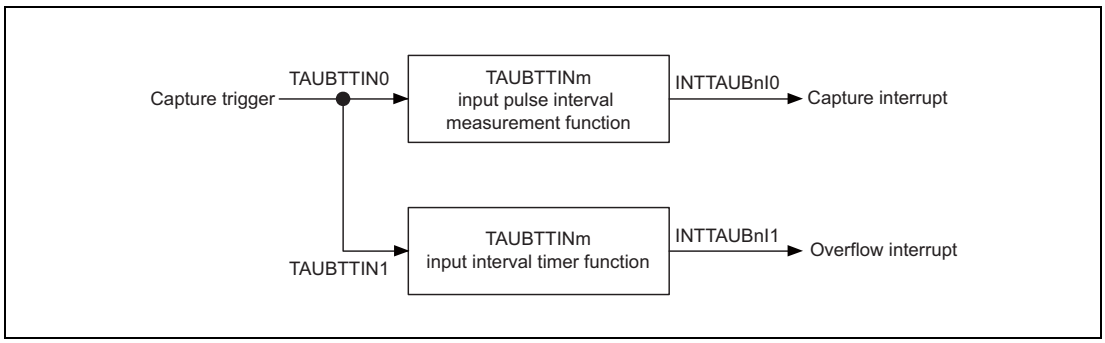

**Figure 24.15 Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function**

#### Timing diagram

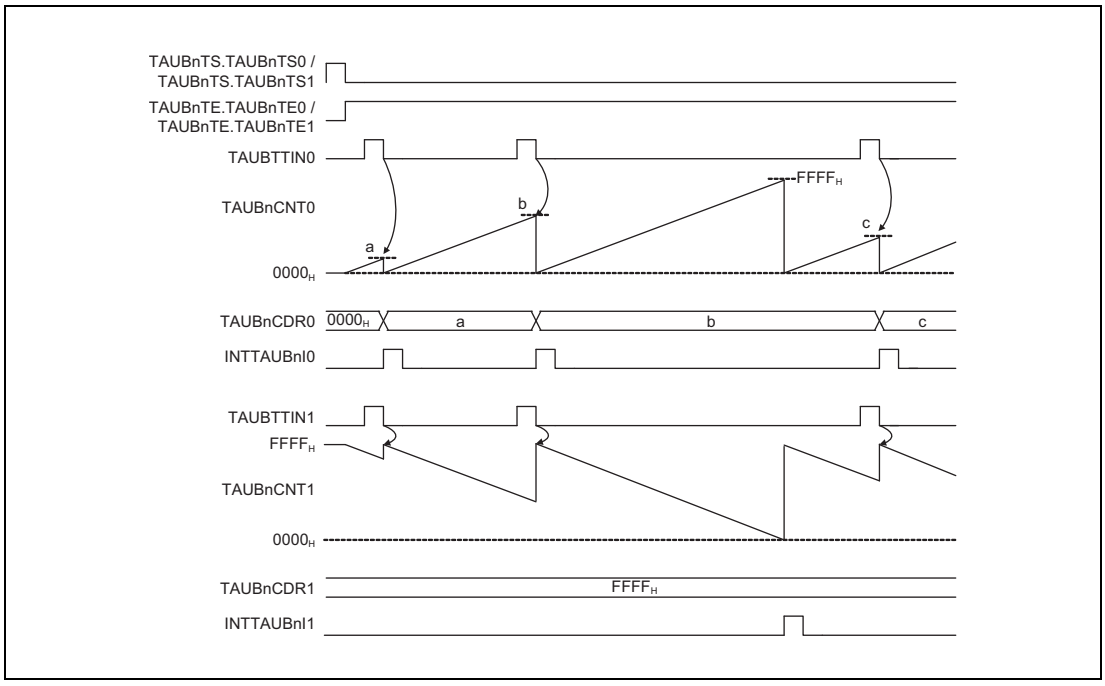

**Figure 24.16 Interrupt Generation by Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function**

### 24.10.2 Example of Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm width measurement) can detect the overflow when TAUBnCNTm of the TAUBTTINm input signal width measurement function exceeds $FFFF_H$.

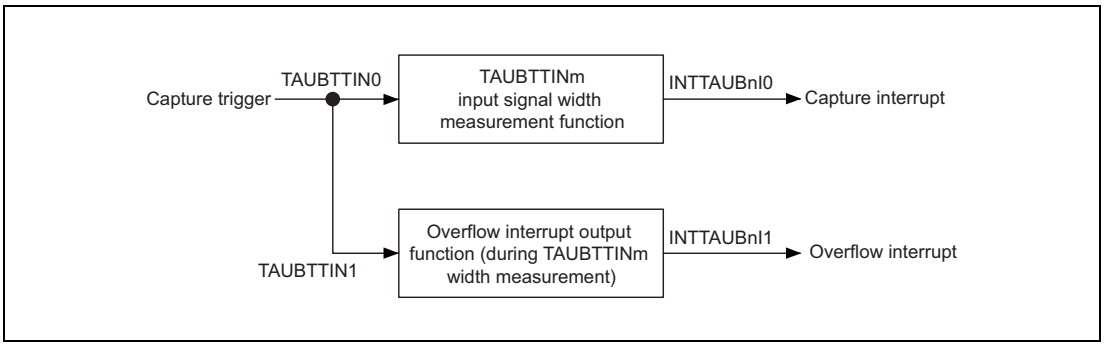

**Figure 24.17 Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)**

**Timing diagram**

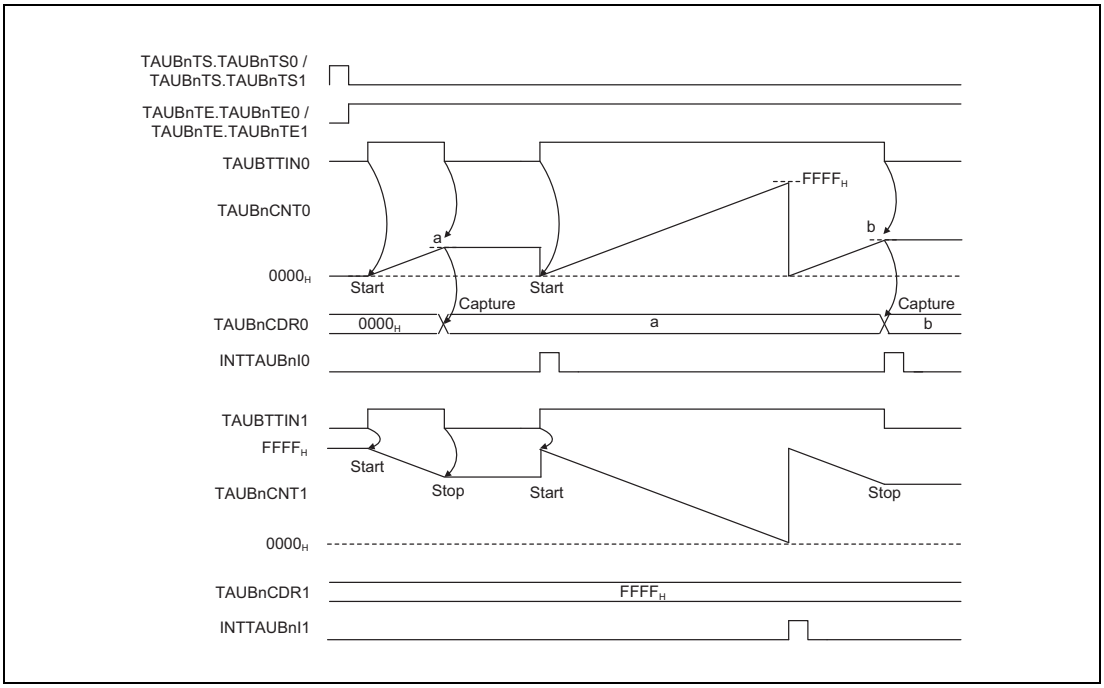

**Figure 24.18 Interrupt Generation by Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)**

### 24.10.3 Example of Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUBnIm of the interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input position detection function exceeds $FFFF_H$.

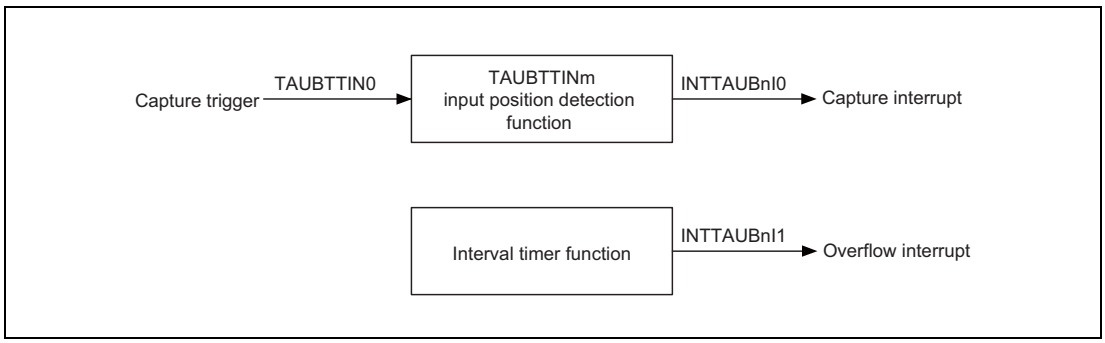

**Figure 24.19 Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function**

#### Timing diagram

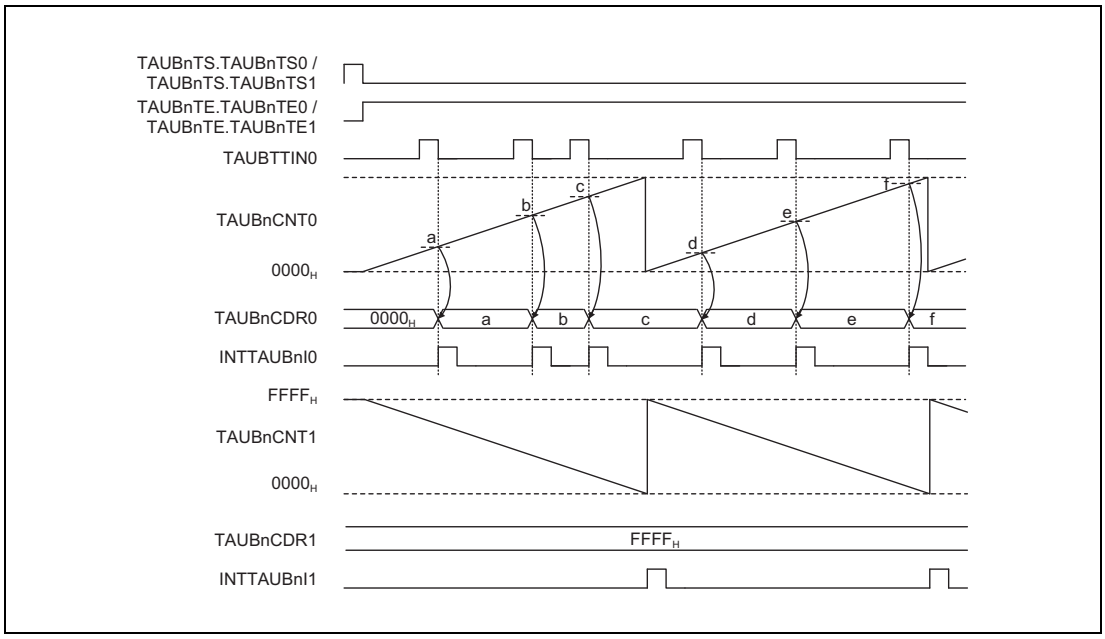

**Figure 24.20 Interrupt Generation by Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function**

### 24.10.4 Example of Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm input period count detection) can detect the overflow when TAUBnCNTm of the TAUBTTINm input period count detection function exceeds $FFFF_H$.

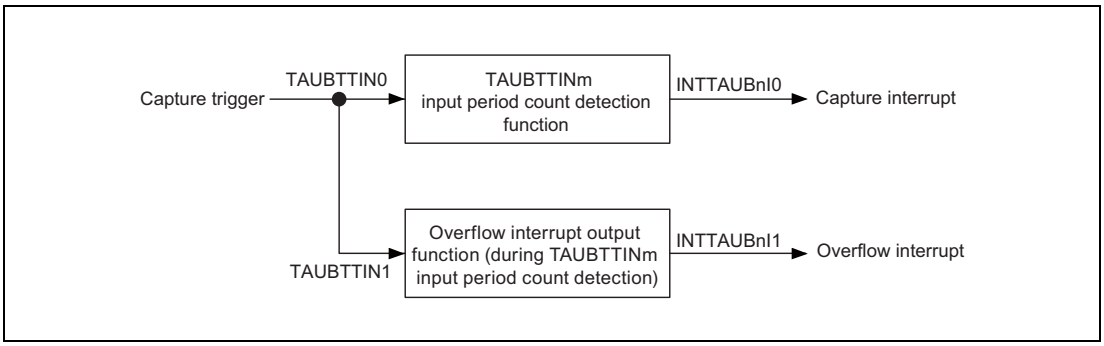

**Figure 24.21 Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (TAUBTTINm Input Period Count Detection)**

**Timing diagram**

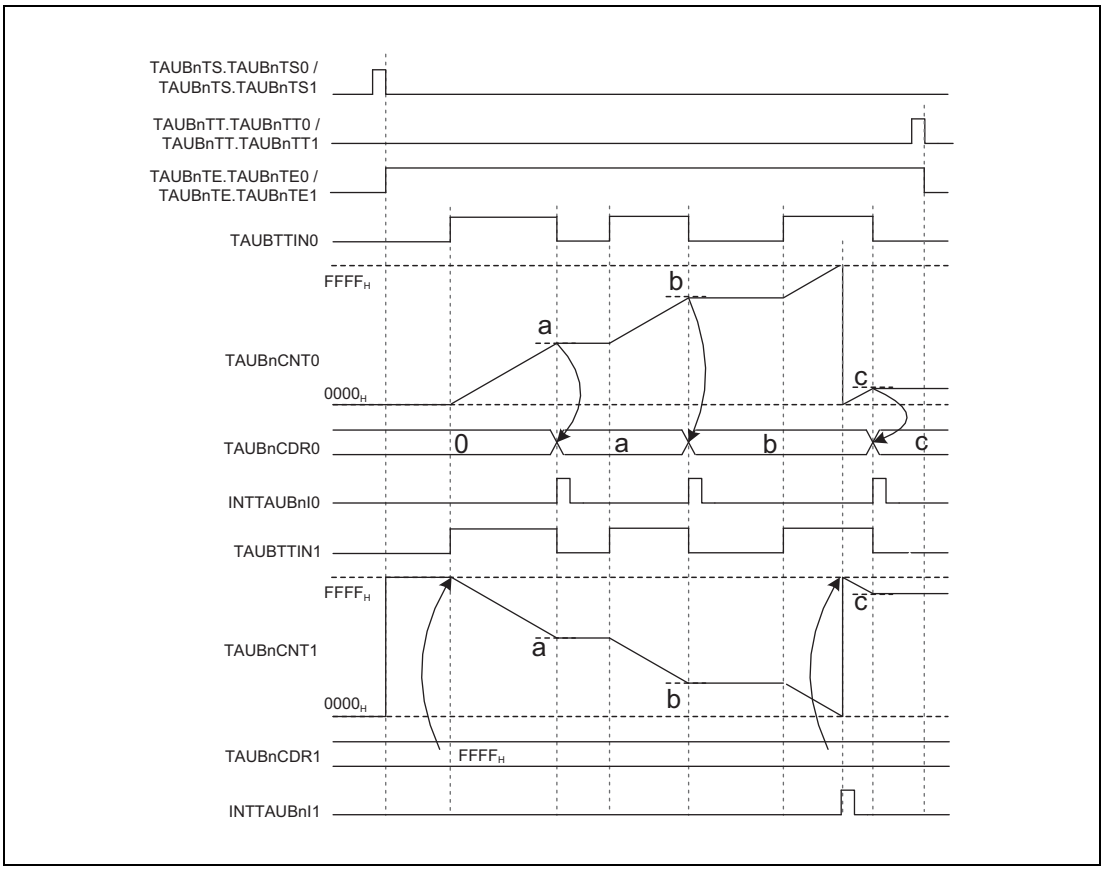

**Figure 24.22 Interrupt Generation by Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)**

## 24.11 TAUBTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

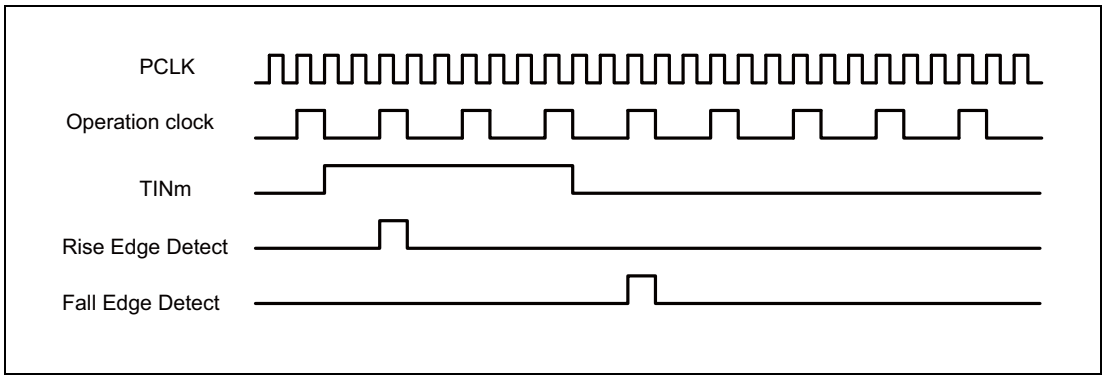

**Figure 24.23 Basic Edge Detection Timing**

**Figure 24.23** is an image of the operation timing. Actually, the delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn will be generated.

# 24.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUB. For a general overview of independent channel operation functions, see **Section 24.2, Overview**.

## 24.12.1 Interval Timer Function

### 24.12.1.1 Overview

#### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals. When an interrupt is generated, the TAUBTTOUTm signal toggles, resulting in a square wave.

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

When the counter reaches $0000_H$, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

#### Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle. This results in an inverted TAUBTTOUTm signal output when TAUBnCMORm.TAUBnMD0 is set to 1.

### 24.12.1.2 Equations

INTTAUBnIm cycle = count clock cycle × (TAUBnCDRm + 1)

TAUBTTOUTm square wave cycle = count clock cycle × (TAUBnCDRm + 1) × 2

### 24.12.1.3 Block Diagram and General Timing Diagram

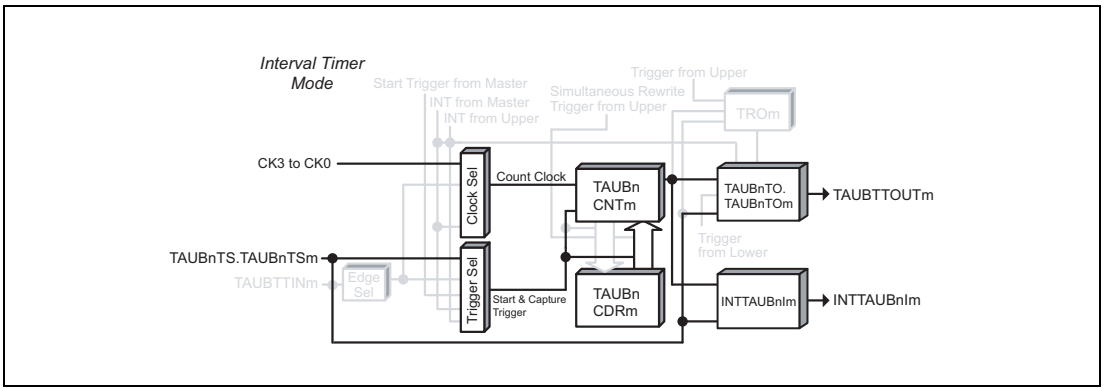

**Figure 24.24 Block Diagram for Interval Timer Function**

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

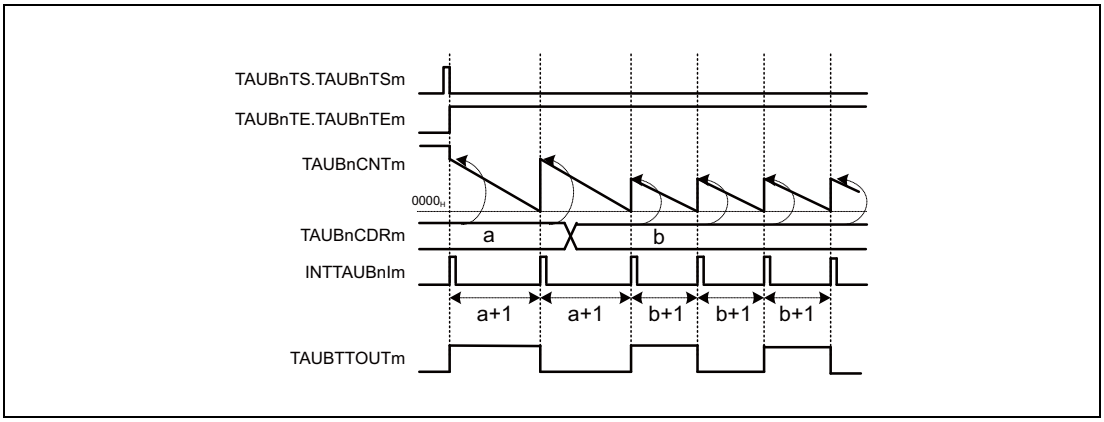

**Figure 24.25 General Timing Diagram for Interval Timer Function**

### 24.12.1.4 Register Settings

#### (1) TAUBnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBnCKS [1:0] | | — | TAUBn CCS0 | TAUBn MAS | TAUBnSTS[2:0] | | | TAUBnCOS [1:0] | | — | TAUBnMD[4:1] | | | | TAUBn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 24.39 Contents of the TAUBnCMORm Register for Interval Timer Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUBnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3 |
| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | TAUBnCCS0 | Write $0_B$. |
| 11 | TAUBnMAS | Write $0_B$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $000_B$. |
| 7, 6 | TAUBnCOS[1:0] | Write $00_B$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0000_B$. |
| 0 | TAUBnMD0 | 0: INTTAUBnIm is not generated and TAUBTTOUTm does not toggle at operation start.<br>1: INTTAUBnIm is generated and TAUBTTOUTm toggles at operation start or restart. |

#### (2) TAUBnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUBnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 24.40 Contents of the TAUBnCMURm Register for Interval Timer Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

### (3) Channel output mode

Table 24.41 Control Bit Settings for Independent Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUBnTOE.TAUBnTOEm | Write $1_B$. |
| TAUBnTOM.TAUBnTOMm | Write $0_B$. |
| TAUBnTOC.TAUBnTOCm | Write $0_B$. |
| TAUBnTOL.TAUBnTOLm | Write $0_B$. |
| TAUBnTDE.TAUBnTDEm | Write $0_B$. |
| TAUBnTDL.TAUBnTDLm | Write $0_B$. |

**NOTE**

The channel output mode can also be set to channel output mode controlled by software by setting TAUBnTOE.TAUBnTOEm = 0. TAUBTTOUTm can then be controlled independently of the interrupts.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Interval Timer Function. Therefore, these registers must be set to 0.

Table 24.42 Simultaneous Rewrite Settings for Interval Timer Function

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm | |
| TAUBnRDC.TAUBnRDCm | |

### 24.12.1.5 Operating Procedure for Interval Timer Function

Table 24.43 Operating Procedure for Interval Timer Function

| | Operation | Status of TAUBn |
|---|---|---|
| Initial channel setting | Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.39, Contents of the TAUBnCMORm Register for Interval Timer Function** and **Table 24.40, Contents of the TAUBnCMURm Register for Interval Timer Function**<br><br>Set the value of the TAUBnCDRm register<br><br>Set the channel output mode by setting the control bits as described in **Table 24.41, Control Bit Settings for Independent Channel Output Mode 1** | Channel operation is stopped. |
| Start operation | Set TAUBnTS.TAUBnTSm to 1.<br>TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is set to 1 and the counter starts.<br>TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated and TAUBTTOUTm toggles. |
| During operation | The TAUBnCDRm register value can be changed at any time.<br>The TAUBnCNTm register can be read at all times. | TAUBnCNTm counts down. When the counter reaches $0000_H$:<br>• TAUBnCNTm reloads the TAUBnCDRm value and continues count operation<br>• INTTAUBnIm is generated and TAUBTTOUTm toggles. |
| Stop operation | Set TAUBnTT.TAUBnTTm to 1.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm and TAUBTTOUTm stop and retain their current values. |

Restart operation

### 24.12.1.6 Specific Timing Diagrams

#### (1) TAUBnCDRm = $0000_H$, count clock = PCLK/2

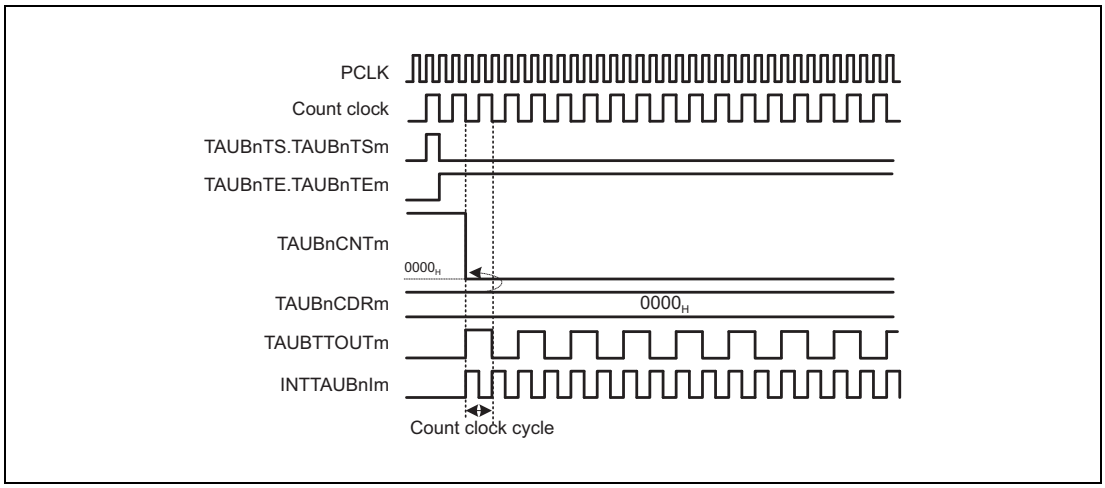

Figure 24.26 TAUBnCDRm = $0000_H$, Count Clock = PCLK/2

- TAUBnCDRm = $0000_H$, and the count clock = PCLK/2, the TAUBnCDRm value is written to TAUBnCNTm every count clock, meaning that TAUBnCNTm is always $0000_H$.
- INTTAUBnIm is generated every count clock, resulting in TAUBTTOUTm toggling every count clock.

#### (2) TAUBnCDRm = $0000_H$, count clock = PCLK

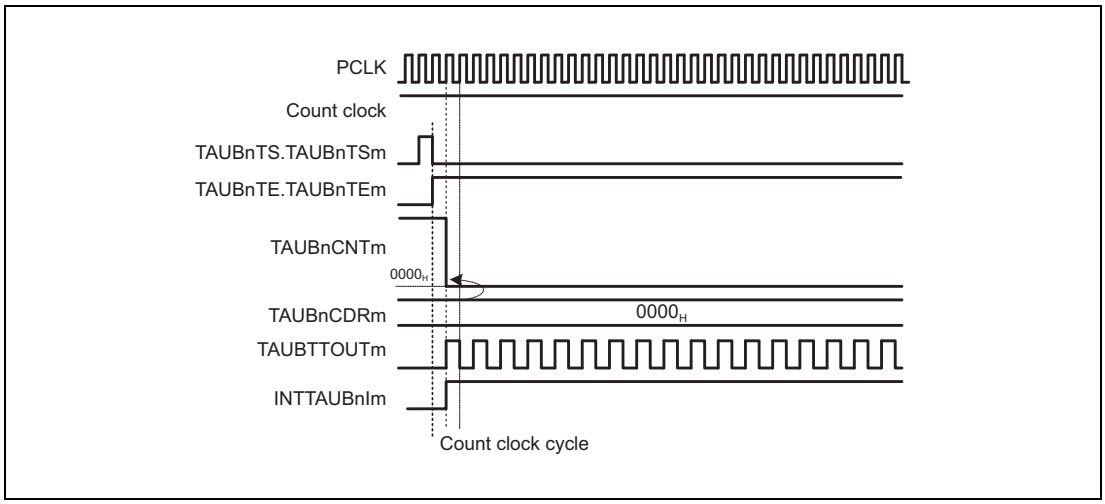

Figure 24.27 TAUBnCDRm = $0000_H$, Count Clock = PCLK

- TAUBnCDRm = $0000_H$, and the count clock = PCLK, the TAUBnCDRm value is written to TAUBnCNTm every PCLK clock, meaning that TAUBnCNTm is always $0000_H$.
- INTTAUBnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
  TAUBTTOUTm is toggled every PCLK clock.

### (3) Operation stop and restart (TAUBnCMORm TAUBnMDO = 1)

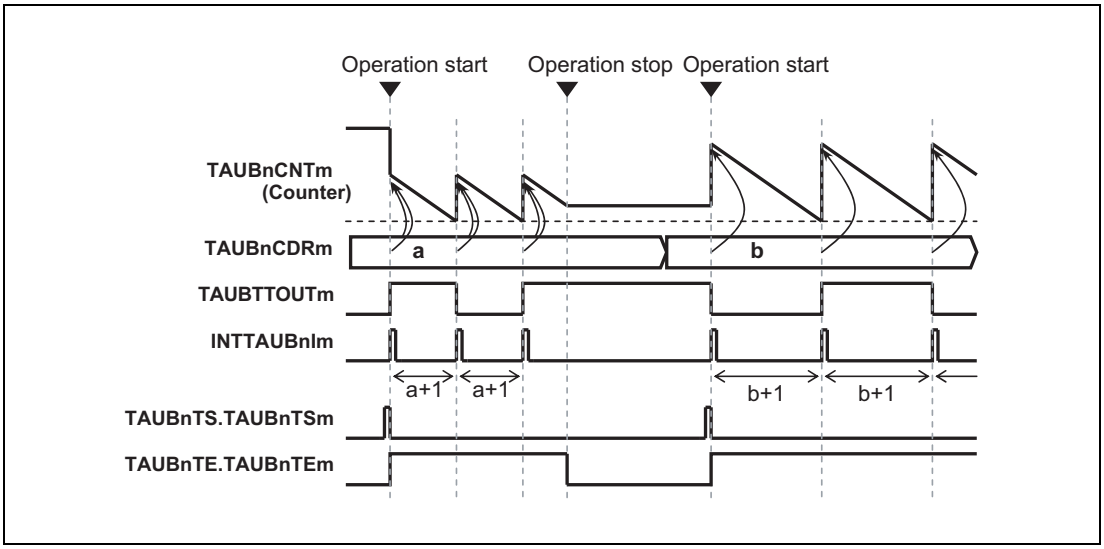

**Figure 24.28 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 1**

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1.

### (4) Operation stop and restart (TAUBnCMORm.TAUBnMD0 = 0)

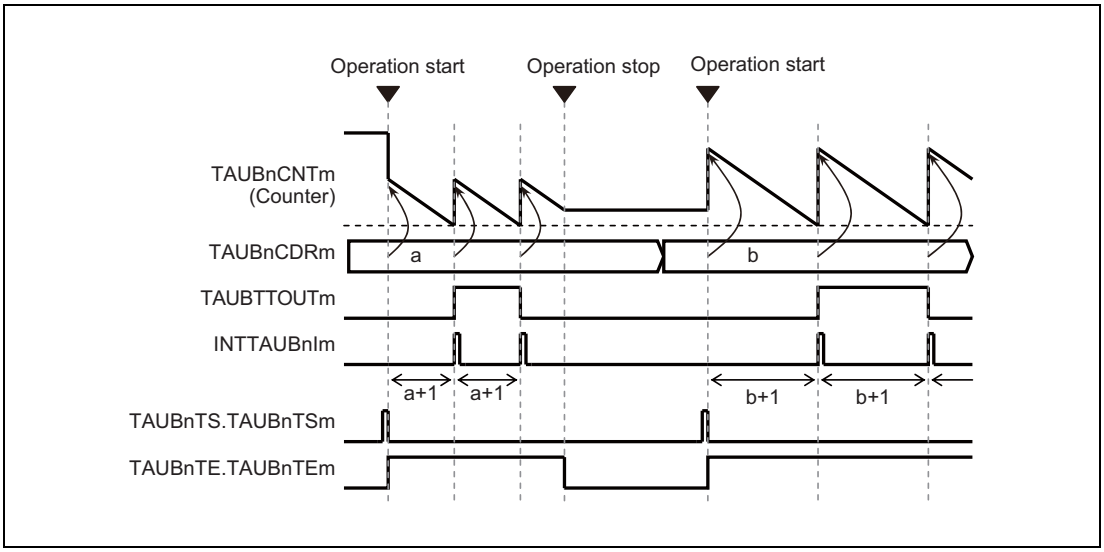

**Figure 24.29 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 0**

### (5) Forced restart (TAUBnCMORm.TAUBnMD0 = 1)

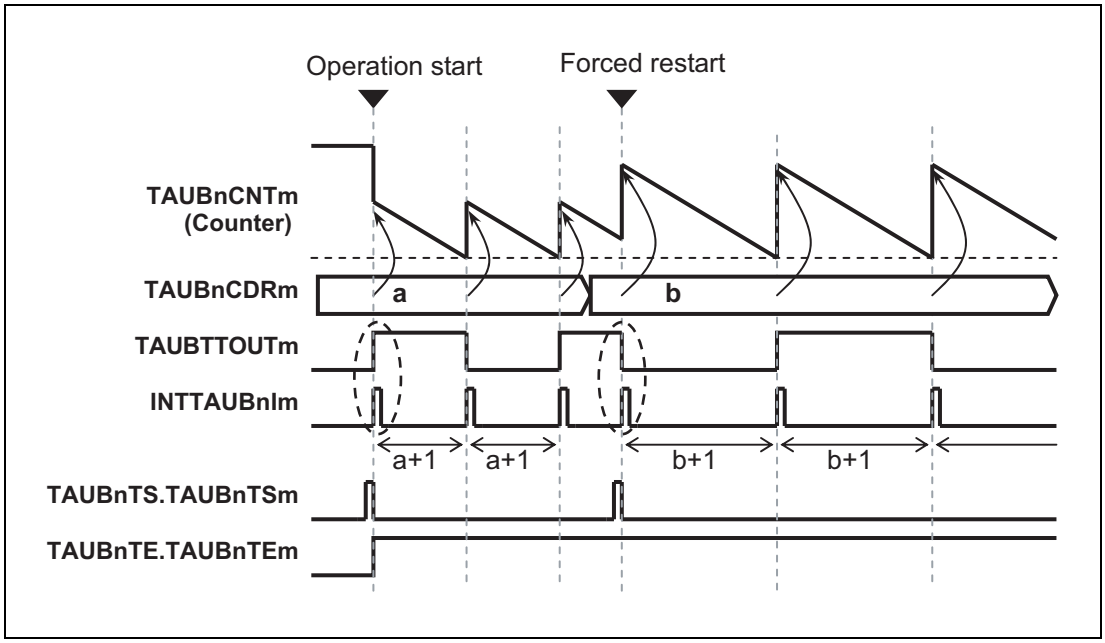

Figure 24.30 Forced Restart Operation, TAUBnCMORm.TAUBnMD0 = 1

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt at start or restart is generated and the output TAUBTTOUTm toggles.

### (6) Forced restart (TAUBnCMORm.TAUBnMD0 = 0)

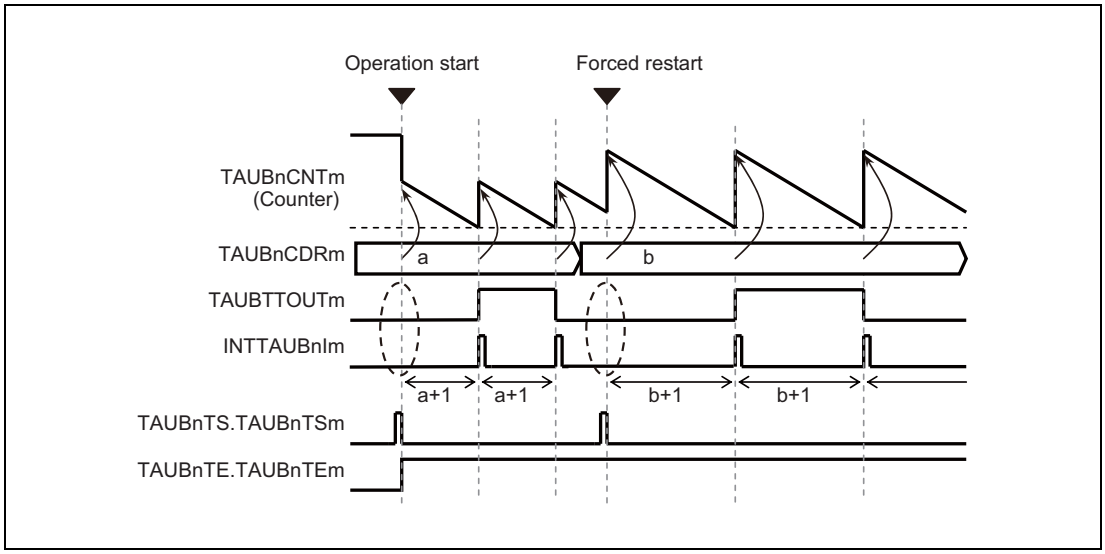

**Figure 24.31 Forced Restart Operation (TAUBnCMORm.TAUBnMD0 = 0)**

- The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle.

## 24.12.2 TAUBTTINm Input Interval Timer Function

### 24.12.2.1 Overview

#### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals or when a valid TAUBTTINm input edge is detected.

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

INTTAUBnIm is generated when the counter reaches $0000_H$ or by an effective TAUBTTINm input edge. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The type of edge used as the trigger is specified using the TAUBnCMURm.TAUBnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

### 24.12.2.2 Block Diagram and General Timing Diagram

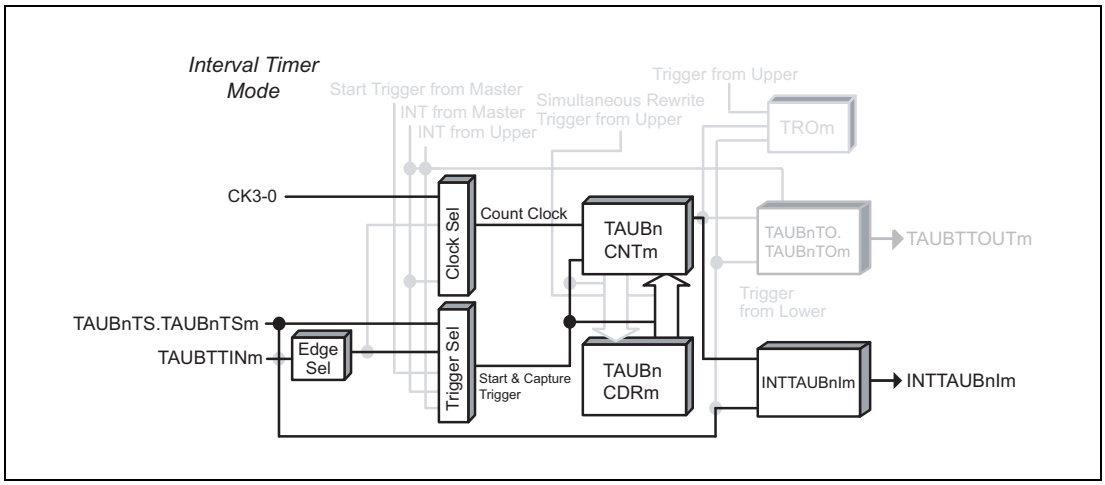

**Figure 24.32 Block Diagram for TAUBTTINm Input Interval Timer Function**

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1).
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $01_B$)

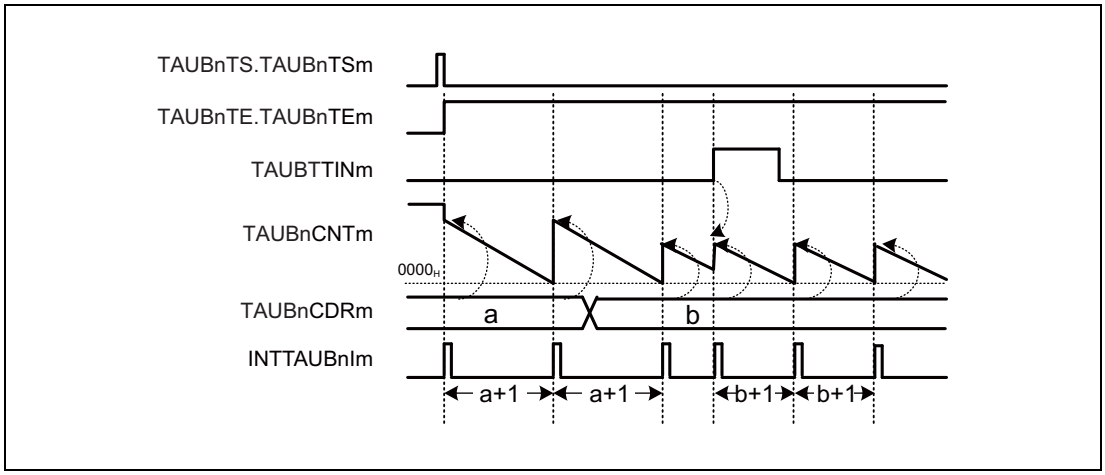

**Figure 24.33 General Timing Diagram for TAUBTTINm Input Interval Timer Function**

### (3) Channel output mode

This function does not use channel output mode.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Interval Timer Function. Therefore, these registers must be set to 0.

**Table 24.46 Simultaneous Rewrite Settings for TAUBTTINm Input Interval Timer Function**

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0 |

| Stop operation | Set TAUBnTT.TAUBnTTm to 1<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm stop and retain their current values. |

Restart operation

### 24.12.2.5 Specific Timing Diagrams

The timing diagrams in **Section 24.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by an effective TAUBTTINm input edge.

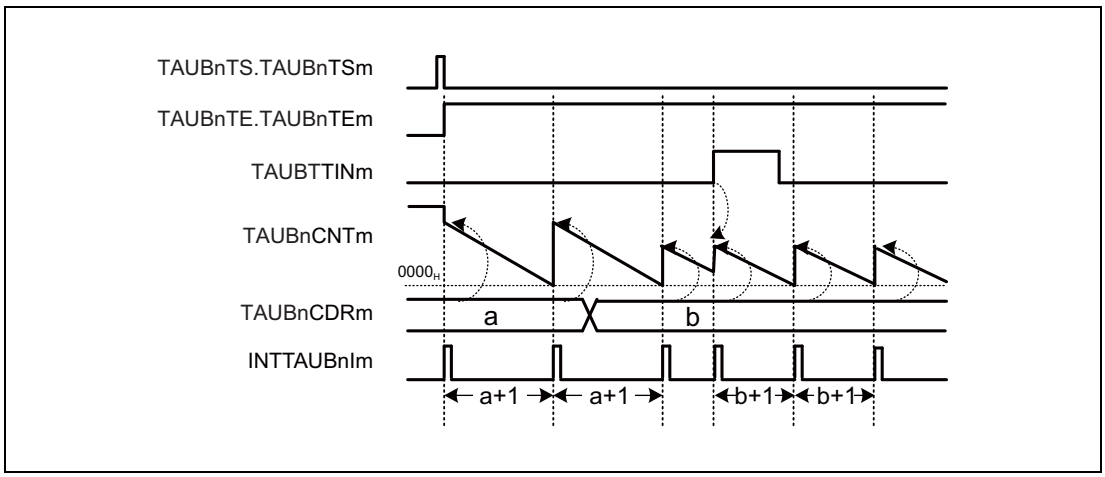

**Figure 24.34 Counter Triggered by Rising TAUBTTINm Input Edge (TAUBnCMURm.TAUBnTIS[1:0] = $01_B$), TAUBnCMORm.TAUBnMD0 = 1**

- If an effective TAUBTTINm input edge is detected, an interrupt INTTAUBnIm is generated. In this example, the effective edge is a rising edge (TAUBnCMURm.TAUBnTIS[1:0] = $01_B$).

## 24.12.3 Clock Divide Function

### 24.12.3.1 Overview

#### Summary

This function is used as a frequency divider. The frequency of the input signal TAUBTTINm is divided by a factor related to TAUBnCDRm, and an interrupt INTTAUBnIm is generated.

#### Prerequisites

- TAUBTTINm must have a fixed frequency
- The operation mode must be set to interval timer mode, see **Table 24.48, Contents of the TAUBnCMORm Register for Clock Divide Function**

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value, using TAUBTTINm as the count clock.

When the counter value reaches $0000_H$, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm stops but retain their values. The function can be restarted by setting TAUBnTS.TAUBnTSm = 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.

#### Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated.

**NOTE**

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits.

### 24.12.3.2 Block Diagram and General Timing Diagram

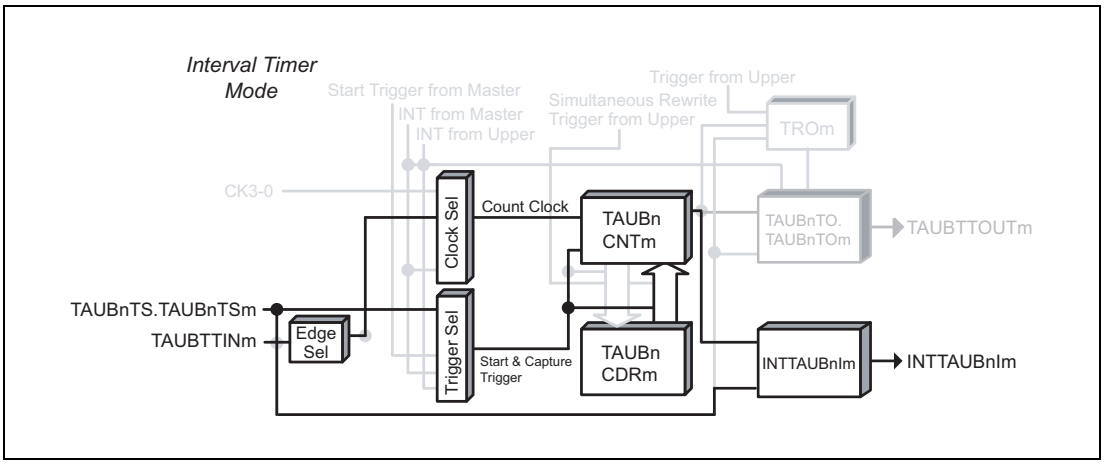

**Figure 24.35 Block Diagram for Clock Divide Function**

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $01_B$)

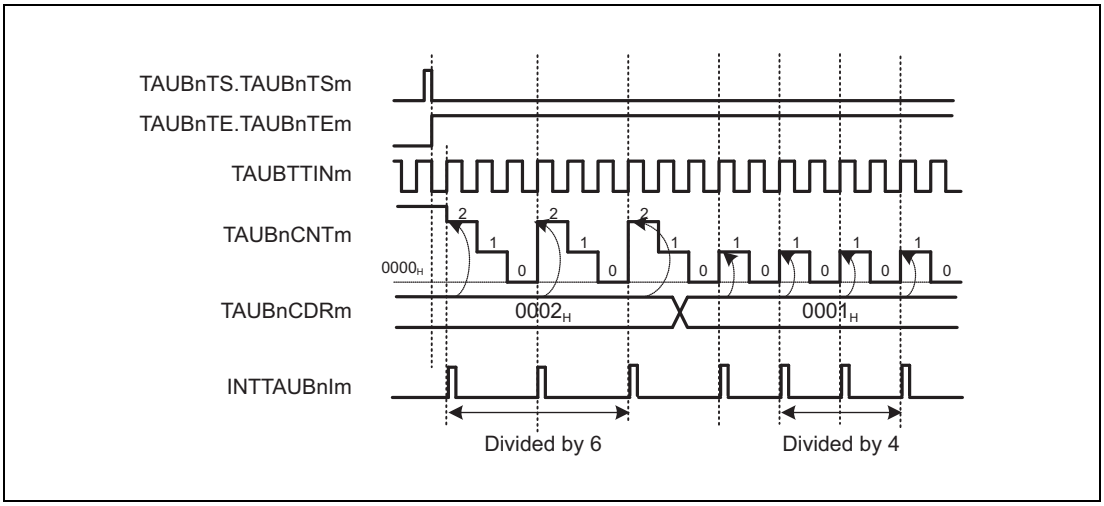

**Figure 24.36 General Timing Diagram for Clock Divide Function**

### 24.12.3.3 Register Settings

#### (1) TAUBnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

### (3) Channel output mode

This function does not use channel output mode.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Clock Divide Function. Therefore, these registers must be set to 0.

**Table 24.50 Simultaneous Rewrite Settings for Clock Divide Function**

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm | |
| TAUBnRDC.TAUBnRDCm | |

## 24.12.3.4 Operating Procedure for Clock Divide Function

**Table 24.51 Operating Procedure for Clock Divide Function**

| | Operation | Status of TAUBn |
|---|---|---|
| Initial channel setting | Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.48, Contents of the TAUBnCMORm Register for Clock Divide Function** and **Table 24.49, Contents of the TAUBnCMURm Register for Clock Divide Function**<br><br>Set the value of the TAUBnCDRm register. | Channel operation is stopped. |

| Stop operation | Set TAUBnTT.TAUBnTTm to 1.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm stops and retains its current value. |

Restart operation

### 24.12.3.5 Specific Timing Diagrams

#### (1) TAUBnCDRm = $0000_H$

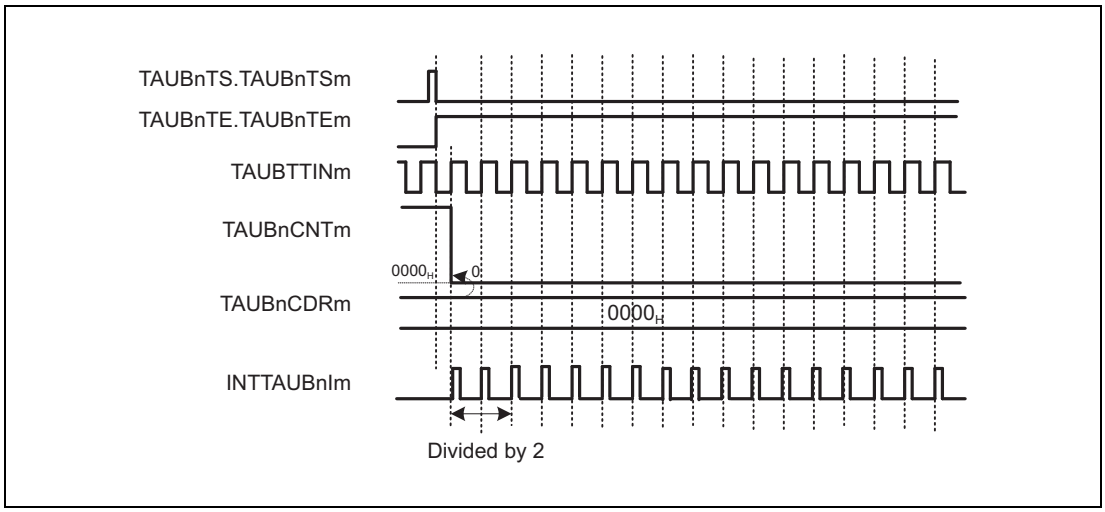

**Figure 24.37 TAUBnCDRm = $0000_H$, TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = $01_B$**

- If TAUBnCDRm is $0000_H$, TAUBnCNTm is also always $0000_H$.
- INTTAUBnIm is generated every count clock.

**Figure 24.37** is an image of the operation timing. Actually, there is a delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn.

#### (2) Operation restart

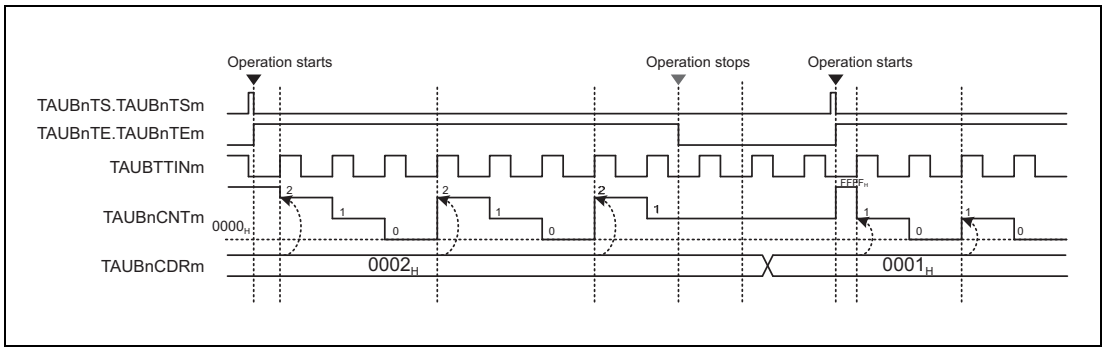

**Figure 24.38 Operation Restart (TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = $01_B$)**

### (3) Forced restart

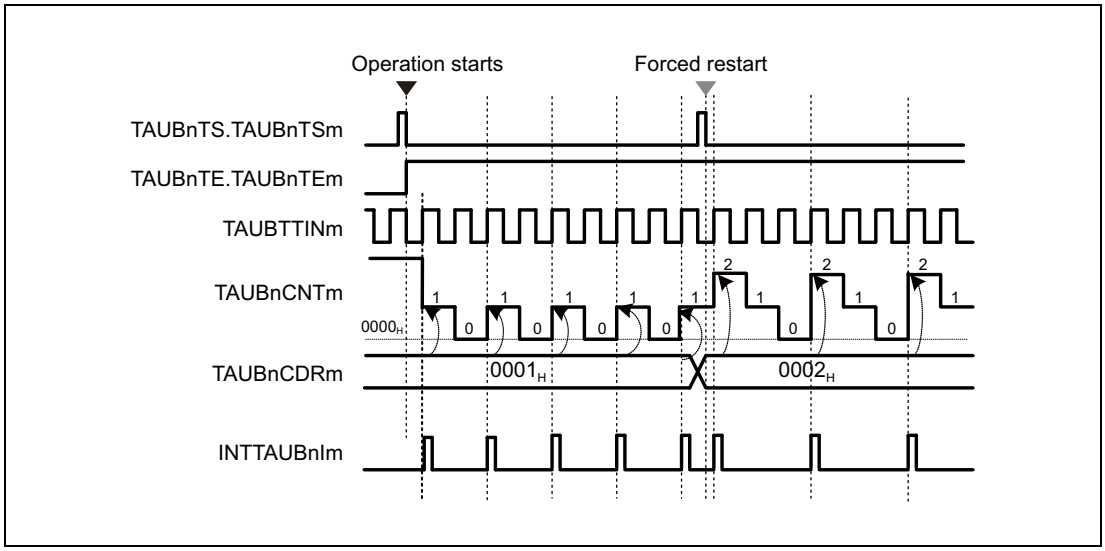

**Figure 24.39 Forced Restart (TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = $01_B$)**

To forcibly restart the counter.

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- The value of TAUBnCDRm is written to TAUBnCNTm and the count operation restarts.

## 24.12.4 External Event Count Function

### 24.12.4.1 Overview

#### Summary

This function is used as an event timer. It generates an interrupt (INTTAUBnIm) when a specific number of valid edges of TAUBTTINm input are detected.

#### Prerequisites

- The operation mode must be set to event count mode, see **Table 24.52, Contents of the TAUBnCMORm Register for External Event Count Function**
- TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When the counter starts, the current value of TAUBnCDRm is written to TAUBnCNTm.

When an effective TAUBTTINm input edge is detected, the value of TAUBnCNTm reduces by 1. TAUBnCNTm retains this value until a valid TAUBTTINm input edge is detected or the counter is restarted.

When effective edges are detected (TAUBnCDRm + 1) times, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues to operate.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

#### Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = $00_B$, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = $01_B$, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = $10_B$, rising and falling edges trigger the counter.

### 24.12.4.2 Equations

Number of valid edges,
detected before INTTAUBnIm is generated = TAUBnCDRm + 1

### 24.12.4.3 Block Diagram and General Timing Diagram

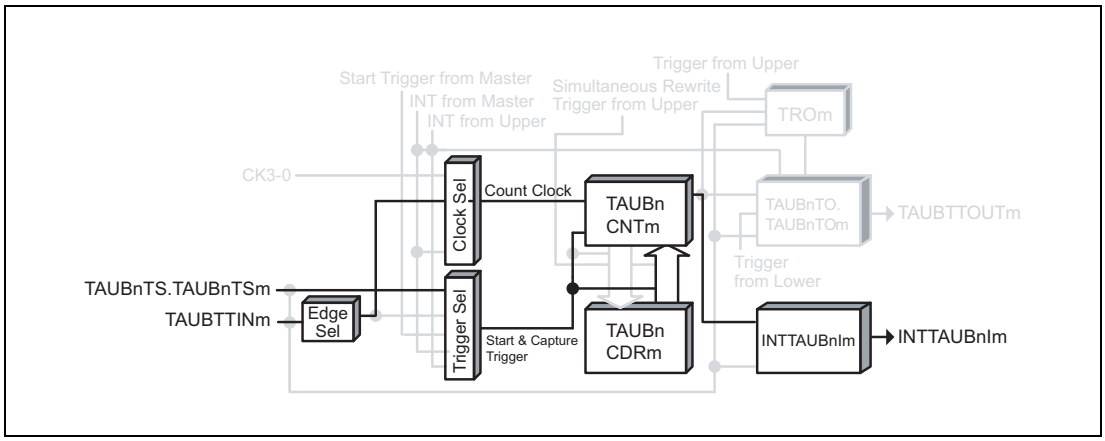

**Figure 24.40 Block Diagram for External Event Count Function**

The following settings apply to the general timing diagram.

- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $01_B$)

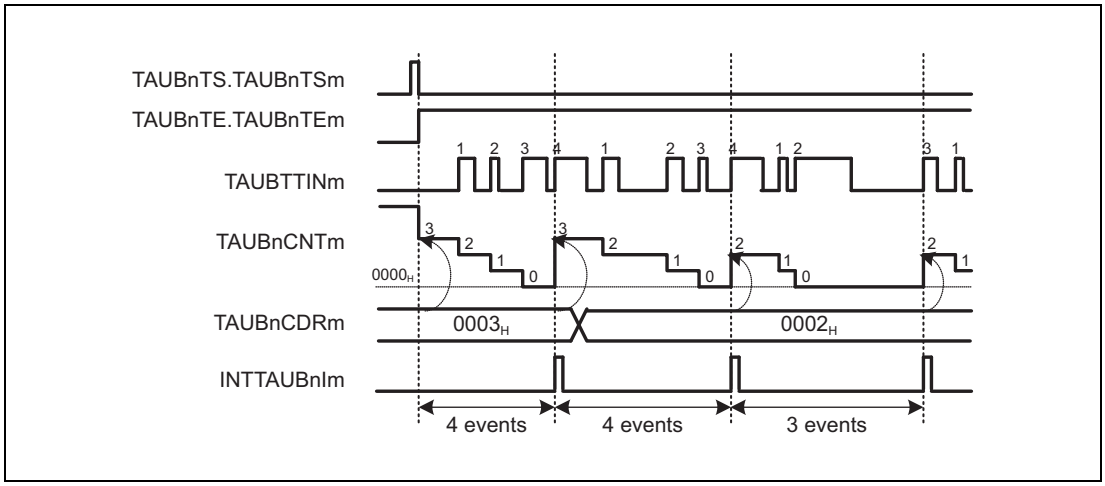

**Figure 24.41 General Timing Diagram for External Event Count Function**

### 24.12.4.4 Register Settings

#### (1) TAUBnCMORm

Restart operation

### 24.12.4.6 Specific Timing Diagrams

#### (1) TAUBnCDRm = $0000_H$

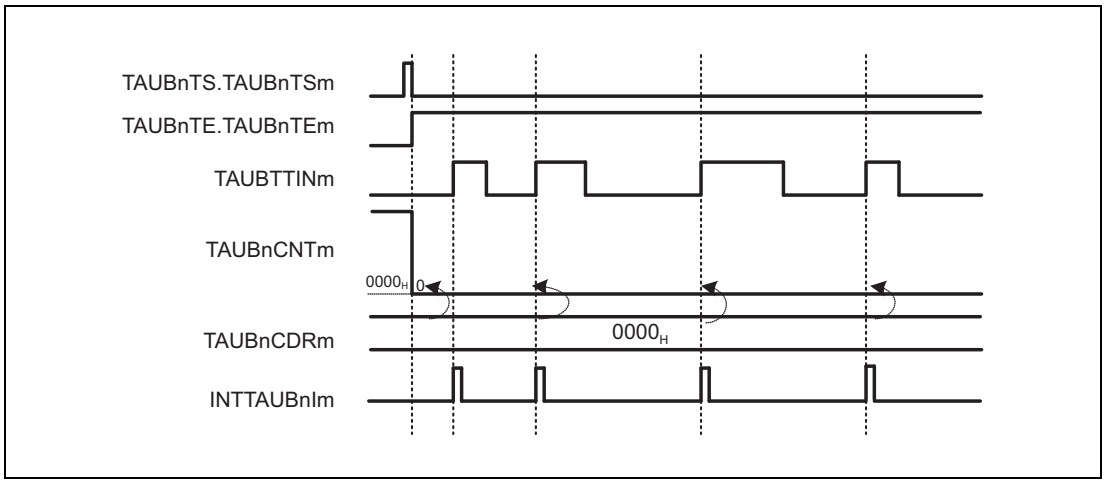

Figure 24.42 TAUBnCDRm = $0000_H$, TAUBnCMURm.TAUBnTIS[1:0] = $01_B$

- If $0000_H$ = TAUBnCDRm, $0000_H$ is loaded to TAUBnCNTm every time a valid TAUBTTINm input edge is detected.

  This means, INTTAUBnIm is generated every time a valid TAUBTTINm input edge is detected.

#### (2) Operation stop and restart

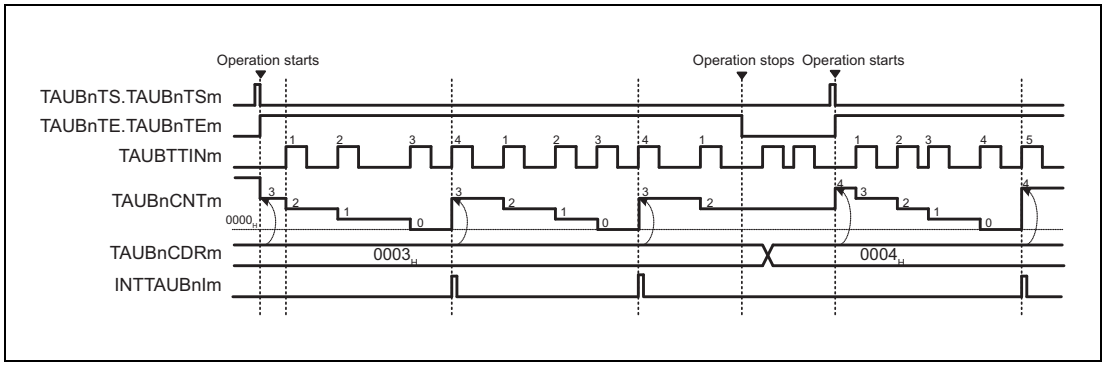

Figure 24.43 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = $01_B$)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained. TAUBTTINm continues and TAUBnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm loads the TAUBnCDRm value and restarts count operation.

### (3) Forced restart

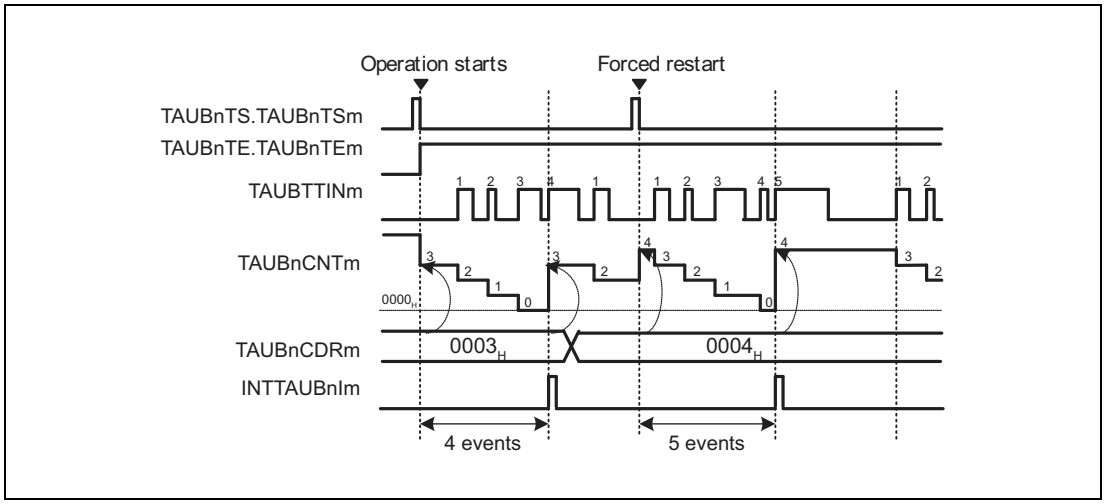

**Figure 24.44 Forced Restart (TAUBnCMURm.TAUBnTIS[1:0] = $01_B$)**

A forced restart applies the new TAUBnCDRm value to TAUBnCNTm immediately.

- The counter can be restarted (without stopping it first), by setting TAUBnTS.TAUBnTSm to 1 during operation.
- The value of TAUBnCDRm is loaded to TAUBnCNTm and the counter awaits the next valid TAUBTTINm input edge.

## 24.12.5 One-Pulse Output Function

### 24.12.5.1 Overview

#### Summary

This function generates an interrupt (INTTAUBnIm) when a valid TAUBTTINm input edge is detected and subsequently, in a specific interval. TAUBTTINm input signal pulses that occur within the defined interval are ignored.

#### Prerequisites

- The operation mode must be set to pulse one-count mode. (See **Table 24.56, Contents of the TAUBnCMORm Register for One-Pulse Output Function**).
- Trigger detection must be disabled during counting (TAUBnCMORm.TAUBnMD0 = 0).

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input edge is detected. The value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from the TAUBnCDRm value, and an interrupt is generated.

When the counter reaches $0001_H$ an interrupt is generated. The counter stops at $0000_H$ and awaits the next effective TAUBTTINm input edge.

When the counter is counting down, further TAUBTTINm input signals are ignored, i.e. the counter does not reset.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

#### Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = $00_B$, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = $01_B$, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = $10_B$, rising and falling edges trigger the counter.

### 24.12.5.2 Equations

Interval between TAUBTTINm and INTTAUBnIm = count clock cycle × TAUBnCDRm

### 24.12.5.3 Block Diagram and General Timing Diagram

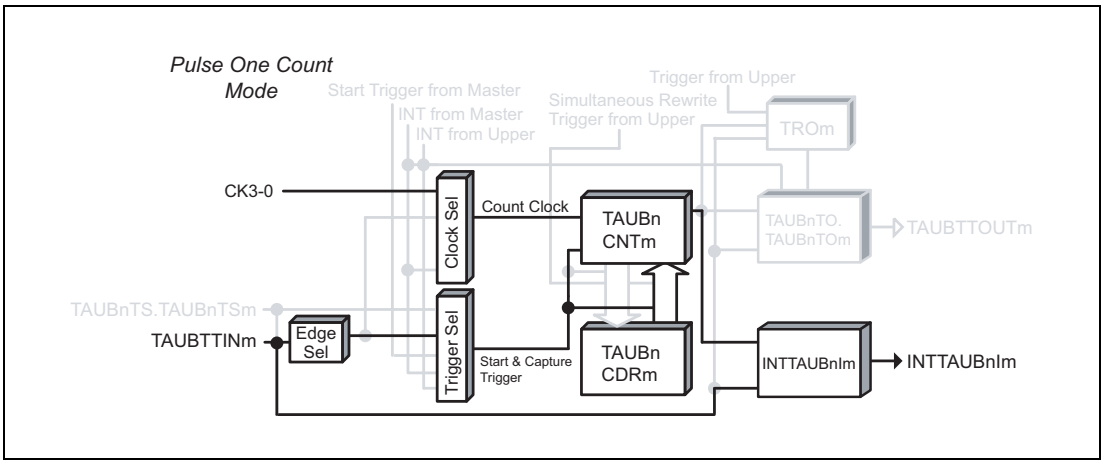

**Figure 24.45 Block Diagram for One-Pulse Output Function**

The following settings apply to the general timing diagram.

- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)

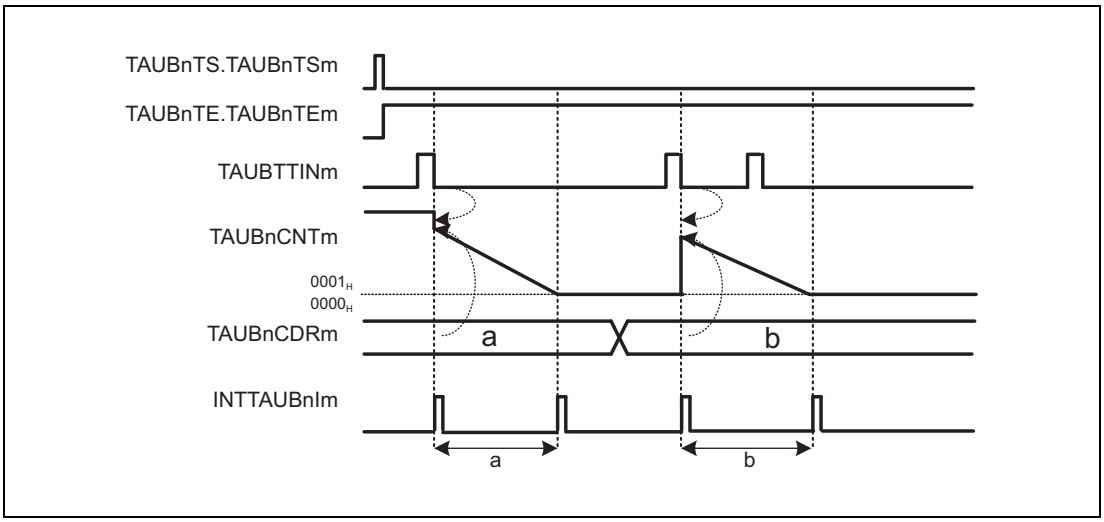

**Figure 24.46 General Timing Diagram for One-Pulse Output Function**

### 24.12.5.4 Register Settings

#### (1) TAUBnCMORm

### (3) Channel output mode

This function does not use channel output mode.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the One-Pulse Output Function.
Therefore, these registers must be set to 0.

**Table 24.58 Simultaneous Rewrite Settings for One-Pulse Output Function**

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm | |
| TAUBnRDC.TAUBnRDCm | |

| Stop operation | Set TAUBnTT.TAUBnTTm to 1.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm stops and retains its current value. |

Restart operation

## 24.12.6 TAUBTTINm Input Pulse Interval Measurement Function

### 24.12.6.1 Overview

#### Summary

This function captures the count value and uses this value and the overflow bit TAUBnCSRm.TAUBnOVF to measure the interval of the TAUBTTINm input signal.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter TAUBnCNTm starts counting up from $0000_H$. When a valid TAUBTTINm edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter resets to $0000_H$ and subsequently continues operation.

If the counter reaches $FFFF_H$ before a valid TAUBTTINm edge is detected, it overflows to $0000_H$. The counter is reset to $0000_H$ and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

**Table 24.60 Effects of an Overflow**

| TAUBnCMORm. TAUBnCOS[1:0] | When Overflow Occurs | | When a Valid TAUBTTINm Input is then Detected | |
|---|---|---|---|---|
| | TAUBnCDRm | TAUBnCSRm. TAUBnOVF | TAUBnCDRm, TAUBnCNTm | TAUBnCSRm. TAUBnOVF |
| 00 | Unchanged | 0 | TAUBnCNTm loaded to TAUBnCDRm | 1 |
| 01 | | 1 | | |
| 10 | Set to $FFFF_H$ | 0 | TAUBnCNTm set to 0, TAUBnCDRm unchanged | Unchanged |
| 11 | | 1 | | |

If TAUBnCMORm.TAUBnCOS[0] is 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the interval of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

The function can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm stops but retains its value. While the function is stopped, TAUBTTINm input valid edge detection and TAUBnCNTm capture are not performed.

The counter is reset to $0000_H$ and subsequently continues operation.

#### Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the interrupt at start or restart is not generated.

**NOTE**

When TAUBnCMORm.TAUBnCOS[1:0] = $10_B$ or $11_B$, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

#### 24.12.6.2 Equations

TAUBTTINm input pulse interval = count clock cycle ×

[(TAUBnCSRm.TAUBnOVF × ($FFFF_H$ + 1)) + TAUBnCDRm capture value + 1]

### 24.12.6.3 Block Diagram and General Timing Diagram

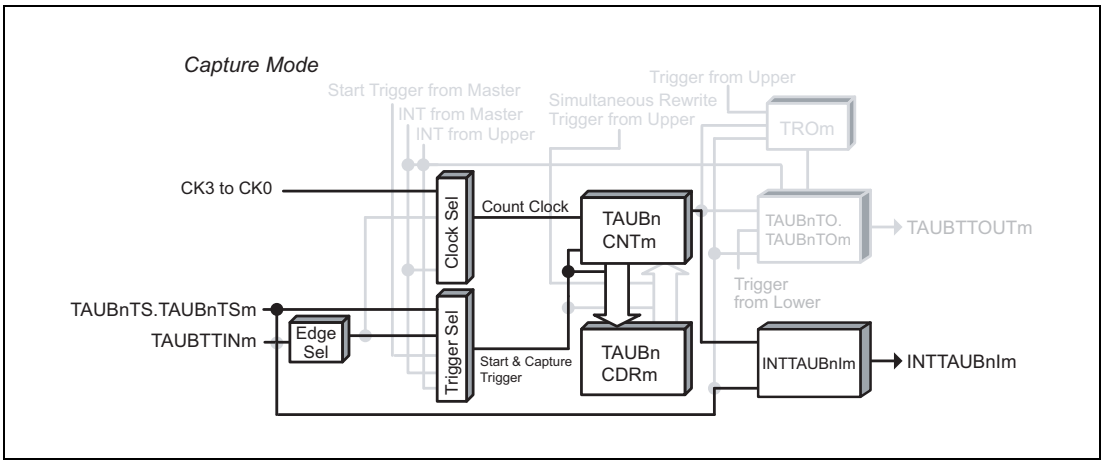

**Figure 24.47 Block Diagram for TAUBTTINm Input Pulse Interval Measurement Function**

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)
- When a valid TAUBTTINm input is detected after an overflow TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = $00_B$)

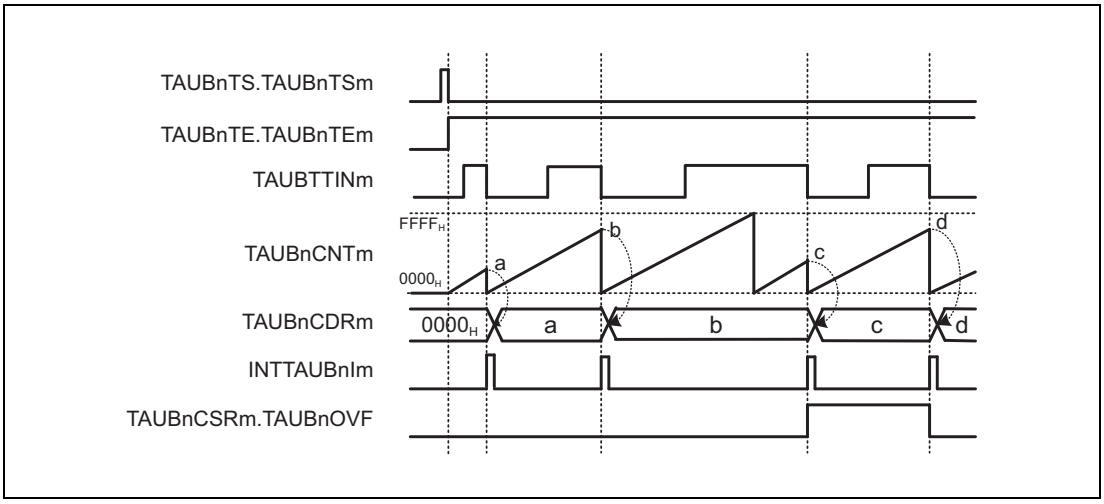

**Figure 24.48 General Timing Diagram for TAUBTTINm Input Pulse Interval Measurement Function**

### 24.12.6.4 Register Settings

#### (1) TAUBnCMORm

| 1, 0 | TAUBnTIS[1:0] | 00: Falling edge detection<br>01: Rising edge detection<br>10: Rising and falling edge detection<br>11: Setting prohibited |

### (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Pulse Interval Measurement Function. Therefore, these registers must be set to 0.

**Table 24.63 Simultaneous Rewrite Settings for TAUBTTINm Input Pulse Interval Measurement Function**

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm | |
| TAUBnRDC.TAUBnRDCm | |

## 24.12.6.5 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

**Table 24.64 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function**

| | Operation | Status of TAUBn |
|---|---|---|
| Initial channel setting | Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.61, Contents of the TAUBnCMORm Register for TAUBTTINm Input Pulse Interval Measurement Function** and **Table 24.62, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Measurement Function**<br><br>The TAUBnCDRm register functions as a capture register. | Channel operation is stopped. |
| Start operation | Set TAUBnTS.TAUBnTSm to 1.<br>TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is set to 1 and the counter starts.<br>TAUBnCNTm is cleared to $0000_H$. INTTAUBnIm is generated when TAUBnCMORm.TAUBnMD0 is set to 1. |
| During operation | Detection of TAUBTTINm edges.<br><br>The values of TAUBnCMURm.TAUBnTIS[1:0] bits can be changed at any time.<br>The TAUBnCDRm and TAUBnCSRm registers can be read at any time.<br>The TAUBnCSCm.TAUBnCLOV bit can be set to 1. (The TAUBnCSRm.TAUBnOVF bit can be cleared to 0.) | TAUBnCNTm starts to count up from $0000_H$.<br>When a TAUBTTINm valid edge is detected:<br>• TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and returns to $0000_H$<br>• INTTAUBnIm is then generated.<br>Afterwards, this procedure is repeated. |
| Stop operation | Set TAUBnTT.TAUBnTTm to 1.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values. |

Restart operation

### 24.12.6.6 Specific Timing Diagrams: Overflow Behavior

#### (1) TAUBnCMORm.TAUBnCOS[1:0] = $00_B$

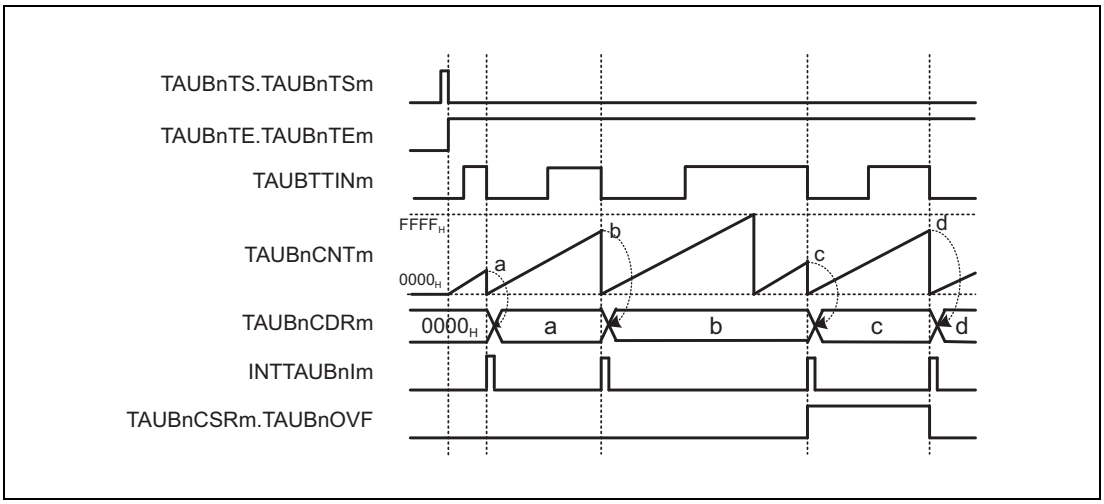

**Figure 24.49 TAUBnCMORm.TAUBnCOS[1:0] = $00_B$, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = $00_B$**

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is loaded to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

### (2) TAUBnCMORm.TAUBnCOS[1:0] = $01_B$

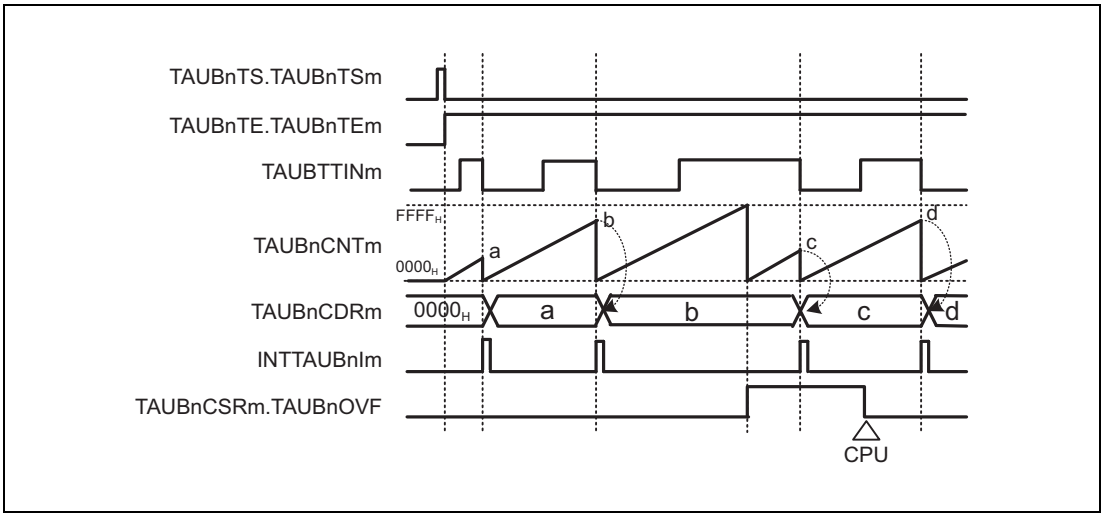

**Figure 24.50 TAUBnCMORm.TAUBnCOS[1:0] = $01_B$, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = $00_B$**

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command. (TAUBnCSCm.TAUBnCLOV bit = 1)

### (3) TAUBnCMORm.TAUBnCOS[1:0] = $10_B$

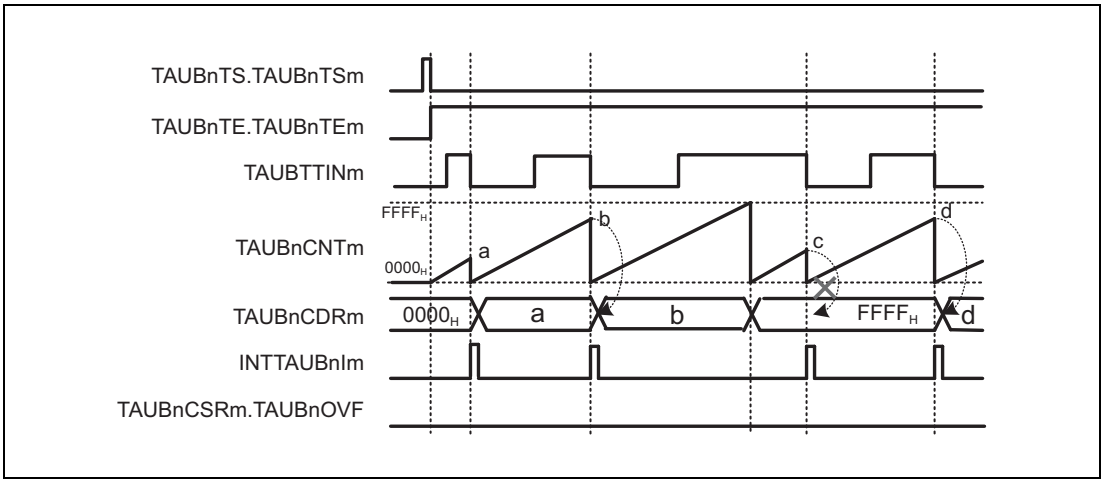

**Figure 24.51 TAUBnCMORm.TAUBnCOS[1:0] = $10_B$, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = $00_B$**

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$ and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

### (4) TAUBnCMORm.TAUBnCOS[1:0] = $11_B$

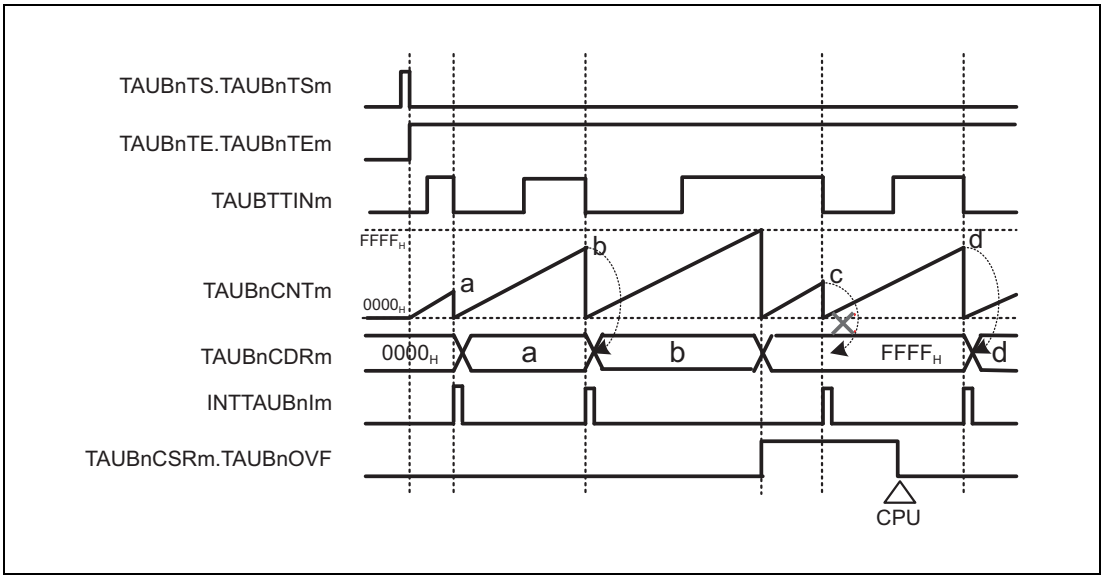

**Figure 24.52 TAUBnCMORm.TAUBnCOS[1:0] = $11_B$, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = $00_B$**

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

### (5) When rising and falling edge detection are selected (TAUBnCMORm.TAUBnMD0 = 1)

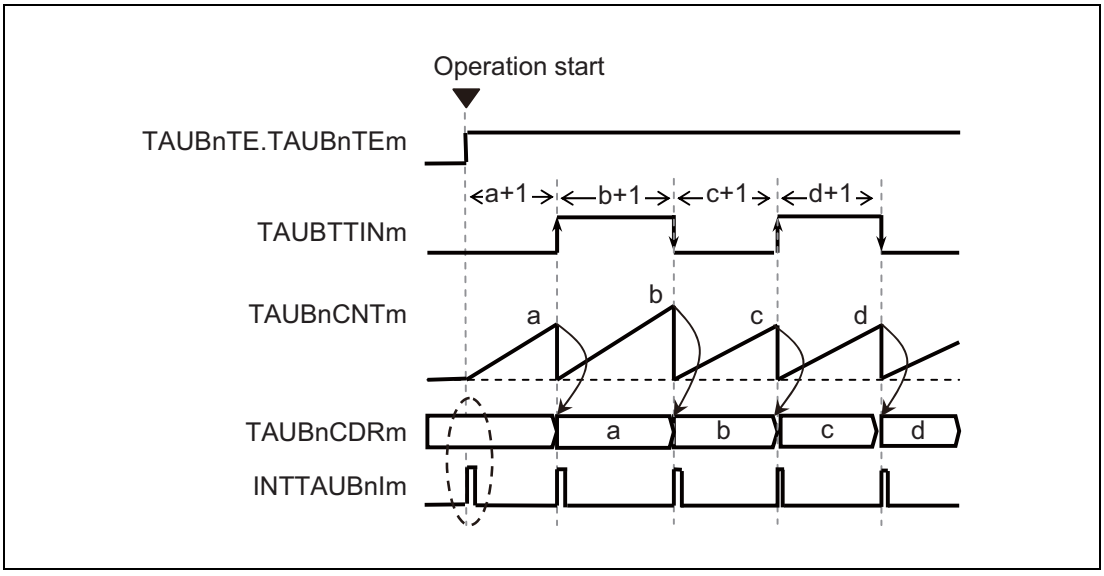

**Figure 24.53 TAUBnCMORm.TAUBnMD0 = 1**

Setting TAUBnCMURm.TAUBnTIS[1:0] to $10_B$ (detection of both edges selected) measures the TAUBTTINm rising and falling edge intervals.

### (6) Operation stop and operation restart (TAUBnCMORm.TAUBnMD0 = 0)

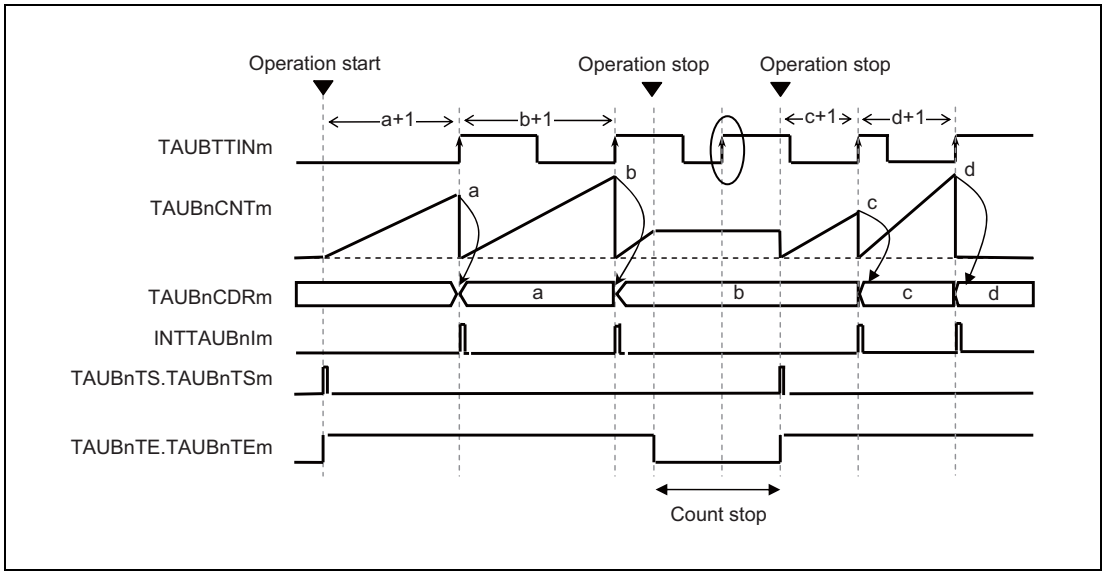

**Figure 24.54 Operation Stop and Operation Restart (TAUBnCMORm.TAUBnMD0 = 0)**

Setting TAUBnTT.TAUBnTTm to 1 clears TAUBnTE.TAUBnTEm to 0, which stops the count operation. At this time, TAUBnCNTm retains the status and stops.

When TAUBnTE.TAUBnTEm retains 0 (operation stopped), TAUBTTINm input is ignored (edge detection is ignored and capture operation is not performed).

Setting TAUBnTS.TAUBnTSm to 1 clears the counter to $0000_H$ and restarts count-up operation.

## 24.12.7 TAUBTTINm Input Signal Width Measurement Function

### 24.12.7.1 Overview

#### Summary

This function measures the width of a TAUBTTINm signal by starting counting on one edge of the TAUBTTINm signal and capturing the counter value on the opposite edge.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm start edge is detected, the counter TAUBnCNTm starts counting up from $0000_H$. When a valid TAUBTTINm stop edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter retains its value (TAUBnCDRm + 1) and awaits the next valid TAUBTTINm input start edge.

If the counter reaches $FFFF_H$ before a valid TAUBTTINm stop edge is detected, it overflows. The counter is reset to $0000_H$ and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

**Table 24.65 Effects of an Overflow**

| TAUBnCMORm.TAUBnCOS[1:0] | When Overflow Occurs | | When a Valid TAUBTTINm Input Stop Edge is Detected | |
|---|---|---|---|---|
| | TAUBnCDRm | TAUBnCSRm.TAUBnOVF | TAUBnCDRm, TAUBnCNTm | TAUBnCSRm.TAUBnOVF |
| 00 | Unchanged | 0 | TAUBnCNTm written to TAUBnCDRm | 1 |
| 01 | | 1 | | |
| 10 | Set to $FFFF_H$ | 0 | TAUBnCNTm stops counting TAUBnCDRm unchanged | Unchanged |
| 11 | | 1 | | |

If TAUBnCMORm.TAUBnCOS[0] = 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the width of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

This function cannot be forcibly restarted.

**NOTE**

When TAUBnCMORm.TAUBnCOS[1] = 1, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 24.12.7.2 Equations

TAUBTTINm input signal width = count clock cycle ×

[(TAUBnCSRm.OVF × ($FFFF_H$ + 1)) + TAUBnCDRm capture value + 1]

### 24.12.7.3 Block Diagram and General Timing Diagram

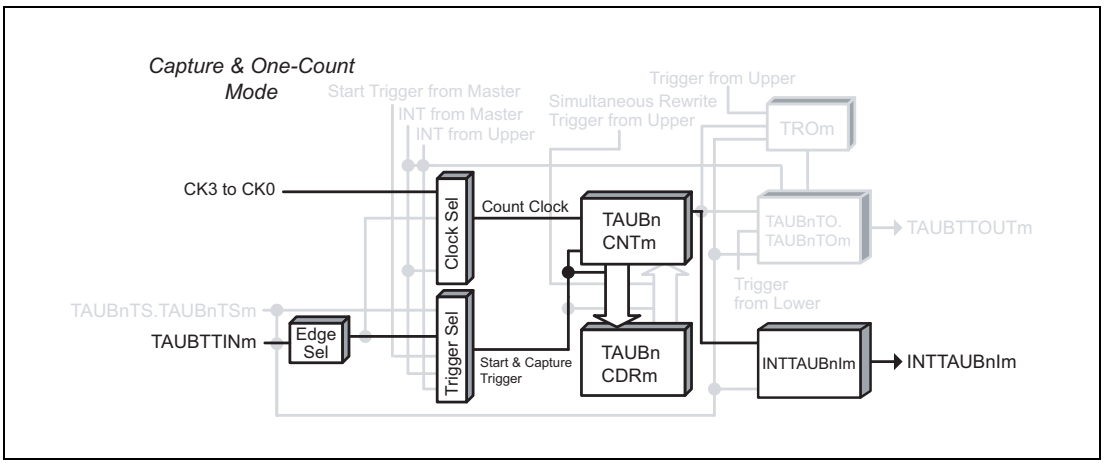

**Figure 24.55 Block Diagram for TAUBTTINm Input Signal Width Measurement Function**

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = $11_B$)
- When a valid TAUBTTINm input is detected after an overflow, TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = $00_B$)

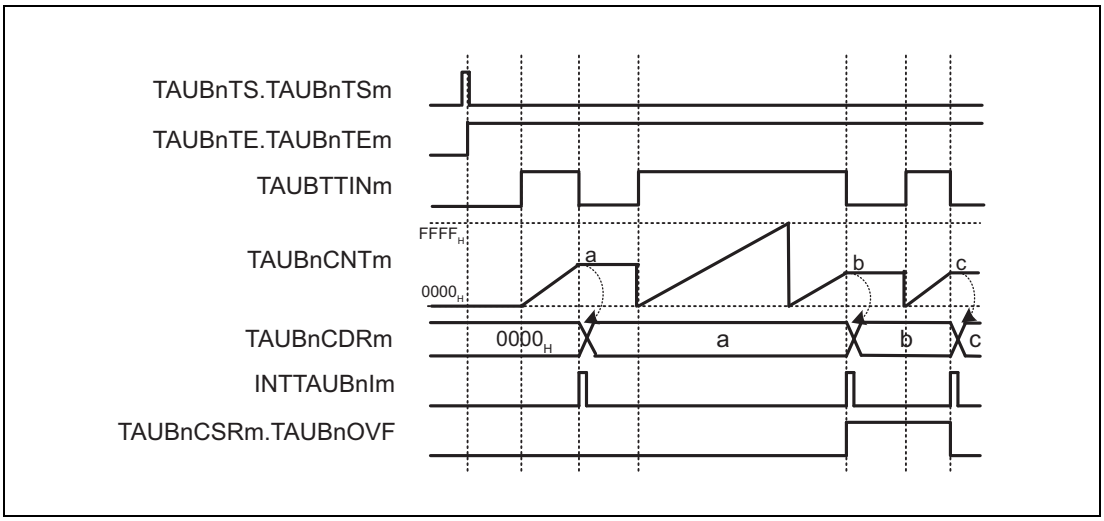

**Figure 24.56 General Timing Diagram for TAUBTTINm Input Signal Width Measurement Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS[1:0] | 10: Rising and falling edge detection (low width measurement)<br>11: Rising and falling edge detection (high width measurement) |

#### (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Signal Width Measurement Function. Therefore, these registers must be set to 0.

**Table 24.68 Simultaneous Rewrite Settings for TAUBTTINm Input Signal Width Measurement Function**

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm | |
| TAUBnRDC.TAUBnRDCm | |

### 24.12.7.5 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

**Table 24.69 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function**

| | Operation | Status of TAUBn |
|---|---|---|
| Initial channel setting | Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.66, Contents of the TAUBnCMORm Register for TAUBTTINm Input Signal Width Measurement Function** and **Table 24.67, Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Measurement Function**<br><br>The TAUBnCDRm register functions as a capture register. | Channel operation is stopped. |
| Start operation | Set TAUBnTS.TAUBnTSm to 1.<br>TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.<br>When a TAUBTTINm start edge is detected, TAUBnCNTm start edge to count up. |
| During operation | The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time.<br>TAUBnCSCm.TAUBnCLOV bit can be set to 1. | TAUBnCNTm starts to count up from $0000_H$.<br>When a TAUBTTINm valid edge is detected:<br>• TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and retains its value<br>• INTTAUBnIm is then generated.<br>• The count stops at the value transferred to TAUBnCDRm + 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.<br>Afterwards, this procedure is repeated. |
| Stop operation | Set TAUBnTT.TAUBnTTm to 1.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TEm is cleared to 0 and the counter stops.<br>TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values. |

Restart operation

### 24.12.7.6 Specific Timing Diagrams: Overflow Behavior

#### (1) TAUBnCMORm.TAUBnCOS[1:0] = $00_B$

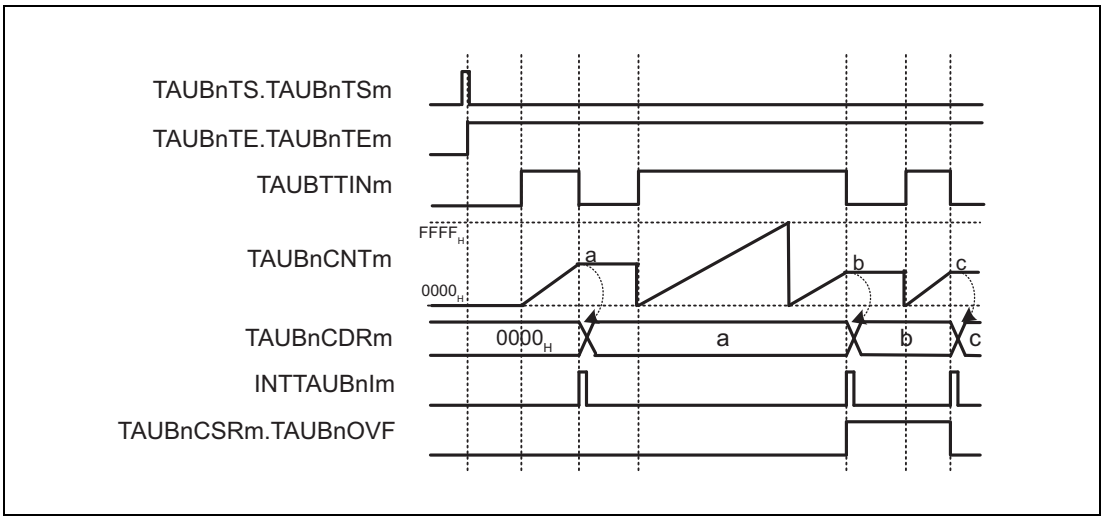

**Figure 24.57 TAUBnCMORm.TAUBnCOS[1:0] = $00_B$, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = $11_B$**

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

#### (2) TAUBnCMORm.TAUBnCOS[1:0] = $01_B$

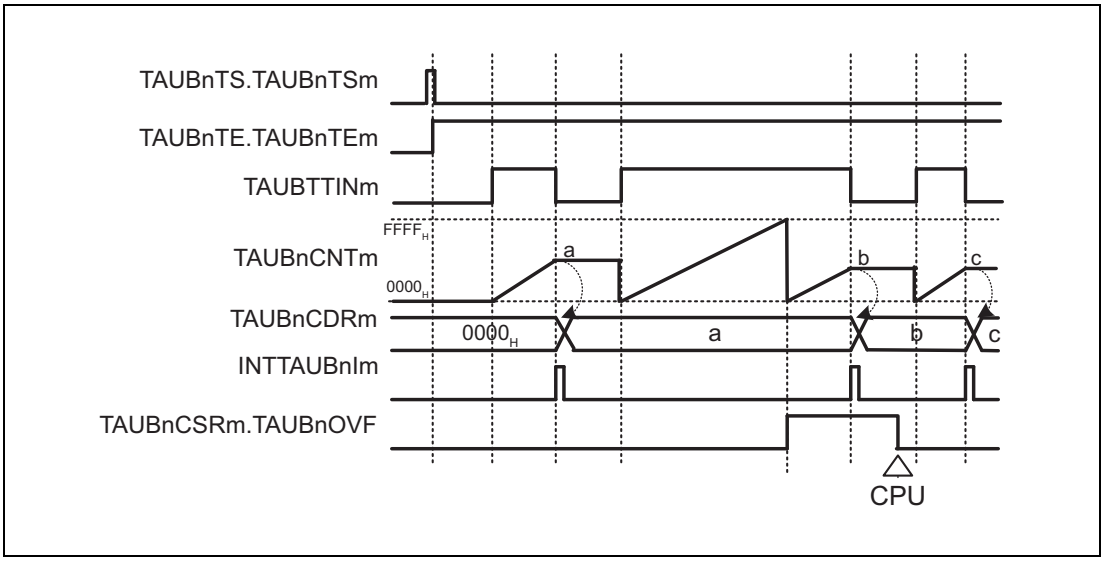

**Figure 24.58 TAUBnCMORm.TAUBnCOS[1:0] = $01_B$, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = $11_B$**

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command (The TAUBnCSCm.TAUBnCLOV bit = 1).

### (3) TAUBnCMORm.TAUBnCOS[1:0] = $10_B$

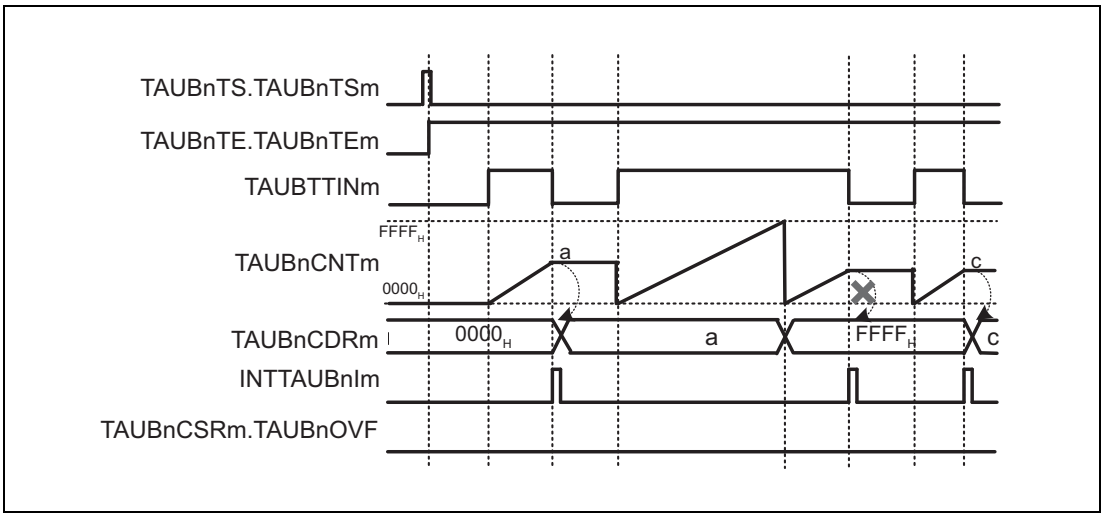

**Figure 24.59 TAUBnCMORm.TAUBnCOS[1:0] = $10_B$, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = $11_B$**

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$ and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

### (4) TAUBnCMORm.TAUBnCOS[1:0] = $11_B$

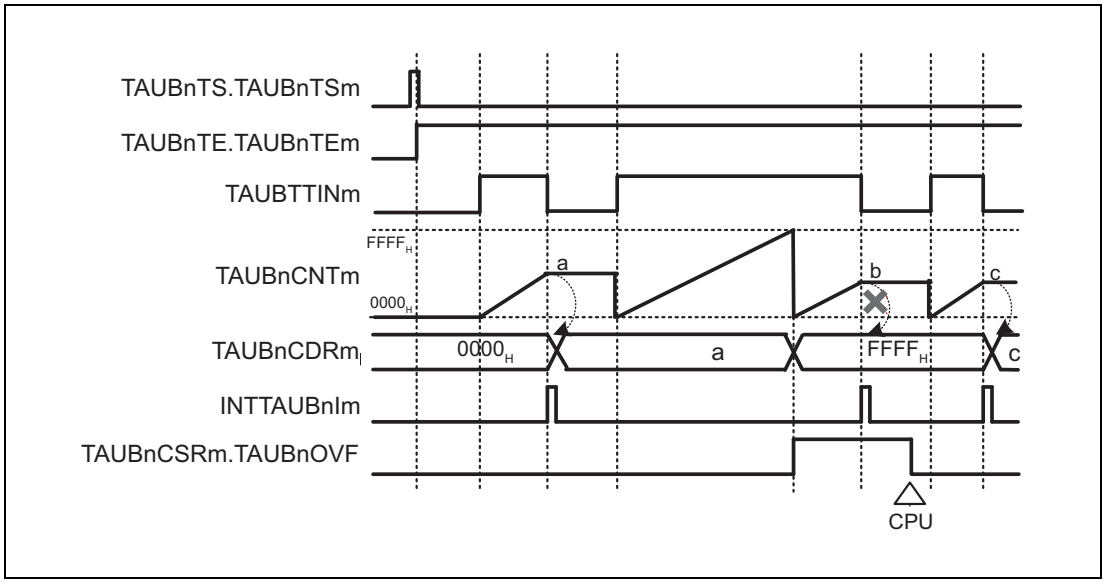

**Figure 24.60 TAUBnCMORm.TAUBnCOS[1:0] = $11_B$, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = $11_B$**

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

### (5) When an overflow occurs (high width measurement)

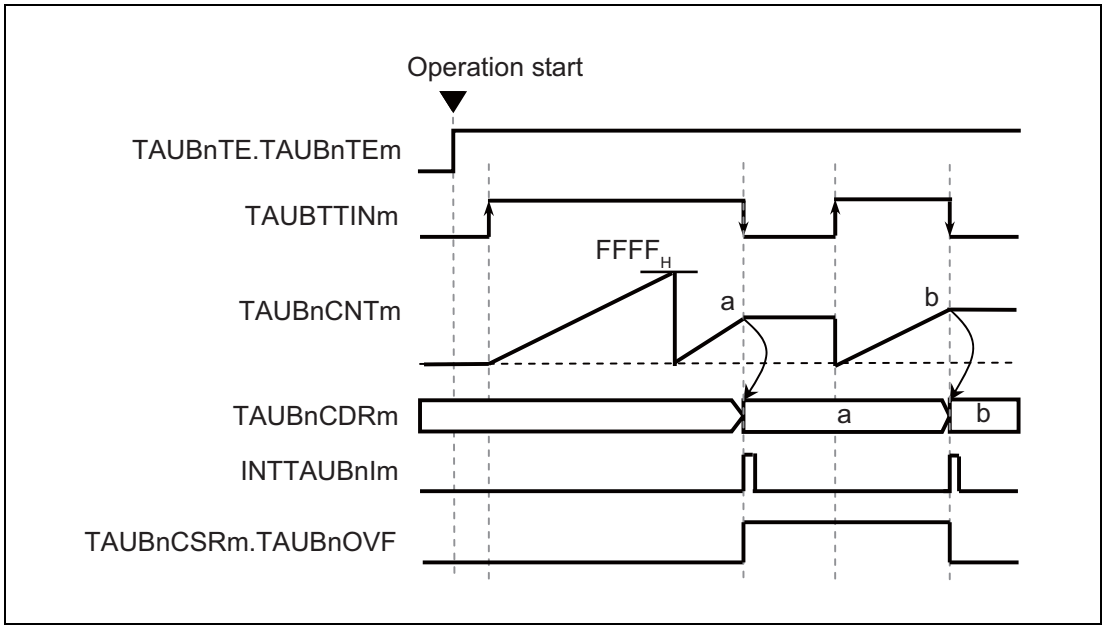

**Figure 24.61 When an Overflow Occurs**

When a capture trigger is input after the counter value has overflowed, the counter value is transferred to TAUBnCDRm and at the same time TAUBnCSRm.TAUBnOVF is set to 1.

TAUBnCSRm.TAUBnOVF is kept at 1 until the next capture trigger occurs.

If the next capture trigger is not accompanied by an overflow, TAUBnCSRm.TAUBnOVF is cleared to 0.

TAUBTTINm input signal width (example when TAUBnCSRm.TAUBnOVF is 1 and TAUBnCDRm is a)
= count clock cycle × (($10000_H$ × TAUBnCSRm.TAUBnOVF) + (TAUBnCDRm capture value + 1))
= count clock cycle × (($10000_H$ × 1) + (a+1))
= count clock cycle × ($10000_H$ + a+1)

## 24.12.8 TAUBTTINm Input Position Detection Function

### 24.12.8.1 Overview

#### Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUBTTINm signal.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter starts to count from $0000_H$. When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The count operation continues.

When the counter reaches $FFFF_H$, the counter restarts from $0000_H$.

**NOTE**

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of ± 1 operation clock cycle.

#### Conditions

If the TAUBnCMORm.MD0 bit is set to 0, the first interrupt after a start or restart is not generated.

### 24.12.8.2 Equations

Function duration at a TAUBTTINm input pulse =

count clock cycle × (TAUBnCDRm capture value + 1)

### 24.12.8.3 Block Diagram and General Timing Diagram

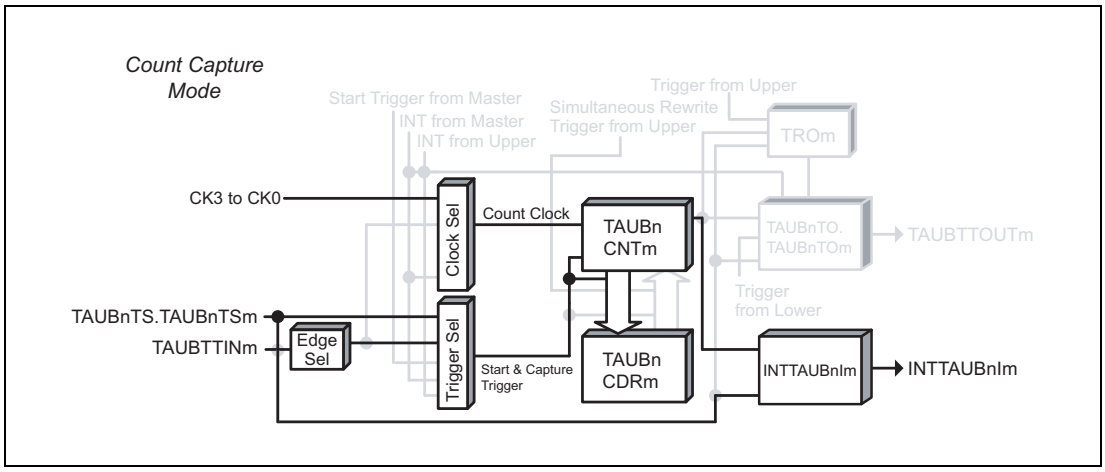

**Figure 24.62 Block Diagram for TAUBTTINm Input Position Detection Function**

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)

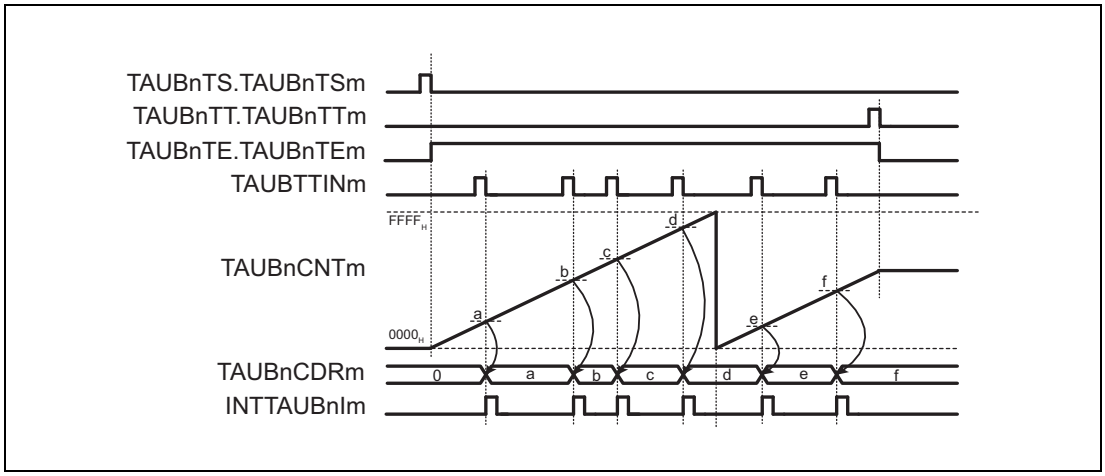

**Figure 24.63 General Timing Diagram for TAUBTTINm Input Position Detection Function**

| Stop operation | Set TAUBnTT.TAUBnTTm to 1.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm stops and retains its current value. |

Restart operation

### 24.12.8.6 Specific Timing Diagrams

#### (1) Operation stop and restart

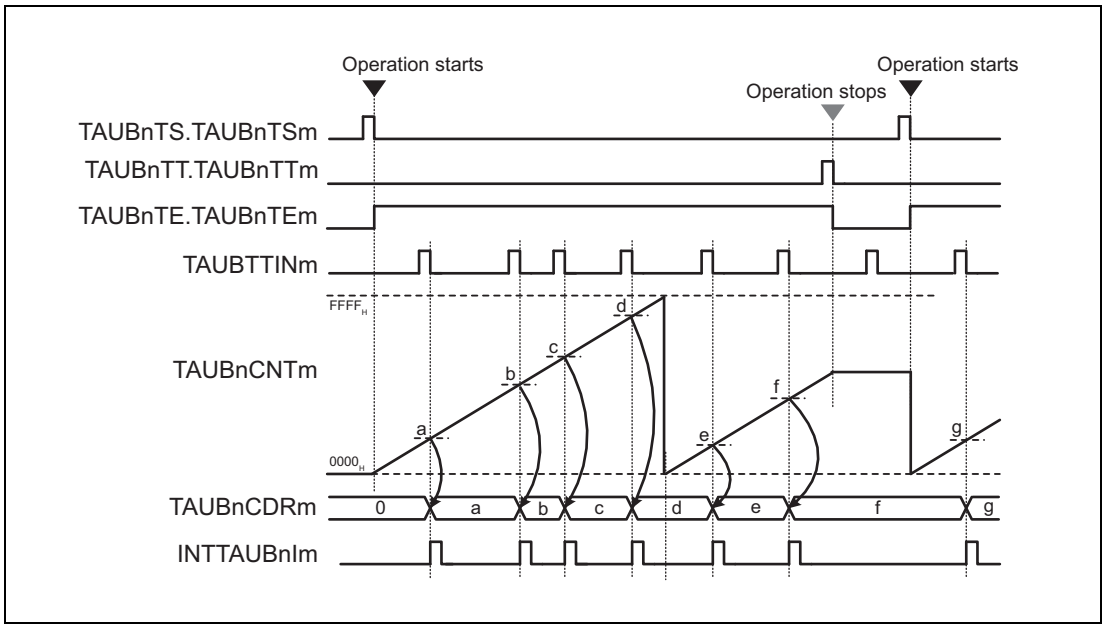

**Figure 24.64 Operation Stop and Restart (TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)**

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from $0000_H$.

## 24.12.9 TAUBTTINm Input Period Count Detection Function

### 24.12.9.1 Overview

#### Summary

This function measures the cumulative width of a TAUBTTINm input signal.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter awaits a valid TAUBTTINm input edge.

When a valid TAUBTTINm input start edge is detected, the counter starts to count from $0000_H$.

When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The counter stops and retains its value (TAUBnCDRm + 1) until the next valid TAUBTTINm input start edge is detected.

When a next valid TAUBTTINm input start edge is detected, the counter restarts from the value retained while stopping.

If the counter reaches $FFFF_H$, the counter restarts from $0000_H$.

**NOTES**

1. The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits.
2. As this function is to measure the TAUBTTINm input signal width, setting TAUBnTS.TAUBnTSm to 1 is disabled while TAUBnTE.TAUBnTEm = 1.

#### Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = $10_B$, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = $11_B$, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

### 24.12.9.2 Equations

Cumulative TAUBTTINm input width =

count clock cycle × (TAUBnCDRm capture value + 1)

### 24.12.9.3 Block Diagram and General Timing Diagram

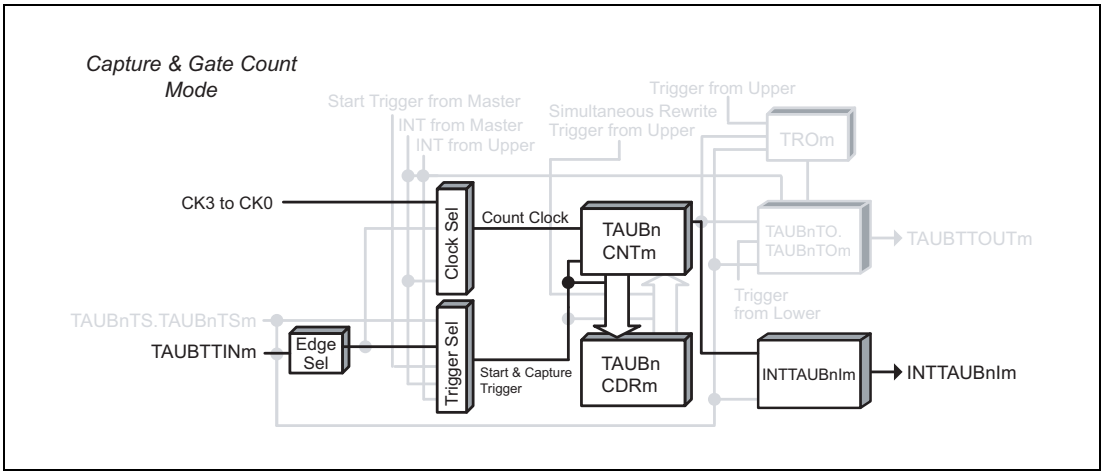

**Figure 24.65 Block Diagram for TAUBTTINm Input Period Count Detection Function**

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = $11_B$)

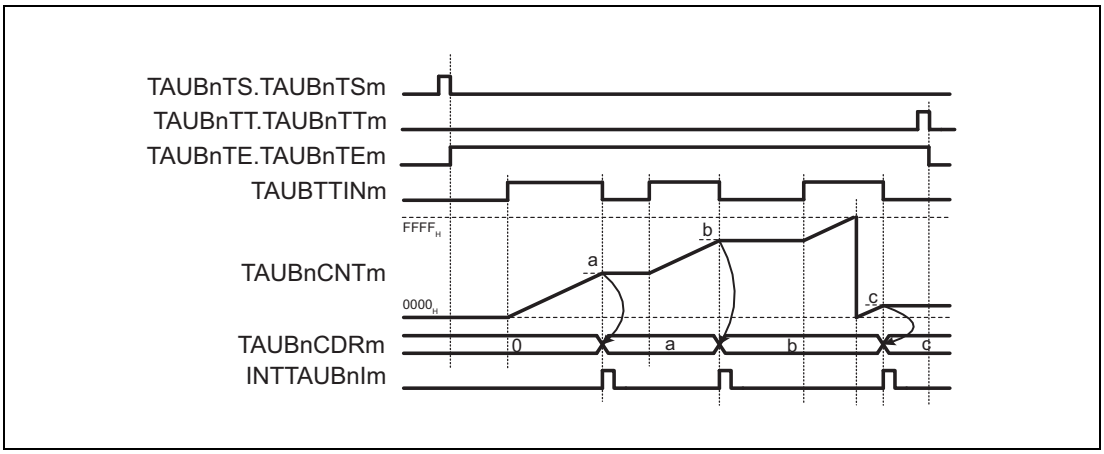

**Figure 24.66 General Timing Diagram for TAUBTTINm Input Period Count Detection Function**

### 24.12.9.4 Register Settings

#### (1) TAUBnCMORm

#### (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Period Count Detection Function. Therefore, these registers must be set to 0.

**Table 24.76 Simultaneous Rewrite Settings for TAUBTTINm Input Period Count Detection Function**

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm | |
| TAUBnRDC.TAUBnRDCm | |

### 24.12.9.5 Operating Procedure for TAUBTTINm Input Period Count Detection Function

**Table 24.77 Operating Procedure for TAUBTTINm Input Period Count Detection Function**

| | Operation | Status of TAUBn |
|---|---|---|
| Initial channel setting | Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.74, Contents of the TAUBnCMORm Register for TAUBTTINm Input Period Count Detection Function** and **Table 24.75, Contents of the TAUBnCMURm Register for the TAUBTTINm Input Period Count Detection Function**<br><br>The TAUBnCDRm register functions as a capture register. | Channel operation is stopped. |
| Start operation | Set TAUBnTS.TAUBnTSm to 1.<br>TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. |
| During operation | Detection of TAUBTTINm edges.<br><br>The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time. | When a TAUBTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUBnCNTm starts to count up from the stop value.<br>When TAUBnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUBnCDRm and INTTAUBnIm is generated.<br>Counting stops at the “value transferred to TAUBnCDRm + 1” value and TAUBnCNTm waits for detection of the TAUBTTINm start edge.<br>When TAUBnCNTm reaches $FFFF_H$, the counter restarts from $0000_H$.<br>Afterwards, this procedure is repeated. |
| Stop operation | Set TAUBnTT.TAUBnTTm to 1.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm stops and retains its current value. |

Restart operation

### 24.12.9.6 Specific Timing Diagrams

#### (1) Operation stop and restart

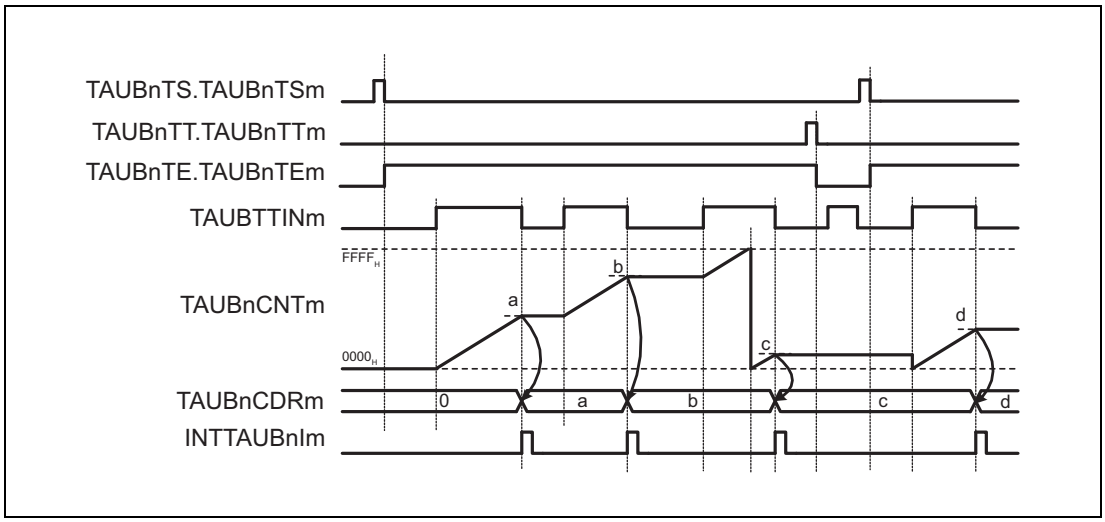

**Figure 24.67 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = $11_B$)**

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from $0000_H$.

## 24.12.10 TAUBTTINm Input Pulse Interval Judgment Function

### 24.12.10.1 Overview

#### Summary

This function outputs the result of a comparison between the count value (TAUBnCNTm) and the value in the channel data register (TAUBnCDRm) when a TAUBTTINm input pulse occurs. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid edge is detected or TAUBnTS.TAUBnTSm is set to 1, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. TAUBnCNTm reloads the value of TAUBnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches $0000_H$ before a TAUBTTINm valid edge is detected, TAUBnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

#### Conditions

The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:

- If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm.
- If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.

### 24.12.10.2 Block Diagram and General Timing Diagram

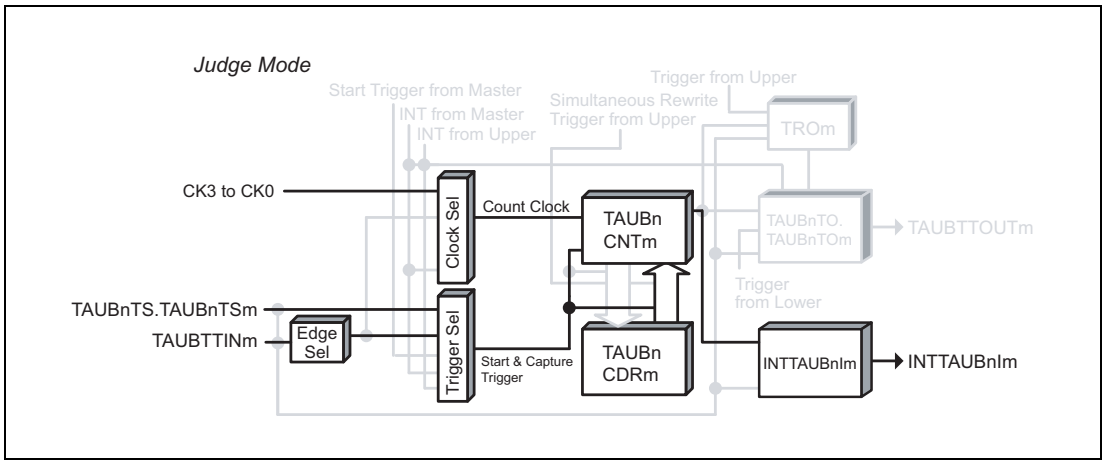

**Figure 24.68 Block Diagram for TAUBTTINm Input Pulse Interval Judgment Function**

The following settings apply to the general timing diagram.

- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)

Restart operation

## 24.12.11 TAUBTTINm Input Signal Width Judgment Function

### 24.12.11.1 Overview

#### Summary

This function compares the count value (TAUBnCNTm) for the high or low level width of a TAUBTTINm input signal and the TAUBnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUBnIm.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm input start edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid stop edge is detected, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. The counter TAUBnCNTm retains its value until the next TAUBTTINm valid start edge is detected, regardless of the result of the comparison.

If the counter reaches $0000_H$ before a valid TAUBTTINm stop edge is detected, TAUBnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

#### Conditions

- The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:
  - If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm.
  - If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.
- The TAUBnCMURm.TAUBnTIS[1:0] bits specify the type of width measurement:
  - For high width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = $11_B$) the start edge is a rising TAUBTTINm edge and the stop edge is a falling TAUBTTINm edge.
  - For low width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = $10_B$) the start edge is a falling TAUBTTINm edge and the stop edge is a rising TAUBTTINm edge.
- Forced restart is not possible for this function.

### 24.12.11.2 Block Diagram and General Timing Diagram

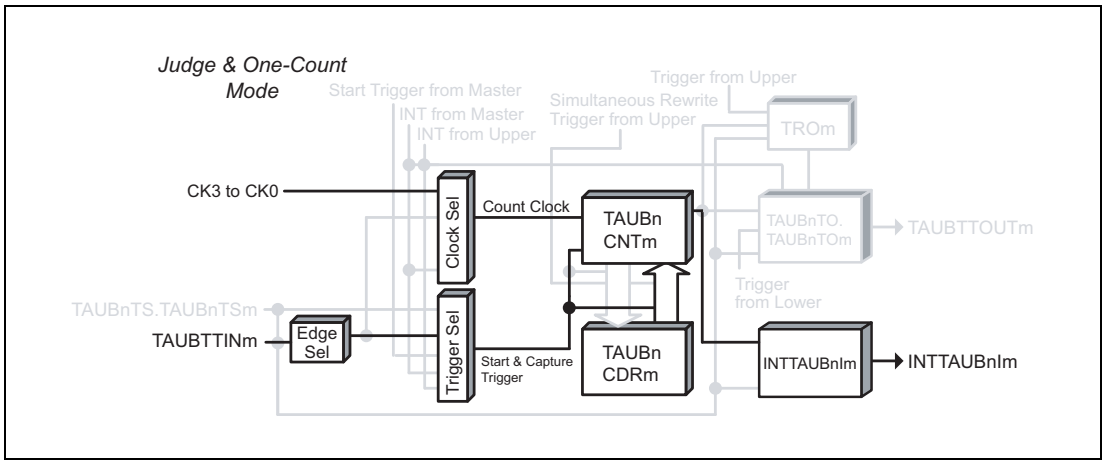

**Figure 24.70 Block Diagram for TAUBTTINm Input Signal Width Judgment Function**

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm (TAUBnCMORm.TAUBnMD0 = 0)
- TAUBTTINm valid start edge = rising edge, TAUBTTINm valid stop edge = falling edge (TAUBnCMURm.TAUBnTIS[1:0] = $11_B$)

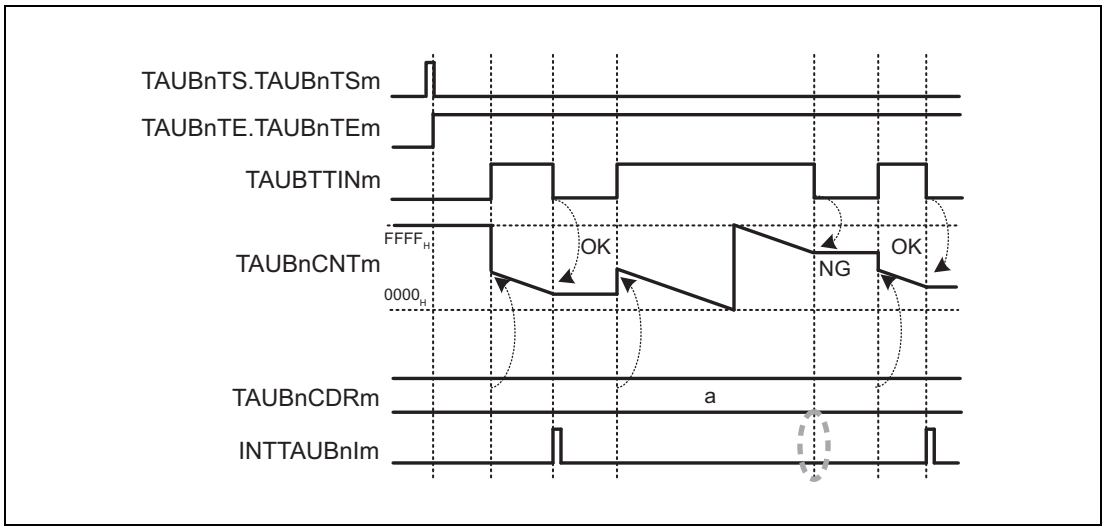

**Figure 24.71 General Timing Diagram for TAUBTTINm Input Signal Width Judgment Function**

### 24.12.11.3 Register Settings

#### (1) TAUBnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Restart operation

## 24.12.12 Overflow Interrupt Output Function (during TAUBTINm Width Measurement)

### 24.12.12.1 Overview

#### Summary

This function measures the width of an individual TAUBTTINm input signal. An interrupt is generated if the TAUBTTINm input width is longer than $FFFF_H + 1$.

#### Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $FFFF_H$.

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. $FFFF_H$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUBTTINm input start edge is detected, TAUBnCNTm loads $FFFF_H$ and starts to count down.

If the counter reaches $0000_H$ before a stop edge is detected, an interrupt is generated.

#### Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = $10_B$, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = $11_B$, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

**NOTE**

The counter cannot be restarted during operation.

### 24.12.12.2 Block Diagram and General Timing Diagram

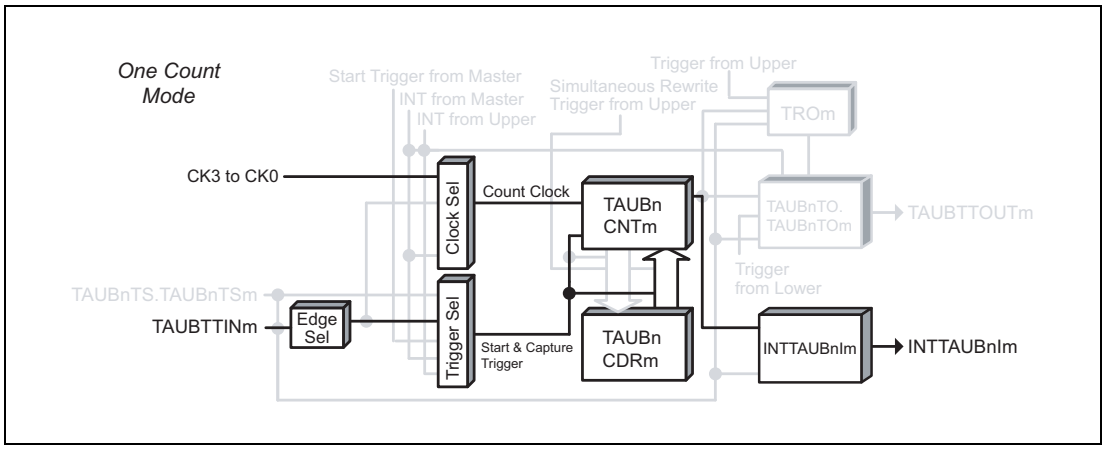

**Figure 24.72 Block Diagram for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)**

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = $11_B$)

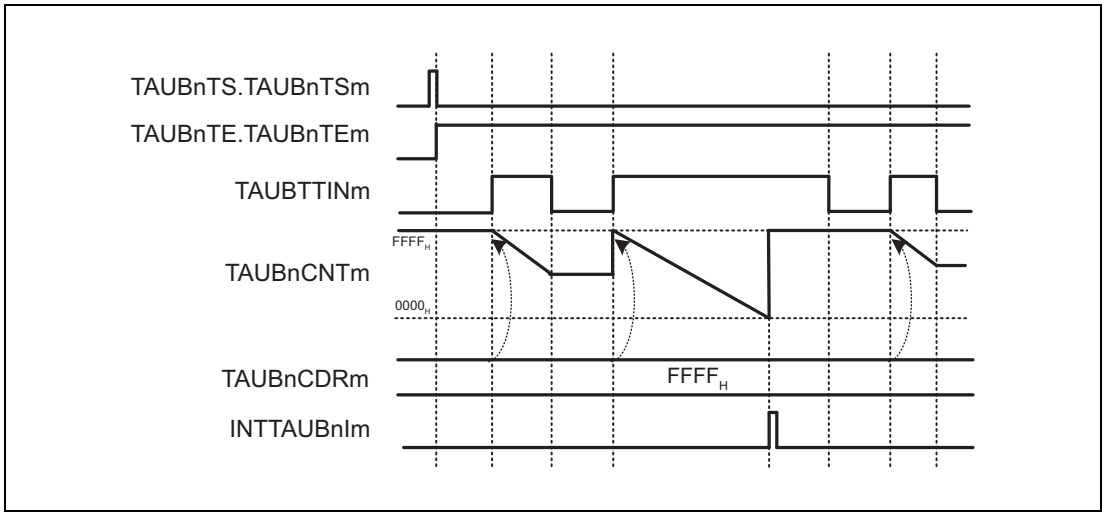

**Figure 24.73 General Timing Diagram for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)**

### 24.12.12.3 Register Settings

#### (1) TAUBnCMORm

## 24.12.13 Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

### 24.12.13.1 Overview

#### Summary

This function measures the cumulative width of a TAUBTTINm input signal. An interrupt is generated and an overflow interrupt can be output if the cumulative TAUBTTINm input width is longer than $FFFF_H$.

#### Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $FFFF_H$

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. $FFFF_H$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUBTTINm input start edge and then continues to count down from the current value.

When the counter reaches $0000_H$ an interrupt is generated. $FFFF_H$ is written to TAUBnCNTm and the counter continues to count down until a TAUBTTINm input stop edge is detected.

#### Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = $10_B$, the TAUBTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = $11_B$, the TAUBTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

**NOTE**

The counter cannot be restarted during operation.

### 24.12.13.2 Block Diagram and General Timing Diagram

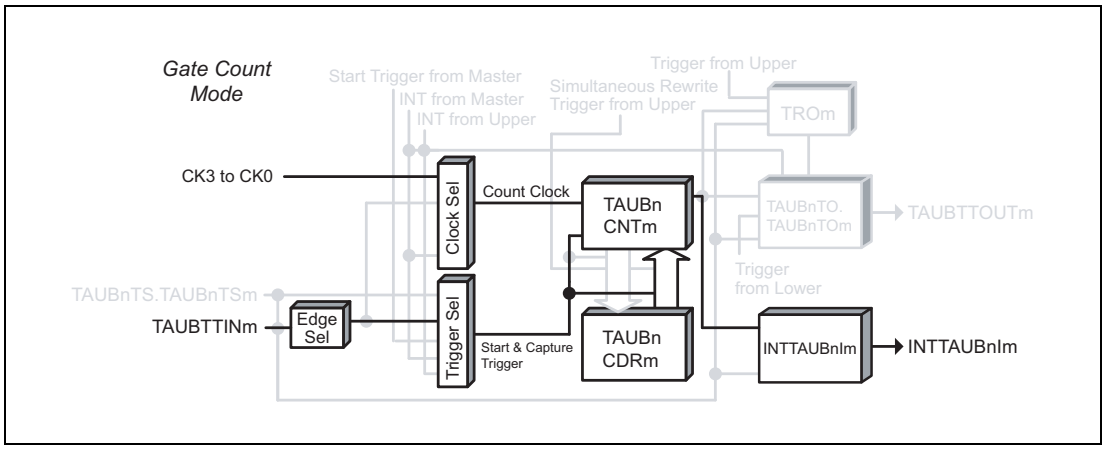

**Figure 24.74 Block Diagram for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)**

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = $11_B$)

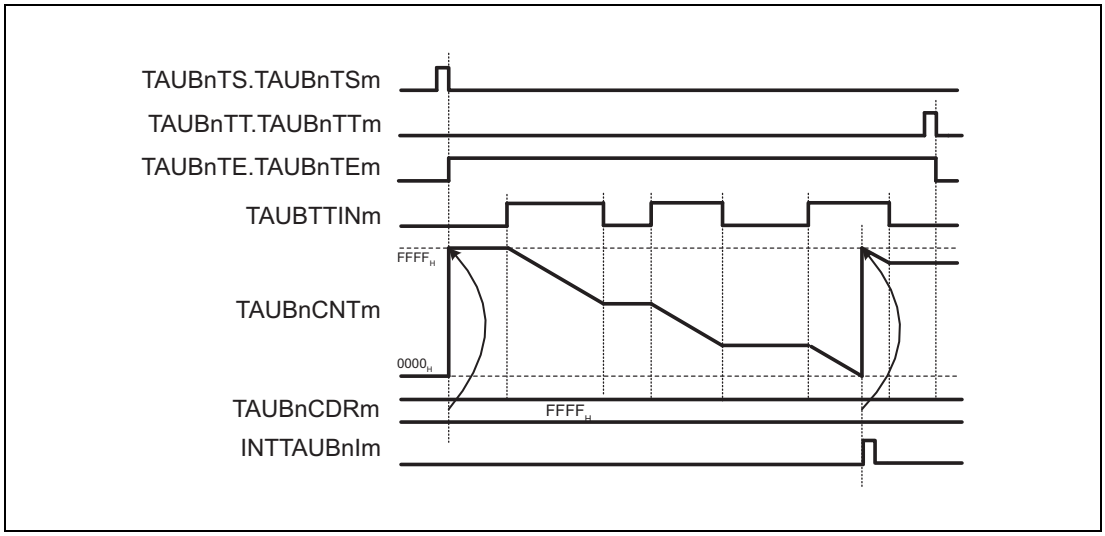

**Figure 24.75 General Timing Diagram for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)**

# 24.13 Independent Channel Simultaneous Rewrite Functions

The following describes functions that carry out simultaneous rewrite:

## 24.13.1 Simultaneous Rewrite Trigger Generation Function Type 1

### 24.13.1.1 Overview

#### Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals. The upper channel is for generating the simultaneous rewrite trigger (TAUBnRDC.TAUBnRDCm = 1), and the lower channels are for conducting simultaneous rewrite when triggered from the upper channel (TAUBnRDC.TAUBnRDCm = 0).

#### Prerequisites

- Two (or more) channels that are lower than the channel used as the upper channel, each with simultaneous rewrite enabled (TAUBnRDE.TAUBnRDEm = 1)
- The operation mode of the upper channel must be set to interval timer mode, see **Table 24.94, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1.**
- For the operation modes that can be set to the lower channels, see **Table 24.37, Channel Functions and the Methods They Use for Simultaneous Rewrite.**
- In this function, TAUBTTOUTm is not used for all the channels.

#### Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) of the upper and lower channel(s) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of the data register buffer of the upper channel (TAUBnCDRm buf) is written to the counter (TAUBnCNTm) and the counter starts to count down from this value.
The counter(s) of the lower channel(s) start to count as specified by their selected operating modes.

When a counter reaches $0000_H$, an interrupt is generated from the channel.
The corresponding TAUBnCNTm then reloads the current TAUBnCDRm buffer value and subsequently continues operation.

If the channel where the interrupt occurs is specified as the trigger channel for simultaneous rewrite (TAUBnRDC.TAUBnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUBnRSF.TAUBnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

**Condition**

- The channel which is monitored for INTTAUBnIm is specified by setting TAUBnRDC.TAUBnRDCm = 1 for the corresponding channel. The TAUBnRDC.TAUBnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.

#### 24.13.1.2 Equations

Simultaneous rewrite trigger generation cycle = count clock cycle × (TAUBnCDRm + 1)

To control simultaneous rewrite, the following condition must be satisfied:

**[For PWM]**

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1) × number of interrupts] – 1

**[For triangle PWM]**

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1) × 2 × number of interrupts] – 1

That is, the ratio of TAUBnCDRm + 1 and value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

Note that the cycle for the triangle PWM is twice the cycle for the PWM

### 24.13.1.3 Block Diagram and General Timing Diagram

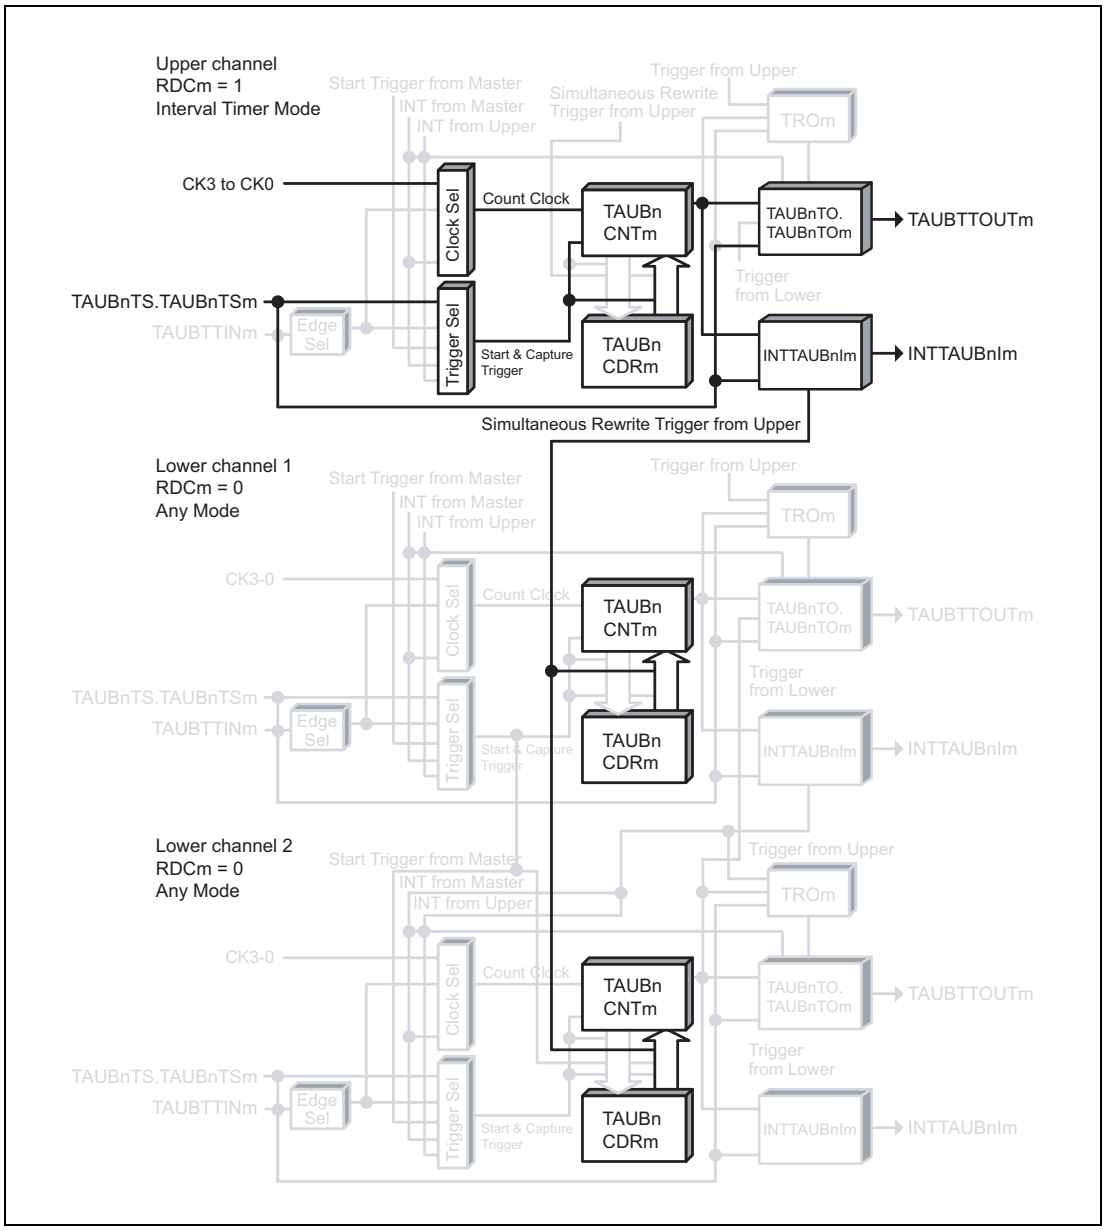

**Figure 24.76 Block Diagram for Simultaneous Rewrite Trigger Generation Function Type 1**

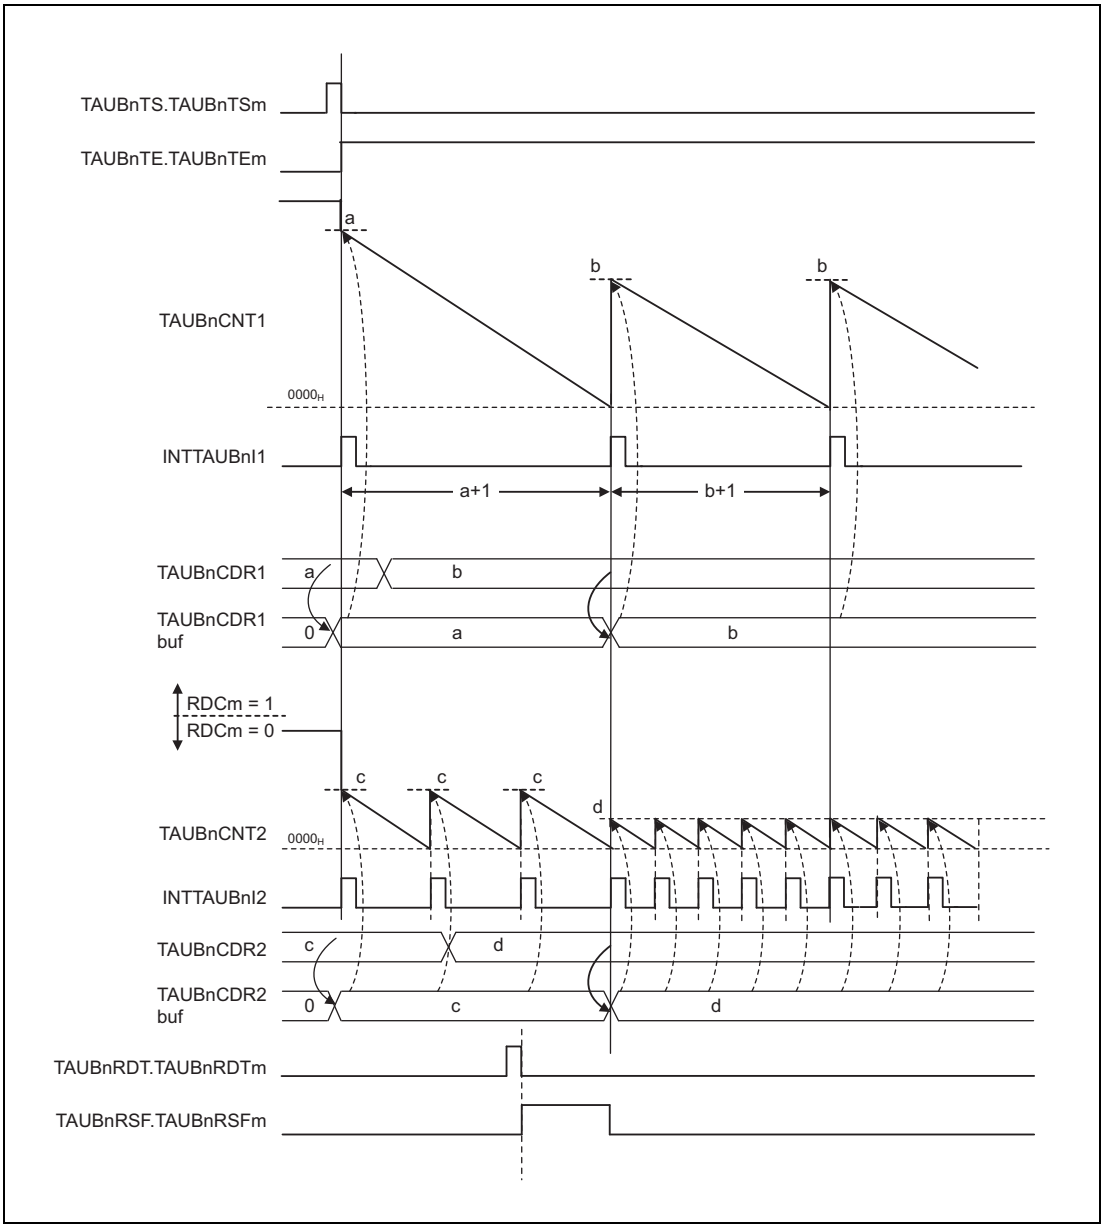

**Figure 24.77 General Timing Diagram for Simultaneous Rewrite Trigger Generation Function Type 1**

### 24.13.1.4 Register Settings for The Upper Channel

#### (1) TAUBnCMORm for the upper channel

|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

#### (3) Channel output mode for the upper channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function. However, it can be used in independent channel output mode controlled by software.

#### (4) Simultaneous rewrite for the upper channel

Table 24.96 Simultaneous Rewrite Settings for the Upper Channel in Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 1: Selects an upper channel as the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting |
| TAUBnRDC.TAUBnRDCm | 1: Channel is monitored for an INTTAUBnIm signal that is used as the simultaneous rewrite trigger |

### 24.13.1.5 Register Settings for the Lower Channel(s)

#### (1) TAUBnCMORm for the lower channel(s)

For the TAUBnCMORm register of the lower channels, follow the TAUBnCMORm register settings for the operation mode that can be set. (See **Table 24.37, Channel Functions and the Methods They Use for Simultaneous Rewrite**)

#### (2) TAUBnCMURm for the lower channel(s)

For the TAUBnCMURm register of the lower channels, follow the TAUBnCMURm register settings for the operation mode that can be set. (See **Table 24.37, Channel Functions and the Methods They Use for Simultaneous Rewrite**)

#### (3) Channel output mode for the lower channel(s)

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 24.37, Channel Functions and the Methods They Use for Simultaneous Rewrite**.

#### (4) Simultaneous rewrite for the lower channel(s)

Table 24.97 Simultaneous Rewrite Settings for the Lower Channel in Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 1: Selects an upper channel as the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 24.13.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

**Table 24.98 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1**

| | Operation | Status of TAUBn |
|---|---|---|

Afterwards, this procedure is repeated. |
| Stop operation | Set TAUBnTT.TAUBnTTm to 1.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm stops and retains its current value. |

Restart operation

# 24.14 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the Timer Array Unit B. For a general overview of synchronous channel operation, see **Section 24.2, Overview**.

## 24.14.1 PWM Output Function

### 24.14.1.1 Overview

#### Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the pulse width (duration) of the TAUBTTOUTm to be set. The pulse cycle is set in the master channel. The pulse width is set in the slave channel.

#### Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 24.99, Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function**
- The operation mode of the slave channel(s) must be set to one-count mode, see **Table 24.102, Contents of the TAUBnCMORm Register for the Slave Channel of the PWM Output Function**
- TAUBTTOUTm is not used for the master channel of this function
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 1.

#### Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) toggles, which realizes a PWM output.

- Master channel:

  When the counter of the master channel reaches $0000_H$, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter loads the TAUBnCDRm value and counts down.

- Slave channel:

  INTTAUBnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value. The TAUBTTOUTm signal is set to the active level.

  When the counter reaches $0000_H$, i.e. duty time has elapsed, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset to the inactive level. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

**Conditions**

Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

### 24.14.1.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUBnCDRm (slave) / (TAUBnCDRm (master) + 1)) × 100

– Duty cycle = 0%
  TAUBnCDRm (slave) = $0000_H$
– Duty cycle = 100%
  TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

### 24.14.1.3 Block Diagram and General Timing Diagram

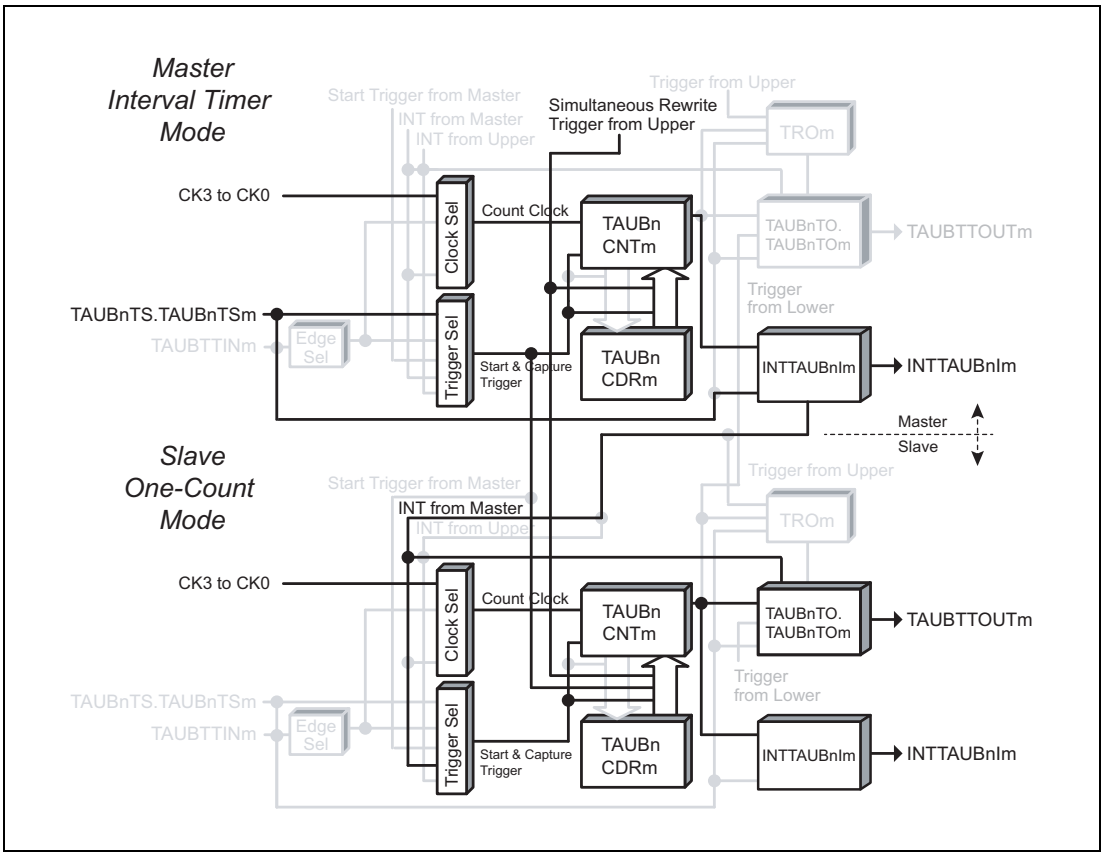

**Figure 24.78 Block Diagram for PWM Output Function**

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

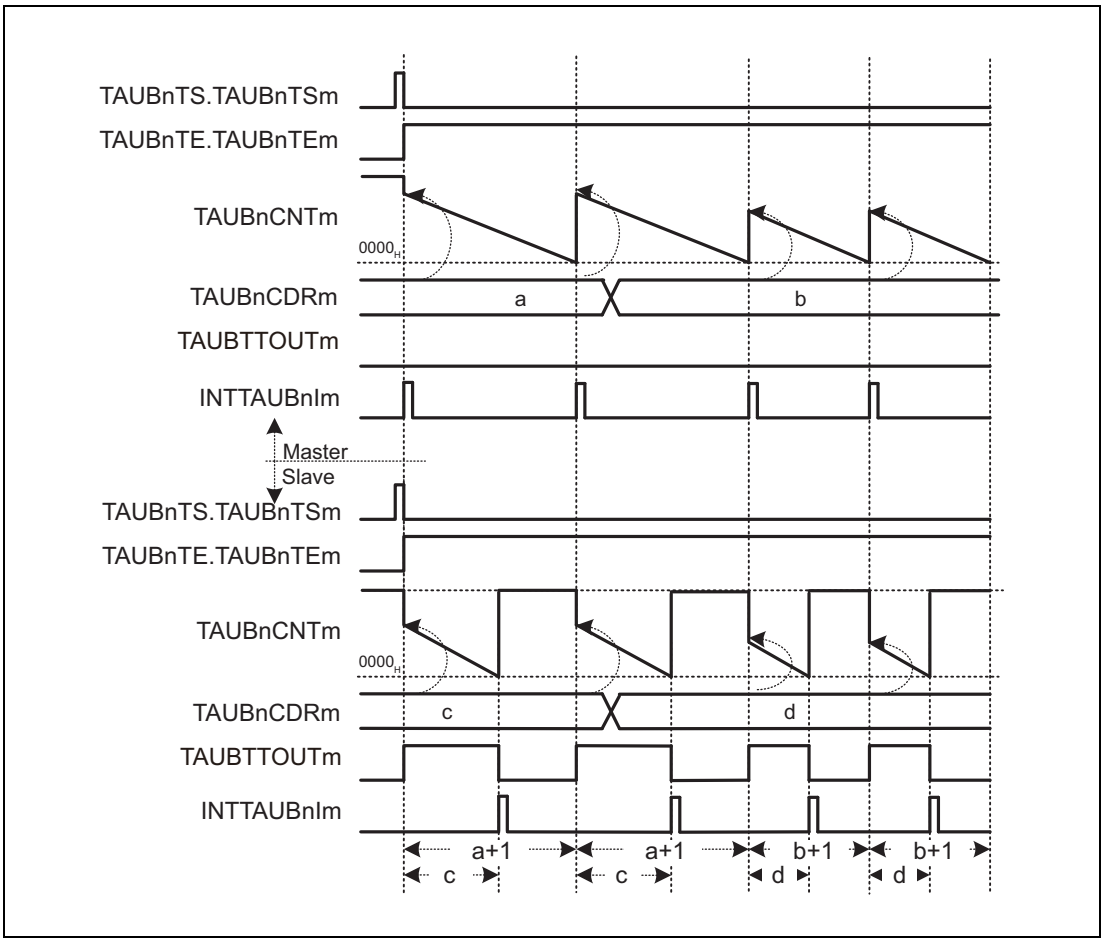

**Figure 24.79 General Timing Diagram for PWM Output Function**

**NOTE**

The interval between the starting to count and an interrupt being generated is the value of corresponding TAUBnCDRm + 1.

### 24.14.1.4 Register Settings for the Master Channel

#### (1) TAUBnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | TAUBnCCS0 | Write $0_B$. |
| 11 | TAUBnMAS | Write $1_B$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $000_B$. |
| 7, 6 | TAUBnCOS[1:0] | Write $00_B$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0000_B$. |
| 0 | TAUBnMD0 | Write $1_B$. |

#### (2) TAUBnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUBnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 24.100 Contents of the TAUBnCMURm Register for the Master Channel of the PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

### (3) Channel output mode for the master channel

The channel output mode is not used by this function.

### (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

**Table 24.101 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function**

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers.<br>1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

**NOTE**

When used in TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel operating in **Section 24.13.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Configure the operation following the conditions below.

- The channel set to Simultaneous Rewrite Trigger Output Function Type 1: TAUBnRDCm = 1, TAUBnRDSm = 1
  The setting value of TAUBnCDRm to this channel is as follows.
  = ((setting value of TAUBnCDRm of the master channel subject to simultaneous rewrite + 1) × number of interrupts) – 1
- Master channel: TAUBnRDCm = 0, TAUBnRDSm = 1
- Slave channel: TAUBnRDCm = 0, TAUBnRDSm = 1

Although the value of duty exceeds 100% when the setting value of TAUBnCDRm (slave) > the setting value of TAUBnCDRm (master) + 1, the output will be aggregated to 100%.

### 24.14.1.5 Register Settings for the Slave Channel(s)

#### (1) TAUBnCMORm for the slave channel(s)

Restart operation

### 24.14.1.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

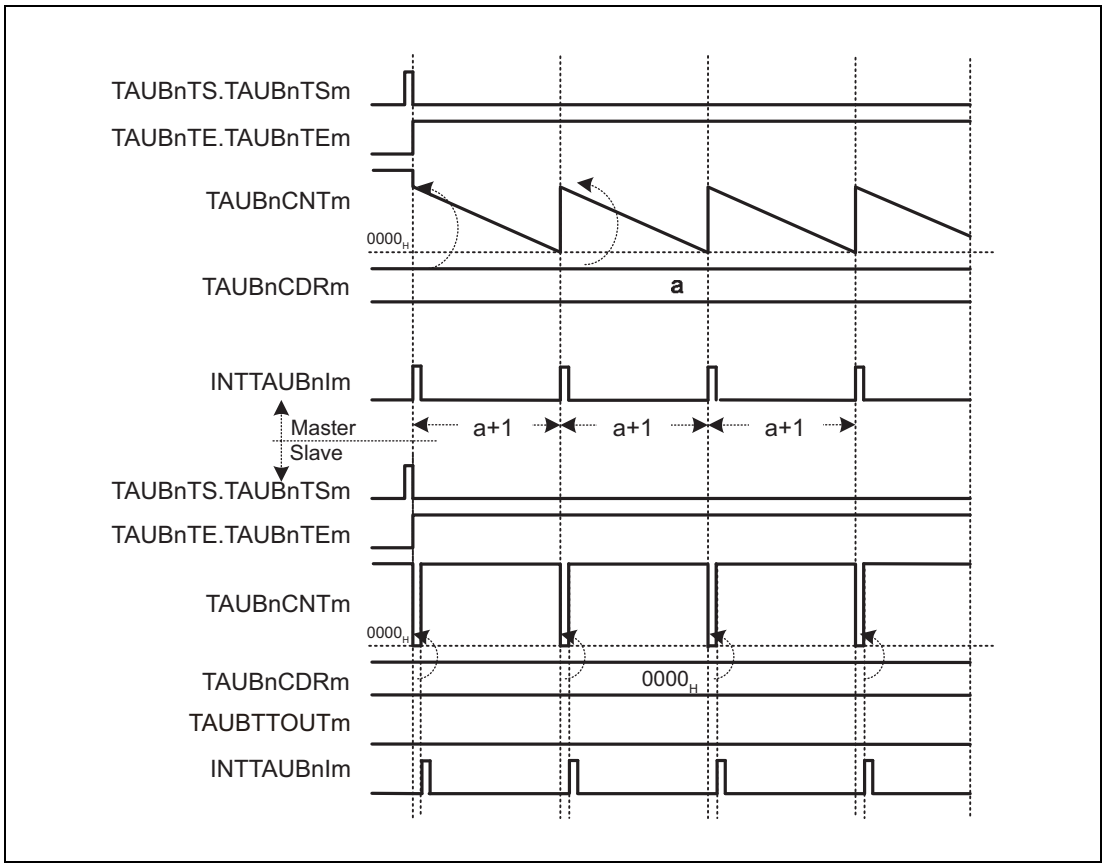

**Figure 24.80 TAUBnCDRm (slave) = $0000_H$, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)**

- Every time the master channel generates an interrupt (INTTAUBnIm), $0000_H$ is written to TAUBnCNTm (slave). As a result, a slave channel interrupt (INTTAUBnIm) is generated at the same time and TAUBTTOUTm remains inactive.
- TAUBnCNTm (slave) generates an interrupt every time the value of TAUBnCDRm is loaded.

**(2) Duty cycle = 100%**

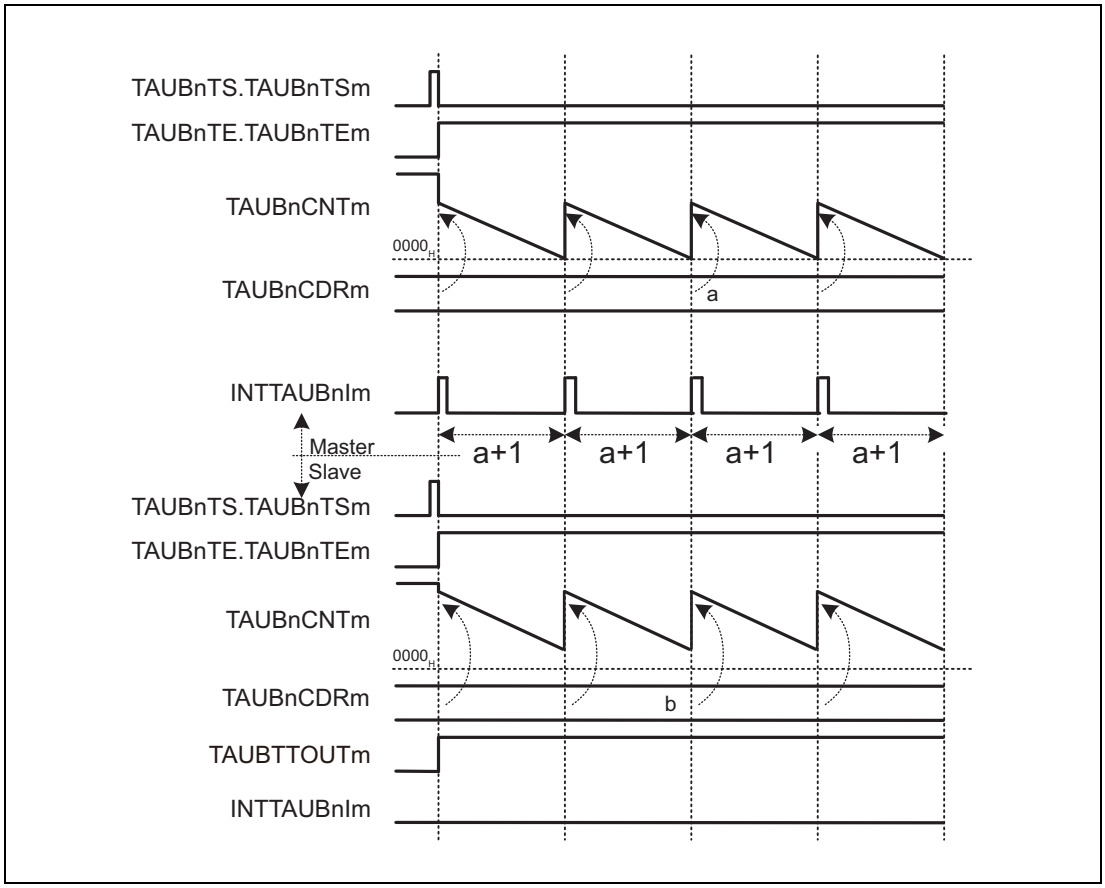

**Figure 24.81 TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)**

If the value TAUBnCDRm (slave) is higher than the value TAUBnCDRm (master), the counter of the slave channel cannot reach $0000_H$ and cannot generate interrupts. The TAUBTTOUTm remains at active state.

### (3) Operation stop and restart

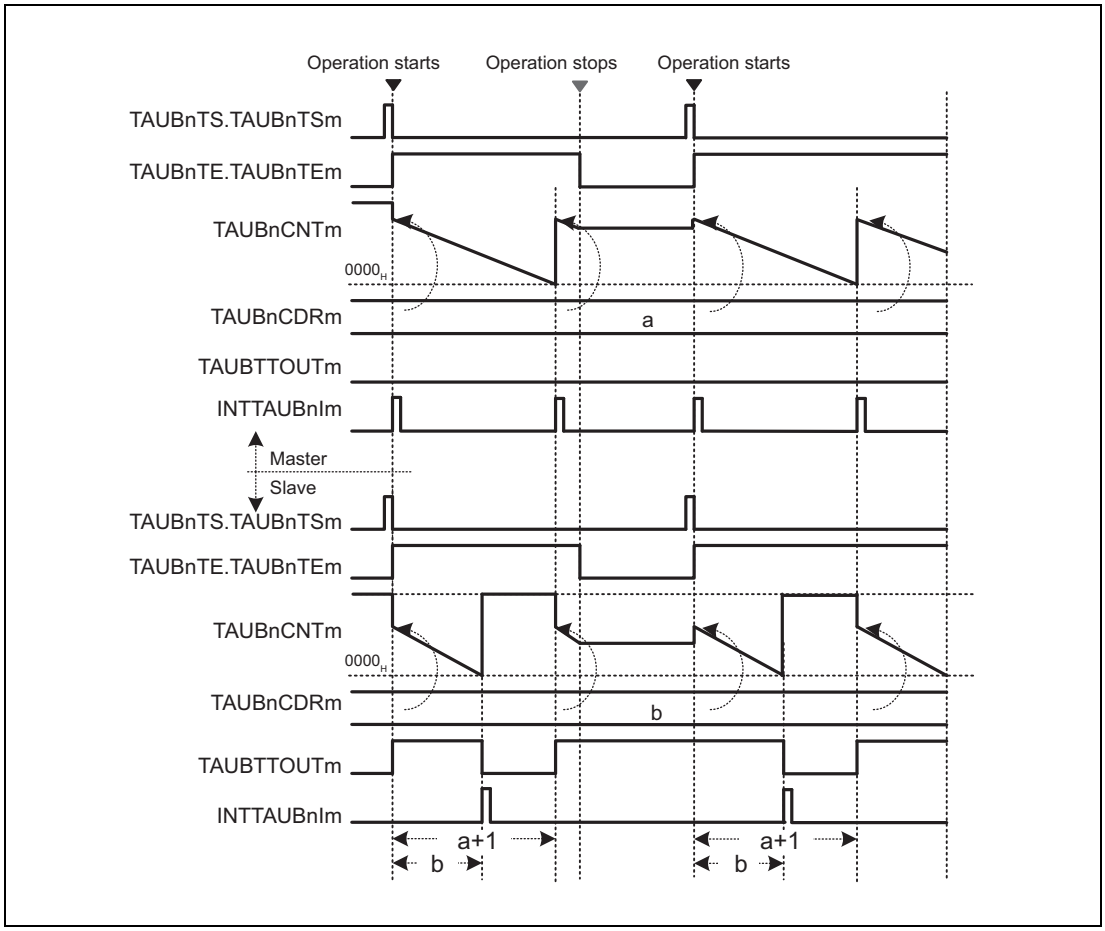

**Figure 24.82 Operation Stop and Restart, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)**

- The counter can be stopped by setting TAUBnTT.TAUBnTTm of the master and slave channel(s) to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm of master and slave channel(s) to 1. TAUBnCNTm of master and slave channel reload the current values of TAUBnCDRm and start to count down from these values.

### (4) Operation stop and restart (Slave output, Initialization)

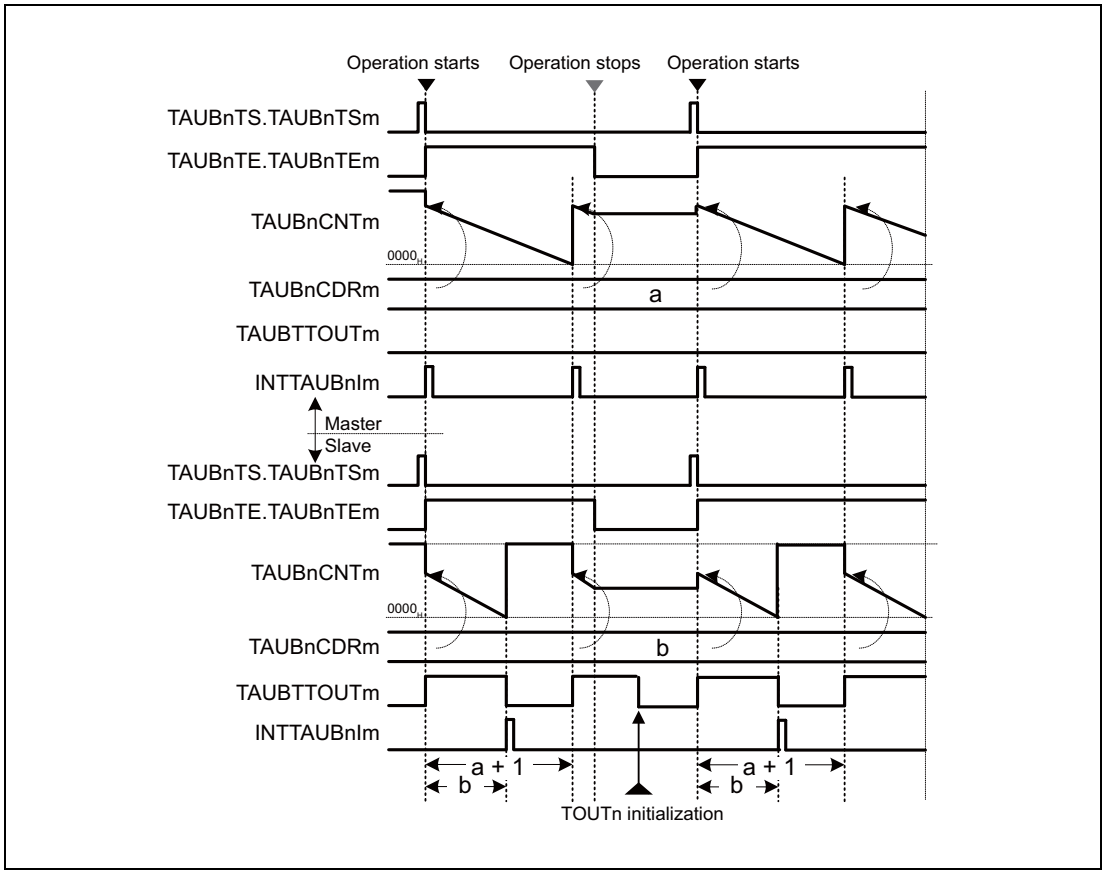

**Figure 24.83 Operation Stop and Restart (Slave Output, Initialization)**

When TAUBnTOE.TAUBnTOEm of the slave channel is set to 0 while TAUBnTE.TAUBnTEm = 0 and the inactive level of TAUBTTOUTm is written in the TAUBnTO.TAUBnTOm, the output level of TAUBTTOUTm (slave channel) becomes active when INTTAUBnIm is issued when the count operation is started after restart.

## 24.14.2 One-Shot Pulse Output Function

### 24.14.2.1 Overview

#### Summary

This function outputs a signal pulse with a defined pulse width and a specific delay time compared to an external input signal pulse by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

#### Prerequisites

- Two channels
- The operation mode of the master channel must be set to one-count mode, see **Table 24.107, Contents of the TAUBnCMORm Register for the Master Channel of the One-Shot Pulse Output Function**
- The operation mode of the slave channel must be set to pulse one-count mode, see **Table 24.110, Contents of the TAUBnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function**
- TAUBTTOUTm is not used for the master channel of this function
- The channel output mode of the slave channel must be set to independent channel output mode 2.
- TAUBTTINm (master) has to be detected while TAUBnCNTm (master) and TAUBnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUBTTINm (slave).

#### Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) for master and slave channels to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

- Master channel:
  When the next valid TAUBTTINm input edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm. The counter starts to count down from this value. If TAUBnCMORm.TAUBnMD0 = 0, a trigger (TAUBTTINm) which is detected within the delay time is ignored.
  When the counter of the master channel reaches $0000_H$, INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next valid TAUBTTINm input edge.
- Slave channel:
  INTTAUBnIm generated on the master channel triggers the counter of the slave channel. The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value.
  An interrupt is generated and the TAUBTTOUTm signal is set.
  When the counter reaches $0001_H$, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter remains at $0000_H$ and awaits the next INTTAUBnIm of the master channel.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

The counter of the master channel can be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

**NOTES**

1. If a forced restart of the counter is executed during operation, the width of the output signal does not correspond to the value of TAUBnCDRm (slave).
2. The TAUBTTINm input signal is sampled at the frequency of the operating clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of ± 1 operation clock cycle.

**Conditions**

- If TAUBnCMORm.TAUBnMD0 of the master channel is set to 0, during counting detected TAUBTTINm input edges are ignored.
- Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

#### 24.14.2.2 Equations

Delay from trigger input to pulse output
= (TAUBnCDRm (master) + 1) × count clock cycle

Pulse width = (TAUBnCDRm (slave)) × count clock cycle

### 24.14.2.3 Block Diagram and General Timing Diagram

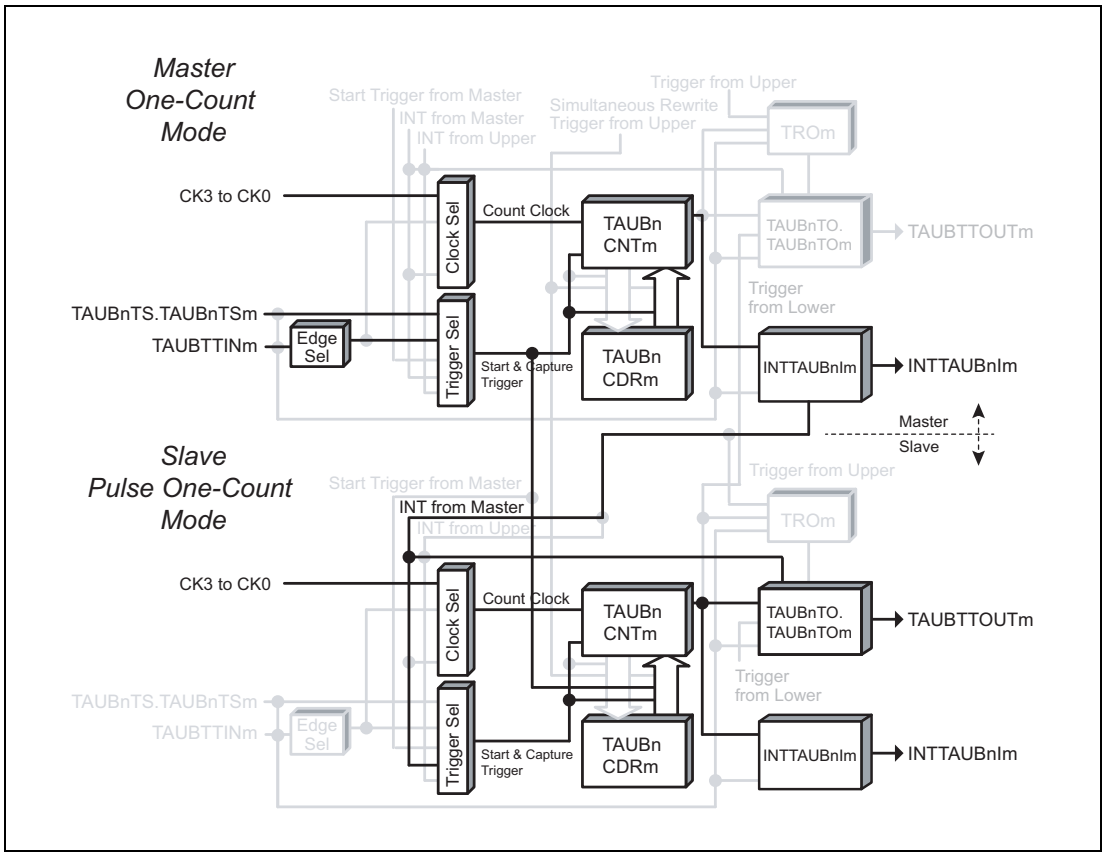

**Figure 24.84 Block Diagram for One-Shot Pulse Output Function**

The following settings apply to the general basic diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)

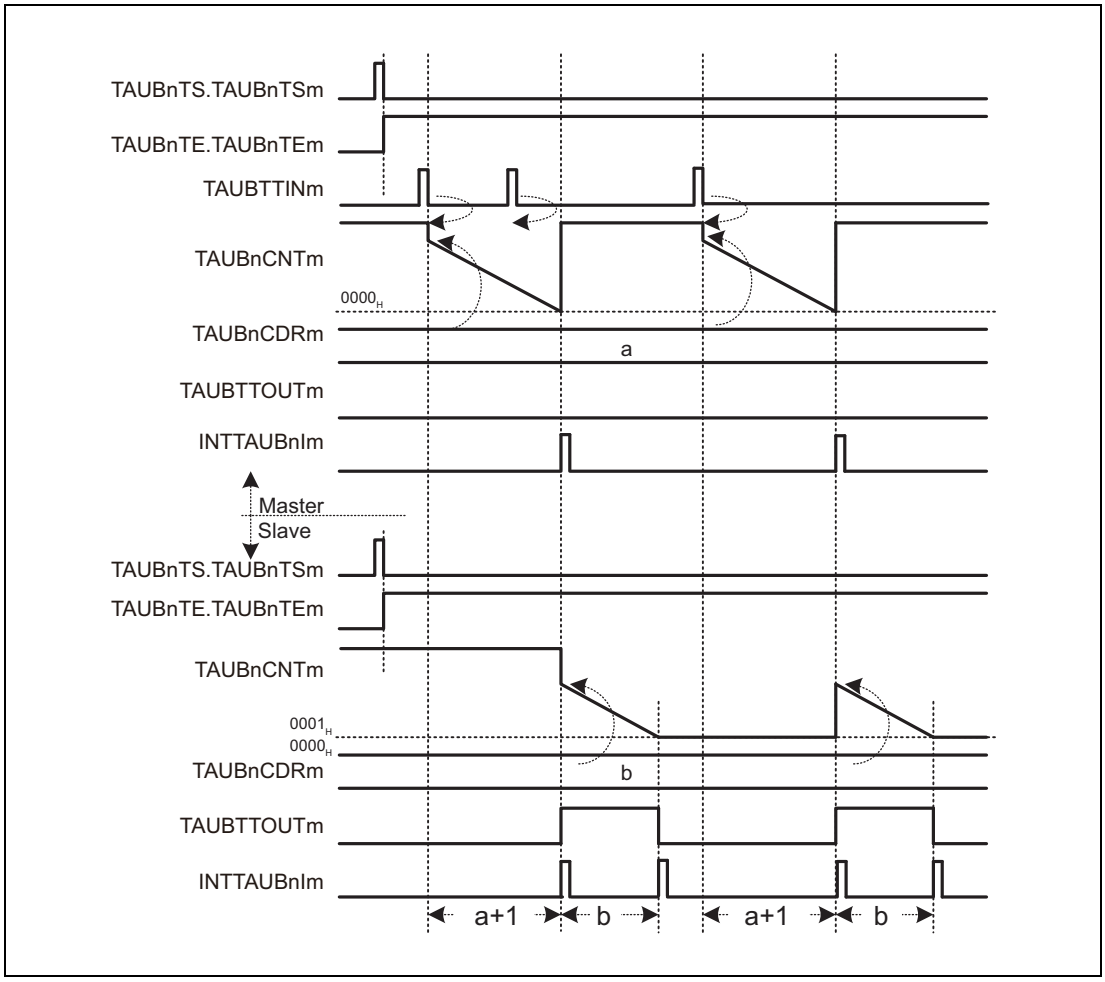

**Figure 24.85 General Timing Diagram for One-Shot Pulse Output Function**

### 24.14.2.4 Register Settings for the Master Channel

**Table 24.111 Contents of the TAUBnCMURm Register for the Slave Channel of the One-Shot Pulse Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

### (3) Channel output mode for the slave channel

Table 24.112 Control Bit Settings for Independent Channel Output Mode 2

| Bit Name | Setting |
|---|---|
| TAUBnTOE.TAUBnTOEm | 1: Enables independent channel output mode |
| TAUBnTOM.TAUBnTOMm | 0: Independent channel output |
| TAUBnTOC.TAUBnTOCm | 1: Operating mode 2 |
| TAUBnTOL.TAUBnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUBnTDE.TAUBnTDEm | 0: Disables dead time operation |
| TAUBnTDL.TAUBnTDLm | 0: When dead time operation is disabled (TAUBnTDE.TAUBnTDEm = 0), set these bits to 0 |

### (4) Simultaneous rewrite for the slave channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.113 Simultaneous Rewrite Settings for the Slave Channel of the One-Shot Pulse Output Function

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: The master channel is the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 24.14.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 24.114 Operating Procedure for One-Shot Pulse Output Function

| | Operation | Status of TAUBn |
|---|---|---|
| Initial channel setting | Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.2.4, Register Settings for the Master Channel**.<br><br>Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.2.5, Register Settings for the Slave Channel**.<br><br>Set the values of the TAUBnCDRm registers of all channels | Channel operation is stopped. |
| Start operation | Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously.<br>TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the master channel awaits a TAUBTTINm input. |
| During operation | TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time.<br><br>TAUBnRDT.TAUBnRDTm can be changed during operation. | When a valid TAUBTTINm input edge is detected, TAUBnCNTm of the master channel loads the TAUBnCDRm value and counts down. When the counter reaches $0000_H$:<br>• INTTAUBnIm (master) is generated<br>• TAUBnCNTm (master) is reset to $FFFF_H$ and waits for the next valid TAUBTTINm input edge.<br>• TAUBnCNTm (slave) reloads the TAUBnCDRm value and starts to count down<br>• INTTAUBnIm (slave) is generated<br>• TAUBTTOUTm (slave) is set to the active level.<br>When TAUBnCNTm (slave) reaches $0001_H$:<br>• The counter of TAUBnCNTm (slave) stops.<br>• INTTAUBnIm (slave) is generated<br>• TAUBTTOUTm (slave) is set to an inactive level. |
| Stop operation | Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm and TAUBTTOUTm stop and retain their current values. |

Restart operation

### 24.14.2.7 Specific Timing Diagrams

#### (1) TAUBnCDRm (master) = $0000_H$

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)

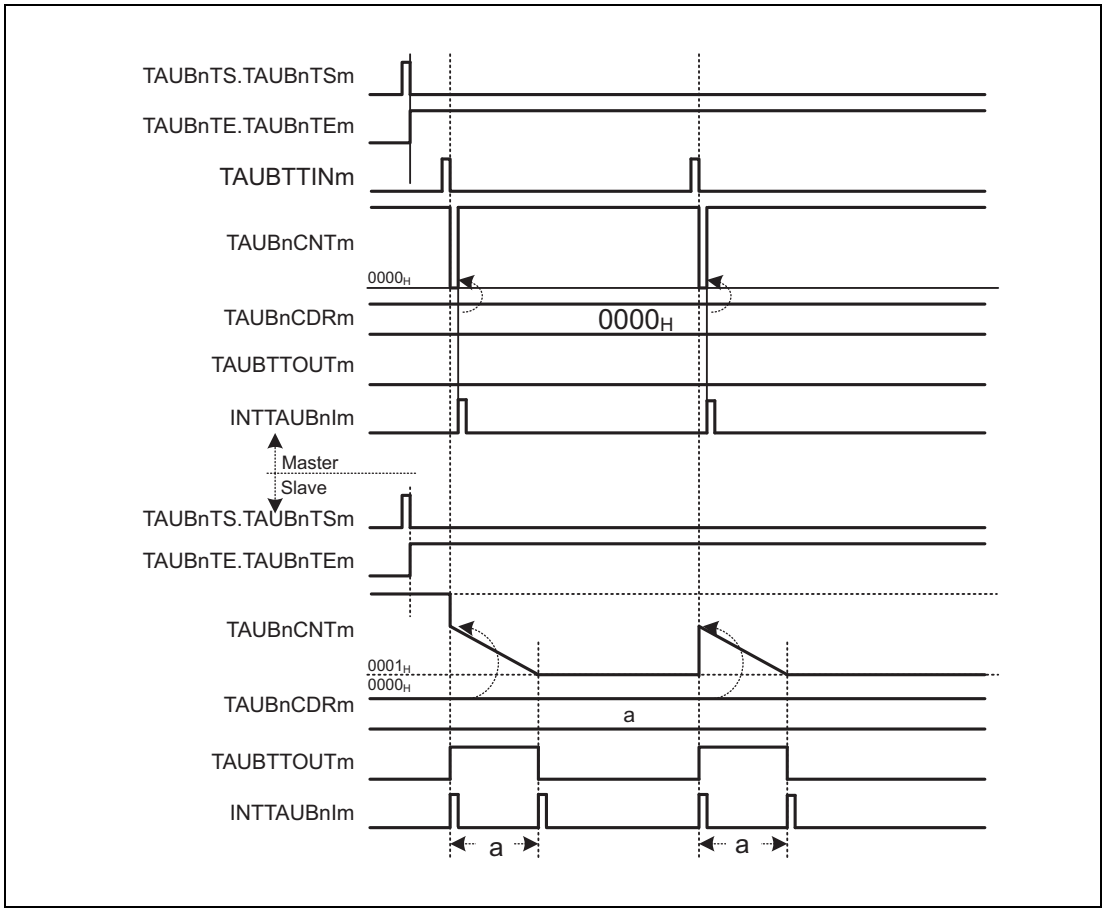

**Figure 24.86 TAUBnCDRm (master) = $0000_H$**

- When a valid TAUBTTINm input edge is detected, the value $0000_H$ is written to TAUBnCNTm (master). The counter is set to $0000_H$ for one count and returns to $FFFF_H$.
  Thus, the slave channel starts to count down one count clock later to TAUBTTINm (master).

### (2) TAUBnCDRm (slave) = $0000_H$

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)

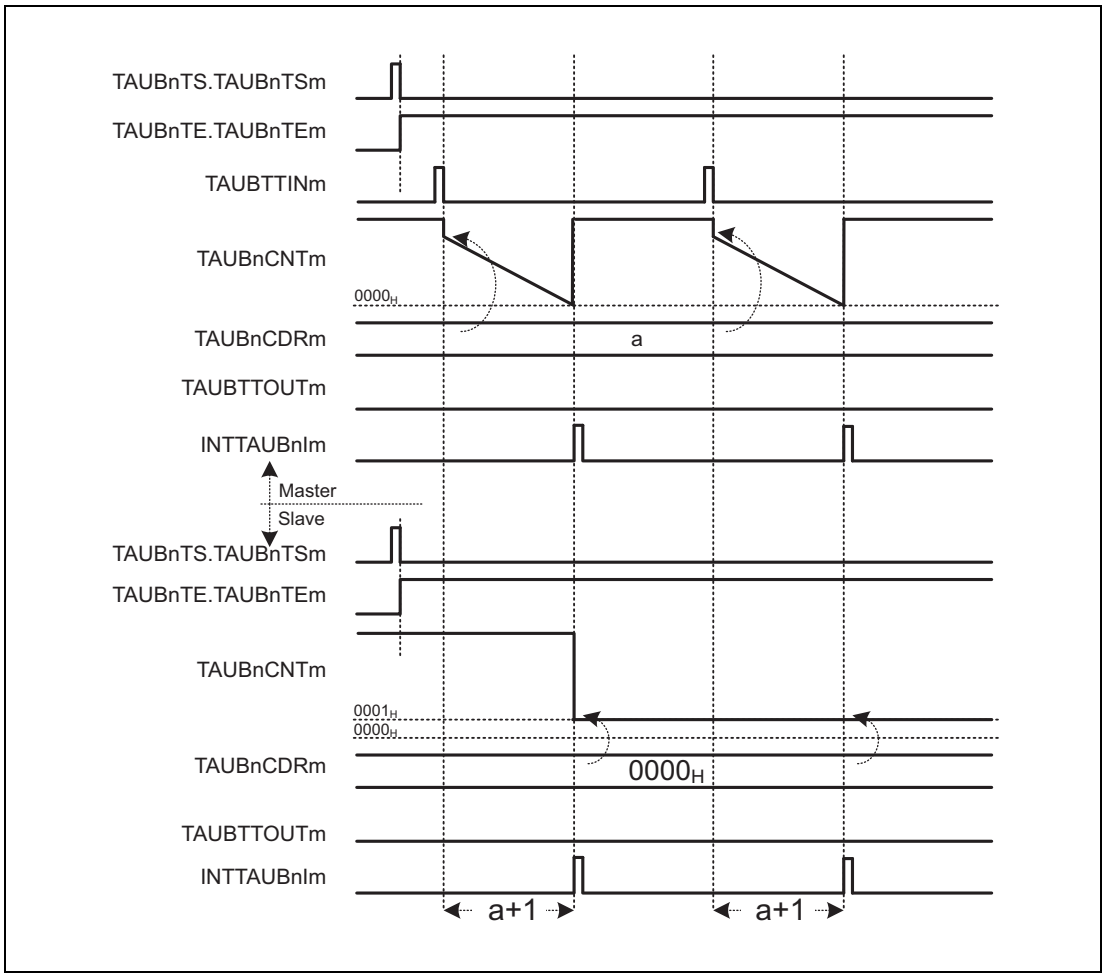

**Figure 24.87 TAUBnCDRm (slave) = $0000_H$**

- TAUBTTOUTm remains at inactive state, because the pulse width is zero.

### (3) TAUBnCMORm.TAUBnMD0 = 0

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)

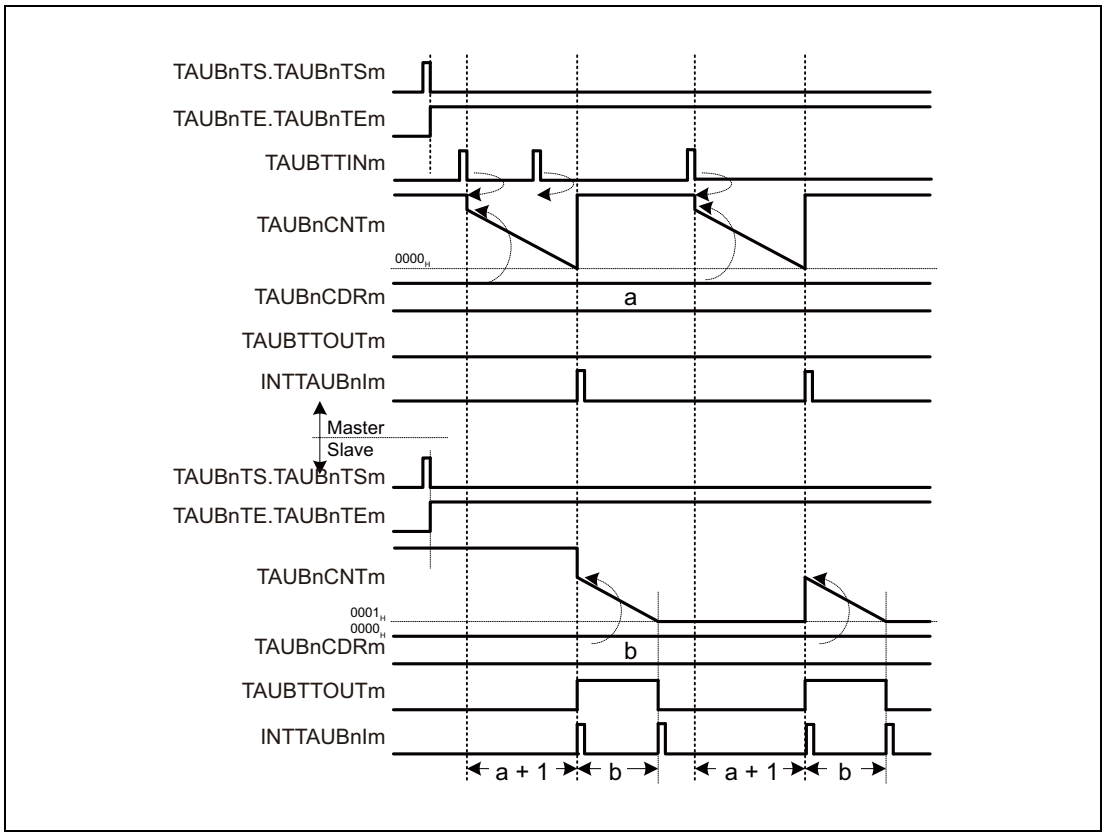

**Figure 24.88 TAUBnCMORm.TAUBnMD0 = 0**

- Even when an effective edge is input to TAUBTTINm while the counter of the master channel counts down, the counter continues counting down.

### (4) TAUBnCMORm.TAUBnMD0 = 1

The following settings apply to this diagram.

- Start trigger detection enabled during counting (TAUBnCMORm.TAUBnMD0 = 1)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)

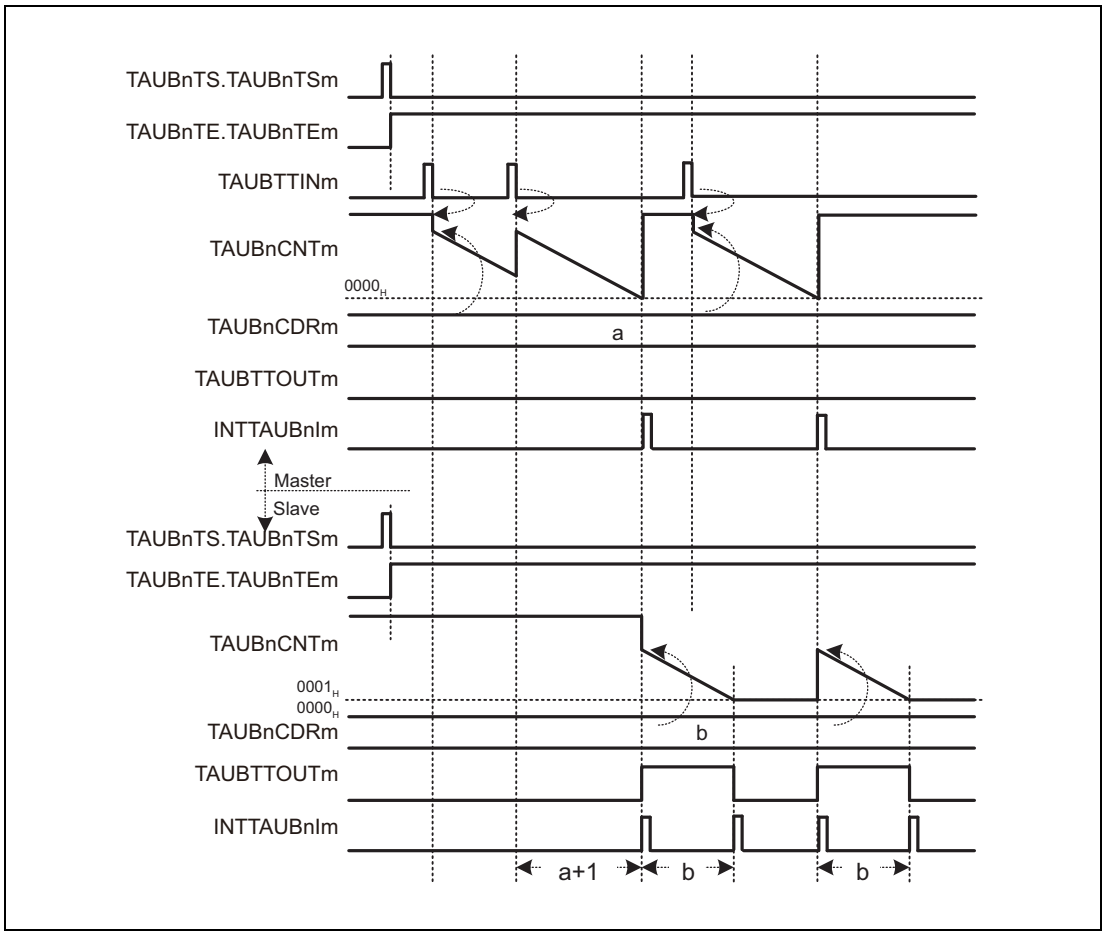

**Figure 24.89 TAUBnCMORm.TAUBnMD0 = 1**

- If a valid TAUBTTINm input edge is detected while the counter of the master channel counts down, TAUBnCNTm reloads the value of TAUBnCDRm. The counter restarts to count down.

This means the delay for INTTAUBnIm generation interval is extended by the value of TAUBnCNTm at the time when a valid TAUBTTINm input edge is detected.

### (5) Operation stop and restart

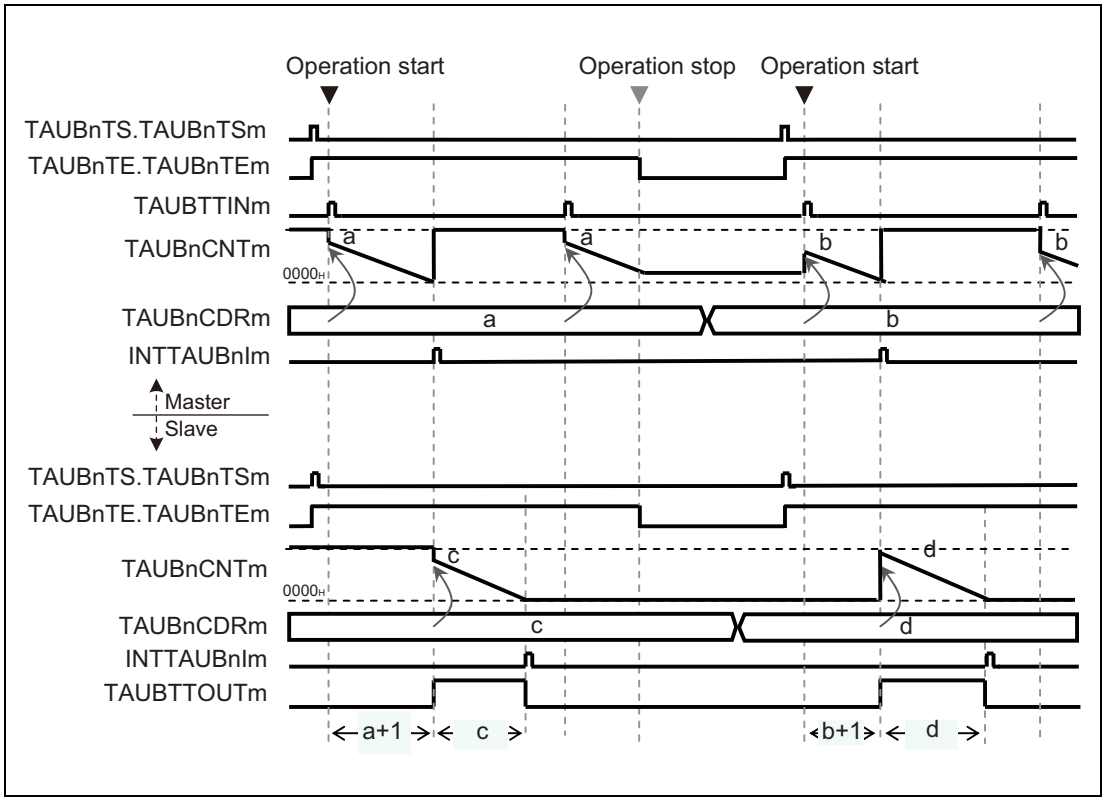

**Figure 24.90 Stopping and Restarting the Operation**

Setting TTm of the master and slave channels to 1 clears TAUBnTE.TAUBnTEm to 0, thereby stopping the count operation. If this happens, TAUBnCNTm and TAUBTTOUTm stop operation with the values retained.

Setting TAUBnTS.TAUBnTSm of the master and slave channels to 1 concurrently sets TAUBnTE.TAUBnTEm to 1.

When the start trigger is detected while the TAUBnTE.TAUBnTEm is set to 1, the TAUBnCDRm value is transferred to TAUBnCNTm and the operation restarts.

### (6) Restarting the master channel while the slave channel is counting

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = $00_B$)

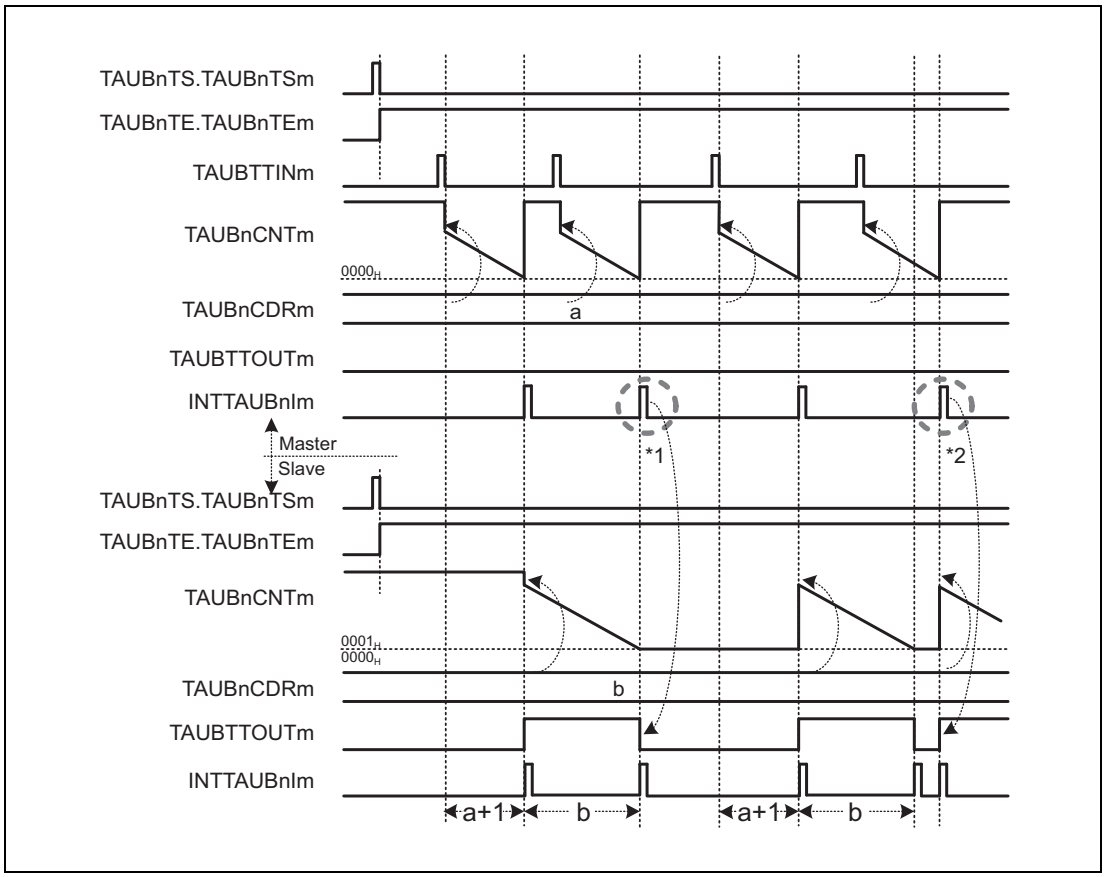

**Figure 24.91 Input Interval of TAUBTTINm ≤ Delay Time + Pulse Width + 1**

- If the master channel generates an interrupt before the counter of the slave channel has reached $0001_H$ or exactly when $0001_H$ is reached (*1), the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUBnCDRm (slave) is reloaded. An interrupt is generated and TAUBTTOUTm toggles. If TAUBnCNTm (master) has started to count down while the TAUBnCNTm (slave) is still counting (*2), TAUBTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

## 24.14.3 Delay Pulse Output Function

### 24.14.3.1 Overview

#### Summary

This function outputs two signals. The reference signal has a defined pulse width and pulse cycle specified using the master channel and slave channel 1.
Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by amount specified in slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1.
  The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified in slave channel 2.

#### Prerequisites

- Four channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 24.115, Contents of the TAUBnCMORm Register for the Master Channel of the Delay Pulse Output Function**.
- The operation mode of slave channels 1 and 2 must be set to one-count mode, see **Table 24.118, Contents of the TAUBnCMORm Register for the Slave Channel 1 of the Delay Pulse Output Function** and **Table 24.122, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Delay Pulse Output Function**.
- The operation mode of slave channel 3 must be set to pulse one-count mode, see **Table 24.125, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Delay Pulse Output Function**
- TAUBTTOUTm is not used for the master channel and slave channel 2
- The channel output mode of slave channel 1 must be set to synchronous channel output mode 1.
- The channel output mode of slave channel 3 must be set to independent channel output mode 1.

#### Description

The counters of the channel group are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm to 1, enabling count operation.

- Master channel:

  The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value. INTTAUBnIm is generated on the master channel.
  When the counter of the master channel reaches $0000_H$, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter reloads the TAUBnCDRm value and counts down.

- Slave channels 1 and 2:

  When the slave channels 1 and 2 detect an interrupt from the master channel, they start to count down from the current value of TAUBnCDRm. The TAUBTTOUTm signal (slave 1) is set.

  – Slave channel 1:
  When the counter of slave channel 1 reaches $0000_H$ (duty time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel.

  – Slave channel 2:
  When the counter of slave channel 2 reaches $0000_H$, delay time has elapsed and INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel.
  INTTAUBnIm (slave channel 2) triggers the counter of slave channel 3

- Slave channel 3:
  When slave channel 3 detects an interrupt from slave channel 2, it starts to count down from the current value of TAUBnCDRm. INTTAUBnIm is generated and the TAUBTTOUTm signal (slave 3) is set.
  When the counter of slave channel 3 reaches $0001_H$, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset.
  The output from slave channel 3 is the delayed PWM pulse.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

**Conditions**

Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

### 24.14.3.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty width 1 = (TAUBnCDRm (slave 1)) × count clock cycle

Delay = (TAUBnCDRm (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUBnCDRm (slave 3)) × count clock cycle

Where the setting of the delay is within the following range:

$0000_H \leq$ TAUBnCDRm (slave 2) < TAUBnCDRm (master)

**NOTES**

1. The output waveform of TAUBTTOUTm (slave 3) is the output waveform of TAUBTTOUTm (slave 1) delayed for the delay generated by slave 2. It cannot be delayed for more than the pulse cycle.
2. When INTTAUBnIm of slave 2 occurs while slave 3 is counting, slave 3 restarts the operation. Therefore, the output waveform of TAUBTTOUTm (slave 3) retains the active level. (In this case, TAUBTTOUTm (Slave-CH-3) cannot output the waveform of the delayed basic pulse of TAUBTTOUTm (Slave-CH-1).)

### 24.14.3.3 Block Diagram and General Timing Diagram

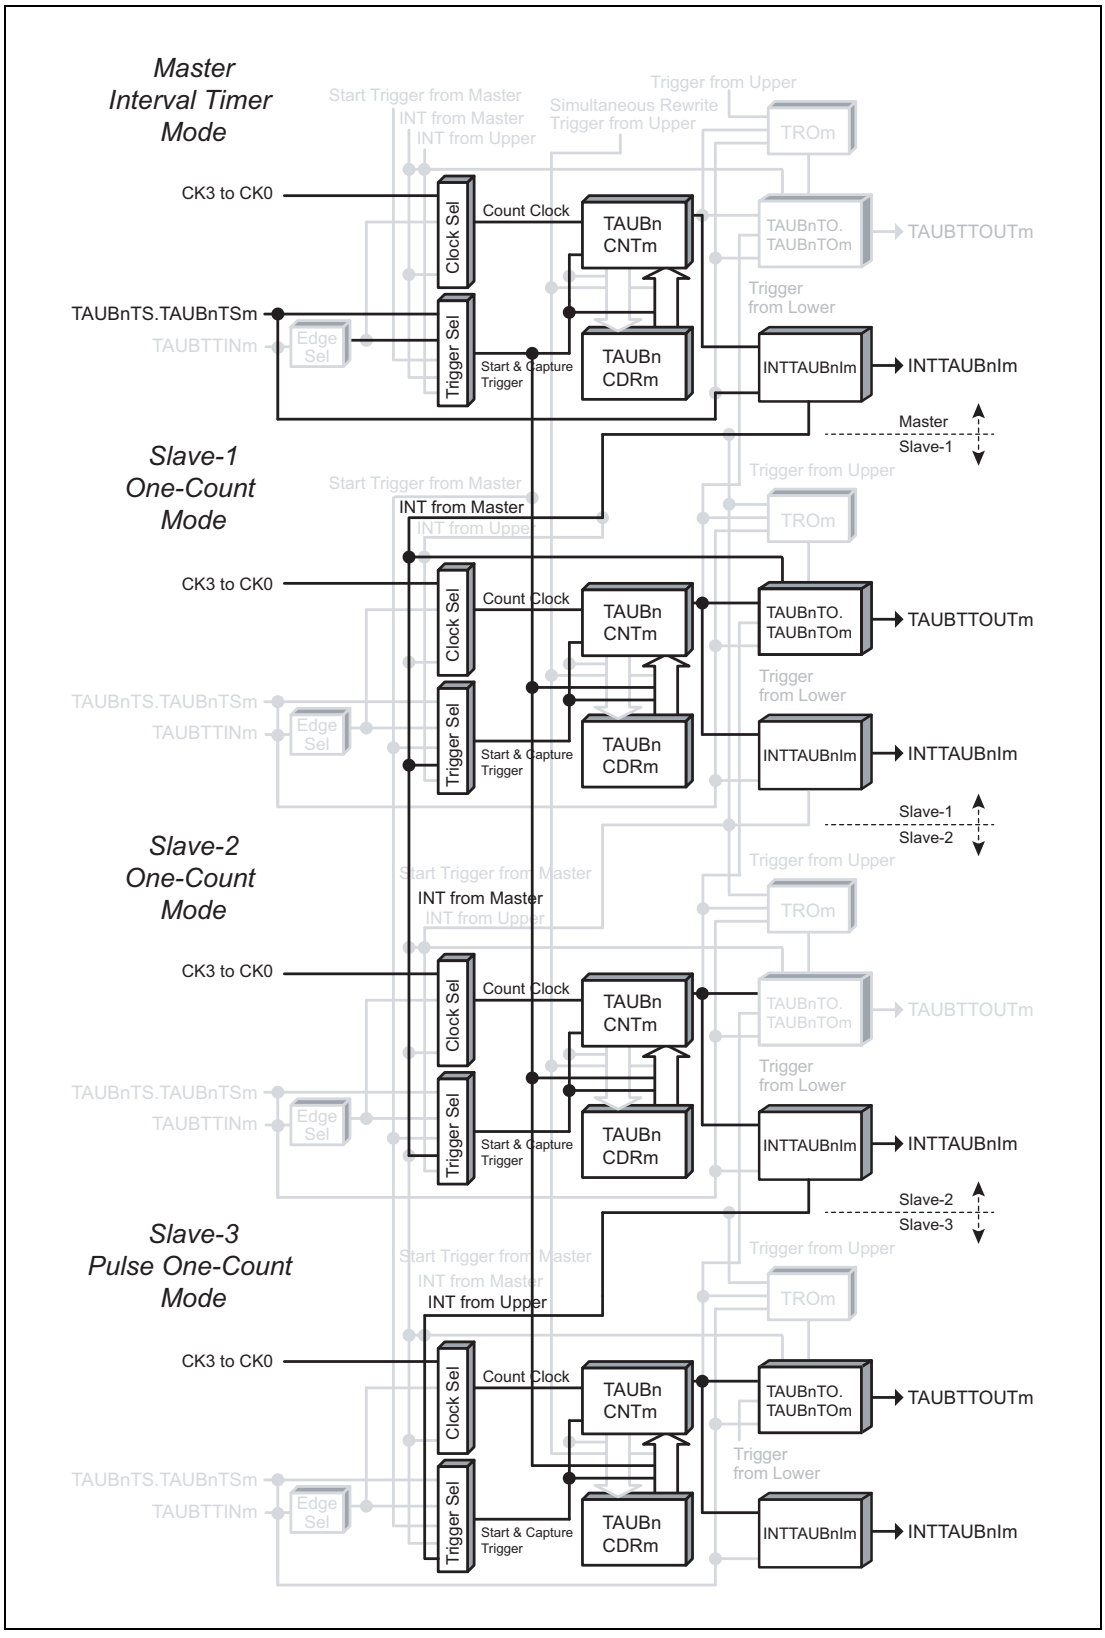

Figure 24.92 Block Diagram for Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

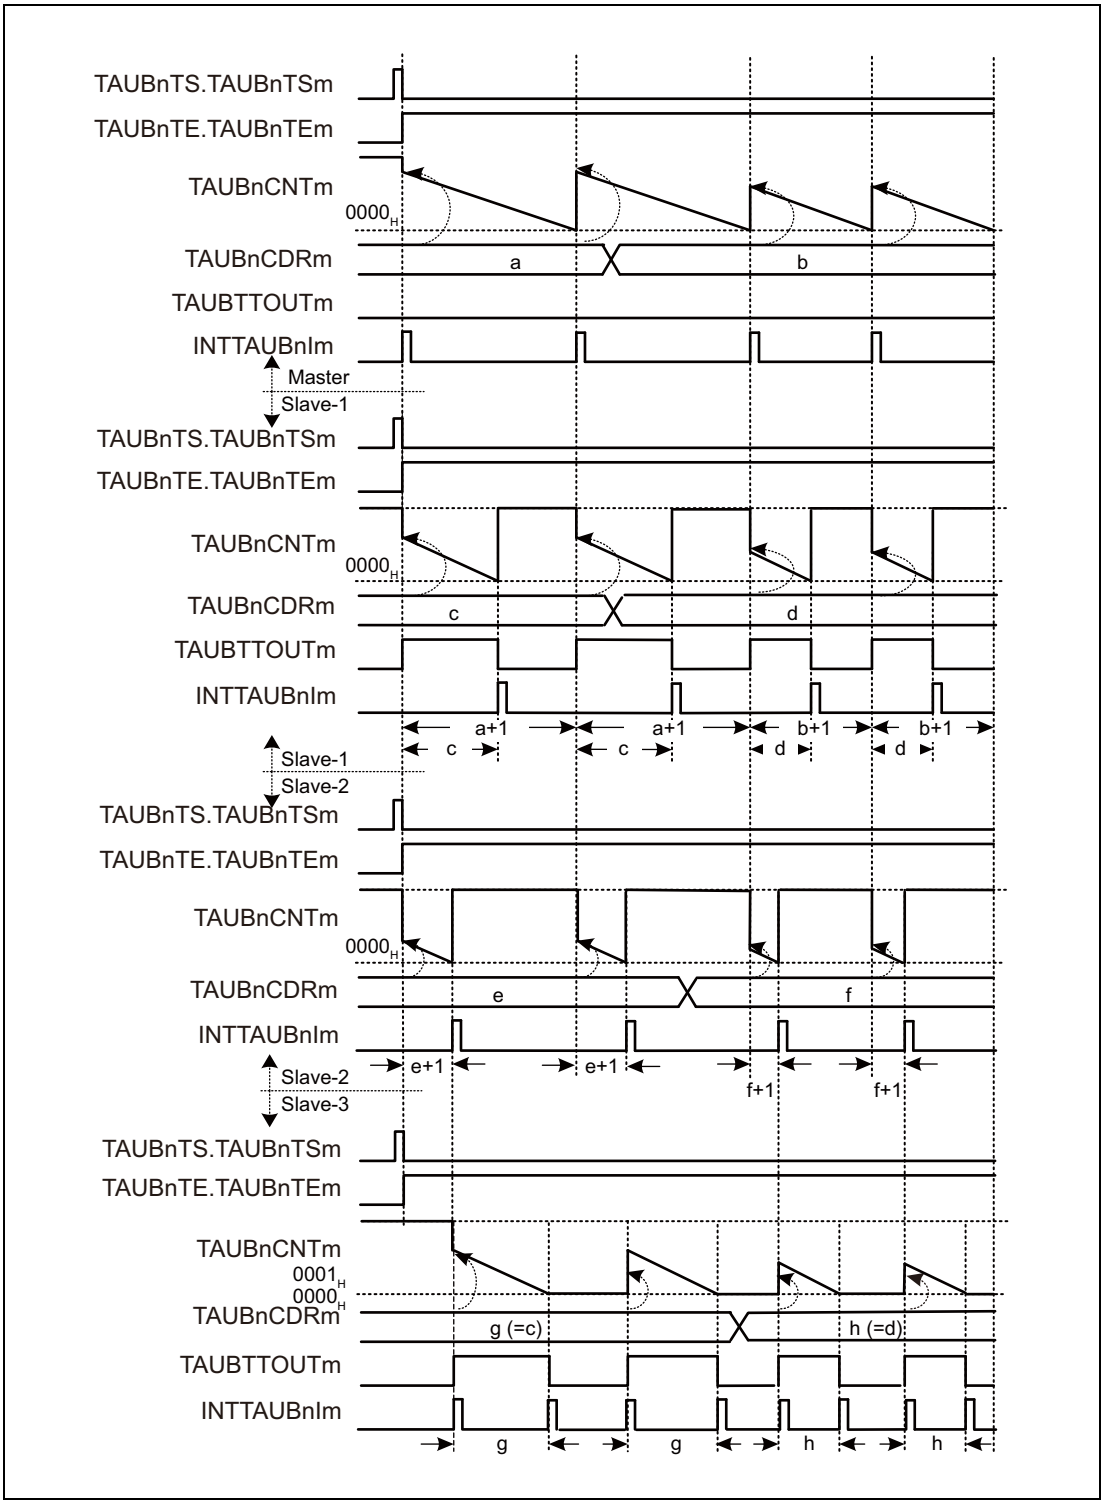

**Figure 24.93 General Timing Diagram for Delay Pulse Output Function**

| 7, 6 | TAUBnCOS[1:0] | Write $00_B$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0000_B$. |
| 0 | TAUBnMD0 | Write $1_B$. |

#### (2) TAUBnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUBnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 24.116 Contents of the TAUBnCMURm Register for the Master Channel of the Delay Pulse Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

### (3) Channel output mode for the master channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by the master channel of this function.

### (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

**Table 24.117 Simultaneous Rewrite Settings for the Master Channel of the Delay Pulse Output Function**

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: The master channel is the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 24.14.3.5 Register Settings for Slave Channel 1

#### (1) TAUBnCMORm for slave channel 1

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 24.126 Contents of the TAUBnCMURm Register for the Slave Channel 3 of the Delay Pulse Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

#### (3) Channel output mode for slave channel 3

Table 24.127 Control Bit Settings for Independent Channel Output Mode 2

| Bit Name | Setting |
|---|---|
| TAUBnTOE.TAUBnTOEm | Write $1_B$. |
| TAUBnTOM.TAUBnTOMm | Write $0_B$. |
| TAUBnTOC.TAUBnTOCm | Write $1_B$. |
| TAUBnTOL.TAUBnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUBnTDE.TAUBnTDEm | Write $0_B$. |
| TAUBnTDL.TAUBnTDLm | Write $0_B$. |

#### (4) Simultaneous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.128 Simultaneous Rewrite Settings for Slave Channel 3 of the Delay Pulse Output Function

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: The master channel is the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 24.14.3.8 Operating Procedure for Delay Pulse Output Function

Table 24.129 Operating Procedure for Delay Pulse Output Function (1/2)

| | Operation | Status of TAUBn |
|---|---|---|
| Initial channel setting | Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.3.4, Register Settings for the Master Channel**.<br><br>Slave channel 1: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.3.5, Register Settings for Slave Channel 1**.<br><br>Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.3.6, Register Settings For Slave Channel 2**.<br><br>Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.3.7, Register Settings for Slave Channel 3**.<br><br>Set the values of the TAUBnCDRm registers of all channels | Channel operation is stopped. |

**Table 24.129 Operating Procedure for Delay Pulse Output Function (2/2)**

| | Operation | Status of TAUBn |
|---|---|---|
| Start operation | Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously.<br>TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master channel and slave channels 1 and 2 start. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave 1) is set. |
| During operation | TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time.<br><br>TAUBnRDT.TAUBnRDTm can be changed during operation. | TAUBnCNTm of the master channel and slave channels 1 and 2 load TAUBnCDRm and count down.<br><br>When the counter of the master channel reaches $0000_H$:<br>• INTTAUBnIm (master) is generated<br>• TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation<br>• TAUBnCNTm (slave 1 and slave 2) reload the TAUBnCDRm value and start counting down<br>• TAUBTTOUTm (slave 1) is set<br><br>When TAUBnCNTm (slave 1) reaches $0000_H$:<br>• INTTAUBnIm (slave 1) is generated<br>• TAUBTTOUTm (slave 1) is reset<br><br>When TAUBnCNTm (slave 2) reaches $0000_H$:<br>• INTTAUBnIm (slave 2) is generated<br>• INTTAUBnIm (slave 3) is generated<br>• TAUBTTOUTm (slave 3) is set<br>• TAUBnCNTm (slave 3) reloads the TAUBnCDRm value and starts counting down<br><br>When TAUBnCNTm (slave 3) reaches $0001_H$:<br>• INTTAUBnIm (slave 3) is generated<br>• TAUBTTOUTm (slave 3) is reset |
| Stop operation | Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm and TAUBTTOUTm stop and retain their current values. |

Restart operation

### 24.14.3.9 Specific Timing Diagrams

#### (1) Duty cycle (slave 3) = 100%

The following values apply to the figure below.

- TAUBnCDRm (master) = $000A_H$
- TAUBnCDRm (slave 1) = $000B_H$
- TAUBnCDRm (slave 2) = $0000_H$
- TAUBnCDRm (slave 3) = $000B_H$

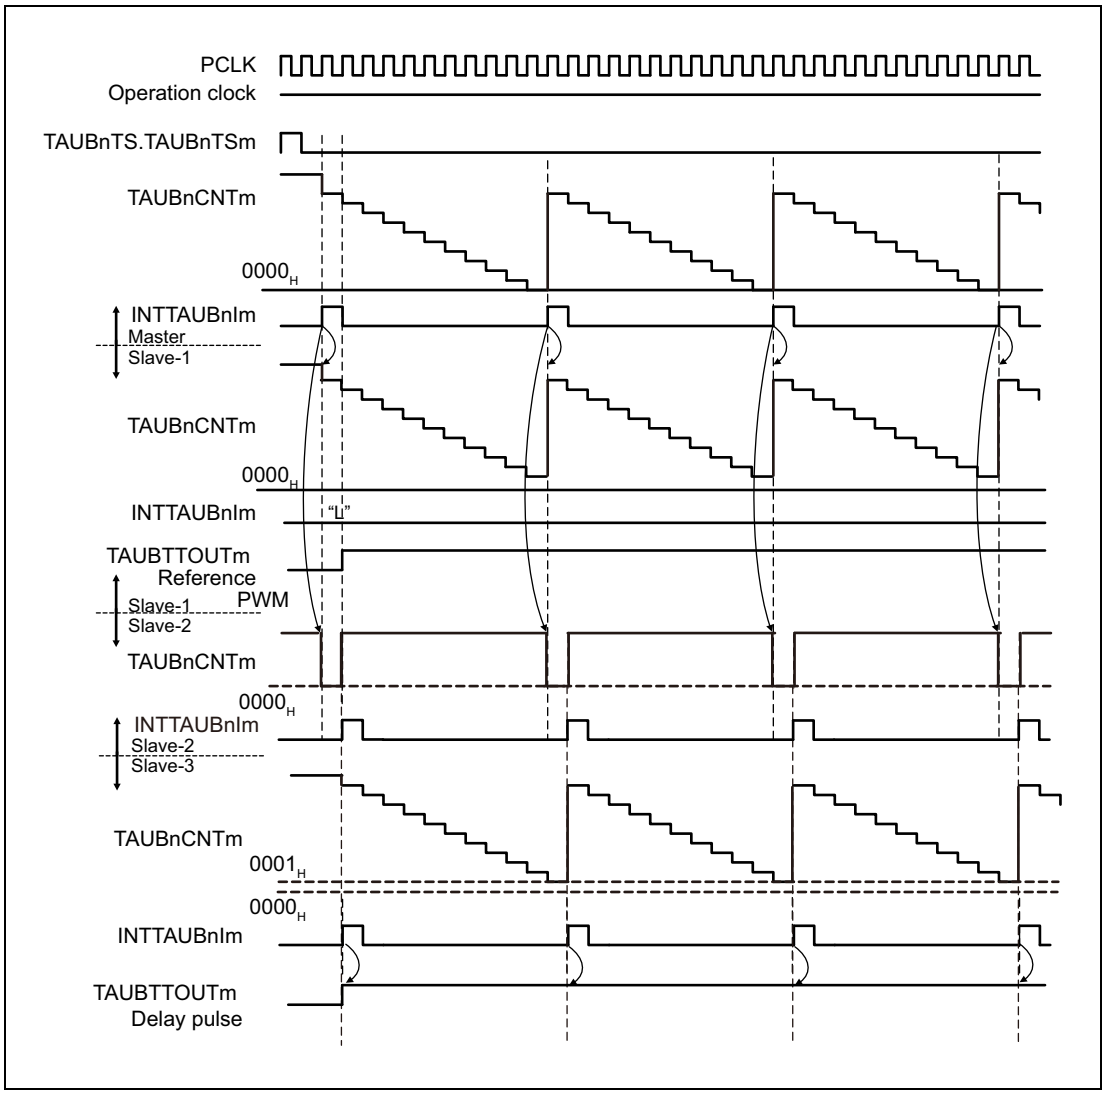

**Figure 24.94 Duty Cycle (slave 3) = 100%**

- If the value of TAUBnCDRm (slave 1 and 3) is higher than the value of TAUBnCDRm (master), the counter of slave channel 1 cannot reach 0000H and cannot generate interrupt request signals. TAUBTTOUTm of channels 1 and 3 remain in the active state.

### (2) TAUBTTOUTm (slave 1) = TAUBTTOUTm (slave 3)

The following values apply to the figure below.

- TAUBnCDRm (master) = $000A_H$
- TAUBnCDRm (slave 1) = $0005_H$
- TAUBnCDRm (slave 2) = $0000_H$
- TAUBnCDRm (slave 3) = $0005_H$

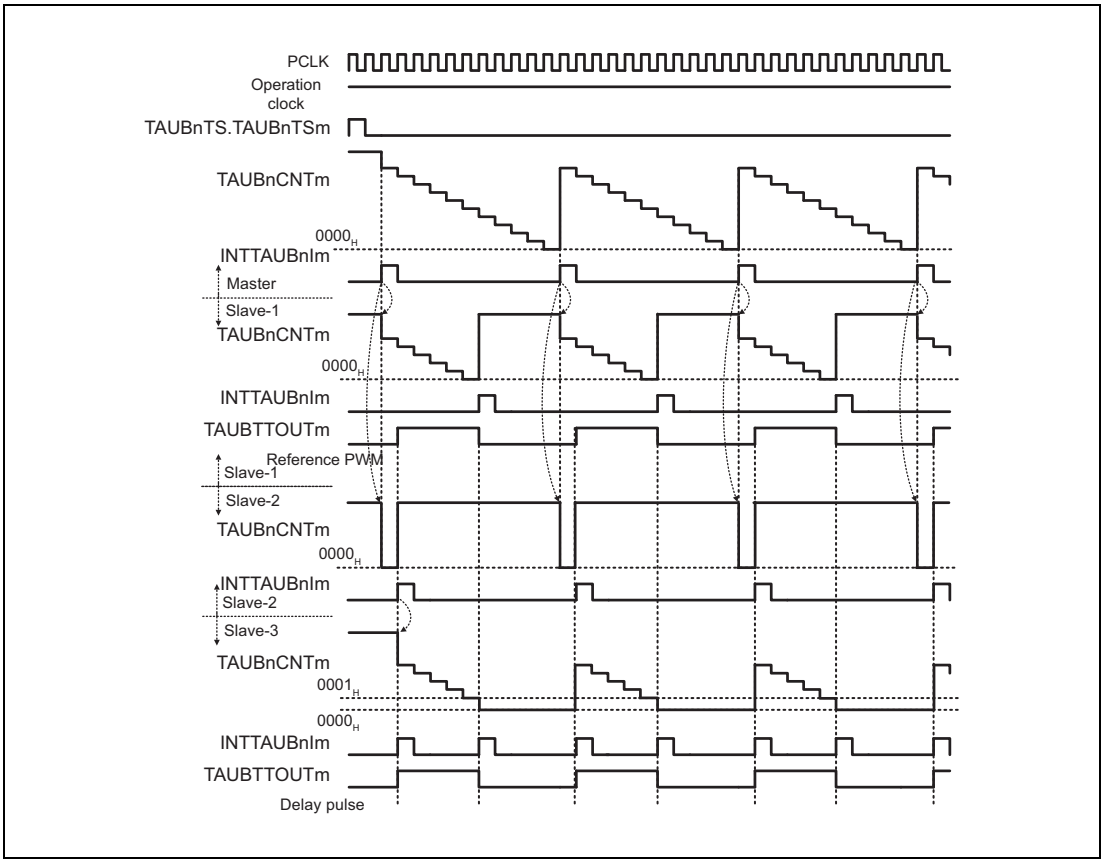

**Figure 24.95 TAUBTTOUTm (slave 1) = TAUBTTOUTm (slave 3)**

- If TAUBnCDRm (slave 2) = $0000_H$, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

## 24.14.4 AD Conversion Trigger Output Function Type 1

### 24.14.4.1 Overview

#### Summary

This function is identical to **Section 24.14.1, PWM Output Function** except that TAUBTTOUTm is not output.

This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

### 24.14.4.2 Block Diagram and General Timing Diagram

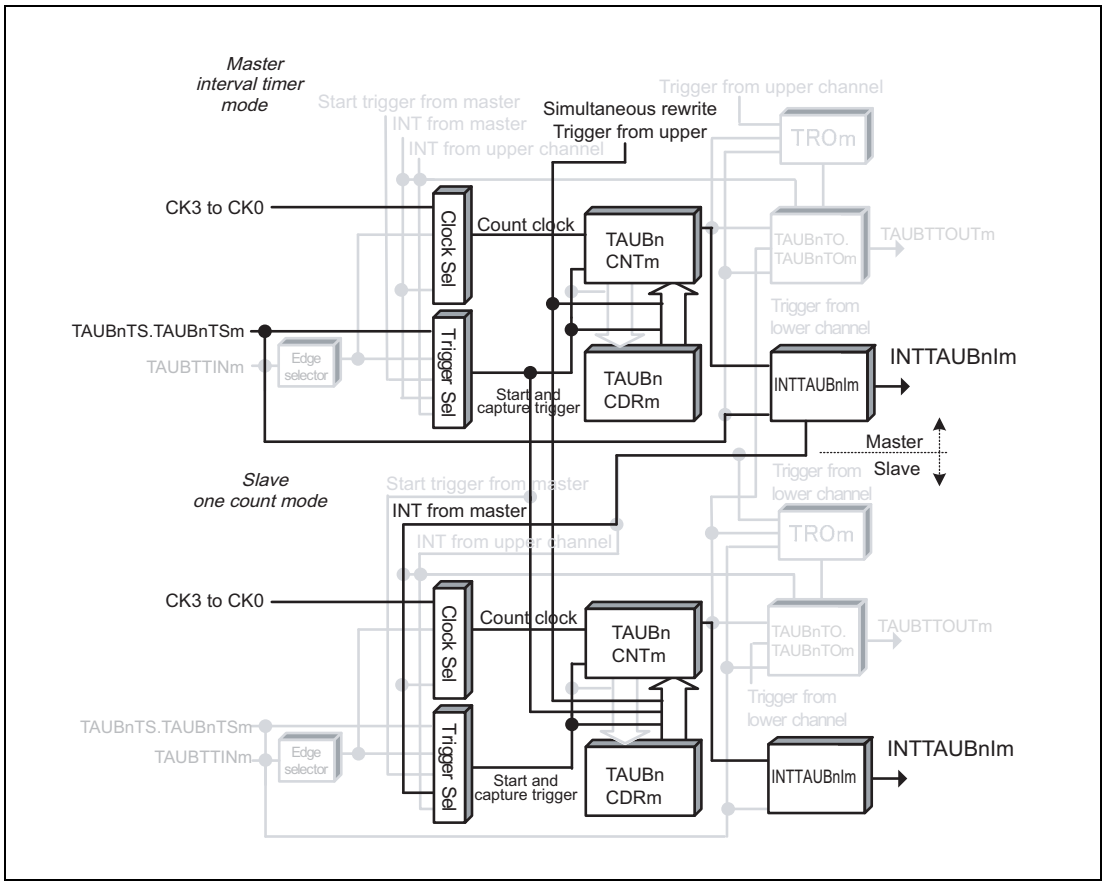

**Figure 24.96 Block Diagram for AD Conversion Trigger Output Function Type 1**

The following settings apply to the general timing diagram.

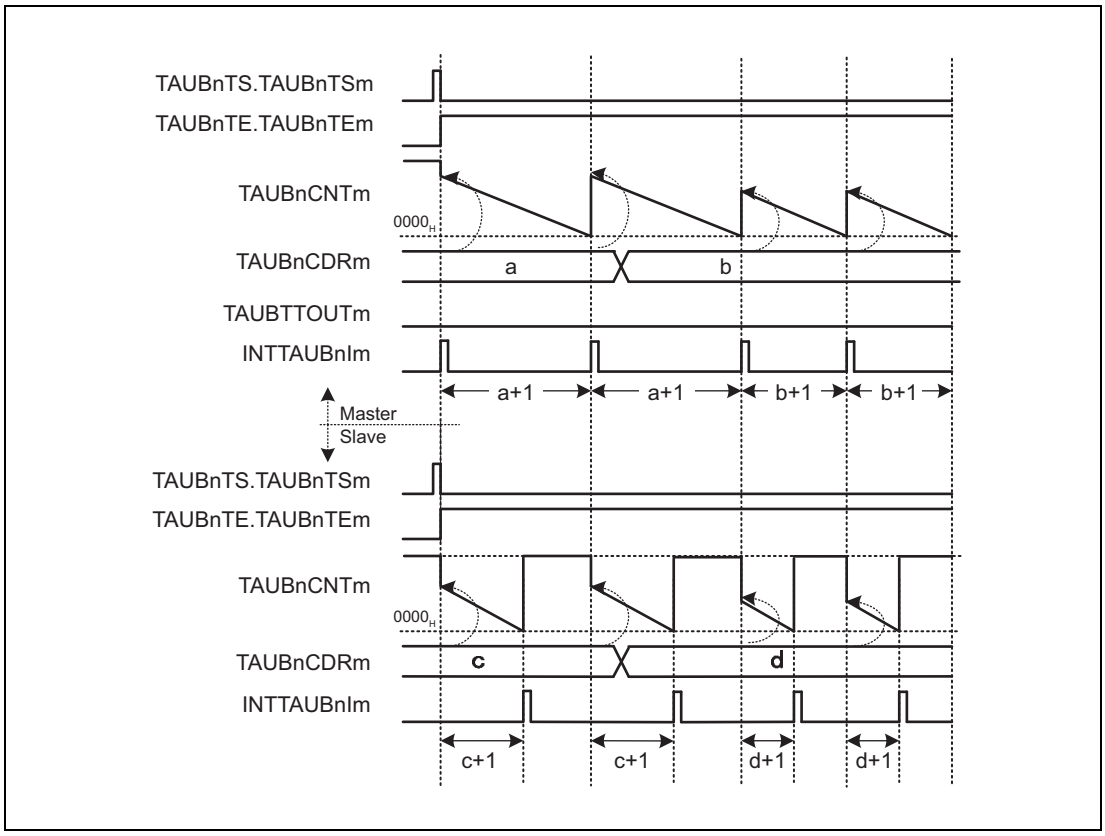

**Figure 24.97 General Timing Diagram for AD Conversion Trigger Output Function Type 1**

## 24.14.5 Triangle PWM Output Function

### 24.14.5.1 Overview

#### Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master channel generates a carrier cycle from two pulse cycles. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slaves counter.

#### Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 24.130, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function**.
- The operation mode of the slave channel(s) must be set to up down count mode, see **Table 24.134, Contents of the TAUBnCMORm Register for the Slave Channel of the Triangle PWM Output Function**.
- The channel output mode of the master channel must be set to independent channel output mode 1.
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
  - If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 0,TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0. (recommended)
  - If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 1, TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnOEm is 0.

#### Functional description

The counters are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 for every channel. This in turn sets TAUBnTE.TAUBnTEm, enabling count operation. The current values of TAUBnCDRm (master and slave) are written to TAUBnCNTm (master and slave) and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:
  When the counter of the master channel reaches $0000_H$ (pulse cycle time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then reloads the TAUBnCDRm value and counts down.

- Slave channel:
  INTTAUBnIm generated on the master channel triggers the counter of the slave channel:
  - If the slave counter currently counts down, it changes count direction.
  - If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

  When the counter of the slave channel reaches $0001_H$ while counting up or down, INTTAUBnIm is generated and the TAUBTTOUTm (slave) signal is set or reset.

  The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.

  TAUBTTOUTm can be switched between positive and negative phase setting TAUBnTOL.TAUBnTOLm during operation.

The counters can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

**Conditions**

Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

### 24.14.5.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUBnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle =

[(TAUBnCDRm (master) + 1 - TAUBnCDRm (slave))/ (TAUBnCDRm (master) + 1)] × 100

- Duty cycle = 100%
  TAUBnCDRm (slave) = $0000_H$
- Duty cycle = 0%
  TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

### 24.14.5.3 Block Diagram and General Timing Diagram

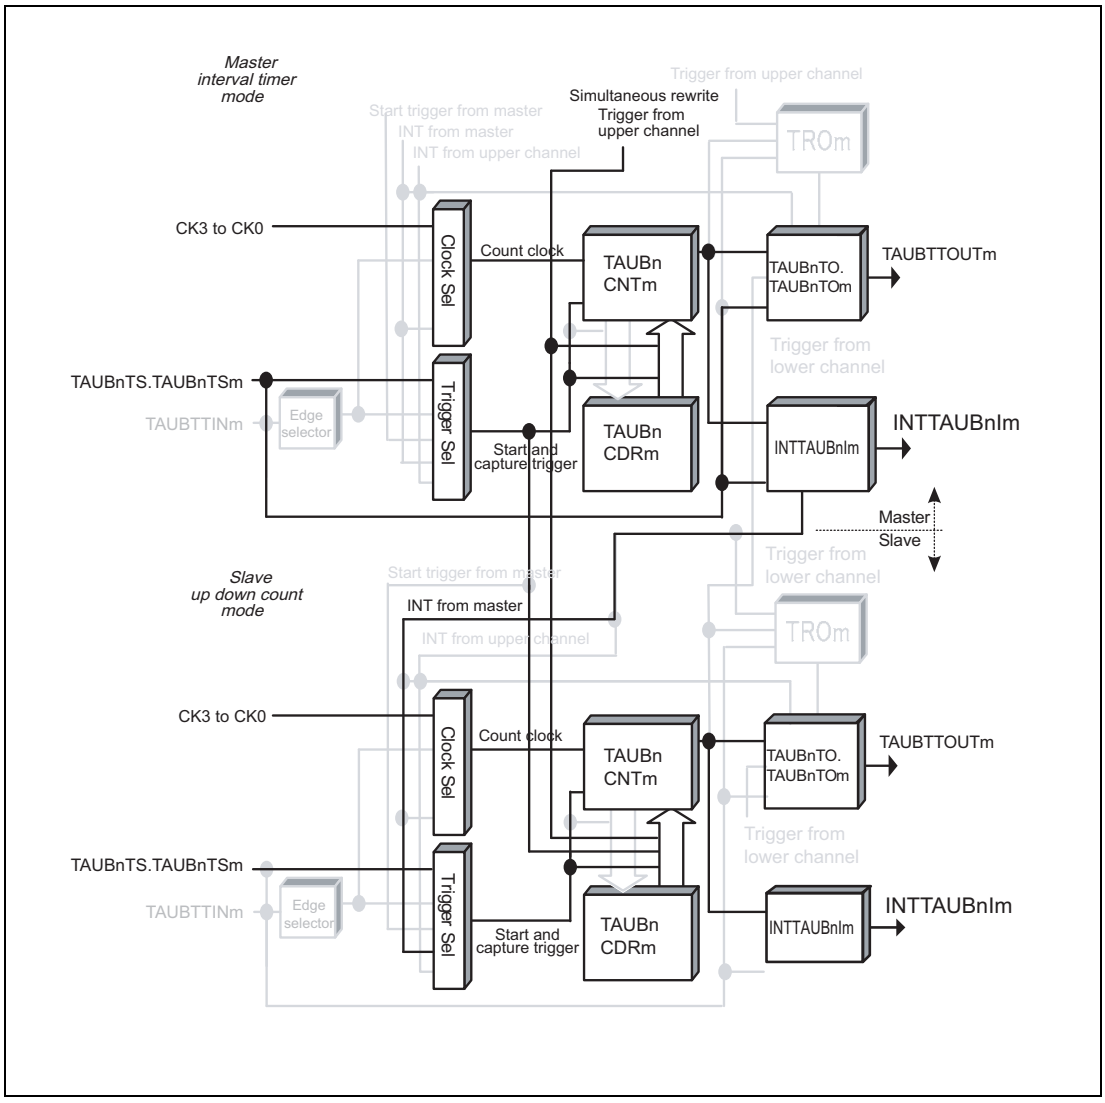

**Figure 24.98 Block Diagram for Triangle PWM Output Function**

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

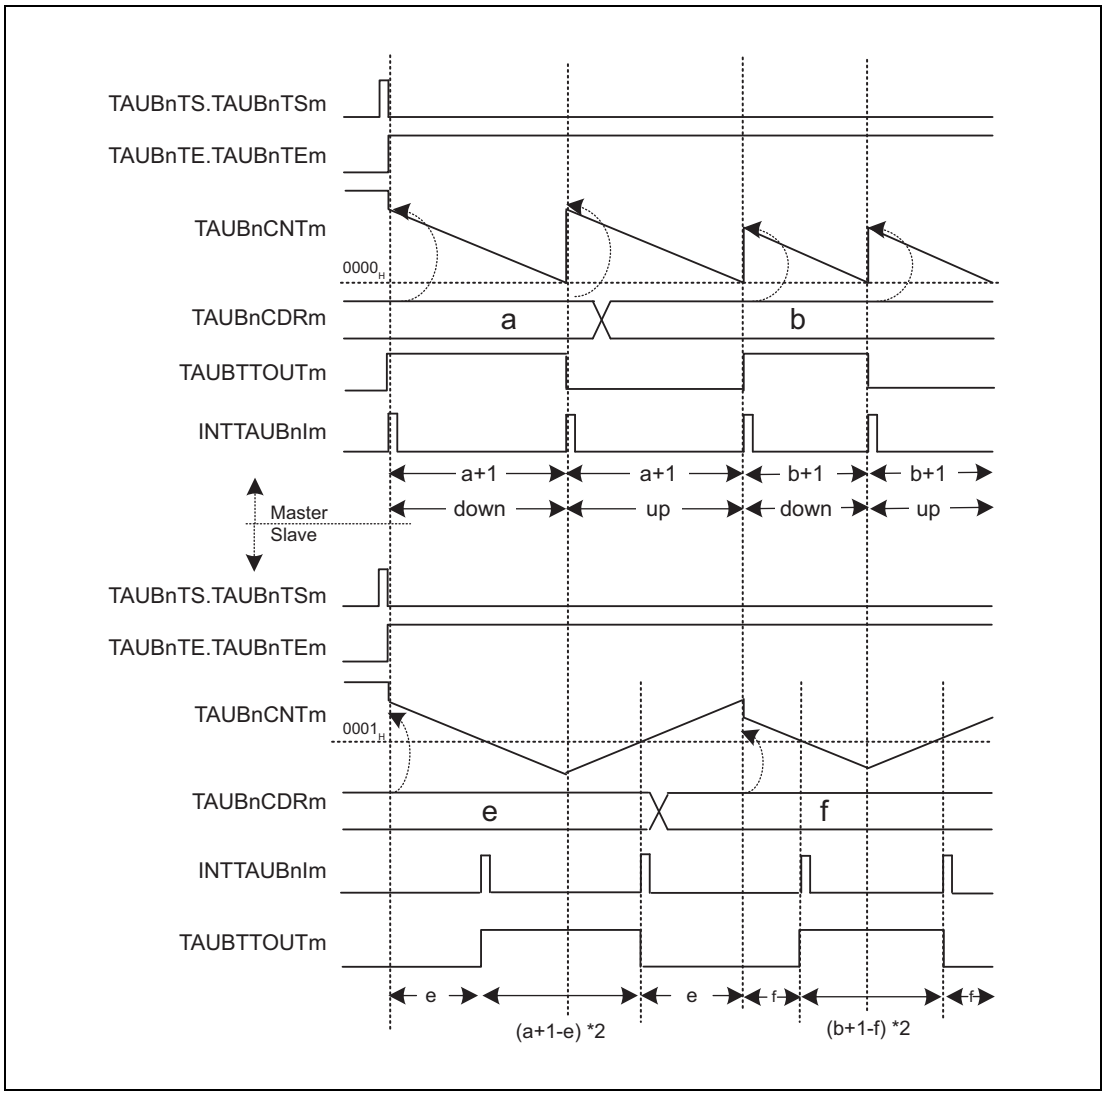

**Figure 24.99 General Timing Diagram for Triangle PWM Output Function**

### 24.14.5.4 Register Settings for the Master Channel

#### (1) TAUBnCMORm for the master channel

| TAUBnTDL.TAUBnTDLm | Write $0_B$. |

### (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.133 Simultaneous Rewrite Settings for the Master Channel of the Triangle PWM Output Function

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers.<br>1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

**NOTE**

If TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel that generates the simultaneous rewrite trigger signal.

### 24.14.5.5 Register Settings for the Slave Channel(s)

#### (1) TAUBnCMORm for the slave channel(s)

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUBnCKS [1:0] | | — | TAUBn CCS0 | TAUBn MAS | TAUBnSTS[2:0] | | | TAUBnCOS [1:0] | | — | TAUBnMD[4:1] | | | | TAUBn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 24.134 Contents of the TAUBnCMORm Register for the Slave Channel of the Triangle PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUBnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical. |
| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | TAUBnCCS0 | Write $0_B$. |
| 11 | TAUBnMAS | Write $0_B$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $111_B$. |
| 7, 6 | TAUBnCOS[1:0] | Write $00_B$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $1001_B$. |
| 0 | TAUBnMD0 | Write $0_B$. |

#### (2) TAUBnCMURm for the slave channel(s)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUBnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 24.135 Contents of the TAUBnCMURm Register for the Slave Channel of the Triangle PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

### (3) Channel output mode for the slave channel(s)

Table 24.136 Control Bit Settings for Synchronous Channel Output Mode 2

| Bit Name | Setting |
|---|---|
| TAUBnTOE.TAUBnTOEm | Write $1_B$. |
| TAUBnTOM.TAUBnTOMm | Write $1_B$. |
| TAUBnTOC.TAUBnTOCm | Write $1_B$. |
| TAUBnTOL.TAUBnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUBnTDE.TAUBnTDEm | Write $0_B$. |
| TAUBnTDL.TAUBnTDLm | Write $0_B$. |

### (4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.137 Simultaneous Rewrite Settings for the Slave Channel of the Triangle PWM Output Function

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers.<br>1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 24.14.5.6 Operating Procedure for Triangle PWM Output Function

Table 24.138 Operating Procedure for Triangle PWM Output Function

| | Operation | Status of TAUBn |
|---|---|---|
| Initial channel setting | Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.5.4, Register Settings for the Master Channel**<br><br>Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.5.5, Register Settings for the Slave Channel(s)**<br><br>Set the values of the TAUBnCDRm registers of all channels | Channel operation is stopped. |
| Start operation | Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously.<br>TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start.<br>INTTAUBnIm (master) is generated on the master channel when TAUBnCMORm.TAUBnMD0 set to 1. |
| During operation | TAUBnCDRm can be changed at any time.<br>TAUBnTOL.TAUBnTOLm can be changed.<br>TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time.<br><br>TAUBnRDT.TAUBnRDTm can be changed during operation. | TAUBnCNTm of the master and slave channels loads TAUBnCDRm and counts down. When the counter of the master channel reaches $0000_H$:<br>• INTTAUBnIm (master) is generated<br>• TAUBTTOUTm (master) toggles<br>• TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation.<br>• TAUBnCNTm (slave) reloads the TAUBnCDRm value or counts in the reverse direction.<br>When TAUBnCNTm of the slave = $0001_H$:<br>• INTTAUBnIm (slave) is generated<br>• TAUBTTOUTm (slave) is set (in count-down status) or reset (in count-up status) |
| Stop operation | Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm and TAUBTTOUTm stop and retain their current values. |

Restart operation

### 24.14.5.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnCDRm = a = $5_H$
- Slave channel:
  - TAUBnCDRm = $6_H$

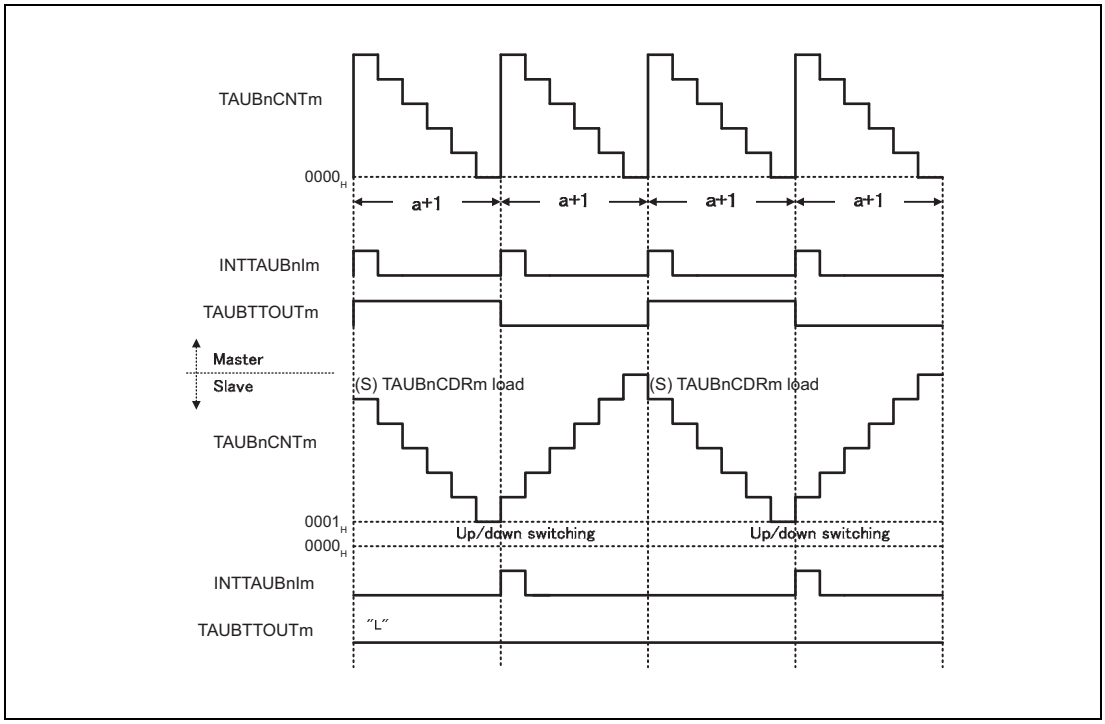

**Figure 24.100 TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1**

- If TAUBnCDRm (slave) ≥ TAUBnCDRm (master) +1, INTTAUBnIm of slave channel is not generated during counting down. The set signal is never detected, so TAUBTTOUTm remains at low state.

### (2) Duty cycle = 100%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnCDRm = a = $5_H$
- Slave channel:
  - TAUBnCDRm = $0_B$

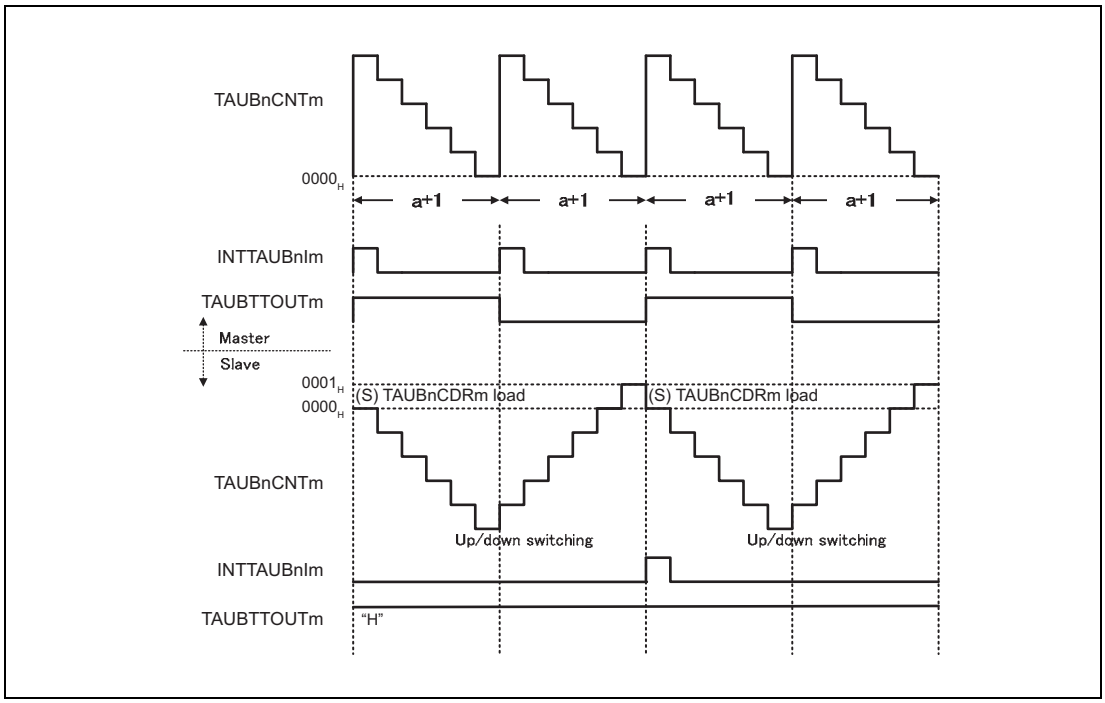

**Figure 24.101 TAUBnCDRm (slave) = $0000_H$**

- If TAUBnCDRm (slave) = $0000_H$, INTTAUBnIm of slave channel is not generated during counting up. The reset signal is never detected, so TAUBTTOUTm remains at high state.

## 24.14.6 Triangle PWM Output Function with Dead Time

### 24.14.6.1 Overview

#### Summary

This function generates multiple triangle PWM outputs with a defined dead time by using a master and two or more slave channels. The resulting PWM signals with the dead time are output via TAUBTTOUTm of the slave channels 2 and 3. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master generates a carrier cycle. The first pulse controls the down status and the second pulse controls the up status of the slaves counter.

An interrupt on slave 2 causes TAUBTTOUTm of the slave channels to be set or reset.
Depending on the settings of TAUBnTDL.TAUBnTDLm, delay time is added to positive or negative logic side of the signal (i.e. whether TAUBTTOUTm is set or reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

#### Prerequisites

- Three channels. Select an even channel CH (a) and an odd channel CH (a + 1) for slave channel 2 and 3 respectively.
- The operation mode of the master channel must be set to interval timer mode, see **Table 24.140, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time**
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even-numbered channel (a), and slave channel 3 is an odd-numbered channel (a + 1). Slave channel 1 can be used as a separate timer (independent function).
- The operation mode of slave channel 2 must be set to up down mode, see **Table 24.144, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time**
  Furthermore, slave channel 2 must be an even channel
- The operation mode of slave channel 3 must be set to one-count mode, see **Table 24.148, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time**
  Furthermore, slave channel 3 must be an odd channel
- The channel output mode of the master channel must be set to independent channel output mode 1
- The channel output mode of the slave channels 2 and 3 must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
  - If the TAUBnCMORm.MD0 (master) bit is set to 0,TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0. (recommended)
  - If the TAUBnCMORm.MD0 (master) bit is set to 1, TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnTOEm is 0.

**NOTE**

Slave channel 1 is not used for Triangle PWM Output Function with Dead Time. Slave channel 1 can be used as a separate timer (independent function).

### Functional description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current values of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:
  When the counter of the master channel reaches $0000_H$, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. The counter reloads the TAUBnCDRm value and counts down.
- Slave channel 2:
  INTTAUBnIm generated on the master channel triggers the counter of the slave channel 2:
  - If the slave counter currently counts down, it changes count direction.
  - If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

  The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.
  When the counter value of slave channel 2 reaches $0001_H$, INTTAUBnIm is generated.
- Slave channel 3:
  INTTAUBnIm of slave channel 2 triggers the counter of slave channel 3. The current value of TAUBnCDRm (slave 3) is written to TAUBnCNTm (slave 3) and the counter starts to count down from this TAUBnCDRm value.
  When the counter reaches $0000_H$, INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of slave channel 2.

The TAUBnTDL.TAUBnTDLm settings of the corresponding channel specify whether it is set/reset immediately, or after dead time has elapsed, as shown in **Table 24.139, Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2**.

The TAUBnTOL.TOLm settings specify whether set corresponds to a high signal (TAUBnTOL.TAUBnTOLm = 0) or a low signal (TAUBnTOL.TAUBnTOLm = 1).

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

TAUBnCDRm value of slave channel 2 can be set to $0000_H$ to output 100% TAUBTTOUTm.

**NOTE**

If a forced restart is executed during operation, TAUBTTOUTm is not output as a triangle PWM signal.

**Conditions**

Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

TAUBnTOL.TAUBnTOLm and TAUBnTDL.TAUBnTDLm bits should be set before the counter starts, and slave channels 2 and 3 should have opposite TAUBnTOL.TAUBnTOLm settings or opposite TAUBnTDL.TAUBnTDLm settings.

**Table 24.139 Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2**

| TAUBnTDL.TAUBnTDLm | Count Direction of Slave Channel 2 when Interrupt is Generated | TAUBTTOUTm Set/Reset Timing |
|---|---|---|
| 0 | Down | Set after dead time has elapsed |
| | Up | Reset immediately |
| 1 | Down | Set immediately |
| | Up | Reset after dead time has elapsed |

### 24.14.6.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUBnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (positive phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 – (TAUBnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (negative phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 + (TAUBnCDRm (slave 3) + 1)] × count clock cycle

### 24.14.6.3 Block Diagram and General Timing Diagram

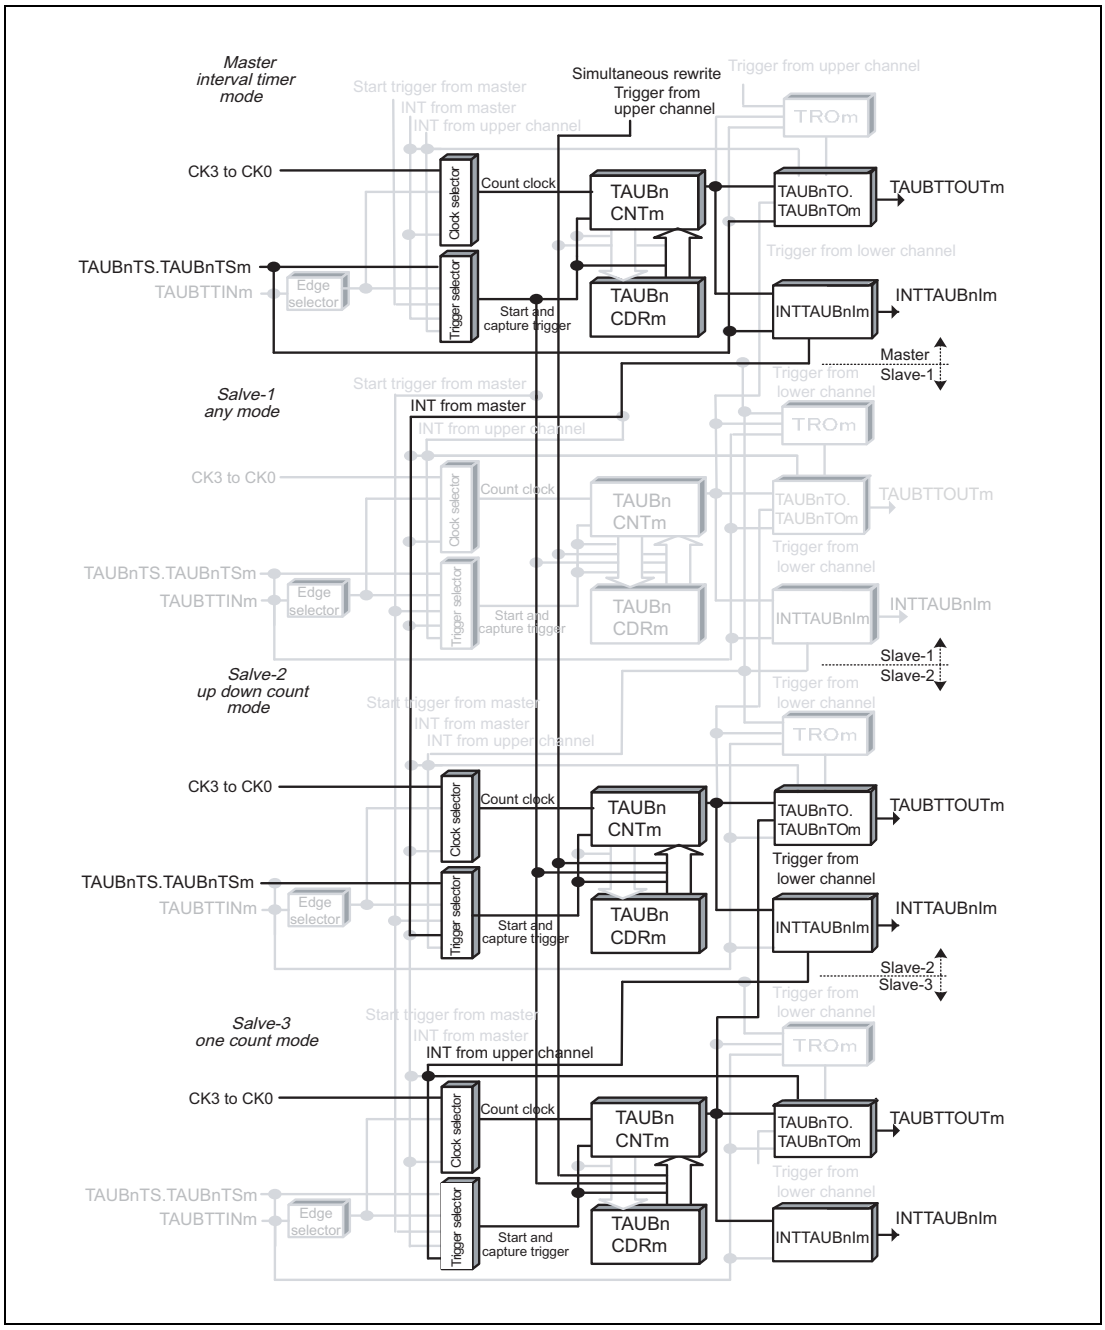

Figure 24.102 Block Diagram for Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Slave channel 2:
  - INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
  - TAUBnTDL.TAUBnTDLm = 0
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Enables start trigger detection during counting (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnTDL.TAUBnTDLm = 1
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)

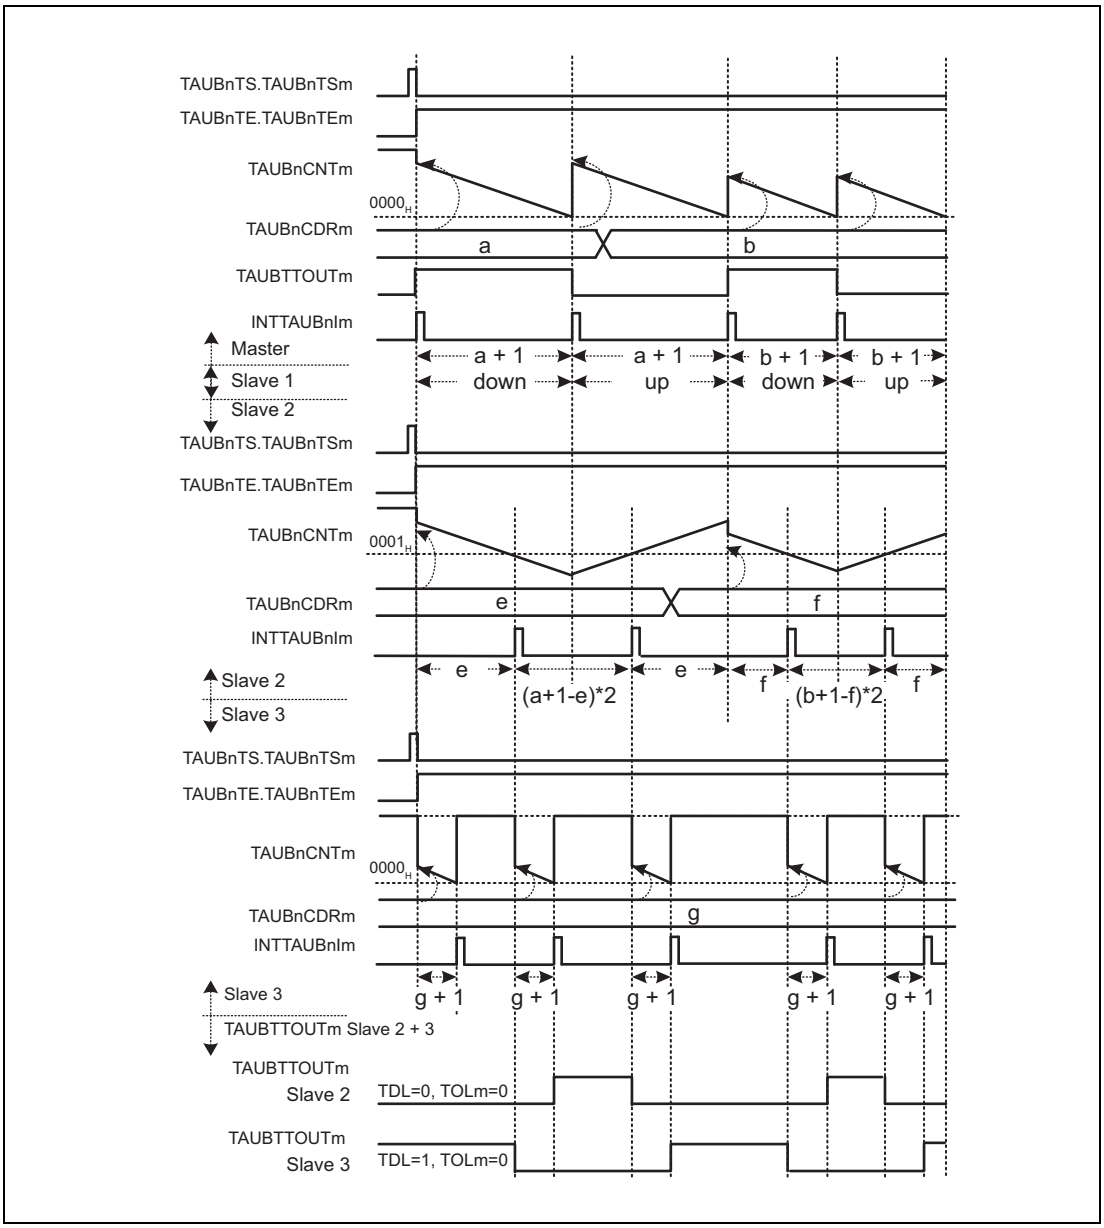

**Figure 24.103 General Timing Diagram for Triangle PWM Output Function with Dead Time**

### 24.14.6.4 Register Settings for the Master Channel

#### (1) TAUBnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 7, 6 | TAUBnCOS[1:0] | Write $00_B$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0100_B$. |
| 0 | TAUBnMD0 | Write $1_B$. |

#### (2) TAUBnCMURm for slave channel 3

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUBnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 24.149 Contents of the TAUBnCMURm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

### (3) Channel output mode for slave channel 3

Table 24.150 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

| Bit Name | Setting |
|---|---|
| TAUBnTOE.TAUBnTOEm | Write $1_B$. |
| TAUBnTOM.TAUBnTOMm | Write $1_B$. |
| TAUBnTOC.TAUBnTOCm | Write $1_B$. |
| TAUBnTOL.TAUBnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUBnTDE.TAUBnTDEm | Write $1_B$. |
| TAUBnTDL.TAUBnTDLm | 0: Dead time is added to the positive phase<br>1: Dead time is added to the negative phase |

**CAUTION**

Set TAUBnTDL.TAUBnTDLm exclusively to the even channel.

### (4) Simultaneous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.151 Simultaneous Rewrite Settings for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
|---|---|
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers.<br>1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 24.14.6.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 24.152 Operating Procedure for Triangle PWM Output with Dead Time

| | Operation | Status of TAUBn |
|---|---|---|
| Initial channel setting | Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.6.4, Register Settings for the Master Channel**<br><br>Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.6.5, Register Settings for Slave Channel 2**<br><br>Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.6.6, Register Settings for Slave Channel 3**<br><br>Set the values of the TAUBnCDRm registers of all channels | Channel operation is stopped. |
| Start operation | Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously.<br>TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start.<br>INTTAUBnIm (master) is generated when TAUBnCMORm.TAUBnMD0 is set to 1 on the master channel. |
| During operation | TAUBnCDRm can be changed at any time.<br><br>TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time.<br><br>TAUBnRDT.TAUBnRDTm can be changed during operation. | TAUBnCNTm of the master channel and slave channel 2 load TAUBnCDRm and count down.<br>When the counter of the master channel reaches $0000_H$:<br>• INTTAUBnIm (master) is generated<br>• TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation<br>• TAUBnCNTm (slave 2) reloads the TAUBnCDRm value or counts in the reverse direction<br>When TAUBnCNTm (slave 2) reaches $0001_H$:<br>• INTTAUBnIm (slave 2) is generated<br>• TAUBnCNTm of slave channel 3 loads the TAUBnCDRm value and counts down<br>When TAUBnCNTm of slave channel 3 = $0000_H$:<br>• INTTAUBnIm is generated |
| Stop operation | Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously.<br>TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.<br>TAUBnCNTm and TAUBTTOUTm stop and retain their current values. |

Restart operation

### 24.14.6.8 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

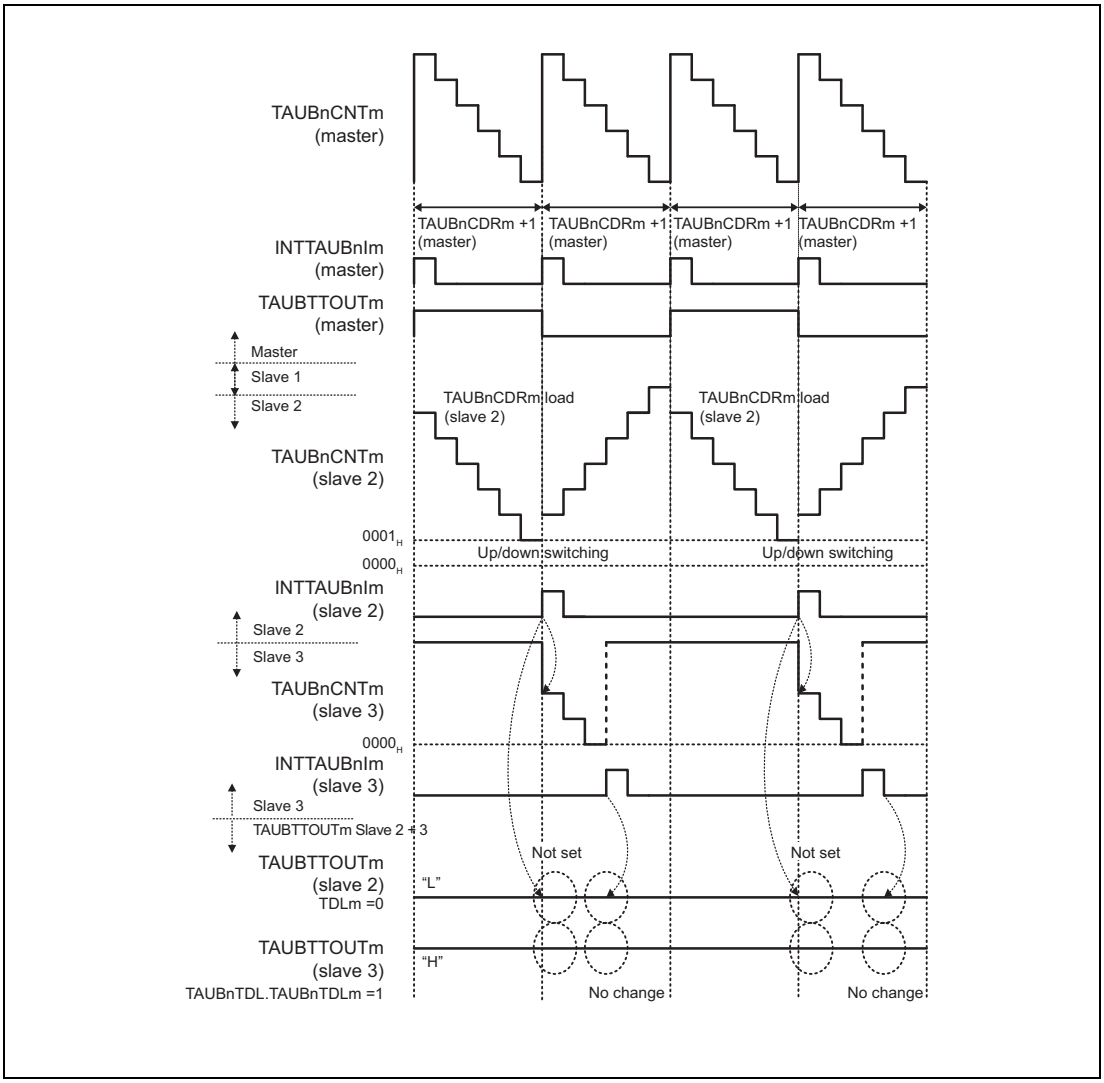

**Figure 24.104 TAUBnCDRm (slave 2) ≥ TAUBnCDRm (master) + 1**

- If TAUBnCDRm (slave 2) ≥ TAUBnCDRm (master), the counter of slave channel cannot reach $0000_H$ during counting down. Therefore TAUBTTOUTm cannot toggle, i.e. it remains at its initial state. The interrupt from slave channel 2 occurs during count up, therefore it is a reset signal.

### (2) Duty cycle = 100%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

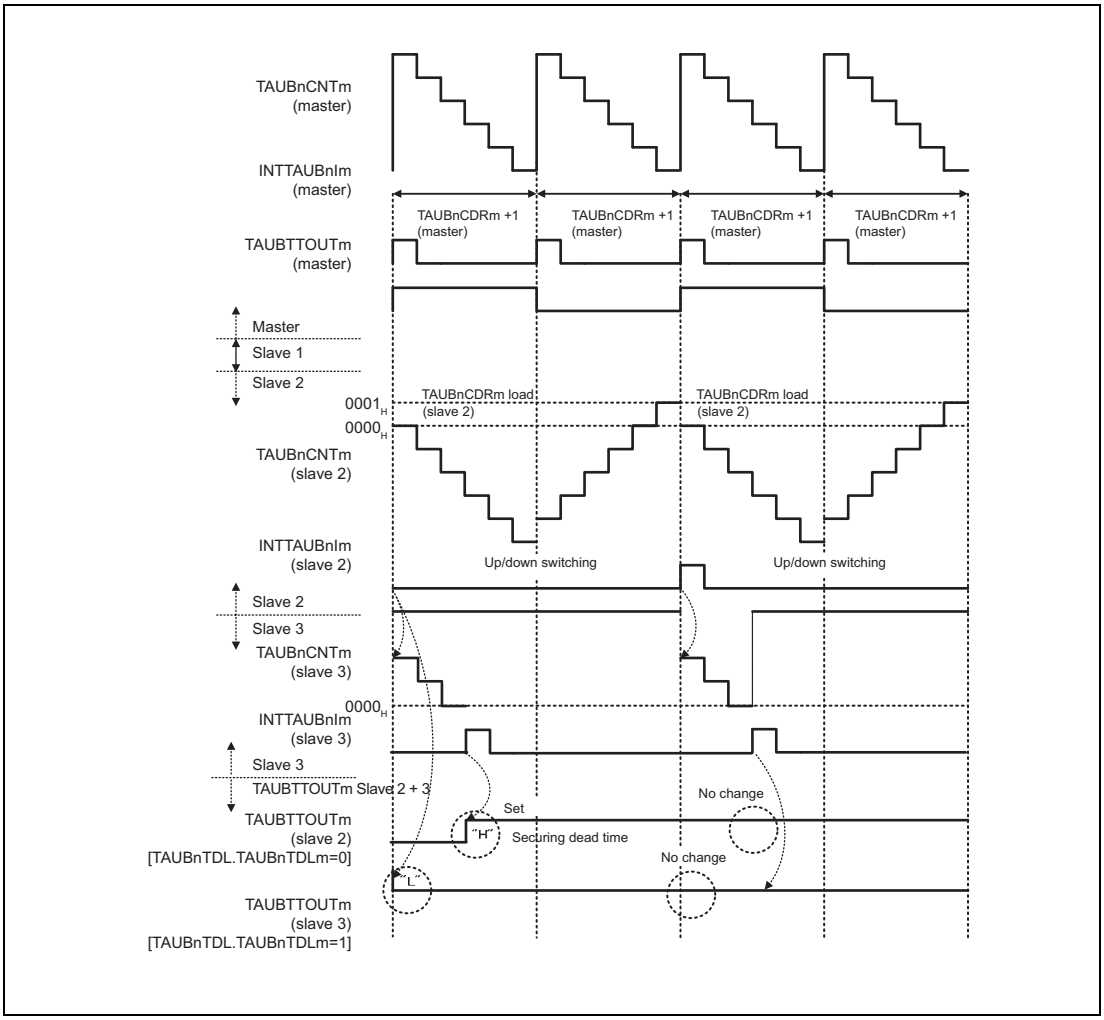

**Figure 24.105 TAUBnCDRm (slave 2) = $0000_H$**

- If TAUBnCDRm (slave 2) = $0000_H$ the counter of slave channel cannot reach $0001_H$ while counting up and therefore cannot generate an INTTAUBnIm while counting up.
  - The set conditions for a channel in which TAUBnTDL.TAUBnTDLm = 0 are met after dead time has elapsed. TAUBTTOUTm toggles but remains in the new state because the reset conditions are never satisfied for such a channel.
  - Slave channel 3 in the above diagram is set when the counter starts.
    However, the reset conditions for a channel in which TAUBnTDL.TAUBnTDLm = 1 are never satisfied so TAUBTTOUTm remains in its initial state for such a slave channel.

### (3) TAUBTTOUTm (slave 2) = 0% and TAUBTTOUTm (slave 3) ≥ 0%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

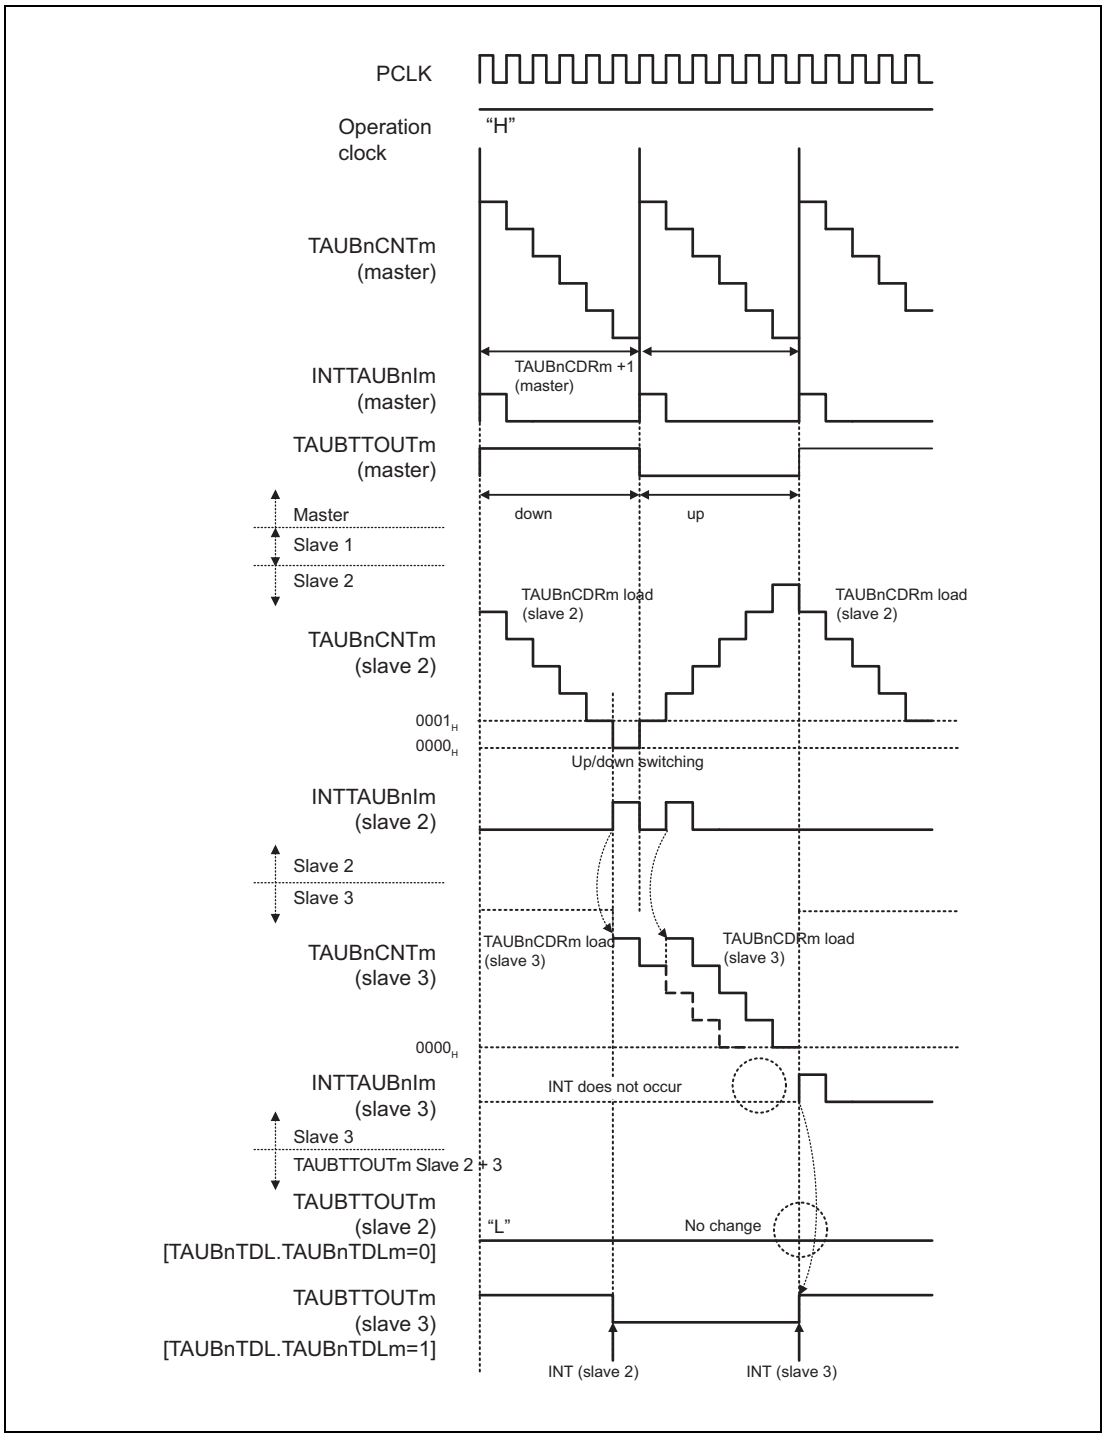

**Figure 24.106 TAUBnCDRm (master) = $0005_H$, TAUBnCDRm (slave 2) = $0005_H$ TAUBnCDRm (slave 3) = $0004_H$**

- When the counter of slave channel 2 reaches $0000_H$ after detecting that the counter reached $0001_H$, INTTAUBnIm (slave 2) is generated. The counter of slave channel 3 starts to count down.
- If another INTTAUBnIm (slave 2) is generated while the counter of slave channel 3 is still counting down, the value of TAUBnCDRm (slave 3) is reloaded and the counter restarts counting down from this value.
- In the diagram above, the first interrupt on channel 2 occurs while the counter is counting down, and the second while it is counting up.
- After the first interrupt, a slave for which TAUBnTDL.TAUBnTDLm = 0 waits for dead time to elapse before setting. However, if another interrupt occurs on slave 2, before the dead time has elapsed, the counter is counting up, so the signal acts as a reset signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 0 always remains inactive.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 is set and reset as normal when the corresponding INTTAUBnIm is generated.

### (4) TAUBTTOUTm (slave 2) > 0% and TAUBTTOUTm (slave 3) = 100%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

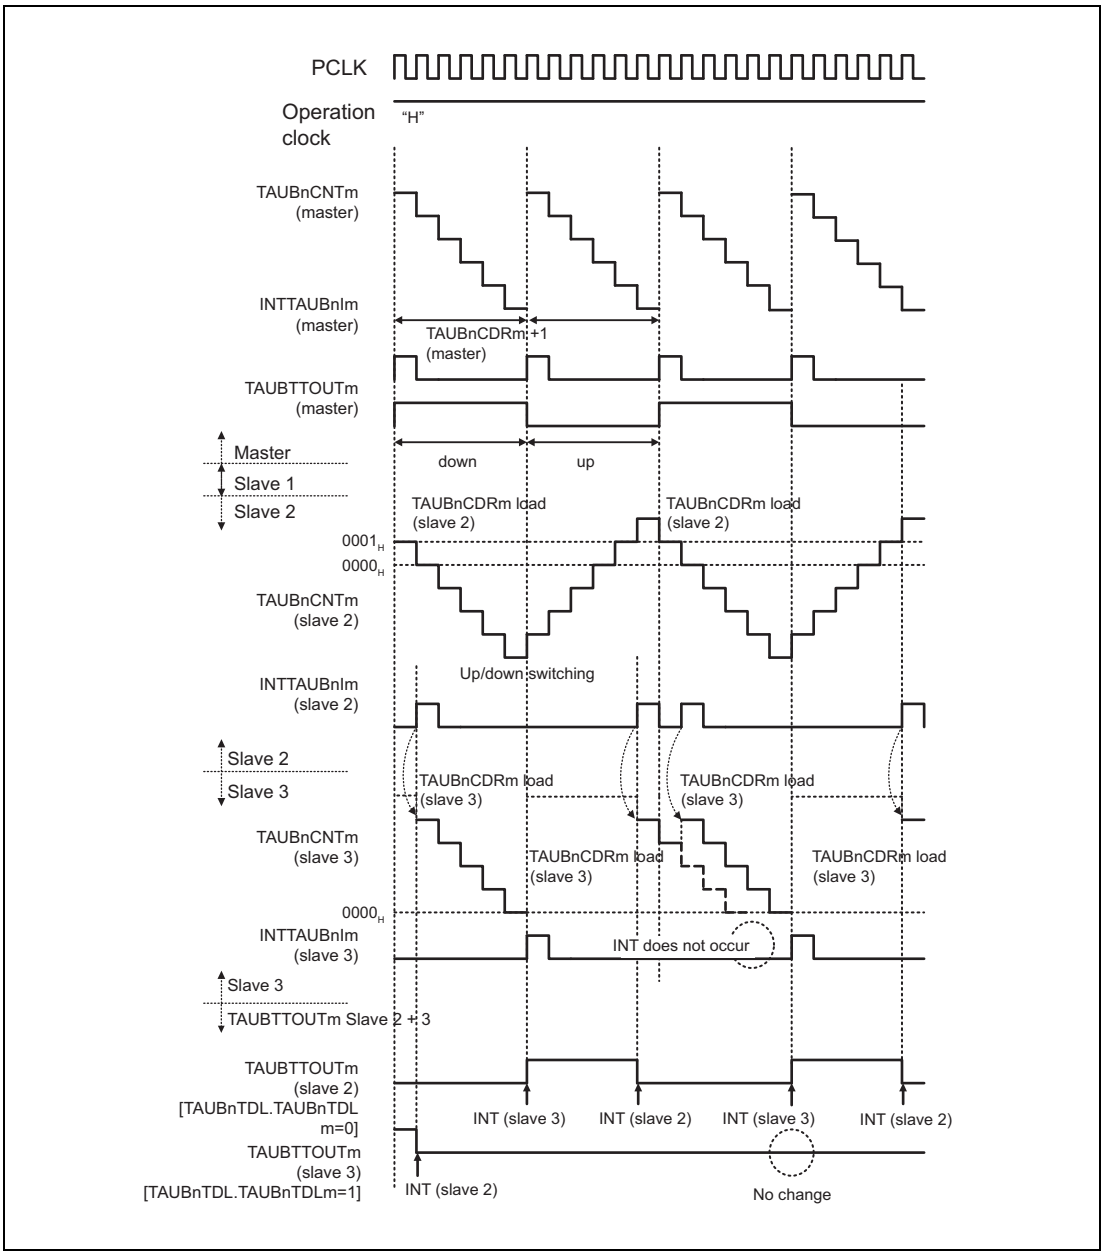

**Figure 24.107 TAUBnCDRm (master) = $0005_H$, TAUBnCDRm (slave 2) = $0001_H$ TAUBnCDRm (slave 3) = $0004_H$ PWM Signal Width (negative phase) ≥ Carrier Cycle**

- After the second interrupt on slave channel 2, a slave for which TAUBnTDL.TAUBnTDLm = 1 is reset after the dead time has elapsed. However if another interrupt occurs on slave 2 before the dead time has elapsed, slave channel 3 is restarted, and then if an interrupt on slave channel 3 is generated, the counter is counting up, so the signal acts as a setting signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 1 always remains active.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 0 is set and reset as normal when the corresponding INTTAUBnIm is generated.

#### (5) Inhibited INTTAUBnIm to set TAUBTTOUTm positive phase period

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

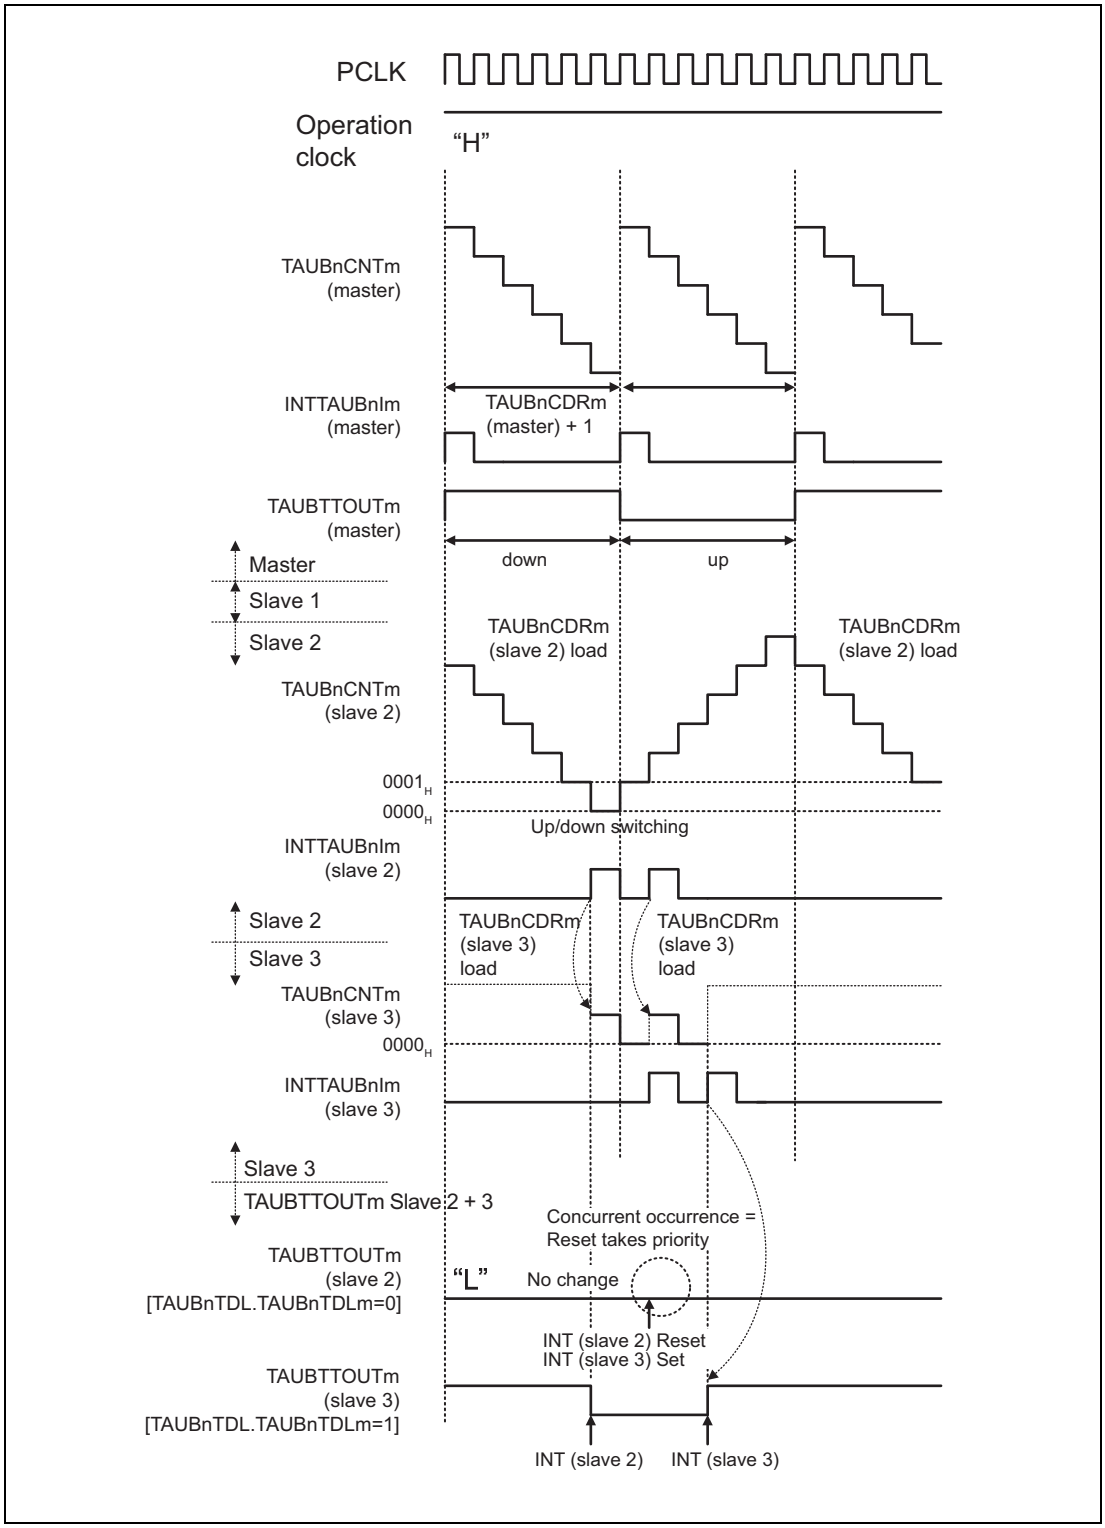

**Figure 24.108 TAUBnCDRm (master) = $0005_H$, TAUBnCDRm (slave 2) = $0005_H$, TAUBnCDRm (slave 3) = $0001_H$ PWM Signal Width (positive phase) = 0**

- The counter of slave channel 3 reaches $0000_H$ and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 0 (slave channel 2 in this example).
- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, this reset signal is given priority if TAUBnTOL.TAUBnTOLm = 0 (if TAUBnTOL.TAUBnTOLm = 1, the set signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 0 remains in the value after reset.

### (6) Inhibited INTTAUBnIm to set TAUBTTOUTm negative phase period

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

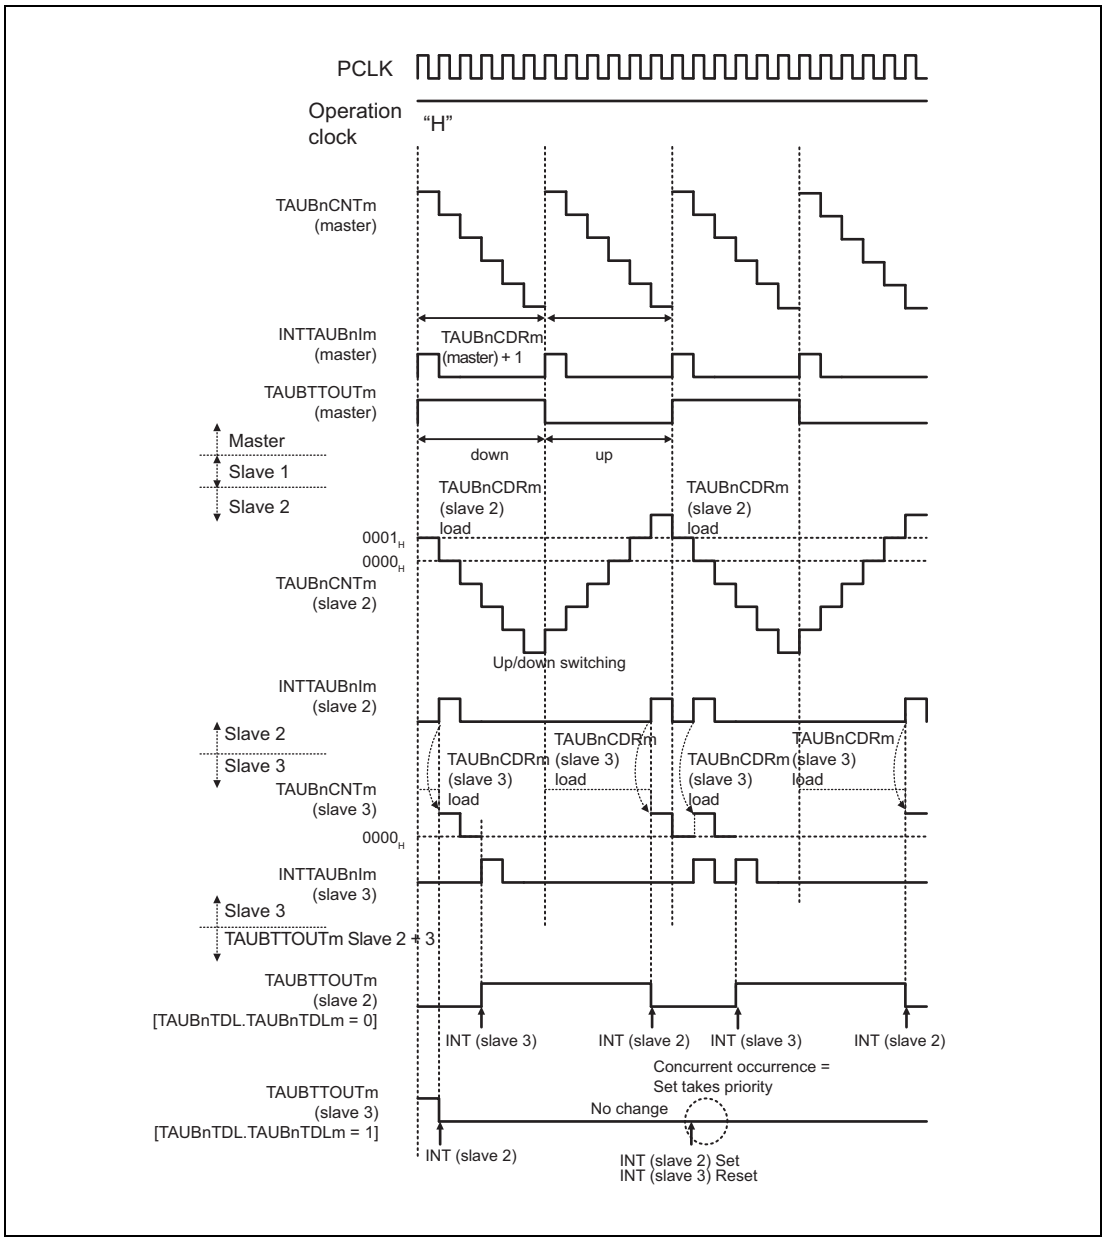

**Figure 24.109 TAUBnCDRm (master) = $0005_H$, TAUBnCDRm (slave 2) = $0001_H$, TAUBnCDRm (slave 3) = $0001_H$ PWM Signal Width (negative phase) = Carrier Cycle**

- The counter of slave channel 3 reaches $0000_H$ and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 1 (slave 3 in this example).

- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, the set signal is given priority if TAUBnTOL.TAUBnTOLm = 1 (if TAUBnTOL.TAUBnTOLm = 0, the reset signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 remains in the value after reset.

### (7) Slave 2 TAUBnCDRm = $0000_H$ (Duty cycle = 100%)

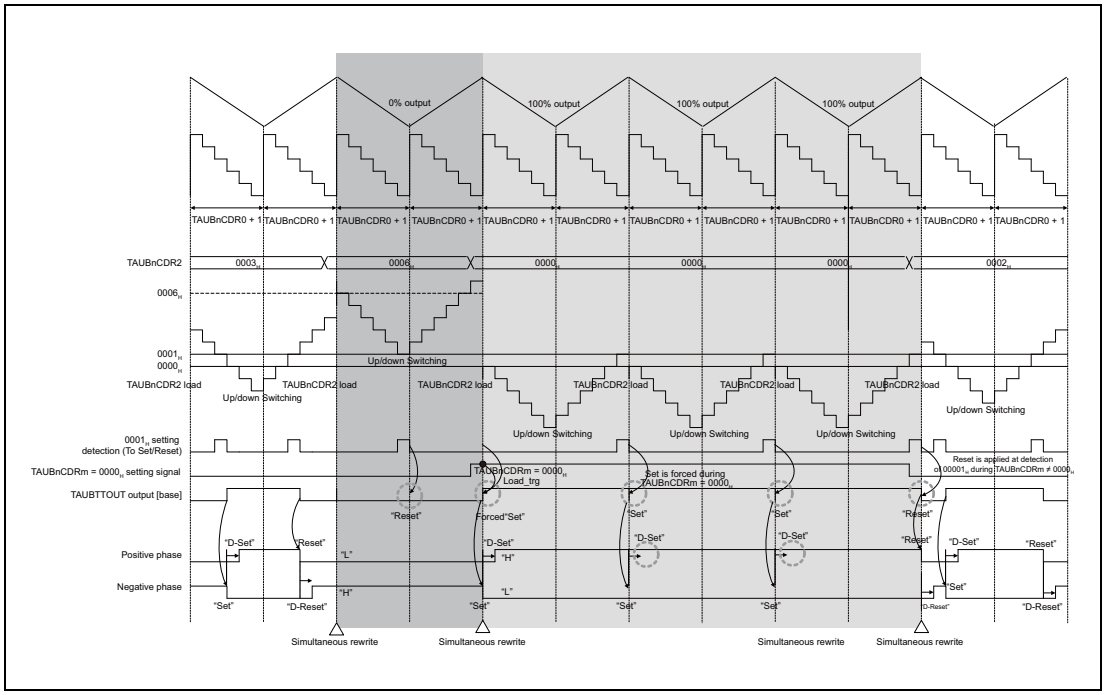

**Figure 24.110 Slave 2 TAUBnCDRm = $0000_H$ (Duty cycle = 100%)**

When rewriting (slave channel 2) TAUBnCDRm ≠ $0000_H$ to (slave channel 2) TAUBnCDRm = $0000_H$ (100% output), set the negative phase side at the start of the carrier cycle, and set the positive phase side after dead time is secured.

When rewriting (slave channel 2) TAUBnCDRm = $0000_H$ (100% output) to (slave channel 2) TAUBnCDRm ≠ $0000_H$, reset the positive phase side at the end of the carrier cycle, and reset the negative phase side after dead time is secured.

## 24.14.7 A/D Conversion Trigger Output Function Type 2

### 24.14.7.1 Overview

#### Summary

This function is identical to **Section 24.14.5, Triangle PWM Output Function**, except that TAUBTTOUTm is not output.

This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

### 24.14.7.2 Block Diagram and General Timing Diagram

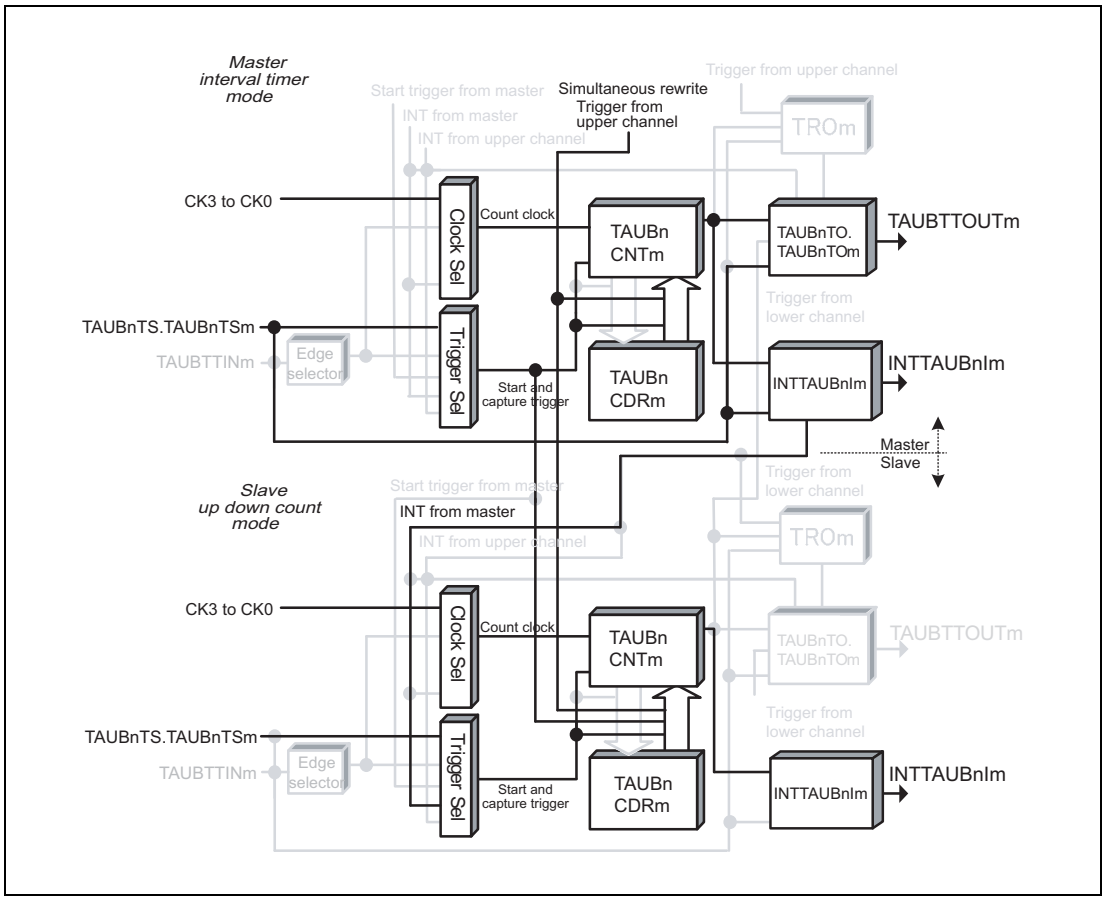

**Figure 24.111 Block Diagram for A/D Conversion Trigger Output Function Type 2**

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

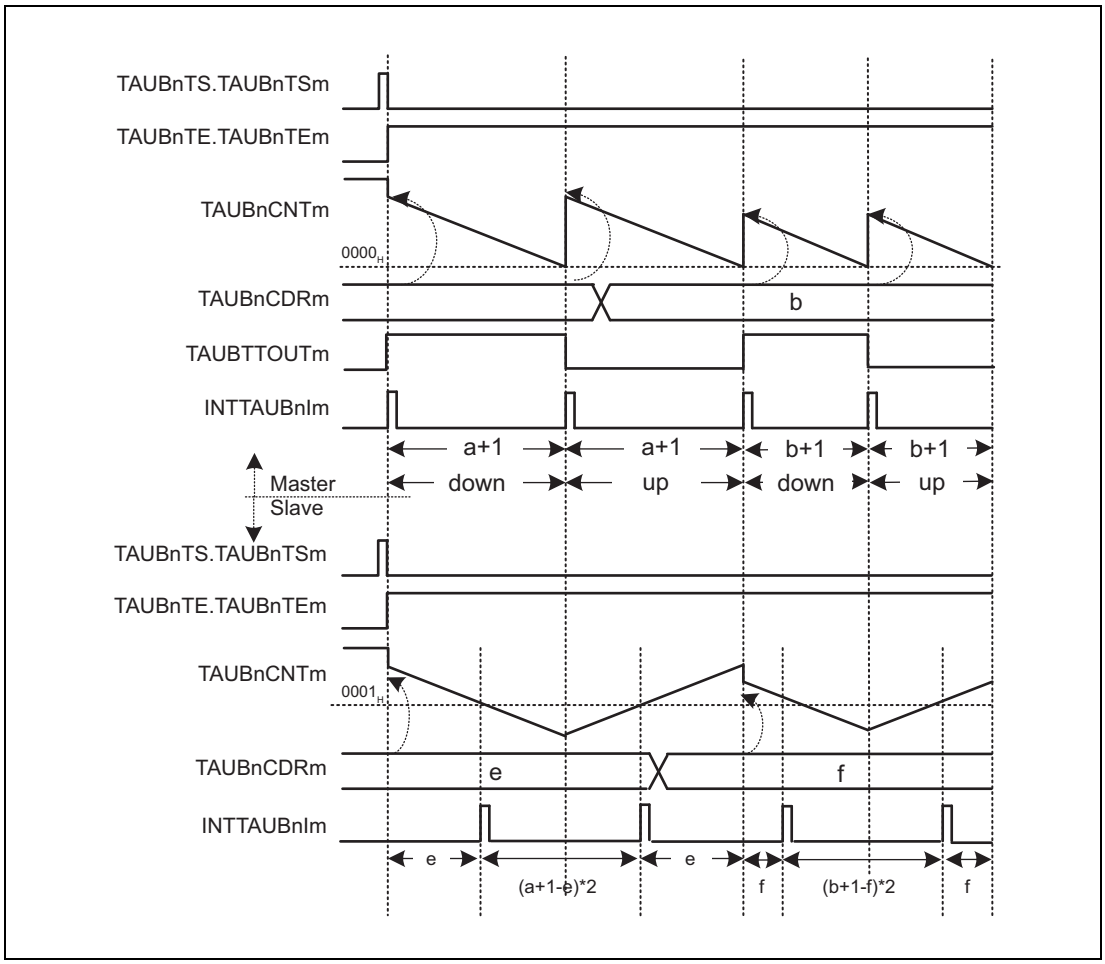

**Figure 24.112 General Timing Diagram for A/D Conversion Trigger Output Function Type 2**

# Section 25 Timer Array Unit D (TAUD)

This section contains a generic description of the timer array unit D (TAUD).

The first part in this section describes the RH850/F1K specific features, such as the number of units and the register base addresses. The remainder of the section describes the functions and registers of the TAUD.

## 25.1 Features of RH850/F1K TAUD

### 25.1.1 Number of Units and Channels

This microcontroller has the following number of TAUD units.

**Table 25.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | | |
| Name | TAUDn (n = 0) | | |

TAUDn has the following number of channels of timers.

**Table 25.2 TAUDn Unit Configurations and Channels**

| Unit Name (Channel Name) TAUDn | Channels per Unit | RH850/F1K 100 pins (16 ch) | RH850/F1K 144 pins (16 ch) | RH850/F1K 176 pins (16 ch) |
|---|---|---|---|---|
| TAUD0 | 16 | √ | √ | √ |

**Table 25.3 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual TAUD units are identified by the index “n”; for example, TAUDnTOM is the TAUDn channel output mode register. |
| m | The TAUD has 16 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 15), thus a certain channel is denoted as CHm.<br>The even numbered channels (m = 0, 2, 4, 6, 8, 10, 12, 14) are denoted as CHm_even.<br>The odd numbered channels (m = 1, 3, 5, 7, 9, 11, 13, 15) are denoted as CHm_odd. |

### 25.1.2 Register Base Address

TAUDn base addresses are listed in the following table.

TAUDn register addresses are given as offsets from the base addresses.

**Table 25.4 Register Base Address**

| Base Address Name | Base Address |
|---|---|
| <TAUD0_base> | FFE2 $0000_H$ |

### 25.1.3 Clock Supply

The TAUDn clock supply is shown in the following table.

**Table 25.5 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| TAUDn | PCLK | CKSCLK_IPERI1 | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_IPERI1 | |

### 25.1.4 Interrupt Requests

TAUDn interrupt requests are listed in the following table.

**Table 25.6 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **TAUD0** | | | |
| INTTAUD0I0 | Channel 0 interrupt | 8, 132 | 0 |
| INTTAUD0I1 | Channel 1 interrupt | 48 | 15 |
| INTTAUD0I2 | Channel 2 interrupt | 9, 158 | 64 |
| INTTAUD0I3 | Channel 3 interrupt | 49 | 76 |
| INTTAUD0I4 | Channel 4 interrupt | 10, 133 | 1 |
| INTTAUD0I5 | Channel 5 interrupt | 50 | 16 |
| INTTAUD0I6 | Channel 6 interrupt | 11, 134 | 65 |
| INTTAUD0I7 | Channel 7 interrupt | 51 | 77 |
| INTTAUD0I8 | Channel 8 interrupt | 12, 135 | 2 |
| INTTAUD0I9 | Channel 9 interrupt | 52 | 17 |
| INTTAUD0I10 | Channel 10 interrupt | 13, 159 | 66 |
| INTTAUD0I11 | Channel 11 interrupt | 53 | 78 |
| INTTAUD0I12 | Channel 12 interrupt | 14, 160 | 3 |
| INTTAUD0I13 | Channel 13 interrupt | 54 | 18 |
| INTTAUD0I14 | Channel 14 interrupt | 15, 161 | 67 |
| INTTAUD0I15 | Channel 15 interrupt | 55 | 79 |

### 25.1.5 Reset Sources

TAUDn reset sources are listed in the following table. TAUDn is initialized by these reset sources.

**Table 25.7 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| TAUDn | All reset sources (ISORES) |

### 25.1.6 External Input/Output Signals

External input/output signals of TAUDn are listed below. .

**Table 25.8 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **TAUD0** | | |
| TAUDTTIN0 | Channel 0 input*1 | TAUD0I0 |
| TAUDTTIN1 | Channel 1 input*1 | TAUD0I1 |
| TAUDTTIN2 | Channel 2 input*1 | TAUD0I2 |
| TAUDTTIN3 | Channel 3 input*1 | TAUD0I3 |
| TAUDTTIN4 | Channel 4 input*1 | TAUD0I4 |
| TAUDTTIN5 | Channel 5 input*1 | TAUD0I5 |
| TAUDTTIN6 | Channel 6 input*1 | TAUD0I6 |
| TAUDTTIN7 | Channel 7 input*1 | TAUD0I7 |
| TAUDTTIN8 | Channel 8 input*1 | TAUD0I8 |
| TAUDTTIN9 | Channel 9 input*1 | TAUD0I9 |
| TAUDTTIN10 | Channel 10 input*1 | TAUD0I10 |
| TAUDTTIN11 | Channel 11 input*1 | TAUD0I11 |
| TAUDTTIN12 | Channel 12 input*1 | TAUD0I12 |
| TAUDTTIN13 | Channel 13 input*1 | TAUD0I13 |
| TAUDTTIN14 | Channel 14 input*1 | TAUD0I14 |
| TAUDTTIN15 | Channel 15 input*1 | TAUD0I15 |
| TAUDTTOUT0 | Channel 0 output | TAUD0O0 |
| TAUDTTOUT1 | Channel 1 output | TAUD0O1 |
| TAUDTTOUT2 | Channel 2 output | TAUD0O2 |
| TAUDTTOUT3 | Channel 3 output | TAUD0O3 |
| TAUDTTOUT4 | Channel 4 output | TAUD0O4 |
| TAUDTTOUT5 | Channel 5 output | TAUD0O5 |
| TAUDTTOUT6 | Channel 6 output | TAUD0O6 |
| TAUDTTOUT7 | Channel 7 output | TAUD0O7 |
| TAUDTTOUT8 | Channel 8 output | TAUD0O8 |
| TAUDTTOUT9 | Channel 9 output | TAUD0O9 |
| TAUDTTOUT10 | Channel 10 output | TAUD0O10 |
| TAUDTTOUT11 | Channel 11 output | TAUD0O11 |
| TAUDTTOUT12 | Channel 12 output | TAUD0O12 |
| TAUDTTOUT13 | Channel 13 output | TAUD0O13 |
| TAUDTTOUT14 | Channel 14 output | TAUD0O14 |
| TAUDTTOUT15 | Channel 15 output | TAUD0O15 |

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

## 25.1.7 Internal Input/Output Signals

The internal input/output signals of TAUDn are listed below.

**Table 25.9 Internal Input/Output Signals**

| Unit Signal Name | Description | Connected to |
|---|---|---|
| TAUDnTSSTm | Simultaneous channel start trigger input | PIC |
| TAUDnTUDCm (m = 0, 2, 8) | TAUD master up/down signal output | PIC |

## 25.1.8 TAUD0 Input Selection

The output from port TAUD0Im (m = 0 to 15) can be input to TAUDTTINm (m = 0 to 15) as shown in the following figure.

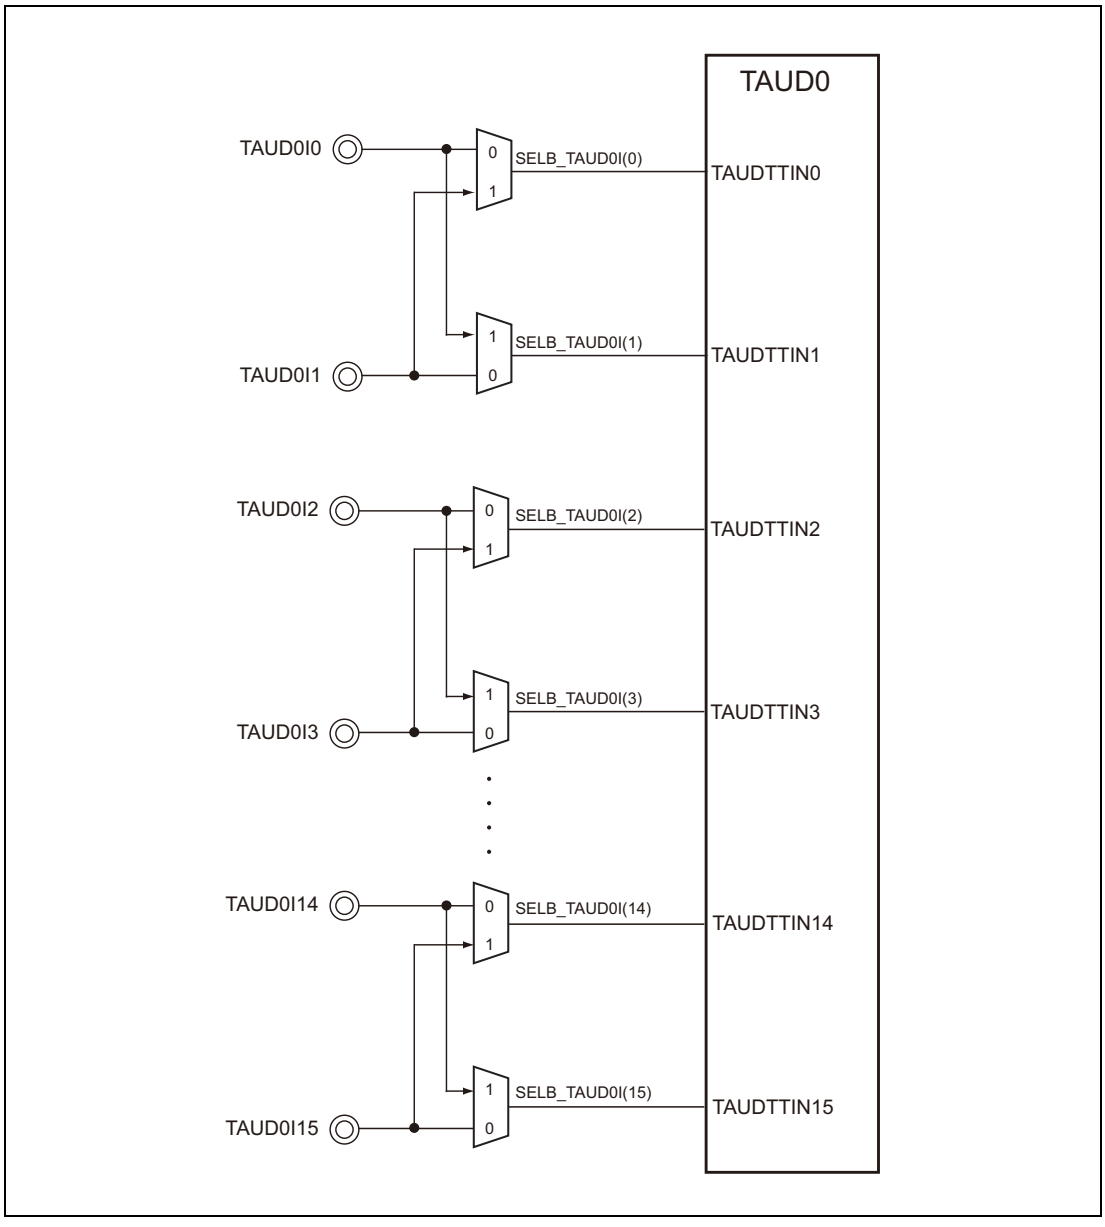

**Figure 25.1 Selection of Signals Input to TAUD0**

The following table shows the method of selecting input signals to several TAUD0 inputs.

**Table 25.10 TAUD0 Input Selection**

| Input Signal | Function | Settings |
|---|---|---|
| TAUDTTIN [m] | Port TAUD0I[m] | SELB_TAUD0I [m] = 0 |
| | Port TAUD0I[m + 1] | SELB_TAUD0I [m] = 1 |
| TAUDTTIN [m + 1] | Port TAUD0I[m + 1] | SELB_TAUD0I [m + 1] = 0 |
| | Port TAUD0I[m] | SELB_TAUD0I [m + 1] = 1 |

### 25.1.8.1 List of Registers

Input signal selection register is listed in the following table.

**Table 25.11 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| SL_TAUD0 | TAUDTTINm Input Signal Selection Register | SELB_TAUD0I | FFE2 $4000_H$ |

### 25.1.8.2 SELB_TAUD0I — TAUDTTINm Input Signal Selection Register

This register selects the TAUDTTINm input signals.

**Access:** This register can be read or written in 16-bit units.

**Address:** FFE2 $4000_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SELB_TAUD0I15 | SELB_TAUD0I14 | SELB_TAUD0I13 | SELB_TAUD0I12 | SELB_TAUD0I11 | SELB_TAUD0I10 | SELB_TAUD0I9 | SELB_TAUD0I8 | SELB_TAUD0I7 | SELB_TAUD0I6 | SELB_TAUD0I5 | SELB_TAUD0I4 | SELB_TAUD0I3 | SELB_TAUD0I2 | SELB_TAUD0I1 | SELB_TAUD0I0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.12 SELB_TAUD0I Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | SELB_TAUD0Im | Selection of TAUDTTINm input signal |

| TAUD Input | Bit [m+1] | Bit [m] | Input signal |
|---|---|---|---|
| TAUDTTIN[m] | x | 0 | Selection of port TAUD0I[m] |
| | x | 1 | Selection of port TAUD0I[m + 1] |
| TAUDTTIN[m+1] | 0 | x | Selection of port TAUD0I[m + 1] |
| | 1 | x | Selection of port TAUD0I[m] |

(m = 0, 2, 4, 6, 8, 10, 12, 14)

**CAUTION**

Do not change the input signal of each channel during the timer counting.

## 25.2 Overview

### 25.2.1 Functional Overview

The TAUD has the following functions:

- 16 channels
- 16-bit counter and 16-bit data register per channel
- Independent channel operation
- Synchronous channel operation (master and slave operation)
- Generation of different types of output signal
- Real-time output
- Counter can be triggered by external signal
- Interrupt generation

The Timer Array Unit D is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUDnCNTm and a 16-bit data register TAUDnCDRm to hold the start or compare value of the counter.

It also contains several control and status registers.

#### Independent and synchronous operation

Every channel can operate in different operation modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, its operation mode and functions are not affected by those of other channels. When a channel is operated synchronously it is either a master or a slave. A master channel can have multiple slaves, and the state of one channel affects that of the other channels. For example, this means that one channel can control when another starts to count, is reset, etc.

## 25.2.2 Terms

In this section, the following terms are used.

### Independent / synchronous channel operation

Independent or synchronous channel operation describes the dependency of channels on each other:

- If a channel operates independently of all other channels, this is called independent channel operation.
- If a channel operates depending on other channels, this is called synchronous channel operation.

### Channel group

In synchronous channel operation, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

### Operation mode

An operation mode can be selected for every channel m. The operation mode defines the basic operation and features of a channel.

In synchronous channel operation, every channel in the channel group can operate in a different operation mode.

Examples are “Capture Mode”, “Event Count Mode”, and “Interval Timer Mode”.

### Channel output mode

The channel output mode defines the operation of TAUDTTOUTm

- of a single channel (independent output operation) or
- of all channels in a channel group (synchronous output operation).

Examples are “Independent Channel Output Mode 1” and “Synchronous Channel Output Mode 2 with Dead Time Output”.

### Channel operation function

The channel operation function defines the complete function and all features

- of a single channel (independent channel operation) or
- of all channels in a channel group (synchronous channel operation).

### Upper / lower channel

Depending on the channel number m, a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:

For channel 5, channel 3 is an upper channel and channel 9 is a lower channel.

### 25.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

**Table 25.13 Functional List of TAUD Operations**

| Operation Function | Example |
|---|---|
| **Independent Channel Operation Functions** | **Section 25.12** |
| Interval Timer Function | **Section 25.12.1** |

### 25.2.4 TAUD I/O and Interrupt Request Signals

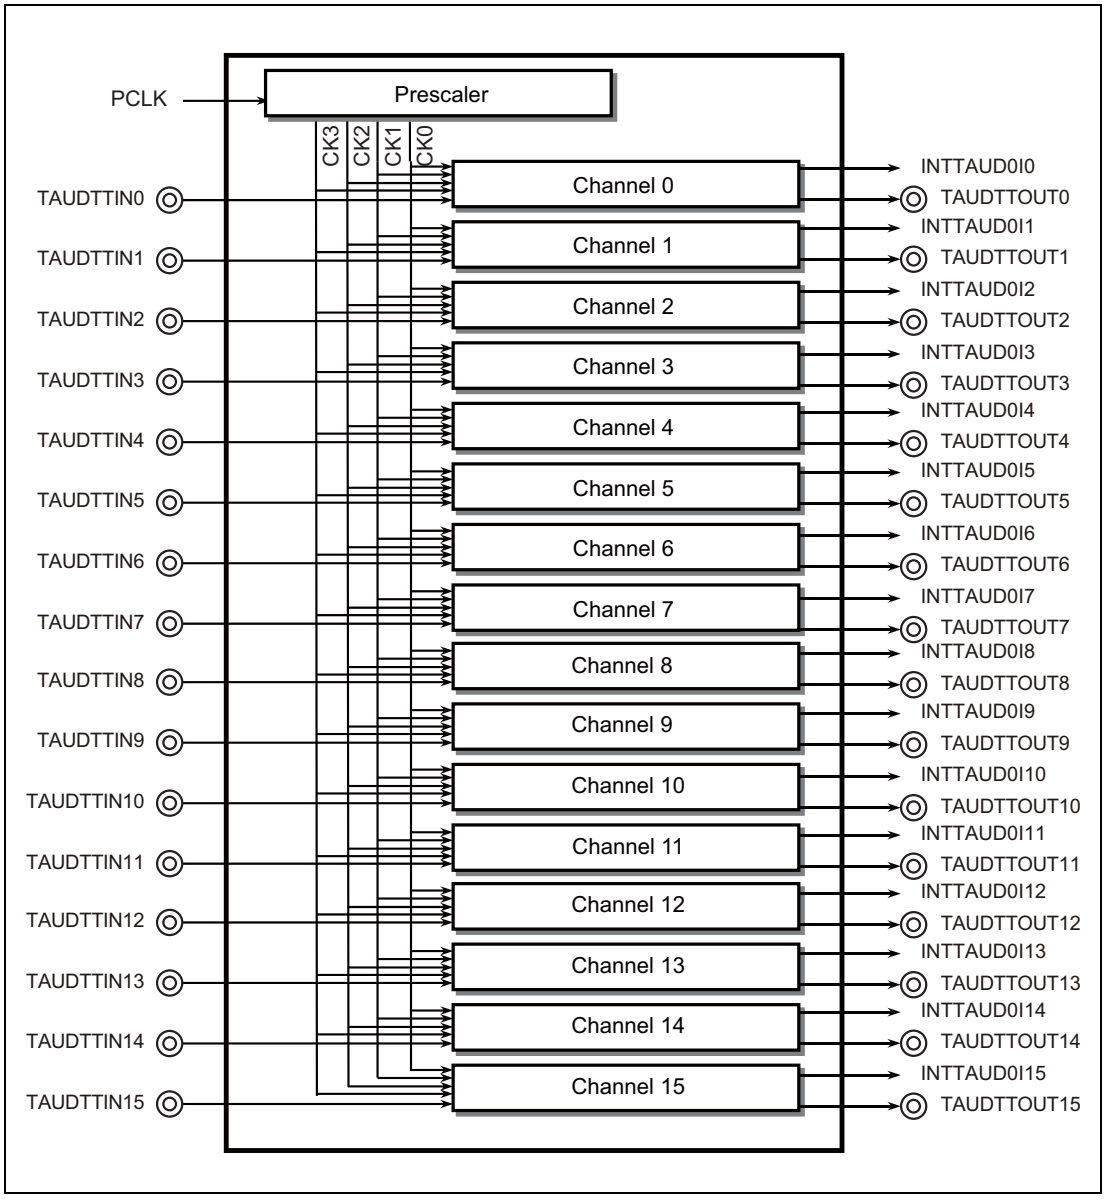

**Figure 25.2 TAUD I/O and Interrupt Request Signals**

## 25.2.5 Block Diagram

**Figure 25.3** shows the main components of the TAUD.

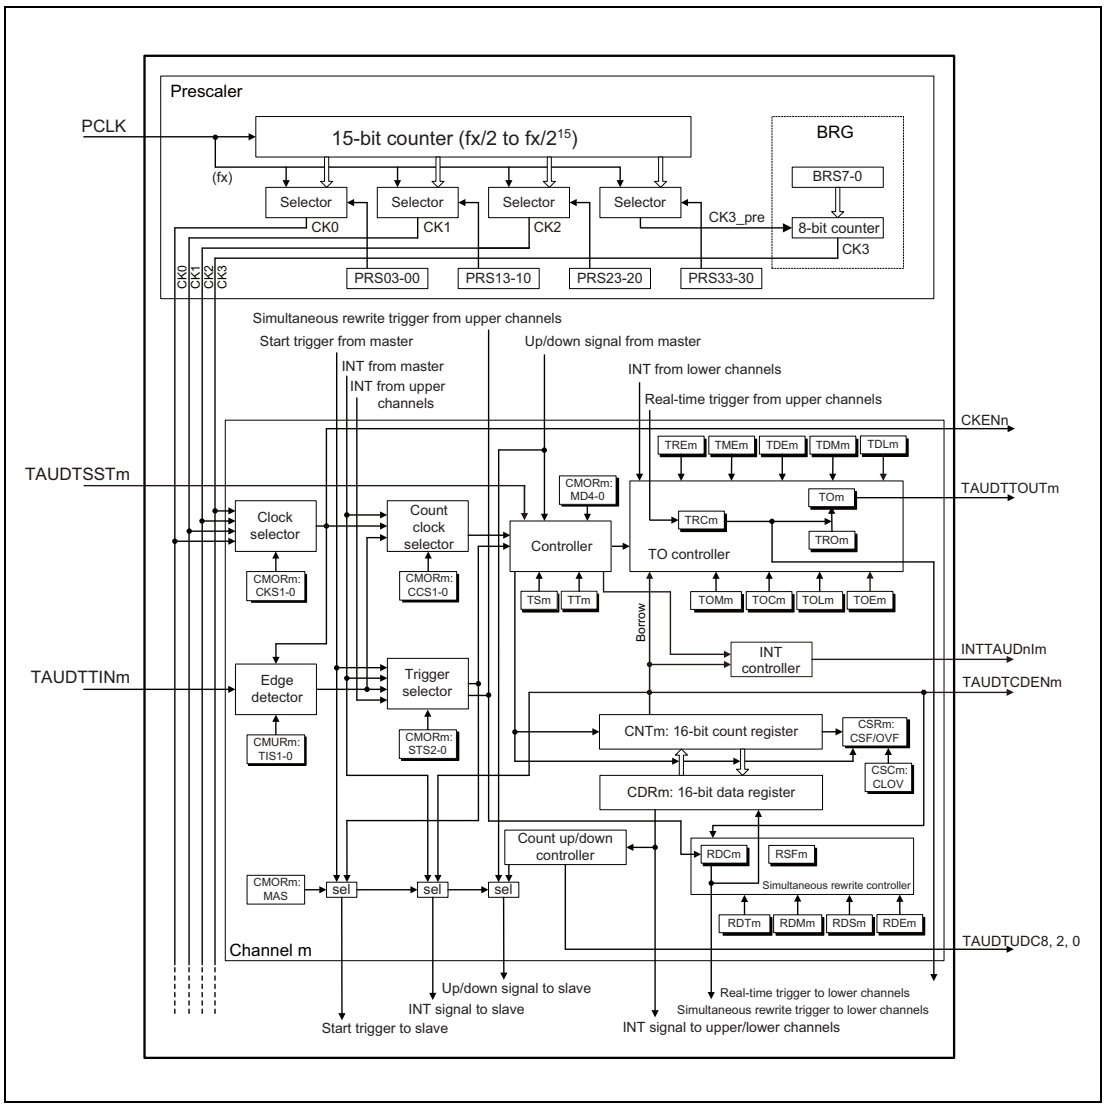

**Figure 25.3 Block Diagram of the TAUD**

The module name “TAUDn” has been omitted from the register names for the sake of clarity in the above figure.

## 25.2.6 Description of Blocks

The following describes the functional blocks:

### Prescaler block

The prescaler block provides up to four clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived from PCLK by a configurable prescaler division factor of $2^0$ to $2^{15}$. The fourth count clock CK3 can be adjusted more precisely by using BRG to set an additional division factor that is not a power of 2.

### Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- INTTAUDnIm from master channel
- TAUDTTINm input signal valid edge

### Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUDnCMORm.TAUDnMD[4:0])
- Counter start enable (TAUDnTS.TAUDnTSm) and counter stop (TAUDnTT.TAUDnTTm)
  When counter start is enabled, status flag TAUDnTE.TAUDnTEm is set.
- Count direction (up/down) (can be controlled by master channel)

### Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUDnTE.TAUDnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

- Synchronous channel start trigger input TAUDnTSSTm
- TAUDTTINm input signal valid edge
- INTTAUDnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUDTTOUTm generation unit.

### Simultaneous rewrite controller

Simultaneous rewrite control is a function that can be used in synchronous operating modes. The data registers (TAUDnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

### TAUDnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

# 25.3 Registers

## 25.3.1 List of Registers

TAUD registers are listed in the following table.

For details about <TAUDn_base>, see **Section 25.1.2, Register Base Address**.

**Table 25.14 List of Registers**

| Module | Register | Symbol | Address |
|---|---|---|---|
| **TAUDn prescaler registers** | | | |
| TAUDn | TAUDn prescaler clock select register | TAUDnTPS | <TAUDn_base> + $240_H$ |
| | TAUDn prescaler baud rate setting register | TAUDnBRS | <TAUDn_base> + $244_H$ |
| **TAUDn control registers** | | | |
| TAUDn | TAUDn channel data register m | TAUDnCDRm | <TAUDn_base> + m × $4_H$ |
| | TAUDn channel counter register m | TAUDnCNTm | <TAUDn_base> + $80_H$ + m × $4_H$ |
| | TAUDn channel mode OS register m | TAUDnCMORm | <TAUDn_base> + $200_H$ + m × $4_H$ |
| | TAUDn channel mode user register m | TAUDnCMURm | <TAUDn_base> + $C0_H$ + m × $4_H$ |
| | TAUDn channel status register m | TAUDnCSRm | <TAUDn_base> + $140_H$ + m × $4_H$ |
| | TAUDn channel status clear trigger register m | TAUDnCSCm | <TAUDn_base> + $180_H$ + m × $4_H$ |
| | TAUDn channel start trigger register | TAUDnTS | <TAUDn_base> + $1C4_H$ |
| | TAUDn channel enable status register | TAUDnTE | <TAUDn_base> + $1C0_H$ |
| | TAUDn channel stop trigger register | TAUDnTT | <TAUDn_base> + $1C8_H$ |
| **TAUDn output registers** | | | |
| TAUDn | TAUDn channel output enable register | TAUDnTOE | <TAUDn_base> + $5C_H$ |
| | TAUDn channel output register | TAUDnTO | <TAUDn_base> + $58_H$ |
| | TAUDn channel output mode register | TAUDnTOM | <TAUDn_base> + $248_H$ |
| | TAUDn channel output configuration register | TAUDnTOC | <TAUDn_base> + $24C_H$ |
| | TAUDn channel output active level register | TAUDnTOL | <TAUDn_base> + $040_H$ |
| | TAUDn channel dead time output enable register | TAUDnTDE | <TAUDn_base> + $250_H$ |
| | TAUDn channel dead time output mode register | TAUDnTDM | <TAUDn_base> + $254_H$ |
| | TAUDn channel dead time output level register | TAUDnTDL | <TAUDn_base> + $54_H$ |
| | TAUDn channel real-time output register | TAUDnTRO | <TAUDn_base> + $4C_H$ |
| | TAUDn channel real-time output enable register | TAUDnTRE | <TAUDn_base> + $258_H$ |
| | TAUDn channel real-time output control register | TAUDnTRC | <TAUDn_base> + $25C_H$ |
| | TAUDn channel modulation output enable register | TAUDnTME | <TAUDn_base> + $50_H$ |
| **TAUDn reload data registers** | | | |
| TAUDn | TAUDn channel reload data enable register | TAUDnRDE | <TAUDn_base> + $260_H$ |
| | TAUDn channel reload data mode register | TAUDnRDM | <TAUDn_base> + $264_H$ |
| | TAUDn channel reload data control CH select register | TAUDnRDS | <TAUDn_base> + $268_H$ |
| | TAUDn channel reload data control register | TAUDnRDC | <TAUDn_base> + $26C_H$ |
| | TAUDn channel reload data trigger register | TAUDnRDT | <TAUDn_base> + $44_H$ |
| | TAUDn channel reload status register | TAUDnRSF | <TAUDn_base> + $48_H$ |
| **TAUDn Emulation Register** | | | |
| TAUDn | TAUDn emulation register | TAUDnEMU | <TAUDn_base> + $290_H$ |

## 25.3.2 Details of TAUDn Prescaler Registers

### 25.3.2.1 TAUDnTPS — TAUDn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescaler. CK3 is generated by dividing CK3_PRE by the factor specified in TAUDnBRS.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn_base> + $240_H$

**Value after reset:** $FFFF_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnPRS3 [3:0] | | | | TAUDnPRS2 [3:0] | | | | TAUDnPRS1 [3:0] | | | | TAUDnPRS0 [3:0] | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.15 TAUDnTPS Register Contents (1/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | TAUDnPRS3 [3:0] | Specifies CK3_PRE clock.<br>CK3_PRE clock is an input clock to BRG unit which supplies the CK3 operation clock to all channels. |

| TAUDnPRS3[3:0] | CK3_PRE Clock |
|---|---|
| $0000_B$ | PCLK/$2^0$ |
| $0001_B$ | PCLK/$2^1$ |
| $0010_B$ | PCLK/$2^2$ |
| $0011_B$ | PCLK/$2^3$ |
| $0100_B$ | PCLK/$2^4$ |
| $0101_B$ | PCLK/$2^5$ |
| $0110_B$ | PCLK/$2^6$ |
| $0111_B$ | PCLK/$2^7$ |
| $1000_B$ | PCLK/$2^8$ |
| $1001_B$ | PCLK/$2^9$ |
| $1010_B$ | PCLK/$2^{10}$ |
| $1011_B$ | PCLK/$2^{11}$ |
| $1100_B$ | PCLK/$2^{12}$ |
| $1101_B$ | PCLK/$2^{13}$ |
| $1110_B$ | PCLK/$2^{14}$ |
| $1111_B$ | PCLK/$2^{15}$ |

The above bits are rewritable only when all the counters using CK3 are stopped (TAUDnTE.TAUDnTEm = 0).

**Table 25.15 TAUDnTPS Register Contents (2/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 11 to 8 | TAUDnPRS2 [3:0] | Specifies the CK2 clock. |

| TAUDnPRS2[3:0] | CK2 Clock |
|---|---|
| $0000_B$ | $PCLK/2^0$ |
| $0001_B$ | $PCLK/2^1$ |
| $0010_B$ | $PCLK/2^2$ |
| $0011_B$ | $PCLK/2^3$ |
| $0100_B$ | $PCLK/2^4$ |
| $0101_B$ | $PCLK/2^5$ |
| $0110_B$ | $PCLK/2^6$ |
| $0111_B$ | $PCLK/2^7$ |
| $1000_B$ | $PCLK/2^8$ |
| $1001_B$ | $PCLK/2^9$ |
| $1010_B$ | $PCLK/2^{10}$ |
| $1011_B$ | $PCLK/2^{11}$ |
| $1100_B$ | $PCLK/2^{12}$ |
| $1101_B$ | $PCLK/2^{13}$ |
| $1110_B$ | $PCLK/2^{14}$ |
| $1111_B$ | $PCLK/2^{15}$ |

The above bits are rewritable only when all the counters using CK2 are stopped (TAUDnTE.TAUDnTEm = 0).

| | | |
|---|---|---|
| 7 to 4 | TAUDnPRS1 [3:0] | Specifies the CK1 clock. |

| TAUDnPRS1[3:0] | CK1 Clock |
|---|---|
| $0000_B$ | $PCLK/2^0$ |
| $0001_B$ | $PCLK/2^1$ |
| $0010_B$ | $PCLK/2^2$ |
| $0011_B$ | $PCLK/2^3$ |
| $0100_B$ | $PCLK/2^4$ |
| $0101_B$ | $PCLK/2^5$ |
| $0110_B$ | $PCLK/2^6$ |
| $0111_B$ | $PCLK/2^7$ |
| $1000_B$ | $PCLK/2^8$ |
| $1001_B$ | $PCLK/2^9$ |
| $1010_B$ | $PCLK/2^{10}$ |
| $1011_B$ | $PCLK/2^{11}$ |
| $1100_B$ | $PCLK/2^{12}$ |
| $1101_B$ | $PCLK/2^{13}$ |
| $1110_B$ | $PCLK/2^{14}$ |
| $1111_B$ | $PCLK/2^{15}$ |

The above bits are rewritable only when all the counters using CK1 are stopped (TAUDnTE.TAUDnTEm = 0).

**Table 25.15 TAUDnTPS Register Contents (3/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 to 0 | TAUDnPRS0 [3:0] | Specifies the CK0 clock. |

| TAUDnPRS0[3:0] | CK0 Clock |
|---|---|
| $0000_B$ | PCLK/$2^0$ |
| $0001_B$ | PCLK/$2^1$ |
| $0010_B$ | PCLK/$2^2$ |
| $0011_B$ | PCLK/$2^3$ |
| $0100_B$ | PCLK/$2^4$ |
| $0101_B$ | PCLK/$2^5$ |
| $0110_B$ | PCLK/$2^6$ |
| $0111_B$ | PCLK/$2^7$ |
| $1000_B$ | PCLK/$2^8$ |
| $1001_B$ | PCLK/$2^9$ |
| $1010_B$ | PCLK/$2^{10}$ |
| $1011_B$ | PCLK/$2^{11}$ |
| $1100_B$ | PCLK/$2^{12}$ |
| $1101_B$ | PCLK/$2^{13}$ |
| $1110_B$ | PCLK/$2^{14}$ |
| $1111_B$ | PCLK/$2^{15}$ |

The above bits are rewritable only when all the counters using CK0 are stopped (TAUDnTE.TAUDnTEm = 0).

**NOTE**

The TAUDn clock input PCLK is specified in the first part of this section, **Section 25.1.3, Clock Supply**.

### 25.3.2.2 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUDnTPS.TAUDnPRS3[3:0].

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUDn_base> + $244_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TAUDnBRS[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.16 TAUDnBRS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | TAUDnBRS[7:0] | Specifies a CK3_PRE clock division factor for generating CK3. |

| TAUDnBRS[7:0] | CK3 Clock |
|---|---|
| $0000\ 0000_B$ | CK3_PRE / 1 |
| $0000\ 0001_B$ | CK3_PRE / 2 |
| $0000\ 0010_B$ | CK3_PRE / 3 |
| $0000\ 0011_B$ | CK3_PRE / 4 |
| ... | ... |
| $1111\ 1110_B$ | CK3_PRE / 255 |
| $1111\ 1111_B$ | CK3_PRE / 256 |

## 25.3.3 Details of TAUDn Control Registers

### 25.3.3.1 TAUDnCDRm — TAUDn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUDnCMORm.TAUDnMD[4:1].

**Access:** This register can be read or written in 16-bit units.
- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

**Address:** <TAUDn_base> + m × $4_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCDR[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.17 TAUDnCDRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnCDR [15:0] | Data register for capture/compare values |

### 25.3.3.2 TAUDnCNTm — TAUDn Channel Counter Register

This is a channel m counter register.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUDn_base> + $80_H$ + m × $4_H$

**Value after reset:** $FFFF_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCNT[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 25.18 TAUDnCNTm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnCNT [15:0] | 16-bit counter value |

A read value depends on a counter value, a changed operating mode, TAUDnTS.TAUDnTSm or TAUDnTT.TAUDnTTm bit value.

The initial read value of the counter depends on an operating mode and how the counter is stopped.

- Stop by a reset
- Stop by a counter stop trigger (TAUDnTT.TAUDnTTm = 1)

**Table 25.19** lists the initial counter read values after the counter is stopped (TAUDnTE.TAUDnTEm = 0) and re-enabled (TAUDnTS.TAUDnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUDnTS.TAUDnTSm = 1) with the counter waiting for a start trigger.

**Table 25.19 TAUDnCNTm Read Values after Re-Enabling Counter**

| Mode Name | Count Method (Up/Down) | TAUDnCNTm Value | | |
|---|---|---|---|---|
| | | Start Value*1 | After Stop Trigger | After One Count |
| Interval timer mode | Count down | $FFFF_H$ | Stop value | — |
| Judge mode | Count down | $FFFF_H$ | Stop value | — |
| Capture mode | Count up | $0000_H$ | Stop value | — |
| Event count mode | Count down | $FFFF_H$ | Stop value | — |
| One-count mode | Count down | $FFFF_H$ | Stop value | Stop value |
| Capture and one-count mode | Count up | $0000_H$ | Stop value | Capture value + 1 (TAUDnCDRm) |
| Judge and one-count mode | Count down | $FFFF_H$ | Stop value | TAUDnCNTm value – 1 |
| Count-up/-down mode | Count down/up | $FFFF_H$ | Stop value | — |
| Pulse one-count mode | Count down | $FFFF_H$ | Stop value | $0000_H$ |
| Count capture mode | Count up | $0000_H$ | Stop value | — |
| Gate count mode | Count down | $FFFF_H$ | Stop value | Stop value |
| Capture and gate count mode | Count up | $0000_H$ | Stop value | Stop value |

Note 1. The value set for TAUDnCNTm when the operating mode is changed after a reset is deasserted.

### 25.3.3.3 TAUDnCMORm — TAUDn Channel Mode OS Register

This register controls channel m operation.

**Access:** This register can be read or written in 16-bit units. Writable only when the counter is stopped (TAUDnTE.TAUDnTEm = 0).

**Address:** <TAUDn_base> + $200_H$ + m × $4_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS [1:0] | | TAUDnCCS [1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS [1:0] | | — | TAUDnMD[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.20 TAUDnCMORm Register Contents (1/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Selects an operation clock.<br>An operation clock is used for the TAUDTTINm input edge detection circuit. Setting of TAUDnCMORm.TAUDnCCS[1:0] bits also allows the operation clock to serve as the TAUDnCNTm counter clock. |

| TAUDn CKS1 | TAUDn CKS0 | Selection of Operation Clock |

**Table 25.20 TAUDnCMORm Register Contents (3/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 4 to 0 | TAUDnMD[4:0] | Specifies an operating mode. |

| TAUDnMD4 | TAUDnMD3 | TAUDnMD2 | TAUDnMD1 | TAUDnMD0 | Functional Description |
|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 1/0 | Interval timer mode |
| 0 | 0 | 0 | 1 | 1/0 | Judge mode |
| 0 | 0 | 1 | 0 | 1/0 | Capture mode |
| 0 | 0 | 1 | 1 | 0 | Event count mode |
| 0 | 1 | 0 | 0 | 1/0 | One-count mode |
| 0 | 1 | 0 | 1 | 1/0 | Setting prohibited |
| 0 | 1 | 1 | 0 | 0 | Capture and one-count mode |
| 0 | 1 | 1 | 1 | 1/0 | Judge and one-count mode |
| 1 | 0 | 0 | 0 | 0 | Setting prohibited |
| 1 | 0 | 0 | 1 | 0 | Count-up/-down mode |
| 1 | 0 | 1 | 0 | 1/0 | Pulse one-count mode |
| 1 | 0 | 1 | 1 | 1/0 | Count capture mode |
| 1 | 1 | 0 | 0 | 0 | Gate count mode |
| 1 | 1 | 0 | 1 | 0 | Capture and gate count mode |

| Mode | Role of TAUDnMD0 Bit |
|---|---|
| Interval timer mode<br>Capture mode<br>Count capture mode | Specifies whether INTTAUDnIm is generated at the beginning of count operation (when a start trigger is entered) or not.<br>0: INTTAUDnIm is not generated.<br>1: INTTAUDnIm is generated. |
| Event count mode<br>Count-up/-down mode | This bit should be set to 0 (the INTTAUDnIm signal is not output at the beginning of count operation). |
| One-count mode<br>Pulse one-count mode | Enables/disables start trigger detection during counting.<br>0: Disables detection.<br>1: Enables detection.<br>**CAUTION**<br>• INTTAUDnIm signal is not output at the beginning of count operation in one-count mode.<br>• INTTAUDnIm signal is output at the beginning of count operation in pulse one-count mode. |
| Gate count mode | This bit should be set to 0 (disables start trigger detection during counting). |
| Capture and one-count mode<br>Capture and gate count mode | This bit should be set to 0.<br>**CAUTION**<br>INTTAUDnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled. |
| Judge mode<br>Judge and one-count mode | Specifies INTTAUDnIm output timing.<br>0: When TAUDnCNTm ≤ TAUDnCDRm<br>1: When TAUDnCNTm > TAUDnCDRm |

### 25.3.3.4 TAUDnCMURm — TAUDn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUDTTINm input.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUDn_base> + $C0_H$ + m × $4_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.21 TAUDnCMURm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | Specifies a valid edge of TAUDTTINm input signal. |

| TAUDn TIS1 | TAUDn TIS0 | Functional Description |
|---|---|---|
| 0 | 0 | Falling edge |
| 0 | 1 | Rising edge |
| 1 | 0 | Detection of rising and falling edges (selects low width measurement)<br>Start trigger: Falling edge<br>Stop trigger (capture): Rising edge |
| 1 | 1 | Detection of rising and falling edges (selects high width measurement)<br>Start trigger: Rising edge<br>Stop trigger (capture): Falling edge |

- Edge detection of TAUDTTINm input signal is based on the operation clock selected by TAUDnCMORm.TAUDnCKS[1:0].

### 25.3.3.5 TAUDnCSRm — TAUDn Channel Status Register

This register indicates the count direction and overflow status of channel m counter.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUDn_base> + $140_H$ + m × $4_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnCSF | TAUDnOVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 25.22 TAUDnCSRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | TAUDnCSF | Indicates a count direction.<br>0: Count-up<br>1: Count-down<br>The read value of this bit is valid only in the following mode:<br>• Count-up/-down mode |
| 0 | TAUDnOVF | Indicates counter overflow status.<br>0: No overflow occurs.<br>1: Overflow occurs.<br>This bit is used only in the following modes:<br>• Capture mode<br>• Capture and one-count mode<br><br>The function of this bit depends on the setting of control bit TAUDnCMORm.TAUDnCOS[1:0]. |

### 25.3.3.6 TAUDnCSCm — TAUDn Channel Status Clear Register

This is a trigger register for clearing the overflow flag TAUDnCSRm.TAUDnOVF of channel m.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as $00_H$.

**Address:** <TAUDn_base> + $180_H$ + m × $4_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TAUDnCLOV |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 25.23 TAUDnCSCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAUDnCLOV | 0: No function<br>1: Clears overflow flag TAUDnCSRm.TAUDnOVF. |

### 25.3.3.7 TAUDnTS — TAUDn Channel Start Trigger Register

This register enables the counter operation of each channel.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as $0000_H$.

**Address:** <TAUDn_base> + $1C4_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnTS15 | TAUDnTS14 | TAUDnTS13 | TAUDnTS12 | TAUDnTS11 | TAUDnTS10 | TAUDnTS09 | TAUDnTS08 | TAUDnTS07 | TAUDnTS06 | TAUDnTS05 | TAUDnTS04 | TAUDnTS03 | TAUDnTS02 | TAUDnTS01 | TAUDnTS00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

**Table 25.24 TAUDnTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTSm | Enables the counter operation of channel m.<br>0: No function<br>1: Enables the counter operation and sets TAUDnTE.TAUDnTEm to 1.<br>The counter operation is only enabled when TAUDnTE.TAUDnTEm is set to 1.<br>Whether counting is started or not depends on a selected operating mode. |

### 25.3.3.8 TAUDnTE — TAUDn Channel Enable Status Register

This register enables/disables a counter operation.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUDn_base> + $1C0_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnTE15 | TAUDnTE14 | TAUDnTE13 | TAUDnTE12 | TAUDnTE11 | TAUDnTE10 | TAUDnTE09 | TAUDnTE08 | TAUDnTE07 | TAUDnTE06 | TAUDnTE05 | TAUDnTE04 | TAUDnTE03 | TAUDnTE02 | TAUDnTE01 | TAUDnTE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 25.25 TAUDnTE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTEm | Enables/disables the counter operation of channel m.<br>0: Disables counter operation.<br>1: Enables counter operation.<br>This bit is set to 1 when trigger input of TAUDnTSSTm (synchronous channel start trigger signal) is detected or when TAUDnTS.TAUDnTSm is set to 1. This bit is set to 0 when TAUDnTT.TAUDnTTm is set to 1. |

### 25.3.3.9 TAUDnTT — TAUDn Channel Stop Trigger Register

This register stops the counter operation of each channel.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as $0000_H$.

**Address:** <TAUDn_base> + $1C8_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnTT15 | TAUDnTT14 | TAUDnTT13 | TAUDnTT12 | TAUDnTT11 | TAUDnTT10 | TAUDnTT09 | TAUDnTT08 | TAUDnTT07 | TAUDnTT06 | TAUDnTT05 | TAUDnTT04 | TAUDnTT03 | TAUDnTT02 | TAUDnTT01 | TAUDnTT00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

**Table 25.26 TAUDnTT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTTm | Stops the counter operation of channel m.<br>0: No function<br>1: Stops the counter operation and resets TAUDnTE.TAUDnTEm.<br>TAUDnCNTm, TAUDnTO.TAUDnTOm, and TAUDTTOUTm retain the values provided before the counter is stopped. |

## 25.3.4 Details of TAUDn Simultaneous Rewrite Registers

### 25.3.4.1 TAUDnRDE — TAUDn Channel Reload Data Enable Register

This register enables/disables simultaneous rewrite of TAUDnCDRm/TAUDnTOLm data register.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn_base> + $260_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn RDE15 | TAUDn RDE14 | TAUDn RDE13 | TAUDn RDE12 | TAUDn RDE11 | TAUDn RDE10 | TAUDn RDE09 | TAUDn RDE08 | TAUDn RDE07 | TAUDn RDE06 | TAUDn RDE05 | TAUDn RDE04 | TAUDn RDE03 | TAUDn RDE02 | TAUDn RDE01 | TAUDn RDE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.27 TAUDnRDE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnRDEm | Enables/disables simultaneous rewrite of the data register of channel m.<br>0: Disables simultaneous rewrite<br>1: Enables simultaneous rewrite |

### 25.3.4.2 TAUDnRDS — TAUDn Channel Reload Data Control Channel Select Register

This register selects a channel that controls simultaneous rewrite.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn_base> + $268_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn RDS15 | TAUDn RDS14 | TAUDn RDS13 | TAUDn RDS12 | TAUDn RDS11 | TAUDn RDS10 | TAUDn RDS09 | TAUDn RDS08 | TAUDn RDS07 | TAUDn RDS06 | TAUDn RDS05 | TAUDn RDS04 | TAUDn RDS03 | TAUDn RDS02 | TAUDn RDS01 | TAUDn RDS00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.28 TAUDnRDS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnRDSm | Selects a channel that controls a simultaneous rewrite trigger.<br>0: Master channel<br>1: Another upper channel |

### 25.3.4.3 TAUDnRDM — TAUDn Channel Reload Data Mode Register

This register selects the timing for generating a simultaneous rewrite control signal.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn_base> + $264_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn RDM15 | TAUDn RDM14 | TAUDn RDM13 | TAUDn RDM12 | TAUDn RDM11 | TAUDn RDM10 | TAUDn RDM09 | TAUDn RDM08 | TAUDn RDM07 | TAUDn RDM06 | TAUDn RDM05 | TAUDn RDM04 | TAUDn RDM03 | TAUDn RDM02 | TAUDn RDM01 | TAUDn RDM00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.29 TAUDnRDM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnRDMm | Selects the timing for generating a simultaneous rewrite trigger signal.<br>0: When the master channel counter starts to count<br>1: At the peak of cycle of triangular wave<br>These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 0. |

### 25.3.4.4 TAUDnRDC — TAUDn Channel Reload Data Control Register

This register specifies a channel which generates an INTTAUDnIm signal to trigger simultaneous rewrite.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn_base> + $26C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn RDC15 | TAUDn RDC14 | TAUDn RDC13 | TAUDn RDC12 | TAUDn RDC11 | TAUDn RDC10 | TAUDn RDC09 | TAUDn RDC08 | TAUDn RDC07 | TAUDn RDC06 | TAUDn RDC05 | TAUDn RDC04 | TAUDn RDC03 | TAUDn RDC02 | TAUDn RDC01 | TAUDn RDC00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.30 TAUDnRDC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnRDCm | Specifies whether the channel generates a simultaneous rewrite trigger signal or not.<br>0: Does not operate as a simultaneous rewrite trigger channel.<br>1: Operates as a simultaneous rewrite trigger channel.<br>These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 1. |

### 25.3.4.5 TAUDnRDT — TAUDn Channel Reload Data Trigger Register

This register triggers a simultaneous rewrite enabling state.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as $0000_H$.

**Address:** <TAUDn_base> + $044_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn RDT15 | TAUDn RDT14 | TAUDn RDT13 | TAUDn RDT12 | TAUDn RDT11 | TAUDn RDT10 | TAUDn RDT09 | TAUDn RDT08 | TAUDn RDT07 | TAUDn RDT06 | TAUDn RDT05 | TAUDn RDT04 | TAUDn RDT03 | TAUDn RDT02 | TAUDn RDT01 | TAUDn RDT00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

**Table 25.31 TAUDnRDT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnRDTm | Triggers a simultaneous rewrite enabling state.<br>0: No function<br>1: The simultaneous rewrite enabling flag (TAUDnRSFm) is set to 1. The system waits for a simultaneous rewrite trigger.<br>These bits only apply when:<br>• TAUDnRDE.TAUDnRDEm = 1 |

### 25.3.4.6 TAUDnRSF — TAUDn Channel Reload Status Register

This flag register indicates simultaneous rewrite status.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUDn_base> + $048_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn RSF15 | TAUDn RSF14 | TAUDn RSF13 | TAUDn RSF12 | TAUDn RSF11 | TAUDn RSF10 | TAUDn RSF09 | TAUDn RSF08 | TAUDn RSF07 | TAUDn RSF06 | TAUDn RSF05 | TAUDn RSF04 | TAUDn RSF03 | TAUDn RSF02 | TAUDn RSF01 | TAUDn RSF00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 25.32 TAUDnRSF Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnRSFm | Indicates simultaneous rewrite status.<br>0: Indicates that simultaneous rewrite has been completed due to the generation of simultaneous rewrite trigger.<br>1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous rewrite enabling state (TAUDnRDTm = 1). |

## 25.3.5 Details of TAUDn Output Registers

### 25.3.5.1 TAUDnTOE — TAUDn Channel Output Enable Register

This register enables/disables the independent channel output mode controlled by software.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn_base> + $5C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn TOE15 | TAUDn TOE14 | TAUDn TOE13 | TAUDn TOE12 | TAUDn TOE11 | TAUDn TOE10 | TAUDn TOE09 | TAUDn TOE08 | TAUDn TOE07 | TAUDn TOE06 | TAUDn TOE05 | TAUDn TOE04 | TAUDn TOE03 | TAUDn TOE02 | TAUDn TOE01 | TAUDn TOE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.33 TAUDnTOE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTOEm | Enables/disables the independent channel output function.<br>0: Disables the independent timer output function (controlled by software).<br>1: Enables the independent timer output function. |

### 25.3.5.2 TAUDnTO — TAUDn Channel Output Register

This register specifies and reads a TAUDTTOUTm level.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn_base> + $58_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn TO15 | TAUDn TO14 | TAUDn TO13 | TAUDn TO12 | TAUDn TO11 | TAUDn TO10 | TAUDn TO09 | TAUDn TO08 | TAUDn TO07 | TAUDn TO06 | TAUDn TO05 | TAUDn TO04 | TAUDn TO03 | TAUDn TO02 | TAUDn TO01 | TAUDn TO00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTOm | Specifies and reads a TAUDTTOUTm level.<br>0: Low level<br>1: High level<br>Only TAUDnTOm bits for which Independent Channel Output function is disabled (TAUDnTOEm = 0) can be written. |

### 25.3.5.3 TAUDnTOM — TAUDn Channel Output Mode Register

This register specifies the output mode of each channel.

**Access:** This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

**Address:** <TAUDn_base> + $248_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTOMm | Specifies an output mode.<br>0: Independent channel operation<br>1: Synchronous channel operation |

### 25.3.5.4 TAUDnTOC — TAUDn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUDnTOMm.

**Access:** This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

**Address:** <TAUDn_base> + $24C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 25.36 TAUDnTOC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTOCm | Specifies an output mode.<br>0: Operating mode 1<br>1: Operating mode 2<br>As listed below, the output mode depends on the setting of TAUDnTOM.TAUDnTOMm. |

| TAUDn TOMm | TAUDn TOCm | Functional Description |
|---|---|---|
| 0 | 0 | Toggle mode: Toggle operation is conducted when INTTAUDnIm occurs. |
| 0 | 1 | Set/reset mode: Set when INTTAUDnIm occurs at the beginning of count operation, and reset when INTTAUDnIm is caused by detection of a match between TAUDnCNTm and TAUDnCDRm. |
| 1 | 0 | Synchronous channel operating mode 1: Set when INT occurs on master channels, and reset when INT occurs on slave channels. |
| 1 | 1 | Synchronous channel operating mode 2: Set when INTTAUDnIm occurs in count-down status, and reset when INTTAUDnIm occurs in count-up status. |

### 25.3.5.5 TAUDnTOL — TAUDn Channel Output Active Level Register

This register specifies the output logic of channel output bit (TAUDnTO.TAUDnTOm).

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn_base> + $040_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 15 to 0 | TAUDnTOLm | Specifies the output logic of channel m output bit (TAUDnTO.TAUDnTOm).<br>0: Positive logic (active high)<br>1: Negative logic (active low)<br>The setting of these bits applies to all channel output modes other than independent channel output mode controlled by software. |

## 25.3.6 Details of TAUDn Dead Time Output Registers

### 25.3.6.1 TAUDnTDE — TAUDn Channel Dead Time Output Enable Register

This register enables/disables the dead time operation of every channel.

**Access:** This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

**Address:** <TAUDn_base> + $250_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn TDE15 | TAUDn TDE14 | TAUDn TDE13 | TAUDn TDE12 | TAUDn TDE11 | TAUDn TDE10 | TAUDn TDE09 | TAUDn TDE08 | TAUDn TDE07 | TAUDn TDE06 | TAUDn TDE05 | TAUDn TDE04 | TAUDn TDE03 | TAUDn TDE02 | TAUDn TDE01 | TAUDn TDE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.38 TAUDnTDE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTDEm | Enables/disables the dead time control operation of channel m.<br>0: Disables dead time operation<br>1: Enables dead time operation.<br>The same setting should be made for both even and odd slave channels in pairs.<br>These bit settings are applied when:<br>• TAUDnTOE.TAUDnTOEm, TAUDnTOM.TAUDnTOMm, TAUDnTOC.TAUDnTOCm = 1 |

### 25.3.6.2 TAUDnTDM — TAUDn Channel Dead Time Output Mode Register

This register specifies the timing to add dead time during dead time output.

**Access:** This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

**Address:** <TAUDn_base> + $254_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 15 to 0 | TAUDnTDMm | Specifies the timing to add dead time during dead time output.<br>0: When detecting the duty cycle of an upper even channel (duty dead time output).<br>1: When detecting the TIN input edge of a lower odd channel (one-phase dead time output).<br>The same setting should be made for both even and odd slave channels in pairs.<br>These bit settings are applied when:<br>• TAUDnTOE.TAUDnTOEm, TAUDnTOM.TAUDnTOMm, TAUDnTOC.TAUDnTOCm, TAUDnTDE.TAUDnTDEm = 1 |

### 25.3.6.3 TAUDnTDL — TAUDn Channel Dead Time Output Level Register

This register selects a phase in which dead time is added.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn_base> + $54_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 15 to 0 | TAUDnTDLm | Selects a phase in which dead time is added.<br>0: Normal phase<br>1: Reverse phase<br>These bit settings are applied when:<br>• TAUDnTOE.TAUDnTOEm, TAUDnTOM.TAUDnTOMm, TAUDnTOC.TAUDnTOCm, TAUDnTDE.TAUDnTDEm = 1 |

## 25.3.7 Details of TAUDn Real-time/Modulation Output Registers

### 25.3.7.1 TAUDnTRE — TAUDn Channel Real-time Output Enable Register

This register enables/disables real-time output.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn_base> + $258_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDn TRE15 | TAUDn TRE14 | TAUDn TRE13 | TAUDn TRE12 | TAUDn TRE11 | TAUDn TRE10 | TAUDn TRE09 | TAUDn TRE08 | TAUDn TRE07 | TAUDn TRE06 | TAUDn TRE05 | TAUDn TRE04 | TAUDn TRE03 | TAUDn TRE02 | TAUDn TRE01 | TAUDn TRE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.41 TAUDnTRE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTREm | Enables or disables real-time output of channel m.<br>0: Disables real-time output<br>1: Enables real-time output.<br>These bit settings are applied only when TAUDnTOE.TAUDnTOEm = 1. When TAUDnTRE.TAUDnTREm = 0, TAUDTTOUTm is not affected by real-time output.<br>When TAUDnTRE.TAUDnTREm = 1, TAUDTTOUTm outputs the value of real-time output bit TAUDnTRO.TAUDnTROm in response to a timer operation. |

### 25.3.7.2 TAUDnTRC — TAUDn Channel Real-time Output Control Register

This register controls the real-time output trigger of each channel.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn_base> + $25C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 25.42 TAUDnTRC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTRCm | Specifies a channel on which the real-time output trigger for channel m is generated.<br>0: Next upper channel with this bit set to 1<br>1: Channel m<br>These bit settings are applied only when TAUDnTRE.TAUDnTREm = 1. |

### 25.3.7.3 TAUDnTRO — TAUDn Channel Real-time Output Register

This register sets a value which is output to TAUDTTOUTm.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn_base> + $04C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.43 TAUDnTRO Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTROm | Sets a value which is output to TAUDTTOUTm.<br>0: Low<br>1: High<br>TAUDnTROm value is not output to TAUDTTOUTm when TAUDnTRE.TAUDnTREm = 0, even if a real-time output trigger occurs. |

### 25.3.7.4 TAUDnTME — TAUDn Channel Modulation Output Enable Register

This register enables/disables modulation output for timer output and real-time output.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn_base> + $050_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 25.44 TAUDnTME Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | TAUDnTMEm | Enables/disables modulation output for timer output and real-time output of channel m.<br>0: Disables modulation<br>1: Enables modulation<br>These bit settings are applied only when TAUDnTOE.TAUDnTOEm and TAUDnTRE.TAUDnTREm = 1. |

## 25.3.8 TAUDn Emulation Register

### 25.3.8.1 TAUDnEMU — TAUDn Emulation Register

This register controls SVSTOP operations.

**Access:** This register can be read or written in 8-bit units.
Perform write operations when the counter is stopped (TAUDnTE.TAUDnTEm = 0) and (EPC.SVSTOP = 0).

**Address:** <TAUDn_base> + $290_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TAUDnSVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 25.45 TAUDnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | TAUDnSVSDIS | When EPC.SVSTOP bit = 0:<br>Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0).<br><br>When EPC.SVSTOP bit = 1:<br>0: The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint).<br>1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## 25.4 Operating Procedure

The following lists the general operation procedure for the TAUDn.

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUDTTOUTm is also initialized and outputs a low level.

(1) Set the TAUDnTPS and TAUDnBRS registers to specify the clock frequency of CK0 to CK3.

(2) Configure the desired TAUDn function:
- Set the operation mode
- Set the channel output mode
- Set any other control bits

(3) Enable the counter by setting the TAUDnTS.TAUDnTSm bit to 1.
The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.

(4) If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUDnTT.TAUDnTTm bit to 1. The counter can be forcibly restarted by setting the TAUDnTS.TAUDnTSm bit to 1.

(5) Stop the function by setting the TAUDnTT.TAUDnTTm bit to 1.

**NOTES**

1. A detailed description of the required control bits and the operation of the individual functions are given in **Section 25.12, Independent Channel Operation Functions** and **Section 25.15, Synchronous Channel Operation Functions**.
2. The function can be changed while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

## 25.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels). Several rules apply to the settings of channels. These rules are detailed in **Section 25.5.1, Rules of Synchronous Channel Operation**.

Two special features for synchronous channel operation are detailed in the following:

- **Section 25.5.2, Simultaneous Start and Stop of Synchronous Channel Counters**
- **Section 25.6, Simultaneous Rewrite**

### 25.5.1 Rules of Synchronous Channel Operation

#### Number of master and slave channels

- Only even channels (CH0, CH2, CH4, …) can be set as master channels. Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 and the lower channels (CH3, CH4, CH5, …) can be set as slave channels.
- If multiple master channels are used, slave channels cannot cross the master channels.
  Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

#### Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the TAUDnCMORm.TAUDnCKS[1:0] bits of the slave and master channel.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 25.4**.

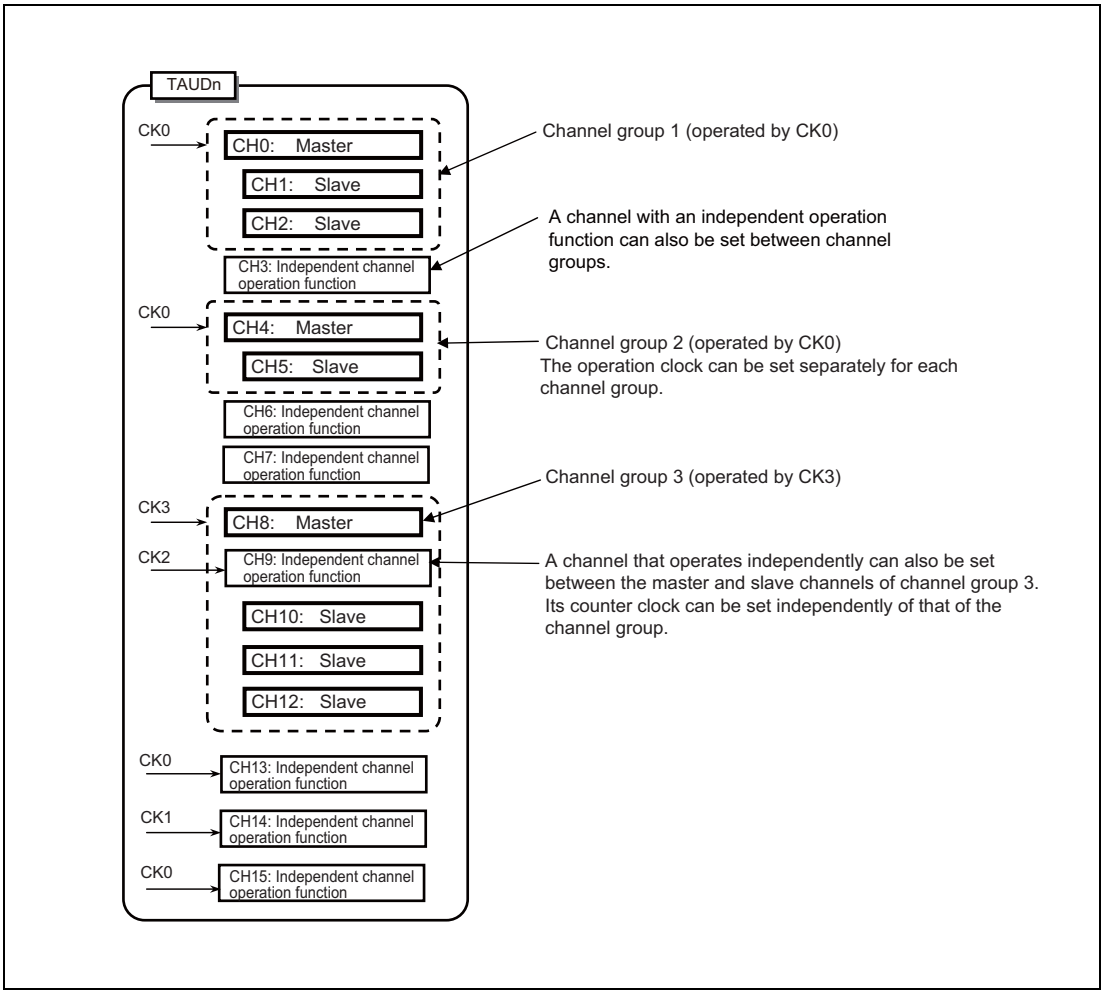

**Figure 25.4 Grouping of Channels and Assignment of Count Clocks**

### Control trigger signal for master/slave channels

- Master channels can output control trigger signals to slave channels.
- Slave channels can use control trigger signals from master channels but cannot output control trigger signals for their own to lower channels.
- Master channels cannot use control trigger signals from upper master channels.

### 25.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit and between the units.

#### 25.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUDnTS.TAUDnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUDnTT.TAUDnTTm bits of the channels should be set at the same time.

Setting to the TAUDnTS.TAUDnTSm bits to 1 also sets the corresponding TAUDnTE.TAUDnTEm bits to 1, enabling counting. The count start timing depends on operating mode.

#### 25.5.2.2 Simultaneous Start between the Units

Counters in different units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

For details about how to perform simultaneous start between the units, see **Section 29.8, Simultaneous Start Trigger Function**.

# 25.6 Simultaneous Rewrite

## 25.6.1 Overview of Operations

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUDnCDRm and TAUDnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUDnIm being issued on the upper channel specified by TAUDnRDC.TAUDnRDCm

There are four methods for simultaneous rewrite. These are listed in **Table 25.46**, along with how to specify them and when they cause simultaneous rewrite to be triggered.

**Table 25.46 Simultaneous Rewrite Methods and when They are Triggered**

| Method | Simultaneous Rewrite Triggered when | TAUDnRDE. TAUDnRDEm | TAUDnRDS. TAUDnRDSm | TAUDnRDM. TAUDnRDMm |
|---|---|---|---|---|
| — | No simultaneous rewrite | 0 | 0 | 0 |
| A | The master channel (re)starts counting | 1 | 0 | 0 |
| B | Counting is started in the master channel. The master channel starts counting down at the peak of triangular cycle of the corresponding slave channel. | 1 | 0 | 1 |
| C1 | INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm | 1 | 1 | 0/1 |
| C2 | INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm that in turn is triggered by an external signal | 1 | 1 | 0/1 |

**Table 25.47** lists which of these four methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 25.14, Independent Channel Simultaneous Rewrite Functions**, **Section 25.15, Synchronous Channel Operation Functions**, and **Section 25.16, Synchronous Non-Complementary and Complementary Modulation Output Functions**.

**Table 25.47 Channel Functions and the Methods They Use for Simultaneous Rewrite**

| Function | A | B | C1 | C2 | TAUDnTOL. TAUDnTOLm |
|---|---|---|---|---|---|
| Simultaneous Rewrite Trigger Output Function Type 1 | | | √ | | |
| PWM Output Function | √ | | √ | | √ |
| One-Shot Pulse Output Function | √ | | | | |
| Trigger Start PWM Output Function | √ | | | √ | |
| Delay Pulse Output Function | √ | | | | |
| Triangle PWM Output Function | | √ | √ | | √ |
| Triangle PWM Output Function with Dead Time | | √ | √ | | |
| Interrupt Request Signals Culling Function | √ | √ | √ | | |
| AD Conversion Trigger Output Function Type 1 | √ | | √ | | |
| AD Conversion Trigger Output Function Type 2 | | √ | √ | | |

| Non-Complementary Modulation Output Function Type 2 | | √ | √ | | |
| Complementary Modulation Output Function | | √ | √ | | |

**Note:** √: Available, (Blank): Unavailable

### 25.6.2 How to Control Simultaneous Rewrite

**Figure 25.5** shows the general procedure for simultaneous rewrite. The three main blocks (initial settings, start and counter count operation, and simultaneous rewrite) are explained afterwards.

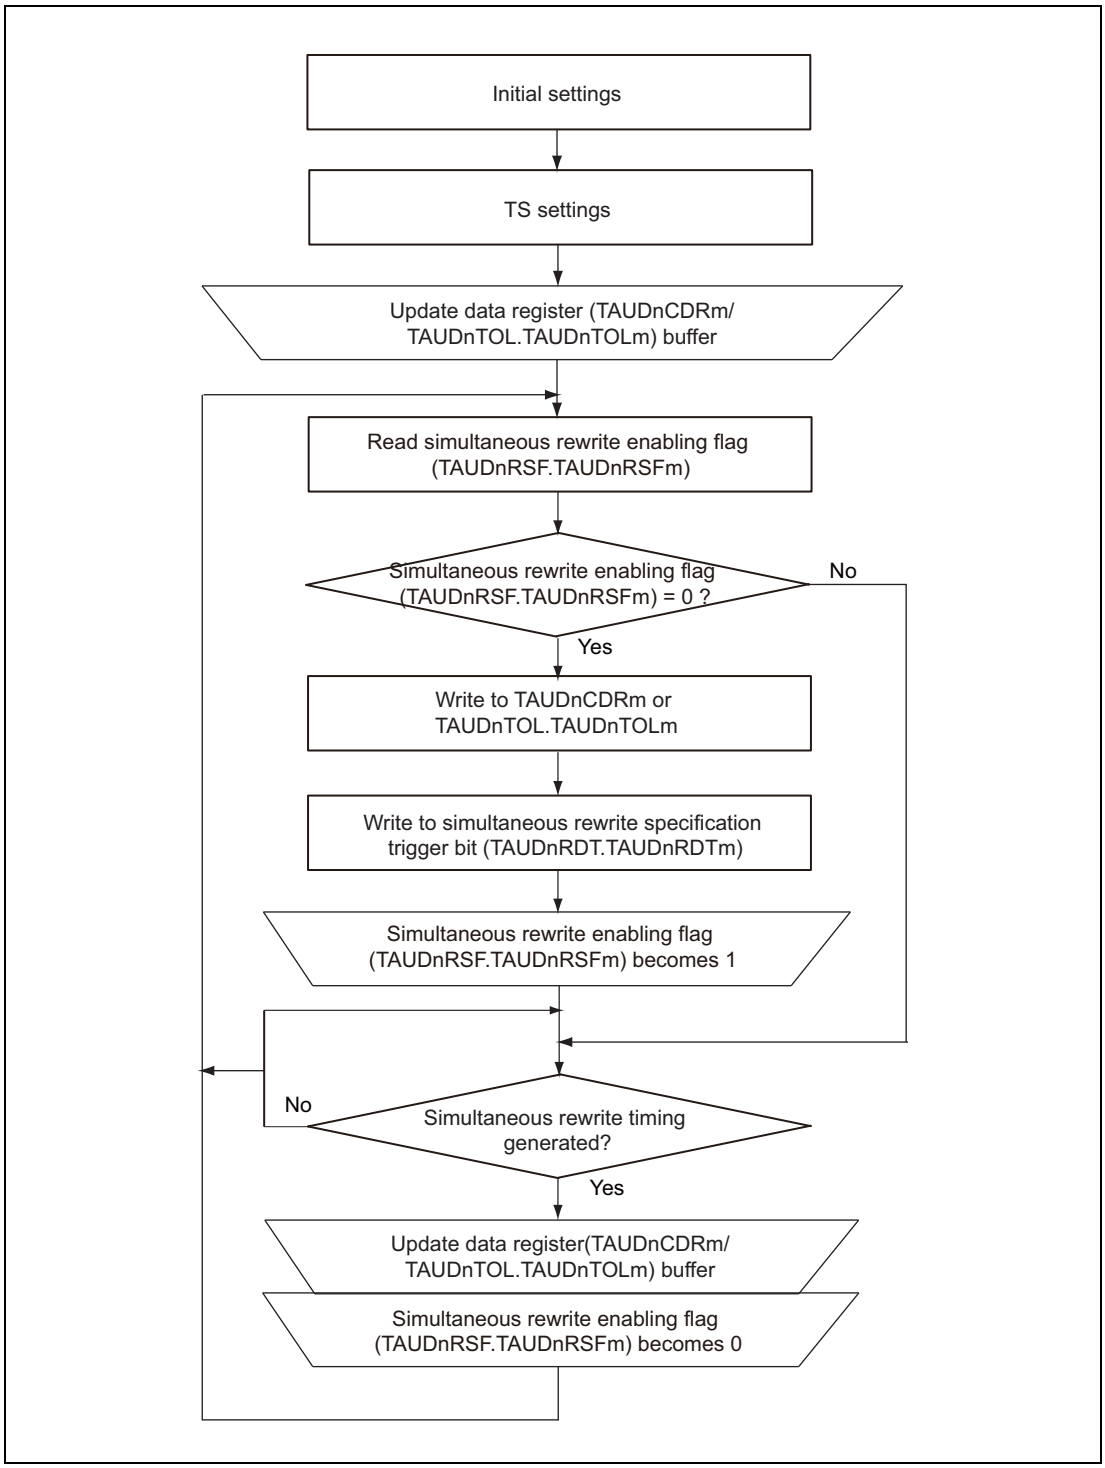

**Figure 25.5 General Procedure for Simultaneous Rewrite**

#### 25.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUDnRDE.TAUDnRDEm = 1
- To select the type of simultaneous rewrite, set TAUDnRDM.TAUDnRDMm and TAUDnRDS.TAUDnRDSm according to the values listed in **Table 25.46, Simultaneous Rewrite Methods and when They are Triggered**.
- Specify a simultaneous rewrite trigger channel by using TAUDnRDC.TAUDnRDCm. (Prerequisite: TAUDnRDS.TAUDnRDSm has been set to the upper channel.)

#### 25.6.2.2 Start Counter and Count Operation

- To start all the TAUDnCNTm counters of the channel group, set the corresponding TAUDnTS.TAUDnTSm bits to 1. The values of TAUDnTOL.TAUDnTOLm and the data registers (TAUDnCDRm) are loaded into the corresponding TAUDnTOL.TAUDnTOLm buffer (TAUDnTOL.TAUDnTOLm buf) and data buffer registers (TAUDnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1 sets the reload flag (TAUDnRSF.TAUDnRSFm) to 1, enabling simultaneous rewrite. TAUDnRSF.TAUDnRSFm remains set to 1 until simultaneous rewrite is completed.
- When the specified trigger for simultaneous rewrite is detected, the TAUDnRSF.TAUDnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1). If it is, simultaneous rewrite is carried out. Otherwise the simultaneous rewrite is not carried out and waits for the next trigger detection.

#### 25.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and are applied the next time the counter starts or restarts.
- When simultaneous rewrite is complete, the TAUDnRSF.TAUDnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

### 25.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUDnRDE.TAUDnRDEm, TAUDnRDS.TAUDnRDSm, TAUDnRDM.TAUDnRDMm, and TAUDnRDC.TAUDnRDCm cannot be changed while the counter is in operation (TAUDnTE.TAUDnTEm = 1).
- TAUDnTOL.TAUDnTOLm can only be rewritten during operation with PWM output function or triangle PWM output function. For all other output functions, TAUDnTOL.TAUDnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUDTTOUTm outputs an invalid wave.
- When an upper channel is used as a channel issuing the simultaneous rewrite trigger (TAUDnRDS.TAUDnRDSm = 1), the TAUDnRDC.TAUDnRDCm bit controls all the lower channels. This means that if the TAUDnRDC.TAUDnRDCm bits of CH2 and CH7 are set to 1 and the TAUDnRDC.TAUDnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger (TAUDnRDE.TAUDnRDEm and TAUDnRDS.TAUDnRDSm = 1) but no upper channel is set (TAUDnRDC.TAUDnRDC[15:0] = 0), simultaneous rewrite cannot take place.

### 25.6.4 Types of Simultaneous Rewrite

In the following section, the four simultaneous rewrite methods are explained using timing diagrams.

#### 25.6.4.1 Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A)

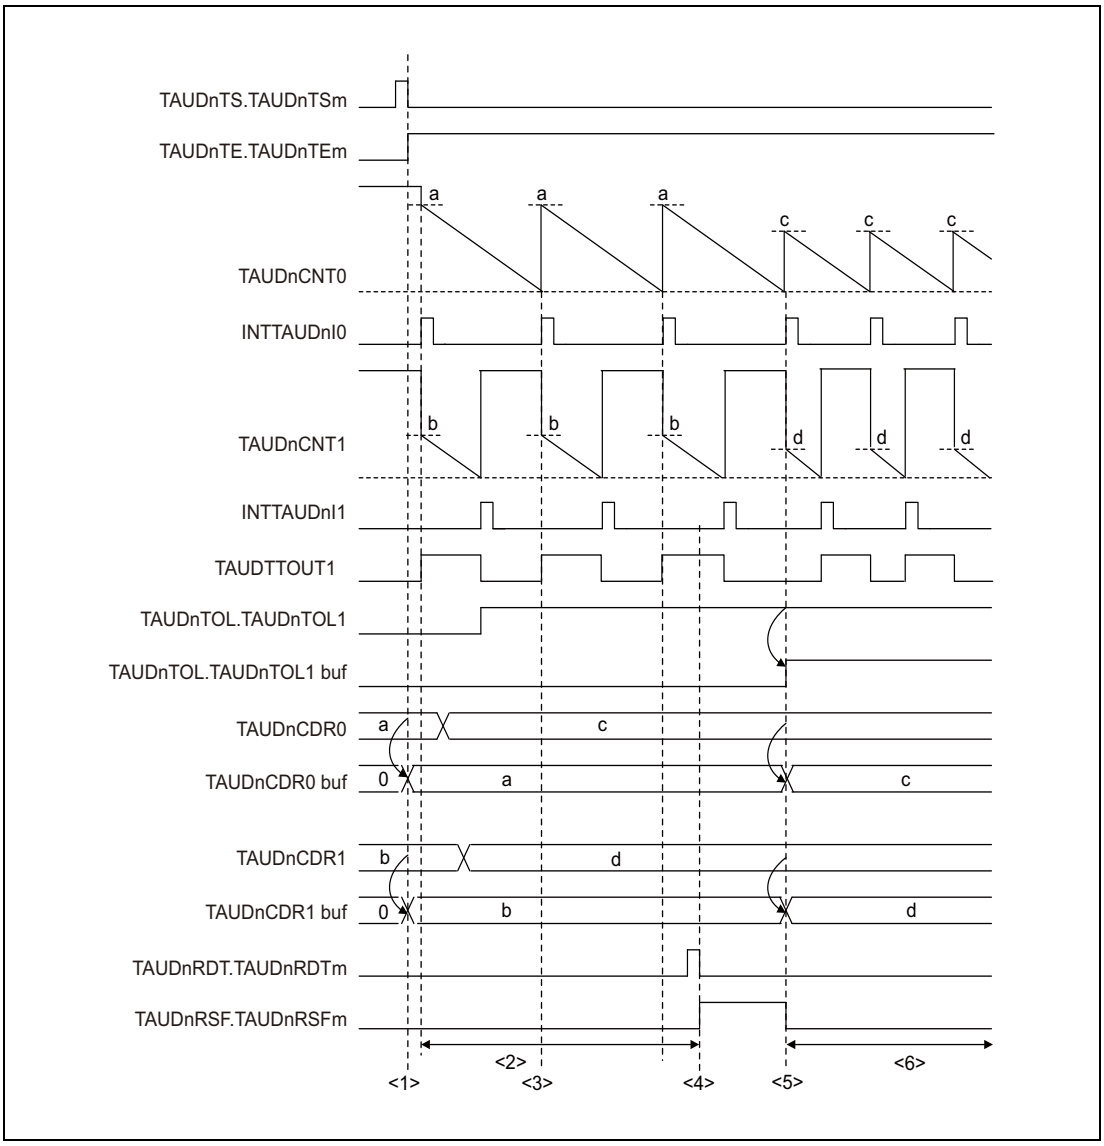

**Figure 25.6 Simultaneous Rewrite when the Master Channel (Re)starts Counting**

**Setting:**

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

**Description:**

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer and TAUDnTOL.TAUDnTOLm value is copied to the TAUDnTOL.TAUDnTOLm buffer.

(2) The TAUDnCDRm and TAUDnTOL.TAUDnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0)

(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.

(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer and the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

### 25.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel (Method B)

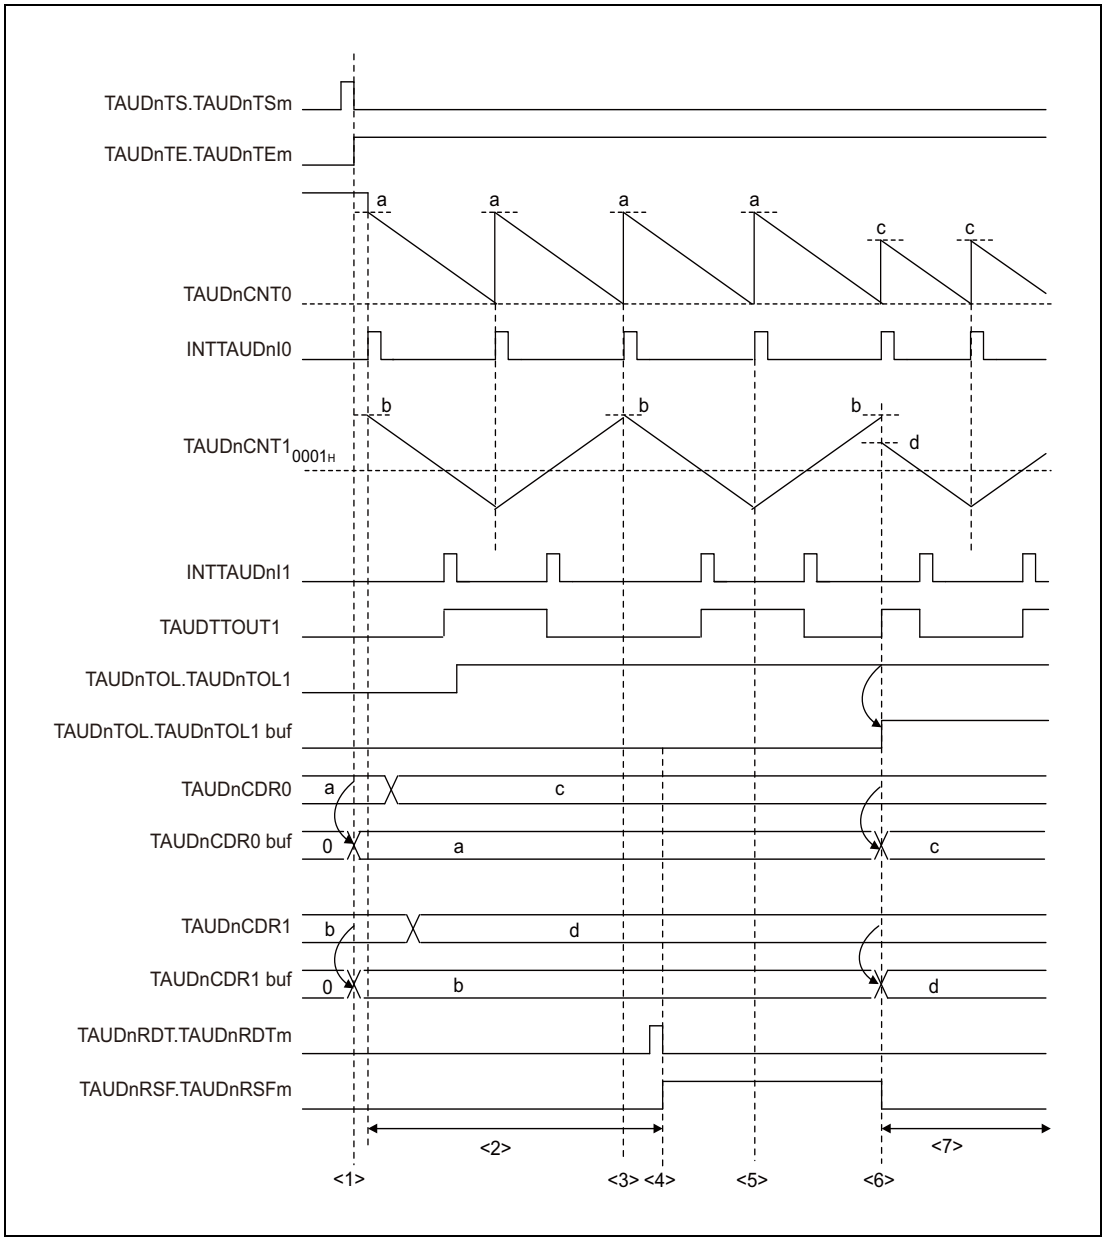

**Figure 25.7 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel**

**Setting:**

CH0 is the master channel which performs counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

**Description:**

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer.

(2) The TAUDnCDRm and TAUDnTOL registers can be written at any time.

(3) Simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0).

(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.

(6) Simultaneous rewrite takes place at the top of the triangular cycle. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer, the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.

(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

#### 25.6.4.3 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1)

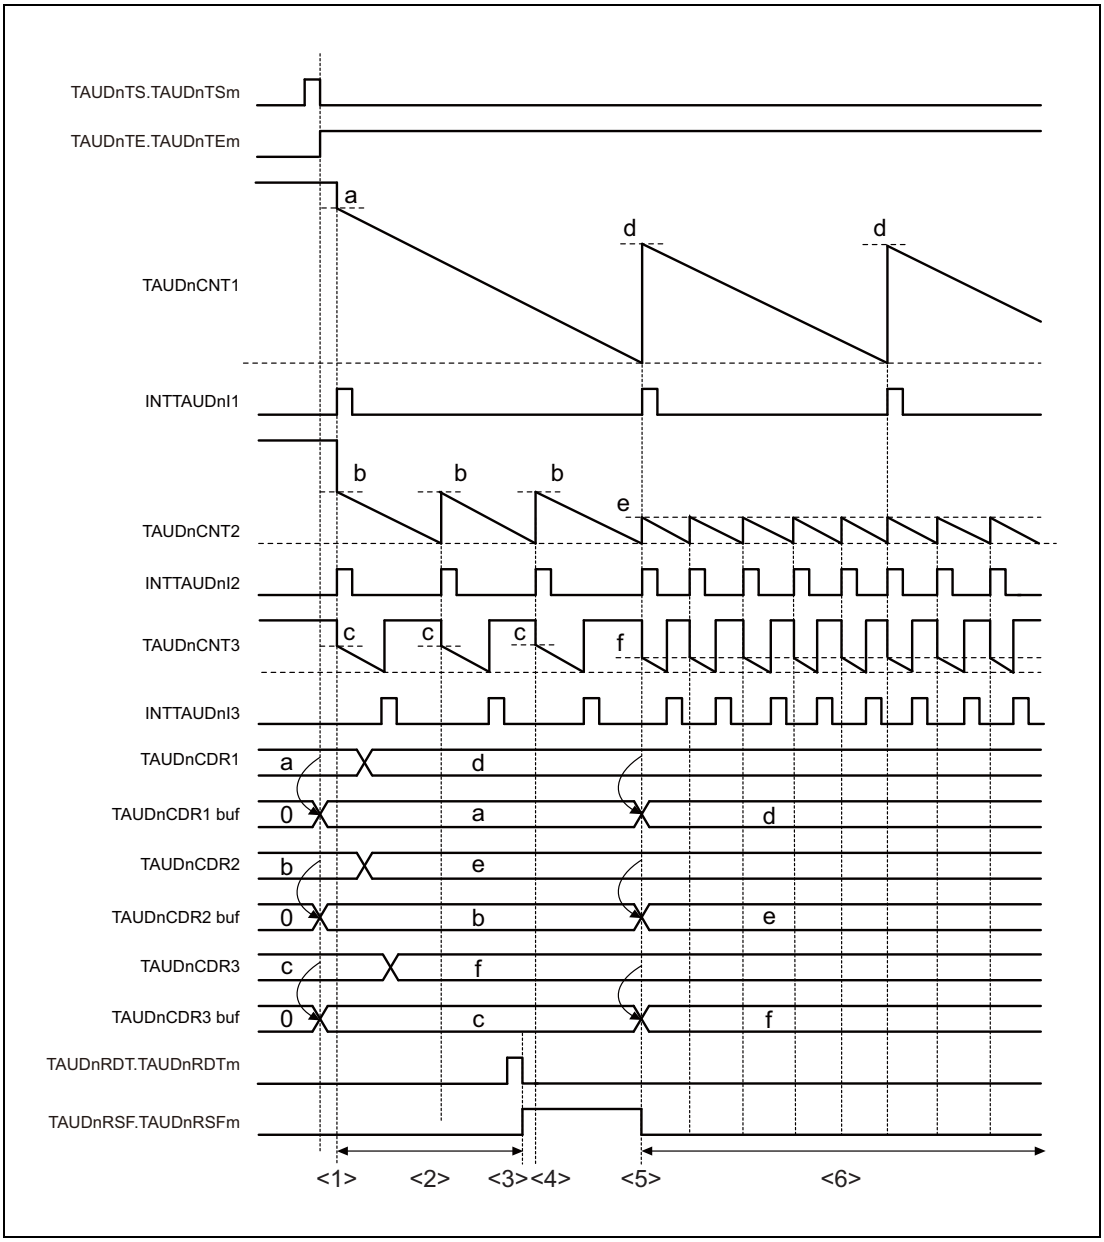

**Figure 25.8 Simultaneous Rewrite When INTTAUDnIm Is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm**

**Setting:**

CH1 is an upper channel which performs counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUDnRDC register specifies a channel which generates simultaneous rewrite triggers.

**Description:**

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer.

(2) The TAUDnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches $0000_H$. The TAUDnCDRm values are loaded into the corresponding TAUDnCDRm buffers.

(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be rechanged.

### 25.6.4.4 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2)

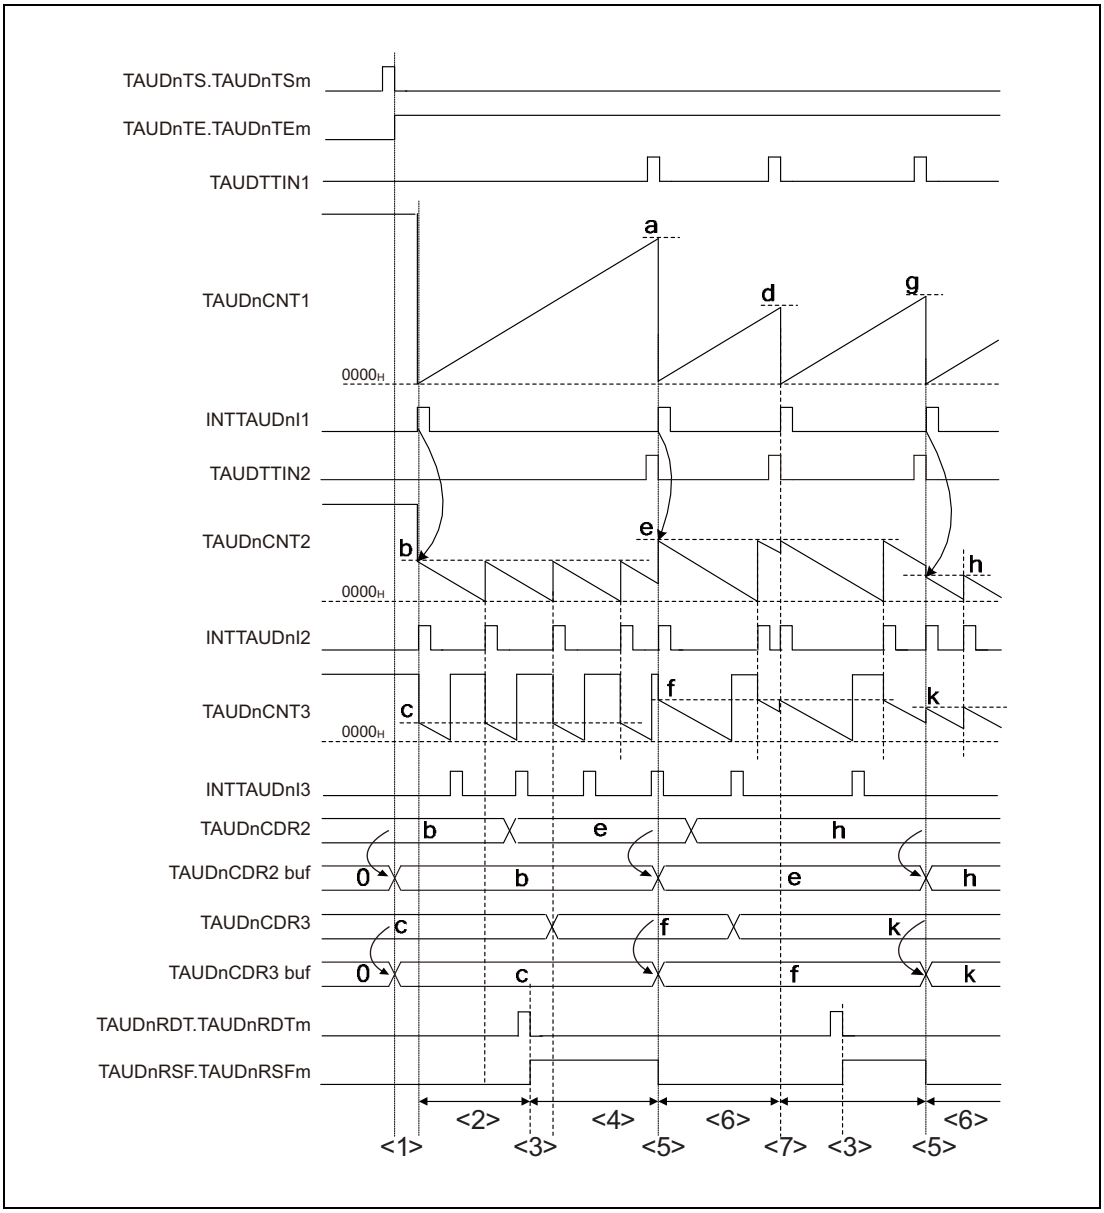

**Figure 25.9 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal**

**Setting:**

CH1 is an upper channel which performs counting up, CH2 is a master channel, and CH3 is the slave channel. The synchronous channel operation method C2 is applied. The TAUDnRDC register specifies which upper channel is monitored for an INTTAUDnIm trigger.

**Description:**

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer. However, as TAUDnCDR1 operates in capture mode, TAUDnCDR1 value is not copied to the TAUDnCDR1 buffer.

(2) The TAUDnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is caused by external signal TIN1. The TAUDnCDRm values are written to the corresponding TAUDnCDRm buffers.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be changed again.

(7) An external signal occurs at TIN2 but simultaneous rewrite does not take place because it is disabled (TAUDnRSF.TAUDnRSFm = 0).

## 25.7 Channel Output Modes

The output of the TAUDTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUDnTOE.TAUDnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUDnTO.TAUDnTOm) is sent to the output pin (TAUDTTOUTm).
- By TAUD signals (TAUDnTOE.TAUDnTOEm = 1)
  When controlled by TAUD signals, the output level of TAUDTTOUTm is set or reset or toggled by internal signals. The value of TAUDnTO.TAUDnTOm is updated accordingly to reflect the value of TAUDTTOUTm.
  - Independently (TAUDnTOM.TAUDnTOMm = 0)
    In case of independent operation, the output of the TAUDTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUDnTOM.TAUDnTOMm = 0).
  - Synchronously (TAUDnTOM.TAUDnTOMm = 1)
    In case of synchronous operation, the output of the TAUDTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUDnTOM.TAUDnTOMm = 1).

The TAUDnTO.TAUDnTOm bit can always be read to determine the current value of TAUDTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

### Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 25.48, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 25.7.2, Channel Output Modes Controlled Independently by TAUDn Signals**
- **Section 25.7.3, Channel Output Modes Controlled Synchronously by TAUDn Signals**

### Batch operation of TAUDnTOm bit

Whether a set value is reflected to the TAUDnTOm bit or not is controlled by the TAUDnTOE.TAUDnTOEm bit.

The TAUDnTOm setting is written only to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 0 when a write to the TAUDnTO register is attempted. No TAUDnTOm setting is reflected to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 1.

**NOTE**

TAUDnTO.TAUDnTOm bit is placed so that its bit number corresponds to a channel number.

### Output logic

Positive logic or negative logic of the output is specified by control bit TAUDnTOL.TAUDnTOLm.

The value of TAUDnTOL.TAUDnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. Otherwise, changes to TAUDnTOL.TAUDnTOLm result in an undefined TAUDTTOUTm signal output.

See **Section 25.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 25.48**.

**Table 25.48 Channel Output Modes**

| Channel Output Mode | TAUDn TOE. TAUDn TOEm | TAUDn TOM. TAUDn TOMm | TAUDn TOC. TAUDn TOCm | TAUDn TDE. TAUDn TDEm | TAUDn TRE. TAUDn TREm | TAUDn TME. TAUDn TMEm | TAUDn TDM. TAUDn TDMm |
|---|---|---|---|---|---|---|---|
| **By software** | | | | | | | |
| Independent channel output mode controlled by software | 0 | X | | | | | |
| **By TAUD signals, independently** | | | | | | | |
| Independent channel output mode 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| with real-time output | | | | | 1 | | |
| Independent channel output mode 2 | | | 1 | | 0 | | |
| **By TAUD signals, synchronously** | | | | | | | |
| Synchronous channel output mode 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| with non-complementary modulation output | | | | | 1 | X | |
| Synchronous channel output mode 2 | | | 1 | 0 | 0 | 0 | 0 |
| with dead time output | | | | 1 | | | |
| with one-phase PWM output | | | | | | | 1 |
| with complementary modulation output | | | | | 1 | 1 | 0 |
| with non-complementary modulation output | | | 1 | 0 | | | |

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

**NOTES**

1. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1):
   - TAUDnTOM.TAUDnTOMm
   - TAUDnTOC.TAUDnTOCm
   - TAUDnTDE.TAUDnTDEm
   - TAUDnTRE.TAUDnTREm
   - TAUDnTDM.TAUDnTDMm
2. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1) except in channel output modes with modulation output:
   - TAUDnTME.TAUDnTMEm
   - TAUDnTDL.TAUDnTDLm

### 25.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUDTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUDnTOE.TAUDnTOEm = 0).

(1) Set TAUDnTO.TAUDnTOm to specify the initial level of the TAUDTTOUTm output.

(2) Set channel output mode according to **Table 25.48, Channel Output Modes**, and the output logic using the TAUDnTOL.TAUDnTOLm bit.

(3) Start the counter (TAUDnTS.TAUDnTSm = 1).

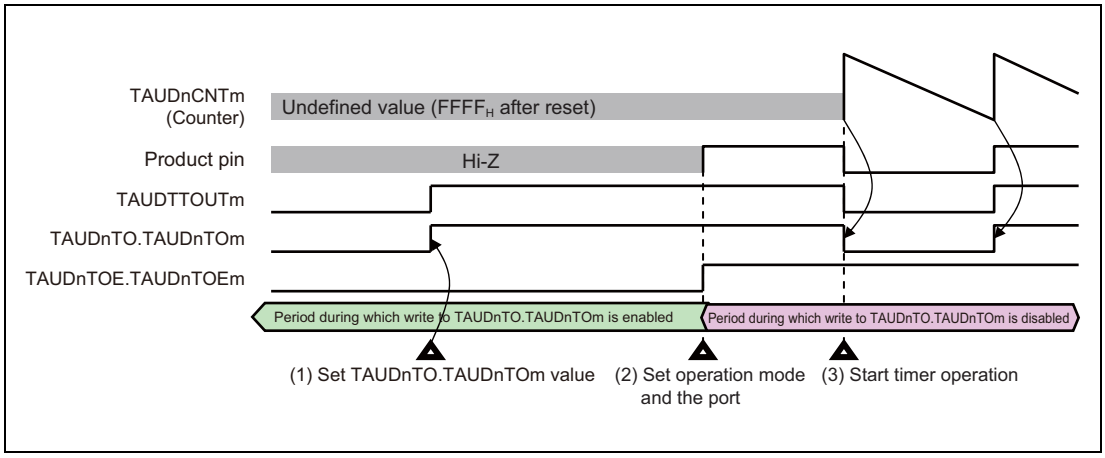

**Figure 25.10 General Procedure for Specifying a TAUDTTOUTm Channel Output Mode**

## 25.7.2 Channel Output Modes Controlled Independently by TAUDn Signals

This section lists the channel output modes that are controlled independently by TAUDn signals. The control bits used to specify a mode are listed in **Table 25.48, Channel Output Modes**.

### 25.7.2.1 Independent Channel Output Mode 1

#### Set/reset conditions

In this output mode, TAUDTTOUTm toggles when INTTAUDnIm is detected. The value of TAUDnTOL.TAUDnTOLm is ignored.

#### Prerequisites

There are no prerequisites other than those shown in **Table 25.48, Channel Output Modes**.

### 25.7.2.2 Independent Channel Output Mode 1 with Real-Time Output

In this output mode, the value of TAUDnTRO.TAUDnTROm bit of the trigger channel is output to TAUDTTOUTm. The trigger channel is specified by setting the corresponding TAUDnTRC.TAUDnTRCm bit to 1. It controls all lower channels for which TAUDnTRC.TAUDnTRCm = 0.

#### Set/reset conditions

The value of TAUDnTRO.TAUDnTROm bit is sent to TAUDTTOUTm only when an INTTAUDnIm interrupt occurs on the trigger channel. The interrupt is generated either:

- at certain specified intervals or
- on detection of a valid TAUDTTINm input edge/counter start

The type of trigger is set using the TAUDnCMORm.TAUDnMD[4:1] bits.

#### Prerequisites

Both the master and slave channels can be set as a trigger generation channel. A channel for which TAUDnTRC.TAUDnTRCm is set to 1 serves as a trigger generation channel regardless of the value of TAUDnTRE.TAUDnTREm.

If there is no channel for which TAUDnTRC.TAUDnTRCm is set to 1 or if TAUDnTRC.TAUDnTRC0 = 0, real-time output cannot take place.

This can be seen in **Figure 25.11**.

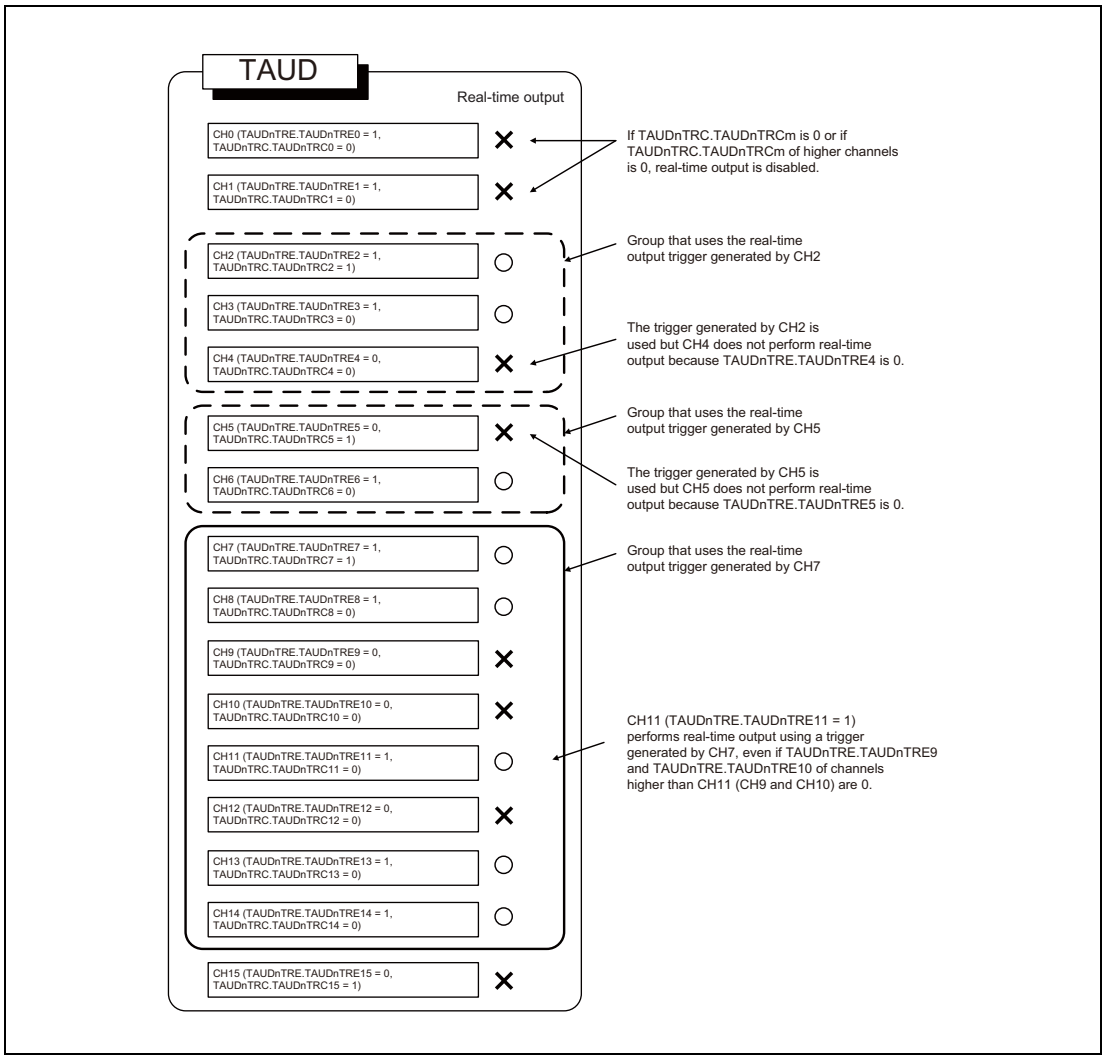

**Figure 25.11 Real-Time Output**

### 25.7.2.3 Independent Channel Output Mode 2

#### Set/reset conditions

In this output mode, TAUDTTOUTm is set when INTTAUDnIm occurs at the time of count start, and reset when INTTAUDnIm occurs due to a match between TAUDnCNTm and TAUDnCDRm.

#### Prerequisites

There are no prerequisites other than those shown in **Table 25.48, Channel Output Modes**.

## 25.7.3 Channel Output Modes Controlled Synchronously by TAUDn Signals

This section lists the channel output modes that are controlled synchronously by TAUDn signals. The control bits used to specify a mode are listed in **Table 25.48, Channel Output Modes**.

### 25.7.3.1 Synchronous Channel Output Mode 1

#### Set/reset conditions

In this output mode, INTTAUDnIm of master channel serves as a set signal and INTTAUDnIm of the slave channel as a reset signal. If INTTAUDnIm of master channel and INTTAUDnIm of the slave channel are generated at the same time, INTTAUDnIm of the slave channel (reset signal) has priority over INTTAUDnIm (set signal) of master channel, i.e., the master channel is ignored.

#### Prerequisites

There are no prerequisites other than those shown in **Table 25.48, Channel Output Modes**.

### 25.7.3.2 Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

#### Set/reset conditions

In this output mode, TAUDTTOUTm outputs the result of an AND operation between the PWM output and the real-time output bit (TAUDnTRO.TAUDnTROm) of a channel.

The phase period to which the dead time is added is specified using the TAUDnTDL.TAUDnTDLm bit; for positive phase set TAUDnTDL.TAUDnTDLm = 0 and for negative phase set TAUDnTDL.TAUDnTDLm = 1.

#### Prerequisites

A set of at least three channels is required to generate the PWM output. The master channel and slave channel 1 generate a period, and slave channel 2 generates the duty cycle. In typical applications, five more slave channels are also used that operate in the same manner as slave channel 2.

Only the PWM output and the real-time output bit of the same channel can be combined.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed, its new value is applied upon detection of INTTAUDnIm on the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on the master channel.

### 25.7.3.3 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is a triangle PWM output at TAUDTTOUTm. For details, see **Section 25.15.7, Triangle PWM Output Function**.

#### Set/reset conditions

TAUDnCNTm of the slave channel counts down and up alternatively. When it passes $0001_H$ it generates an interrupt, causing TAUDTTOUTm to toggle.

**Prerequisites**

A set of two channels is required to generate the triangle PWM output. TAUDTTOUTm should be set to 0 before the function starts.

### 25.7.3.4 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 25.12**.

**Set/reset conditions**

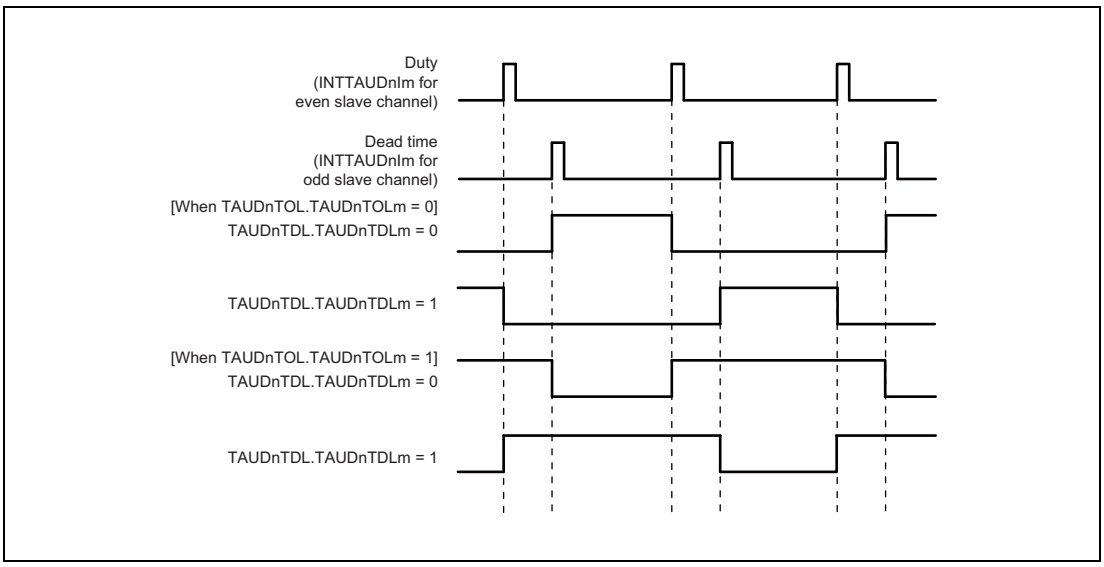

**Figure 25.12 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output**

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

**Prerequisites**

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel
  The master channel should be set to interval timer mode.
- One even slave channel
  The even slave channel should be set to count-up/-down mode.
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm

- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

### 25.7.3.5 Synchronous Channel Output Mode 2 with One-Phase PWM Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 25.13**.

#### Set/reset conditions

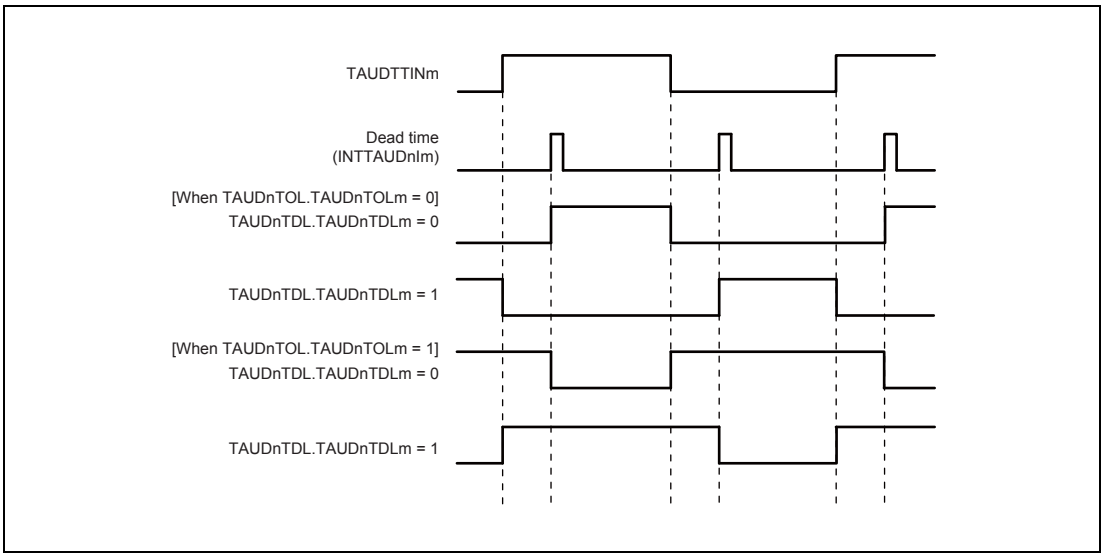

**Figure 25.13 Set/Reset Conditions for Synchronous Channel Output Mode 2 with One-Phase PWM Output**

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

#### Prerequisites

One-phase PWM output control requires a set of two channels:

- One even slave channel
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm
- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

### 25.7.3.6 Synchronous Channel Output Mode 2 with Complementary Modulation Output

#### Set/reset conditions

In this output mode, TAUDTTOUTm outputs a PWM signal, a high signal, or a low signal depending on the value of real-time output bit (TAUDnTRO.TAUDnTROm), the modulation output bit (TAUDnTME.TAUDnTMEm), and the output level bit (TAUDnTOL.TAUDnTOLm) of a pair of slave channels.

For details, see **Section 25.16.3, Complementary Modulation Output Function**.

#### Prerequisites

A set of at least four channels is required for this mode. The master channel and slave channel 1 generate a period, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time. Slave channels 2 and 3 are a pair. In typical applications, four more channels are also used, which operates in the same manner as slave channels 2 and 3 respectively.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed during operation, its new value is applied upon detection of INTTAUDnIm at the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on an even slave channel.

### 25.7.3.7 Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

The difference from synchronous channel output mode 1 with non-complementary modulation output is the PWM wave shape.

Mode 1 has a square wave while mode 2 has a triangular wave.

## 25.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUDnTS.TAUDnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

**CAUTION**

**The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.**

### 25.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUDnTS.TAUDnTSm is set to 1. The value of data register is also loaded when the counter starts.

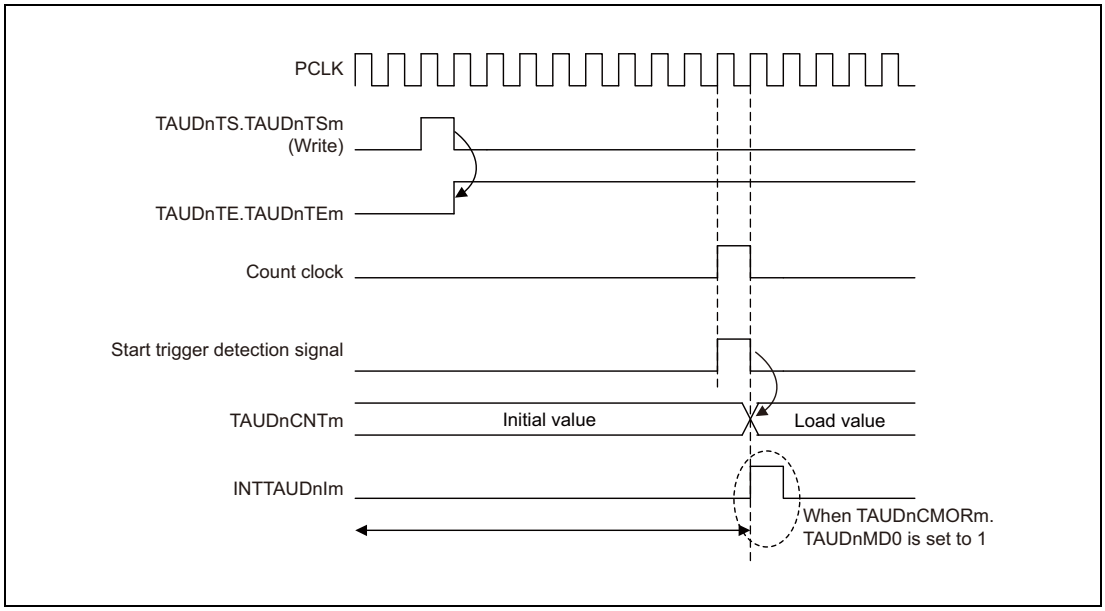

**Figure 25.14 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode**

**NOTE**

Make sure to set TAUDnCMORm.TAUDnMD0 to 0 when using the count-up/-down mode.

### 25.8.2 Event Count Mode

The value of data register is loaded as soon as TAUDnTS.TAUDnTSm is set to 1. The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

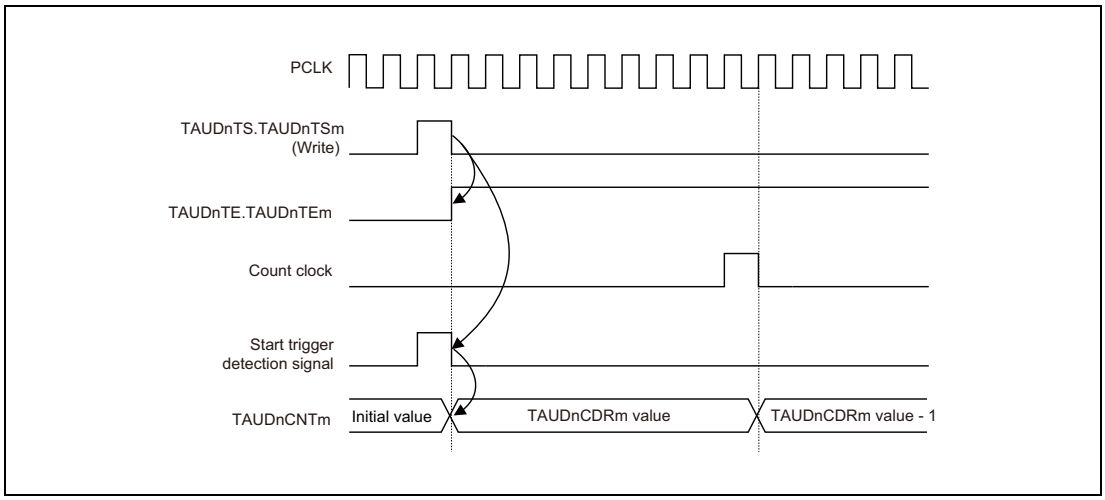

**Figure 25.15 Start Timing in Event Count Mode**

### 25.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUDTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

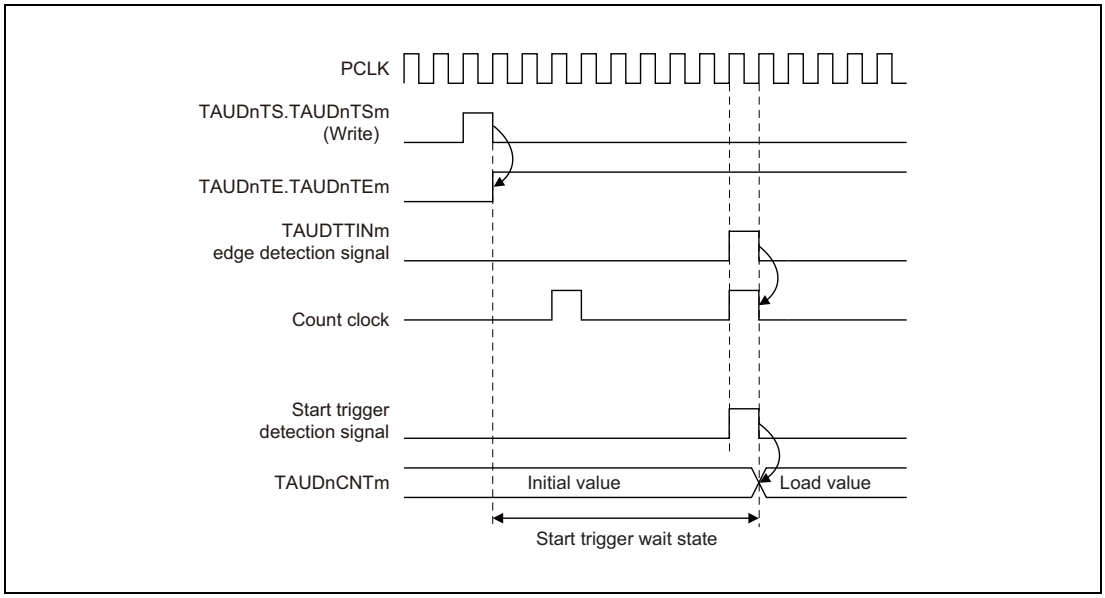

**Figure 25.16 Count Start Timing in Other Operating Modes**

## 25.9 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUDnIm is generated using the TAUDnCMORm.TAUDnMD0 bit. The generation of INTTAUDnIm when the TAUDnCMORm.TAUDnMD0 bit starts counting and the effect to TAUDTTOUTm depend on the selected function. For details, refer to the description of TAUDnCMORm.TAUDnMD0 of each function.

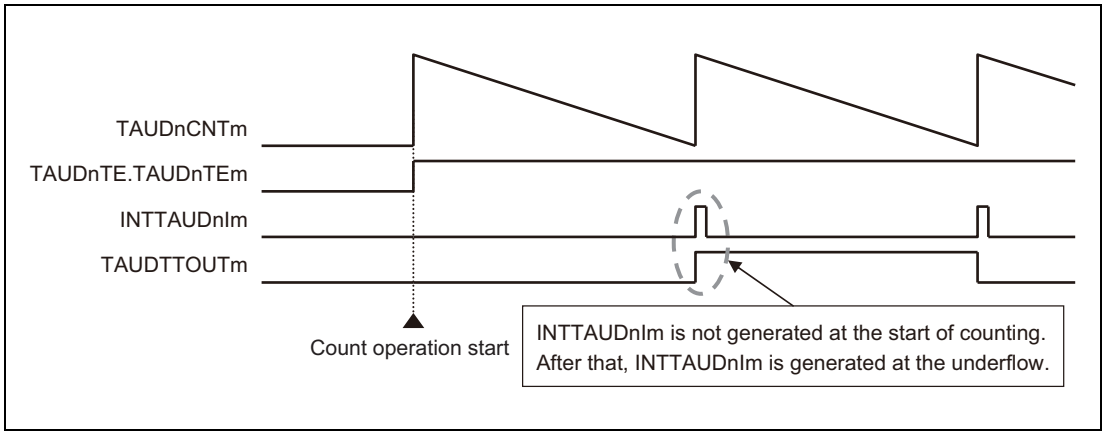

**Figure 25.17 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 = 0)**

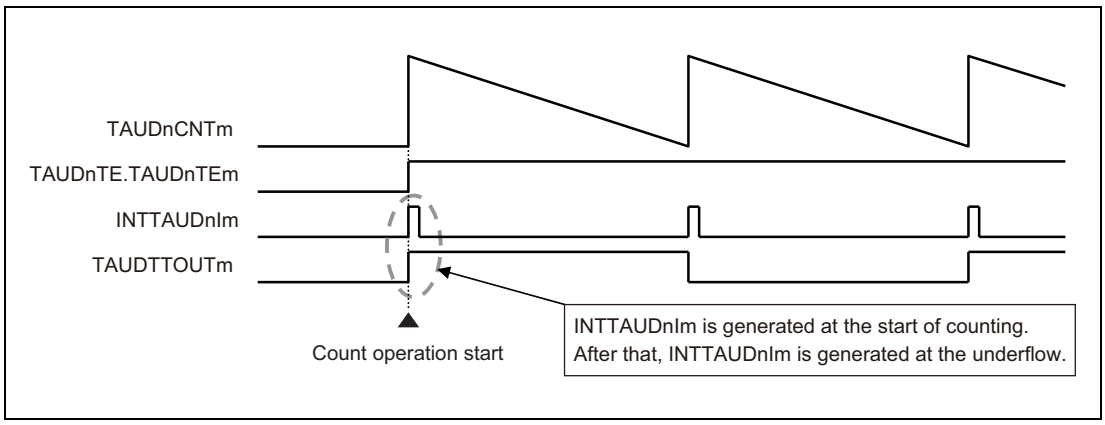

**Figure 25.18 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 = 1)**

## 25.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches $FFFF_H$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches $0000_H$ at the same time as the first channel overflows (TAUDnCNTm = $FFFF_H$).
- Set TAUDnCDRm of the second channel to $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUDTTINm input.
- The trigger detection settings (TAUDnCMORm.TAUDnSTS[2:0] and TAUDnCMURm.TAUDnTIS[1:0]) must be identical for both channels.

**Result:**

The down-counter of the second channel reaches $0000_H$ at exactly the same time as the up-counter of the first channel overflows (TAUDnCNTm = $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

### 25.10.1 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the TAUDTTINm input interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input pulse interval measurement function exceeds $FFFF_H$.

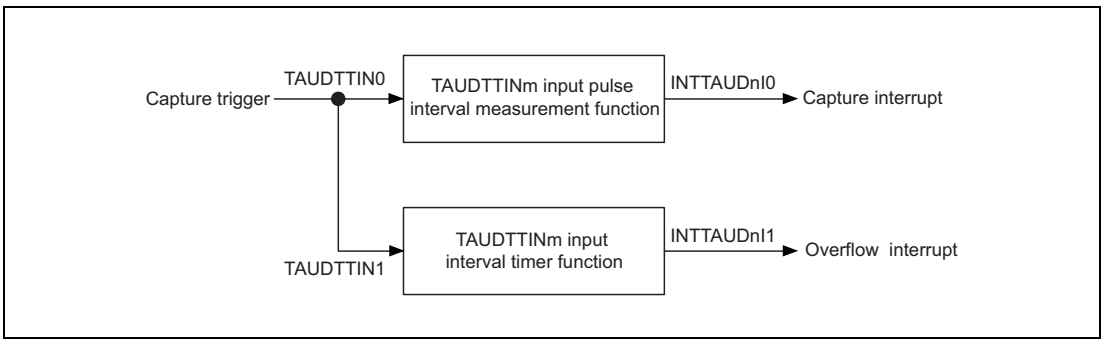

**Figure 25.19 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function**

**Timing diagram**

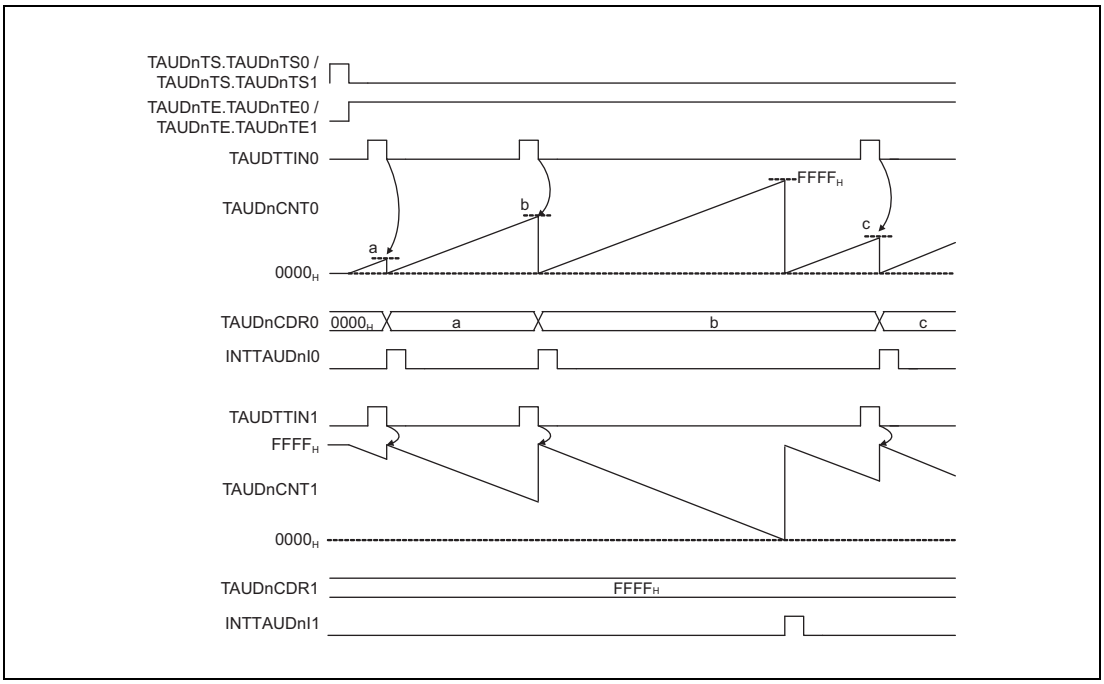

**Figure 25.20 Interrupt Generation via Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function**

### 25.10.2 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at measuring the TAUDTTINm width) can detect the overflow when TAUDnCNTm of the TAUDTTINm input signal width measurement function exceeds $FFFF_H$.

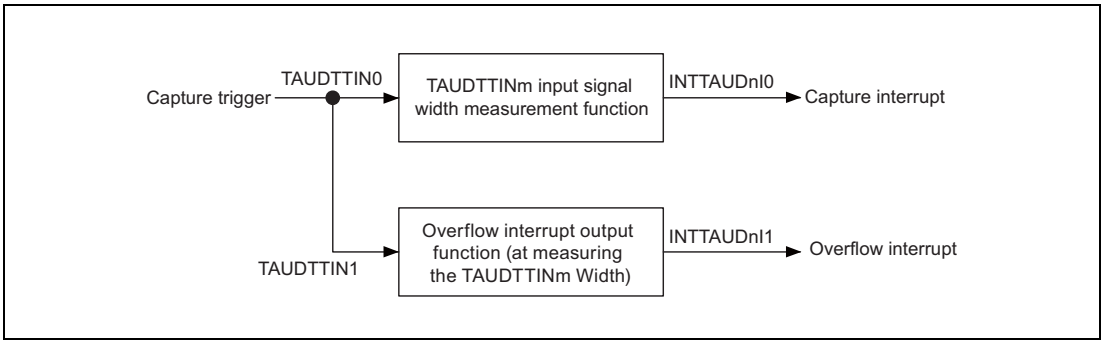

**Figure 25.21 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)**

#### Timing diagram

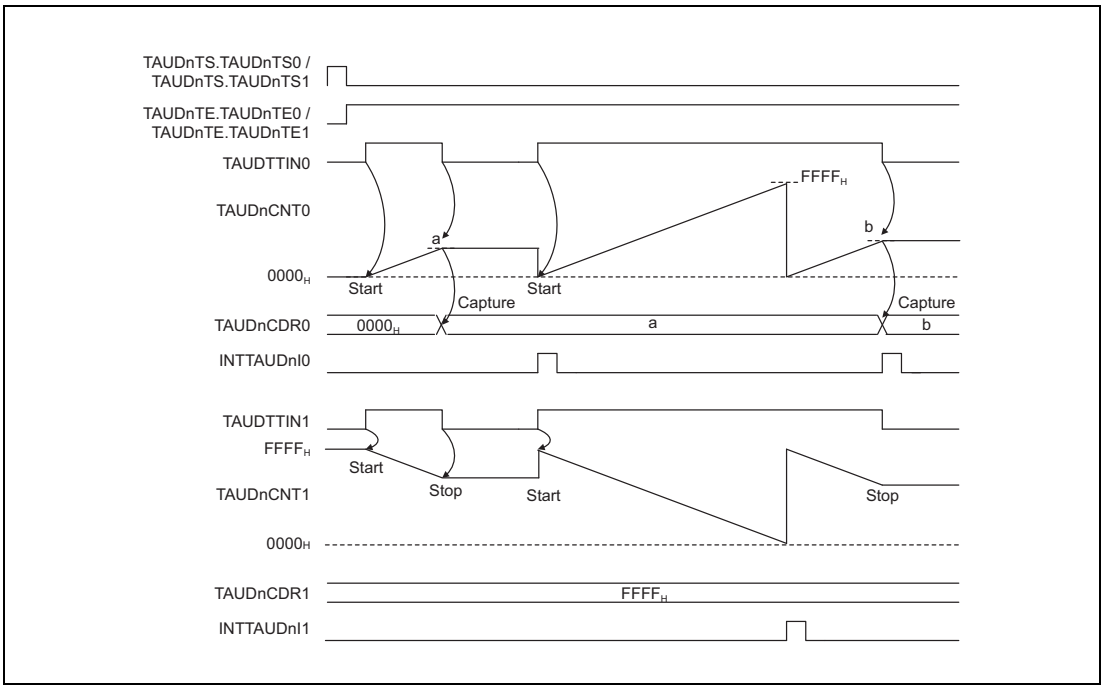

**Figure 25.22 Interrupt Generation via Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)**

### 25.10.3 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUDnIm of the interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input position detection function exceeds $FFFF_H$.

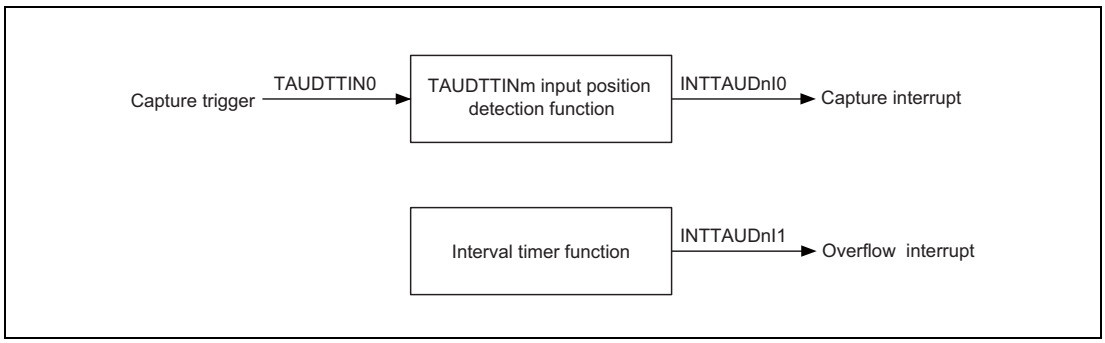

**Figure 25.23 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function**

#### Timing diagram

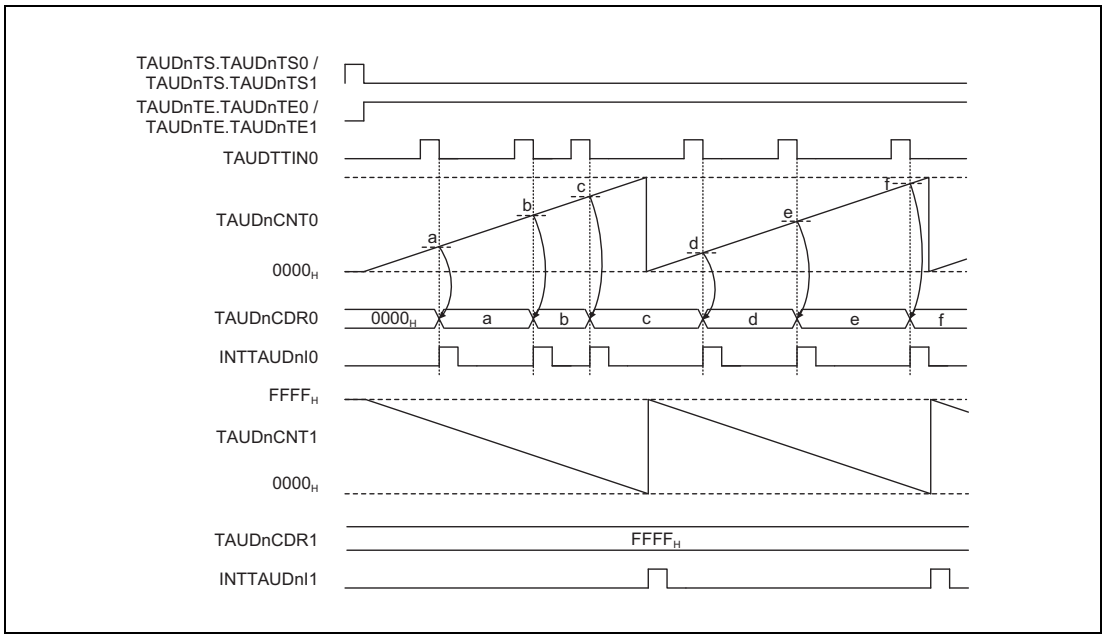

**Figure 25.24 Interrupt Generation via Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function**

### 25.10.4 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at detecting the TAUDTTINm input period count) can detect the overflow when TAUDnCNTm of the TAUDTTINm input period count detection function exceeds $FFFF_H$.

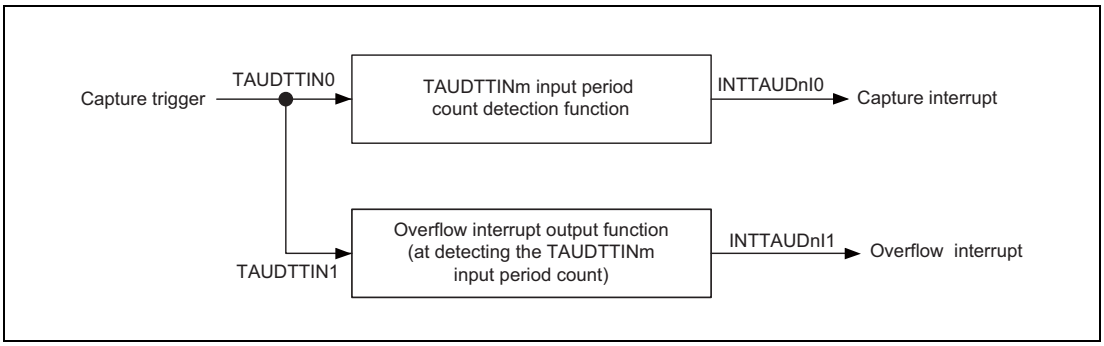

**Figure 25.25 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)**

#### Timing diagram

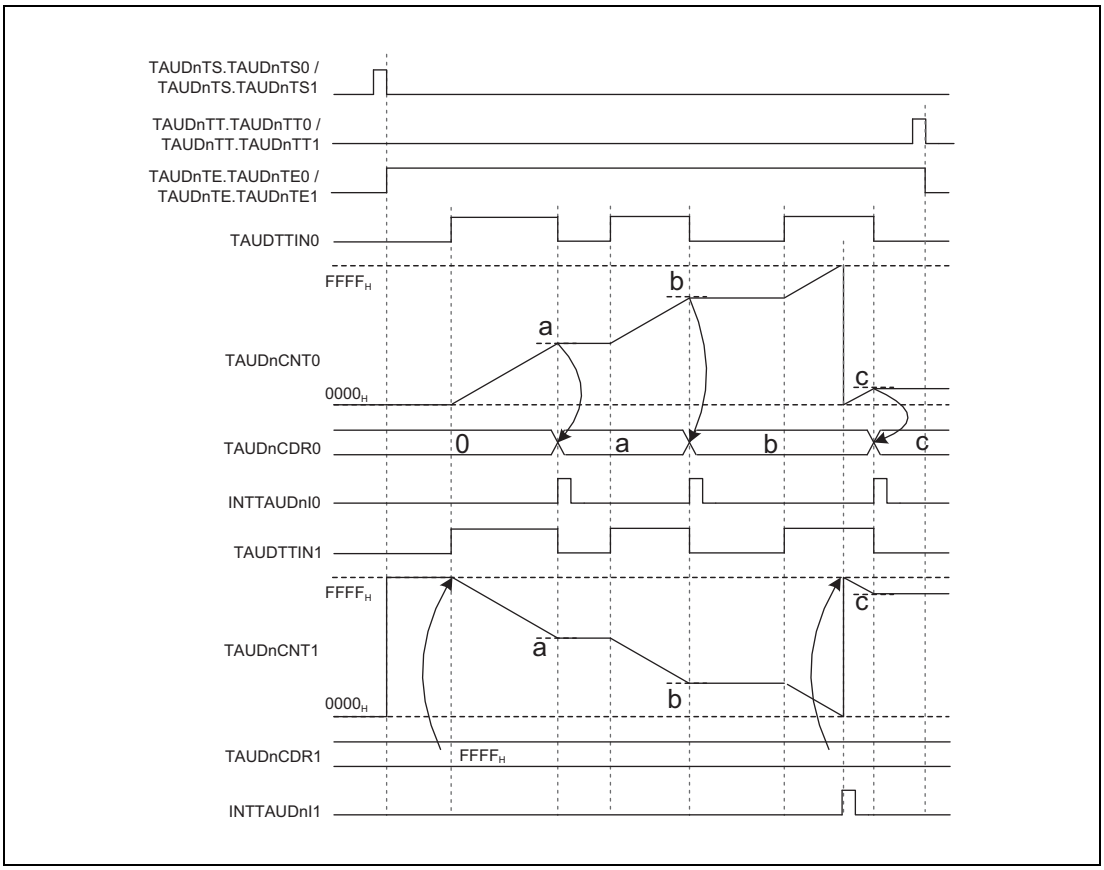

**Figure 25.26 Interrupt Generation via Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)**

## 25.11 TAUDTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

**Figure 25.27** shows when edge detection takes place.

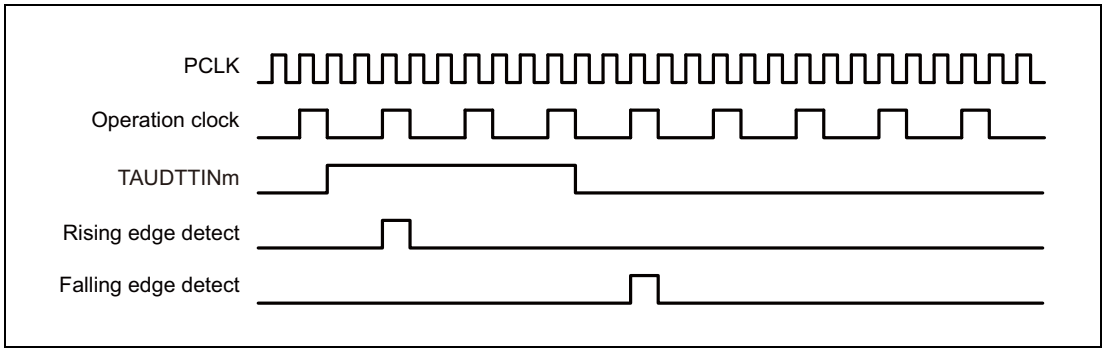

**Figure 25.27 Basic Edge Detection Timing**

**Figure 25.27** shows an operation timing image. Actually, a noise filter or synchronization circuit which is located between the TAUDnIm pin and TAUDn causes a delay time.

## 25.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the Timer Array Unit D. For a general overview of independent channel operation, see **Section 25.2, Overview**.

This section describes functions that generate interrupts at regular intervals or with a specified delay.

### 25.12.1 Interval Timer Function

#### 25.12.1.1 Overview

**Summary**

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

**Prerequisites**

- The operation mode must be set to Interval Timer Mode, see **Table 25.49, Contents of the TAUDnCMORm Register for Interval Timer Function**.
- The channel output mode must be set to Independent Channel Output Mode 1, see **Section 25.7, Channel Output Modes**.

**Functional description**

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is written to TAUDnCNTm and the counter starts to count down from this value.

When the counter reaches $0000_H$, INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and subsequently continues operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.

**Conditions**

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in a negative TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

#### 25.12.1.2 Equations

INTTAUDnIm cycle = count clock cycle × (TAUDnCDRm + 1)

TAUDTTOUTm square wave cycle = count clock cycle × (TAUDnCDRm + 1) × 2

### 25.12.1.3 Block Diagram and General Timing Diagram

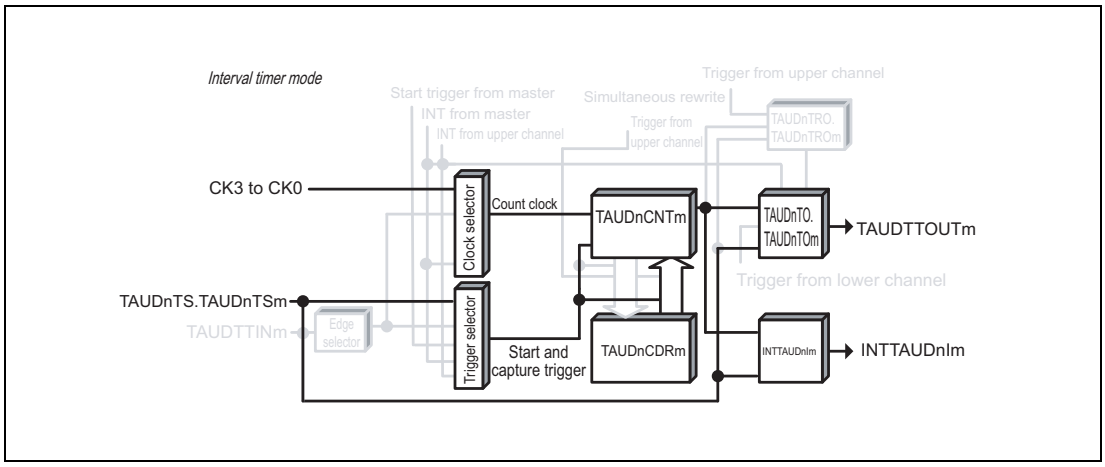

**Figure 25.28 Block Diagram of Interval Timer Function**

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1).

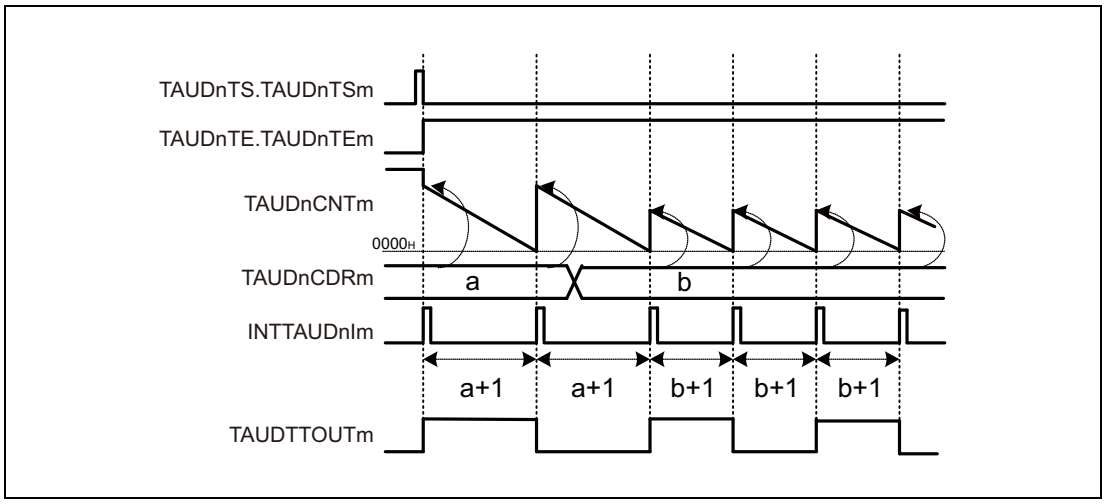

**Figure 25.29 General Timing Diagram of Interval Timer Function**

### 25.12.1.4 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS [1:0] | | TAUDnCCS [1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS [1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.49 Contents of the TAUDnCMORm Register for Interval Timer Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS [1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3 |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Independent operation, set to 0. |
| 10 to 8 | TAUDnSTS[2:0] | 000: Triggers the counter by software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated to toggle TAUDTTOUTm at the beginning of an operation.<br>1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation. |

#### (2) TAUDnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.50 Contents of the TAUDnCMURm Register for Interval Timer Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode

Table 25.51 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRC.TAUDnTRCm | |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

**NOTE**

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Section 25.7, Channel Output Modes**.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the interval timer function. Therefore, these registers should be set to 0.

Table 25.52 Simultaneous Rewrite Settings for Interval Timer Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

### 25.12.1.5 Operating Procedure for Interval Timer Function

Table 25.53 Operating Procedure for Interval Timer Function

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.49, Contents of the TAUDnCMORm Register for Interval Timer Function**, and **Table 25.50, Contents of the TAUDnCMURm Register for Interval Timer Function**.<br><br>Set the value of TAUDnCDRm register.<br><br>Set channel output mode by setting the control bits as described in **Table 25.51, Control Bit Settings in Independent Channel Output Mode 1**. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm to 1.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is set to 1 and the counter starts.<br>The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles. |
| During Operation | The TAUDnCDRm register value can be changed at any time.<br>The TAUDnCNTm register can be read at all times. | TAUDnCNTm counts down. When the counter reaches $0000_H$:<br>• The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues.<br>• INTTAUDnIm is generated and TAUDTTOUTm toggles. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart operation

### 25.12.1.6 Specific Timing Diagrams

#### (1) TAUDnCDRm = $0000_H$, count clock = PCLK/2

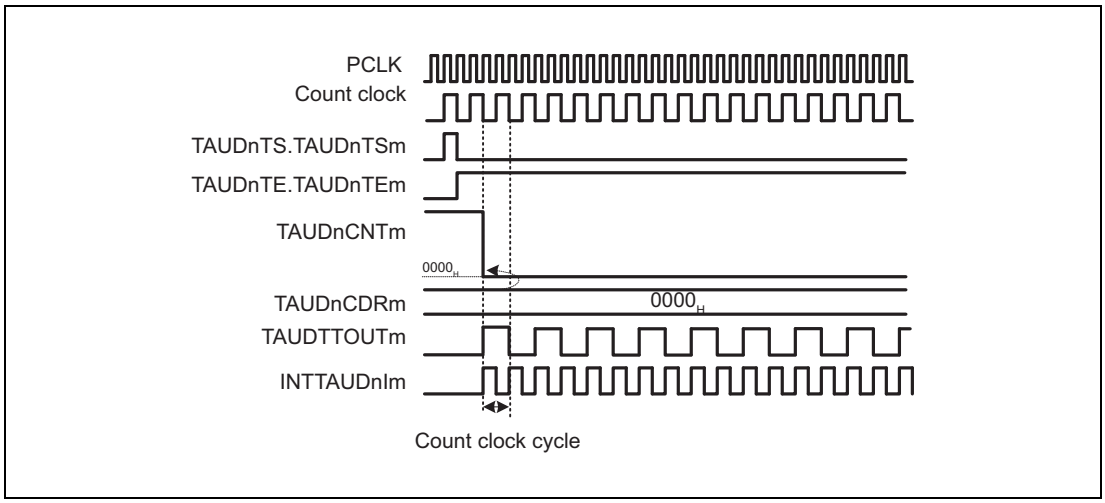

**Figure 25.30 TAUDnCDRm = $0000_H$, Count Clock = PCLK/2**

- If TAUDnCDRm = $0000_H$ and the count clock = PCLK/2, the TAUDnCDRm value is loaded into TAUDnCNTm every count clock, meaning that TAUDnCNTm is always $0000_H$.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

### (2) TAUDnCDRm = $0000_H$, count clock = PCLK

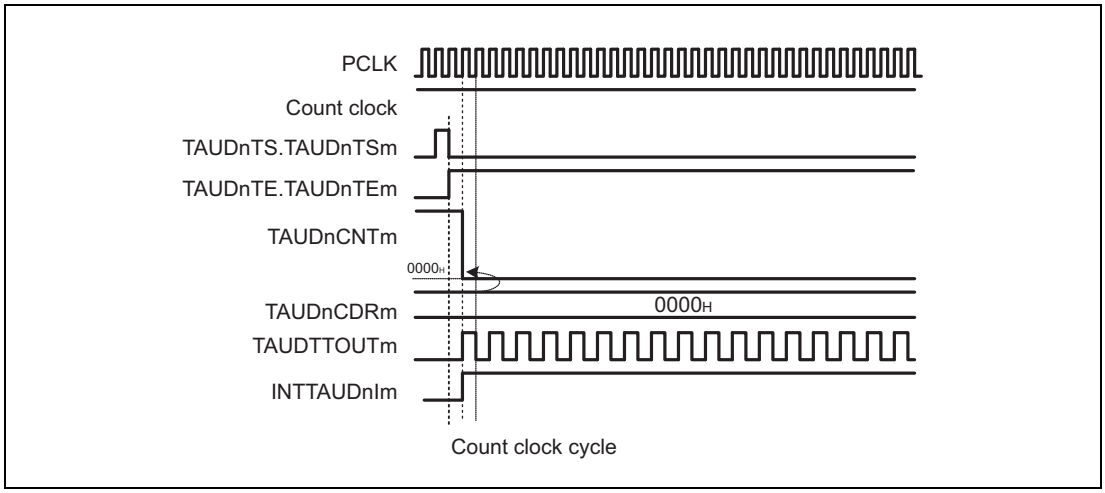

Figure 25.31 TAUDnCDRm = $0000_H$, Count Clock = PCLK

- If TAUDnCDRm = $0000_H$ and the count clock = PCLK, the TAUDnCDRm value is loaded into TAUDnCNTm every PCLK clock, meaning that TAUDnCNTm is always $0000_H$.
- INTTAUDnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
  TAUDTTOUTm is toggled every PCLK clock.

### (3) Operation stop and restart

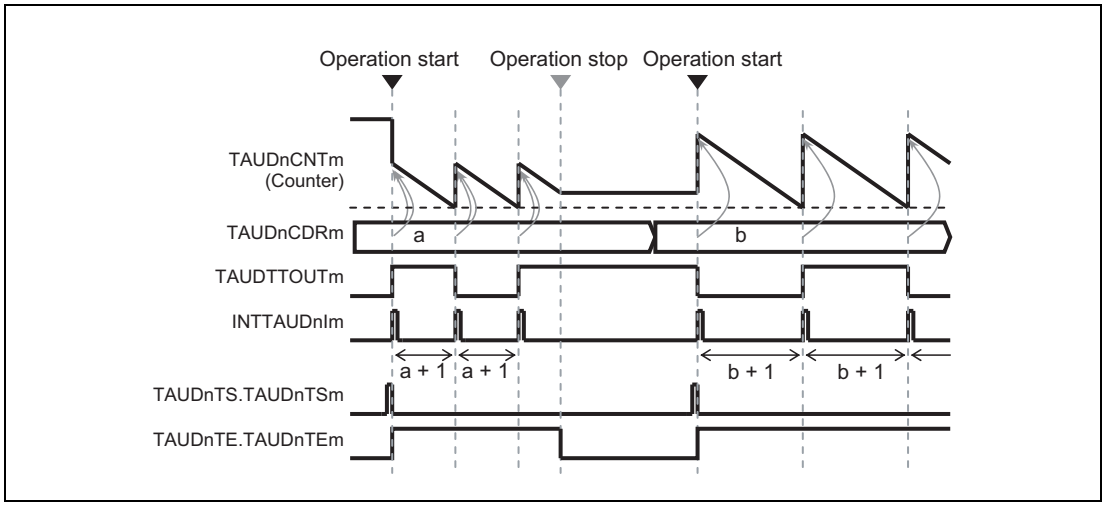

Figure 25.32 Operation Stop and Restart (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

### (4) Forced restart (TAUDnCMORm.TAUDnMD0 = 1)

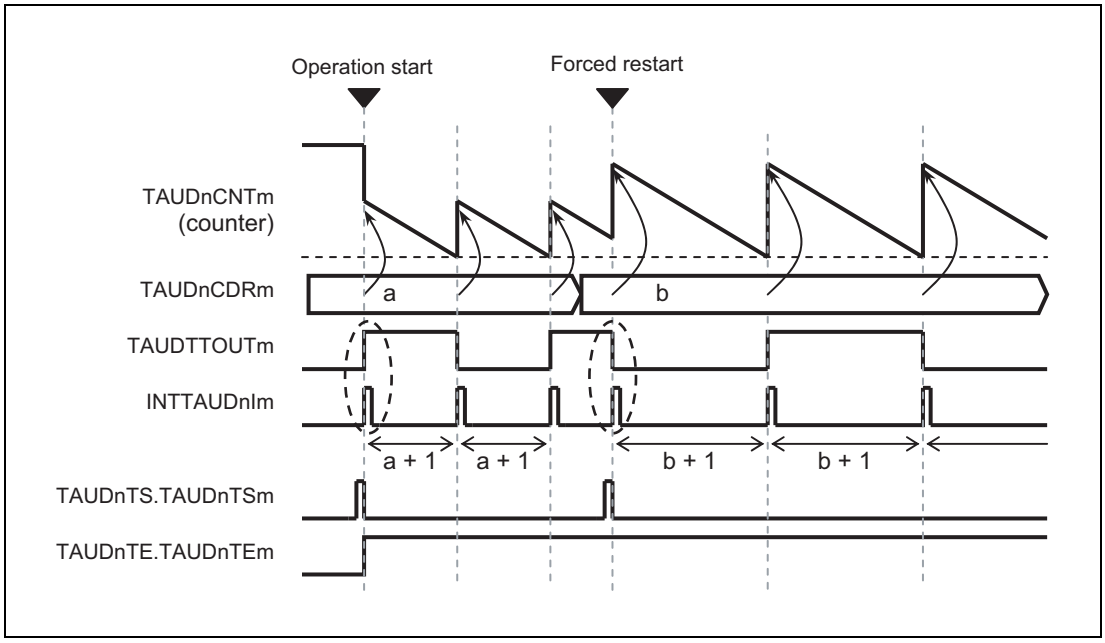

**Figure 25.33 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 1)**

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUDnCDRm value is reflected to TAUDnCNTm and counting starts. Execute a forced restart to reflect the changed TAUDnCDRm value immediately.
- When a forced restart is made, an interrupt (INTTAUDnIm) is generated and TAUDTTOUTm is inverted.

### (5) Forced restart (TAUDnCMORm.TAUDnMD0 = 0)

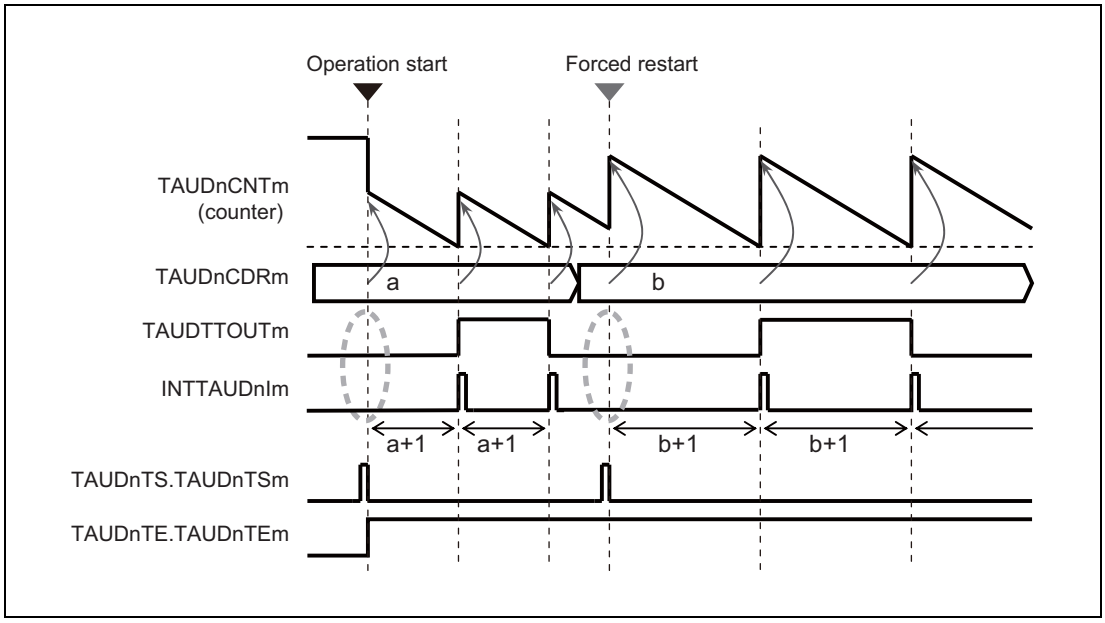

**Figure 25.34 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 0)**

- When a forced restart is made, an interrupt (INTTAUDnIm) is not generated and TAUDTTOUTm is not inverted.

## 25.12.2 TAUDTTINm Input Interval Timer Function

### 25.12.2.1 Overview

#### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals or when a valid TAUDTTINm input edge is detected. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

#### Prerequisites

- The operating mode should be set to interval timer mode. See **Table 25.54, Contents of the TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function**.
- The channel output mode should be set to independent channel output mode 1. See **Section 25.7, Channel Output Modes**.

#### Functional description

This function operates in an identical manner to the interval timer function (see **Section 25.12.1, Interval Timer Function**) except that this function is restarted by a valid TAUDTTINm input edge. The type of edge used as a trigger is specified using the TAUDnCMURm.TAUDnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

### 25.12.2.2 Equations

INTTAUDnIm cycle = count clock cycle × (TAUDnCDRm + 1)

TAUDTTOUTm square wave cycle = count clock cycle × (TAUDnCDRm + 1) × 2

### 25.12.2.3 Block Diagram and General Timing Diagram

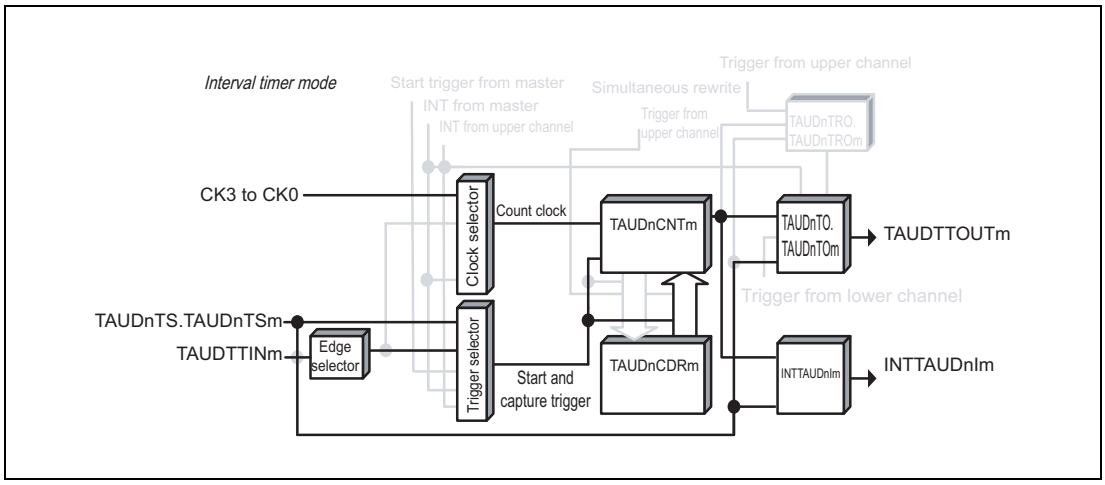

**Figure 25.35 Block Diagram of TAUDTTINm Input Interval Timer Function**

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1).
- Rising edge detection (TAUDnCMURm.TAUDnTIS[1:0] = $01_B$)

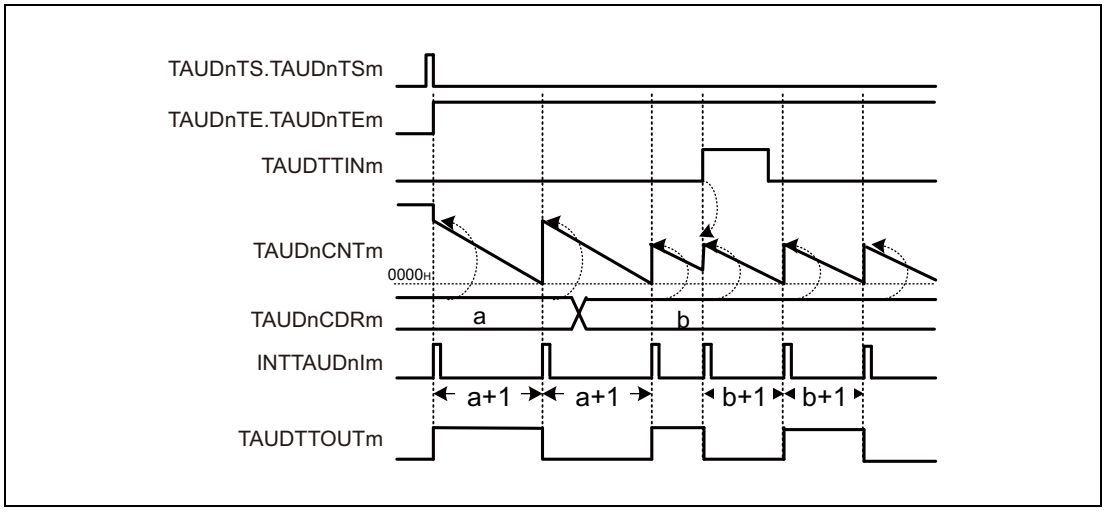

**Figure 25.36 General Timing Diagram of TAUDTTINm Input Interval Timer Function**

### 25.12.2.4 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 1, 0 | TAUDnTIS[1:0] | 00: Detection of falling edge<br>01: Detection of rising edge<br>10: Detection of rising and falling edges<br>11: Setting prohibited |

### (3) Channel output mode

Table 25.56 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1<br>(Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled<br>(TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled<br>(TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRC.TAUDnTRCm | |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Section 25.7, Channel Output Modes**.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm Input Interval Timer Function. Therefore, these registers should be set to 0.

Table 25.57 Simultaneous Rewrite Settings for TAUDTTINm Input Interval Timer Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled<br>(TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

### 25.12.2.5 Operating Procedure for TAUDTTINm Input Interval Timer Function

Table 25.58 Operating Procedure for TAUDTTINm Input Interval Timer Function

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.54, Contents of the TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function**, and **Table 25.55, Contents of the TAUDnCMURm Register for TAUDTTINm Input Interval Timer Function**.<br><br>Set the value of TAUDnCDRm register.<br><br>Set channel output mode by setting the control bits as described in **Table 25.56, Control Bit Settings in Independent Channel Output Mode 1**. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm to 1.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is set to 1 and the counter starts.<br>The TAUDnCDRm value is loaded in TAUDnCNTm.<br>When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles. |
| During Operation | The values of the TAUDnCMURm.TAUDnTIS[1:0] and the TAUDnCDRm register are changeable at any time.<br>The TAUDnCNTm register can be read at all times.<br><br>Detection of TAUDTTINm edge | TAUDnCNTm counts down. When the counter reaches $0000_H$:<br>• The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues.<br>• INTTAUDnIm is generated and TAUDTTOUTm toggles.<br>When a TAUDTTINm input valid edge is detected during count operation, the TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues.<br>Afterwards, this procedure is repeated. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart Operation

### 25.12.2.6 Specific Timing Diagrams

The timing diagrams in **Section 25.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by a valid TAUDTTINm input edge.

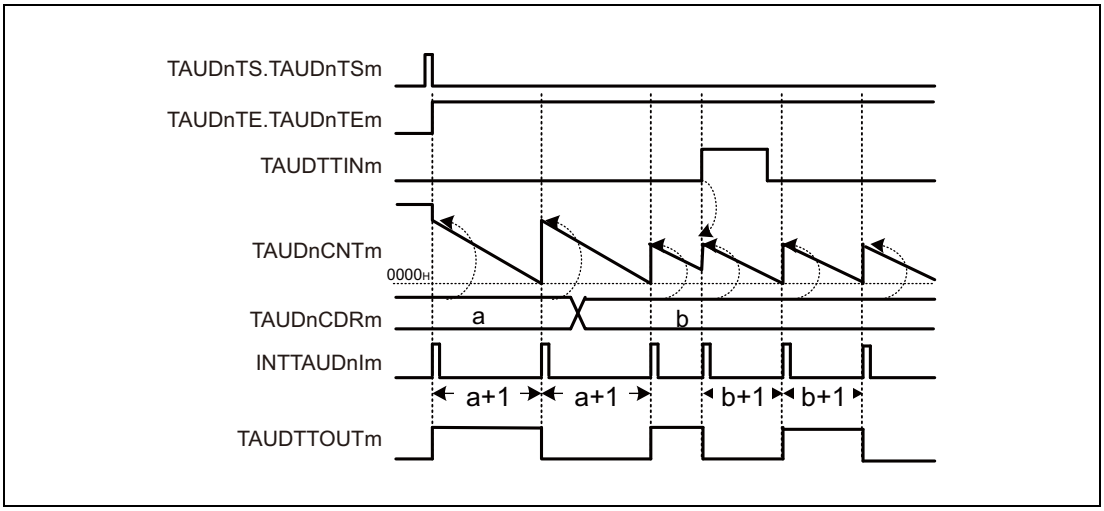

**Figure 25.37 Counter Triggered by Rising TAUDTTINm Input Edge (TAUDnCMURm.TAUDnTIS[1:0] = $01_B$), TAUDnCMORm.TAUDnMD0 = 1**

- If a valid TAUDTTINm input edge is detected, an interrupt is generated which causes TAUDTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUDnCMURm.TAUDnTIS[1:0] = $01_B$)

## 25.12.3 Clock Divide Function

### 25.12.3.1 Overview

#### Summary

This function is used as a frequency divider. The frequency of the input signal TAUDTTINm is divided by a factor related to TAUDnCDRm, and the resulting signal is output to TAUDTTOUTm.

#### Prerequisites

- TAUDTTINm should have a fixed frequency.
- The operating mode should be set to interval timer mode. (See **Table 25.59, Contents of the TAUDnCMORm Register for Clock Divide Function**.)
- The channel output mode should be set to independent channel output mode 1. (See **Section 25.7, Channel Output Modes**.)

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value, using TAUDTTINm as a count clock.

When the counter value reaches $0000_H$, INTTAUDnIm occurs and TAUDTTOUTm signal is toggled. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The value of TAUDnCDRm can be rewritten at any time. The changed value of TAUDnCDRm is applied when the counter starts to count down next time.

The counter can be stopped by setting TAUDnTT.TAUDnTTm = 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The function can be restarted by setting TAUDnTS.TAUDnTSm = 1. The counter can also be forcibly restarted without making a stop by setting TAUDnTS.TAUDnTSm = 1 during operation (forced restart).

#### Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in a negative TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

**NOTE**

TAUDTTINm input signals are sampled at the frequency of the operation clock set by TAUDnCMORm.TAUDnCKS[1:0] bits. Therefore, the TAUDTTOUTm output clock cycle has an error of ± 1 operation clock cycle.

### 25.12.3.2 Equations

- When rising edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/[(TAUDnCDRm + 1) × 2]
- When falling edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/[(TAUDnCDRm + 1) × 2]
- When falling and rising edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/(TAUDnCDRm + 1)

### 25.12.3.3 Block Diagram and General Timing Diagram

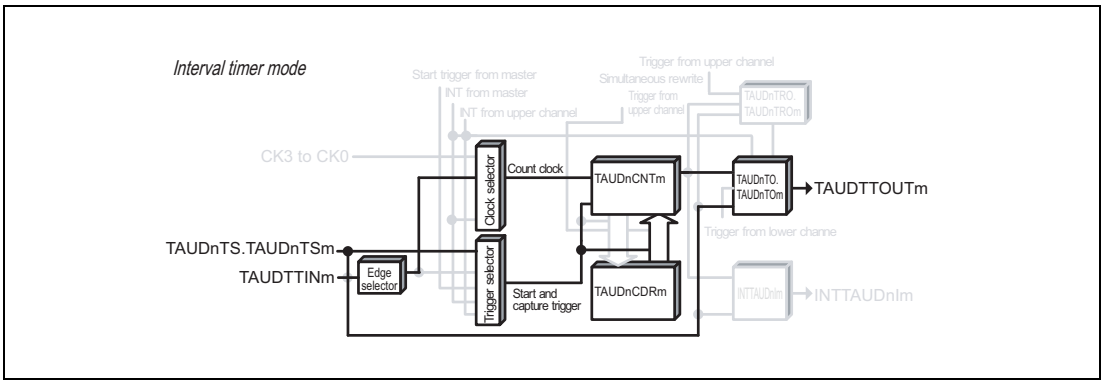

**Figure 25.38 Block Diagram of Clock Divide Function**

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = $01_B$)

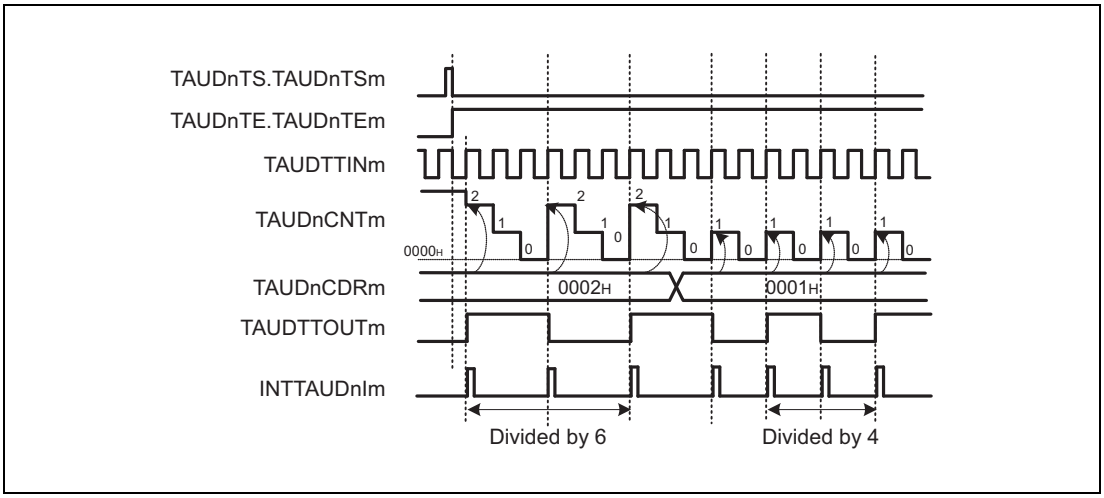

**Figure 25.39 General Timing Diagram of Clock Divide Function**

**Table 25.60 Contents of the TAUDnCMURm Register for Clock Divide Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Detection of falling edge<br>01: Detection of rising edge<br>10: Detection of rising and falling edges<br>11: Setting prohibited |

### (3) Channel output mode

Table 25.61 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRC.TAUDnTRCm | |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the clock divide function. Therefore, these registers should be set to 0.

Table 25.62 Simultaneous Rewrite Settings for Clock Divide Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

### 25.12.3.5 Operating Procedure for Clock Divide Function

Table 25.63 Operating Procedure for Clock Divide Function

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.59, Contents of the TAUDnCMORm Register for Clock Divide Function**, and **Table 25.60, Contents of the TAUDnCMURm Register for Clock Divide Function**.<br><br>Set the value of TAUDnCDRm register.<br><br>Set channel output mode by setting the control bits as described in **Table 25.61, Control Bit Settings in Independent Channel Output Mode 1**. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm to 1.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is set to 1 and the counter starts.<br>TAUDnCNTm loads TAUDnCDRm value. | During Operation | The value of TAUDnCDRm is changeable at any time.<br>The TAUDnCNTm register can be read at all times. | TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When the counter reaches $0000_H$:<br>• TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues.<br>• INTTAUDnIm is generated.<br>• TAUDTTOUTm is toggled.<br>Afterwards, this procedure is repeated. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops. TAUDnCNTm and TAUDTTOUTm retain their current values. |

Restart Operation

### 25.12.3.6 Specific Timing Diagrams

#### (1) TAUDnCDRm = $0000_H$

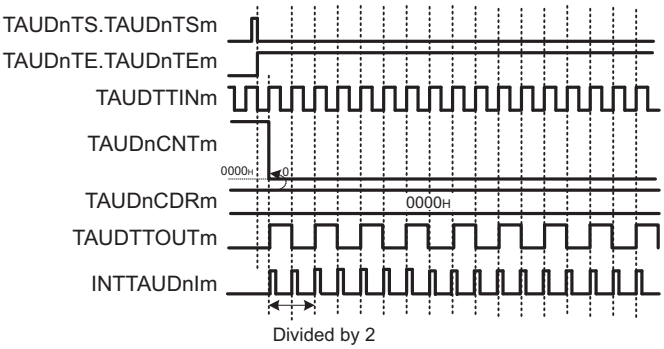

**Figure 25.40 TAUDnCDRm = $0000_H$, TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = $01_B$**

- If TAUDnCDRm is $0000_H$, TAUDnCNTm is always $0000_H$.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

**Figure 25.40** shows an operation timing example. Actually, there is a delay from TINm detection until TOUTm output because of the delay time of a noise filter or synchronization circuit placed between the TAUDnIm pin and TAUDn.

#### (2) Operation restart

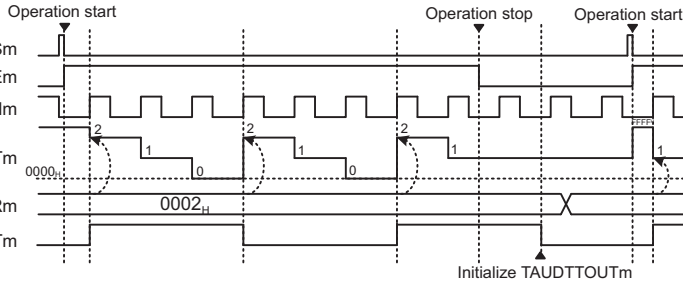

**Figure 25.41 Operation Restart (TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = $01_B$)**

To reset the value of TAUDTTOUTm:

- Set TAUDnTOE.TAUDnTOEm = 0 when the counter is stopped (TAUDnTE.TAUDnTEm = 0).
- Then, write either 0 or 1 to TAUDnTO.TAUDnTOm to set the new start value of TAUDTTOUTm.

### (3) Forced restart

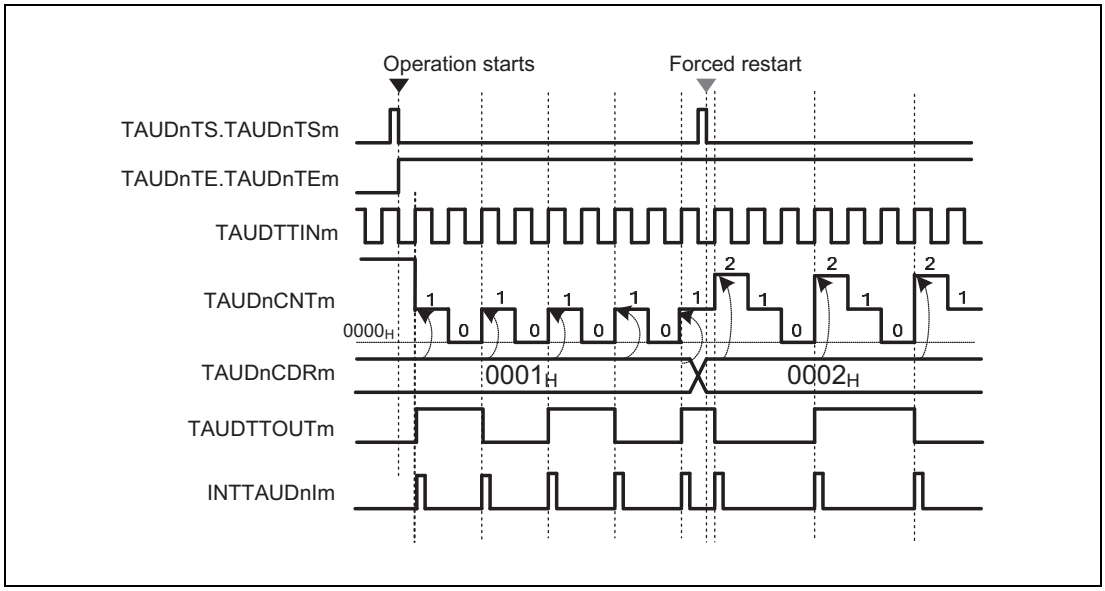

**Figure 25.42 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = $01_B$)**

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm = 1 during operation.
- The value of TAUDnCDRm is written to TAUDnCNTm and the count operation restarts.
- TAUDTTOUTm restarts at the same level as before the forced restart.

## 25.12.4 External Event Count Function

### 25.12.4.1 Overview

#### Summary

This function is used as an event timer, which generates an interrupt (INTTAUDnIm) when a specific number of valid TAUDTTINm input edges are detected.

#### Prerequisites

- The operating mode should be set to the event count mode. (See **Table 25.64, Contents of the TAUDnCMORm Register for External Event Count Function**.)
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When the counter starts, the current value of TAUDnCDRm is loaded into TAUDnCNTm.

When a valid TAUDTTINm input edge is detected, the value of TAUDnCNTm decrements by 1. TAUDnCNTm retains this value until a valid TAUDTTINm input edge is detected or the counter is restarted.

When the valid edge is detected for the (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUDnTS.TAUDnTSm to 1 during operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

An edge type used as a trigger is specified by TAUDnCMURm.TAUDnTIS[1:0] bits.

- When TAUDnCMURm.TAUDnTIS[1:0] = $00_B$, falling edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = $01_B$, rising edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = $10_B$, both edges are counted.

### 25.12.4.2 Equations

Number of valid edges detected before INTTAUDnIm generation = TAUDnCDRm + 1

### 25.12.4.3 Block Diagram and General Timing Diagram

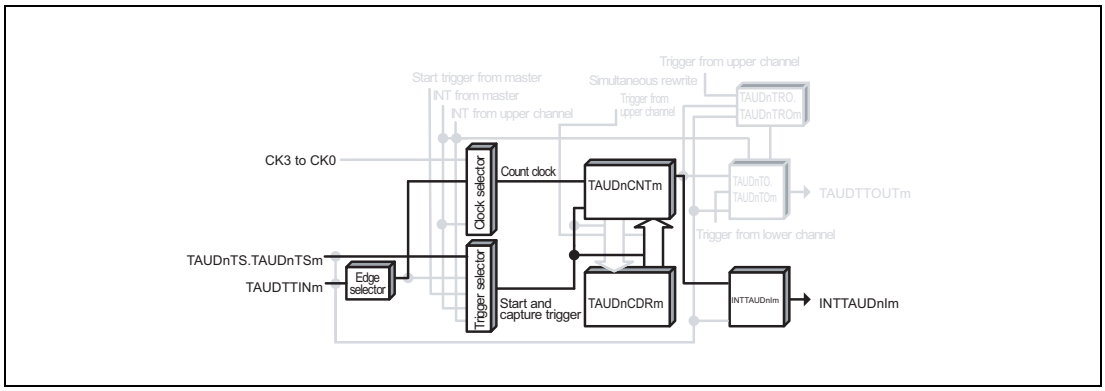

**Figure 25.43 Block Diagram of External Event Count Function**

The following settings apply to the general timing diagram.

- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = $01_B$)

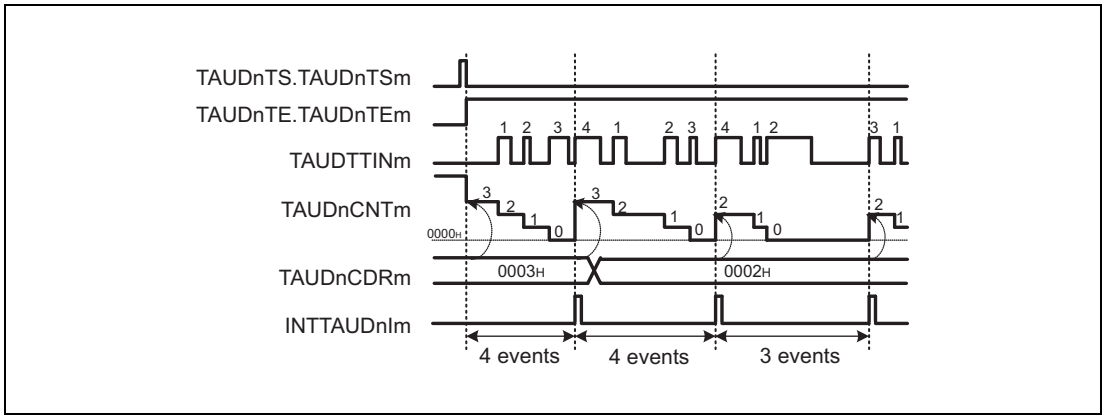

**Figure 25.44 General Timing Diagram of External Event Count Function**

### 25.12.4.4 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

#### (3) Channel output mode

The channel output mode is not used by this function.

#### (4) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the external event count function. Therefore, these registers should be set to 0.

**Table 25.66 Simultaneous Rewrite Settings for External Event Count Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

### 25.12.4.5 Operating Procedure for External Event Count Function

**Table 25.67 Operating Procedure for External Event Count Function**

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.64, Contents of the TAUDnCMORm Register for External Event Count Function**, and **Table 25.65, Contents of the TAUDnCMURm Register for External Event Count Function**.<br><br>Set the value of TAUDnCDRm register. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm to 1.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is set to 1 and the counter starts.<br>TAUDnCNTm loads TAUDnCDRm value and waits for TAUDTTINm input edge detection. |
| During Operation | Detection of TAUDTTINm edge<br><br>The value of TAUDnCDRm is changeable at any time.<br><br>The TAUDnCNTm register can be read at any time. | TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When effective edges are detected (TAUDnCDRm + 1) times:<br>• TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues.<br>• INTTAUDnIm is generated.<br>Afterwards, this procedure is repeated. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops and retains its current value. |

Restart Operation

### 25.12.4.6 Specific Timing Diagrams

#### (1) TAUDnCDRm = $0000_H$

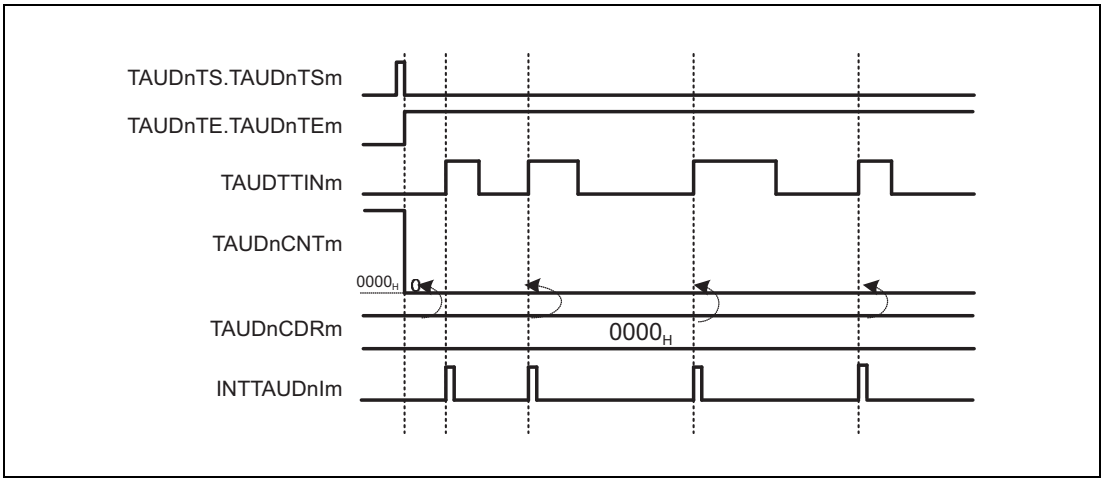

Figure 25.45 TAUDnCDRm = $0000_H$, TAUDnCMURm.TAUDnTIS[1:0] = $01_B$

- If $0000_H$ = TAUDnCDRm, $0000_H$ is loaded into TAUDnCNTm each time a valid TAUDTTINm input edge is detected.
  In other words, INTTAUDnIm is generated each time a valid TAUDTTINm input edge is detected.

#### (2) Operation stop and restart

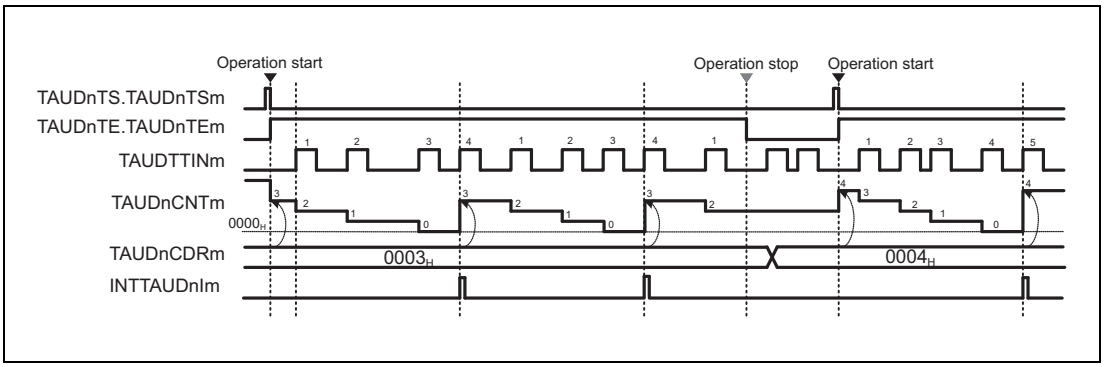

Figure 25.46 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = $01_B$)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value. TAUDTTINm continues and TAUDnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm loads the TAUDnCDRm value and restarts count operation.

### (3) Forced restart

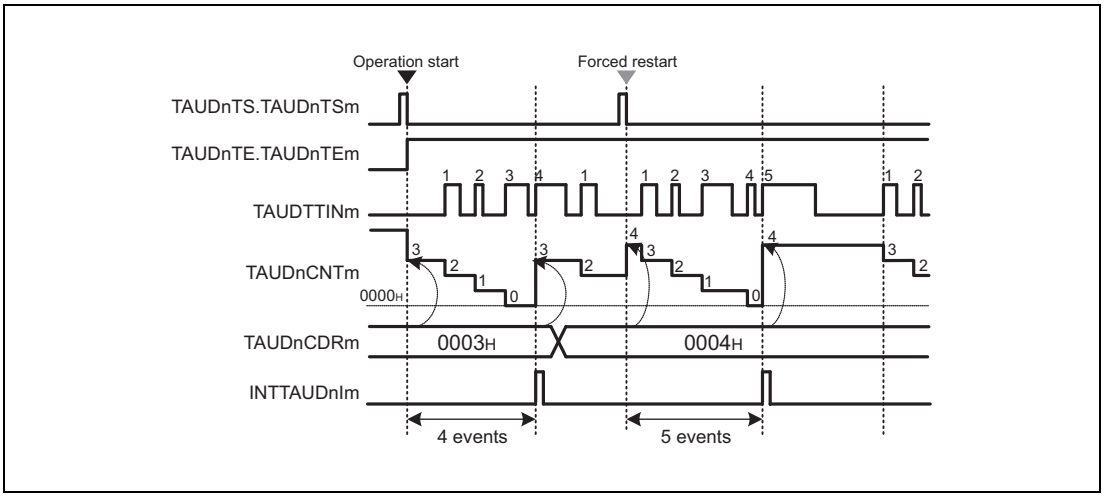

**Figure 25.47 Forced Restart Operation (TAUDnCMURm.TAUDnTIS[1:0] = $01_B$)**

Once a forced restart is made, the changed TAUDnCDRm value is applied to TAUDnCNTm immediately.

- The counter can be restarted without making a stop by setting TAUDnTS.TAUDnTSm to 1 during operation.
- The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter awaits the next valid TAUDTTINm input edge.

## 25.12.5 Delay Count Function

### 25.12.5.1 Overview

#### Summary

This function generates interrupts (INTTAUDnIm), which have a defined delay to the TAUDTTINm input signal. TAUDTTINm input signal pulses that occur within the delay period are ignored.

#### Prerequisites

- The operating mode should be set to one-count mode. See **Table 25.68, Contents of the TAUDnCMORm Register for Delay Count Function**.
- TAUDTTOUTm is not used with this function.
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches $0000_H$, an interrupt is generated. The counter returns to $FFFF_H$ and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = $00_B$, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = $01_B$, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = $10_B$, rising and falling edges trigger the counter.

### 25.12.5.2 Equations

Delay between TAUDTTINm and INTTAUDnIm = count clock cycle × (TAUDnCDRm + 1)

### 25.12.5.3 Block Diagram and General Timing Diagram

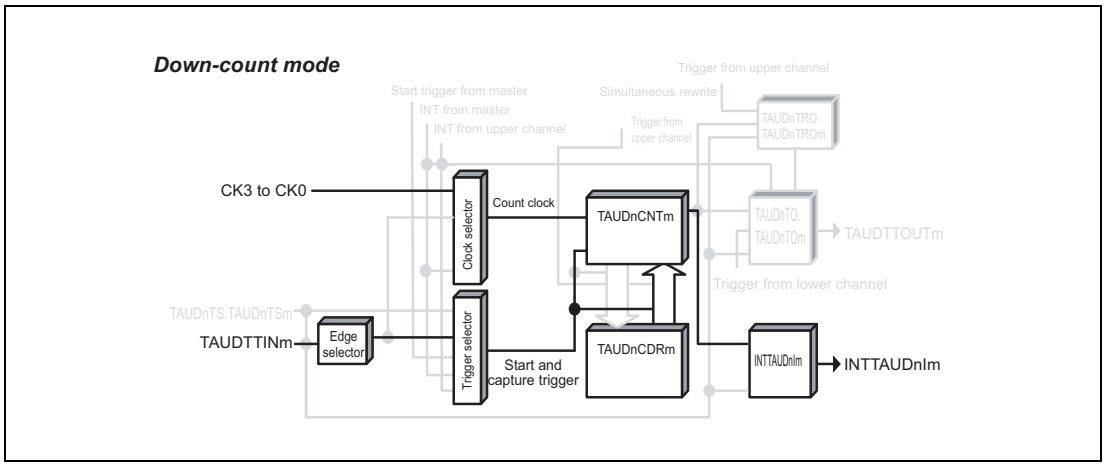

**Figure 25.48 Block Diagram of Delay Count Function**

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

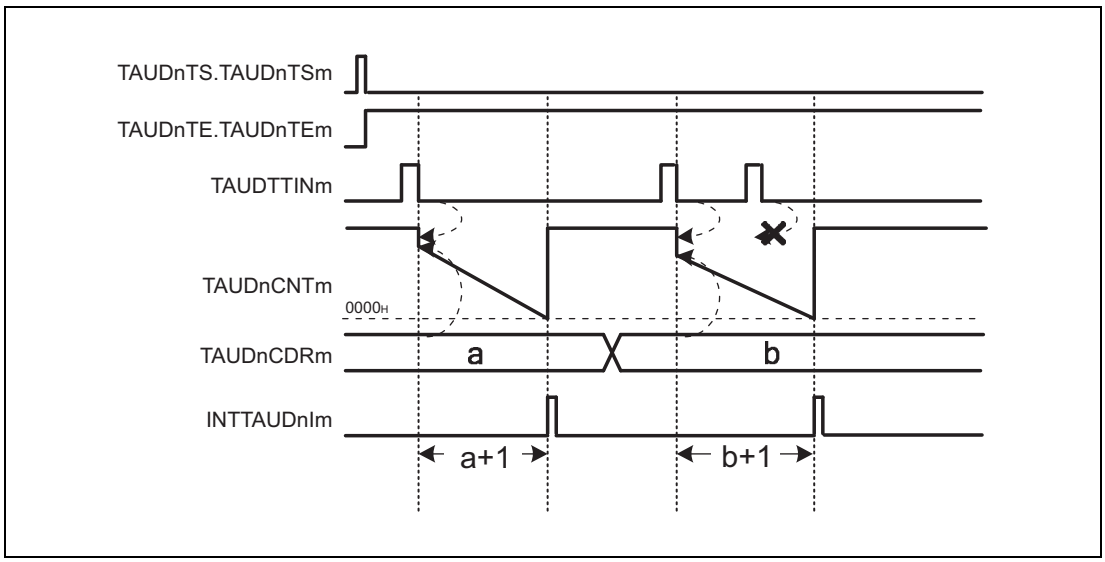

**Figure 25.49 General Timing Diagram of Delay Count Function**

### 25.12.5.4 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Restart Operation

## 25.12.6 One-Pulse Output Function

### 25.12.6.1 Overview

#### Summary

This function generates an interrupt (INTTAUDnIm) when a valid TAUDTTINm input edge is detected and at a defined interval afterward. TAUDTTINm input signal pulses that occur within the defined interval are ignored. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

#### Prerequisites

- The operation mode should be set to pulse one-count mode. (See **Table 25.72, Contents of the TAUDnCMORm Register for One-Pulse Output Function**.)
- The channel output mode should be set to independent channel output mode 2. (See **Section 25.7, Channel Output Modes**.)
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. An interrupt is generated and TAUDTTOUTm is set to active level.

When the counter reaches $0001_H$, an interrupt is generated and TAUDTTOUTm is set to the inactive level. The counter stops at $0000_H$ and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = $00_B$, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = $01_B$, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = $10_B$, rising and falling edges trigger the counter.

### 25.12.6.2 Equations

Interval between TAUDTTINm and INTTAUDnIm = TAUDTTOUTm (timer output) width = count clock cycle × TAUDnCDRm

### 25.12.6.3 Block Diagram and General Timing Diagram

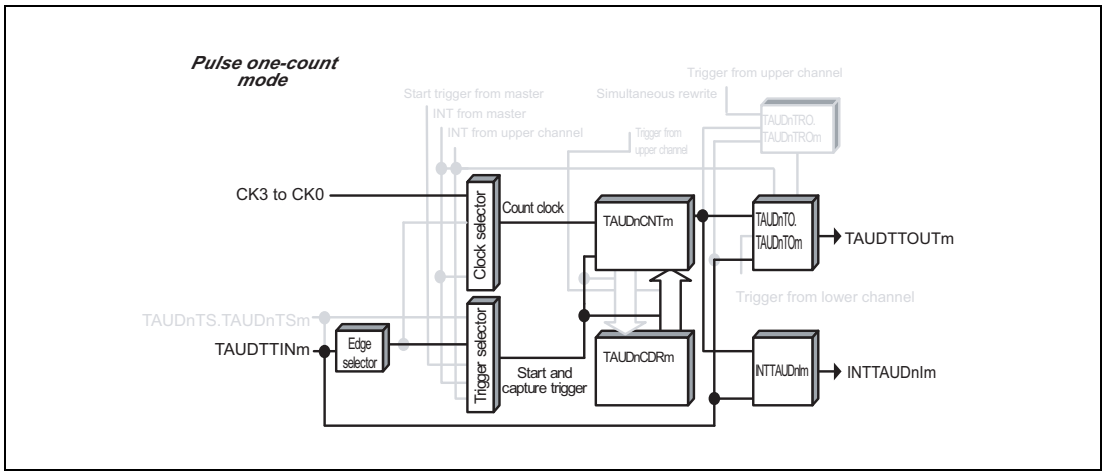

**Figure 25.50 Block Diagram of One-Pulse Output Function**

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

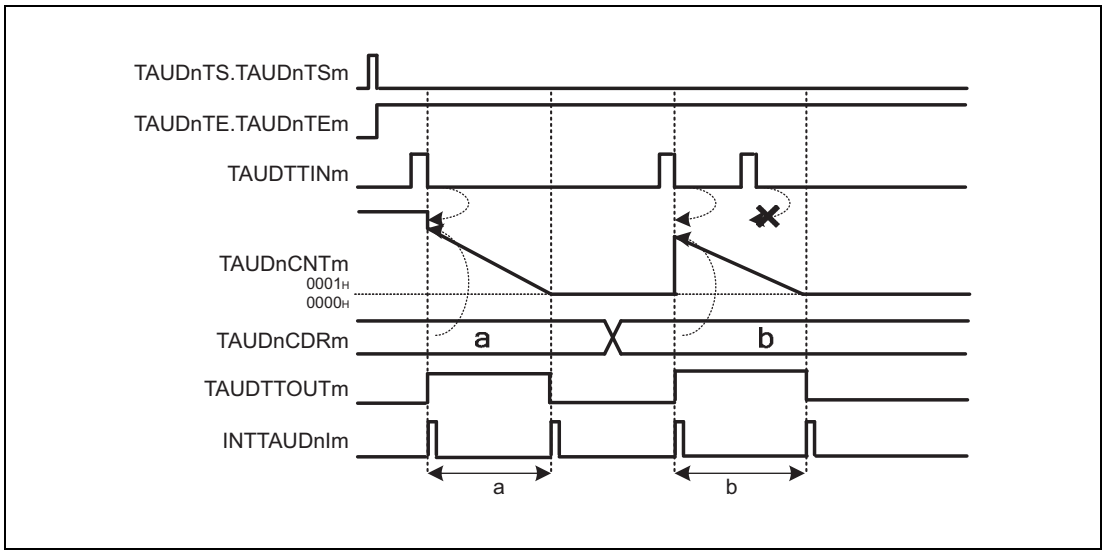

**Figure 25.51 General Timing Diagram of One-Pulse Output Function**

### 25.12.6.4 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

### (3) Channel output mode

Table 25.74 Control Bit Settings in Independent Channel Output Mode 2

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode controlled by software. |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRC.TAUDnTRCm | |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

**NOTE**

The channel output mode can also be set to channel output mode controlled by software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Table 25.48, Channel Output Modes**.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the One-Pulse Output Function. Therefore, these registers should be set to 0.

Table 25.75 Simultaneous Rewrite Settings for One-Pulse Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

TAUDnCNTm counts down. When the counter reaches $0001_H$:<br>• INTTAUDnIm is generated.<br>• TAUDTTOUTm is set to its inactive level.<br>TAUDnCNTm stops counting and waits for a trigger.<br><br>If a trigger occurs while TAUDnCNTm is counting, the trigger is ignored. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart Operation

## 25.12.7 TAUDTTINm Input Pulse Interval Measurement Function

### 25.12.7.1 Overview

#### Summary

This function captures the count value and uses this value and the overflow bit TAUDnCSRm.TAUDnOVF to measure the interval of the TAUDTTINm input signals.

#### Prerequisites

- The operating mode should be set to capture mode. See **Table 25.78, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function**.
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter TAUDnCNTm starts to count up from $0000_H$. When a valid TAUDTTINm edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter resets to $0000_H$ and subsequently continues operation.

If the counter reaches $FFFF_H$ before a valid TAUDTTINm edge is detected, it overflows to $0000_H$. The counter is reset to $0000_H$ and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

**Table 25.77 Effects of Overflow**

| TAUDnCMORm. TAUDnCOS[1:0] | When Overflow Occurs | | When a Valid TAUDTTINm Input is Detected | |
|---|---|---|---|---|
| | TAUDnCDRm | TAUDnCSRm. TAUDnOVF | TAUDnCDRm, TAUDnCNTm | TAUDnCSRm. TAUDnOVF |
| 00 | Unchanged | 0 | TAUDnCNTm loaded into TAUDnCDRm | 1 |
| 01 | | 1 | | |
| 10 | Set to $FFFF_H$ | 0 | TAUDnCNTm set to 0, TAUDnCDRm unchanged | Unchanged |
| 11 | | 1 | | |

When TAUDnCMORm.TAUDnCOS[0] = 1, the overflow bit (TAUDnCSRm.TAUDnOVF) can be cleared only by setting TAUDnCSCm.TAUDnCLOV = 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the interval of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, the overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

The function can be stopped by setting TAUDnTT.TAUDnTTm = 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm stops but retains its value. While the function is stopped, valid TAUDTTINm input edge detection and TAUDnCNTm capture are not performed.

The counter is reset to $0000_H$ and subsequently continues operation.

**Conditions**

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

**NOTE**

When TAUDnCMORm.TAUDnCOS[1:0] = $10_B$ or $11_B$, the value of TAUDnCNTm is not loaded into TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 25.12.7.2 Equations

TAUDTTINm input pulse interval = count clock cycle × [(TAUDnCSRm.TAUDnOVF × ($FFFF_H$ + 1)) + TAUDnCDRm capture value + 1]

### 25.12.7.3 Block Diagram and General Timing Diagram

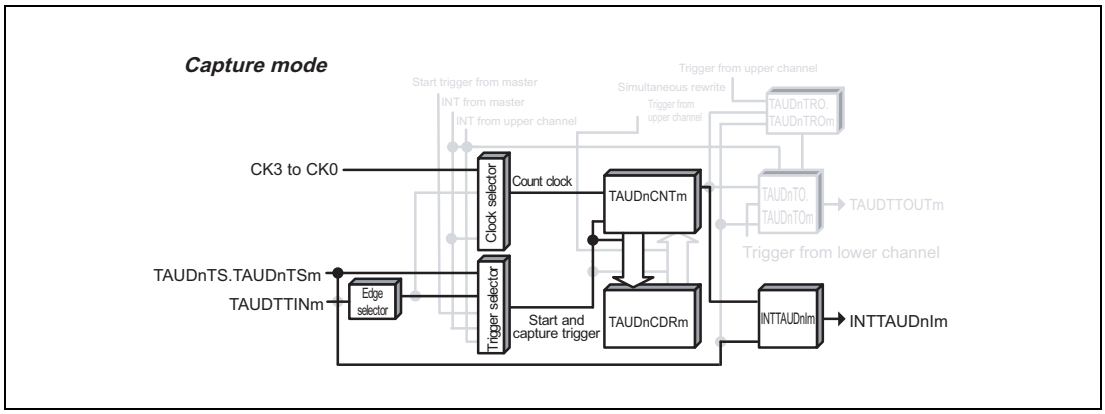

**Figure 25.52 Block Diagram of TAUDTTINm Input Pulse Interval Measurement Function**

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 0).
- Falling edge detection (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1 (TAUDnCMORm.TAUDnCOS[1:0] = $00_B$).

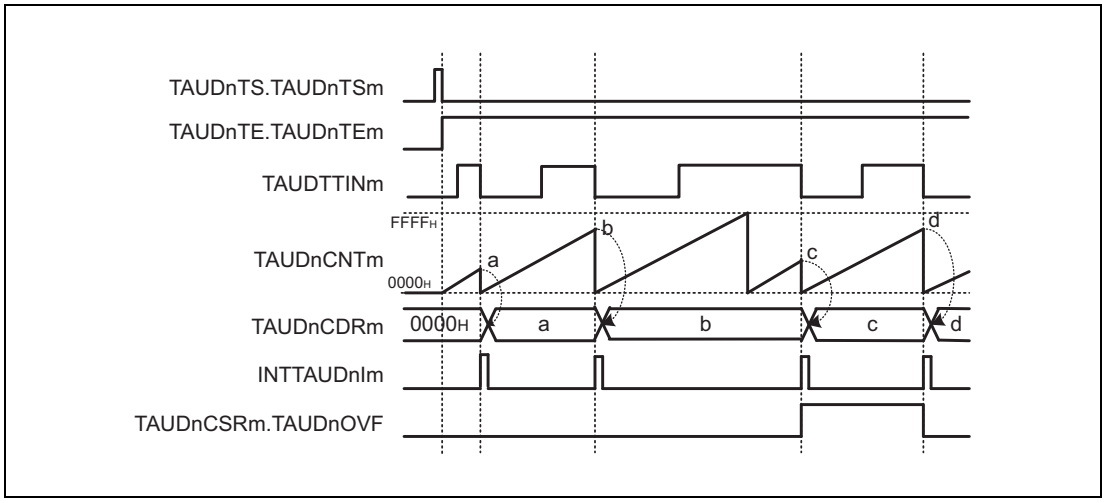

**Figure 25.53 General Timing Diagram of TAUDTTINm Input Pulse Interval Measurement Function**

### 25.12.7.4 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Detection of falling edge<br>01: Detection of rising edge<br>10: Detection of rising and falling edges<br>11: Setting prohibited |

### (3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval measurement function. Therefore, these registers should be set to 0.

**Table 25.80 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Measurement Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

## 25.12.7.5 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

**Table 25.81 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function**

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.78, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function**, and **Table 25.79, Contents of the TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Measurement Function**.<br><br>The TAUDnCDRm register functions as a capture register. | Channel operation is stopped. |

| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values. |

Restart Operation

### 25.12.7.6 Specific Timing Diagrams: Overflow Operation

#### (1) TAUDnCMORm.TAUDnCOS[1:0] = $00_B$

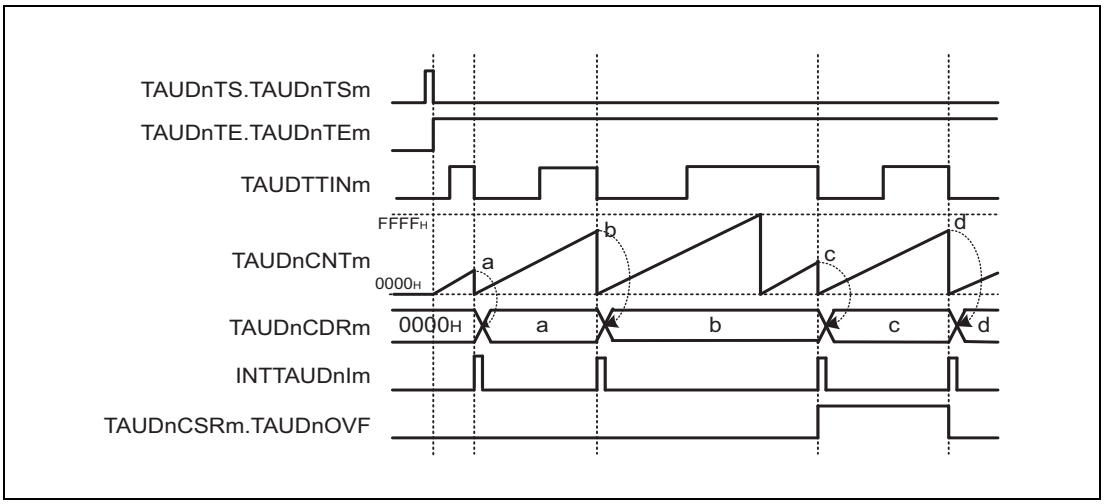

**Figure 25.54 TAUDnCMORm.TAUDnCOS[1:0] = $00_B$, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = $00_B$**

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

#### (2) TAUDnCMORm.TAUDnCOS[1:0] = $01_B$

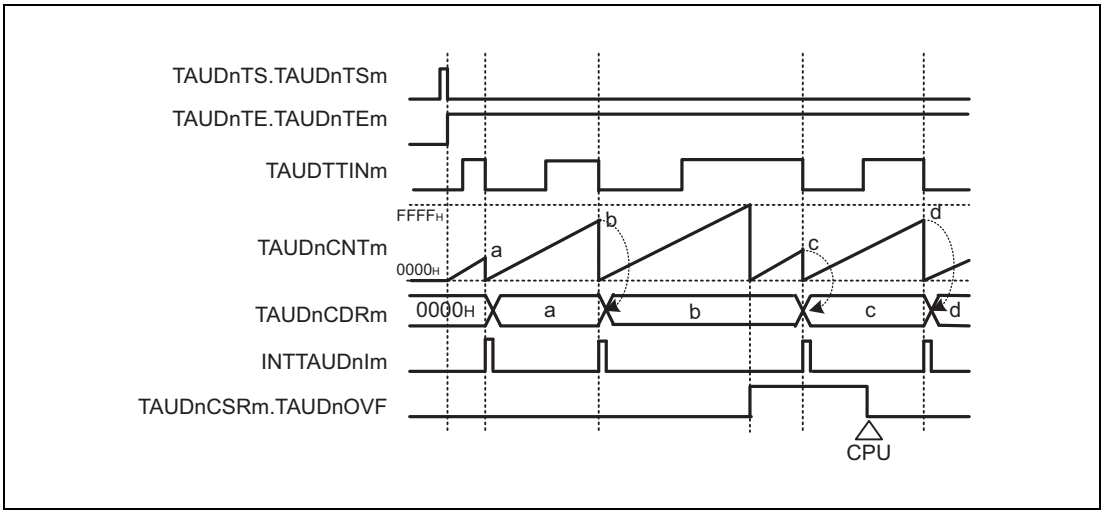

**Figure 25.55 TAUDnCMORm.TAUDnCOS[1:0] = $01_B$, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = $00_B$**

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to1.

- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

### (3) TAUDnCMORm.TAUDnCOS[1:0] = $10_B$

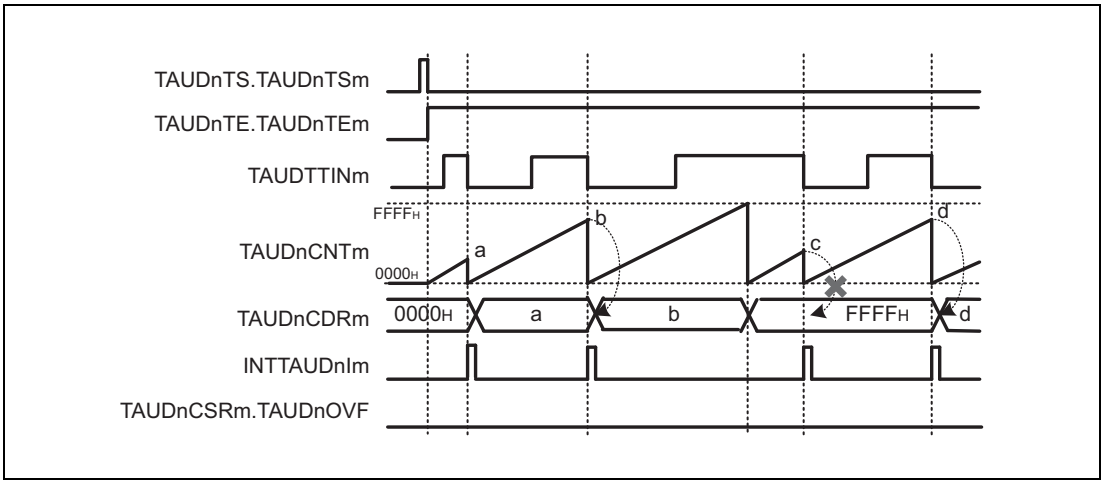

**Figure 25.56 TAUDnCMORm.TAUDnCOS[1:0] = $10_B$, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = $00_B$**

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.

### (4) TAUDnCMORm.TAUDnCOS[1:0] = $11_B$

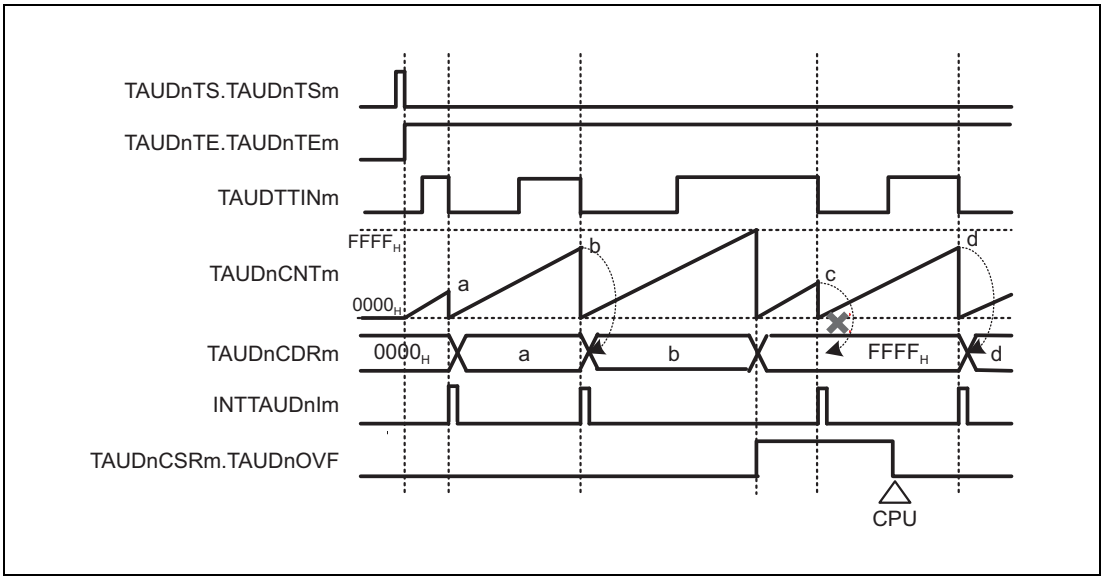

**Figure 25.57 TAUDnCMORm.TAUDnCOS[1:0] = $11_B$, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = $00_B$**

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

## 25.12.8 TAUDTTINm Input Signal Width Measurement Function

### 25.12.8.1 Overview

#### Summary

This function measures the width of a TAUDTTINm signal, by starting the count at one edge of TAUDTTINm and capturing the count value at the other edge.

#### Prerequisites

- The operating mode should be set to capture and one-count mode. See **Table 25.83, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function**.
- TAUDTTOUTm is not used with this function.
- TAUDnCMORm.TAUDnMD0 should be set to 0.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When a valid TAUDTTINm start edge is detected, the counter TAUDnCNTm starts to count up from $0000_H$. When a valid TAUDTTINm stop edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter retains its value (TAUDnCDRm +1) and awaits the next valid TAUDTTINm input start edge.

If the counter reaches $FFFF_H$ before a valid TAUDTTINm stop edge is detected, it overflows. The counter is reset to $0000_H$ and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

**Table 25.82 Effects of Overflow**

| TAUDnCMORm.TAUDnCOS[1:0] | When Overflow Occurs | | When a Valid TAUDTTINm Input Stop Edge is Detected | |
|---|---|---|---|---|
| | TAUDnCDRm | TAUDnCSRm.TAUDnOVF | TAUDnCDRm, TAUDnCNTm | TAUDnCSRm.TAUDnOVF |
| 00 | Unchanged | 0 | TAUDnCNTm loaded into TAUDnCDRm | 1 |
| 01 | | 1 | | |
| 10 | Set to $FFFF_H$ | 0 | TAUDnCNTm stops counting<br>TAUDnCDRm unchanged | Unchanged |
| 11 | | 1 | | |

When TAUDnCMORm.TAUDnCOS[0] = 1, overflow bit TAUDnCSRm.TAUDnOVF can be cleared only by setting TAUDnCSCm.TAUDnCLOV to 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the width of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

This function cannot be forcibly restarted.

**NOTE**

When TAUDnCMORm.TAUDnCOS[1] = 1, the value of TAUDnCNTm is not loaded to TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 25.12.8.2 Equations

TAUDTTINm input signal width = count clock cycle × [(TAUDnCSRm.TAUDnOVF × ($FFFF_H$ + 1)) + TAUDnCDRm capture value + 1]

### 25.12.8.3 Block Diagram and General Timing Diagram

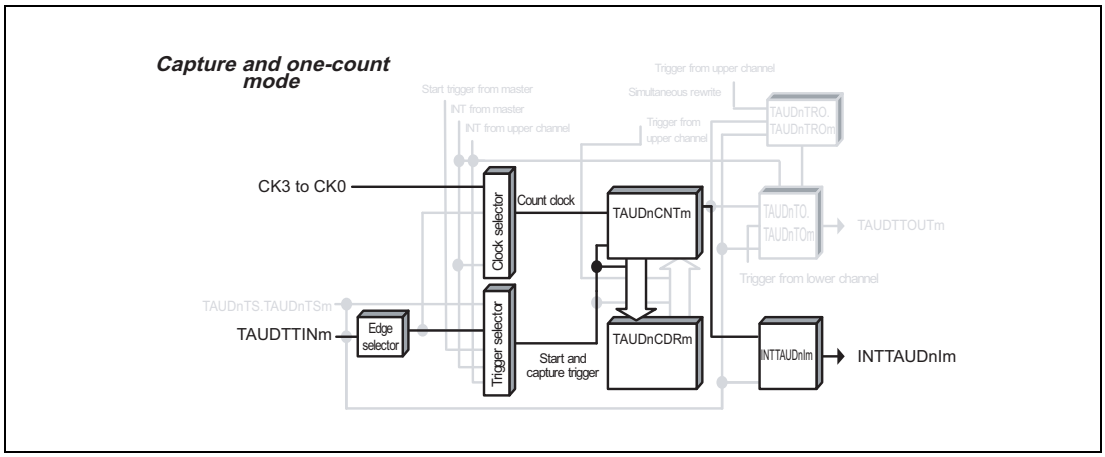

**Figure 25.58 Block Diagram of TAUDTTINm Input Signal Width Measurement Function**

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = $11_B$)
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1. (TAUDnCMORm.TAUDnCOS[1:0] = $00_B$)

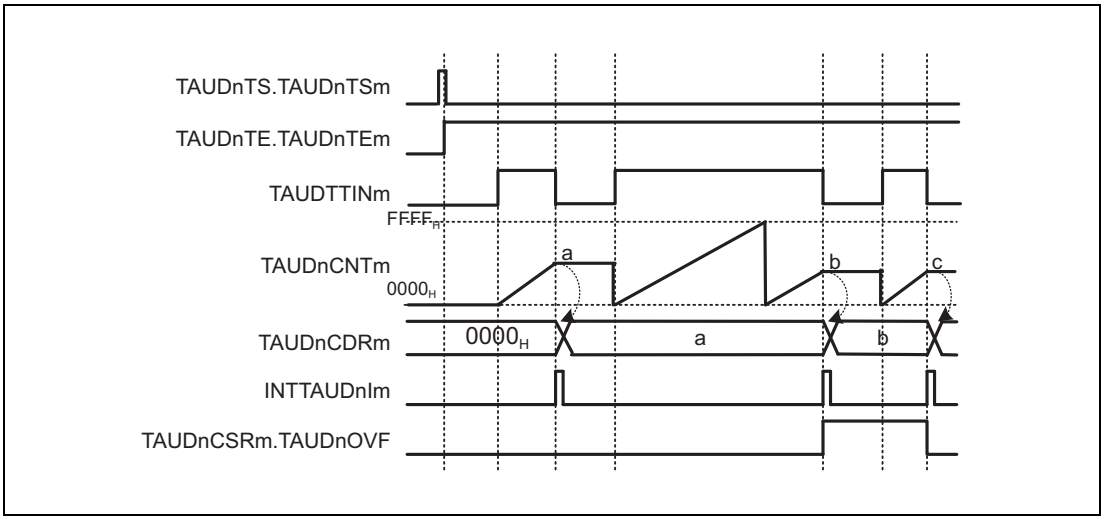

**Figure 25.59 General Timing Diagram of TAUDTTINm Input Signal Width Measurement Function**

### 25.12.8.4 Register Settings

#### (1) TAUDnCMORm

### (3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input signal width measurement function. Therefore, these registers should be set to 0.

**Table 25.85 Simultaneous Rewrite Settings for TAUDTTINm Input Signal Width Measurement Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

## 25.12.8.5 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

**Table 25.86 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function**

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.83, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function**, and **Table 25.84, Contents of the TAUDnCMURm Register For TAUDTTINm Input Signal Width Measurement Function**.<br><br>The TAUDnCDRm register functions as a capture register. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm to 1.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge.<br>When a TAUDTTINm start edge is detected, TAUDnCNTm starts to count up. |
| During Operation | TAUDnCDRm, TAUDnCNTm, and TAUDnCSRm registers can be read at any time.<br>TAUDnCSCm.TAUDnCLOV bit can be set to 1. | TAUDnCNTm starts to count up from $0000_H$.<br>When TAUDTTINm valid edge is detected:<br>• TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and retains its value. INTTAUDnIm is then generated.<br>Counting stops at the “value that transferred to TAUDnCDRm + 1” and TAUDnCNTm waits for detection of the TAUDTTINm start edge.<br>Afterwards, this procedure is repeated. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values. |

Restart Operation

### 25.12.8.6 Specific Timing Diagrams: Overflow Operation

#### (1) TAUDnCMORm.TAUDnCOS[1:0] = $00_B$

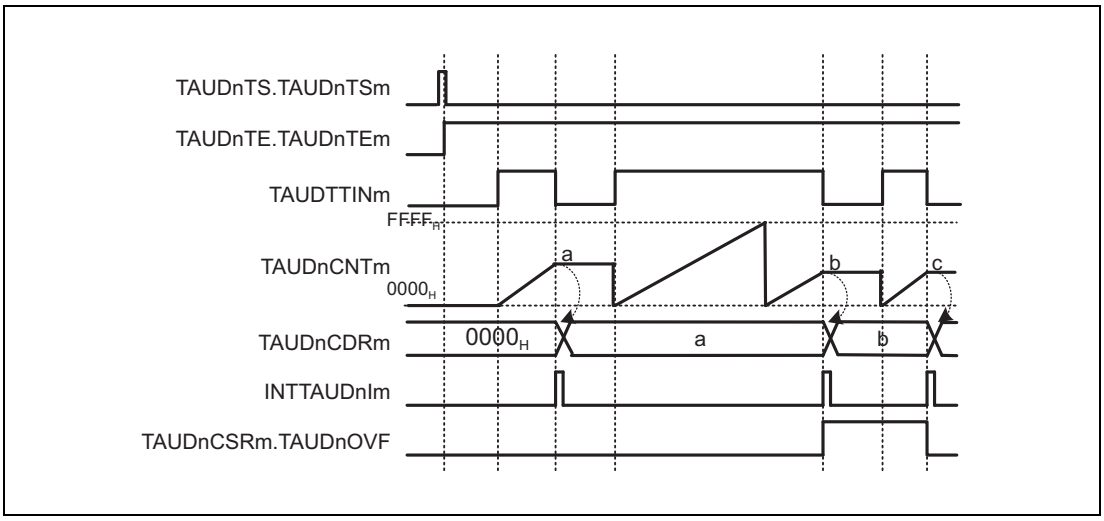

**Figure 25.60 TAUDnCMORm.TAUDnCOS[1:0] = $00_B$, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = $11_B$**

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

### (2) TAUDnCMORm.TAUDnCOS[1:0] = $01_B$

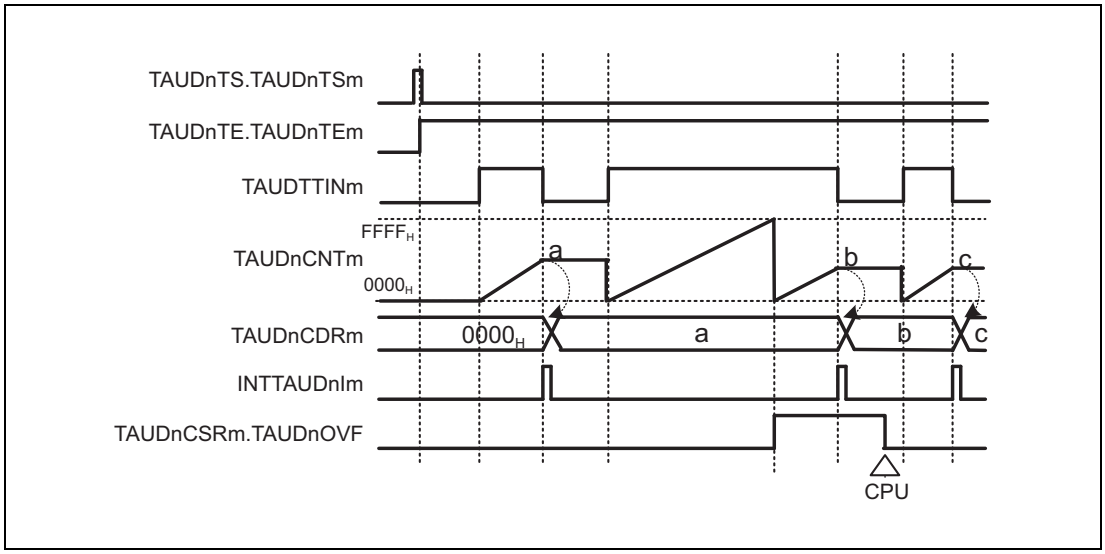

**Figure 25.61 TAUDnCMORm.TAUDnCOS[1:0] = $01_B$, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = $11_B$**

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

### (3) TAUDnCMORm.TAUDnCOS[1:0] = $10_B$

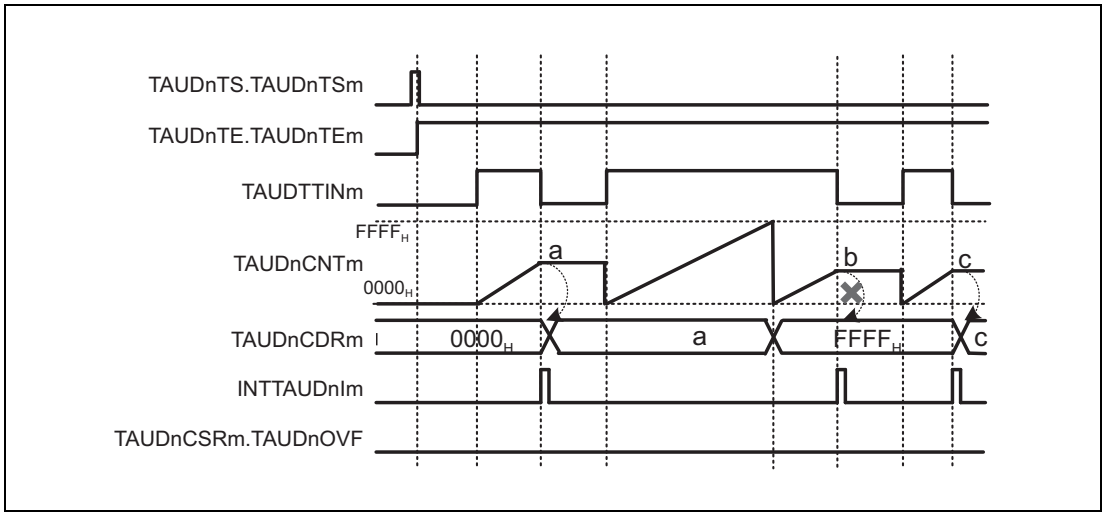

**Figure 25.62 TAUDnCMORm.TAUDnCOS[1:0] = $10_B$, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = $11_B$**

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.

### (4) TAUDnCMORm.TAUDnCOS[1:0] = $11_B$

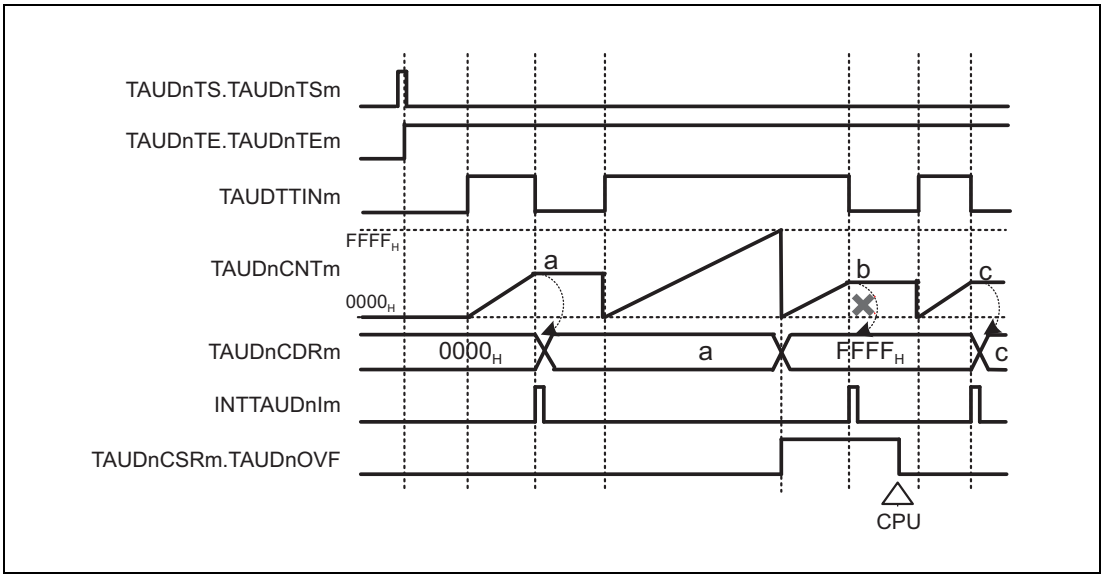

**Figure 25.63 TAUDnCMORm.TAUDnCOS[1:0] = $11_B$, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = $11_B$**

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

## 25.12.9 TAUDTTINm Input Position Detection Function

### 25.12.9.1 Overview

#### Summary

This function measures the input signal duration by capturing the count value at the valid edge of TAUDTTINm.

#### Prerequisites

- The operating mode should be set to count capture mode. (See **Table 25.87, Contents of the TAUDnCMORm Register for TAUDTTINm Input Position Detection Function**.)
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter starts counting from $0000_H$. When a valid TAUDTTINm input edge is detected, the current value of TAUDnCNTm is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The count operation continues.

When the counter reaches $FFFF_H$, the counter restarts from $0000_H$.

**NOTE**

The TAUDTTINm input signal is sampled at the frequency of the operation clock, specified by TAUDnCMORm.TAUDnCKS[1:0] bits. As a result, the output cycle of TAUDTTOUTm has an error of ± 1 operation clock cycle.

#### Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt does not occur at the beginning of operation or after restart. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

### 25.12.9.2 Equations

Functional duration at a TAUDTTINm input pulse =

count clock cycle × (TAUDnCDRm capture value + 1)

### 25.12.9.3 Block Diagram and General Timing Diagram

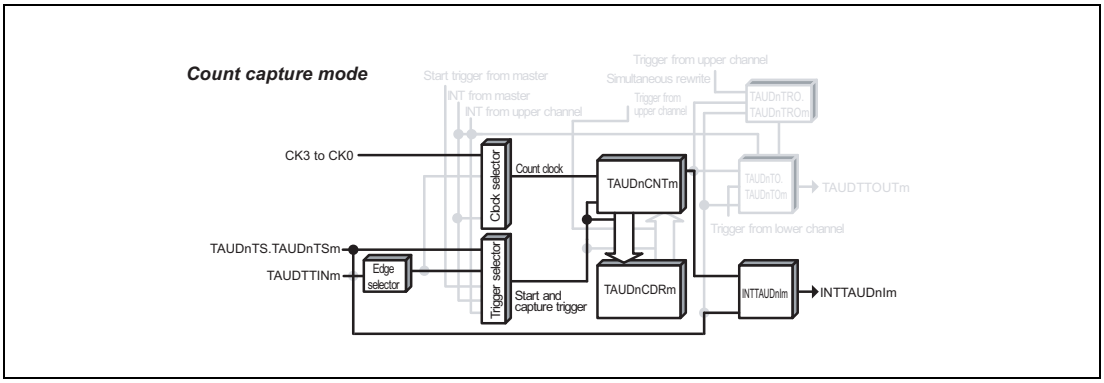

**Figure 25.64 Block Diagram of TAUDTTINm Input Position Detection Function**

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

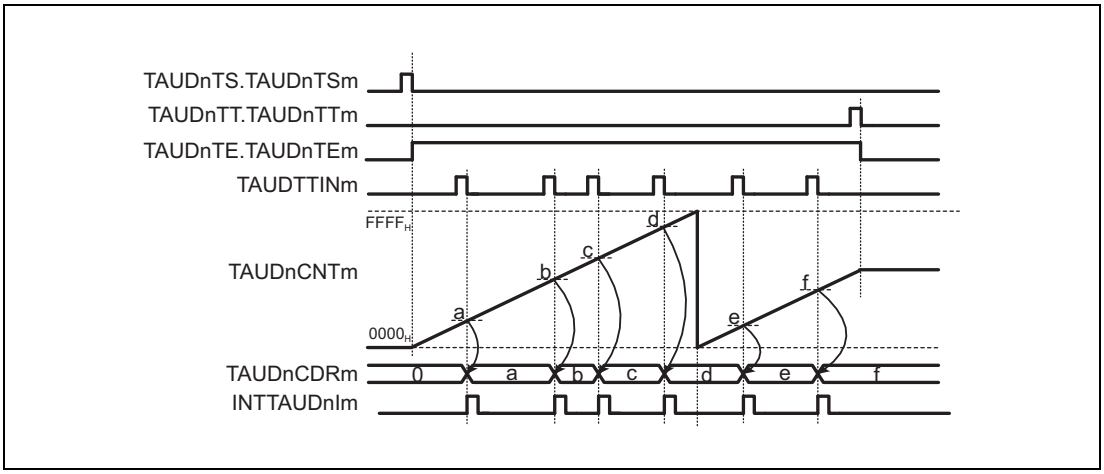

**Figure 25.65 General Timing Diagram of TAUDTTINm Input Position Detection Function**

### 25.12.9.4 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

#### (3) Channel output mode

The channel output mode is not used by this function.

### (4) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input position detection function. Therefore, these registers should be set to 0.

**Table 25.89 Simultaneous Rewrite Settings for TAUDTTINm Input Position Detection Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

## 25.12.9.5 Operating Procedure for TAUDTTINm Input Position Detection Function

**Table 25.90 Operating Procedure for TAUDTTINm Input Position Detection Function**

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.87, Contents of the TAUDnCMORm Register for TAUDTTINm Input Position Detection Function**, and **Table 25.88, Contents of the TAUDnCMURm Register for TAUDTTINm Input Position Detection Function**.<br><br>The TAUDnCDRm register functions as a capture register. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm to 1.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is set to 1 and the counter starts.<br>If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm occurs. |
| During Operation | The values of TAUDnCMURm.TAUDnTIS[1:0] bits can be changed at any time.<br>The TAUDnCDRm and TAUDnCSRm registers can be read at any time. | TAUDnCNTm starts to count up from $0000_H$.<br>When a valid TAUDTTINm edge is detected:<br>• TAUDnCNTm transfers (captures) its own value to TAUDnCDRm.<br>• Outputs INTTAUDnIm.<br>• The counter is not cleared to $0000_H$ and TAUDnCNTm continues counting.<br>Afterwards, this procedure is repeated.<br>When TAUDnCNTm reaches $FFFF_H$, the counter restarts from $0000_H$. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops and retains its current value. |

Restart

### 25.12.9.6 Specific Timing Diagrams

#### (1) Operation stop and restart

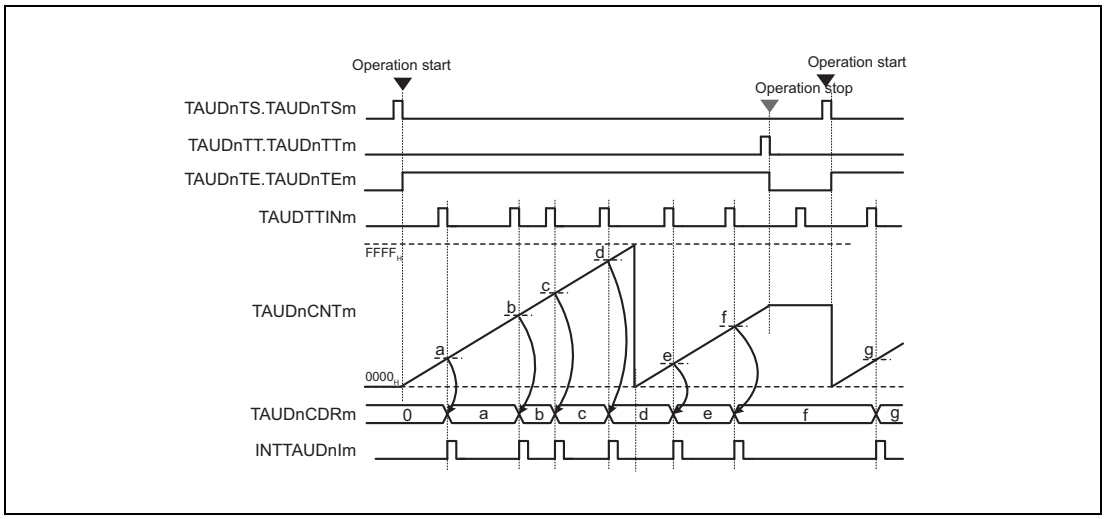

**Figure 25.66 Operation Stop and Restart (TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)**

- The counter can stop operating by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter stops operating, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm restarts to count from $0000_H$.

## 25.12.10 TAUDTTINm Input Period Count Detection Function

### 25.12.10.1 Overview

#### Summary

This function measures the cumulative width of a TAUDTTINm input signal.

#### Prerequisites

- The operating mode should be set to capture and gate count mode. (See **Table 25.91, Contents of the TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function**.)
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter awaits a valid TAUDTTINm input edge.

When a valid TAUDTTINm input start edge is detected, the counter starts to count from $0000_H$.

When a valid TAUDTTINm input stop edge is detected, the current TAUDnCNTm value is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The counter stops and retains its value (TAUDnCDRm + 1) until the next valid TAUDTTINm input start edge is detected.

When the next valid TAUDTTINm input start edge is detected, the counter restarts to count from the value retained when stopped.

If the counter reaches $FFFF_H$, the counter restarts from $0000_H$.

**NOTES**

1. TAUDTTINm input signal is sampled at the frequency of an operation clock set by the TAUDnCMORm.TAUDnCKS[1:0] bits.
2. As this function is to measure the TAUDTTINm input signal width, setting TAUDnTS.TAUDnTSm to 1 is disabled while TAUDnTE.TAUDnTEm = 1.

#### Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = $10_B$, the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = $11_B$, the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

### 25.12.10.2 Equations

Cumulative TAUDTTINm input width =
count clock cycle × (TAUDnCDRm capture value + 1)

### 25.12.10.3 Block Diagram and General Timing Diagram

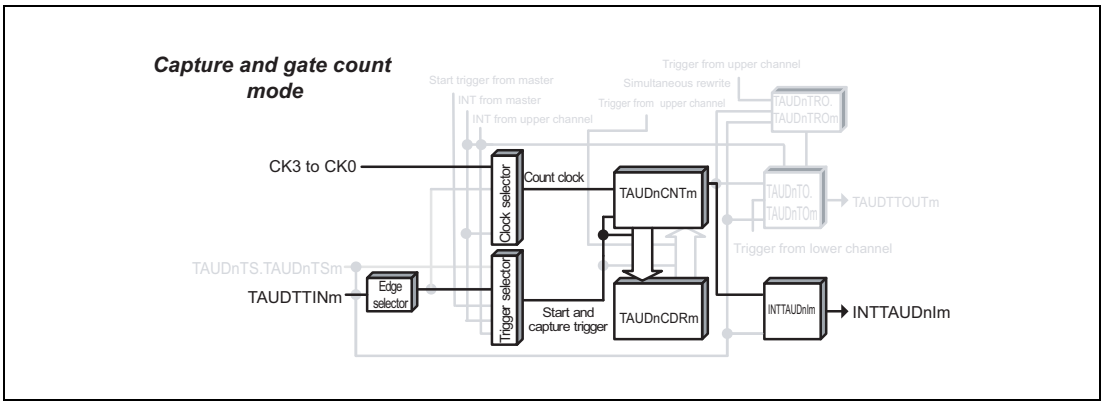

**Figure 25.67 Block Diagram of TAUDTTINm Input Period Count Detection Function**

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = $11_B$)

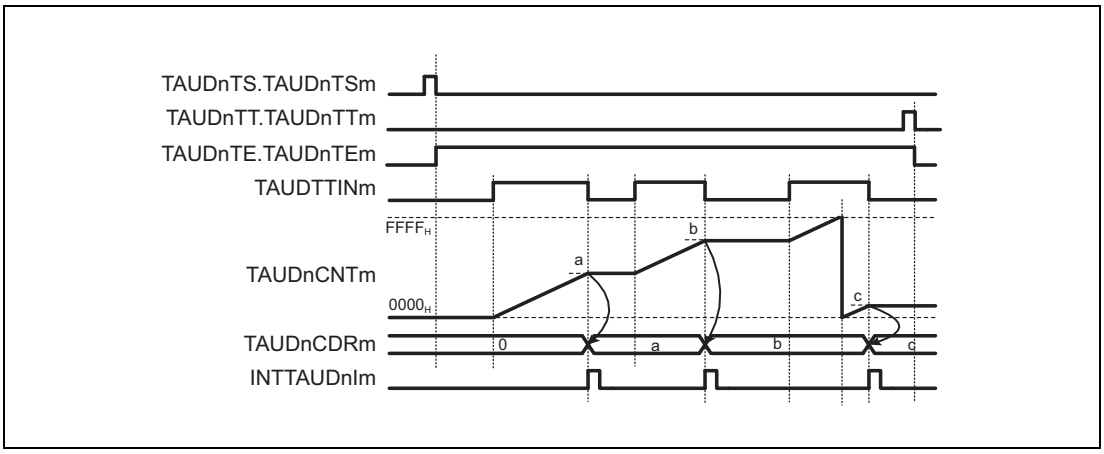

**Figure 25.68 General Timing Diagram of TAUDTTINm Input Period Count Detection Function**

### 25.12.10.4 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 10: Detection of rising and falling edges (low width measurement)<br>11: Detection of rising and falling edges (high width measurement) |

#### (3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

#### (4) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input period count detection function. Therefore, these registers should be set to 0.

**Table 25.93 Simultaneous Rewrite Settings for TAUDTTINm Input Period Count Detection Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

### 25.12.10.5 Operating Procedure for TAUDTTINm Input Period Count Detection Function

**Table 25.94 Operating Procedure for TAUDTTINm Input Period Count Detection Function**

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.91, Contents of the TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function**, and **Table 25.92, Contents of the TAUDnCMURm Register for TAUDTTINm Input Period Count Detection Function**.<br><br>The TAUDnCDRm register functions as a capture register. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm to 1.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. |
| During Operation | Detection of TAUDTTINm edge<br><br>The TAUDnCDRm, TAUDnCNTm, and TAUDnCSRm registers can be read at any time. | When a TAUDTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUDnCNTm starts counting up from the stop value.<br>When TAUDnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUDnCDRm and INTTAUDnIm is generated.<br>Counting stops at the “value transferred to TAUDnCDRm + 1” and TAUDnCNTm waits for detection of the TAUDTTINm start edge.<br>When TAUDnCNTm reaches $FFFF_H$, the counter restarts from $0000_H$.<br>Afterwards, this procedure is repeated. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops and retains its current value. |

Restart Operation

### 25.12.10.6 Specific Timing Diagrams

#### (1) Operation stop and restart

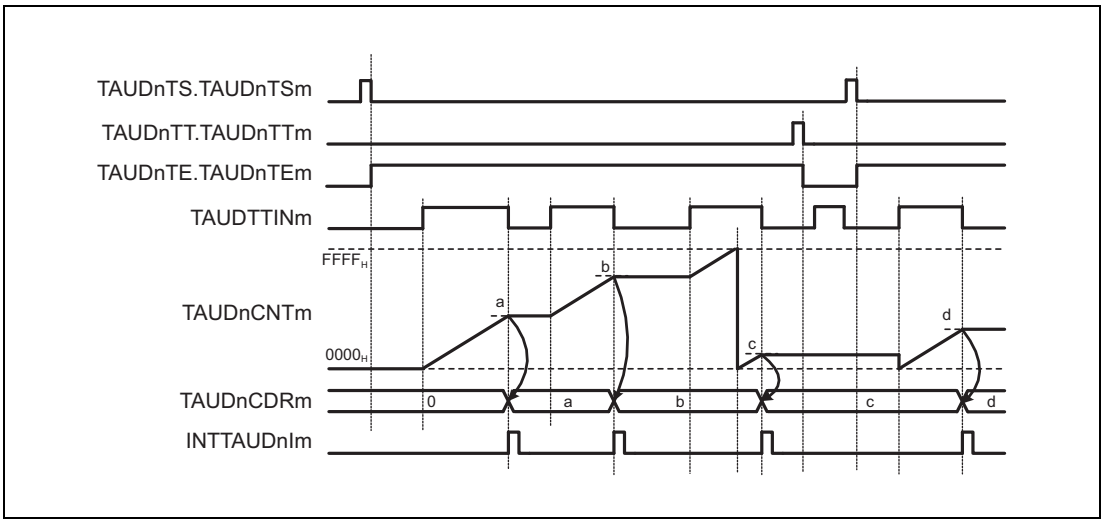

**Figure 25.69 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = $11_B$)**

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter is stopped, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm restarts to count from $0000_H$.

## 25.12.11 TAUDTTINm Input Pulse Interval Judgment Function

### 25.12.11.1 Overview

#### Summary

This function outputs the result of a comparison between the count value (TAUDnCNTm) and the value in the channel data register (TAUDnCDRm) when a TAUDTTINm input pulse occurs. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true.

#### Prerequisites

- The operating mode should be set to judge mode. See **Table 25.95, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function**.
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid edge is detected or TAUDnTS.TAUDnTSm is set to 1, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. TAUDnCNTm reloads the value of TAUDnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches $0000_H$ before a TAUDTTINm valid edge is detected, TAUDnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:

- If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm.
- If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.

### 25.12.11.2 Block Diagram and General Timing Diagram

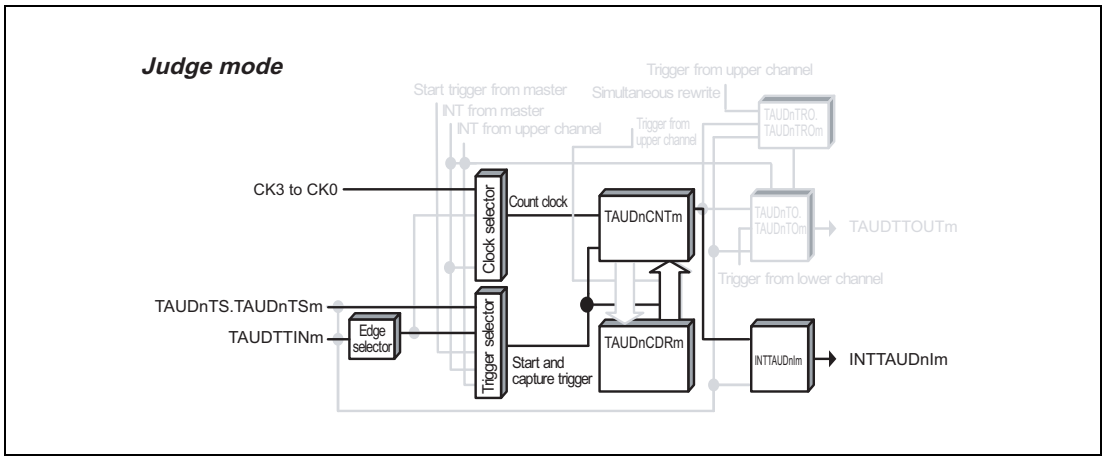

**Figure 25.70 Block Diagram of TAUDTTINm Input Pulse Interval Judgment Function**

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

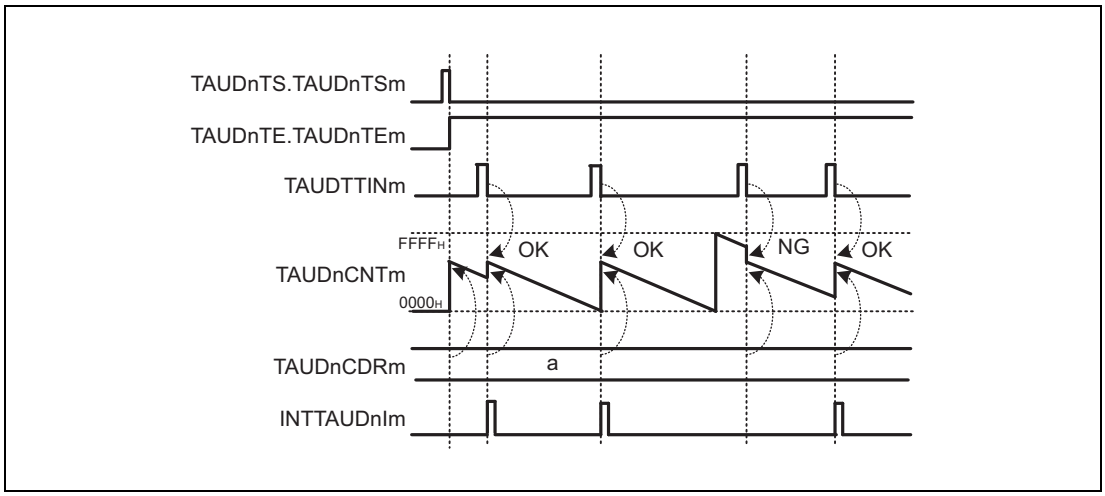

**Figure 25.71 General Timing Diagram of TAUDTTINm Input Pulse Interval Judgment Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Detection of falling edge<br>01: Detection of rising edge<br>10: Detection of rising and falling edges<br>11: Setting prohibited |

### (3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

### (4) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval judgment function. Therefore, these registers should be set to 0.

**Table 25.97 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Judgment Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

## 25.12.11.4 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

## 25.12.12 TAUDTTINm Input Signal Width Judgment Function

### 25.12.12.1 Overview

#### Summary

This function compares the count value (TAUDnCNTm) for the high or low level width of a TAUDTTINm input signal and the TAUDnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUDnIm.

#### Prerequisites

- The operating mode should be set to judge and one-count mode. (See **Table 25.99, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Judgment Function**.)
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When a valid TAUDTTINm input start edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid stop edge is detected, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. The counter TAUDnCNTm retains its value until the next valid TAUDTTINm start edge is detected, regardless of the result of the comparison.

If the counter reaches $0000_H$ before a valid TAUDTTINm stop edge is detected, TAUDnCNTm overflows and is set to $FFFF_H$. The counter then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

- The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:
  - If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm.
  - If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.
- The TAUDnCMURm.TAUDnTIS[1:0] bits specify a type of width measurement:
  - For high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = $11_B$), TAUDTTINm rising edge is used as a start edge and TAUDTTINm falling edge as a stop edge.
  - For low width measurement (TAUDnCMURm.TAUDnTIS[1:0] = $10_B$), TAUDTTINm falling edge is used as a start edge and TAUDTTINm rising edge as a stop edge.
- This function cannot make a forced restart.

### 25.12.12.2 Block Diagram and General Timing Diagram

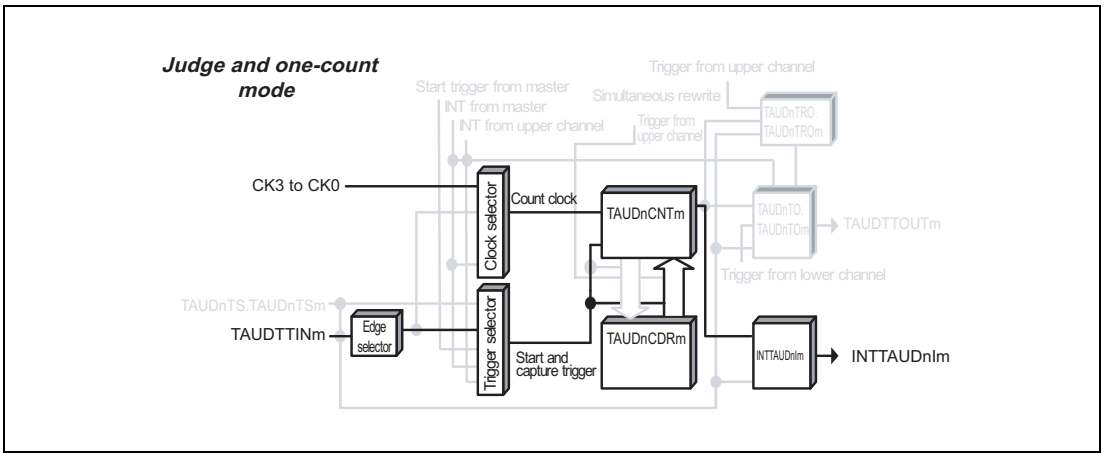

**Figure 25.72 Block Diagram of TAUDTTINm Input Signal Width Judgment Function**

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm (TAUDnCMORm.TAUDnMD0 = 0).
- TAUDTTINm valid start edge = rising edge, TAUDTTINm valid stop edge = falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $11_B$)

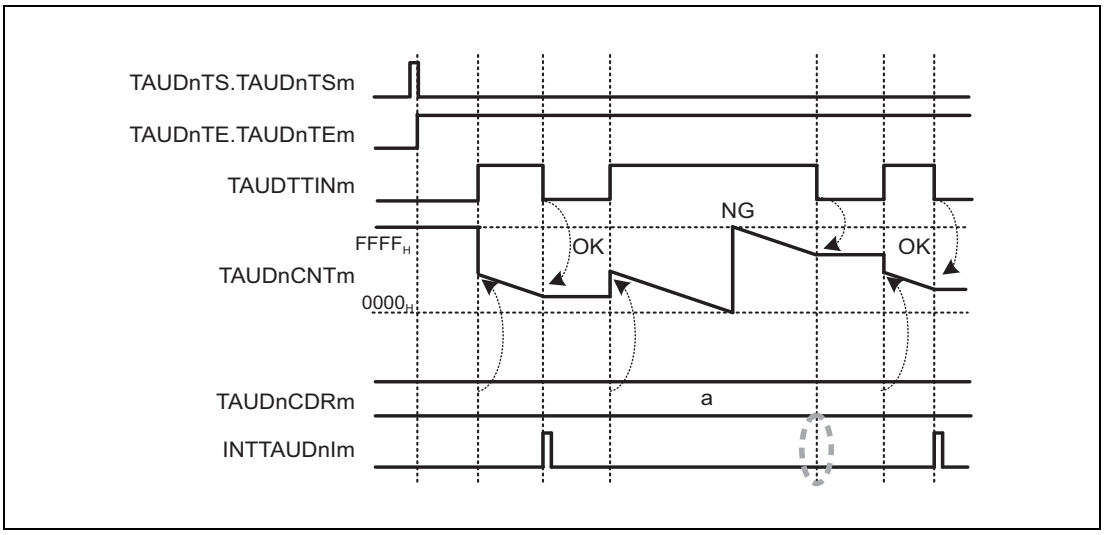

**Figure 25.73 General Timing Diagram of TAUDTTINm Input Signal Width Judgment Function**

### 25.12.12.3 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops and retains its current value. |

Restart Operation

## 25.12.13 Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

### 25.12.13.1 Overview

#### Summary

This function measures the width of an individual TAUDTTINm input signal. An interrupt is generated if the TAUDTTINm input width is longer than $FFFF_H + 1$.

#### Prerequisites

- The operation mode must be set to One-Count Mode (see **Table 25.103, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**).
- TAUDTTOUTm is not used for this function.
- The value of TAUDnCDRm must be set to $FFFF_H$.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. $FFFF_H$ is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUDTTINm input start edge is detected, TAUDnCNTm loads $FFFF_H$ and starts to count down.

If the counter reaches $0000_H$ before a stop edge is detected, an interrupt is generated.

#### Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = $10_B$, the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = $11_B$, the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

**NOTE**

The counter cannot be restarted during operation.

### 25.12.13.2 Block Diagram and General Timing Diagram

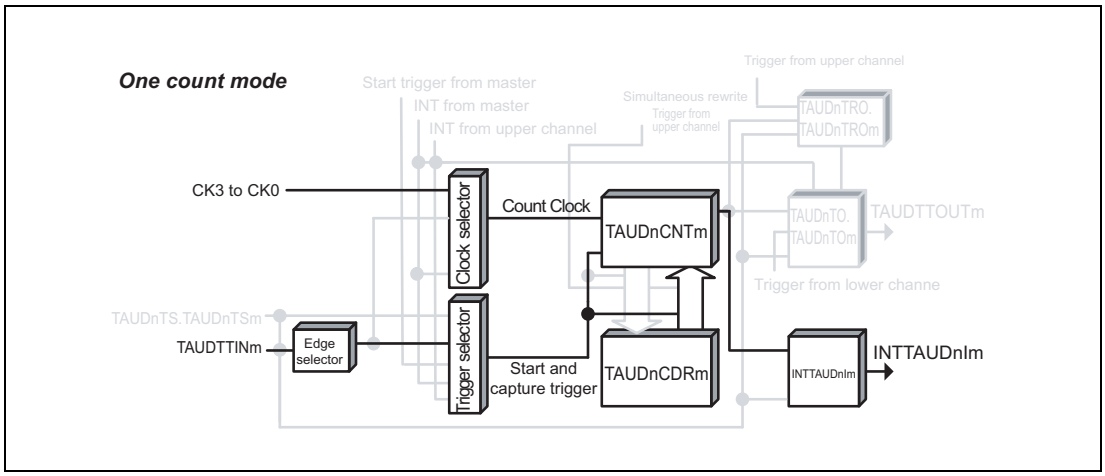

**Figure 25.74 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = $11_B$)

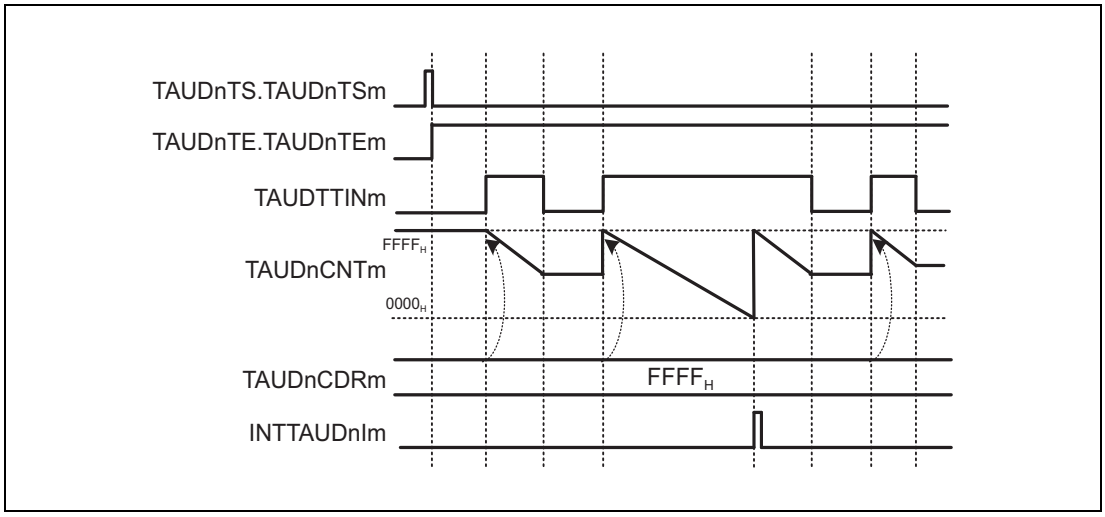

**Figure 25.75 General Timing Diagram for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**

### 25.12.13.3 Register Settings

#### (1) TAUDnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 10: Detection of rising and falling edges (low width measurement)<br>11: Detection of rising and falling edges (high width measurement) |

#### (3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used by this function.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the Overflow Interrupt Output Function (during TAUDTTINm Width Measurement). Therefore, these registers must be set to 0.

**Table 25.105 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

## 25.12.14 Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

### 25.12.14.1 Overview

#### Summary

This function measures the cumulative width of a TAUDTTINm input signal. If the cumulative TAUDTTINm input width is longer than $FFFF_H$, an interrupt is generated and an overflow interrupt can be output.

#### Prerequisites

- The operation mode must be set to Gate Count Mode, (see **Table 25.107, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**).
- TAUDTTOUTm is not used with this function.
- The value of TAUDnCDRm must be set to $FFFF_H$.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. $FFFF_H$ is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUDTTINm input start edge and then continues to count down from the current value.

When the counter reaches $0000_H$ an interrupt is generated. $FFFF_H$ is loaded to TAUDnCNTm and the counter continues to count down until a TAUDTTINm input stop edge is detected.

#### Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = $10_B$, the TAUDTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = $11_B$, the TAUDTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

**NOTE**

The counter cannot be restarted during operation.

### 25.12.14.2 Block Diagram and General Timing Diagram

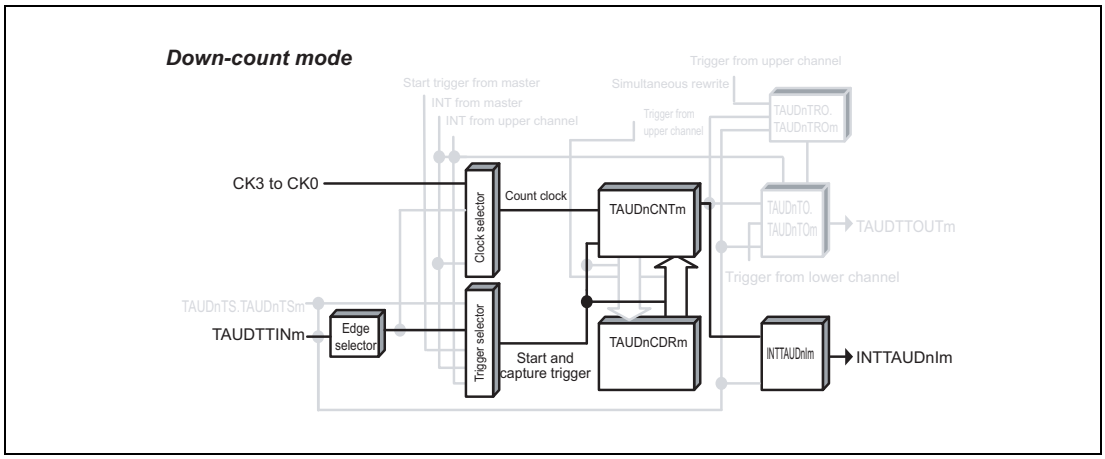

**Figure 25.76 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = $11_B$)

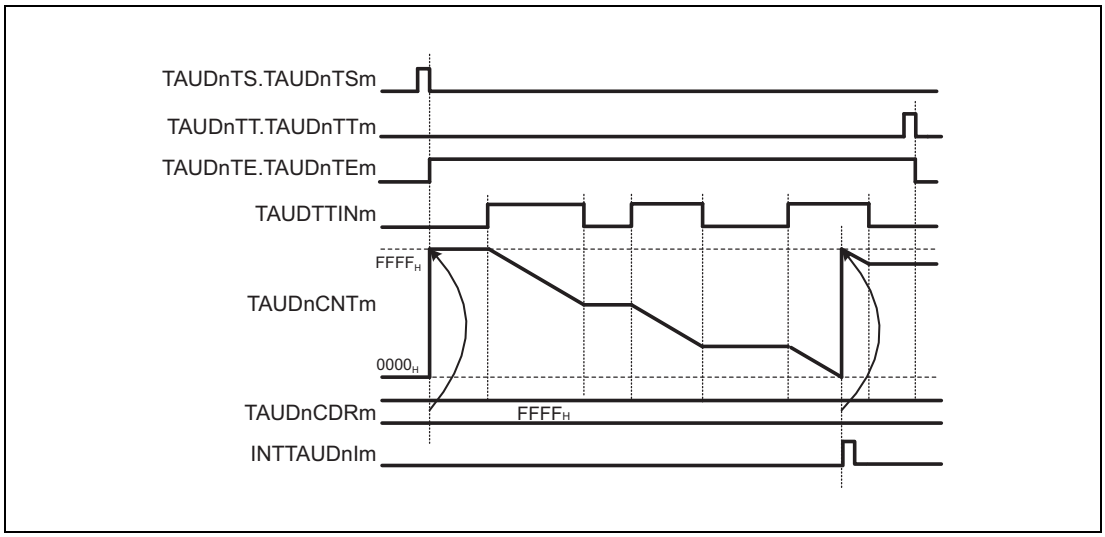

**Figure 25.77 General Timing Diagram for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**

### 25.12.14.3 Register Settings

#### (1) TAUDnCMORm

## 25.12.15 One-Phase PWM Output Function

### 25.12.15.1 Overview

#### Summary

This function adds dead time to a TAUDTTINm input signal. The resulting PWM signal is output via TAUDTTOUTm of the channel and TAUDTTOUTm of upper channels.

#### Prerequisites

- Each of two (or more) channels is enabled for dead time control (TAUDnTDE.TAUDnTDEm = 1).
- The operating mode for the lower channel should be set to one-count mode. (See **Table 25.112, Contents of the TAUDnCMORm Register for the Lower Channel of the One-Phase PWM Output Function**.)
- Any operating mode can be set to upper channels.
- Channel output mode for upper and lower channels should be set to synchronous channel output mode 2 with one-phase PWM output. (See **Section 25.7, Channel Output Modes**.)

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches $0000_H$, an interrupt occurs. The counter is reset to $FFFF_H$ and waits for the next valid TAUDTTINm input start edge.

**Table 25.111 TAUDTTOUTm to which Dead Time is Added and State of TAUDTTINm**

| TAUDnCMURm. TAUDnTIS[1:0] | TAUDnTOL. TAUDnTOLm | TAUDTTOUTm to which Dead Time is Added | TAUDnTDL. TAUDnTDLm | TAUDTTINm State when Added |
|---|---|---|---|---|
| 10 | 0 | TAUDTTOUTm low | 0 | High |
| | | | 1 | Low |
| | 1 | TAUDTTOUTm high | 0 | High |
| | | | 1 | Low |
| 11 | 0 | TAUDTTOUTm low | 0 | Low |
| | | | 1 | High |
| | 1 | TAUDTTOUTm high | 0 | Low |
| | | | 1 | High |

**Conditions**

- TAUDnCMURm.TAUDnTIS[1:0] bits specify the type of width measurement:
  - TAUDnCMURm.TAUDnTIS[1:0] = $10_B$: Uses both edges as valid edges for detection (Low width measurement).
  - TAUDnCMURm.TAUDnTIS[1:0] = $11_B$: Uses both edges as valid edges for detection (High width measurement).
- The TAUDnTDL.TAUDnTDLm bit specifies the operation of TAUDTTOUTm for each channel when an interrupt or valid TAUDTTINm edge is detected on the lower channel:
  - If TAUDnTDL.TAUDnTDLm = 0, an interrupt is used as a TAUDTTOUTm set trigger and a valid TAUDTTINm edge as a TAUDTTOUTm reset trigger.
  - If TAUDnTDL.TAUDnTDLm = 1, a valid TAUDTTINm edge is used as a TAUDTTOUTm set trigger and an interrupt as a TAUDTTOUTm reset trigger.
- This function cannot make a forced restart.

### 25.12.15.2 Block Diagram and General Timing Diagram

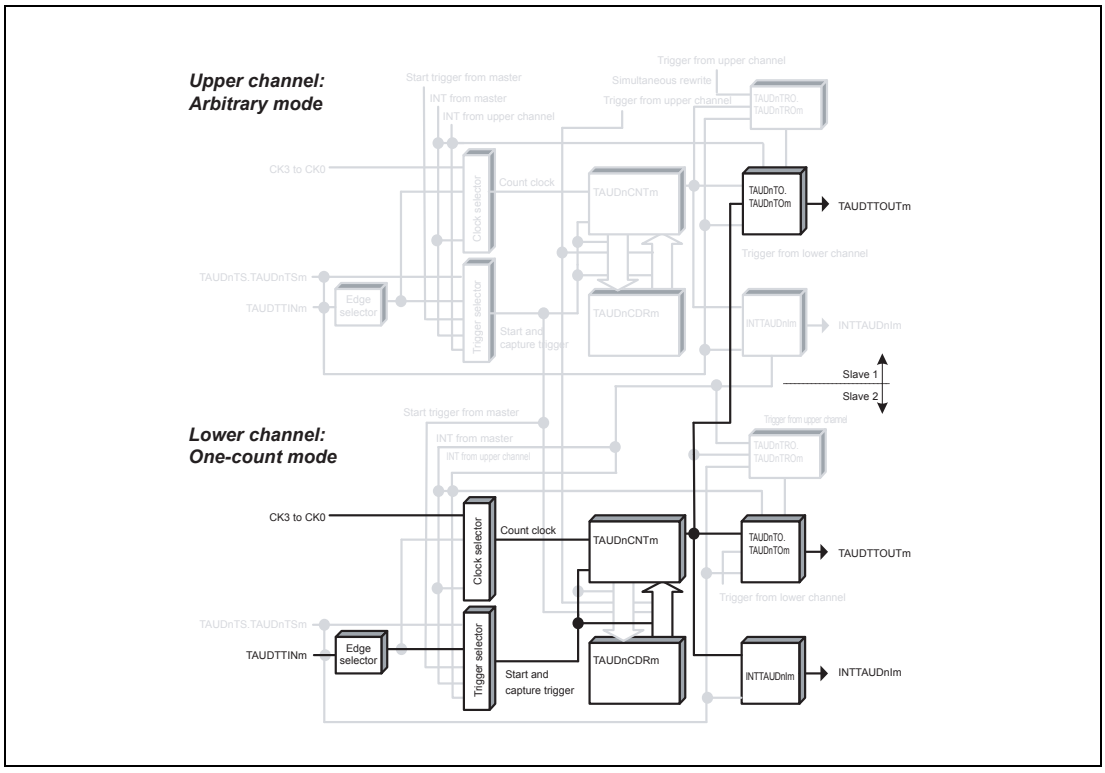

**Figure 25.78 Block Diagram of One-Phase PWM Output Function**

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = $11_B$)

This setting considers a duty as an active high.

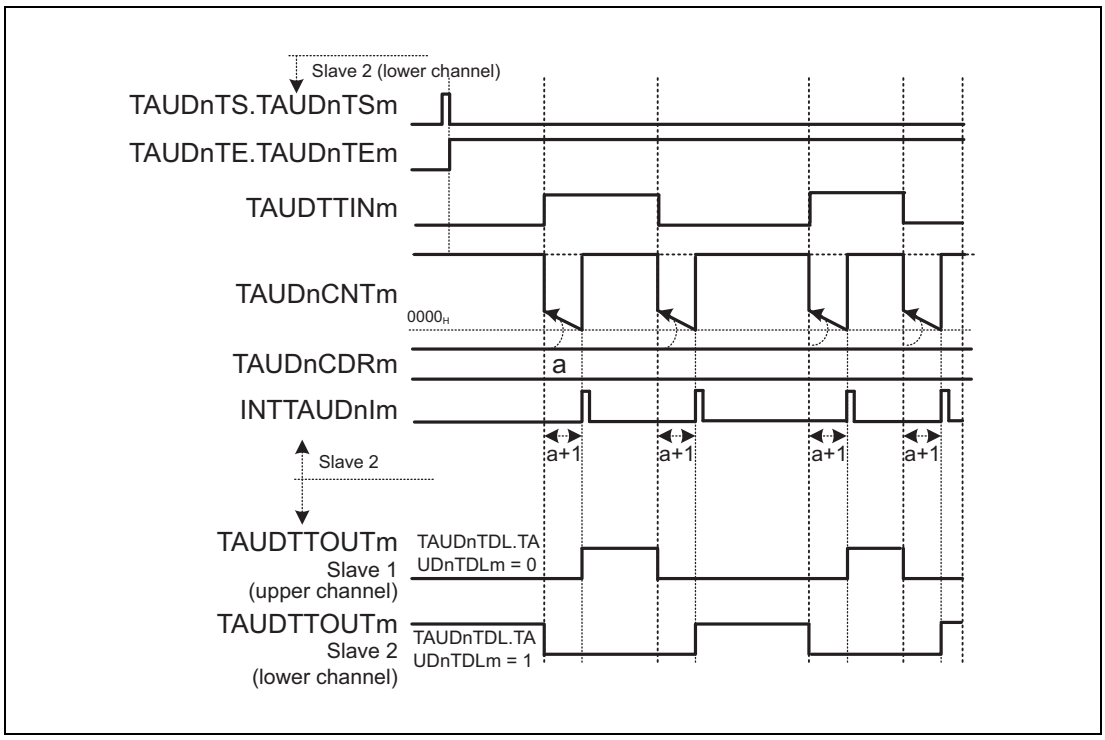

**Figure 25.79 General Timing Diagram of One-Phase PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 10: Detection of rising and falling edges (low width measurement)<br>11: Detection of rising and falling edges (high width measurement) |

### (3) Channel output mode for lower channels

Table 25.114 Control Bit Settings in Synchronous Channel Output Mode 2 with One-Phase PWM Output

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 1: Adds dead time upon detection of a TAUDTTINm input edge on a lower odd channel. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time of the positive-phase width<br>1: Adds dead time of the negative-phase width |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

**CAUTION**

Set TAUDnTDL.TAUDnTDLm exclusively from upper channels.

### (4) Simultaneous rewrite for lower channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the one-phase PWM output function. Therefore, these registers should be set to 0.

Table 25.115 Simultaneous Rewrite Settings for One-Phase PWM Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

Restart Operation

# 25.13 Independent Channel Real-Time Functions

This section describes functions that output the value of the TAUDnTRO.TAUDnTROm bit in real time.

## 25.13.1 Real-Time Output Function Type 1

### 25.13.1.1 Overview

#### Summary

This function outputs a value of the TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated at certain specified intervals.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

#### Prerequisites

- Channels should use the TAUDTTOUTm control of other channels.
- The operating mode for the upper channel should be set to interval timer mode. (See **Table 25.118, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 1**.)
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. (See **Section 25.7, Channel Output Modes**.)
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

#### Functional description

The counter of the upper channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The current value of the data register of the upper channel (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.

When the counter of the upper channel reaches $0000_H$, INTTAUDnIm is generated and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1). TAUDnCNTm then reloads the TAUDnCDRm value to continue operation subsequently.

The TAUDTTOUTm signal changes only when an interrupt is generated, and when its value is different from the current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.

#### Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm = 0) or if the

channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.

- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not output. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

### 25.13.1.2 Equations

INTTAUDnIm generation cycle = count clock cycle × (TAUDnCDRm value + 1)

### 25.13.1.3 Block Diagram and General Timing Diagram

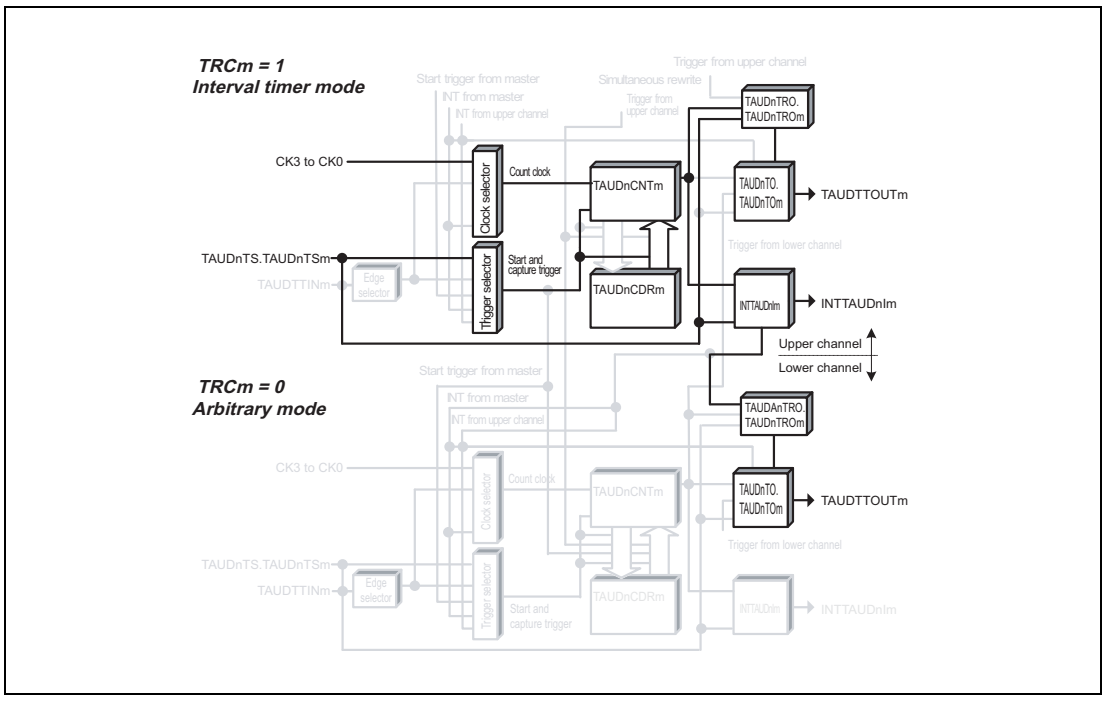

**Figure 25.80 Block Diagram of Real-Time Output Function Type 1**

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for upper channels

Table 25.120 Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low<br>1: Real-time output is high |
| TAUDnTRC.TAUDnTRCm | 1: Channel m generates a unique real-time output trigger |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for upper channels

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the real-time output function type 1. Therefore, these registers should be set to 0.

Table 25.121 Simultaneous Rewrite Settings for Real-Time Output Function Type 1

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

#### 25.13.1.5 Register Settings for Lower Channels

**(1) TAUDnCMORm for lower channels**

The TAUDnCMORm register for lower channels can be set arbitrarily.

**(2) TAUDnCMURm for lower channels**

The TAUDnCMURm register for lower channels can be set arbitrarily.

**(3) Channel output mode for lower channels**

**Table 25.122 Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output**

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0 |
| TAUDnTDL.TAUDnTDLm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0 |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low<br>1: Real-time output is high |
| TAUDnTRC.TAUDnTRCm | 0: Upper channel generates a real-time output trigger for channel m |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

**(4) Simultaneous rewrite for lower channels**

Simultaneous rewrite registers for lower channels are available for any setting.

### 25.13.1.6 Operating Procedure for Real-Time Output Function Type 1

Table 25.123 Operating Procedure for Real-Time Output Function Type 1

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in **Table 25.118, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 1**, and **Table 25.119, Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 1**.<br><br>Set TAUDnCMORm and TAUDnCMURm registers for lower channels as described in **Section 25.13.1.5, Register Settings for Lower Channels**.<br><br>Set the value of TAUDnCDRm register (only channels with TAUDnTRC.TAUDnTRCm = 1)<br><br>Set channel output mode by setting the control bits as described in **Table 25.120, Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output**.<br><br>Set channel output mode by setting the control bits as described in **Table 25.122, Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output**. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | [Channel with TAUDnTRC.TAUDnTRCm set to 1]<br>TAUDnTE.TAUDnTEm is set to 1 and the counter starts.<br>The TAUDnCDRm value is loaded in TAUDnCNTm. | During Operation | TAUDnCDRm and TAUDnTRO.TAUDnTROm can be changed at any time.<br>The TAUDnCNTm register can be read at any time. | TAUDnCNTm counts down. When the counter reaches $0000_H$:<br>• The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues.<br>• INTTAUDnIm is generated.<br>• TAUDTTOUTm outputs the current value of the real-time output bit TAUDnTRO.TAUDnTROm.<br>Afterwards, this procedure is repeated. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops. Both TAUDnCNTm and TAUDTTOUTm retain their current values. |

Restart Operation

### 25.13.1.7 Specific Timing Diagrams

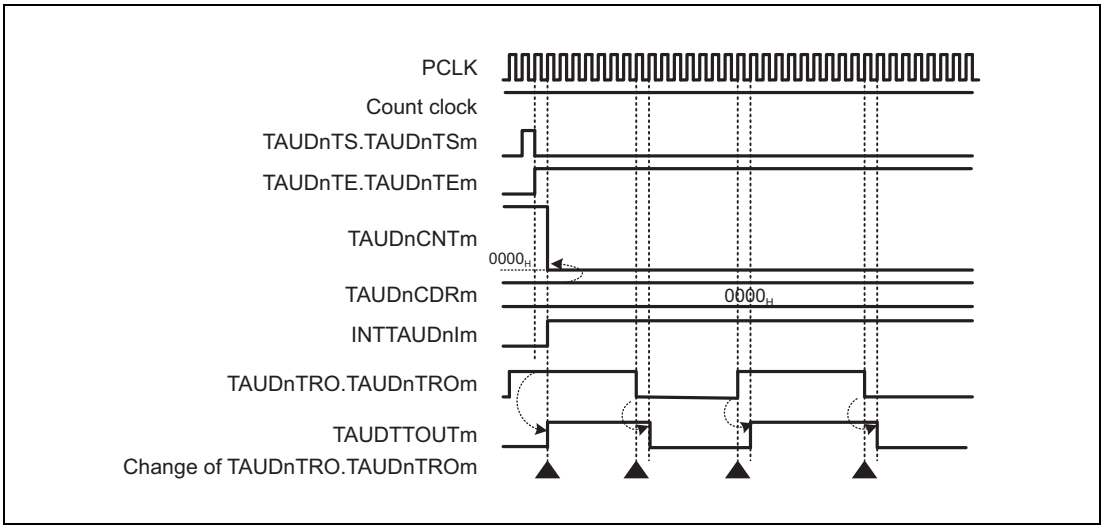

**Figure 25.82 TAUDnCDRm = $0000_H$, TAUDnCMORm.TAUDnMD0 = 1**

- The value of TAUDTTOUTm changes according to the setting of TAUDnTRO.TAUDnTROm with a delay of one PCLK cycle.

## 25.13.2 Real-Time Output Function Type 2

### 25.13.2.1 Overview

#### Summary

This function outputs the value of TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated when a valid TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

#### Prerequisites

- Channels should use the TAUDTTOUTm control of the other channels.
- The operating mode for the upper channel should be set to capture mode. (See **Table 25.124, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 2**.)
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. (See **Section 25.7, Channel Output Modes**.)
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

#### Functional description

The counter for upper channels is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The counter starts to count up.

When a valid TAUDTTINm input edge is generated on one of upper channels, an interrupt occurs and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1).

The TAUDTTOUTm signal changes only when an interrupt is generated, and when TAUDTTOUTm value is different from the current value of TAUDnTRO.TAUDnTROm during the occurrence of the interrupt.

#### Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm = 0) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.
- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not

output. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

### 25.13.2.2 Block Diagram and General Timing Diagram

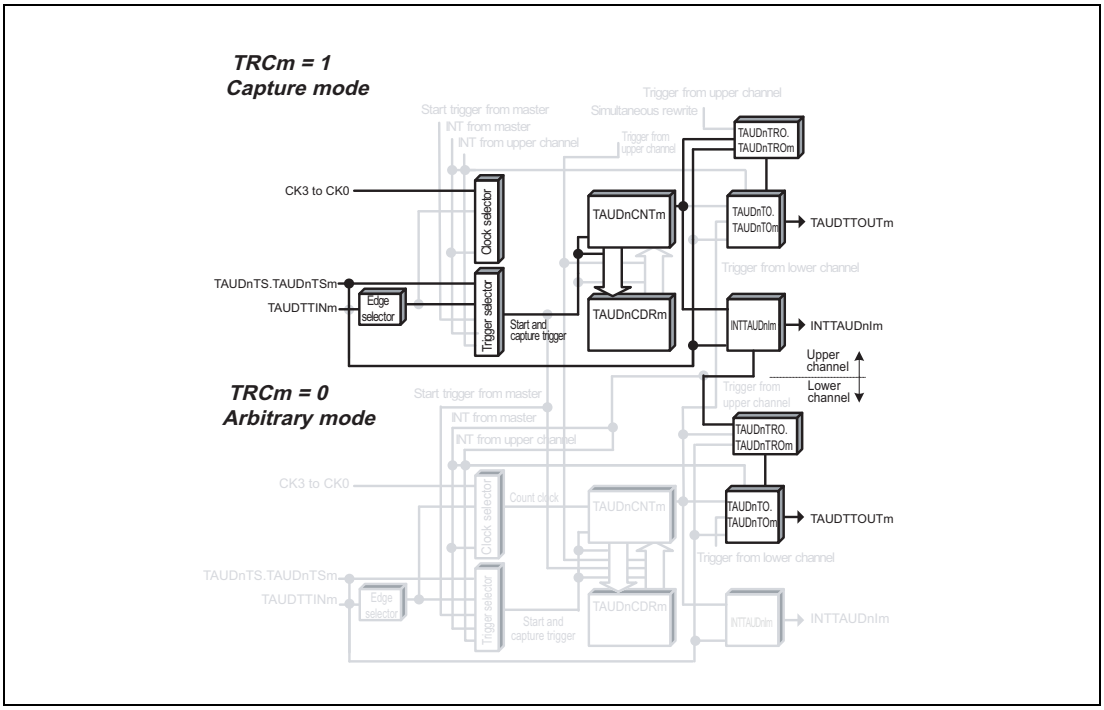

**Figure 25.83 Block Diagram of Real-Time Output Function Type 2**

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)

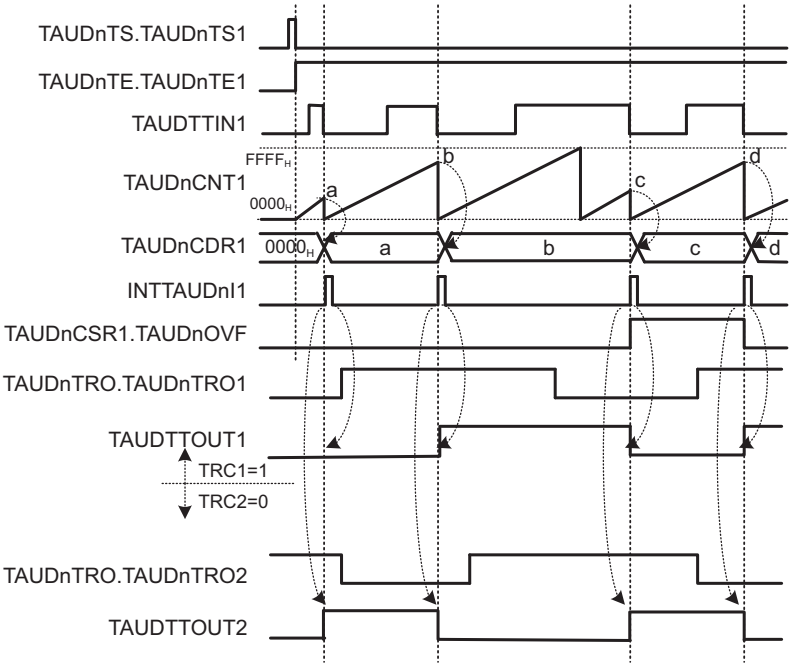

**Figure 25.84 General Timing Diagram of Real-Time Output Function Type 2**

|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Detection of falling edge<br>01: Detection of rising edge<br>10: Detection of rising and falling edges<br>11: Setting prohibited |

### (3) Channel output mode for upper channels

**Table 25.126 Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output**

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low<br>1: Real-time output is high |
| TAUDnTRC.TAUDnTRCm | 1: Channel m generates a unique real-time output trigger |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for upper channels

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the real-time output function type 2. Therefore, these registers should be set to 0.

**Table 25.127 Simultaneous Rewrite Settings for Real-Time Output Function Type 2**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

### 25.13.2.4 Register Settings for Lower Channels

#### (1) TAUDnCMORm for lower channels

The TAUDnCMORm register for lower channels can be set arbitrarily.

#### (2) TAUDnCMURm for lower channels

The TAUDnCMURm register for lower channels can be set arbitrarily.

#### (3) Channel output mode for lower channels

**Table 25.128 Control Bit Settings for Lower Channels in Independent Channel Output Mode 1 with Real-Time Output**

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output. |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low<br>1: Real-time output is high |
| TAUDnTRC.TAUDnTRCm | 0: Upper channel generates a real-time output trigger for channel m |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

#### (4) Simultaneous rewrite for lower channels

Simultaneous rewrite registers for lower channels can be set arbitrarily.

### 25.13.2.5 Operating Procedure for Real-Time Output Function Type 2

Table 25.129 Operating Procedure for Real-Time Output Function Type 2

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in **Table 25.124, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 2**, and **Table 25.125, Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 2**.<br><br>Set TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in **Section 25.13.2.4, Register Settings for Lower Channels**.<br><br>The TAUDnCDRm register functions as a capture register (only channels with TAUDnTRC.TAUnTRCm = 1).<br><br>Set channel output mode by setting the control bits as described in **Table 25.126, Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output**.<br><br>Set channel output mode by setting the control bits as described in **Table 25.128, Control Bit Settings for Lower Channels in Independent Channel Output Mode 1 with Real-Time Output**. | Channel operation is stopped. |

| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops. TAUDnCNTm, TAUDnCSRm.TAUDnOVF, and TAUDTTOUTm retain their current values. |

Restart Operation

### 25.13.2.6 Specific Timing Diagrams

#### (1) Operation start and stop

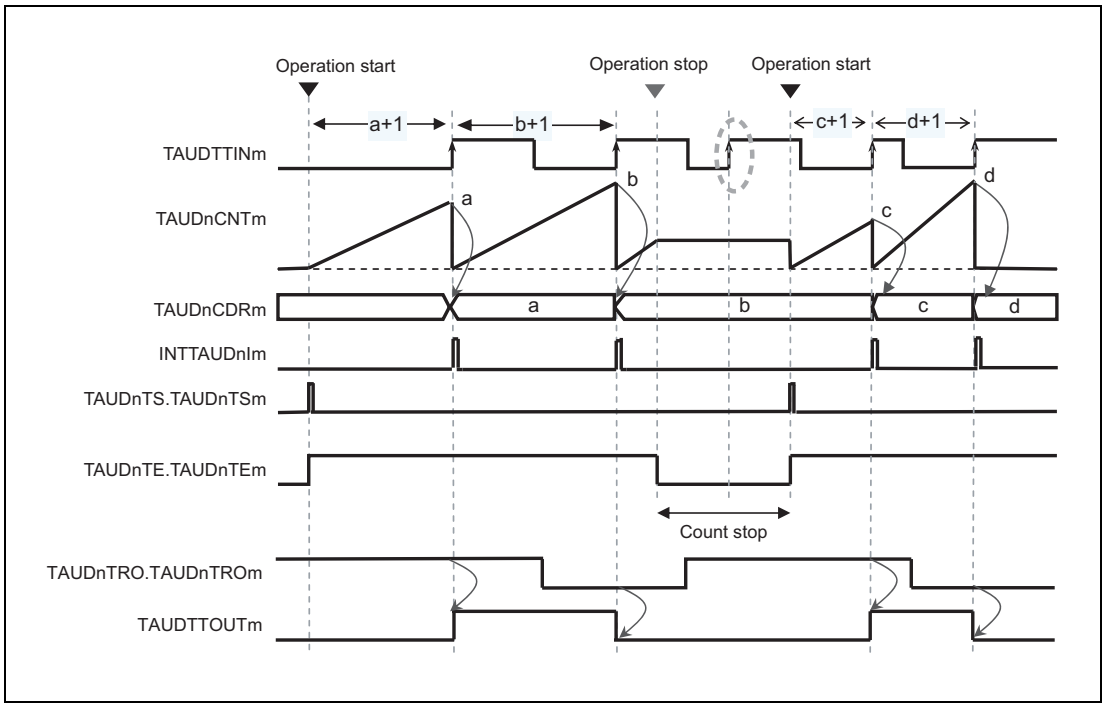

**Figure 25.85 Operation Start and Stop (TAUDnCMORm.TAUDnMD0 = 0)**

- When TAUDnTS.TAUDnTSm is set to 1, the counter starts counting up.
- When a valid input edge is detected, the current value of the counter is written to the data register (TAUDnCDRm) and an interrupt is generated.
- TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) and the counter resets and starts to count up again.
- The TAUDTTOUTm signal only changes when an interrupt is generated, and then only when its value is different from the current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.
- If the counter is stopped (TAUDnTE.TAUDnTEm = 0), valid input edges are ignored and no interrupt is generated.

# 25.14 Independent Channel Simultaneous Rewrite Functions

This section describes functions that carry out simultaneous rewrite.

## 25.14.1 Simultaneous Rewrite Trigger Generation Function Type 1

### 25.14.1.1 Overview

#### Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDCm = 1), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDCm = 0).

#### Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.TAUDnRDEm = 1).
- The operating mode for the upper channel should be set to interval timer mode. (See **Table 25.130, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**.)
- For the operating mode that can be set for lower channels, see **Table 25.47, Channel Functions and the Methods They Use for Simultaneous Rewrite**.
- TAUDTTOUTm is not used for any channel in this function.

#### Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) for upper and lower channels to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of the data register buffer for upper channels (TAUDnCDRm buf) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value. The counter for lower channels start to count according to the selected operating mode.

Once the counter reaches $0000_H$, an interrupt occurs on the channel. The current value of the corresponding TAUDnCDRm buffer is loaded into TAUDnCNTm to continue operation subsequently.

If the channel where an interrupt occurs is specified as a trigger channel for simultaneous rewrite (TAUDnRDC.TAUDnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.TAUDnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

#### Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnRDC.TAUDnRDCm = 1 for the corresponding channel. The TAUDnRDC.TAUDnRDCm

bit should be set to 0 for all other channels in which simultaneous rewrite should take place.

- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

#### 25.14.1.2 Equations

Simultaneous rewrite trigger generation cycle = count clock cycle × (TAUDnCDRm + 1)

To control simultaneous rewrite, the following condition should be satisfied:

[PWM]

TAUDnCDRm = [(value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1) × number of interrupts] – 1

[Triangle PWM]

TAUDnCDRm = [(value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1) × 2 × number of interrupts] – 1

That is, the ratio of TAUDnCDRm + 1 and value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

For triangle PWM, remember that the cycle doubles.

### 25.14.1.3 Block Diagram and General Timing Diagram

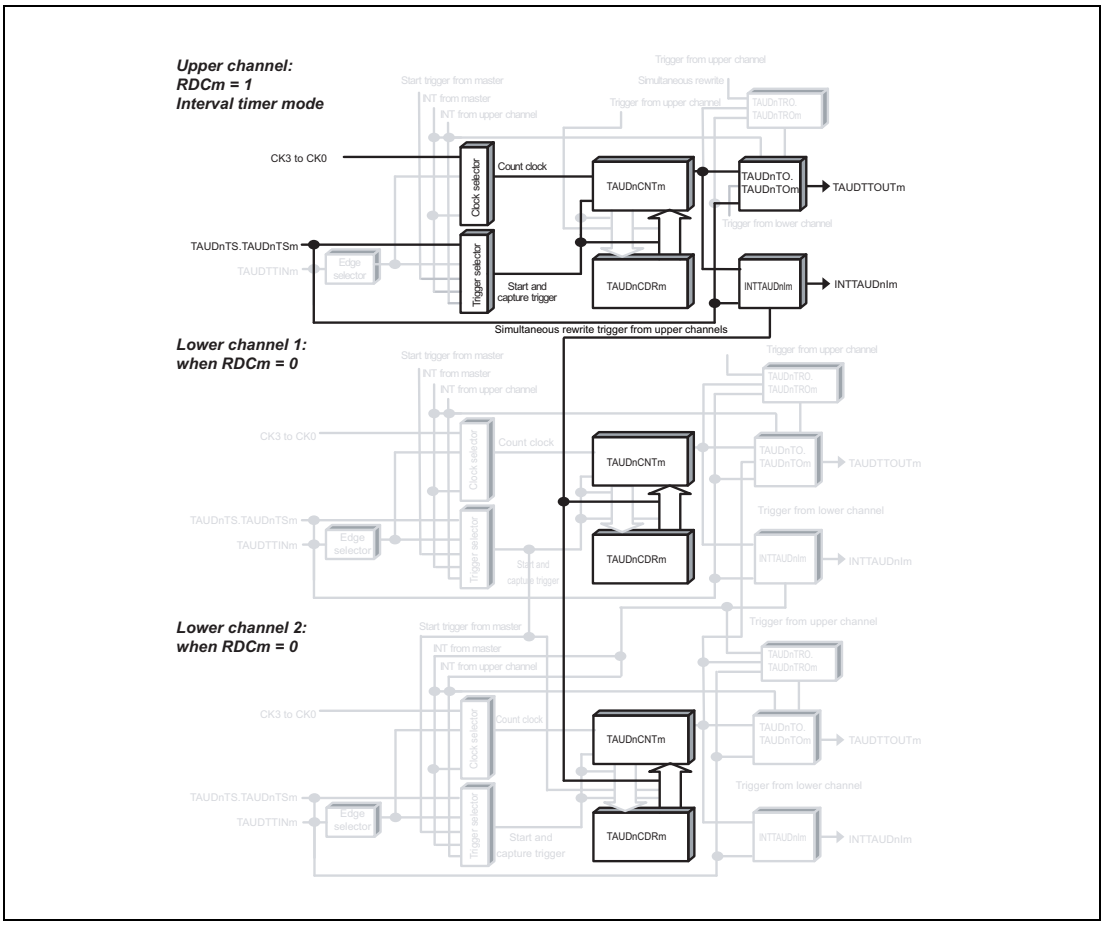

**Figure 25.86 Block Diagram of Simultaneous Rewrite Trigger Generation Function Type 1**

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

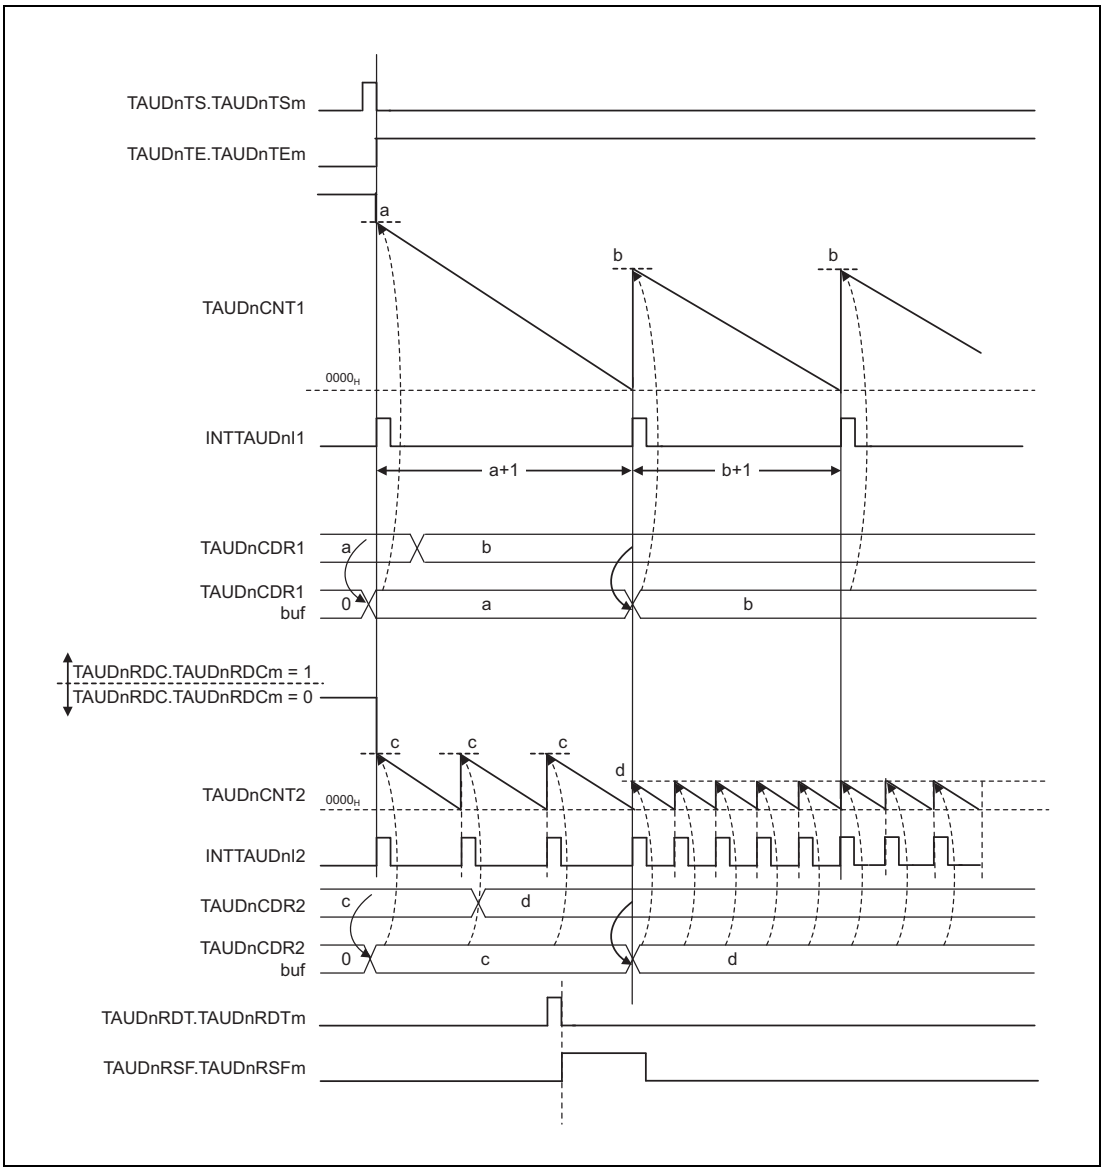

**Figure 25.87 General Timing Diagram of Simultaneous Rewrite Trigger Generation Function Type 1**

### 25.14.1.4 Register Settings for Upper Channels

#### (1) TAUDnCMORm for upper channels

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |

**Table 25.130 Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3 |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Independent operation. Set to 0. |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm not generated at the beginning of operation.<br>1: INTTAUDnIm generated at the beginning of operation. |

#### (2) TAUDnCMURm for upper channels

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.131 Contents of the TAUDnCMURm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

#### (3) Channel output mode for upper channels

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function. However, this mode can be used in independent channel output mode controlled by software.

#### (4) Simultaneous rewrite for upper channels

Table 25.132 Simultaneous Rewrite Settings for Upper Channels in Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 1: Selects one of upper channels as simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Loads a simultaneous rewrite control signal when the master channel starts counting. |
| TAUDnRDC.TAUDnRDCm | 1: Monitors INTTAUDnIm signal which triggers a simultaneous rewrite on the channel. |

### 25.14.1.5 Register Settings for Lower Channels

#### (1) TAUDnCMORm for lower channels

TAUDnCMORm register for lower channels must follow the TAUDnCMORm register settings in the operating mode which can be set. (See **Table 25.47, Channel Functions and the Methods They Use for Simultaneous Rewrite**.)

#### (2) TAUDnCMURm for lower channels

TAUDnCMURm register for lower channels must follow the TAUDnCMURm register settings in the operating mode which can be set. (See **Table 25.47, Channel Functions and the Methods They Use for Simultaneous Rewrite**.)

#### (3) Channel output mode for lower channels

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 25.46, Simultaneous Rewrite Methods and when They are Triggered**.

#### (4) Simultaneous rewrite for lower channels

Table 25.133 Simultaneous Rewrite Settings for Lower Channels in Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 1: Selects one of upper channels as simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Loads a simultaneous rewrite control signal when the master channel starts counting. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.14.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 25.134 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Set TAUDnCMORm and TAUDnCMURm registers for the upper channel as described in **Table 25.130, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**, and **Table 25.131, Contents of the TAUDnCMURm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**.<br><br>Set TAUDnCMORm and TAUDnCMURm registers for lower channels as described in **Section 25.14.1.5, Register Settings for Lower Channels**.<br><br>Set the value of TAUDnCDRm register. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm to 1.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is set to 1 and the counter starts.<br>TAUDnCDRm value is loaded into TAUDnCNTm. If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated. |

When the counter reaches $0000_H$:<br>• The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues.<br>• INTTAUDnIm is generated.<br>If INTTAUDnIm is generated on the channel where TAUDnRDC.TAUDnRDCm is set to 1, simultaneous rewrite is controlled.<br>Afterwards, this procedure is repeated. |
| Stop Operation | Set TAUDnTT.TAUDnTTm to 1.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops and retains its current value. |

Restart Operation

## 25.14.2 Simultaneous Rewrite Trigger Generation Function Type 2

### 25.14.2.1 Overview

#### Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. In this function, the interrupt is generated when a valid TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDCm = 1), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDCm = 0).

#### Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.TAUDnRDEm = 1).
- The operation mode of the upper channel must be set to Capture Mode (see **Table 25.135, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 2**).
- For the operation mode that can be set for a lower channel, see **Table 25.47, Channel Functions and the Methods They Use for Simultaneous Rewrite**.

#### Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) for upper and lower channels to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter for the upper channel starts to count up, and then the counter for lower channels start to count according to the selected operating mode.

When a TAUDTTINm input edge occurs on the upper channel, an interrupt is generated. The trigger is detected by the lower channel(s), which then also generate an interrupt.

When TAUDnRDC.TAUDnRDCm = 1 on the upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.TAUDnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

#### Conditions

- The channel which is monitored for INTTAUDnIm is specified by setting TAUDnRDC.TAUDnRDCm = 1 for the corresponding channel. The TAUDnRDC.TAUDnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1, an interrupt is generated when the function starts. For details see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

### 25.14.2.2 Block Diagram and General Timing Diagram

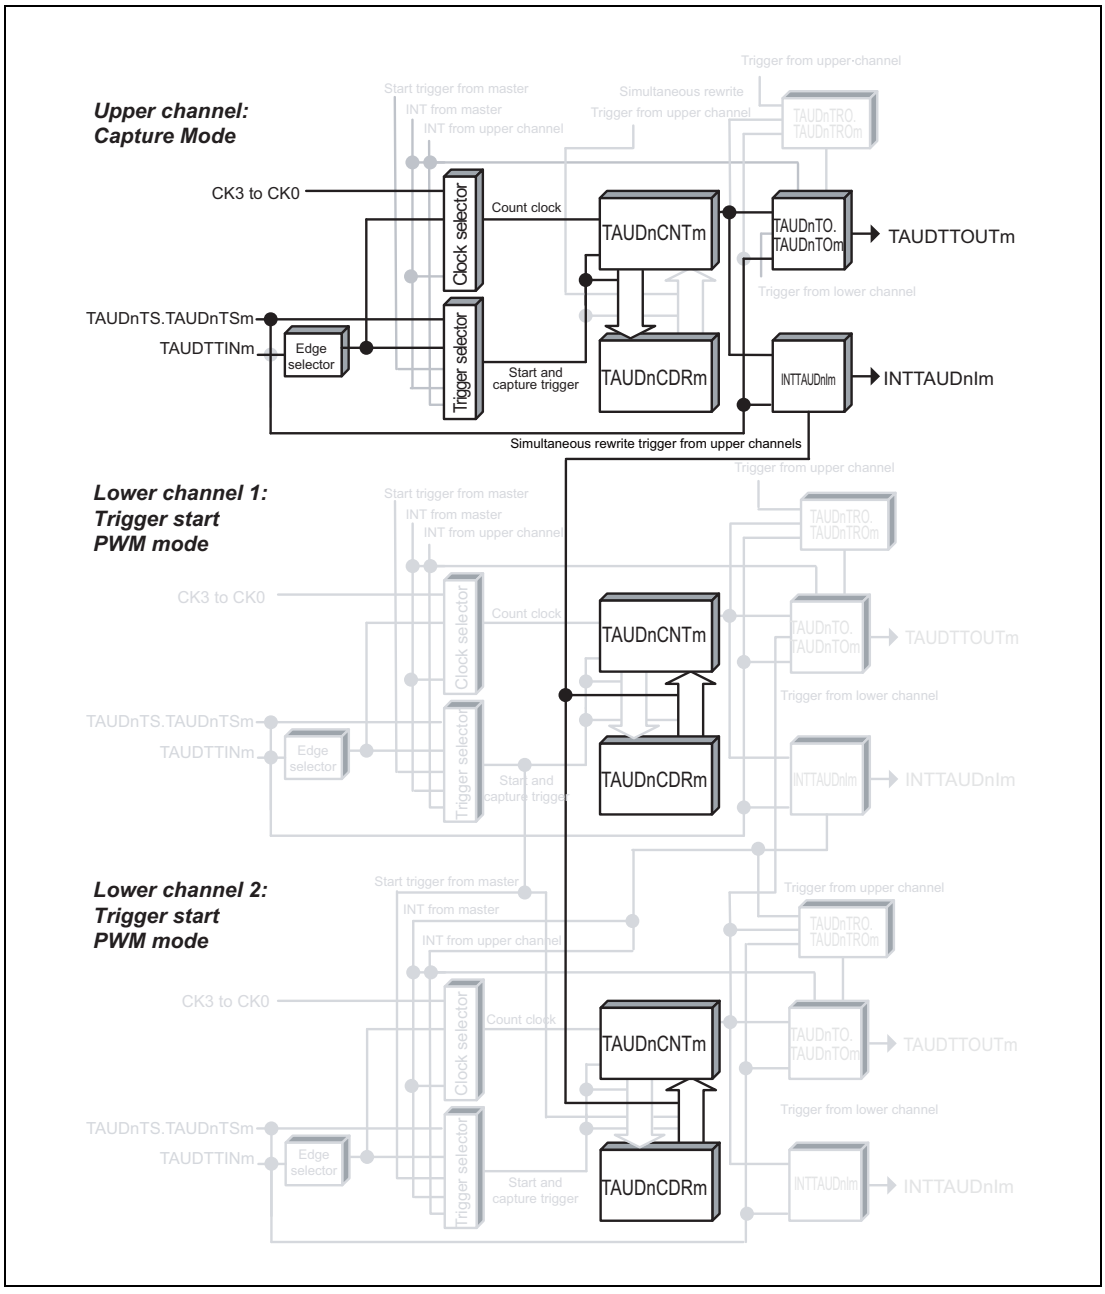

**Figure 25.88 Block Diagram for Simultaneous Rewrite Trigger Generation Function Type 2**

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)
- Upper channel (CH1) generates simultaneous rewrite trigger.

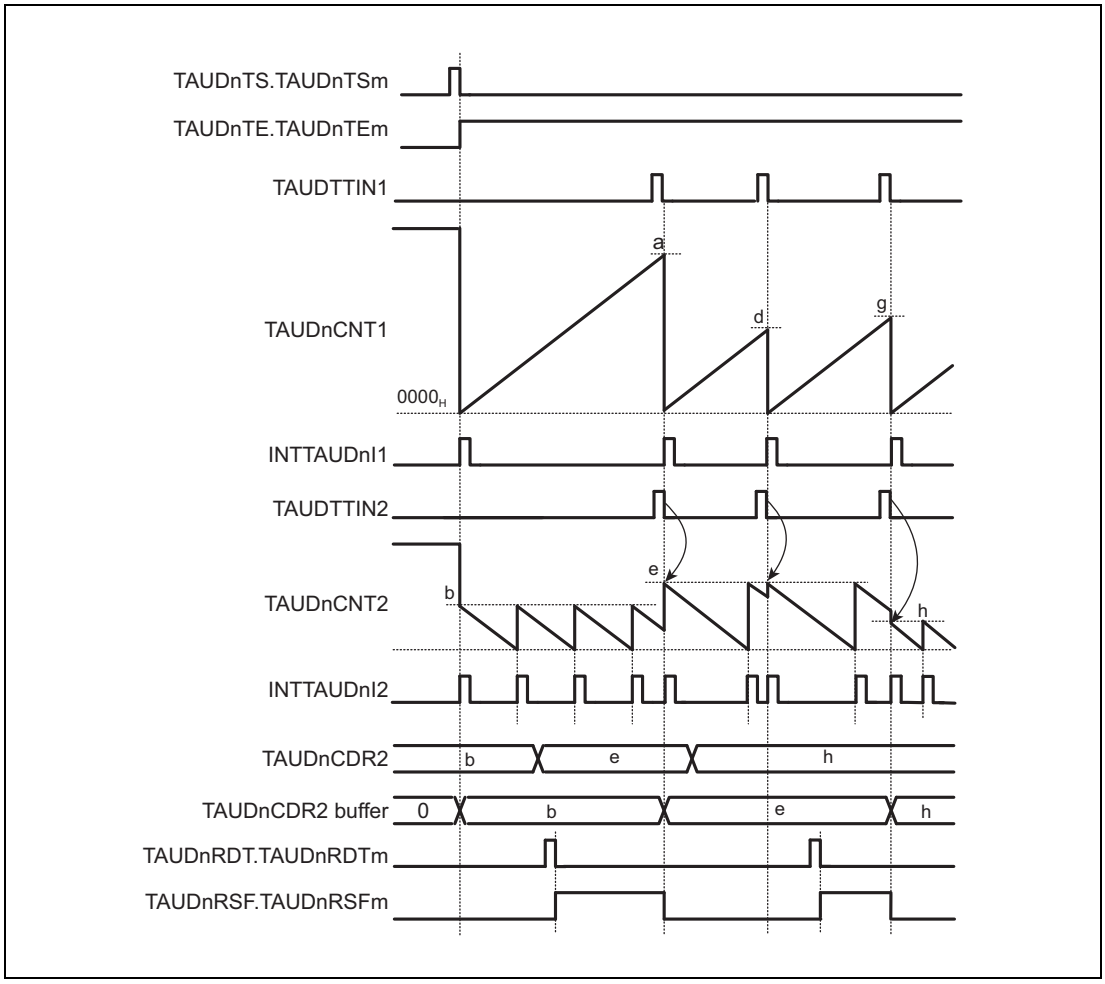

**Figure 25.89 General Timing Diagram for Simultaneous Rewrite Trigger Generation Function Type 2**

### 25.14.2.3 Register Settings for Upper Channels

#### (1) TAUDnCMORm for upper channels

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Restart Operation

# 25.15 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the timer array unit D. For a general overview of synchronous channel operation, see **Section 25.2, Overview**

This section describes functions that generate PWM signals at regular intervals.

## 25.15.1 PWM Output Function

### 25.15.1.1 Overview

#### Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty cycle of the TAUDTTOUTm to be set. The pulse cycle is set in the master channel. The duty cycle is set in the slave channel.

#### Prerequisites

- Two channels
- The operating mode for the master channel should be set to interval timer mode. (See **Table 25.142, Contents of the TAUDnCMORm Register for the Master Channel of the PWM Output Function**.)
- The operating mode for the slave channels should be set to one-count mode. (See **Table 25.145, Contents of the TAUDnCMORm Register for the Slave Channel of the PWM Output Function**.)
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channels should be set to Synchronous Channel Output Mode 1. (See **Section 25.7, Channel Output Modes**.)

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm, and the counter starts counting down from the TAUDnCDRm value. If an INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set/reset, PWM output is made.

- Master channel:
  When the master channel counter reaches $0000_H$ and the pulse cycle time has passed, INTTAUDnIm is generated. The counter loads TAUDnCDRm value into TAUDnCNTm and counts down.
- Slave channel:
  When INTTAUDnIm is generated on the master channel, the counter operation of the slave channel is triggered. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts counting down from the TAUDnCDRm value. TAUDTTOUTm signal is set to the active level.
  When the counter reaches to $0000_H$ (duty time has elapsed), INTTAUDnIm is generated and a TAUDTTOUTm signal is set to an inactive level. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnIm (start of the next pulse cycle) of the master channel.

The counter can stop operating by setting the TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

**Conditions**

Simultaneous rewrite can be used with this function. See **Section 25.6, Simultaneous Rewrite**.

### 25.15.1.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUDnCDRm (slave)/(TAUDnCDRm (master) + 1)) × 100

– Duty cycle = 0%
  TAUDnCDRm (slave) = $0000_H$
– Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

### 25.15.1.3 Block Diagram and General Timing Diagram

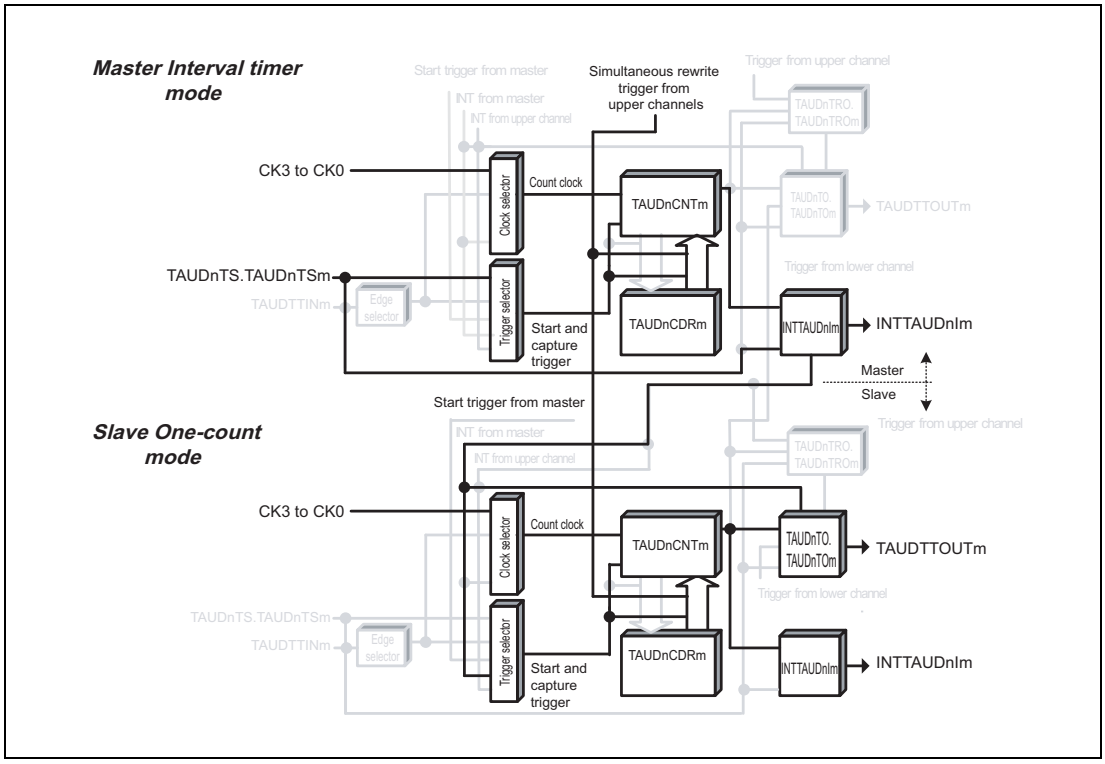

**Figure 25.90 Block Diagram of PWM Output Function**

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

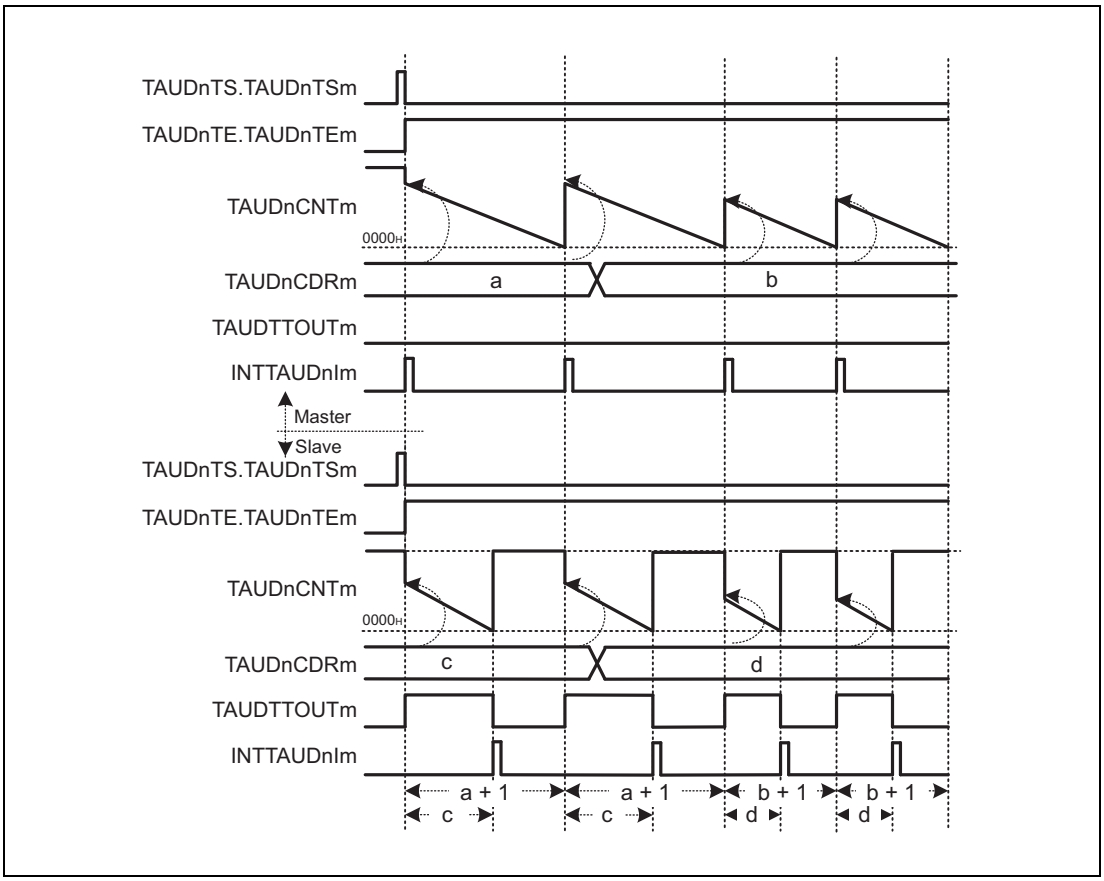

**Figure 25.91 General Timing Diagram of PWM Output Function**

**NOTES**

1. The interval between the starting to count and an interrupt being generated is the value of corresponding TAUDnCDRm + 1.
2. TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 25.15.1.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.142 Contents of the TAUDnCMORm Register for the Master Channel of the PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 1: INTTAUDnIm generated at the beginning of operation. |

#### (2) TAUDnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.143 Contents of the TAUDnCMURm Register for the Master Channel of the PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for the master channel

The channel output mode is not used with this function.

### (4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

**Table 25.144 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers.<br>1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

**NOTE**

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires a channel higher than the master channel that operates with **Section 25.14.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Conduct operation settings under the following conditions:

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1
  TAUDnCDRm settings for this channel are as follows:
  = ((TAUDnCDR setting for the master channel targeted for simultaneous rewrite + 1) × interrupt count) – 1
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm = 0, TAUDnRDSm = 1

If TAUDnCDRm (slave) setting > TAUDnCDRm (master) setting + 1, the duty value (which exceeds 100%) is aggregated to be 100% output.

### 25.15.1.5 Register Settings for Slave Channels

#### (1) TAUDnCMORm for slave channels

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.146 Contents of the TAUDnCMURm Register for the Slave Channel of the PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for slave channels

Table 25.147 Control Bit Settings in Synchronous Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRC.TAUDnTRCm | |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for slave channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.148 Simultaneous Rewrite Settings for Slave Channels of PWM Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers.<br>1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.15.1.6 Operating Procedure for PWM Output Function

Table 25.149 Operating Procedure for PWM Output Function

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.1.4, Register Settings for the Master Channel**.<br><br>Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.1.5, Register Settings for Slave Channels**.<br><br>Set the value of TAUDnCDRm register of every channel. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start.<br>INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set. |
| During operation | TAUDnCDRm can be changed at any time.<br>TAUDnTOL.TAUDnTOLm can be changed.<br>TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.<br><br>TAUDnRDT.TAUDnRDTm can be changed during operation. | TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches $0000_H$:<br>• INTTAUDnIm (master) is generated.<br>• TAUDnCDRm value is loaded into TAUDnCNTm (master) to continue count operation.<br>• TAUDnCDRm value is loaded into TAUDnCNTm (slave) to perform counting down.<br>• TAUDTTOUTm (slave) is set to the active level.<br>If TAUDnCNTm (slave) reaches $0000_H$:<br>• INTTAUDnIm (slave) is generated.<br>• TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops. |
| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart Operation

### 25.15.1.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

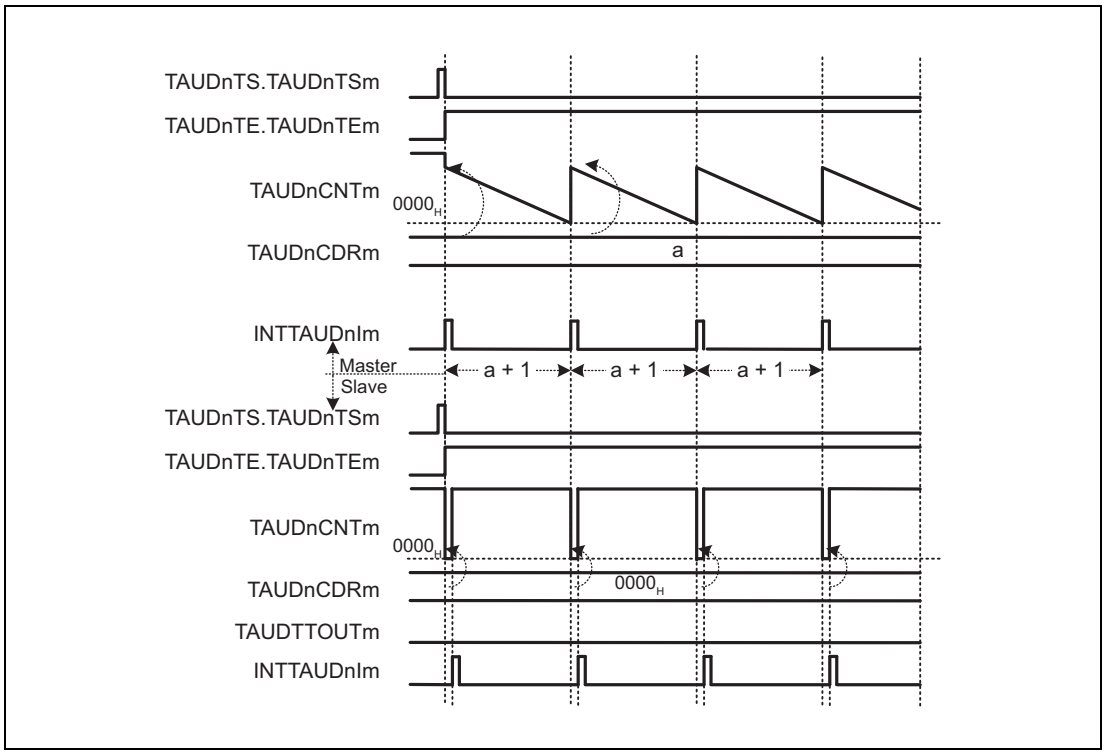

**Figure 25.92 TAUDnCDRm (Slave) = $0000_H$, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)**

- Every time the master channel generates an interrupt (INTTAUDnIm), $0000_H$ is loaded into TAUDnCNTm (slave). As a result, a slave channel interrupt (INTTAUDnIm) is generated at the same time and TAUDTTOUTm remains inactive.
- TAUDnCDRm value is loaded into TAUDnCNTm (slave) to generate an interrupt.

**(2) Duty cycle = 100%**

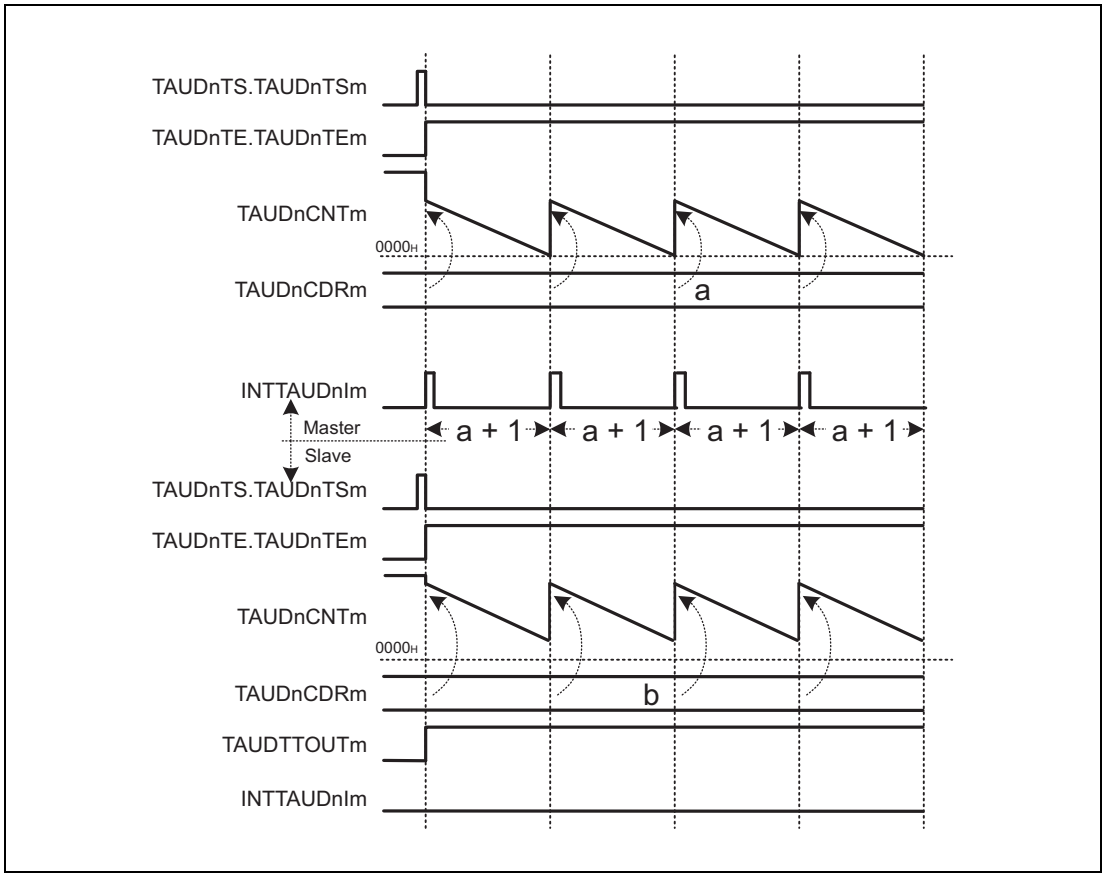

**Figure 25.93 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1 Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)**

- If TAUDnCDRm (slave) value is greater than TAUDnCDRm (master) value, the slave channel counter does not reach $0000_H$ and consequently, no interrupt occurs. TAUDTTOUTm remains active.

### (3) Operation stop and restart

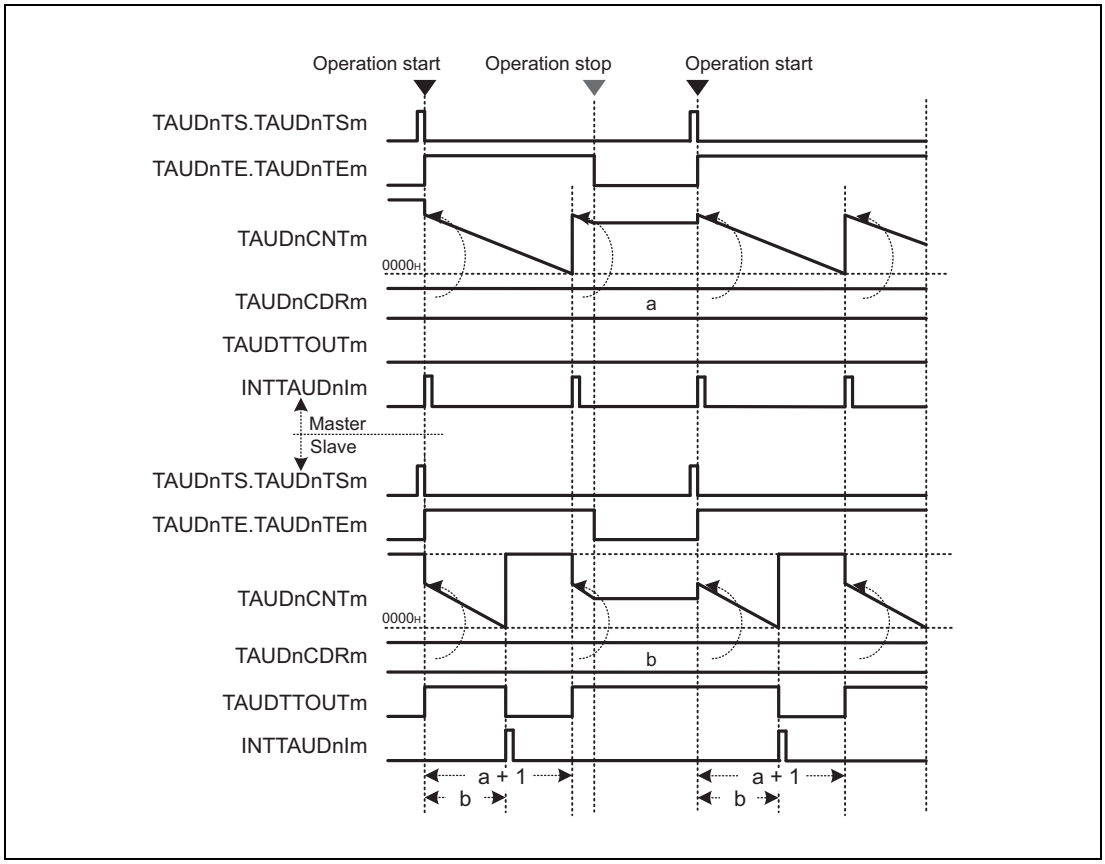

**Figure 25.94 Operation Stop and Restart**
**Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)**

- The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm of master and slave channels to 1. TAUDnCDRm values of the master and slave channels are loaded to TAUDnCNTm and start to count down from these values.

## 25.15.2 One-Shot Pulse Output Function

### 25.15.2.1 Overview

#### Summary

This function outputs a signal pulse with a specific pulse width and delay time (both defined relative to an external input signal pulse) by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

#### Prerequisites

- Two channels
- The operating mode for the master channel should be set to one-count mode. (See **Table 25.150, Contents of the TAUDnCMORm Register for the Master Channel of the One-Shot Pulse Output Function**.)
- The operating mode for slave channels should be set to pulse one-count mode. (See **Table 25.153, Contents of the TAUDnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function**.)
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channel should be set to independent channel output mode 2. (See **Section 25.7, Channel Output Modes**.)
- TAUDTTINm (master) has to be detected while TAUDnCNTm (master) and TAUDnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUDTTINm (slave).

#### Functional description

The counters are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1 for the master and slave channels. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation.

- Master channel:
  When the next valid TAUDTTINm input edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm. The counter starts to count down from this value. If TAUDnCMORm.TAUDnMD0 = 0, a trigger (TAUDTTINm) which is detected within the delay time is ignored.
  When the counter of master channel reaches $0000_H$, INTTAUDnIm is generated. The counter is reset to $FFFF_H$ and waits for the next valid TAUDTTINm input edge.
- Slave channel:
  INTTAUDnIm generated on master channel triggers the counter operation of slave channel. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave). The counter starts counting down from this value. An interrupt occurs and the TAUDTTOUTm signal is set.
  When the counter reaches $0001_H$, INTTAUDnIm is generated and TAUDTTOUTm signal is reset.
  The counter stops at $0000_H$ and waits for the next INTTAUDnIm of master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Setting TAUDnTS.TAUDnTSm to 1 while counting allows the counter to restart counting of master channel without making a stop (forced restart).

**Conditions**

- If TAUDnCMORn.TAUDnMD0 of master channel is set to 0, TAUDTTINm input edges detected during counting are ignored.
- Simultaneous rewrite can be used with this function. See **Section 25.6, Simultaneous Rewrite**.

### 25.15.2.2 Equations

Delay from trigger input to pulse output
= (TAUDnCDRm (master) + 1) × count clock cycle

Pulse width = (TAUDnCDRm (slave)) × count clock cycle

### 25.15.2.3 Block Diagram and General Timing Diagram

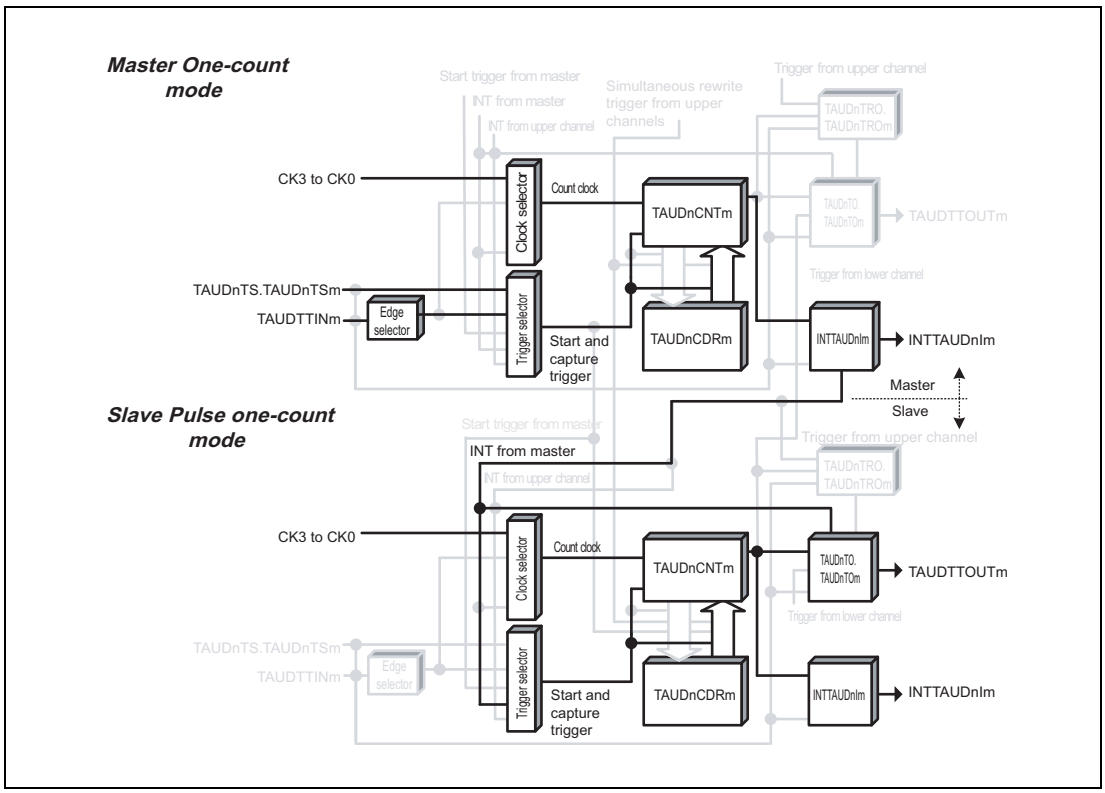

**Figure 25.95 Block Diagram of One-Shot Pulse Output Function**

The following settings apply to the general timing diagram.

- Start trigger detection is disabled during counting (TAUDnCMORm.TAUDnMD0 = 0).
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

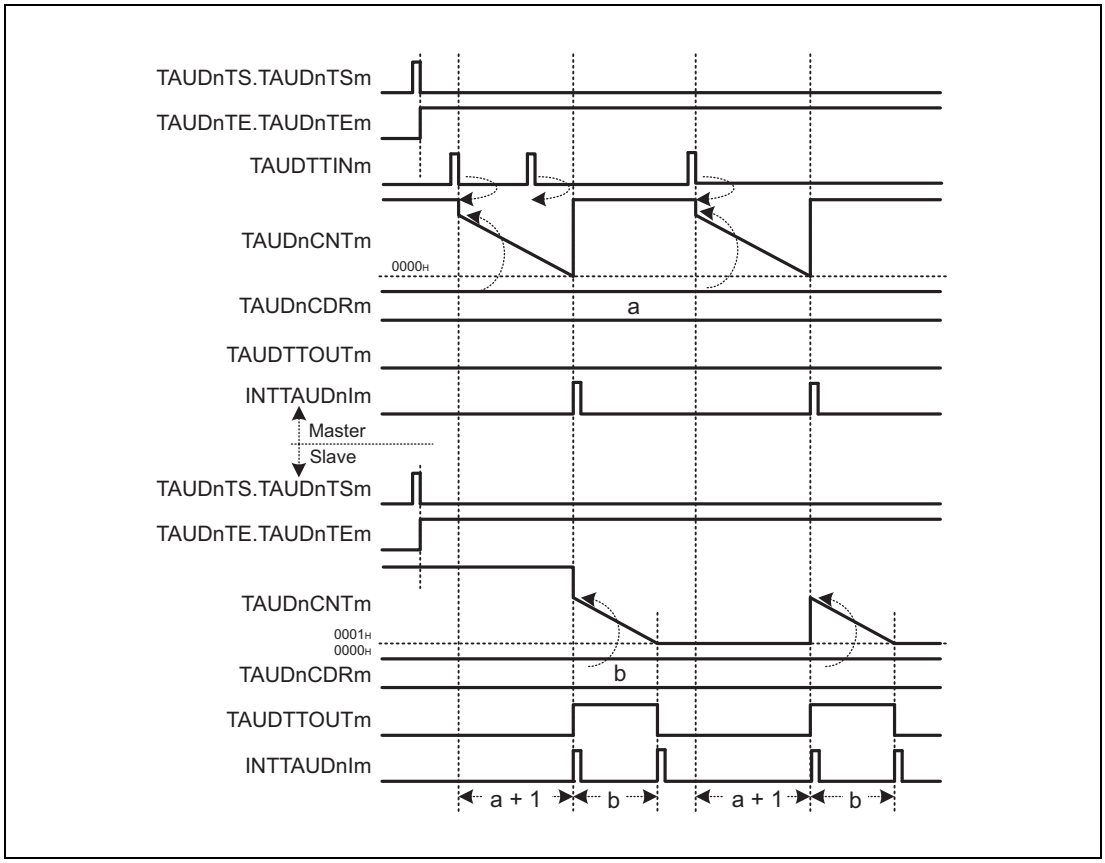

**Figure 25.96 General Timing Diagram of One-Shot Pulse Output Function**

### 25.15.2.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnIm of master channel is a start trigger. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 1010: Pulse one-count mode |
| 0 | TAUDnMD0 | 0: Disables detection of start trigger during count operation.<br>1: Enables start trigger detection while counting.<br>The MD0 bits of the master and slave channels must be indentical. |

#### (2) TAUDnCMURm for slave channels

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.154 Contents of the TAUDnCMURm Register for the Slave Channel of the One-Shot Pulse Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for the slave channel

Table 25.155 Control Bit Settings in Independent Channel Output Mode 2

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0 |
| TAUDnTDL.TAUDnTDLm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0 |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for slave channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.156 Simultaneous Rewrite Settings for Slave Channels of One-Shot Pulse Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Master channel is simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.15.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 25.157 Operating Procedure for One-Shot Pulse Output Function

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.2.4, Register Settings for the Master Channel**.<br><br>Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and channel output mode as described in **Section 25.15.2.5, Register Settings for Slave Channels**.<br><br>Set the value of TAUDnCDRm register of every channel. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the master channel awaits a TAUDTTINm input. |
| During Operation | TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.<br><br>TAUDnRDT.TAUDnRDTm can be changed during operation. | When valid TAUDTTINm input edge is detected, TAUDnCDRm value of master channel is loaded into TAUDnCNTm to perform counting down. When the counter reaches $0000_H$:<br>• INTTAUDnIm (master) is generated.<br>• TAUDnCNTm (master) is reset to $FFFF_H$ and waits for the next valid TAUDTTINm input edge.<br>• TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to perform counting down.<br>• INTTAUDnIm (slave) is generated.<br>• TAUDTTOUTm (slave) is set to the active level.<br>When TAUDnCNTm (slave) reaches $0001_H$:<br>• INTTAUDnIm (slave) is generated.<br>• TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops. |
| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart Operation

### 25.15.2.7 Specific Timing Diagrams

#### (1) TAUDnCDRm (master) = $0000_H$

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

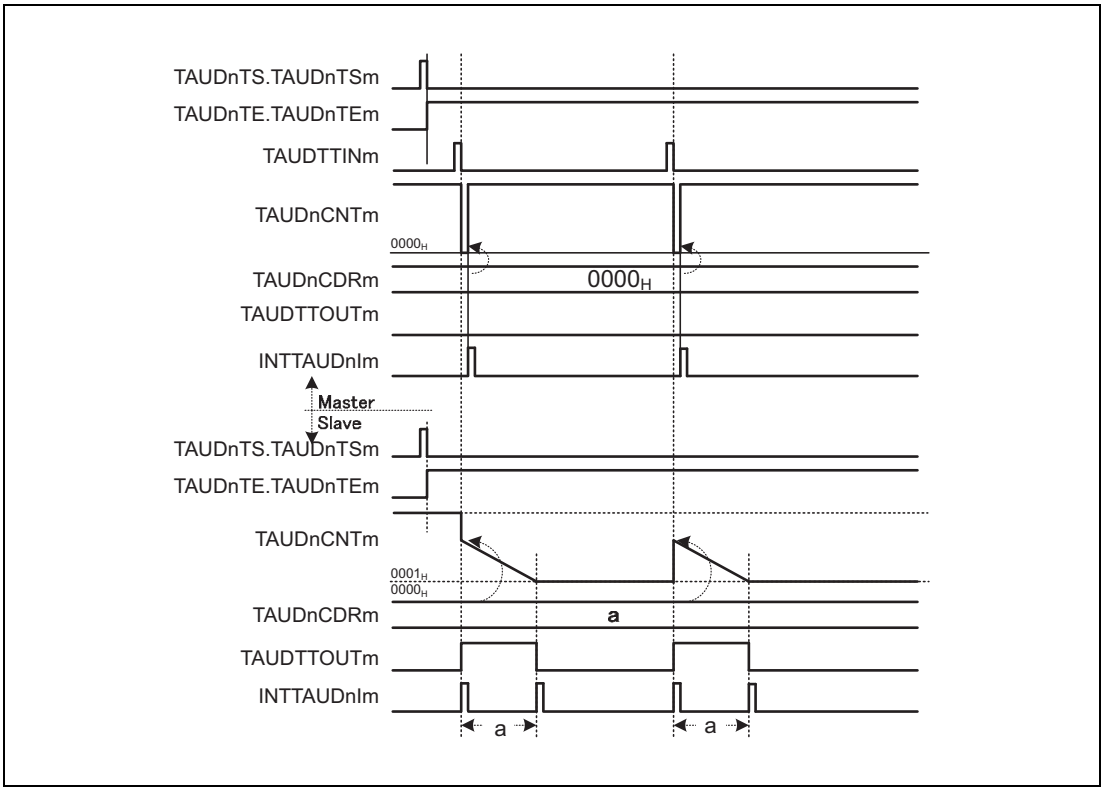

**Figure 25.97 TAUDnCDRm (Master) = $0000_H$**

- When a valid TAUDTTINm input edge is detected, the value $0000_H$ is written to TAUDnCNTm (master). The counter is set to $0000_H$ for one count and returns to $FFFF_H$.
  Thus the slave channel starts to count down one count clock later than TAUDTTINm (master).

### (2) TAUDnCDRm (slave) = $0000_H$

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

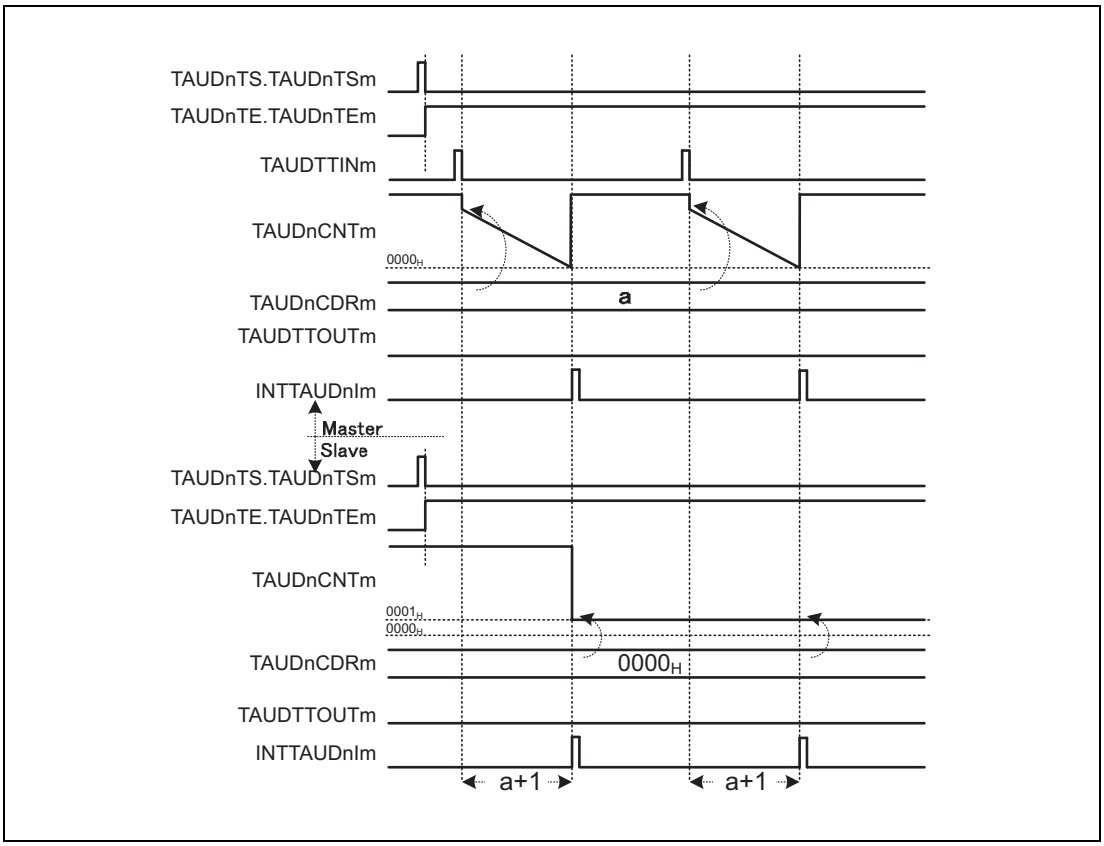

**Figure 25.98 TAUDnCDRm (Slave) = $0000_H$**

- TAUDTTOUTm remains inactive, because the pulse width is zero.

### (3) TAUDnCMORm.TAUDnMD0 = 1

The following settings apply to this diagram.

- Enables start trigger detection while counting. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

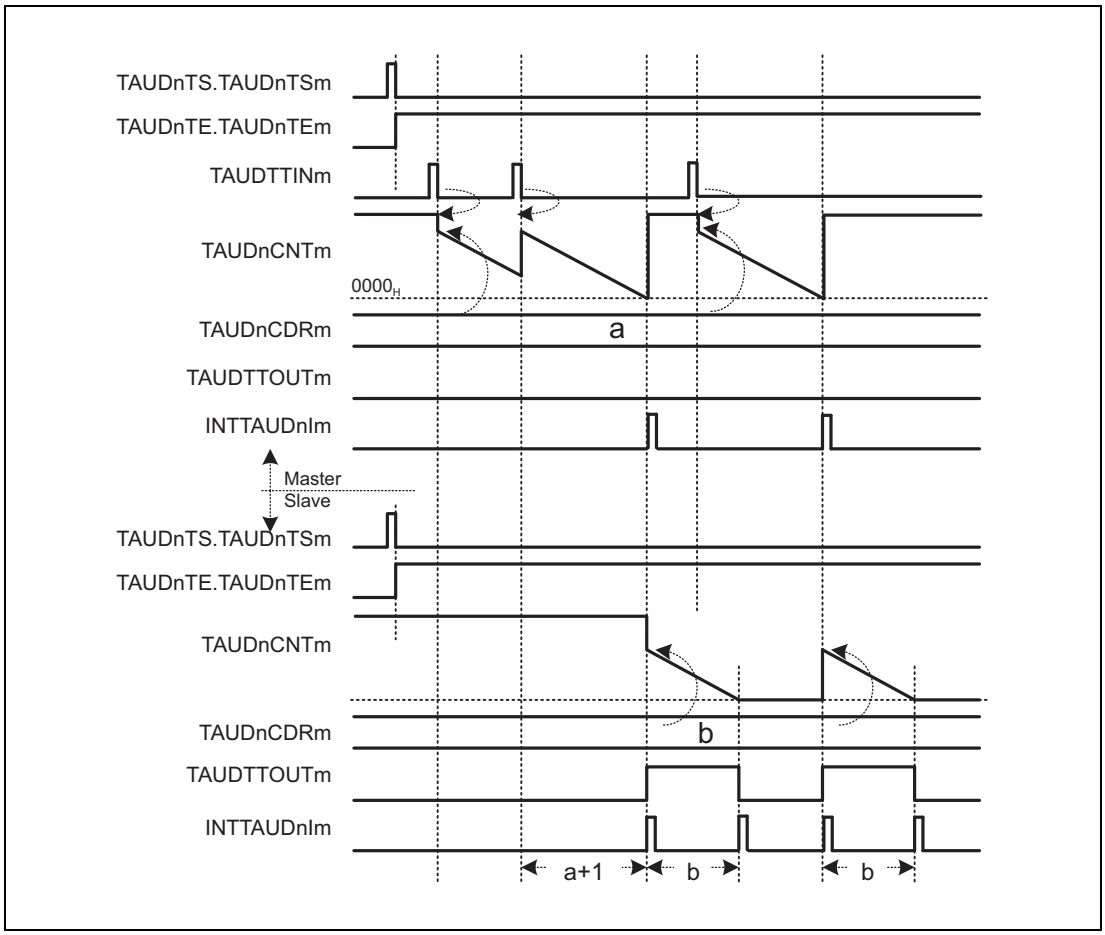

**Figure 25.99 TAUDnCMORm.TAUDnMD0 = 1**

- If a valid TAUDTTINm input edge is detected while the counter of the master channel counts down, TAUDnCNTm reloads the value of TAUDnCDRm. The counter restarts to count down. This means the delay is extended by the value of TAUDnCNTm at the time when a valid TAUDTTINm input edge is detected.

### (4) Restarting the master channel while the slave channel is counting

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

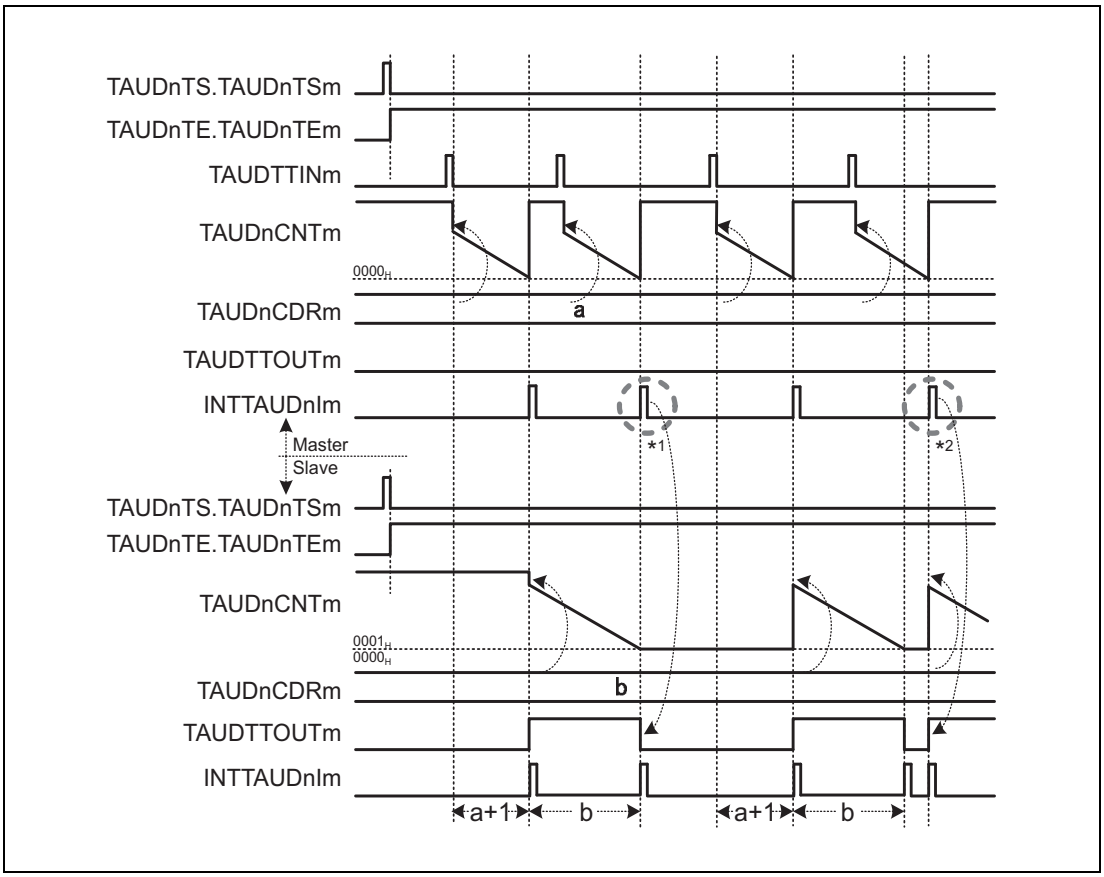

**Figure 25.100 TAUDTTINm input interval ≤ Delay Time + Pulse Width +1**

- If the master channel generates an interrupt before the counter of the slave channel has reached $0001_H$ or exactly when $0001_H$ is reached[*1], the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUDnCDRm (slave) is reloaded. An interrupt is generated and TAUDTTOUTm toggles. If TAUDnCNTm (master) has started to count down while the TAUDnCNTm (slave) is still counting[*2], TAUDTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

## 25.15.3 Trigger Start PWM Output Function

### 25.15.3.1 Overview

#### Summary

This function generates a PWM output using a master and a slave channel. It enables the pulse cycle (frequency) and the duty of the TAUDTTOUTm to be set. The pulse cycle is specified using the master channel. The duty is specified using the slave channel. The Trigger Start PWM Output Function is identical to PWM Output Function except that the master channel of this function can be reset by a valid TAUDTTINm input edge.

#### Prerequisites

- Two channels
- The operation mode of the master channel must be set to Interval Timer Mode (see **Table 25.158, Contents of the TAUDnCMORm Register for the Master Channel of the Trigger Start PWM Output Function**).
- The operation mode of the slave channel must be set to One-Count Mode (see **Table 25.161, Contents of the TAUDnCMORm Register for the Slave Channel of the Trigger Start PWM Output Function**).
- The channel output mode of the slave channel must be set to Synchronous Channel Output Mode 1 (see **Section 25.7, Channel Output Modes**).
- TAUDTTOUTm is not used with the master channel of this function.

#### Functional description

The counters (master and slave) are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The current value of TAUDnCDRm is loaded to TAUDnCNTm, and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel, and a PWM output is realized by setting and resetting TAUDTTOUTm (slave).

- Master channel:
  The current value of TAUDnCDRm is loaded to the counter (TAUDnCNTm), INTTAUDnIm is generated and the counter starts to count down from this value.
  When the counter reaches $0000_H$ and the pulse cycle time has elapsed, INTTAUDnIm is generated and the counters (master and slave) load the current TAUDnCDRm values.
  If a valid TAUDTTINm input edge is detected, the counter of the master channel loads the current TAUDnCDRm value, restarts counting down and generates an interrupt.
- Slave channel:
  When the slave detects an interrupt from the master channel, it starts to count down from the current value of TAUDnCDRm. The TAUDTTOUTm signal is set to the active level.
  When the counter reaches $0000_H$ (duty time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

**Conditions**

Simultaneous rewrite can be used with this function. See **Section 25.6, Simultaneous Rewrite**.

### 25.15.3.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave) / (TAUDnCDRm (master) + 1)] × 100

– Duty cycle = 0%
  TAUDnCDRm (slave) = $0000_H$
– Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

### 25.15.3.3 Block Diagram and General Timing Diagram

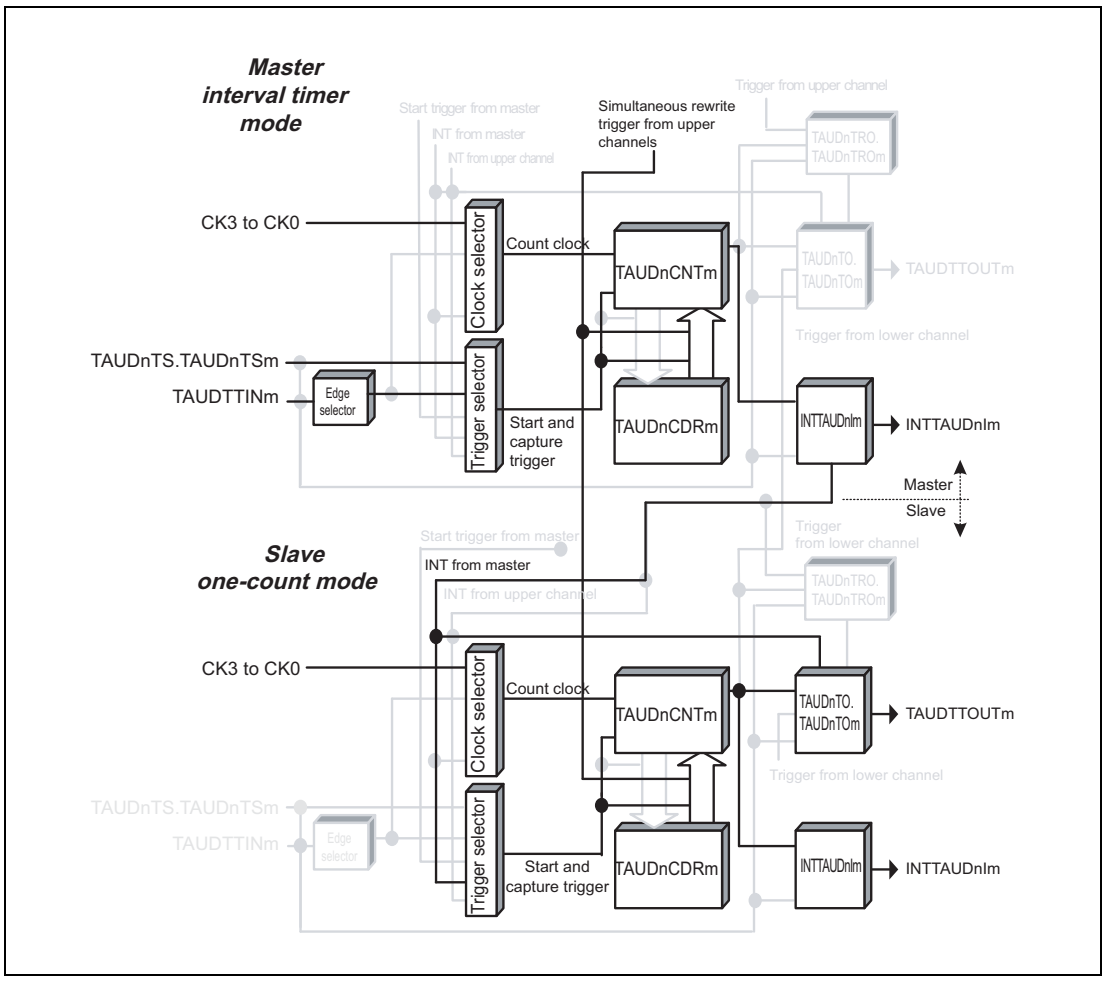

**Figure 25.101 Block Diagram for Trigger Start PWM Output Function**

The following settings apply to the general timing diagram.

- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = $01_B$)
- Positive logic (TAUDnTOL.TAUDnTOLm (slave) = 0)

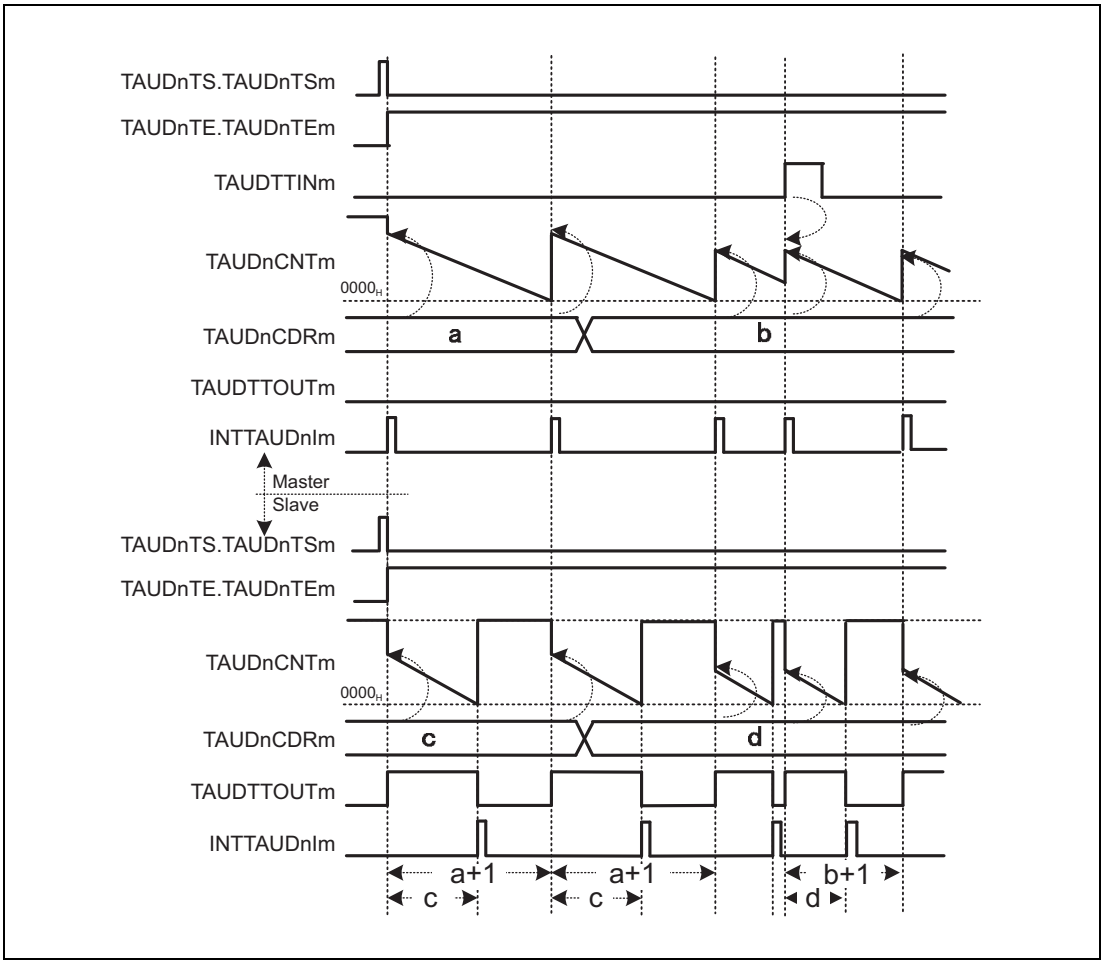

**Figure 25.102 General Timing Diagram for Trigger Start PWM Output Function**

**NOTE**

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 25.15.3.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for the slave channel

Table 25.163 Control Bit Settings in Synchronous Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for slave channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.164 Simultaneous Rewrite Settings for the Slave Channel of the Trigger Start PWM Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers.<br>1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.15.3.6 Operating Procedure for Trigger Start PWM Output Function

Table 25.165 Operating Procedure for Trigger Start PWM Output Function

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.3.4, Register Settings for the Master Channel**.<br><br>Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.3.5, Register Settings for Slave Channels**.<br><br>Set the value of TAUDnCDRm register of every channel. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start.<br>INTTAUDnIm is generated on the master channel. |
| During Operation | TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.<br><br>TAUDnRDT.TAUDnRDTm can be changed during operation. | TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches $0000_H$:<br>• INTTAUDnIm (master) is generated.<br>• TAUDnCDRm value is loaded into TAUDnCNTm (master) to continue count operation.<br>• TAUDnCNTm (slave) loads the TAUDnCDRm value and starts to count down<br>• TAUDTTOUTm (slave) is set<br>When TAUDnCNTm of the slave = $0000_H$:<br>• INTTAUDnIm (slave) is generated.<br>• TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops.<br><br>If a TAUDTTINm input is detected on the master channel while TAUDnCNTm of the master channel is counting down:<br>• TAUDnCNTm (master and slave) loads the TAUDnCDRm value and counts down<br>• INTTAUDnIm (master) is generated.<br>• TAUDTTOUTm (slave) is set to the active level. |
| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart Operation

### 25.15.3.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

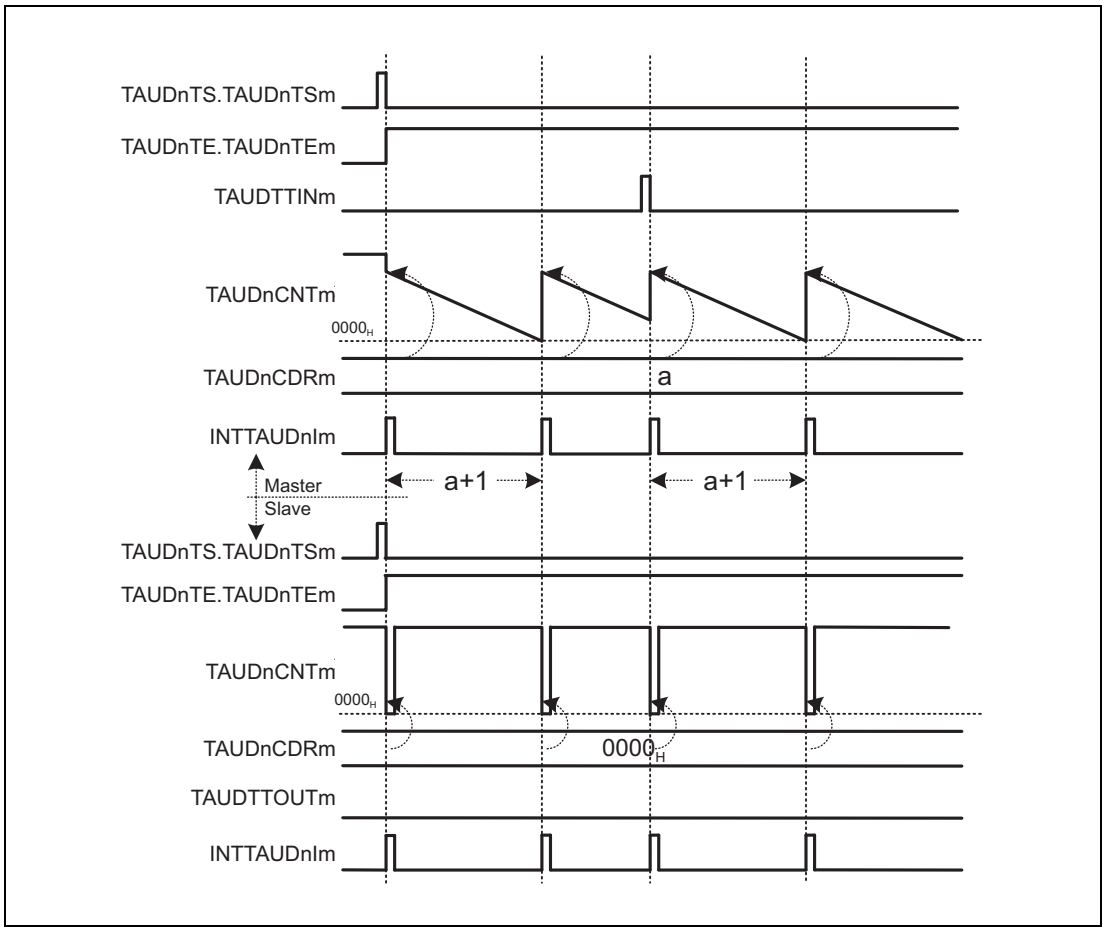

**Figure 25.103 TAUDnCDRm (Slave) = $0000_H$, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0) Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)**

- Every time the master channel generates an interrupt (INTTAUDnIm), $0000_H$ is written to TAUDnCNTm (slave). Therefore, TAUDnCNTm (slave) cannot start to count and TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

**(2) Duty cycle = 100%**

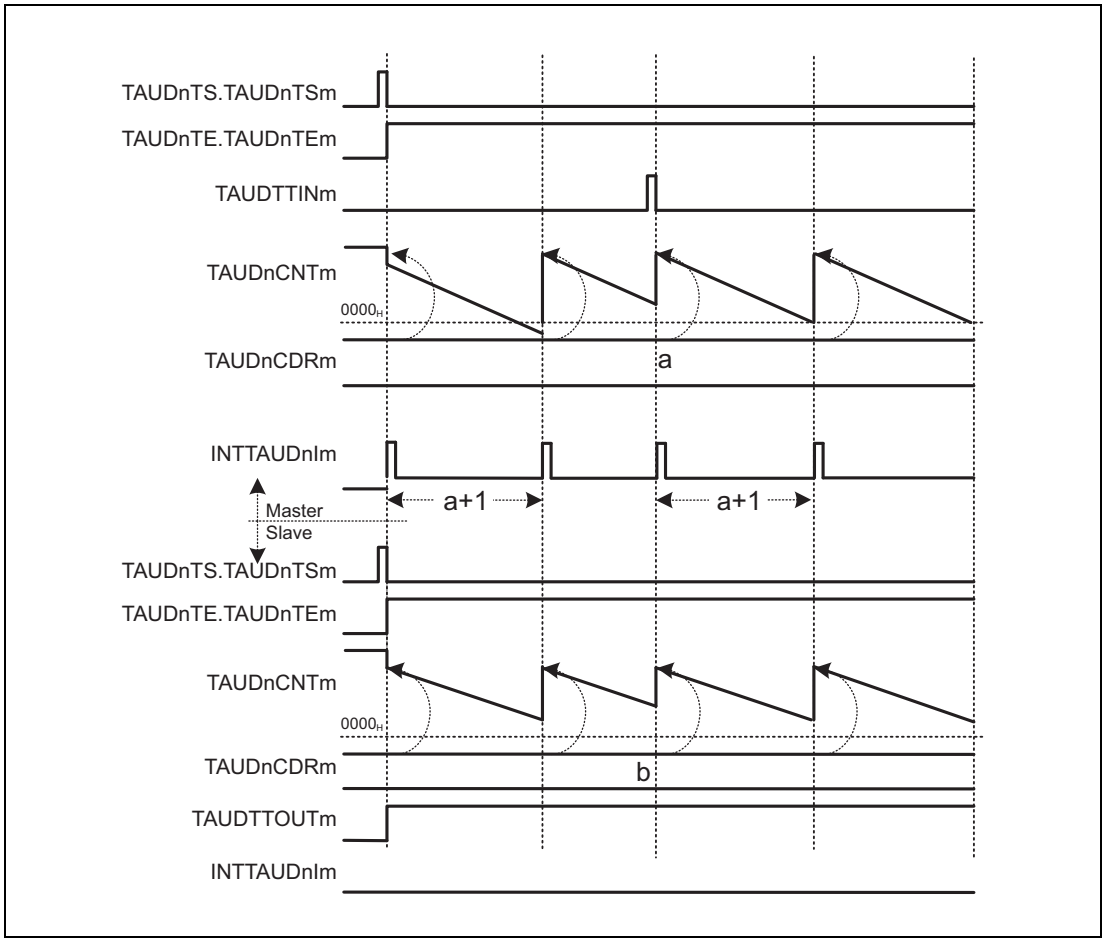

**Figure 25.104 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0) Falling Edge Detection (TAUDnCMURm.TIS[1:0] = $00_B$)**

- If the value TAUDnCDRm (slave) is higher than the value TAUDnCDRm (master), the counter of the slave channel cannot reach $0000_H$ and cannot generate interrupts.
  The TAUDTTOUTm remains at active state.
  The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

### (3) TAUDTTINm detection and active slave counter

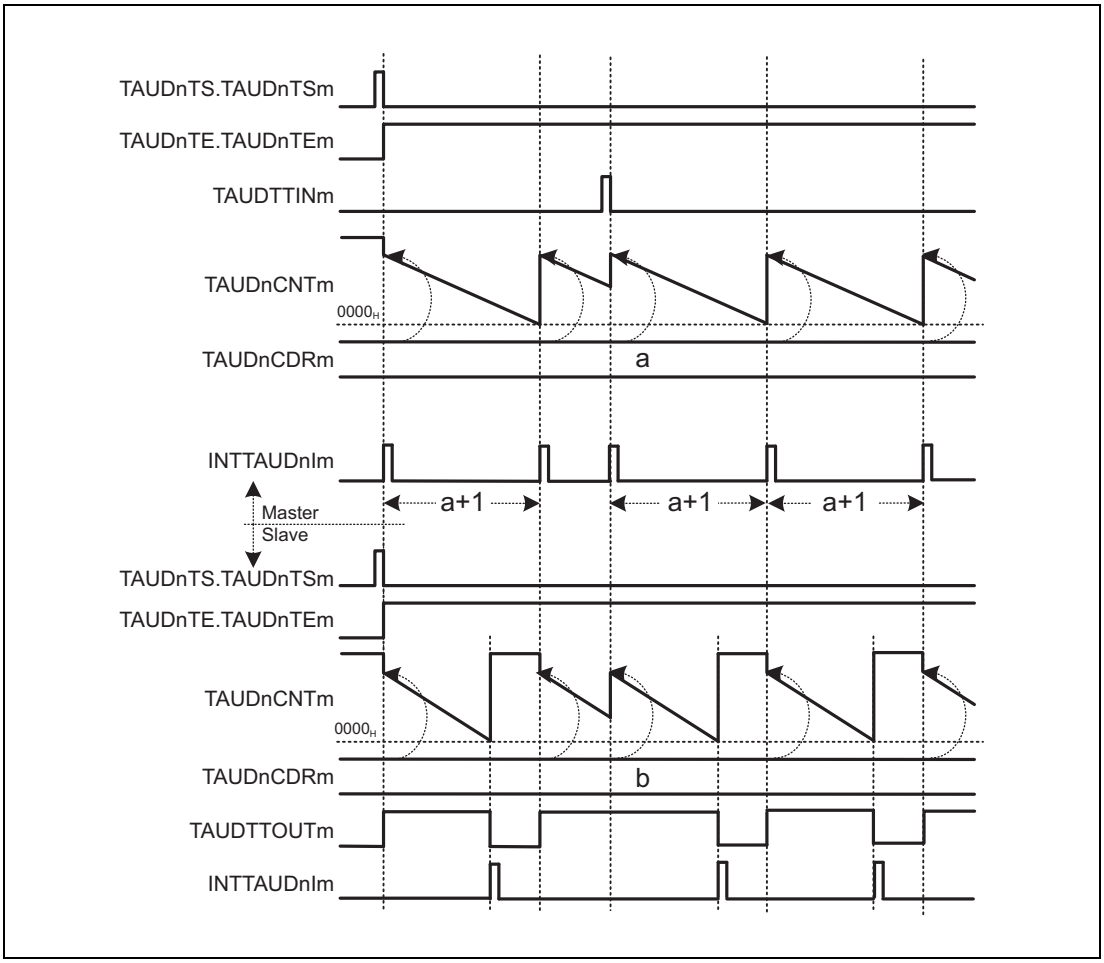

**Figure 25.105 Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)**
**Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)**

- If TAUDnCNTm (slave) reloads the value TAUDnCDRm (slave) while it is still counting down, TAUDTTOUTm remains unchanged and extends the duty.
  The duty does not correspond to the value of the slave's data register.

## 25.15.4 Delay Pulse Output Function

### 25.15.4.1 Overview

#### Summary

This function outputs two signals. The pulse width and pulse cycle of the reference signal are defined using the master channel and slave channel 1. Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by the amount specified on slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1. The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified on slave channel 2.

#### Prerequisites

- Four channels
- The operating mode for the master channel should be set to interval timer mode. (See **Table 25.166, Contents of the TAUDnCMORm Register for the Master Channel of the Delay Pulse Output Function**.)
- The operating mode for slave channels 1 and 2 should be set to one-count mode. (See **Table 25.169, Contents of the TAUDnCMORm Register for Slave Channel 1 of the Delay Pulse Output Function** and **Table 25.173, Contents of the TAUDnCMORm Register for Slave Channel 2 of the Delay Pulse Output Function**.)
- The operating mode for slave channel 3 should be set to pulse one-count mode. (See **Table 25.176, Contents of the TAUDnCMORm Register for Slave Channel 3 of the Delay Pulse Output Function**.)
- TAUDTTOUTm is not used with the master channel and slave channel 2.
- The channel output mode for slave channel 1 should be set to synchronous channel output mode 1. (See **Section 25.7, Channel Output Modes**.)
- The channel output mode for slave channel 3 should be set to independent channel output mode 2. (See **Section 25.7, Channel Output Modes**.)

#### Functional description

The counters of the channel group are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation.

- Master channel:
  The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel.
  When the counter value of master channel reaches $0000_H$ and pulse cycle time has elapsed, INTTAUDnIm is generated. The TAUDnCDRm value is reloaded into the counter to perform counting down.
- Slave channels 1 and 2:
  Slave channels 1 and 2 start to count down from the current TAUDnCDRm value when detecting

an interrupt from the master channel. TAUDTTOUTm signal (slave 1) is set.

– Slave channel 1:
When the counter of slave channel 1 reaches $0000_H$ (duty time has elapsed), INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnIm of master channel.

– Slave channel 2:
When the counter of slave channel 2 reaches $0000_H$ and delay time has elapsed, INTTAUDnIm is generated. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnIm of master channel.
Generating INTTAUDnIm (slave channel 2) triggers the counter of slave channel 3.

- Slave channel 3:
When slave channel 3 detects an interrupt from slave channel 2, its counter starts counting down from the current value of TAUDnCDRm. INTTAUDnIm is generated and the TAUDTTOUTm signal (slave channel 3) is set.
When the counter of slave channel 3 reaches $0001_H$, INTTAUDnIm is generated and the TAUDTTOUTm signal is reset.
The delayed PWM pulse is output from slave channel 3.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

**Conditions**

Simultaneous rewrite can be used with this function. See **Section 25.6, Simultaneous Rewrite**.

### 25.15.4.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty width 1 = (TAUDnCDRm (slave 1)) × count clock cycle

Delay width = (TAUDnCDRm (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUDnCDRm (slave 3)) × count clock cycle

However, the delay width shall be set within the following range:
$0000_H \leq$ TAUDnCDRm (slave 2) < TAUDnCDRm (master)

**NOTES**

1. The waveform of TAUDTTOUTm (slave 3) becomes the waveform made by delaying the waveform of TAUDTTOUTm (slave 1) by the quantity generated by slave 2. It is impossible to make a delay longer than the pulse cycle.
2. If INTTAUD0Im of slave 2 is generated while slave 3 is counting, slave 3 restarts operation. Therefore, the waveform of TAUDTTOUTm (slave 3) is retained on the active level. In this case, TAUDTTOUTm (Slave-CH-3) cannot output the waveform generated by delaying the basic pulse of TAUDTTOUTm (Slave-CH-1).

### 25.15.4.3 Block Diagram and General Timing Diagram

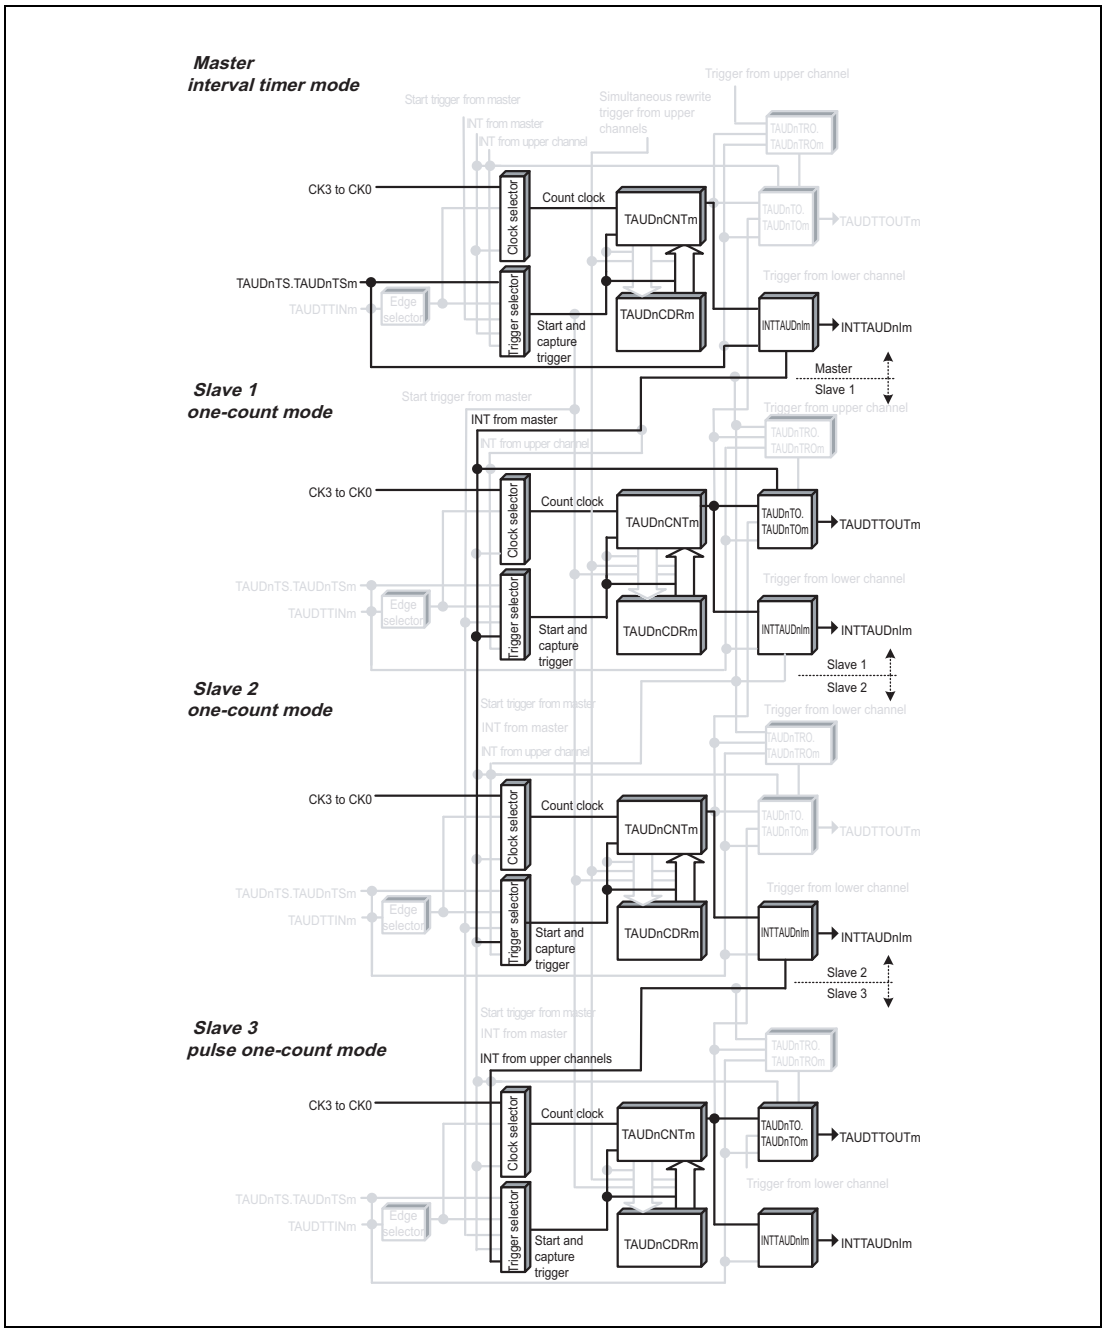

Figure 25.106 Block Diagram of Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUDnTOL.TAUDnTOLm = 0)
- Slave channel 3: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

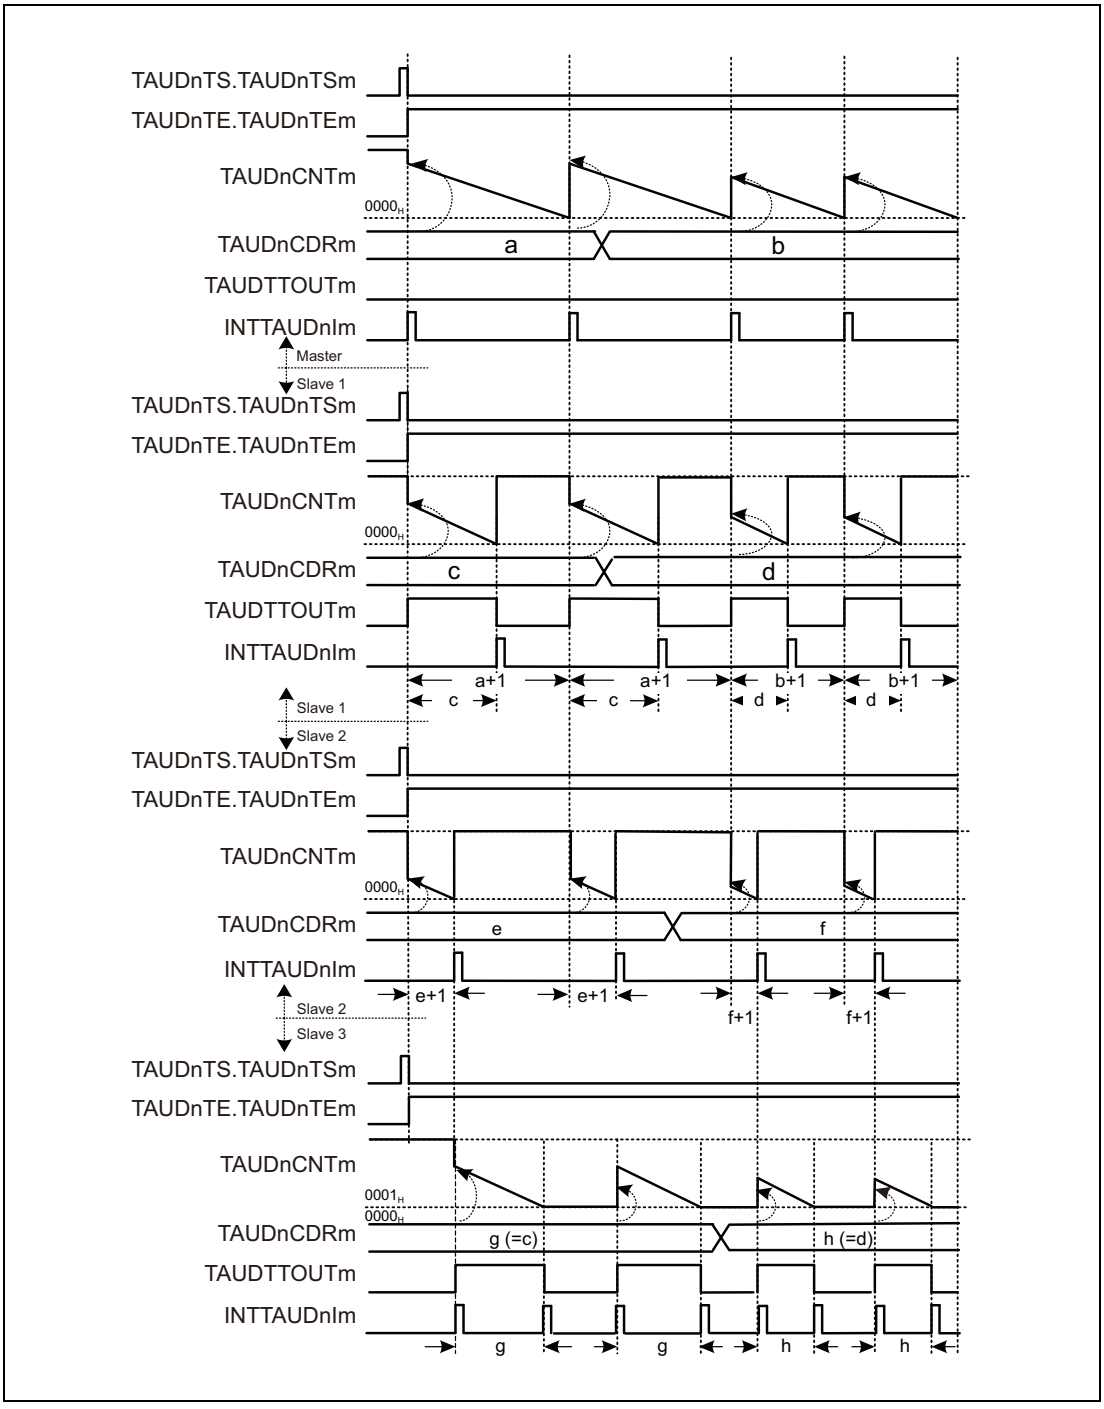

**Figure 25.107 General Timing Diagram of Delay Pulse Output Function**

**NOTE**

TAUDTTOUTm of slave channel 1 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 25.15.4.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for slave channel 1

Table 25.171 Control Bit Settings for Slave Channel 1 in Synchronous Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for slave channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.172 Simultaneous Rewrite Settings for Slave Channel 1 of Delay Pulse Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Master channel is simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.15.4.6 Register Settings for Slave Channel 2

#### (1) TAUDnCMORm for slave channel 2

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for slave channel 3

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.179 Simultaneous Rewrite Settings for Slave Channel 3 of Delay Pulse Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Master channel is simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.15.4.8 Operating Procedure for Delay Pulse Output Function

Table 25.180 Operating Procedure for Delay Pulse Output Function (1/2)

| | Operation | TAUDn Status |

Restart Operation

### 25.15.4.9 Specific Timing Diagrams

#### (1) Duty cycle (slave 3) = 100%

The following values apply to **Figure 25.108**:

- TAUDnCDRm (master) = $000A_H$
- TAUDnCDRm (slave 1) = $000B_H$
- TAUDnCDRm (slave 2) = $0000_H$
- TAUDnCDRm (slave 3) = $000B_H$

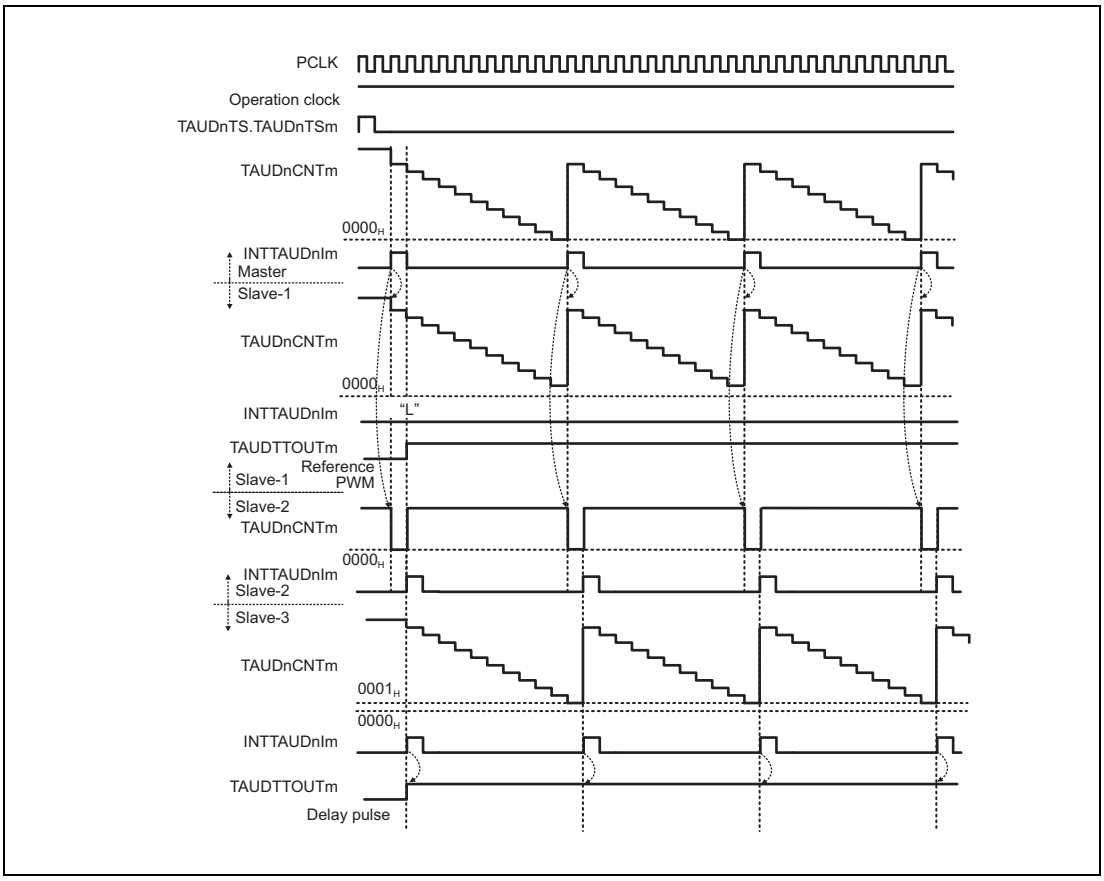

**Figure 25.108 Duty Cycle (Slave 3) = 100%**

- If the value of TAUDnCDRm (slaves 1 and 3) is higher than the value of TAUDnCDRm (master), the counter of the slave channel 1 cannot reach $0000_H$ and cannot generate interrupts. TAUDTTOUTm of channels 1 and 3 remain in the active state.

### (2) TAUDTTOUTm (slave 1) = TAUDTTOUTm (slave 3)

The following values apply to **Figure 25.109**.

- TAUDnCDRm (master) = $000A_H$
- TAUDnCDRm (slave 1) = $0005_H$
- TAUDnCDRm (slave 2) = $0000_H$
- TAUDnCDRm (slave 3) = $0005_H$

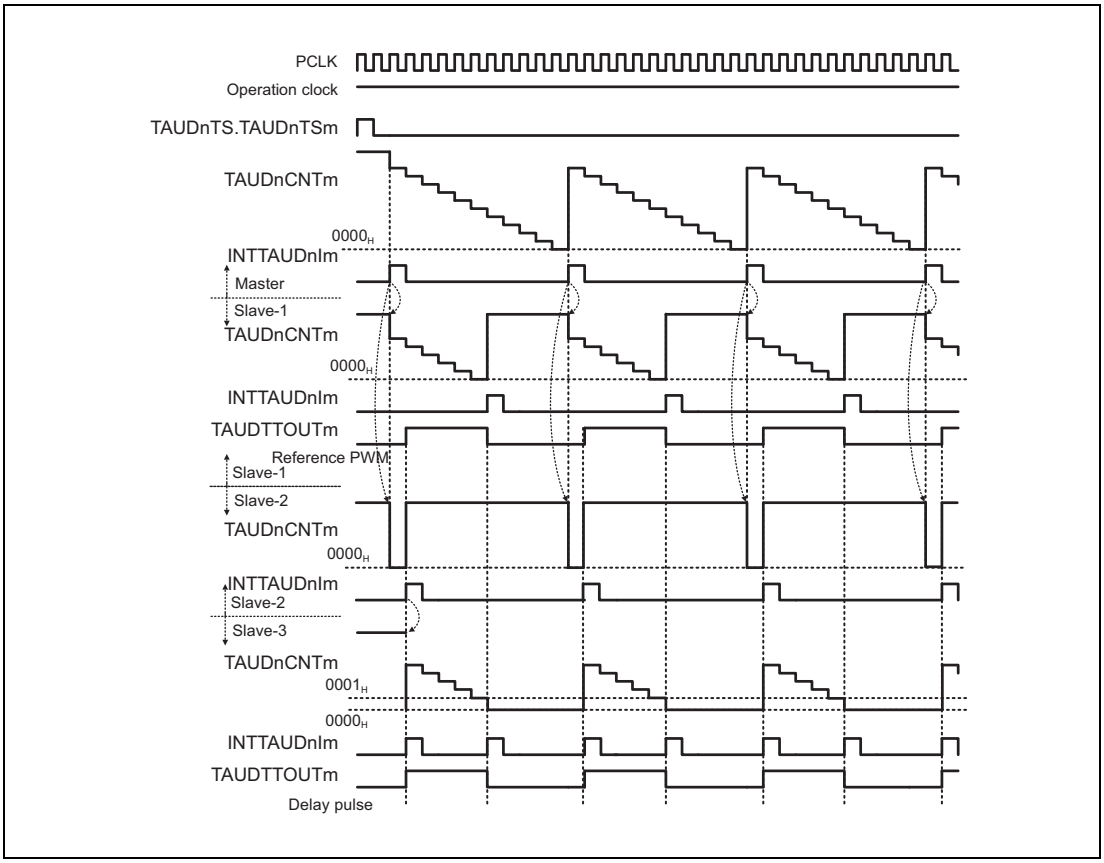

**Figure 25.109 TAUDTTOUTm (Slave 1) = TAUDTTOUTm (Slave 3)**

- If TAUDnCDRm (slave 2) = $0000_H$, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

## 25.15.5 Offset Trigger Output Function

### 25.15.5.1 Overview

#### Summary

This function generates a PWM output using a master channel and a slave channel, enabling the pulse width (duration) of the TAUDTTOUTm to be set. The pulse cycle is set by detecting a valid input edge of master channel. The pulse width is specified on the slave channel.

#### Prerequisites

- Two channels
- The operating mode for the master channel should be set to capture mode. (See **Table 25.181, Contents of the TAUDnCMORm Register for the Master Channel of the Offset Trigger Output Function**.)
- The operating mode for slave channels should be set to one-count mode. (See **Table 25.184, Contents of the TAUDnCMORm Register for the Slave Channel of the Offset Trigger Output Function**.)
- The output mode for slave channels should be set to synchronous channel output mode 1. (See **Section 25.7, Channel Output Modes**.)
- TAUDTTOUTm is not used with the master channel of this function.

#### Functional description

The counter can be enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This makes TAUDnTE.TAUDnTEm = 1, enabling count operation. The master channel counter (TAUDnCNTm) starts to count up from $0000_H$.

- Master channel:
  When a valid TAUDTTINm input edge is detected, the current value of the counter (TAUDnCNTm) is loaded into the data register of master channel (TAUDnCDRm). INTTAUDnIm is generated and the counter restarts to count up from $0000_H$.
- Slave channel:
  If INTTAUDnIm is generated on the master channel, the TAUDTTOUTm (slave) signal is set and the counter of the slave channel is triggered. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts to count down from this value.
  When the counter reaches $0000_H$ (duty time has elapsed), INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

### 25.15.5.2 Equations

Pulse width = (TAUDnCDRm (slave)) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave)/(TAUDnCDRm (master) + 1)] × 100

– Duty cycle = 0%
  TAUDnCDRm (slave) = $0000_H$
– Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

### 25.15.5.3 Block Diagram and General Timing Diagram

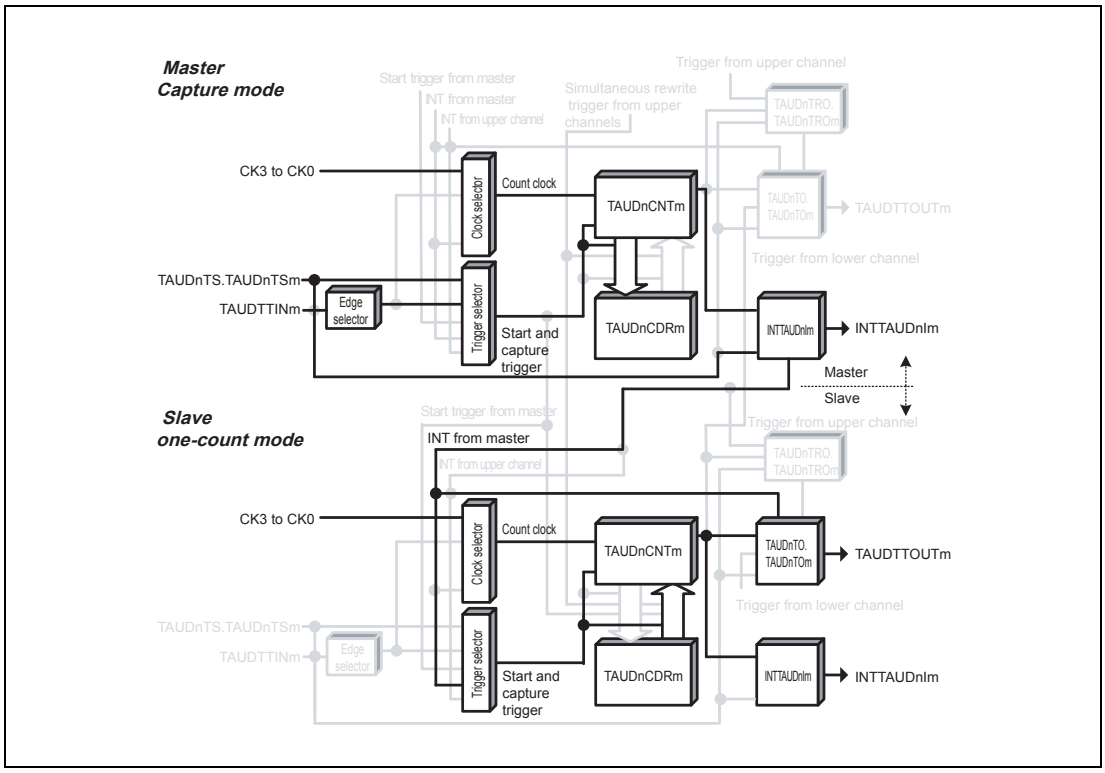

**Figure 25.110 Block Diagram of Offset Trigger Output Function**

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

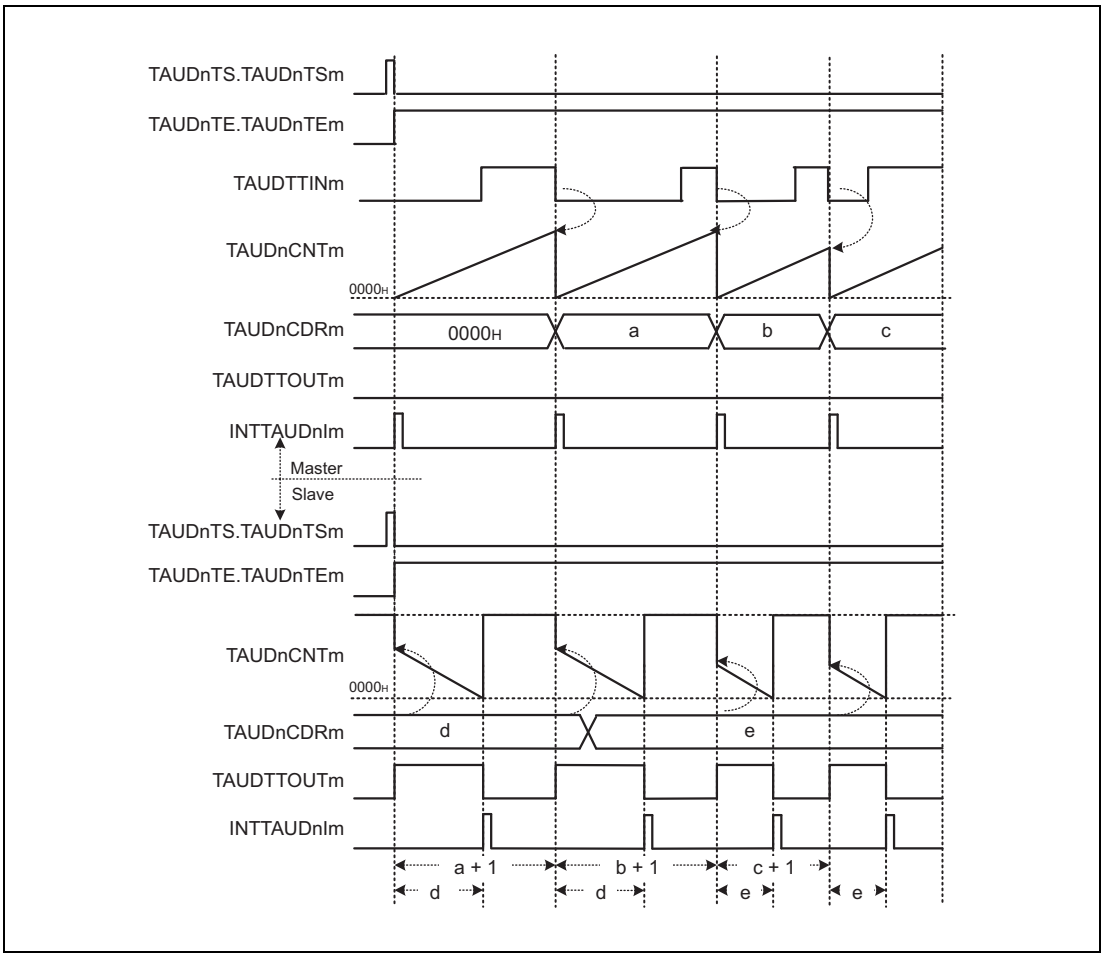

**Figure 25.111 General Timing Diagram of Offset Trigger Output Function**

**NOTE**

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 25.15.5.4 Register Settings for the Master Channel

### (3) Channel output mode for the master channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

### (4) Simultaneous rewrite for the master channel

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0.

**Table 25.183 Simultaneous Rewrite Settings for the Master Channel of Offset Trigger Output Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

### 25.15.5.5 Register Settings for Slave Channels

#### (1) TAUDnCMORm for slave channels

| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.185 Contents of the TAUDnCMURm Register for the Slave Channel of the Offset Trigger Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for slave channels

Table 25.186 Control Bit Settings in Synchronous Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for slave channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0.

Table 25.187 Simultaneous Rewrite Settings for Slave Channels of Offset Trigger Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm | |
| TAUDnRDC.TAUDnRDCm | |

### 25.15.5.6 Operating Procedure for Offset Trigger Output Function

Table 25.188 Operating Procedure for Offset Trigger Output Function

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.5.4, Register Settings for the Master Channel**.<br><br>Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and channel output mode as described in **Section 25.15.5.5, Register Settings for Slave Channels**.<br><br>The TAUDnCDRm register of master channel functions as a capture register.<br>Set the value of TAUDnCDRm register of slave channel. | Channel operation is stopped. |

| During Operation | TAUDnCDRm can be changed at any time.<br><br>TAUDnCSCm.TAUDnCLOV can be set to 1.<br>TAUDnCDRm of slave channel can be changed after the generation of INTTAUDnIm (master).<br>TAUDnCNTm and TAUDnCSRm can be read at any time. | When TAUDnCNTm of the slave = $0000_H$:<br>• INTTAUDnIm (slave) is generated.<br>• TAUDTTOUTm (slave) is reset, and the counter of slave channel stops.<br><br>When TAUDTTINm input edge is detected on the master channel:<br>• INTTAUDnIm (master) is generated.<br>• TAUDnCNTm (master) is reset to $0000_H$ and then continues count operation subsequently.<br>• TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to perform counting down.<br>• TAUDTTOUTm (slave) is set. |
| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart Operation

### 25.15.5.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

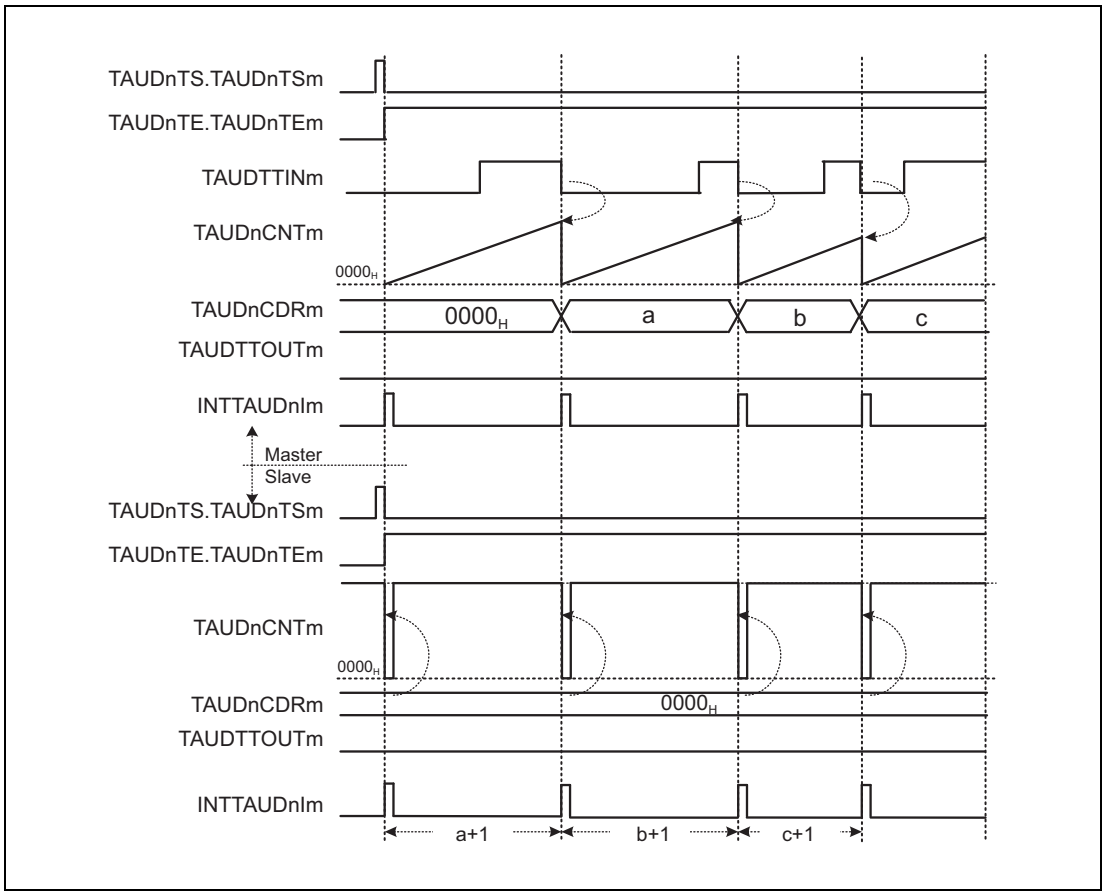

**Figure 25.112 TAUDnCDRm (Slave) = $0000_H$**

- When TAUDnCDRm (slave) = $0000_H$, $0000_H$ is written to TAUDnCNTm every time the master channel generates an interrupt (INTTAUDnIm), and TAUDnCNTm cannot start to count. The TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The slave and the master channels generate interrupts in the same cycle.

### (2) Duty cycle = 100%

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = $00_B$)

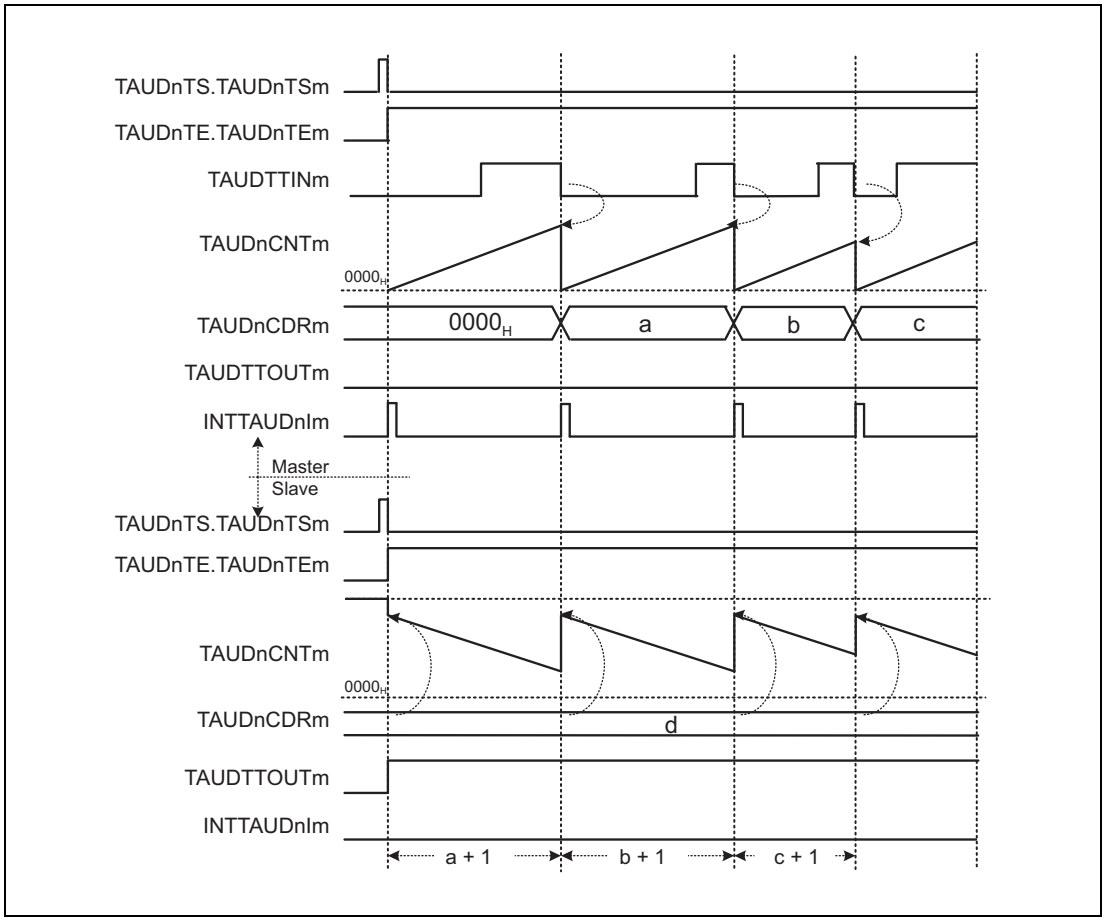

**Figure 25.113 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1**

- If the value TAUDnCDRm (slave) is higher than the interval of valid input edges, the counter of the slave channel cannot reach $0000_H$ and cannot generate interrupts. The TAUDTTOUTm remains at active state.

## 25.15.6 A/D Conversion Trigger Output Function Type 1

### 25.15.6.1 Overview

#### Summary

This function is identical to **Section 25.15.1, PWM Output Function**, except that TAUDTTOUTm is not output.

This is achieved by setting the channel output mode for the slave to independent channel output mode controlled by software.

### 25.15.6.2 Block Diagram and General Timing Diagram

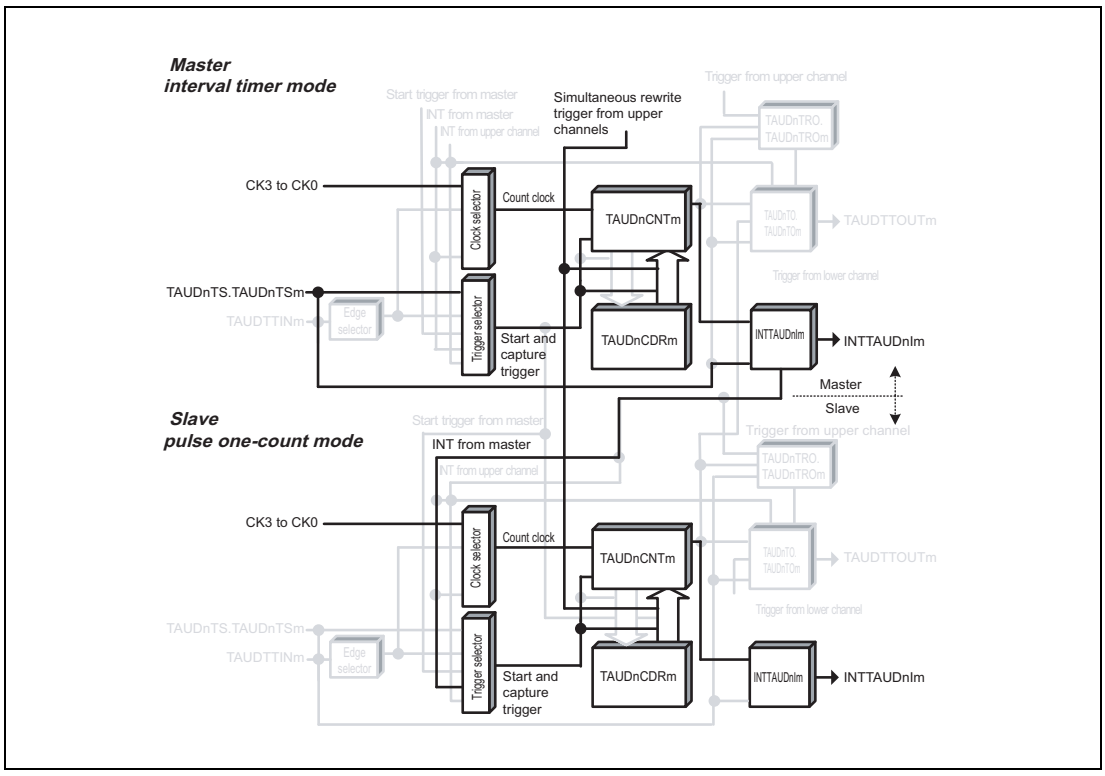

**Figure 25.114 Block Diagram of A/D Conversion Trigger Output Function Type 1**

The following settings apply to the general timing diagram.

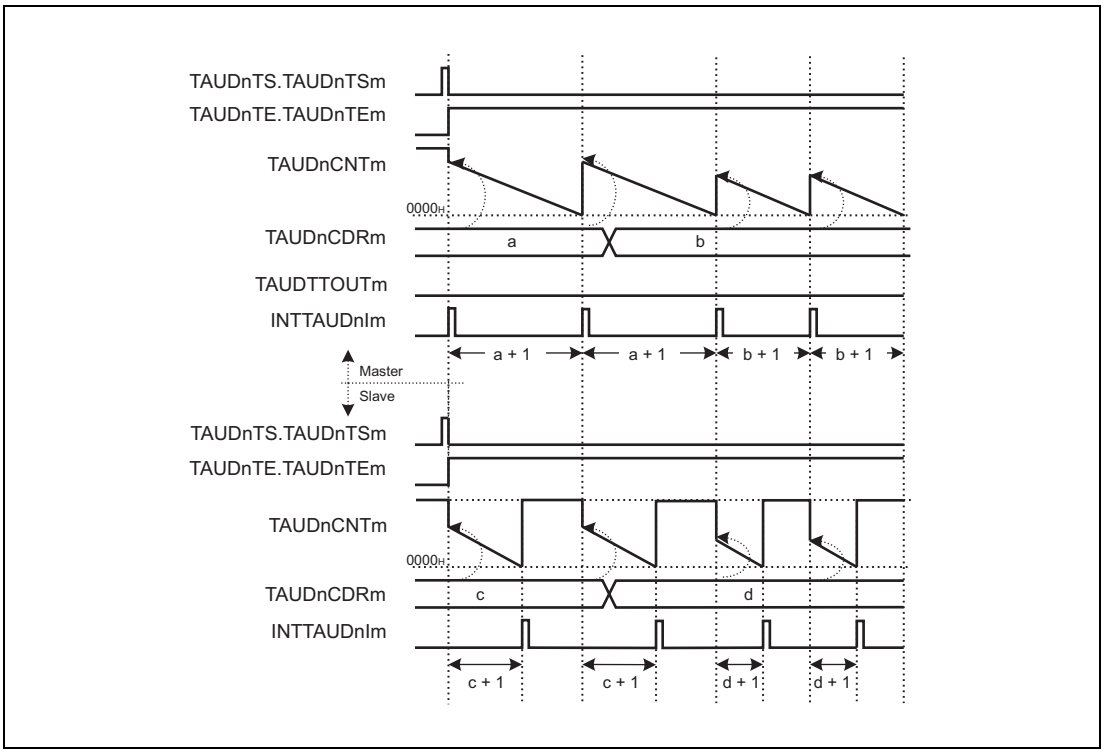

**Figure 25.115 General Timing Diagram of A/D Conversion Trigger Output Function Type 1**

## 25.15.7 Triangle PWM Output Function

### 25.15.7.1 Overview

#### Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels respectively.

The master channel generates a carrier cycle. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slave counter.

#### Prerequisites

- Two channels
- The operating mode for the master channels should be set to interval timer mode. (See **Table 25.189, Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function**.)
- The operating mode for slave channels should be set to count-up/-down mode. (See **Table 25.193, Contents of the TAUDnCMORm Register for the Slave Channel of the Triangle PWM Output Function**.)
- The channel output mode for the master channel should be set to independent channel output mode 1. (See **Section 25.7, Channel Output Modes**.)
- The channel output mode for slave channels should be set to synchronous channel output mode 2. (See **Section 25.7, Channel Output Modes**.)
- The following settings allow the TAUDTTOUTm signal to be at high level during the down status of a carrier cycle.
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0 (recommended setting).
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0.

#### Functional description

The counters are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for every channel. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current values of TAUDnCDRm (master and slave) are loaded into TAUDnCNTm (master and slave) and the counters start counting down from these values. When the TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and TAUDTTOUTm signal of master toggles.

- Master channel:
  When the counter of master channel reaches $0000_H$ (pulse cycle time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and counts down.

- Slave channel:
  If INTTAUDnIm is generated on the master channel, the counter of the slave channel is triggered.
  - If the slave counter is counting down, the count direction changes.
  - If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts to count down.

  When the counter of the slave channel reaches $0001_H$ while counting up or down, INTTAUDnIm is generated and the TAUDTTOUTm (slave) signal is set/reset.
  The counter continues count-up/-down and waits for the next INTTAUDnIm of the master channel.
  Setting TAUDnTOL.TAUDnTOLm allows TAUDTTOUTm signal switching between normal phase and reverse phase during operation.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

**Conditions**

This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.

### 25.15.7.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle 100 [%] =
[(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave))/(TAUDnCDRm (master) + 1)] × 100

- Duty cycle = [%]
  TAUDnCDRm (slave) = $0000_H$
- Duty cycle = 0%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

### 25.15.7.3 Block Diagram and General Timing Diagram

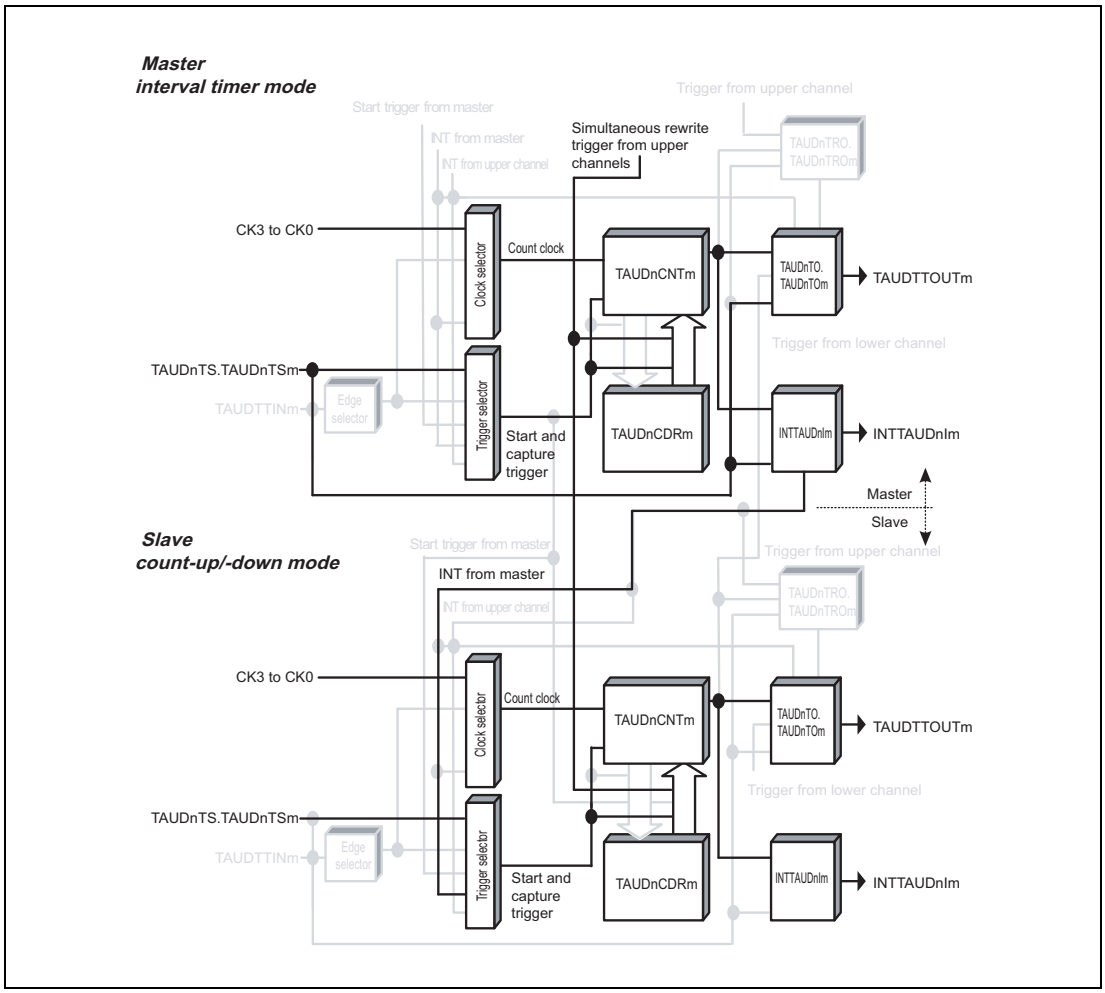

**Figure 25.116 Block Diagram of Triangle PWM Output Function**

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUDnIm is generated at the beginning of operation.
    (TAUDnCMORm.TAUDnMD0 = 1)

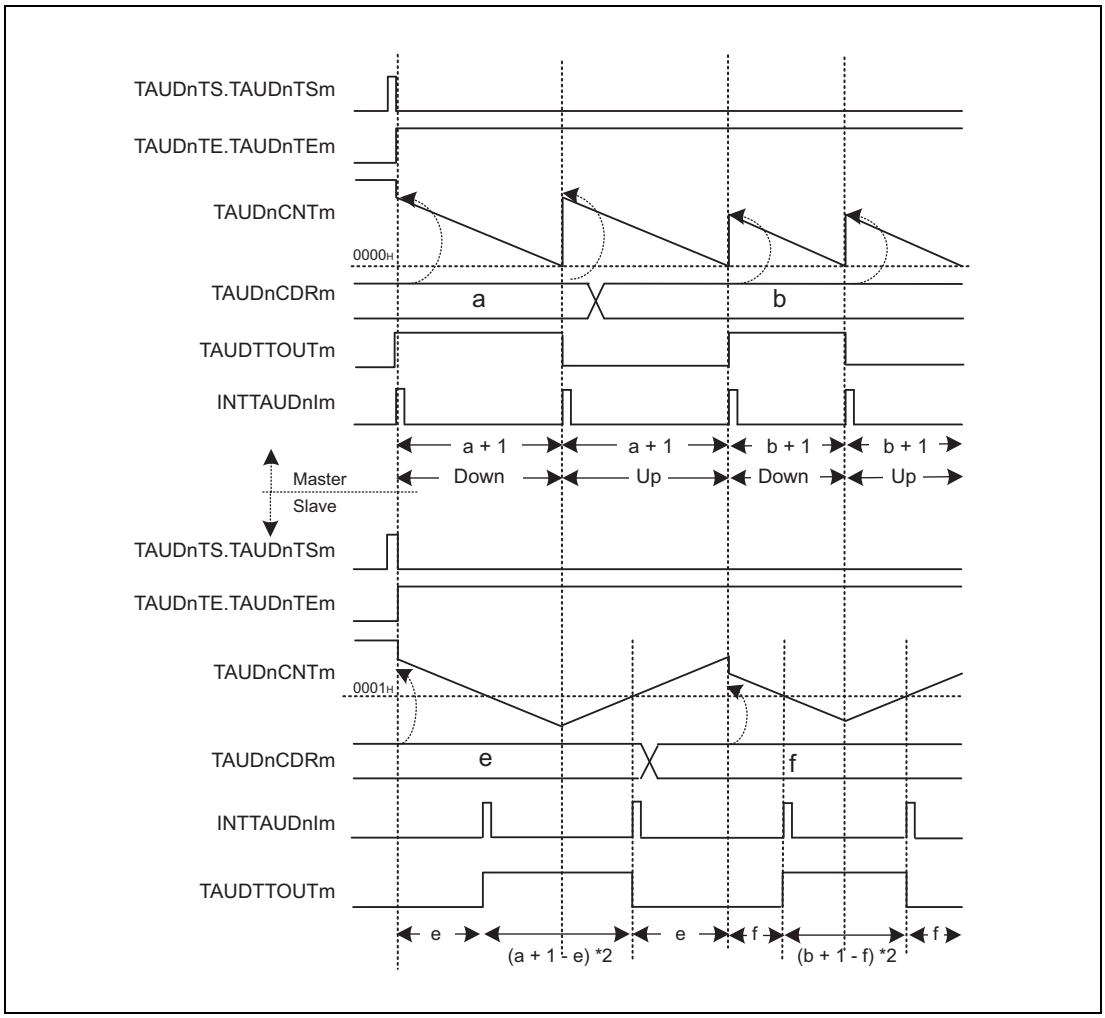

**Figure 25.117 General Timing Diagram of Triangle PWM Output Function**

### 25.15.7.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 25.190 Contents of the TAUDnCMURm Register for the Master Channel of the Triangle PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for the master channel

Table 25.191 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode (the value after reset). |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.192 Simultaneous Rewrite Settings for the Master Channel of Triangle PWM Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers.<br>1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

**NOTE**

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 25.15.7.5 Register Settings for Slave Channels

#### (1) TAUDnCMORm for slave channels

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.194 Contents of the TAUDnCMURm Register for the Slave Channel of the Triangle PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for slave channels

**Table 25.195 Control Bit Settings in Synchronous Channel Output Mode 2**

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for slave channels

Both the master and slave channels should have the same simultaneous rewrite settings.

**Table 25.196 Simultaneous Rewrite Settings for Slave Channels of Triangle PWM Output Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers.<br>1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when the master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.15.7.6 Operating Procedure for Triangle PWM Output Function

Table 25.197 Operating Procedure for Triangle PWM Output Function

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.7.4, Register Settings for the Master Channel**.<br><br>Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.7.5, Register Settings for Slave Channels**.<br><br>Set the value of TAUDnCDRm register of every channel. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start.<br>INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1. |
| During Operation | TAUDnCDRm can be changed at any time.<br>TAUDnTOL.TAUDnTOLm can be changed.<br>TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.<br><br>TAUDnRDT.TAUDnRDTm can be changed during operation. | TAUDnCDRm value of master and slave channels is loaded into TAUDnCNTm to count down. When the counter of master channel reaches $0000_H$:<br>• INTTAUDnIm (master) is generated.<br>• TAUDTTOUTm (master) is toggled.<br>• TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation.<br>• TAUDnCDRm value is reloaded into TAUDnCNTm (slave) or counting is started in opposite direction.<br>When TAUDnCNTm of slave channel reaches $0001_H$:<br>• INTTAUDnIm (slave) is generated.<br>• TAUDTTOUTm (slave) is set in the count-down status or reset in count-up status. |
| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart Operation

### 25.15.7.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = $5_H$
- Slave channel:
  - TAUDnCDRm = $6_H$

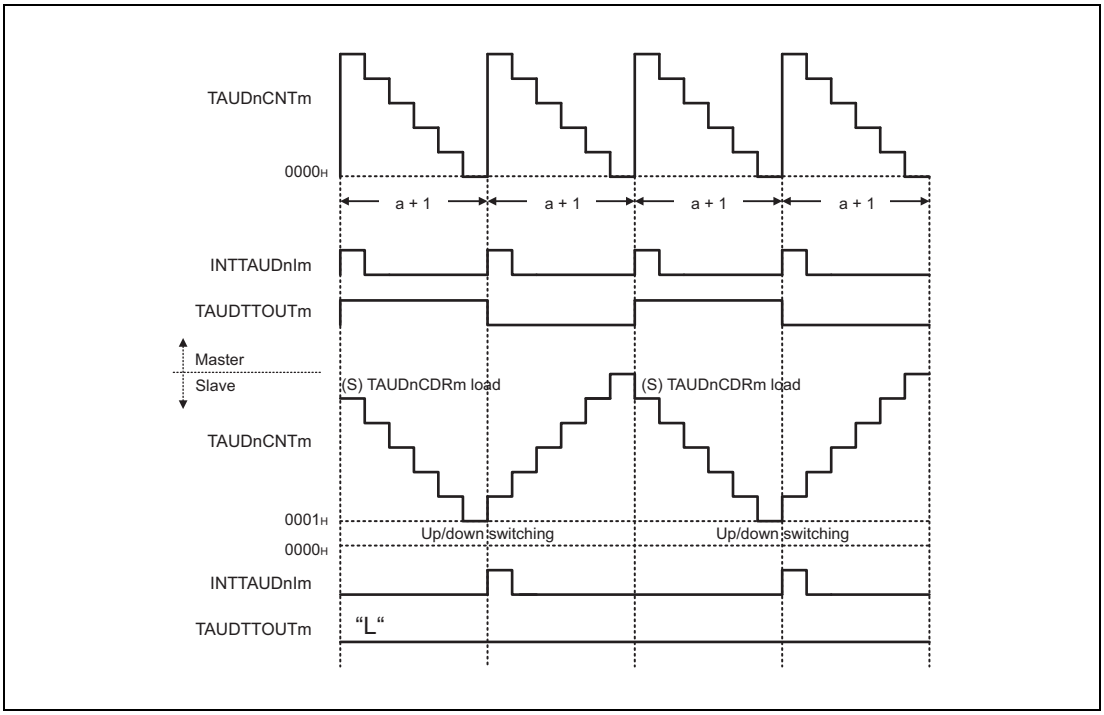

**Figure 25.118 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1**

- If TAUDnCDRm (slave) value ≥ TAUDnCDRm (master) value +1, INTTAUDnIm of the slave channel is not generated while counting down. TAUDTTOUTm remains low because there is no set signal to be detected.

### (2) Duty cycle = 100%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = $5_H$
- Slave channel:
  - TAUDnCDRm = $0_H$

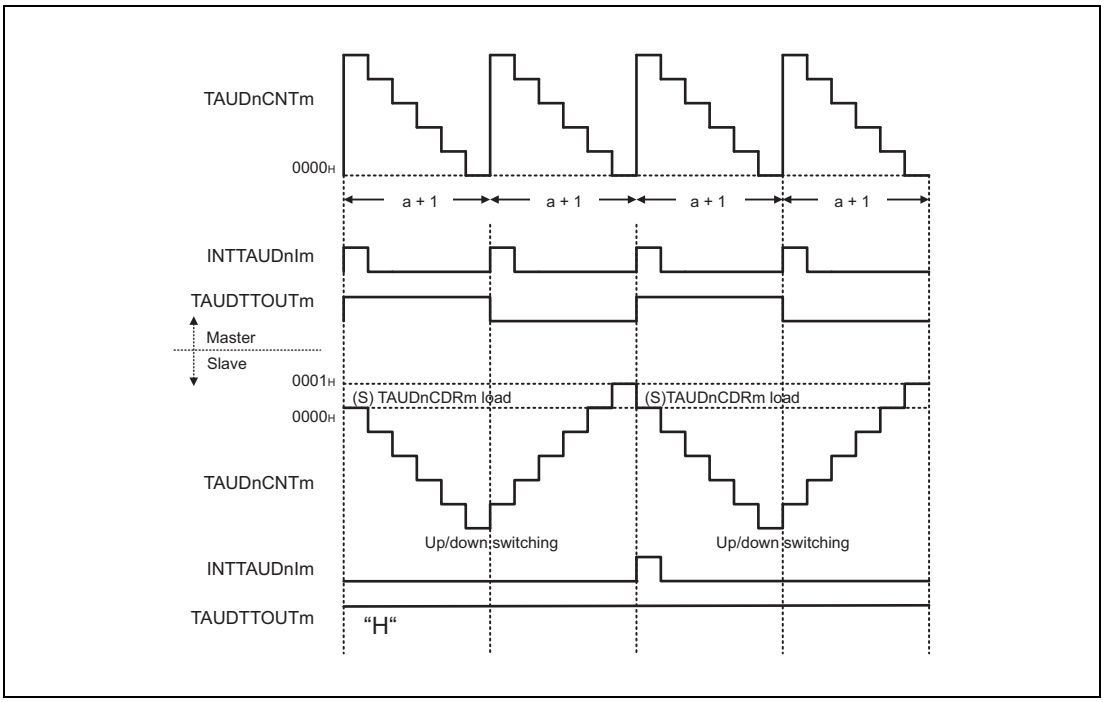

**Figure 25.119 TAUDnCDRm (Slave) = $0000_H$**

- If TAUDnCDRm (slave) = $0000_H$, INTTAUDnIm of the slave channel is not generated while counting up. TAUDTTOUTm remains high because there is no reset signal to be detected.

## 25.15.8 Triangle PWM Output Function with Dead Time

### 25.15.8.1 Overview

#### Summary

This function generates multiple triangle PWM outputs with a predefined dead time added by using a master and two or more slave channels. The resulting PWM signals with dead time are output via TAUDTTOUTm of the slave channels 2 and 3, enabling the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels.

Carrier cycles are generated on the master channel. The first pulse controls the down status of the slave counter and the second one controls the up status.

An interrupt on slave 2 causes TAUDTTOUTm of slave channels to be set/reset. Depending on the settings of TAUDnTDL.TAUDnTDLm, delay time is added to positive or negative logic side of the signal (i.e., whether TAUDTTOUTm is set/reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

#### Prerequisites

- Three channels. For slave channels 2 and 3, select even channel CH (a) and odd channel CH (a + 1).
- The operating mode for the master channel should be set to interval timer mode. (See **Table 25.199, Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time**)
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even channel (a), and slave channel 3 is an odd channel (a + 1). Slave channel 1 can be used as a separate timer (independent function).
- The operating mode for slave channel 2 should be set to count-up/-down mode (See **Table 25.203, Contents of the TAUDnCMORm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time**). Slave channel 2 should be an even channel.
- The operating mode for slave channel 3 should be set to one-count mode (See **Table 25.207, Contents of the TAUDnCMORm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time**). Slave channel 3 should be an odd channel.
- The channel output mode for the master channel should be set to independent channel output mode 1. (See **Section 25.7, Channel Output Modes**)
- The output mode for slave channels 2 and 3 should be set to synchronous channel output mode 2 with dead time output. (See **Section 25.7, Channel Output Modes**)
- The following settings make a TAUDTTOUTm signal at high level during the down status of the carrier cycle:
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0 (recommended setting).
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0.

**NOTE**

The triangle PWM output function with dead time does not use slave channel 1. Slave channel 1 can be used as a separate timer (independent function).

### Functional description

The counter starts by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This makes TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and the master's TAUDTTOUTm signal is toggled.

- Master channel:
  When the counter of the master channel reaches $0000_H$, an INTTAUDnIm is generated and the TAUDTTOUTm signal is toggled. The TAUDnCDRm value is reloaded to continue counting down.
- Slave channel 2:
  If INTTAUDnIm is generated on the master channel, the counter of slave channel 2 is triggered.
  - If the slave counter is counting down, the counting direction changes.
  - If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts counting down.

  The counter continues to count down/up and waits for the next INTTAUDnIm of the master channel.
  When the counter value of slave channel 2 reaches $0001_H$, INTTAUDnIm is generated
- Slave channel 3:
  If INTTAUDnIm is generated on slave channel 2, the counter of slave channel 3 is triggered. The current value of TAUDnCDRm (slave 3) is loaded into TAUDnCNTm (slave 3) and the counter starts to count down from the TAUDnCDRm value.
  When the counter reaches $0000_H$, INTTAUDnIm occurs. The counter returns to $FFFF_H$ and waits for the next INTTAUDnIm of slave channel 2.

As described in **Table 25.198, Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2**, the set/reset timing (right after occurrence of an interrupt or after dead time has elapsed) depends on the TAUDnTDL.TAUDnTDLm setting of the corresponding channel.

The setting of TAUDnTOL.TAUDnTOLm also determines whether a high level signal (TAUDnTOL.TAUDnTOLm = 0) or a low level signal (TAUDnTOL.TAUDnTOLm = 1) is output from the corresponding channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

TAUDTTOUTm can be 100% output by setting the TAUDnCDRm value of slave channel 2 to $0000_H$.

**Conditions**

This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.

TAUDnTOL.TAUDnTOLm and TAUDnTDL.TAUDnTDLm should be set before start of count operation. Slave channels 2 and 3 should have the opposite settings of TAUDnTDL.TAUDnTDLm.

**Table 25.198 Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2**

| TAUDnTDL. TAUDnTDLm | Count Direction of Slave Channel 2 upon Occurrence of Interrupt | TAUDTTOUTm Set/Reset Timing |
|---|---|---|
| 0 | Down | Set after elapse of dead time |
| | Up | Reset right after interrupt occurs |
| 1 | Down | Set right after interrupt occurs |
| | Up | Reset after elapse of dead time |

### 25.15.8.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (normal phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2) )× 2 – (TAUDnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (reverse phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 + (TAUDnCDRm (slave 3) + 1)] × count clock cycle

### 25.15.8.3 Block Diagram and General Timing Diagram

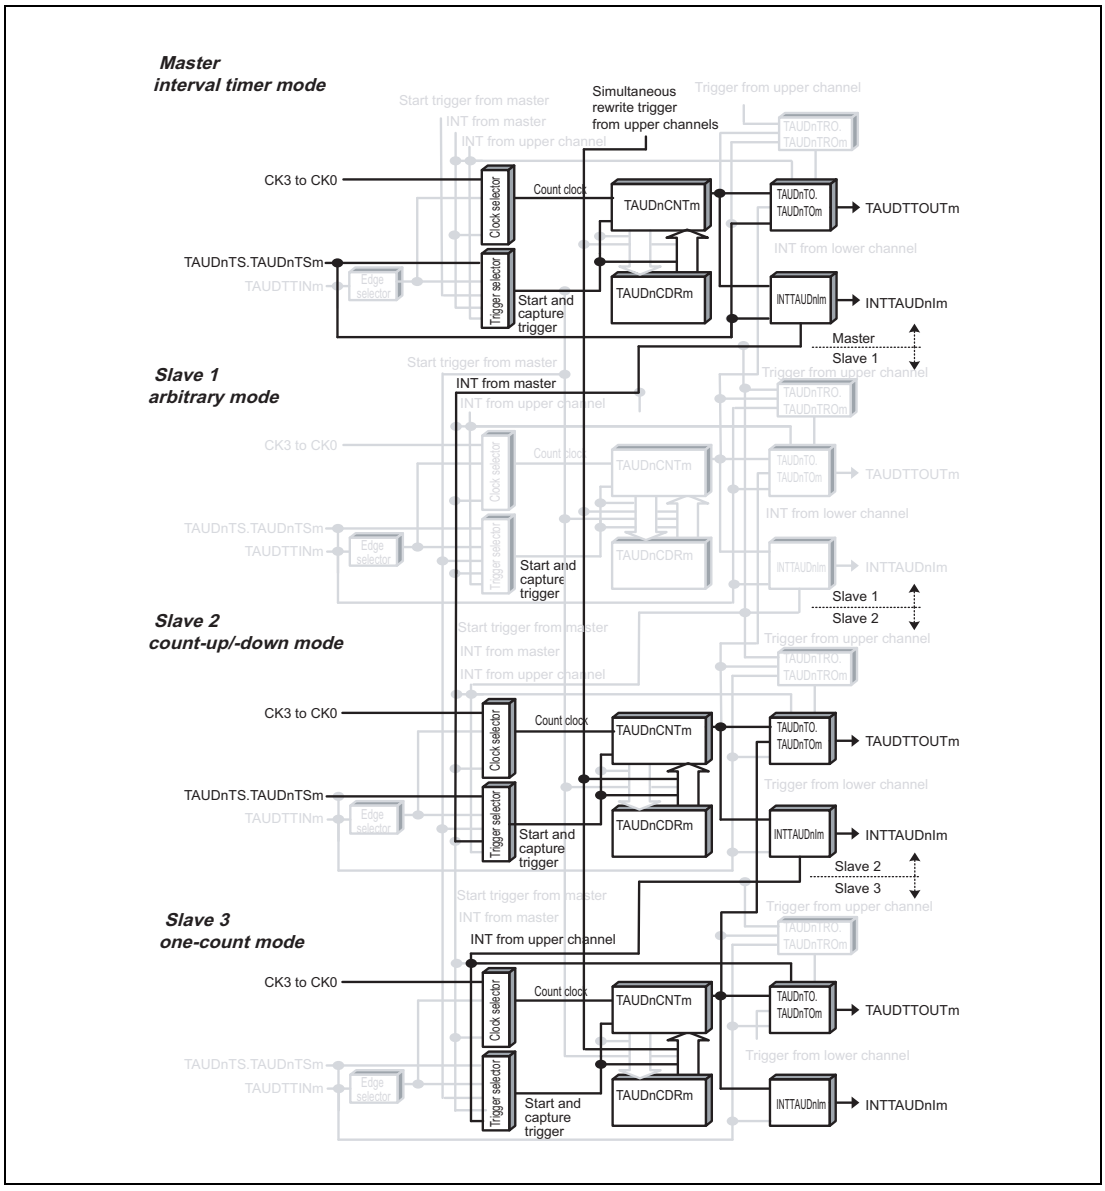

**Figure 25.120 Block Diagram of Triangle PWM Output Function with Dead Time**

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Slave channel 2:
  - INTTAUDnIm not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
  - TAUDnTDL.TAUDnTDLm = 0
  - Positive logic (TAUDnTOL.TAUDnTOLm = 0)

- Slave channel 3:
  - Enables start trigger detection during counting (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnTDL.TAUDnTDLm = 1
  - Positive logic (TAUDnTOL.TAUDnTOLm = 0)

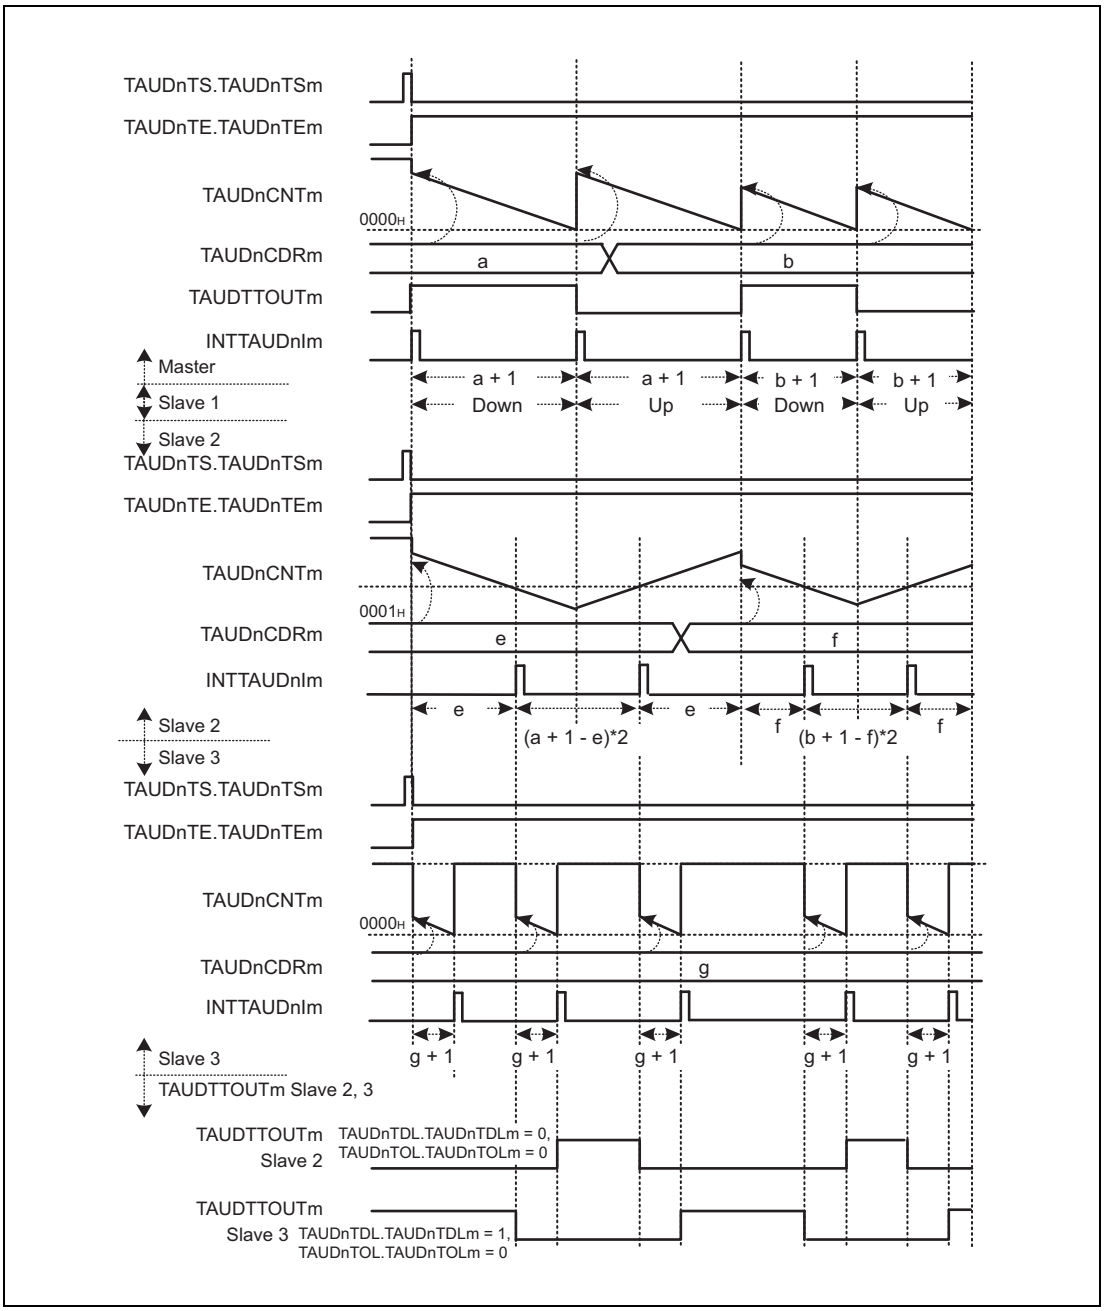

**Figure 25.121 General Timing Diagram of Triangle PWM Output Function with Dead Time**

### 25.15.8.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for the master channel

Table 25.201 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode (the value after reset). |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.202 Simultaneous Rewrite Setting for the Master Channel of Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers.<br>1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

**NOTE**

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 25.15.8.5 Register Settings for Slave Channel 2

#### (1) TAUDnCMORm for slave channel 2

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for slave channel 2

Table 25.205 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time to normal phase.<br>1: Adds dead time to reverse phase. |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

**CAUTION**

Set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

### (4) Simultaneous rewrite for slave channel 2

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.206 Simultaneous Rewrite Settings for Slave Channel 2 of Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers.<br>1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.15.8.6 Register Settings for Slave Channel 3

#### (1) TAUDnCMORm for slave channel 3

**Table 25.207 Contents of the TAUDnCMORm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 110: Dead time output signal of the TAUDTTOUTm generation unit |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Enables start trigger detection while counting. |

#### (2) TAUDnCMURm for slave channel 3

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.208 Contents of the TAUDnCMURm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for slave channel 3

Table 25.209 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time to normal phase.<br>1: Adds dead time to reverse phase. |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

**CAUTION**

Set TAUDnTDL.TAUDnTDLm exclusively from even channels.

### (4) Simultaneous rewrite for slave channel 3

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.210 Simultaneous Rewrite Settings for Slave Channel 3 of Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers.<br>1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.15.8.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 25.211 Operating Procedure for Triangle PWM Output Function with Dead Time

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.8.4, Register Settings for the Master Channel**.<br><br>Slave channel 2: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.8.5, Register Settings for Slave Channel 2**.<br><br>Slave channel 3: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.8.6, Register Settings for Slave Channel 3**.<br><br>Set the value of TAUDnCDRm register of every channel. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start.<br>INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1. |
| During Operation | TAUDnCDRm can be changed at any time.<br>TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.<br><br>TAUDnRDT.TAUDnRDTm can be changed during operation. | TAUDnCDRm value of master channel and slave channel 2 is loaded into TAUDnCNTm to perform counting down. When the counter of master channel reaches $0000_H$:<br>• INTTAUDnIm (master) is generated.<br>• TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation.<br>• TAUDnCDRm value is reloaded into TAUDnCNTm (slave 2) or counting is started in opposite direction.<br>When TAUDnCNTm of slave channel 2 reaches $0001_H$:<br>• INTTAUDnIm (slave 2) is generated.<br>• TAUDnCDRm value of slave channel 3 is loaded into TAUDnCNTm perform counting down.<br>When TAUDnCNTm of slave channel 3 reaches $0000_H$:<br>• INTTAUDnIm is generated. |
| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart Operation

### 25.15.8.8 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to the general timing diagram in **Figure 25.122**.

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

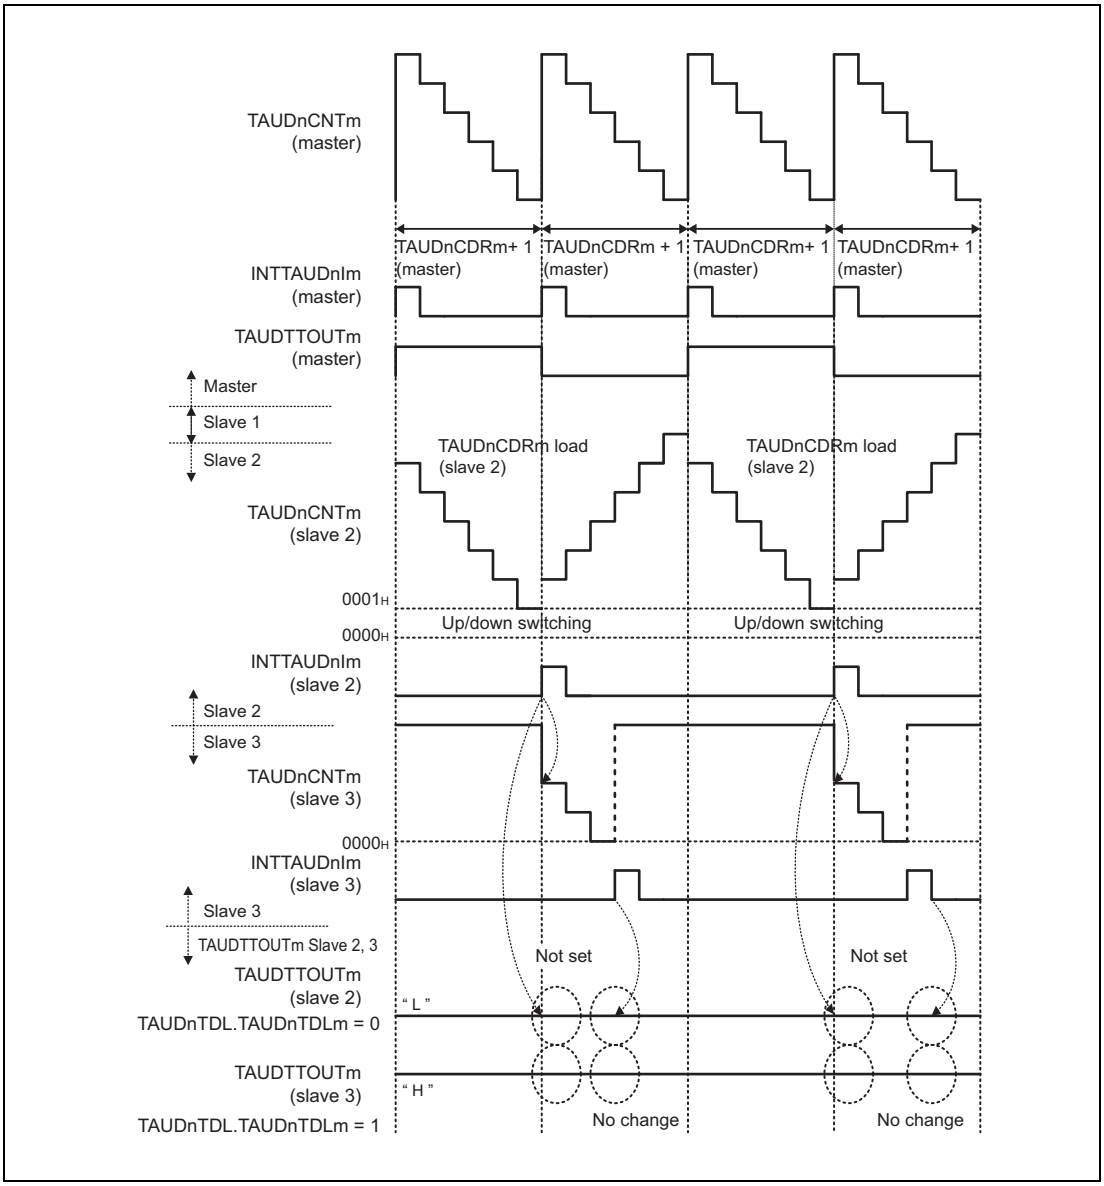

**Figure 25.122 TAUDnCDRm (Slave 2) ≥ TAUDnCDRm (Master) + 1**

- If TAUDnCDRm (slave 2) is greater than TAUDnCDRm (master), the counter of slave channel does not reach $0000_H$ while counting down. Therefore, TAUDTTOUTm signal is not set/reset and remains in the initial state. This signal becomes a reset signal because an interrupt occurs on slave channel 2 during count-up operation.

### (2) Duty cycle = 100%

The following settings apply to the general timing diagram in **Figure 25.123**.

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

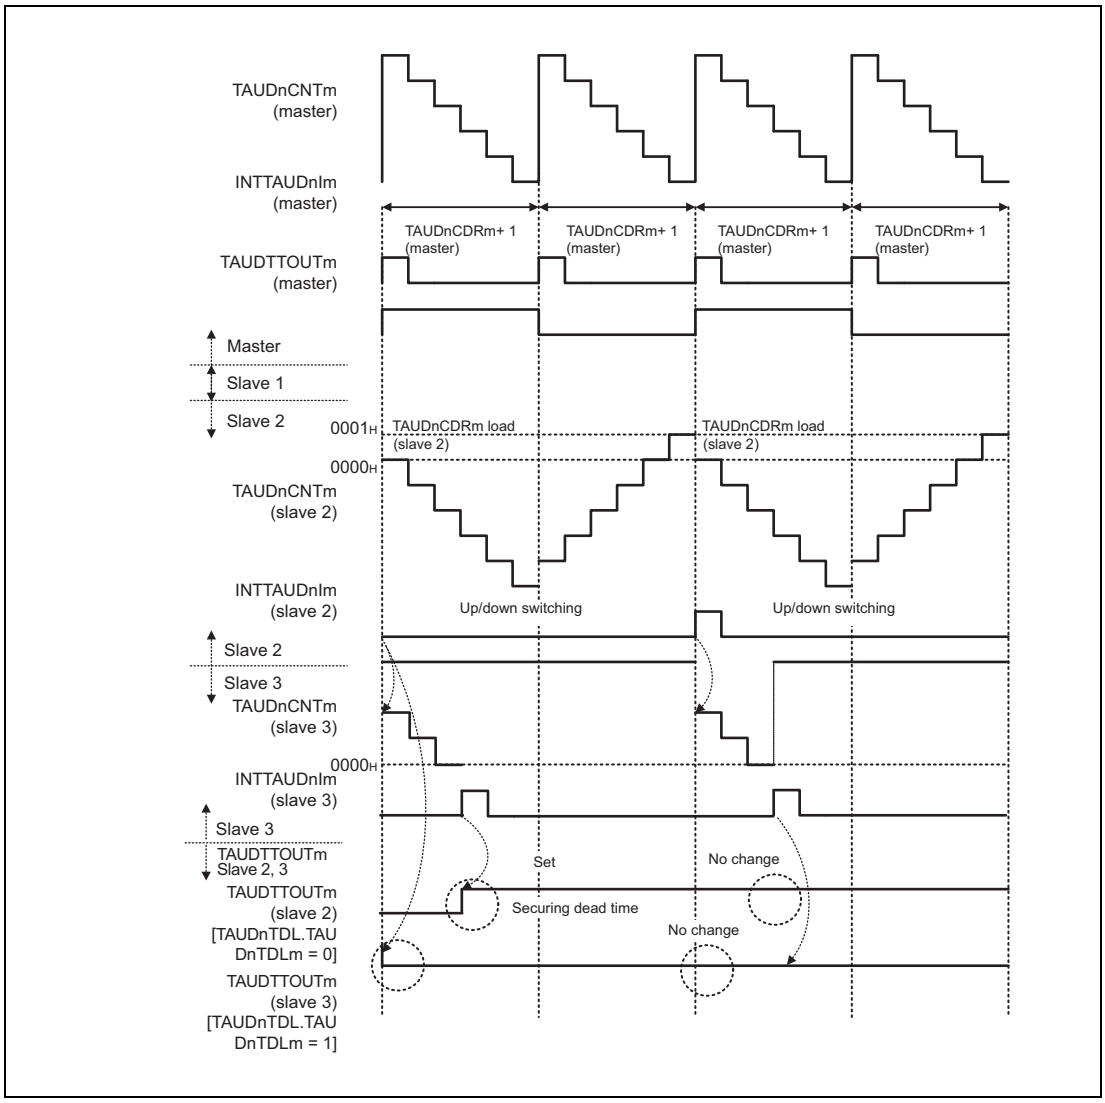

**Figure 25.123 TAUDnCDRm (Slave) = $0000_H$**

- If TAUDnCDRm (slave 2) = $0000_H$, the slave channel counter does not reach $0001_H$ while counting up. Therefore, no INTTAUDnIm is generated during count-up operation.
  - The set conditions for a channel with TAUDnTDL.TAUDnTDLm = 0 are met after elapse of dead time. TAUDTTOUTm is left in a newly set state even if a set/reset is made because no reset conditions are satisfied on such a channel.
  - Slave channel 3 in the above diagram is set when the counter starts. However, TAUDTTOUTm is left in an initial state on the slave channel with TAUDnTDL.TAUDnTDLm = 1 because no reset conditions are satisfied on that channel.

## 25.15.9 A/D Conversion Trigger Output Function Type 2

### 25.15.9.1 Overview

#### Summary

This function is identical to **Section 25.15.7, Triangle PWM Output Function**, except that TAUDTTOUTm is not output.

This function is enabled by setting channel output mode for the slave to independent channel output mode controlled by software.

### 25.15.9.2 Block Diagram and General Timing Diagram

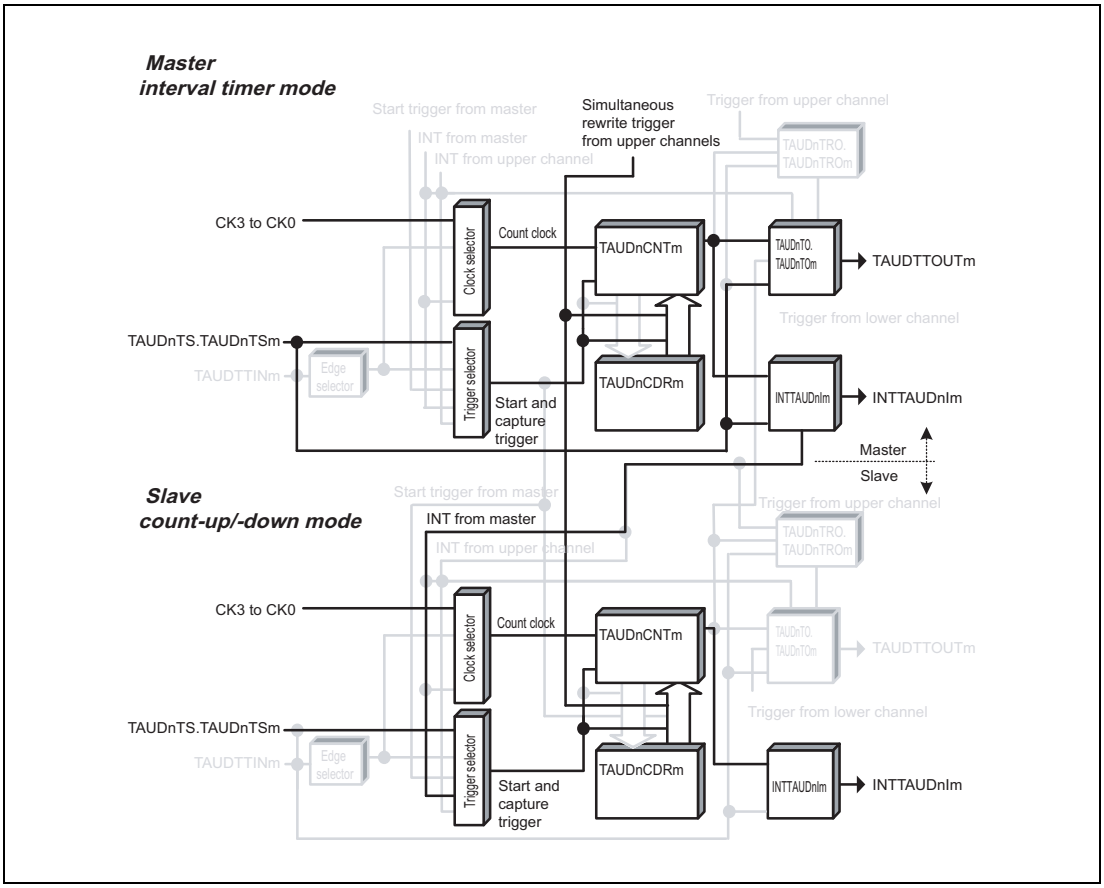

**Figure 25.124 Block Diagram of A/D Conversion Trigger Output Function Type 2**

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUDnIm is generated at the beginning of operation.
    (TAUDnCMORm.TAUDnMD0 = 1)

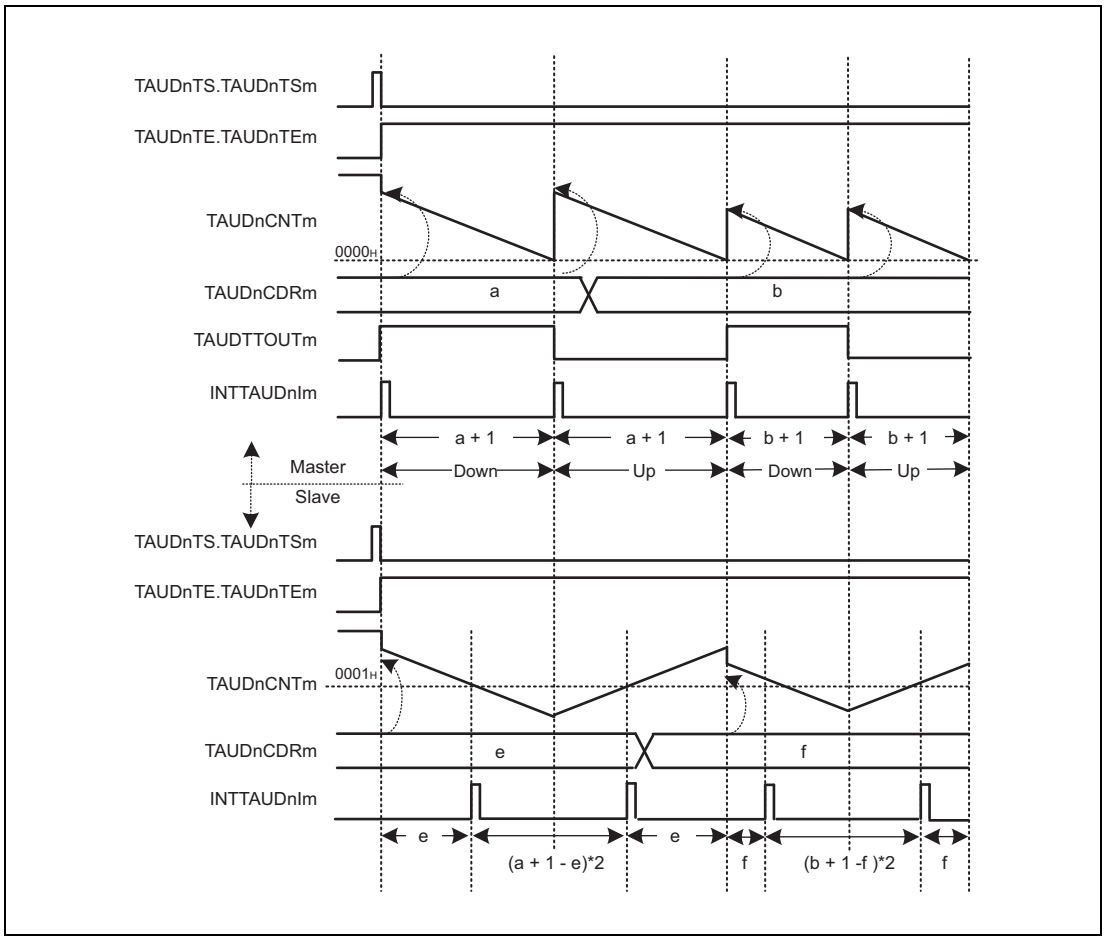

**Figure 25.125 General Timing Diagram of A/D Conversion Trigger Output Function Type 2**

## 25.15.10 Interrupt Request Signals Culling Function

### 25.15.10.1 Overview

#### Summary

This function divides the number of interrupts of the master channel by a specified value using a slave channel.

The interrupt request signals culling function is a sub function of the following functions:

- PWM Output Function (See **Section 25.15.1, PWM Output Function**)
- Triangle PWM Output Function (See **Section 25.15.7, Triangle PWM Output Function**
- Triangle PWM Output Function with Dead Time
  (See **Section 25.15.8, Triangle PWM Output Function with Dead Time**)

#### Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode. (See **Table 25.212, Contents of the TAUDnCMORm Register for the Master Channel of the Interrupt Request Signals Culling Function**)
- The operation mode of the slave channel must be set to Event Count Mode. (See **Table 25.215, Contents of the TAUDnCMORm Register for the Slave Channel of the Interrupt Request Signals Culling Function**)
- This function does not use TAUDTTOUTm.

#### Functional description

The counters (master and slave) are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for both channels. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current value of the data register of the master channel and slave channel (TAUDnCDRm) are written to the counter (TAUDnCNTm).

- Master channel:
  When the counter of the master channel reaches $0000_H$, INTTAUDnIm is generated and TAUDnCDRm value is reloaded to TAUDnCNTm.
- Slave channel:
  Every time the master channel generates an INTTAUDnIm, the counter of the slave channel decrements by one. When the counter reaches $0000_H$, it awaits the next interrupt from the master channel. This causes TAUDnCNTm (slave) to reload the value of TAUDnCDRm, and an INTTAUDnIm is generated.

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm of master and slave channels stops but retains its value.

#### Conditions

This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.

### 25.15.10.2 Equations

Interrupt division operator = TAUDnCDRm (slave channel)

– One INTTAUDnIm is generated for the INTTAUDnIm count of the master channel defined by TAUDnCDRm (slave channel) + 1.

### 25.15.10.3 Block Diagram and General Timing Diagram

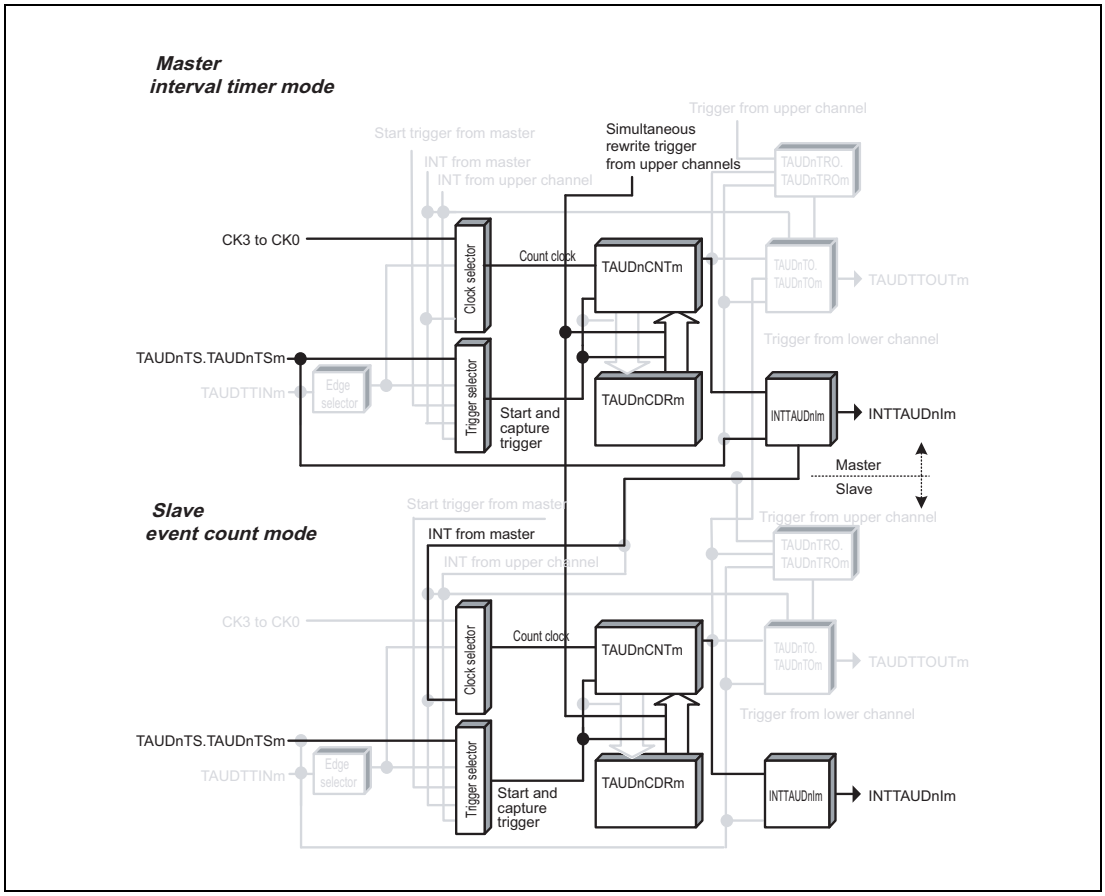

**Figure 25.126 Block Diagram of Interrupt Request Signals Culling Function**

The following settings apply to the general timing diagram.

Master channel:

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

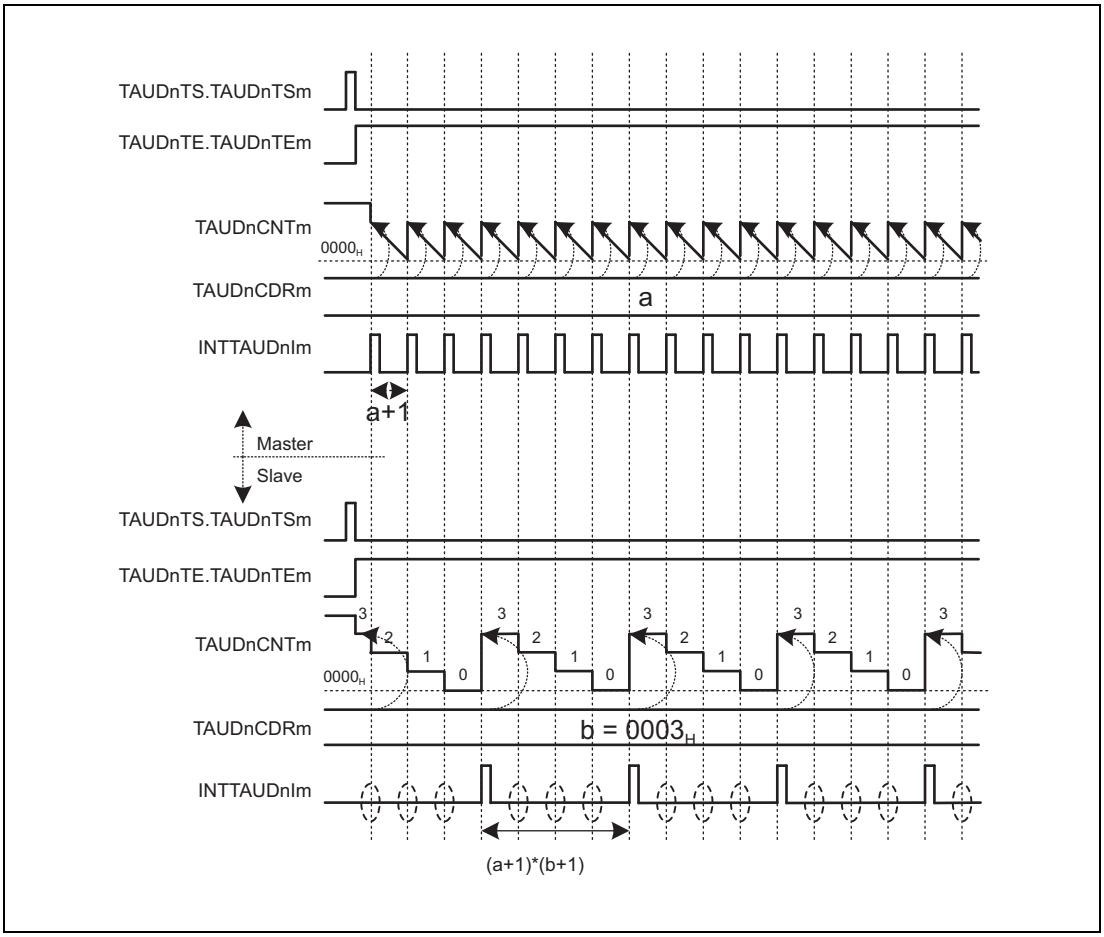

**Figure 25.127 General Timing Diagram of Interrupt Request Signals Culling Function**

### 25.15.10.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 25.216 Contents of the TAUDnCMURm Register for the Slave Channel of the Interrupt Request Signals Culling Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

#### (3) Channel output mode for the slave channel

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

#### (4) Simultaneous rewrite for the slave channel

Both the master and slave channels should have the same simultaneous rewrite settings.

**Table 25.217 Simultaneous Rewrite Settings for the Slave Channel of Interrupt Request Signals Culling Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers.<br>1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.<br>1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 25.15.10.6 Operating Procedure for Interrupt Request Signals Culling Function

**Table 25.218 Operating Procedure for Interrupt Request Signals Culling Function**

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.10.4, Register Settings for the Master Channel**.<br><br>Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.10.5, Register Settings for the Slave Channel**.<br><br>Set the value of TAUDnCDRm register of every channel. | Channel operation is stopped. |
| Start Operation | Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start.<br>INTTAUDnIm is generated on the master channel. |
| During Operation | TAUDnCDRm can be changed at any time.<br>TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.<br><br>TAUDnRDT.TAUDnRDTm can be changed during operation. | TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches $0000_H$:<br>• INTTAUDnIm (master) is generated.<br>• TAUDnCNTm (master) loads TAUDnCDRm value and continues count operation.<br>• TAUDnCNTm of slave channels counts down each time INTTAUDnIm of master channel is detected.<br>When TAUDnCNTm of the slave = $0000_H$:<br>• INTTAUDnIm (slave) is generated.<br>• The TAUDnCDRm value is loaded in TAUDnCNTm (slave) and count operation continues. |
| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm stops and retains its current value. |

Restart Operation

### 25.15.10.7 Specific Timing Diagrams

#### (1) Interrupt count (master) = interrupt count (slave)

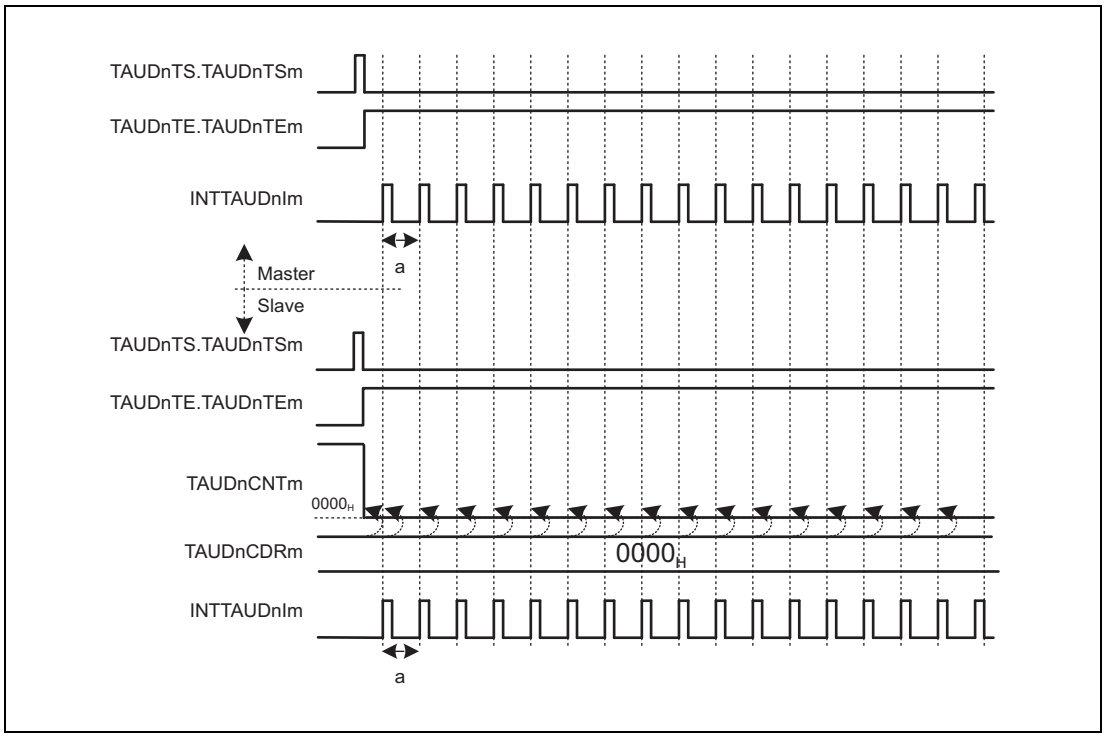

Figure 25.128 TAUDnCDRm (Slave) = $0000_H$

- If TAUDnCDRm = $0000_H$, the TAUDnCDRm value of the slave channel is loaded into TAUDnCNTm each time INTTAUDnIm of master channel is detected. In other words, TAUDnCNTm is always $0000_H$.
- Therefore, an interrupt occurs on the master channel and simultaneously an interrupt occurs on slave channels.

# 25.16 Synchronous Non-Complementary and Complementary Modulation Output Functions

This section describes functions that generate 6-phase PWM output or triangle PWM output using a master channel and seven slave channels.

## 25.16.1 Non-Complementary Modulation Output Function Type 1

### 25.16.1.1 Overview

#### Summary

This function outputs a PWM signal, a high-level signal, or a low-level signal from TAUDTTOUTm depending on the values of the real-time output bits (TAUDnTRO.TAUDnTROm) and the modulation output enable bits (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

#### Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See **Table 25.220, Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1**).
- The operating mode for slave channels 1 to 7 should be set to one-count mode (See **Table 25.223, Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1**, and **Table 25.226, Contents of the TAUDnCMORm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1**).
- TAUDTTOUTm is not used with the master channel of this function.
- TAUDTTOUTm of slave channel 1 is not used with this function, but TAUDnTRC.TAUDnTRCm should be set to 1 (See **Section 25.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 1 with non-complementary modulation output (See **Section 25.7, Channel Output Modes**).
- TAUDnCDRm of slave channel 1 should be set to $0000_H$.

#### Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down. When the counter reaches $0000_H$, INTTAUDnIm is generated.

- Slave channel 1:
  Slave channel 1 is set as a channel that triggers real-time output (TAUDnTRC.TAUDnTRCm = 1). If an interrupt occurs on slave channel 1 (TAUDnCDRm is fixed to $0000_H$), the value of real-time output bit (TAUDnTRO.TAUDnTROm) of the channel that monitors the interrupt on slave channel 1 is reflected to the TAUDTTOUTm output. After that, the counter returns to $FFFF_H$ and waits for the next interrupt of master channel.

- Slave channel 2:
  Slave channel 2 generates a PWM output. The master channel specifies a PWM output cycle and slave channel 2 specifies a duty cycle. After generating an interrupt, the counter returns to $FFFF_H$ and awaits the next interrupt from the master channel.

Slave channels 3 to 7 operate like slave channel 2.

As described in **Table 25.219, TAUDTTOUTm Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOLm = 0)**, a signal output from TAUDTTOUTm depends on the value of the real-time output bit (TAUDnTRO.TAUDnTROm) and modulation output bit (TAUDnTME.TAUDnTMEm) of slave channel.

This function cannot use a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

### Conditions

- If TAUDnTME.TAUDnTMEm = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM (positive logic) corresponding to the channel.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

**Table 25.219 TAUDTTOUTm Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOLm = 0)**

| TAUDnTME.TAUDnTMEm | TAUDnTRO.TAUDnTROm | TAUDTTOUTm Output |
|---|---|---|
| 0 | 0 | Low level |
| | 1 | High level |
| 1 | 0 | Low level |
| | 1 | PWM (positive logic) |

- This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.
- TAUDnCDRm value of slave channel 1 should be set to $0000_H$ so that a real-time output is triggered at the same time with PWM generation on slave channels 2 to 7.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.

#### 25.16.1.2 Equations

Slave channels 2 to 7:

Pulse period = [TAUDnCDRm (master) + 1] × count clock cycle

Duty time = [TAUDnCDRm (slave)] × count clock cycle

### 25.16.1.3 Block Diagram and General Timing Diagram

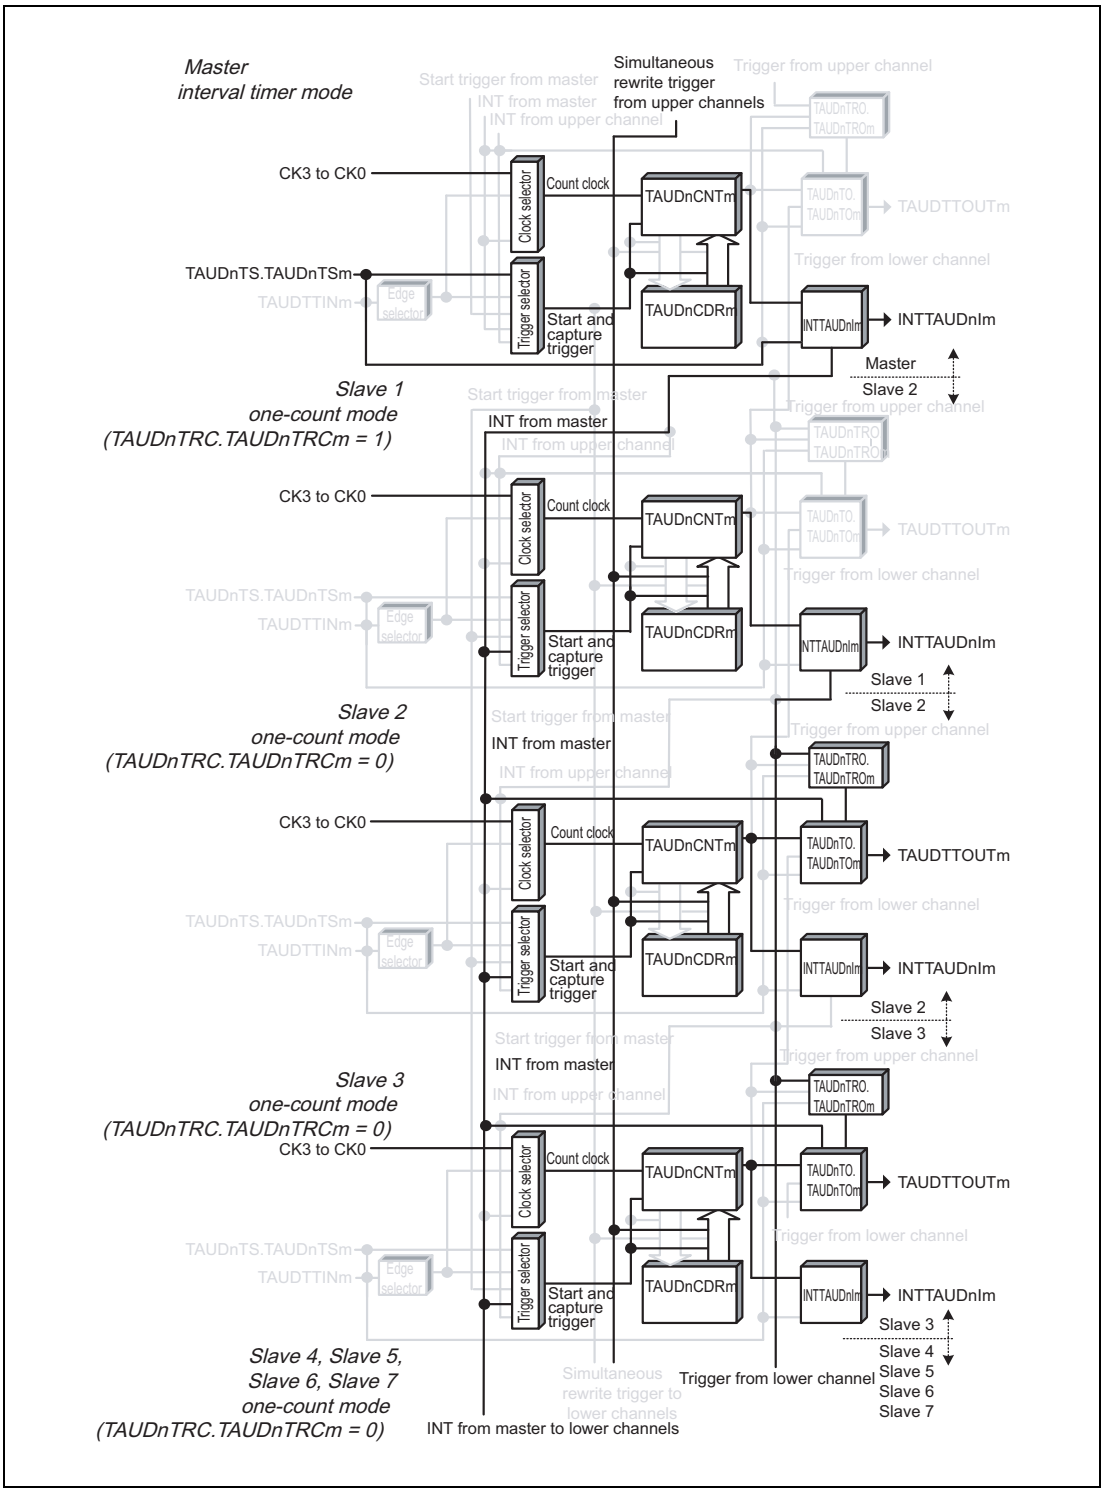

**Figure 25.129 Block Diagram of Non-Complementary Modulation Output Function Type 1**

The following settings apply to the general timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

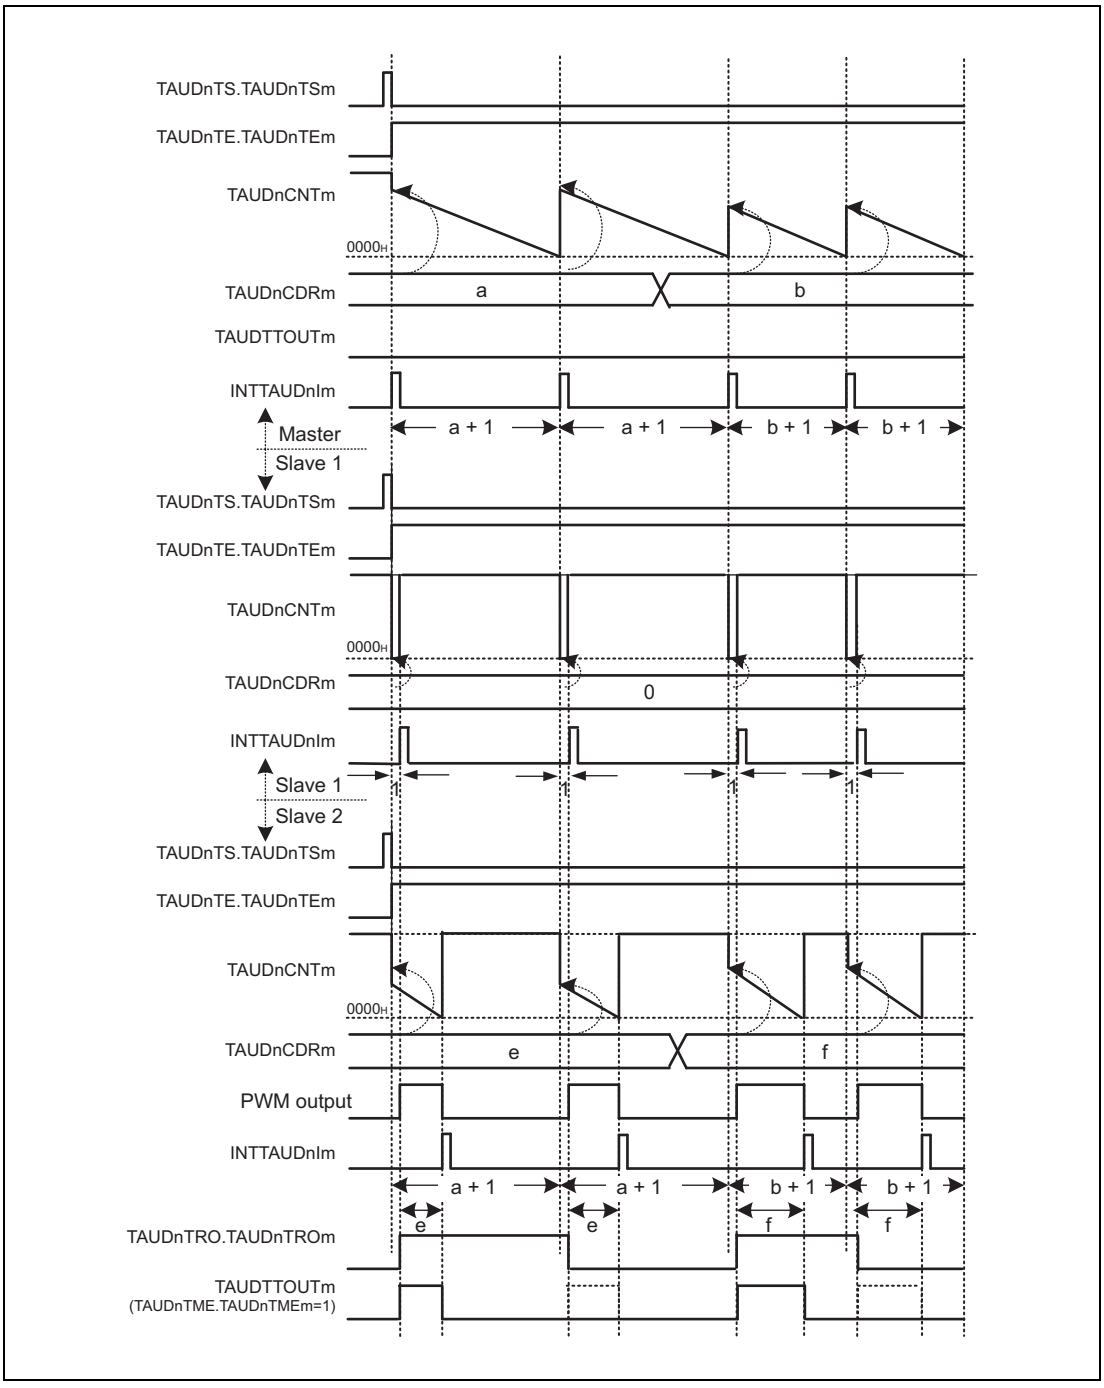

**Figure 25.130 General Timing Diagram of Non-Complementary Modulation Output Function Type 1**

**NOTE**

TAUDTTOUTm of slave channel 2 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 25.16.1.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.220 Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 1: INTTAUDnIm is generated at the beginning of operation or at a restart time. |

#### (2) TAUDnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.221 Contents of the TAUDnCMURm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for the master channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

### (4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

**Table 25.222 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 1**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0. |

**NOTE**

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires an upper channel higher than the master channel that operates with **Section 25.14.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Conduct operation settings under the following conditions.

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1
  In addition, TAUDnCDRm settings for this channel are as follows.
  = ((TAUDnCDR setting for the master channel targeted for simultaneous rewrite + 1) × Interrupt count) – 1
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm = 0, TAUDnRDSm = 1

### 25.16.1.5 Register Settings for Slave Channel 1

#### (1) TAUDnCMORm for slave channel 1

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.223 Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnIm of master channel is a start trigger. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Start trigger during operation is valid. |

#### (2) TAUDnCMURm for slave channel 1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.224 Contents of the TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

**CAUTION**

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

### (4) Simultaneous rewrite for slave channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

**Table 25.225 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0. |

### 25.16.1.6 Register Settings for Slave Channels 2 to 7

#### (1) TAUDnCMORm for slave channels 2 to 7

| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.227 Contents of the TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for slave channels 2 to 7

Table 25.228 Control Bit Settings in Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output. |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low.<br>1: Real-time output is high. |
| TAUDnTRC.TAUDnTRCm | 0: Upper channel generates a real-time output trigger for channel m. |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation<br>1: Enables modulation |

### (4) Simultaneous rewrite of slave channels 2 to 7

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.229 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0. |

### 25.16.1.7 Operating Procedure for Non-Complementary Modulation Output Function Type 1

Table 25.230 Operating Procedure for Non-Complementary Modulation Output Function Type 1 (1/2)

| | Operation | TAUDn Status |

| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

### 25.16.1.8 Specific Timing Diagrams

The following settings apply to the specific timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

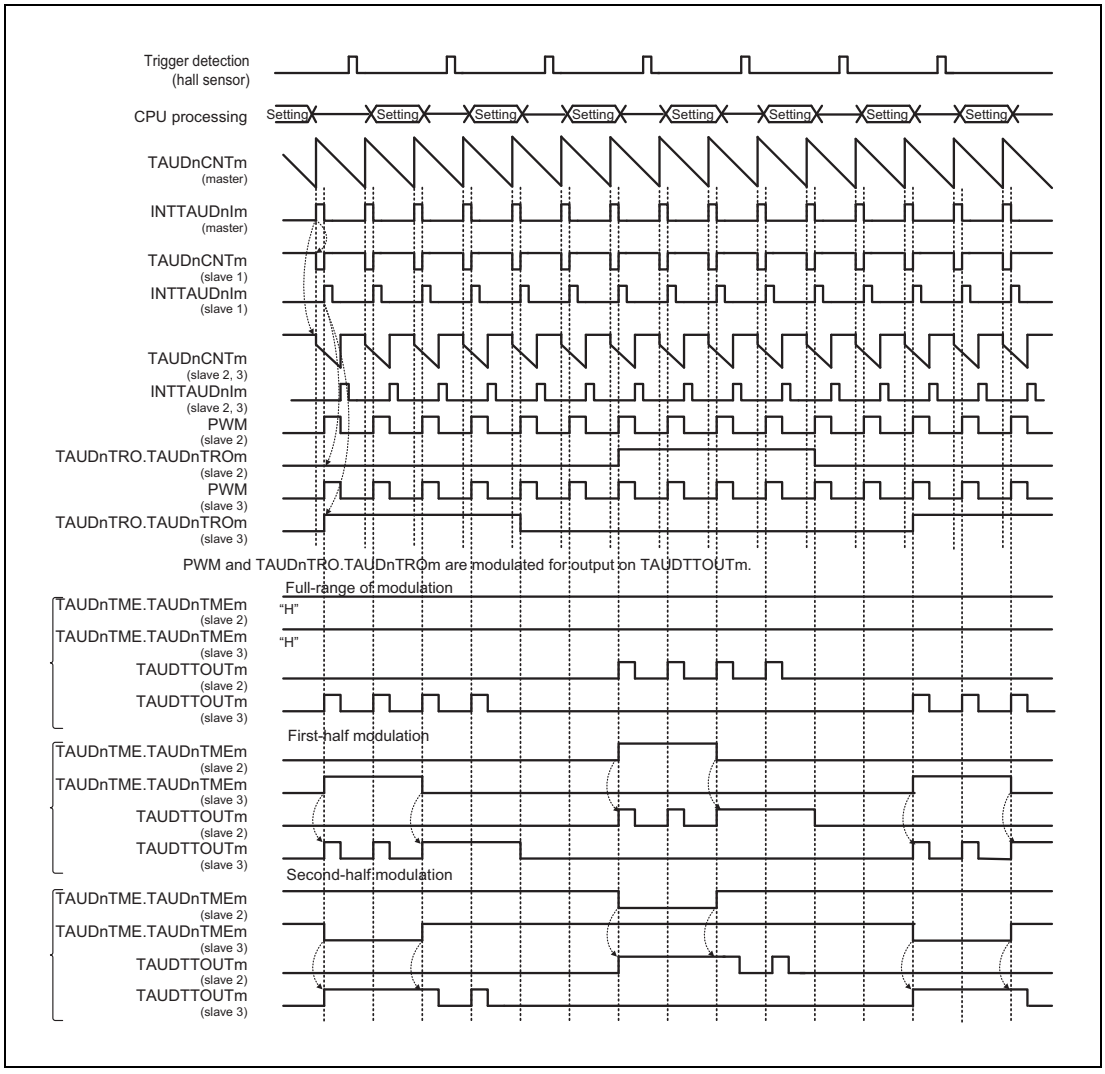

**Figure 25.131 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 1**

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The "Setting" symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and master channel cycle. According to the modified setting, modulation waveforms are output from TAUDTTOUTm.

A TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

## 25.16.2 Non-Complementary Modulation Output Function Type 2

### 25.16.2.1 Overview

#### Summary

This function outputs a triangular PWM output signal, a high-level signal, or low-level signal from TAUDTTOUTm depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output enable bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

#### Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See **Table 25.232, Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channel 1 should be set to event count mode (See **Table 25.236, Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channels 2 to 7 should be set to count-up/-down mode (See **Table 25.239, Contents of the TAUDnCMORm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2**).
- The output mode for the master channel should be set to independent channel output mode 1. (See **Section 25.7, Channel Output Modes**.)
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (See **Section 25.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with non-complementary modulation output (See **Section 25.7, Channel Output Modes**).

### Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm).

- Master channel:
  The counter of master channel starts to count down. When the counter reaches $0000_H$, INTTAUDnIm is generated.
- Slave channel 1:
  When slave channel 1 detects an interrupt from the master channel, the TAUDnCNTm value is decremented. When an interrupt from the master channel is detected (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, the TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.
  Since slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1), if an interrupt occurs on slave channel 1, the real-time output bit (TAUDnTRO.TAUDnTROm) of the channel which monitors an interrupt on the corresponding channel is reflected to the TAUDTTOUTm output.
- Slave channel 2:
  Once detecting an interrupt from the master channel, TAUDnCNTm counts in the reverse direction. When an interrupt is detected during count-up operation, TAUDnCDRm value is reloaded and then the counter starts to count down.
  If TAUDnCNTm = $0001_H$, an interrupt occurs and a PWM output signal is set/reset.

The combined use of the master channel and slave channel 2 generates a PWM output signal. The master channel generates a PWM output cycle and slave channel 2 generate a duty cycle.

Slave channels 3 to 7 operate like slave channel 2.

A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm) and a modulation output bit value (TAUDnTME.TAUDnTMEm) of the slave channel, as described in **Table 25.231, TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)**.

This function cannot make a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

**Conditions**

- If TAUDnTME.TAUDnTMEm = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM (positive logic) corresponding to the channel.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

**Table 25.231 TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)**

| TAUDnTME.TAUDnTMEm | TAUDnTRO.TAUDnTROm | TAUDTTOUTm Output |
|---|---|---|
| 0 | 0 | Low level |
| | 1 | High level |
| 1 | 0 | Low level |
| | 1 | PWM (positive logic) |

- This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.

### 25.16.2.2 Equations

Slave channels 2 to 7:

Carrier cycle (down/up) = [TAUDnCDRm (master) + 1] × 2 × count clock cycle

Duty time = [TAUDnCDRm (master) + 1 - TAUDnCDRm (slave)] × 2 × count clock cycle

### 25.16.2.3 Block Diagram and General Timing Diagram

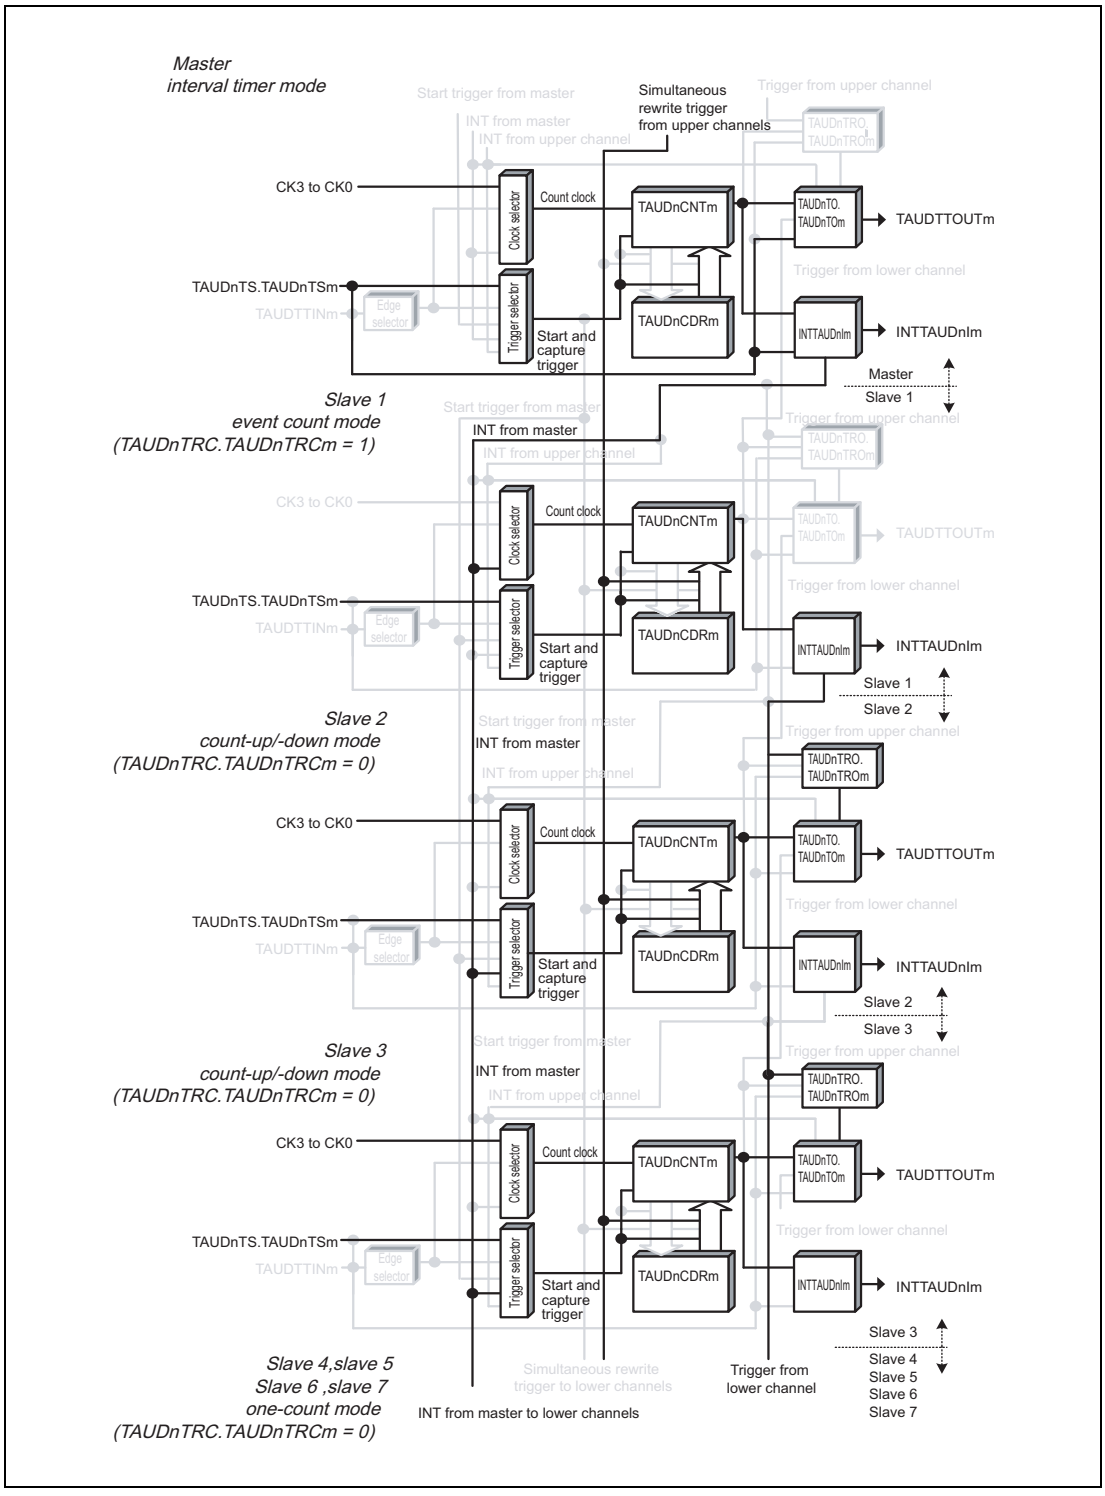

**Figure 25.132 Block Diagram of Non-Complementary Modulation Output Function Type 2**

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

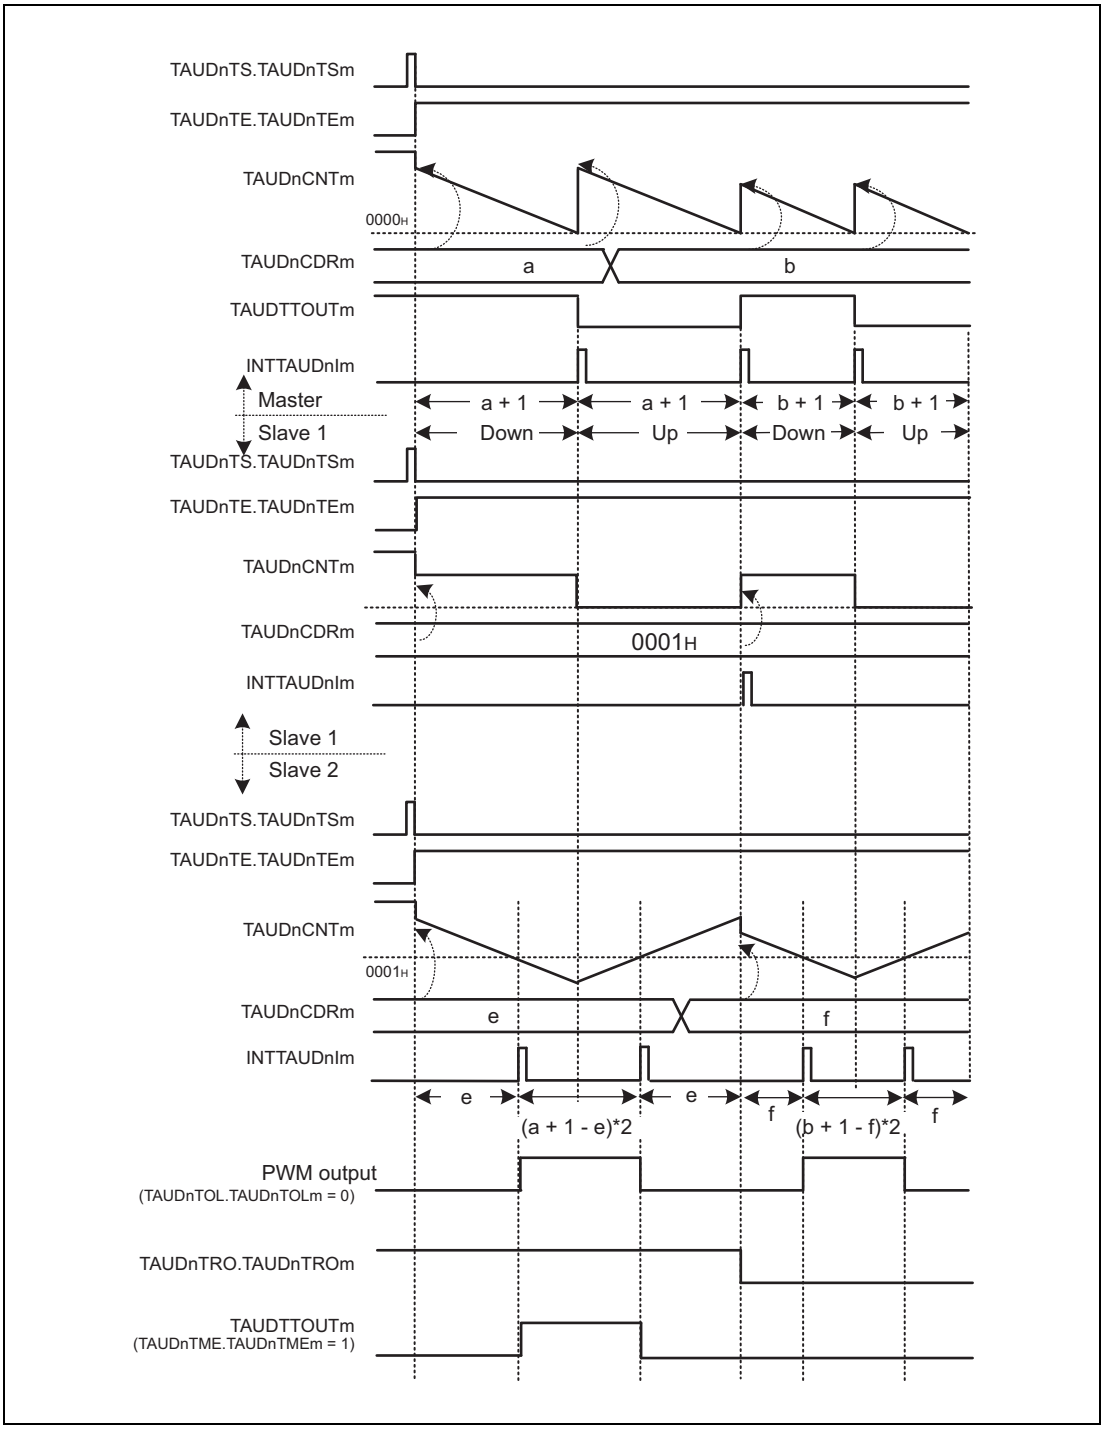

**Figure 25.133 General Timing Diagram of Non-Complementary Modulation Output Function Type 2**

### 25.16.2.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.232 Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 2**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.<br>1: INTTAUDnIm is generated at the beginning of operation or at a restart time. |

#### (2) TAUDnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.233 Contents of the TAUDnCMURm Register for the Master channel of Non-Complementary Modulation Output Function Type 2**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for the master channel

Table 25.234 Control Bit Settings for the Master Channel in Non-Complementary Modulation Output Function Type 2

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (toggle mode with TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode (the value after reset). |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRC.TAUDnTRCm | |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.235 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 2

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

**NOTE**

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 25.16.2.5 Register Settings for Slave Channel 1

#### (1) TAUDnCMORm for slave channel 1

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.236 Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 11: INTTAUDnIm of the master channel is used as the count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software.<br>011: Triggers simultaneous rewrite. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0011: Event count mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated at the beginning of operation or at a restart time. |

#### (2) TAUDnCMURm for slave channel 1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.237 Contents of the TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

**CAUTION**

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

### (4) Simultaneous rewrite for slave channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

**Table 25.238 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0. |

### 25.16.2.6 Register settings for slave channels 2 to 7

#### (1) TAUDnCMORm for slave channels 2 to 7

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 111: The up/down output trigger signal of the master channel |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 1001: Count-up/-down mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated at the beginning of operation or at a restart time. |

#### (2) TAUDnCMURm for slave channels 2 to 7

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.240 Contents of the TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Output mode for slave channels 2 to 7

Table 25.241 Control Bit Settings in Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output. |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low.<br>1: Real-time output is high. |
| TAUDnTRC.TAUDnTRCm | 0: The upper channel generates the real-time output trigger for channel m |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation<br>1: Enables modulation |

### (4) Simultaneous rewrite for slave channels 2 to 7

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.242 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0. |

### 25.16.2.7 Operating Procedure for Non-Complementary Modulation Output Function Type 2

Table 25.243 Operating Procedure for Non-Complementary Modulation Output Function Type 2 (1/2)

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.2.4, Register Settings for the Master Channel**.<br><br>Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.2.5, Register Settings for Slave Channel 1**.<br><br>Slave channels 2 to 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.2.6, Register settings for slave channels 2 to 7**.<br><br>Set the value of TAUDnCDRm register of every channel. Set pulse cycle in TAUDnCDRm of master channel, and in TAUDnCDRm of slave channel 1, set the number of interrupts from master channel to be ignored before slave channel 1 generates a real-time output trigger. Set duty width in TAUDnCDRm of slave channels 2 to 7.<br><br>Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1. | Channel operation is stopped. |

**Table 25.243 Operating Procedure for Non-Complementary Modulation Output Function Type 2 (2/2)**

| | Operation | TAUDn Status |
|---|---|---|
| Start Operation | Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down. |
| During Operation | TAUDnCDRm, TAUDnTRO.TAUDnTROm, and TAUDnTMEm.TAUDnTMEm can be changed at any time.<br>TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.<br><br>TAUDnRDT.TAUDnRDTm can be changed during operation. | The TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. The TAUDnCDRm value of slave channel 1 is loaded and the counter waits for an interrupt from the master channel. When the counter of master channel reaches $0000_H$:<br>• INTTAUDnIm is generated.<br>• TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down.<br>• The TAUDnCNTm value of slave channel 1 decrements by 1 and the counter waits for a next interrupt from the master channel.<br>• TAUDnCNTm of slave channels 2 to 7 reloads the TAUDnCDRm value, or performs counting in opposite direction.<br>• At the same timing when the TAUDnCDRm value is loaded, the TAUDnTME.TAUDnTMEm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output.<br>• When slave channel 1 detects an interrupt from the master channel for the (TAUDnCDRm + 1) times:<br>– INTTAUDnIm is generated.<br>– The TAUDnTRO.TAUDnTROm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output.<br>• When the counter of slave channels 2 to 7 reaches $0001_H$:<br>– INTTAUDnIm is generated.<br>– PWM output signals of slave channels 2 to 7 are set/reset. |
| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

Restart Operation

### 25.16.2.8 Specific Timing Diagrams

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

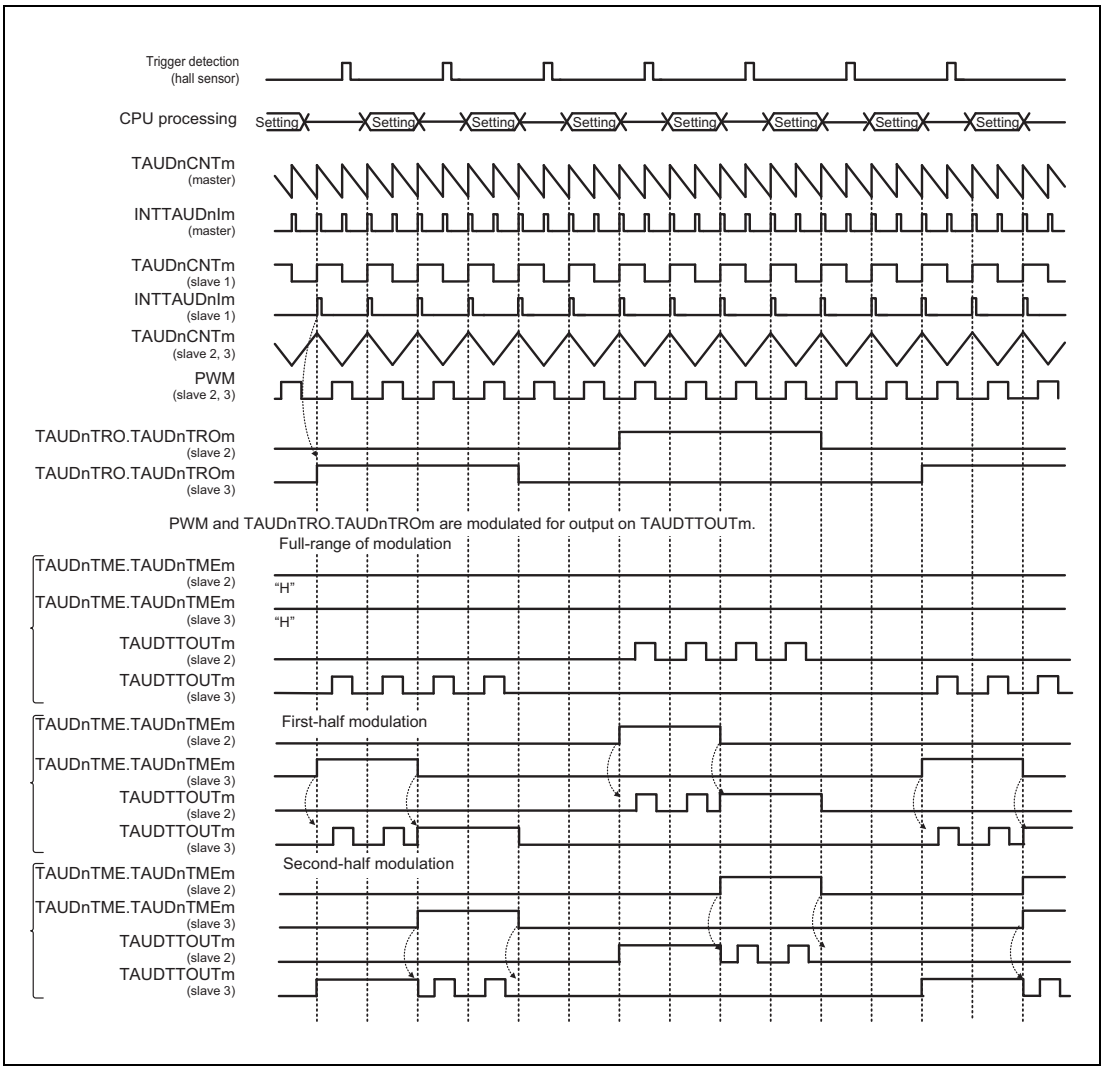

**Figure 25.134 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 2**

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The "Setting" symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

## 25.16.3 Complementary Modulation Output Function

### 25.16.3.1 Overview

#### Summary

This function outputs a triangle PWM output signal, a high-level signal, or low-level signal from TAUDTTOUTm with dead time added, depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels, and an output level bit value (TAUDnTDL.TAUDnTDLm). Three pairs of channels are typically used.

#### Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See **Table 25.245, Contents of the TAUDnCMORm Register for the Master Channel of the Complementary Modulation Output Function**).
- The operating mode for slave channel 1 should be set to event count mode (See **Table 25.249, Contents of the TAUDnCMORm Register for Slave Channel 1 of the Complementary Modulation Output Function**).
- The operating mode for slave channels 2, 4 and 6 should be set to count-up/-down mode (See **Table 25.252, Contents of the TAUDnCMORm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function**).
- The operating mode for slave channels 3, 5 and 7 should be set to one-count mode (See **Table 25.256, Contents of the TAUDnCMORm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function**).
  In addition, as the number of occurrences of an interrupt for slave channels 3, 5 and 7 within the carrier cycle is not uniquely determined, do not use the interrupt as an interrupt source.
- The output mode for master channels should be set to independent channel output mode 1 (See **25.7, Channel Output Modes**).
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (See **Section 25.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with complementary modulation output (See **Section 25.7, Channel Output Modes**).

#### Functional description

- Master channel:
  The counter of the master channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) of the master channel is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.
  When the counter of master channel reaches $0000_H$, INTTAUDnIm is generated. This decrements the counter value of slave channel 1 by 1 and the counter of slave channel 2 starts to count in the opposite direction.
- Slave channel 1:
  When the counter reaches $0000_H$, slave channel 1 waits for the next interrupt from the master

channel. And the TAUDnCDRm value is reloaded into TAUDnCNTm (slave 1) and INTTAUDnIm is generated.
Slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1). The value of real-time output bit (TAUDnTRO.TAUDnTROm) of each channel is applied to the channel that detects the occurrence of an interrupt on slave channel 1 by an interrupt. The real-time output bit value can be changed in any timing by application software but a new value is not applied until an interrupt occurs on slave channel 1.

- Slave channel 2:
  When the slave channel 2 counter reaches $0001_H$, the slave channel 3 counter starts counting down. When the slave channel 3 counter reaches $0000_H$, an interrupt occurs.
- Slave channels 2 and 3:
  The combined use of the master channel and slave channels 2 and 3 generates a PWM output signal. The master channel generates a PWM output cycle, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time.
- Slave channels 4 to 7:
  Slave channels 4 and 6 operate like slave channel 2. Slave channels 5 and 7 operate like slave channel 3.

A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm), a modulation output bit value (TAUDnTME.TAUDnTMEm), and an output level bit value (TAUDnTDL.TAUDnTDLm) of the slave channel, as described in **Table 25.244, TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function**.

It is, however, prohibited that a high-level signal is output from both channel 2 and channel 3 (in order to prevent a motor driver short circuit).

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

#### Conditions

- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 1 (TAUDnTOL.TAUDnTOLm = 0):
  - If TAUDnTRO.TAUDnTROm of one channel is set to 1, TAUDTTOUTm outputs the corresponding PWM of the channel.
  - If TAUDnTRO.TAUDnTROm of both channels is set to 0, TAUDTTOUTm of a pair outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 0 (TAUDnTOL.TAUDnTOLm = 0):
  - If TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm of the channel outputs a high-level signal.
  - If TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm of the channel outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic.

**Table 25.244 TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function**

| TAUDnTME.TAUDnTME02 | TAUDnTME.TAUDnTME03 | TAUDnTRO.TAUDnTRO02 | TAUDnTRO.TAUDnTRO03 | TAUDnTDL.TAUDnTDL02 | TAUDnTDL.TAUDnTDL03 | TAUDTTOUT2 Output | TAUDTTOUT3 Output |
|---|---|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | X | X | Low level | Low level |
| | | 0 | 1 | 1 | 0 | Low level | High level |
| | | 1 | 0 | 0 | 1 | High level | Low level |
| | | 1 | 1 | X | X | Setting prohibited | Setting prohibited |
| 1 | 1 | 0 | 0 | X | X | Low level | Low level |
| | | 0 | 1 | 1 | 0 | ~PWM | PWM |
| | | 1 | 0 | 0 | 1 | PWM | ~PWM |
| | | 1 | 1 | X | X | Setting prohibited | Setting prohibited |

**NOTES**

1. In the above table, PWM indicates a positive PWM signal and ~PWM indicates an inverted PWM signal (positive logic). PWM and ~PWM are set by TAUDnTDL.TAUDnTDLm.
2. Any settings not listed above are prohibited.

- If TAUDnTME.TAUDnTMEm is continuously set to 1 while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, full modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the first half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, first-half modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the second half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, second-half modulation is applied.
- Whether dead time is added to a normal or reverse phase PWM signal when two channels become high-level signal outputs simultaneously depends on a TAUDnTDL.TAUDnTDLm bit value.
  - If TAUDnTDL.TAUDnTDLm = 0, dead time is added to a normal phase PWM signal.
  - If TAUDnTDL.TAUDnTDLm = 1, dead time is added to a reverse phase PWM signal.
  - The operation defined by a TAUDnTDL.TAUDnTDLm bit value should be conducted by application software during operation. To modify TAUDnTDL.TAUDnTDLm, rewrite it during the period when TAUDnTRO.TAUDnTROm is $00_B$.
- The TAUDnCDRm value of slave channel 1 should be set to the value to generate INTTAUDnIm of slave channel 1 at a carrier cycle (peak interrupt timing).
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7:
  - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
  - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7:
  - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.
  - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.

- This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.

#### 25.16.3.2 Equations

Pulse period = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

For slave channels 2 and 3:

PWM signal width (positive phase) = [ (TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2) × 2) – (TAUDnCDRm (slave 3) + 1) ] × count clock cycle

PWM signal width (negative phase) = [ (TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2) × 2) + (TAUDnCDRm (slave 3) + 1) ] × count clock cycle

For slave channels 4 to 7:

Slave channels 4 and 6 are calculated in the same way as slave channel 2, whereas slave channels 5 and 7 are calculated as slave channel 3.

### 25.16.3.3 Block Diagram and General Timing Diagram

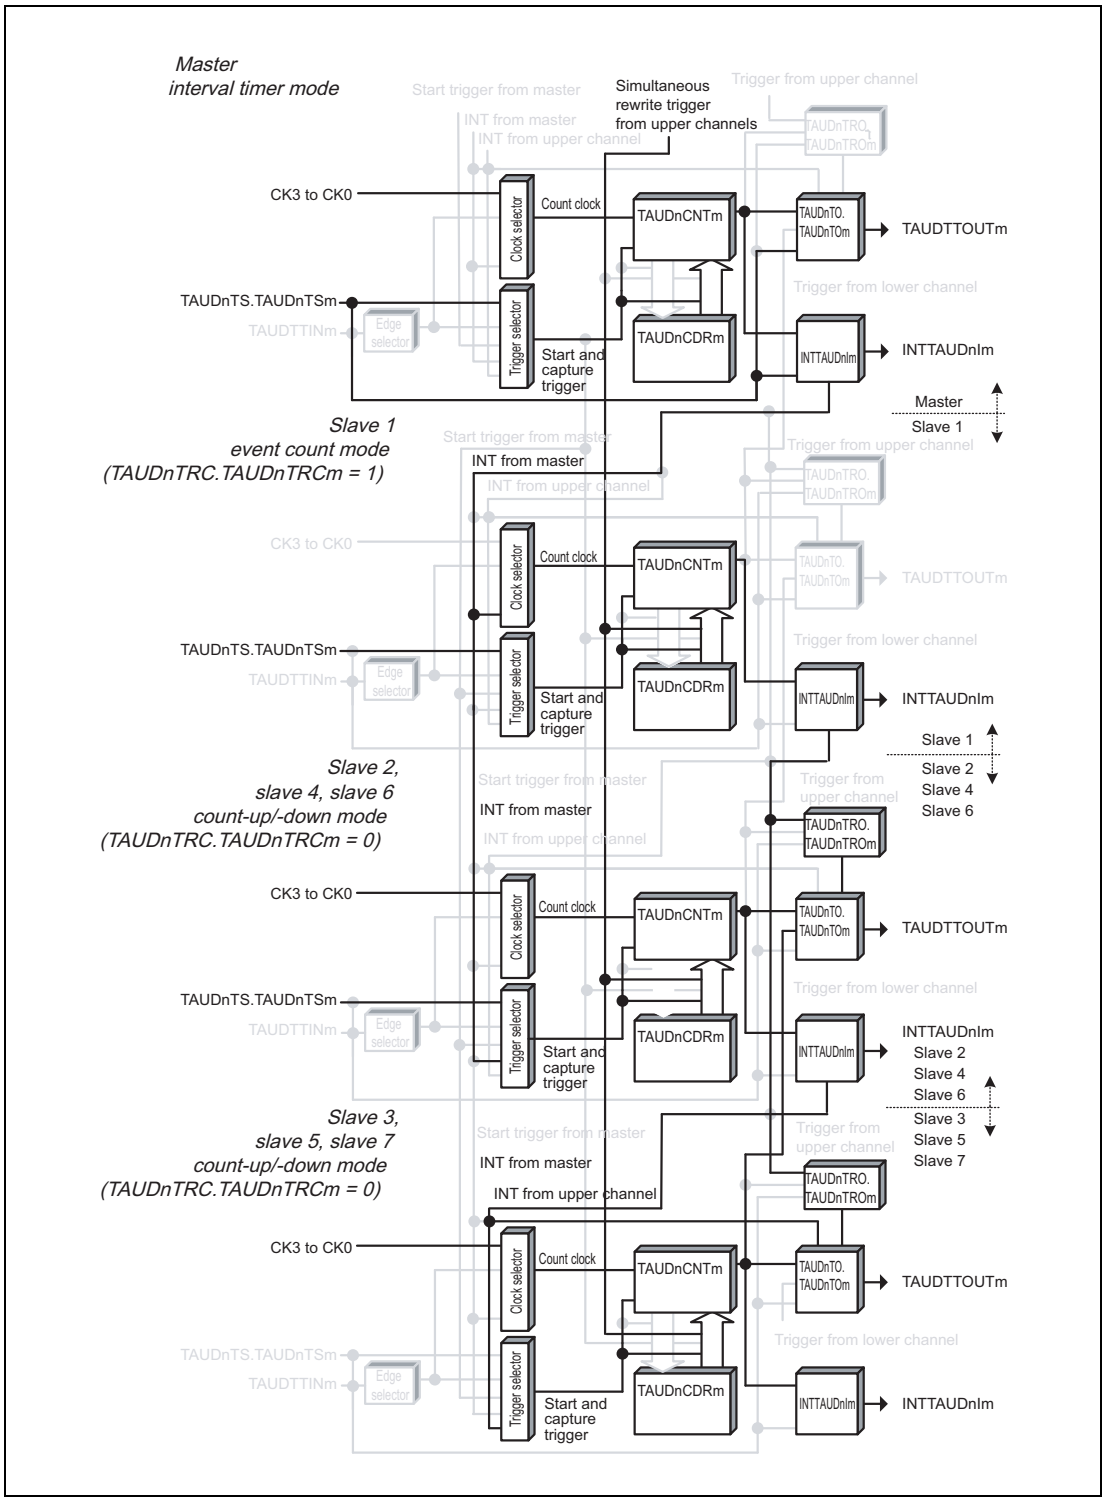

**Figure 25.135 Block Diagram of Complementary Modulation Output Function**

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channel 1: TAUDnCDRm = $0001_H$

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

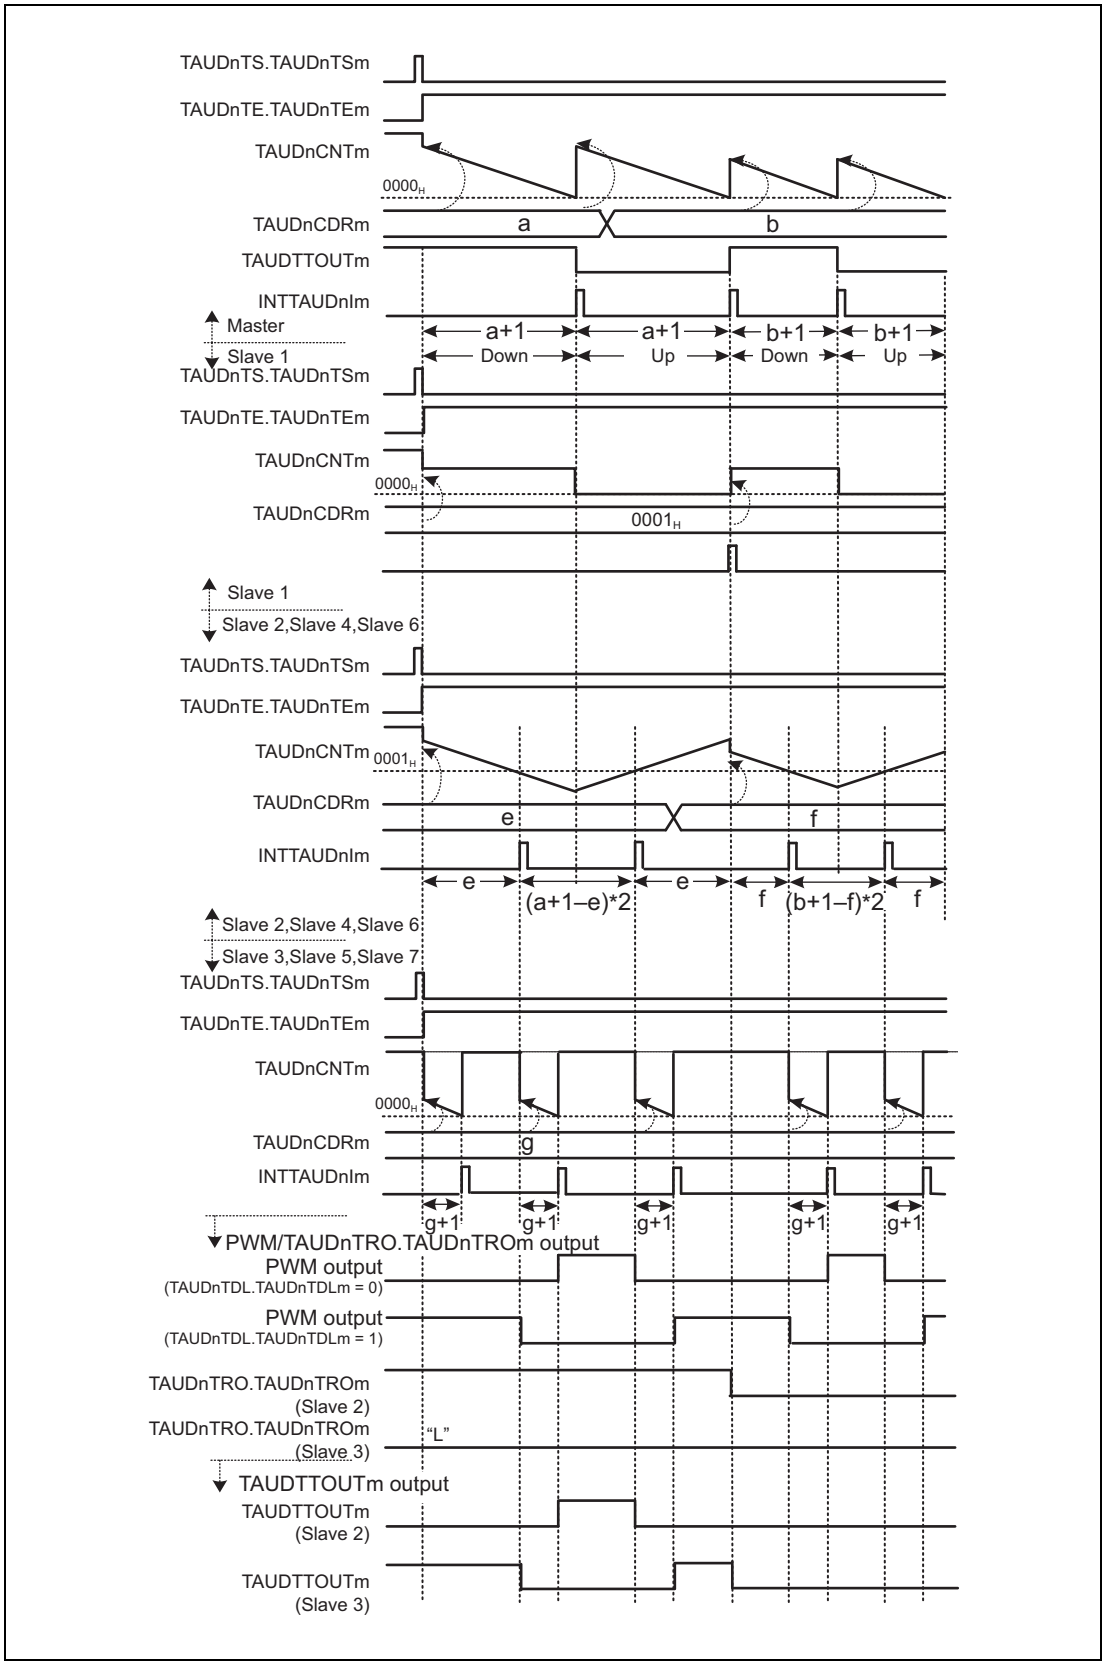

**Figure 25.136 General Timing Diagram of Complementary Modulation Output Function**

### 25.16.3.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.245 Contents of the TAUDnCMORm Register for the Master Channel of the Complementary Modulation Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated and TAUDTTOUTm is not toggled at the beginning of operation or at a restart time.<br>1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation. |

#### (2) TAUDnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.246 Contents of the TAUDnCMURm Register for the Master Channel of the Complementary Modulation Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode for the master channel

**Table 25.247 Control Bit Settings in Independent Channel Output Mode 1**

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode (the value after reset). |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRC.TAUDnTRCm | |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

### (4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

**Table 25.248 Simultaneous Rewrite Settings for the Master Channel of Complementary Modulation Output Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0. |

**NOTE**

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 25.16.3.5 Register Settings for Slave Channel 1

#### (1) TAUDnCMORm for slave channel 1

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.249 Contents of the TAUDnCMORm Register for Slave Channel 1 of the Complementary Modulation Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 11: INTTAUDnIm of the master channel is used as the count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software.<br>011: Triggers simultaneous rewrite. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0011: Event count mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated at the beginning of operation or at a restart time. |

#### (2) TAUDnCMURm for slave channel 1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.250 Contents of the TAUDnCMURm Register for Slave Channel 1 of the Complementary Modulation Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

**CAUTION**

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

### (4) Simultaneous rewrite for slave channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

**Table 25.251 Simultaneous Rewrite Settings for Slave Channel 1 of Complementary Modulation Output Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0. |

### 25.16.3.6 Register settings for slave channels 2, 4, and 6

#### (1) TAUDnCMORm for slave channels 2, 4, and 6

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.252 Contents of the TAUDnCMORm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 111: Up/down output trigger signal of master channel |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 1001: Count-up/-down mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated at the beginning of operation or at a restart time. |

#### (2) TAUDnCMURm for slave channels 2, 4, and 6

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.253 Contents of the TAUDnCMURm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Output mode for slave channels 2, 4, and 6

**Table 25.254 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output**

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time to normal phase.<br>1: Adds dead time to reverse phase. |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output. |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low.<br>1: Real-time output is high. |
| TAUDnTRC.TAUDnTRCm | 0: Upper channel generates a real-time output trigger for channel m. |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation<br>1: Enables modulation |

**CAUTION**

At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

### (4) Simultaneous rewrite for slave channels 2, 4, and 6

Both the master and slave channels should have the same simultaneous rewrite settings.

**Table 25.255 Simultaneous Rewrite Settings for Slave Channels 2, 4, and 6 of Complementary Modulation Output Function**

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0. |

### 25.16.3.7 Register settings for slave channels 3, 5, and 7

#### (1) TAUDnCMORm for slave channels 3, 5, and 7

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUDnCKS[1:0] | | TAUDnCCS[1:0] | | TAUDn MAS | TAUDnSTS[2:0] | | | TAUDnCOS[1:0] | | — | TAUDnMD[4:1] | | | | TAUDn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 25.256 Contents of the TAUDnCMORm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output = CK0<br>01: Prescaler output = CK1<br>10: Prescaler output = CK2<br>11: Prescaler output = CK3<br>The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 110: Dead time trigger |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Enables start trigger detection while counting. |

#### (2) TAUDnCMURm for slave channels 3, 5, and 7

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUDnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 25.257 Contents of the TAUDnCMURm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

### (3) Output mode for slave channels 3, 5, and 7

Table 25.258 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

| Bit Name | Setting |
|---|---|
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic<br>1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time to normal phase.<br>1: Adds dead time to reverse phase. |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output. |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low.<br>1: Real-time output is high. |
| TAUDnTRC.TAUDnTRCm | 0: Upper channel generates a real-time trigger for channel m. |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation<br>1: Enables modulation |

**CAUTION**

At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from even channels.

### (4) Simultaneous rewrite for slave channels 3, 5, and 7

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.259 Simultaneous Rewrite Settings for Slave Channels 3, 5, and 7 of Complementary Modulation Output Function

| Bit Name | Setting |
|---|---|
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers.<br>1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0. |

### 25.16.3.8 Operating Procedure for Complementary Modulation Output Function

Table 25.260 Operating Procedure for Complementary Modulation Output Function (1/2)

| | Operation | TAUDn Status |
|---|---|---|
| Initial Channel Setting | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.3.4, Register Settings for the Master Channel**.<br><br>Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.3.5, Register Settings for Slave Channel 1**.<br><br>Slave channels 2, 4, and 6: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.3.6, Register settings for slave channels 2, 4, and 6**.<br><br>Slave channels 3, 5, and 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.3.7, Register settings for slave channels 3, 5, and 7**.<br><br>Set the value of TAUDnCDRm register of every channel. Set a pulse cycle using TAUDnCDRm of master channel, and an interrupt count of master channel to be ignored using TAUDnCDRm of slave channel 1. Also set a duty width in TAUDnCDRm of slave channels 2, 4, and 6, and a dead time delay on slave channels 3, 5, and 7.<br><br>Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1. | Channel operation is stopped. |

**Table 25.260 Operating Procedure for Complementary Modulation Output Function (2/2)**

Restart Operation

| | Operation | TAUDn Status |
|---|---|---|
| Start Operation | Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously.<br>TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down. |
| During Operation | TAUDnCDRm, TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can be changed at any time.<br>TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.<br><br>TAUDnRDT.TAUDnRDTm can be changed during operation. | TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. TAUDnCDRm value of slave channel 1 is loaded and the counter waits for a master channel interrupt. When the counter of master channel reaches $0000_H$:<br>• INTTAUDnIm is generated.<br>• TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down.<br>• TAUDnCNTm value of slave channel 1 decrements by 1 and the counter waits for the next master channel interrupt.<br>• TAUDnCNTm of slave channels 2, 4, and 6 reloads the TAUDnCDRm value, or performs counting in opposite direction.<br>• At the same timing when the TAUDnCDRm value of slave channels 2, 4, and 6 is loaded, the TAUDnTME.TAUDnTMEm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output.<br>• The counter of slave channel 1 waits for the next interrupt from the master channel when reaching $0000_H$. When the interrupt is detected:<br>– TAUDnCDRm value is reloaded into TAUDnCNTm and the counter waits for the next master channel interrupt.<br>– INTTAUDnIm is generated.<br>– TAUDnTRO.TAUDnTROm is changeable.<br>• When the counter of slave channels 2, 4, and 6 reaches $0001_H$:<br>– INTTAUDnIm is generated.<br>– PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is matched).<br>– TAUDnCDRm value of slave channels 3, 5, and 7 is loaded into TAUDnCNTm to perform counting down.<br>• When the counter of slave channels 3, 5, and 7 reaches $0000_H$:<br>– INTTAUDnIm is generated.<br>– PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is matched). |
| Stop Operation | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously.<br>TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0. | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops.<br>TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

### 25.16.3.9 Specific Timing Diagrams

The following settings apply to the timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channel 1: TAUDnCDRm = $0001_H$
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

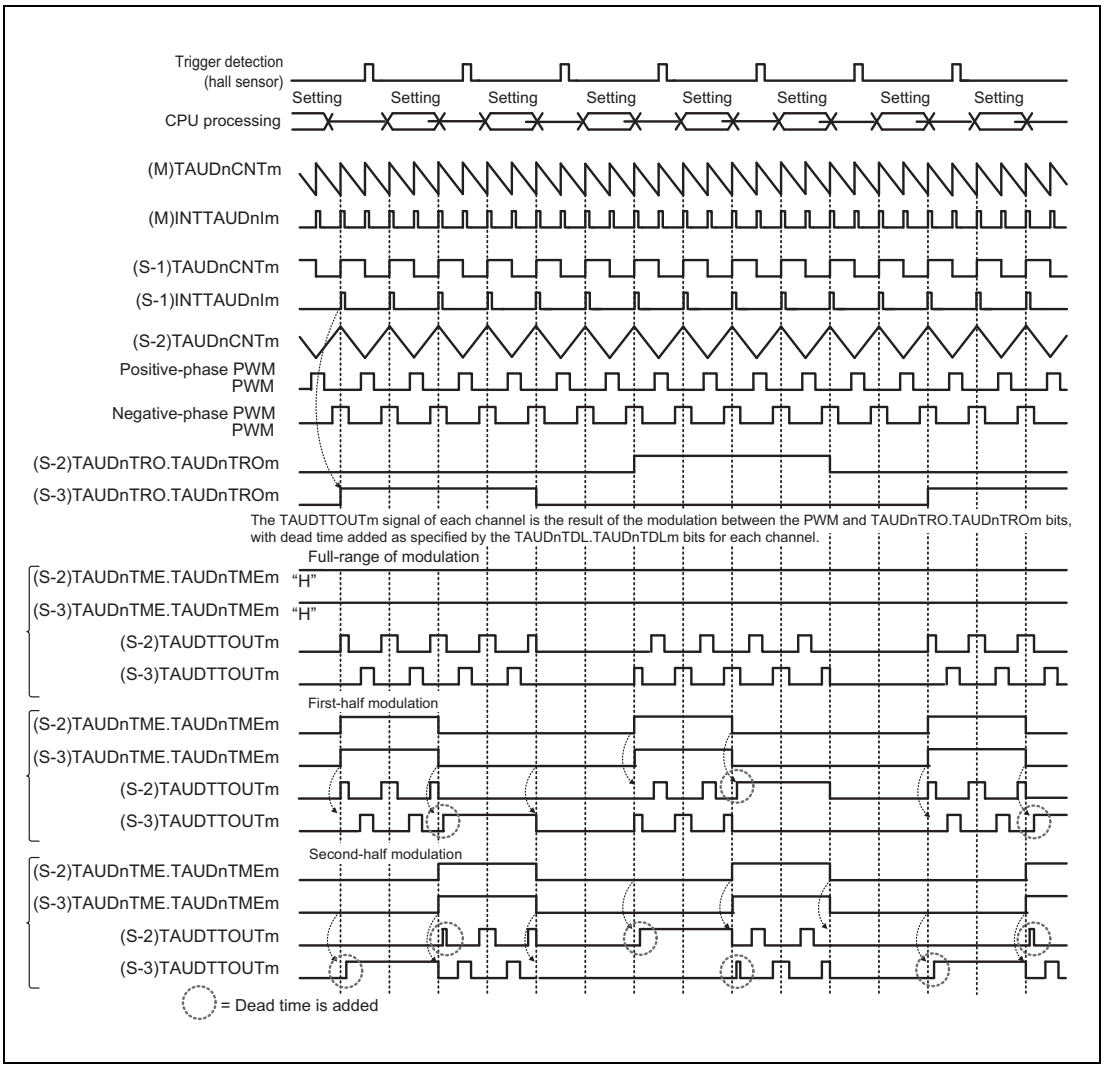

**Figure 25.137 Specific Timing Diagram of Complementary Modulation Output Function**

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

A modulated PWM output signal and TAUDnTRO.TAUDnTROm bit value are output from slave channels 2 and 3.

TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm settings are reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is specified by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

**NOTE**

Dead time is added to suppress simultaneous change of PWM edges of normal and reverse phases.

The “Setting”symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, TAUDnTRO.TAUDnTROm, and TAUDnTDL.TAUDnTDLm can be changed.

# Section 26 Timer Array Unit J (TAUJ)

This section contains a generic description of the timer array unit J (TAUJ).

The first part of this section describes the RH850/F1K specific features, such as the number of units and the register base addresses. The remainder of the section describes the functions and registers of the TAUJ.

## 26.1 Features of RH850/F1K TAUJ

### 26.1.1 Number of Units

This microcontroller has the following number of TAUJ units.

**Table 26.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 2 | 2 | 2 |
| Name | TAUJn (n = 0, 1) | TAUJn (n = 0, 1) | TAUJn (n = 0, 1) |

TAUJn has the following number of channels of timers.

**Table 26.2 TAUJn Unit Configurations and Channels**

| Unit Name (Channel Name) TAUJn | Number of Channels per Unit | RH850/F1K 100 pins (8 ch) | RH850/F1K 144 pins (8 ch) | RH850/F1K 176 pins (8 ch) |
|---|---|---|---|---|
| TAUJ0 | 4 | √ | √ | √ |
| TAUJ1 | 4 | √ | √ | √ |

**Table 26.3 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual TAUJ units are identified by the index “n”; for example, TAUJnTOM is the TAUJn channel output mode register. |
| m | The TAUJ has 4 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 3), thus a certain channel is denoted as CHm.<br>The even numbered channels (m = 0, 2) are denoted as CHm_even.<br>The odd numbered channels (m = 1, 3) are denoted as CHm_odd. |

### 26.1.2 Register Base Address

TAUJn base addresses are listed in the following table.

TAUJn register addresses are given as offsets from the base addresses.

**Table 26.4 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <TAUJ0_base> | $FFE5\ 0000_H$ |
| <TAUJ1_base> | $FFE5\ 1000_H$ |

### 26.1.3 Clock Supply

The TAUJn clock supply is shown in the following table.

**Table 26.5 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| TAUJ0 | PCLK | CKSCLK_ATAUJ | Timer count clock |
| | Register access clock | CPUCLK2 | Bus Clock |
| | | CKSCLK_ATAUJ | |
| TAUJ1 | PCLK | CKSCLK_IPERI1 | Timer count clock |
| | Register access clock | CPUCLK2 | Bus Clock |
| | | CKSCLK_IPERI1 | |

### 26.1.4 Interrupt Requests

TAUJn interrupt requests are listed in the following table.

**Table 26.6 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **TAUJ0** | | | |
| INTTAUJ0I0 | Channel 0 interrupt | 80 | 21 |
| INTTAUJ0I1 | Channel 1 interrupt | 81 | 80 |
| INTTAUJ0I2 | Channel 2 interrupt | 82 | 81 |
| INTTAUJ0I3 | Channel 3 interrupt | 83 | 22 |
| **TAUJ1** | | | |
| INTTAUJ1I0 | Channel 0 interrupt | 168 | 46 |
| INTTAUJ1I1 | Channel 1 interrupt | 169 | 100 |
| INTTAUJ1I2 | Channel 2 interrupt | 170 | 47 |
| INTTAUJ1I3 | Channel 3 interrupt | 171 | 101 |

### 26.1.5 Reset Sources

TAUJn reset sources are listed in the following table. TAUJn is initialized by these reset sources.

**Table 26.7 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| TAUJ0 | All reset sources except the transition to DeepSTOP mode (AWORES) |
| TAUJ1 | All reset sources (ISORES) |

### 26.1.6 External Input/Output Signals

External input/output signals of TAUJn are listed below.

**Table 26.8 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **TAUJ0** | | |
| TAUJTTIN0, TAUJTTIN1 | Channel 0, 1 input | TAUJ0I0, TAUJ0I1 |
| TAUJTTIN2 | Channel 2 input | TAUJ0I2 or RTCA0OUT*1 |
| TAUJTTIN3 | Channel 3 input | TAUJ0I3 or RTCA0OUT*1 |
| TAUJTTOUT0 to TAUJTTOUT3 | Channel 0 to 3 output | TAUJ0O0 to TAUJ0O3 |
| **TAUJ1** | | |
| TAUJTTIN0 to TAUJTTIN3 | Channel 0 to 3 input | TAUJ1I0 to TAUJ1I3 |
| TAUJTTOUT0 to TAUJTTOUT3 | Channel 0 to 3 output | TAUJ1O0 to TAUJ1O3 |

Note 1. For details, see **Section 26.1.8, TAUJ0 Input Selection**.

### 26.1.7 Internal Input/Output Signals

The internal input/output signals of TAUJn are listed below.

**Table 26.9 Internal Input/Output Signals**

| Unit Signal Name | Description | Connected to |
|---|---|---|
| TAUJnTSSTm*1 | Simultaneous channel start trigger input | PIC |

Note 1. n = 1 only. TAUJ0TSSTm is not connected to PIC.

### 26.1.8 TAUJ0 Input Selection

The 1-Hz pulse output (RTCA0OUT) from RTCA0 and the output (TAUJTTOUT0) from TAUJ1 can be input to TAUJTTIN2 and TAUJTTIN3 as shown in the following figure.

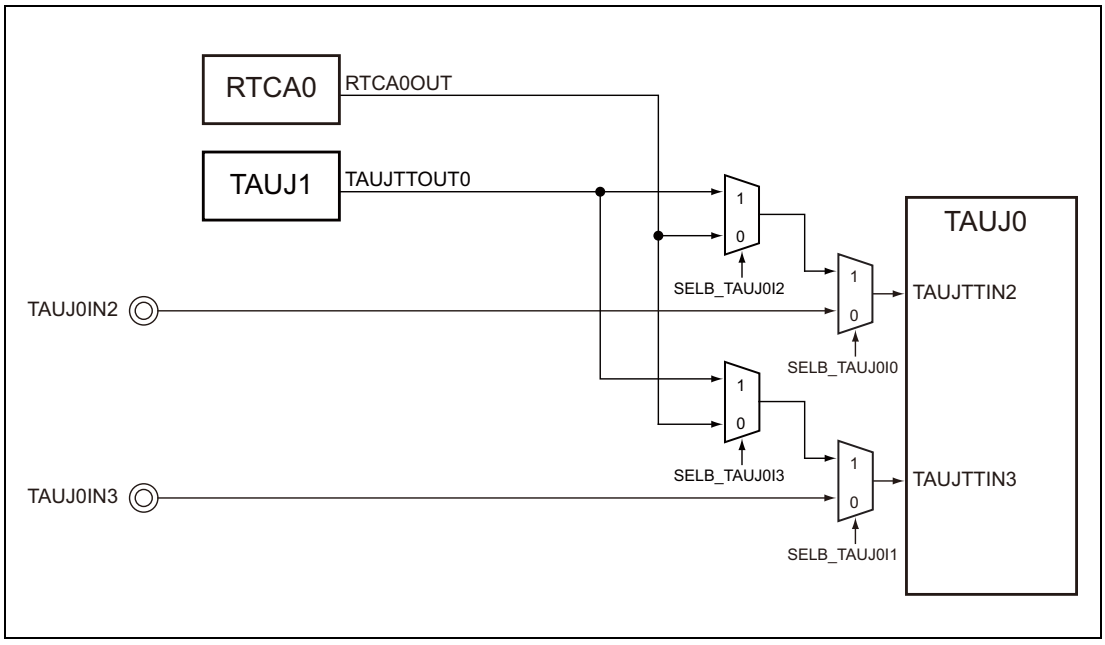

**Figure 26.1 Selection of Signals Input to TAUJ0**

The following table shows how to select signals input to the TAUJ.

**Table 26.10 TAUJ0 Input Selections**

| Input Signal | Function | Settings | | | |
|---|---|---|---|---|---|
| | | SELB_TAUJ0I3 | SELB_TAUJ0I2 | SELB_TAUJ0I1 | SELB_TAUJ0I0 |
| TAUJTTIN2 | Port TAUJ0I2 | — | — | — | 0 |
| | RTCA0OUT (Real-time clock 1-Hz output) | — | 0 | — | 1 |
| | TAUJTTOUT0 (TAUJ1) | — | 1 | — | 1 |
| TAUJTTIN3 | Port TAUJ0I3 | — | — | 0 | — |
| | RTCA0OUT (Real-time clock 1-Hz output) | 0 | — | 1 | — |
| | TAUJTTOUT0 (TAUJ1) | 1 | — | 1 | — |

### 26.1.8.1 List of Registers

Input signal selection register is listed in the following table.

**Table 26.11 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| SL_TAUJ0 | TAUJTTINm Input Signal Selection Register | SELB_TAUJ0I | FFE5 $4000_H$ |

### 26.1.8.2 SELB_TAUJ0I — TAUJTTINm Input Signal Selection Register

This register selects the TAUJ0 input signals.

**Access:** This register can be read or written in 8-bit units.

**Address:** FFE5 $4000_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | SELB_TAUJ0I3 | SELB_TAUJ0I2 | SELB_TAUJ0I1 | SELB_TAUJ0I0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 26.12 SELB_TAUJ0I Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 3 | SELB_TAUJ0I3 | Selection of TAUJTTIN3 input signal:<br>0: RTCA0OUT<br>1: TAUJTTOUT0 |
| 2 | SELB_TAUJ0I2 | Selection of TAUJTTIN2 input signal:<br>0: RTCA0OUT<br>1: TAUJTTOUT0 |
| 1 | SELB_TAUJ0I1 | Selection of TAUJTTIN3 input signal:<br>0: Port TAUJ0I3<br>1: Timer Input |
| 0 | SELB_TAUJ0I0 | Selection of TAUJTTIN2 input signal:<br>0: Port TAUJ0I2<br>1: Timer Input |

# 26.2 Overview

## 26.2.1 Functional Overview

The TAUJ has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUJ is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 4 channels, each equipped with a 32-bit counter TAUJnCNTm and a 32-bit data register TAUJnCDRm to hold the count start value or compare value.

It also contains several control and status registers.

### Independent and synchronous operation

Every channel can operate in two operating modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels.

The synchronous operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

## 26.2.2 Terms

In this section, the following terms are used.

### Independent channel operation function/synchronous operation channel operation function

TAUJ has 4 channels, and provides an independent channel operation function that individual channels operate independently and a synchronous channel operation function that is implemented by using a combination of channels.

- The independent channel operation function can be used any channel independently of all other channels.
- The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

### Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

### Upper/lower channel

Based on the channel number m, a channel with a smaller channel number or higher channel number can be referred to as “upper” or “lower” channel:

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

For instance, as to channel 2, channel 1 is an upper channel and channel 3 is a lower channel. Channel 0 is the highest channel and channel 3 is the lowest channel.

### 26.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

**Table 26.13 Functional List of TAUJ Operations**

| Operation Function | Example |
|---|---|
| **Independent Channel Operation Functions** | **Section 26.12** |
| Interval Timer Function | **Section 26.12.1** |
| TAUJTTINm Input Interval Timer Function | **Section 26.12.2** |
| TAUJTTINm Input Pulse Interval Measurement Function | **Section 26.12.3** |
| TAUJTTINm Input Signal Width Measurement Function | **Section 26.12.4** |
| TAUJTTINm Input Position Detection Function | **Section 26.12.5** |
| TAUJTTINm Input Period Count Detection Function | **Section 26.12.6** |
| Overflow Interrupt Output Function (during TAUJTTINm Width Measurement) | **Section 26.12.7** |
| Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection) | **Section 26.12.8** |
| **Synchronous Channel Operation Functions** | **Section 26.13** |
| PWM Output Function | **Section 26.13.1** |

### 26.2.4 TAUJ I/O and Interrupt Request Signals

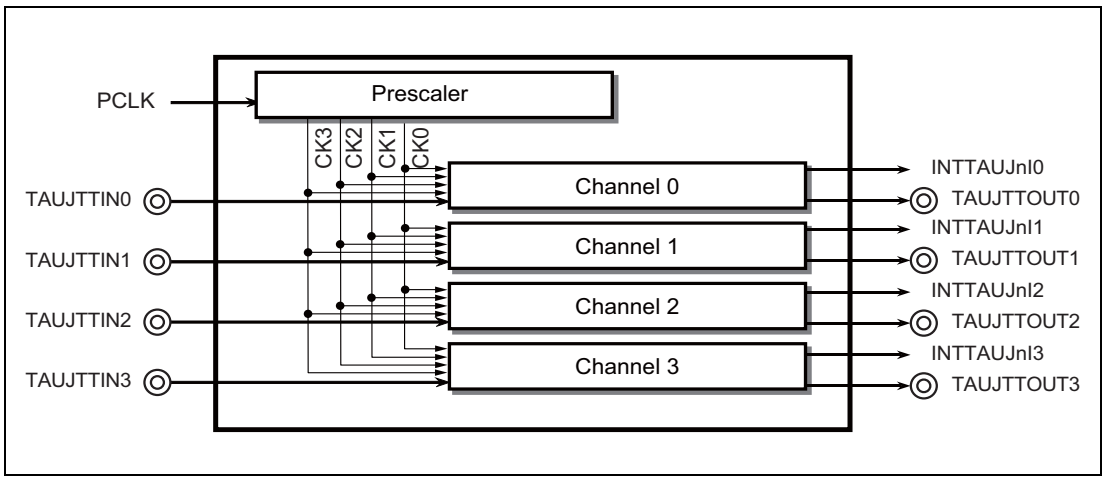

**Figure 26.2 TAUJ I/O and Interrupt Request Signals**

## 26.2.5 Block Diagram

The following figure shows the main components of the TAUJ.

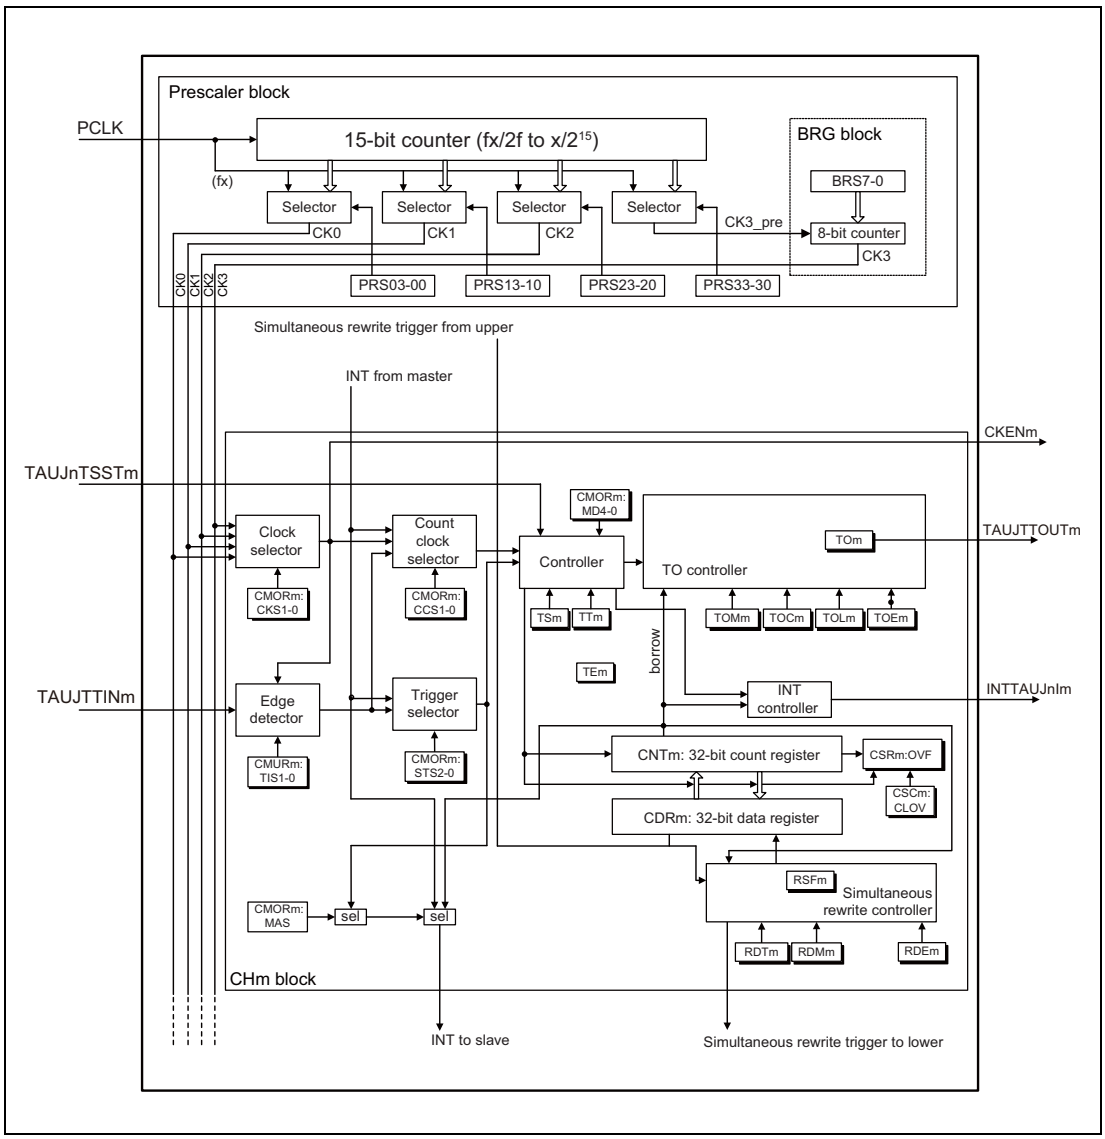

**Figure 26.3 Block Diagram of the TAUJ**

The prefix “TAUJn” has been omitted from the register names for the sake of clarity in the above figure.

## 26.2.6 Description of Block Diagram

The following describes the functional blocks.

### Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived by dividing PCLK in the prescaler division factor of $2^0$ to $2^{15}$. The fourth count clock, CK3, is derived by dividing PCLK by a division factor that is not a power of 2 by using the baud rate generator.

### Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source.

– One of CK0 to CK3 clocks (selected by the clock selector)

### Controller

The controller controls the main operations of the counter.

- Operating mode (selected with the TAUJnCMORm.TAUJnMD[4:0] bits)
- Counter start enable (TAUJnTS.TAUJnTSm) and counter stop (TAUJnTT.TAUJnTTm)

When counter start is enabled, status flag TAUJnTE.TAUJnTEm is set.

### Trigger selector

The counter starts automatically when it is enabled (TAUJnTE.TAUJnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

– Synchronous channel start trigger input TAUJnTSSTm
– Valid edge of the TAUJTTINm input signal
– INTTAUJnIm from the master channel

### Simultaneous rewrite controller

Simultaneous rewrite control is enabled in synchronous operating modes. The data registers of all channels in a channel group (TAUJnCDRm) can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

### TAUJnTO controller

The output control of every channel enables the generation of various output signals such as PWM signals.

# 26.3 Registers

## 26.3.1 List of Registers

TAUJ registers are listed in the following table.

For details about <TAUJn_base>, see **Section 26.1.2, Register Base Address**.

**Table 26.14 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| **TAUJn prescaler registers** | | | |
| TAUJn | TAUJn prescaler clock select register | TAUJnTPS | <TAUJn_base> + $90_H$ |
| | TAUJn prescaler baud rate setting register | TAUJnBRS | <TAUJn_base> + $94_H$ |
| **TAUJn control registers** | | | |
| TAUJn | TAUJn channel data register m | TAUJnCDRm | <TAUJn_base> + m × $4_H$ |
| | TAUJn channel counter register m | TAUJnCNTm | <TAUJn_base> + $10_H$ + m × $4_H$ |
| | TAUJn channel mode OS register m | TAUJnCMORm | <TAUJn_base> + $80_H$ + m × $4_H$ |
| | TAUJn channel mode user register m | TAUJnCMURm | <TAUJn_base> + $20_H$ + m × $4_H$ |
| | TAUJn channel status register m | TAUJnCSRm | <TAUJn_base> + $30_H$ + m × $4_H$ |
| | TAUJn channel status clear trigger register m | TAUJnCSCm | <TAUJn_base> + $40_H$ + m × $4_H$ |
| | TAUJn channel start trigger register | TAUJnTS | <TAUJn_base> + $54_H$ |
| | TAUJn channel enable status register | TAUJnTE | <TAUJn_base> + $50_H$ |
| | TAUJn channel stop trigger register | TAUJnTT | <TAUJn_base> + $58_H$ |
| **TAUJn output registers** | | | |
| TAUJn | TAUJn channel output enable register | TAUJnTOE | <TAUJn_base> + $60_H$ |
| | TAUJn channel output register | TAUJnTO | <TAUJn_base> + $5C_H$ |
| | TAUJn channel output mode register | TAUJnTOM | <TAUJn_base> + $98_H$ |
| | TAUJn channel output configuration register | TAUJnTOC | <TAUJn_base> + $9C_H$ |
| | TAUJn channel output active level register | TAUJnTOL | <TAUJn_base> + $64_H$ |
| **TAUJn reload data registers** | | | |
| TAUJn | TAUJn channel reload data enable register | TAUJnRDE | <TAUJn_base> + $A0_H$ |
| | TAUJn channel reload data mode register | TAUJnRDM | <TAUJn_base> + $A4_H$ |
| | TAUJn channel reload data trigger register | TAUJnRDT | <TAUJn_base> + $68_H$ |
| | TAUJn channel reload status register | TAUJnRSF | <TAUJn_base> + $6C_H$ |
| **TAUJn emulation register** | | | |
| TAUJn | TAUJn emulation register | TAUJnEMU | <TAUJn_base> + $A8_H$ |

## 26.3.2 Details of TAUJn Prescaler Registers

### 26.3.2.1 TAUJnTPS — TAUJn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescalers. CK3 is generated by dividing CK3_PRE by the factor specified in TAUJnBRS.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUJn_base> + $90_H$

**Value after reset:** $FFFF_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUJnPRS3[3:0] | | | | TAUJnPRS2[3:0] | | | | TAUJnPRS1[3:0] | | | | TAUJnPRS0[3:0] | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 26.15 TAUJnTPS Register Contents (1/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | TAUJnPRS3 [3:0] | Specifies a CK3_PRE clock.<br>The CK3_PRE clock is an input clock of the BRG unit which supplies CK3 operation clocks to all channels. |

| TAUJnPRS3[3:0] | CK3_PRE clock |
|---|---|
| $0000_B$ | PCLK/$2^0$ |
| $0001_B$ | PCLK/$2^1$ |
| $0010_B$ | PCLK/$2^2$ |
| $0011_B$ | PCLK/$2^3$ |
| $0100_B$ | PCLK/$2^4$ |
| $0101_B$ | PCLK/$2^5$ |
| $0110_B$ | PCLK/$2^6$ |
| $0111_B$ | PCLK/$2^7$ |
| $1000_B$ | PCLK/$2^8$ |
| $1001_B$ | PCLK/$2^9$ |
| $1010_B$ | PCLK/$2^{10}$ |
| $1011_B$ | PCLK/$2^{11}$ |
| $1100_B$ | PCLK/$2^{12}$ |
| $1101_B$ | PCLK/$2^{13}$ |
| $1110_B$ | PCLK/$2^{14}$ |
| $1111_B$ | PCLK/$2^{15}$ |

The above bits are rewritable only when all the counters using CK3 are stopped (TAUJnTE.TAUJnTEm = 0).

**Table 26.15 TAUJnTPS Register Contents (2/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 11 to 8 | TAUJnPRS2 [3:0] | Specifies a CK2 clock. |

| TAUJnPRS2[3:0] | CK2 clock |
|---|---|
| $0000_B$ | PCLK/$2^0$ |
| $0001_B$ | PCLK/$2^1$ |
| $0010_B$ | PCLK/$2^2$ |
| $0011_B$ | PCLK/$2^3$ |
| $0100_B$ | PCLK/$2^4$ |
| $0101_B$ | PCLK/$2^5$ |
| $0110_B$ | PCLK/$2^6$ |
| $0111_B$ | PCLK/$2^7$ |
| $1000_B$ | PCLK/$2^8$ |
| $1001_B$ | PCLK/$2^9$ |
| $1010_B$ | PCLK/$2^{10}$ |
| $1011_B$ | PCLK/$2^{11}$ |
| $1100_B$ | PCLK/$2^{12}$ |
| $1101_B$ | PCLK/$2^{13}$ |
| $1110_B$ | PCLK/$2^{14}$ |
| $1111_B$ | PCLK/$2^{15}$ |

The above bits are rewritable only when all the counters using CK2 are stopped (TAUJnTE.TAUJnTEm = 0).

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | TAUJnPRS1 [3:0] | Specifies a CK1 clock. |

| TAUJnPRS1[3:0] | CK1 clock |
|---|---|
| $0000_B$ | PCLK/$2^0$ |
| $0001_B$ | PCLK/$2^1$ |
| $0010_B$ | PCLK/$2^2$ |
| $0011_B$ | PCLK/$2^3$ |
| $0100_B$ | PCLK/$2^4$ |
| $0101_B$ | PCLK/$2^5$ |
| $0110_B$ | PCLK/$2^6$ |
| $0111_B$ | PCLK/$2^7$ |
| $1000_B$ | PCLK/$2^8$ |
| $1001_B$ | PCLK/$2^9$ |
| $1010_B$ | PCLK/$2^{10}$ |
| $1011_B$ | PCLK/$2^{11}$ |
| $1100_B$ | PCLK/$2^{12}$ |
| $1101_B$ | PCLK/$2^{13}$ |
| $1110_B$ | PCLK/$2^{14}$ |
| $1111_B$ | PCLK/$2^{15}$ |

The above bits are rewritable only when all the counters using CK1 are stopped (TAUJnTE.TAUJnTEm = 0).

**Table 26.15 TAUJnTPS Register Contents (3/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 to 0 | TAUJnPRS0 [3:0] | Specifies a CK0 clock. |

| TAUJnPRS0[3:0] | CK0 clock |
|---|---|
| $0000_B$ | PCLK/$2^0$ |
| $0001_B$ | PCLK/$2^1$ |
| $0010_B$ | PCLK/$2^2$ |
| $0011_B$ | PCLK/$2^3$ |
| $0100_B$ | PCLK/$2^4$ |
| $0101_B$ | PCLK/$2^5$ |
| $0110_B$ | PCLK/$2^6$ |
| $0111_B$ | PCLK/$2^7$ |
| $1000_B$ | PCLK/$2^8$ |
| $1001_B$ | PCLK/$2^9$ |
| $1010_B$ | PCLK/$2^{10}$ |
| $1011_B$ | PCLK/$2^{11}$ |
| $1100_B$ | PCLK/$2^{12}$ |
| $1101_B$ | PCLK/$2^{13}$ |
| $1110_B$ | PCLK/$2^{14}$ |
| $1111_B$ | PCLK/$2^{15}$ |

The above bits are rewritable only when all the counters using CK0 are stopped (TAUJnTE.TAUJnTEm = 0).

**NOTE**

TAUJn clock input PCLK is defined in the first part of this section, **Section 26.1.3, Clock Supply**.

### 26.3.2.2 TAUJnBRS — TAUJn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUJnTPS. TAUJnPRS3[3:0].

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn_base> + $94_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TAUJnBRS[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 26.16 TAUJnBRS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | TAUJnBRS [7:0] | Specifies a CK3_PRE clock division factor for generating CK3. |

| TAUJnBRS[7:0] | CK3 clock |
|---|---|
| $0000\ 0000_B$ | CK3_PRE / 1 |
| $0000\ 0001_B$ | CK3_PRE / 2 |
| $0000\ 0010_B$ | CK3_PRE / 3 |
| $0000\ 0011_B$ | CK3_PRE / 4 |
| : | : |
| $1111\ 1110_B$ | CK3_PRE / 255 |
| $1111\ 1111_B$ | CK3_PRE / 256 |

## 26.3.3 Details of TAUJn Control Registers

### 26.3.3.1 TAUJnCDRm — TAUJn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUJnCMORm.TAUJnMD[4:1].

**Access:** This register can be read or written in 32-bit units..
- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

**Address:** <TAUJn_base> + $0_H$ + m × $4_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUJnCDR[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 26.17 TAUJnCDRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | TAUJnCDR [31:0] | Data register for capture/compare values |

### 26.3.3.2 TAUJnCNTm — TAUJn Channel Counter Register

This is a channel m counter register.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <TAUJn_base> + $10_H$ + m × $4_H$

**Value after reset:** FFFF $FFFF_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUJnCNT[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUJnCNT[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 26.18 TAUJnCNTm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | TAUJnCNT [31:0] | 32-bit counter value |

The read value depends on a counter, an operating mode change, or TAUJnTS.TAUJnTSm/ TAUJnTT.TAUJnTTm bit value.

The initial counter read value depends on the operating mode and how the counter is stopped.

- By a reset
- By a counter stop trigger (TAUJnTT.TAUJnTTm = 1)

The following table lists the initial counter read values after the counter is stopped (TAUJnTE.TAUJnTEm = 0) and re-enabled (TAUJnTS.TAUJnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUJnTS.TAUJnTSm = 1) with the counter waiting for a start trigger.

**Table 26.19 TAUJnCNTm Read Values after Re-Enabling Counter**

| Mode Name | Count Method (Up/Down) | TAUJnCNTm | | |
|---|---|---|---|---|
| | | Start Value*1 | After Stop Trigger | After One Count |
| Interval timer mode | Count down | FFFF FFFF$_H$ | Stop value | — |
| Capture mode | Count up | 0000 0000$_H$ | Stop value | — |
| One-count mode | Count down | FFFF FFFF$_H$ | Stop value | Stop value |
| Capture and one-count mode | Count up | 0000 0000$_H$ | Stop value | Capture value + 1 (TAUJnCDRm) |
| Count capture mode | Count up | 0000 0000$_H$ | Stop value | — |
| Gate count mode | Count down | FFFF FFFF$_H$ | Stop value | Stop value |
| Capture and gate count mode | Count up | 0000 0000$_H$ | Stop value | Stop value |

Note 1. The value set for TAUJnCNTm when operating mode is changed after a reset is deasserted

### 26.3.3.3 TAUJnCMORm — TAUJn Channel Mode OS Register

This register controls channel m operation.

**Access:** This register can be read or written in 16-bit units.
Writable only when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

**Address:** <TAUJn_base> + $80_H$ + m × $4_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUJnCKS[1:0] | | TAUJnCCS[1:0] | | TAUJn MAS | TAUJnSTS[2:0] | | | TAUJnCOS[1:0] | | — | TAUJnMD[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 26.20 TAUJnCMORm Register Contents (1/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUJnCKS[1:0] | Selects an operation clock, which is used with the TAUJTTINm input edge detection circuit.<br>Setting of TAUJnCMORm.TAUJnCCS[1:0] bits also allows the operation clock to serve as the TAUJnCNTm count clock. |

| TAUJn CKS1 | TAUJn CKS0 | Selection of Operation Clock |
|---|---|---|
| 0 | 0 | CK0 |
| 0 | 1 | CK1 |
| 1 | 0 | CK2 |
| 1 | 1 | CK3 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 13, 12 | TAUJnCCS[1:0] | Selects a count clock for TAUJnCNTm counter. |

| TAUJn CCS1 | TAUJn CCS0 | Selection of Operation Clock |
|---|---|---|
| 0 | 0 | Operation clock specified by TAUJnCMORm.TAUJnCKS[1:0]. |
| 0 | 1 | Setting prohibited |
| 1 | 0 | |
| 1 | 1 | |

| Bit Position | Bit Name | Function |
|---|---|---|
| 11 | TAUJnMAS | Specifies whether the channel is a master or slave channel during synchronous channel operation.<br>0: Slave<br>1: Master<br>This bit setting is valid only for even channels (CHm_even). Odd channels (CHm-odd) are fixed to 0. |

**Table 26.20 TAUJnCMORm Register Contents (2/3)**

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>

| Mode | Role of TAUJnMD0 Bit |
|---|---|
| Interval timer mode<br>Capture mode<br>Count capture mode | Specifies whether INTTAUJnIm is generated at the beginning of count operation (when a start trigger is entered) or not.<br>0: INTTAUJnIm is not generated.<br>1: INTTAUJnIm is generated. |
| One-count mode | Enables/disables start trigger detection during counting.<br>0: Disables detection.<br>1: Enables detection.<br>**CAUTION**<br>In one-count mode, INTTAUJnIm signal is not output at the beginning of count operation. |
| Capture and one-count mode<br>Gate count mode<br>Capture and gate count mode | This bit should be set to 0.<br>**CAUTION**<br>INTTAUJnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled. |

### 26.3.3.4 TAUJnCMURm — TAUJn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUJTTINm input.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn_base> + $20_H$ + m × $4_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUJnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 26.21 TAUJnCMURm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUJnTIS[1:0] | Specifies a valid edge of TAUJTTINm input signal. |

| TAUJn TIS1 | TAUJn TIS0 | Functional Description |
|---|---|---|
| 0 | 0 | Falling edge |
| 0 | 1 | Rising edge |
| 1 | 0 | Detection of falling and rising edges (selection of low width measurement)<br>Start trigger: Falling edge<br>Stop trigger (capture): Rising edge |
| 1 | 1 | Detection of falling and rising edges (selection of high width measurement)<br>Start trigger: Rising edge<br>Stop trigger (capture): Falling edge |

Edge detection of TAUJTTINm input signal is based on the operation clock selected by TAUJnCMORm.TAUJnCKS[1:0].

### 26.3.3.5 TAUJnCSRm — TAUJn Channel Status Register

This register indicates the overflow status of channel m.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUJn_base> + $30_H$ + m × $4_H$

**Value after reset:** $0x_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TAUJnOVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | — | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 26.22 TAUJnCSRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | Reserved | When read, unknown value is returned. |
| 0 | TAUJnOVF | Indicates the counter overflow status:<br>0: No overflow occurs<br>1: Overflow occurs<br>This bit is used only in the following modes:<br>• Capture mode<br>• Capture and one-count mode<br><br>The function of this bit depends on the setting of control bits TAUJnCMORm.TAUJnCOS[1:0]. |

### 26.3.3.6 TAUJnCSCm — TAUJn Channel Status Clear Trigger Register

This register is a trigger register for clearing the overflow flag TAUJnCSRm.TAUJnOVF of channel m.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as $00_H$.

**Address:** <TAUJn_base> + $40_H$ + m × $4_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TAUJnCLOV |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 26.23 TAUJnCSCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAUJnCLOV | 0: No function<br>1: Clears the overflow flag TAUJnCSRm.TAUJnOVF |

### 26.3.3.7 TAUJnTS — TAUJn Channel Start Trigger Register

This register enables the counter operation for each channel.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as $00_H$.

**Address:** <TAUJn_base> + $54_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnTS03 | TAUJnTS02 | TAUJnTS01 | TAUJnTS00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | W | W | W | W |

**Table 26.24 TAUJnTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When writing, write the value after reset. |
| 3 to 0 | TAUJnTSm | Enables the counter operation for channel m:<br>0: No function<br>1: Enables the counter operation and sets TAUJnTE.TAUJnTEm = 1.<br><br>Only the counter operation is enabled even if TAUJnTE.TAUJnTEm = 1.<br>Whether the counter is started or not depends on the selected operating mode. |

### 26.3.3.8 TAUJnTE — TAUJn Channel Enable Status Register

This register indicates whether a counter operation is enabled.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUJn_base> + $50_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnTE03 | TAUJnTE02 | TAUJnTE01 | TAUJnTE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 26.25 TAUJnTE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. |
| 3 to 0 | TAUJnTEm | Indicates whether channel m's counter operation is enabled.<br>0: Counter operation is disabled<br>1: Counter operation is enabled<br><br>This bit is set to 1 when trigger input of TAUJnTSSTm (synchronous channel start trigger signal) is detected or when TAUJnTS.TAUJnTSm is set to 1.<br>This bit is reset to 0 when TAUJnTT.TAUJnTTm is set to 1. |

### 26.3.3.9 TAUJnTT — TAUJn Channel Stop Trigger Register

This register stops the counter operation of each channel.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as $00_H$.

**Address:** <TAUJn_base> + $58_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnTT03 | TAUJnTT02 | TAUJnTT01 | TAUJnTT00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | W | W | W | W |

**Table 26.26 TAUJnTT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When writing, write the value after reset. |
| 3 to 0 | TAUJnTTm | Stops channel m's counter operation.<br>0: No function<br>1: Stops the counter operation and resets TAUJnTE.TAUJnTEm.<br><br>TAUJnCNTm, TAUJnTO.TAUJnTOm, and TAUJTTOUTm retain the values provided before the counter is stopped. |

## 26.3.4 Details of TAUJn Simultaneous Rewrite Register

### 26.3.4.1 TAUJnRDE — TAUJn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUJnCDRm. It also enables and disables simultaneous rewrite of the data register TAUJnTOLm for the PWM output function.

**Access:** This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

**Address:** <TAUJn_base> + $A0_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnRDE03 | TAUJnRDE02 | TAUJnRDE01 | TAUJnRDE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 26.27 TAUJnRDE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnRDEm | Enables/disables simultaneous rewrite of the data register of channel m:<br>0: Disables simultaneous rewrite<br>1: Enabled simultaneous rewrite |

### 26.3.4.2 TAUJnRDM — TAUJn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

**Access:** This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

**Address:** <TAUJn_base> + $A4_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnRDM03 | TAUJnRDM02 | TAUJnRDM01 | TAUJnRDM00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 26.3.4.3 TAUJnRDT — TAUJn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as $00_H$.

**Address:** <TAUJn_base> + $68_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnRDT03 | TAUJnRDT02 | TAUJnRDT01 | TAUJnRDT00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | W | W | W | W |

**Table 26.29 TAUJnRDT Register Contents**

The simultaneous rewrite enabling flag (TAUJnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger.<br>These bits only apply when:<br>• TAUJnRDE.TAUJnRDEm = 1 |

### 26.3.4.4 TAUJnRSF — TAUJn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUJn_base> + $6C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

## 26.3.5 Details of TAUJn Output Registers

### 26.3.5.1 TAUJnTOE — TAUJn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn_base> + $60_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnTOE03 | TAUJnTOE02 | TAUJnTOE01 | TAUJnTOE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 26.31 TAUJnTOE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnTOEm | Enables/disables independent channel output function:<br>0: Disables independent timer output function (controlled by software)<br>1: Enables independent timer output function |

### 26.3.5.2 TAUJnTO — TAUJn Channel Output Register

This register specifies and reads the level of TAUJTTOUTm.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn_base> + $5C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnTO03 | TAUJnTO02 | TAUJnTO01 | TAUJnTO00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 26.32 TAUJnTO Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnTOm | Specifies and reads the level of TAUJTTOUTm:<br>0: Low<br>1: High<br><br>Only TAUJnTOm bits for which Independent Channel Output function is disabled (TAUJnTOEm = 0) can be written. |

### 26.3.5.3 TAUJnTOM — TAUJn Channel Output Mode Register

This register specifies the output mode of each channel.

**Access:** This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

**Address:** <TAUJn_base> + $98_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnTOM03 | TAUJnTOM02 | TAUJnTOM01 | TAUJnTOM00 |

| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 26.33 TAUJnTOM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnTOMm | Specifies the channel output mode:<br>0: Independent channel output mode<br>1: Synchronous channel output mode<br><br>The output mode depends on the settings of channel output control (TAUJnTOE.TAUJnTOEm) bits. |

### 26.3.5.4 TAUJnTOC — TAUJn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUJnTOMm.

**Access:** This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

**Address:** <TAUJn_base> + $9C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnTOC03 | TAUJnTOC02 | TAUJnTOC01 | TAUJnTOC00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 26.34 TAUJnTOC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnTOCm | Specifies the output mode:<br>0: Operation mode 1 (= Toggle mode)<br>1: No function<br><br>This bit must be set to 0 for all output modes except independent channel output mode controlled by software.<br>The output mode also depends on TAUJnTOM.TAUJnTOMm, as shown in the following table. |

| TAUJn TOMm | TAUJn TOCm | Functional Description |
|---|---|---|
| 0 | 0 | Toggle mode: Toggling proceeds when INTTAUJnIm occurs. |
| 0 | 1 | No function |
| 1 | 0 | Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel. |
| 1 | 1 | No function |

### 26.3.5.5 TAUJnTOL — TAUJn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUJnTO.TAUJnTOm).

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn_base> + $64_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAUJnTOL03 | TAUJnTOL02 | TAUJnTOL01 | TAUJnTOL00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnTOLm | Specifies the output logic of the channel m output bit (TAUJnTO.TAUJnTOm):<br>0: Positive logic (active high)<br>1: Negative logic (active low)<br><br>These bits apply in all channel output modes except independent channel output mode controlled by software. |

## 26.3.6 TAUJn Emulation Register

### 26.3.6.1 TAUJnEMU — TAUJn Emulation Register

This register controls operation by SVSTOP.

**Access:** This register can be read or written in 8-bit units.
A write should be performed when counters are stopped (TAUJnTE.TAUJnTEm = 0) and (EPC.SVSTOP = 0).

**Address:** <TAUJn_base> + $A8_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TAUJn SVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 26.36 TAUJnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | TAUJnSVSDIS | When EPC.SVSTOP bit = 0:<br>Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0).<br>When EPC.SVSTOP bit = 1:<br>0: The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint).<br>1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## 26.4 Operating Procedure

The following lists the general operation procedure for the TAUJn:

After a reset is deasserted, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUJTTOUTm is also initialized and outputs a low level.

1. Set the TAUJnTPS and TAUJnBRS registers to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUJn function:
   - Set the operation mode
   - Set any other control bits
3. Enable the counter by setting the TAUJnTS.TAUJnTSm bit to 1.
   The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUJnTT.TAUJnTTm bit to 1. The counter can be forcibly restarted by setting the TAUJnTS.TAUJnTSm bit to 1.
5. Stop the function by setting the TAUJnTT.TAUJnTTm bit to 1.

**NOTES**

1. A detailed description of the required control bits and the operation of the individual functions are given in **Section 26.12, Independent Channel Operation Functions** and **Section 26.13, Synchronous Channel Operation Functions**.
2. The function can be changed while the counter is stopped (TAUJnTE.TAUJnTEm = 0).

## 26.5 Concepts of Synchronous Channel Operation Function

The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in **Section 26.5.1, Rules of Synchronous Channel Operation Function**.

The synchronous channel operation function are detailed in the following section.

- **Section 26.13, Synchronous Channel Operation Functions**

### 26.5.1 Rules of Synchronous Channel Operation Function

#### Number of master and slave channels

- Only even channels (CH0, CH2) can be set as master channels. Any channel other than CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 can be set as slave channel.
- If two master channels are used, slave channels cannot cross the master.
  Example: If CH0 and CH2 are master channels, CH1 can be set as slave channel for CH0, but CH3 cannot.

#### Operation clock

- The same operation clock should be set for the master channel and the synchronized slave channel. This is achieved by setting the same value in the TAUJnCMORm.TAUJnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 26.4**.

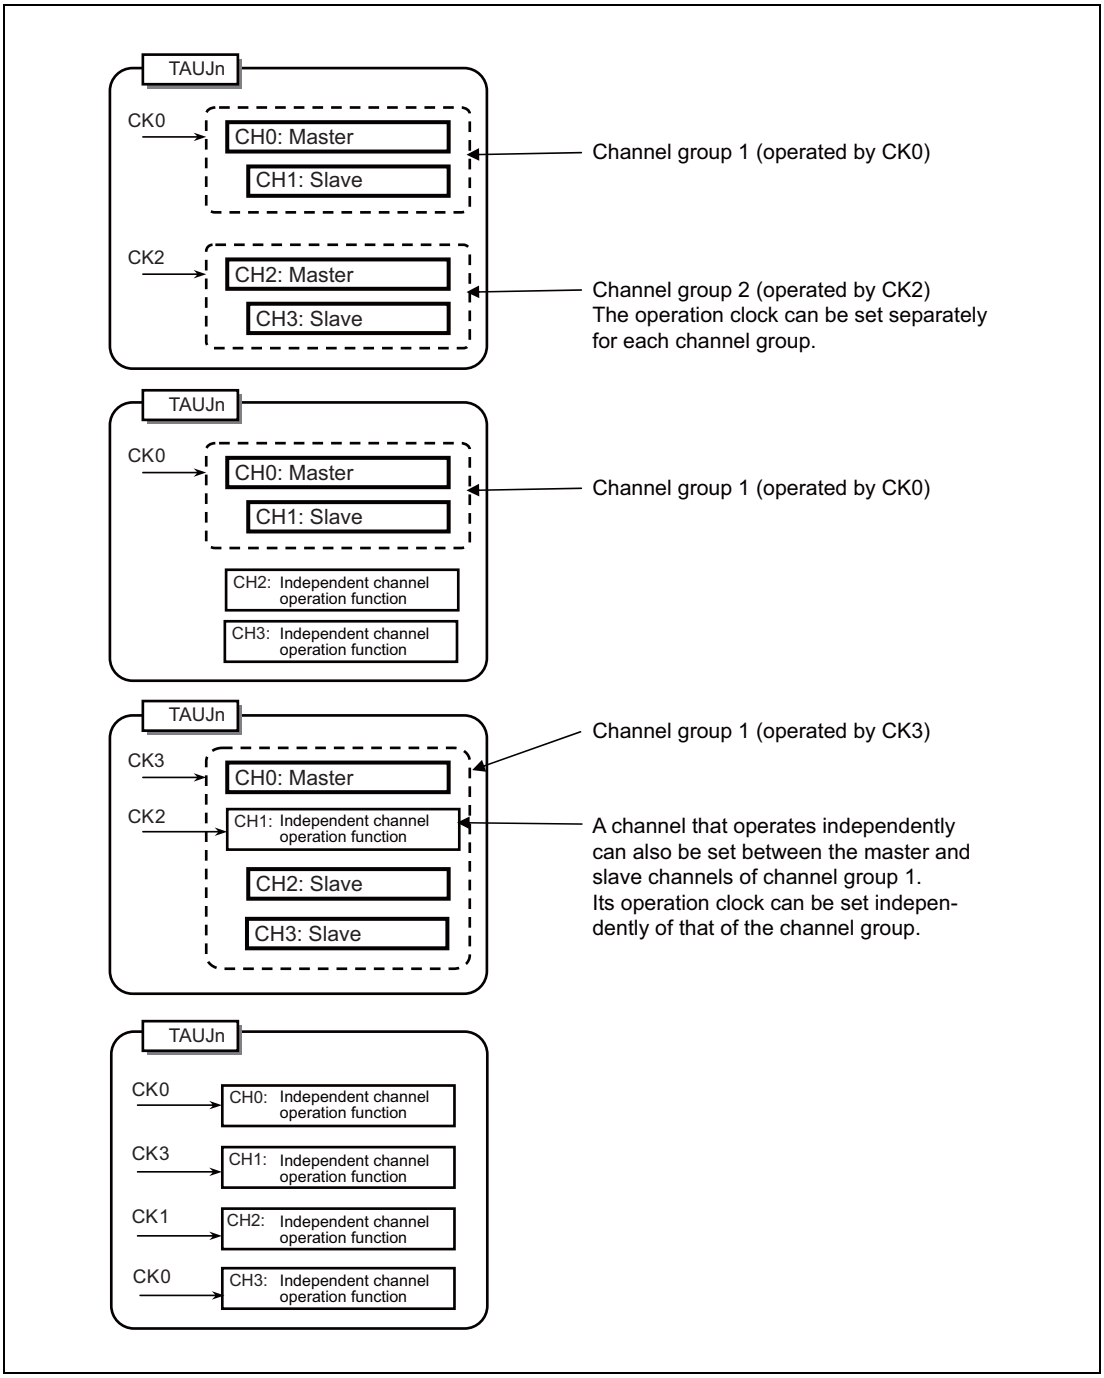

**Figure 26.4 Grouping of Channels and Assignment of Operation Clocks**

### 26.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously, both within a TAUJ unit and between TAUJ units.

#### 26.5.2.1 Simultaneous Start and Stop within a TAUJ Unit

- To simultaneously start synchronized channels, the TAUJnTS.TAUJnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUJnTT.TAUJnTTm bits of the channels should be set at the same time.

Setting 1 in the TAUJnTS.TAUJnTSm bits sets the corresponding TAUJnTE.TAUJnTEm bits to 1, enabling counting. The count start timing of the counter depends on the operating mode.

#### 26.5.2.2 Simultaneous Start between TAUJ Units

Counters in different TAUJ units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

# 26.6 Simultaneous Rewrite

## 26.6.1 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite. The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

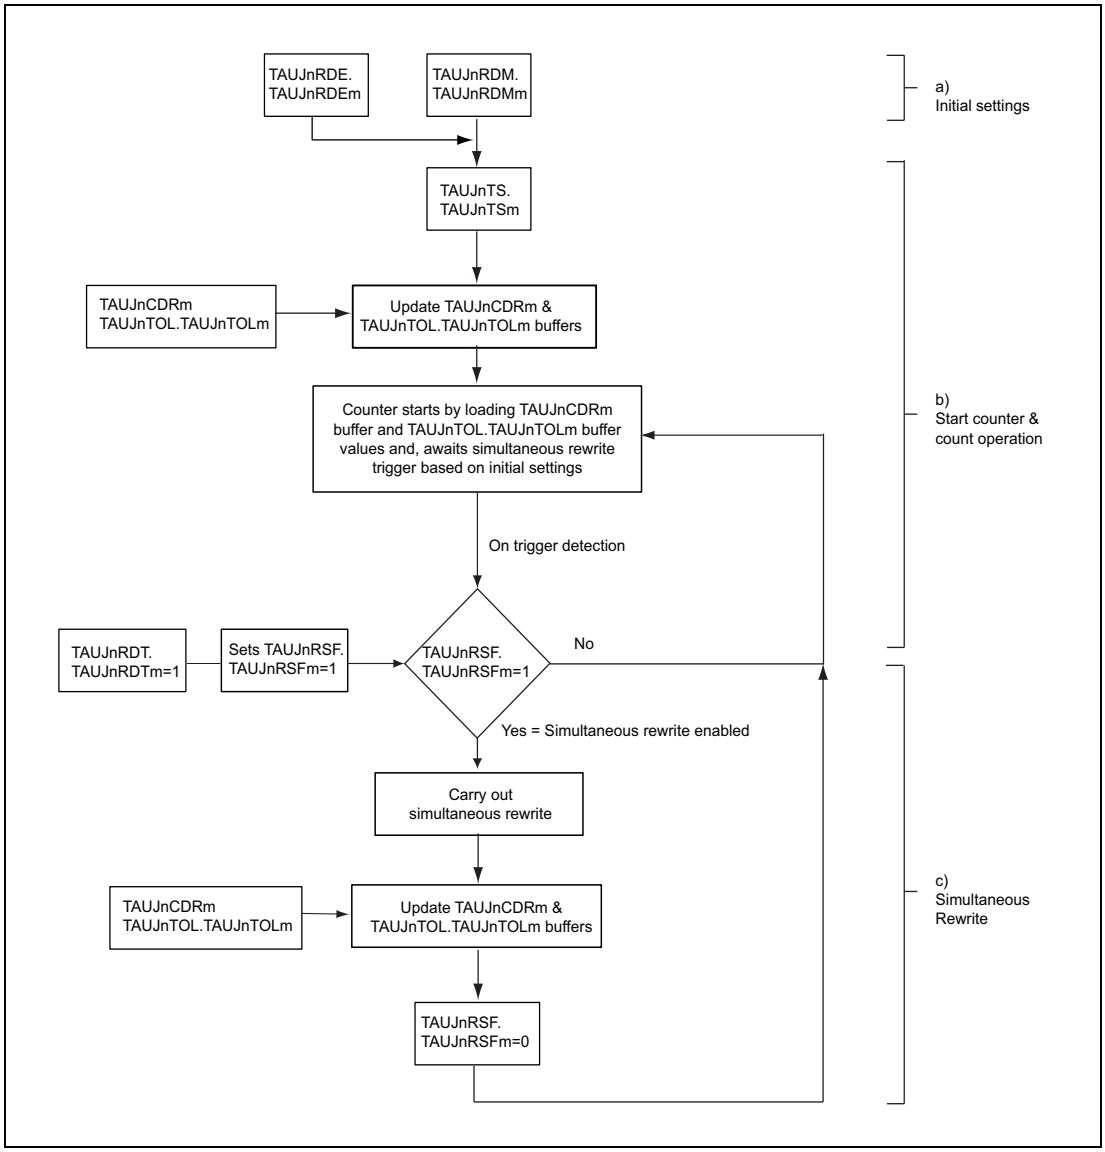

**Figure 26.5 General Procedure for Simultaneous Rewrite**

#### 26.6.1.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUJnRDE.TAUJnRDEm = 1.
- To select simultaneous rewrite when the master channel starts counting, set TAUJnRDM.TAUJnRDMm.

#### 26.6.1.2 Start Counter and Count Operation

- To start all the TAUJnCNTm counters in the channel group, set the corresponding TAUJnTS.TAUJnTSm bits to 1. The values of TAUJnTOL.TAUJnTOLm and the data registers (TAUJnCDRm) are loaded into the corresponding TAUJnTOL.TAUJnTOLm buffer (TAUJnTOL.TAUJnTOLm buf) and data buffer registers (TAUJnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUJnRDT.TAUJnRDTm) to 1 sets the reload flag (TAUJnRSF.TAUJnRSFm) to 1, enabling simultaneous rewrite. TAUJnRSF.TAUJnRSFm remains set to 1 until simultaneous rewrite is completed.
- When a specified trigger for simultaneous rewrite is detected, the TAUJnRSF.TAUJnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1). If enabled, simultaneous rewrite is carried out. Otherwise simultaneous rewrite is not carried out and the system waits for detection of the next simultaneous rewrite trigger.

#### 26.6.1.3 Simultaneous Rewrite

- When the simultaneous rewrite trigger is detected and simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1), the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and the values are applied the next time the counter starts or restarts.
- When the simultaneous rewrite is complete, the TAUJnRSF.TAUJnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

### 26.6.2 Other General Rules for Simultaneous Rewrite

The following rules also apply.

- TAUJnRDE.TAUJnRDEm and TAUJnRDM.TAUJnRDMm cannot be changed while the counter is in operation (TAUJnTE.TAUJnTEm = 1).
- TAUJnTOL.TAUJnTOLm can be rewritten only during operation using the PWM output function. For all other functions, TAUJnTOL.TAUJnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUJTTOUTm outputs an invalid waveform.

### 26.6.3 Simultaneous Rewrite Procedure

The simultaneous rewrite procedure with PWM output function is described in the following figure.

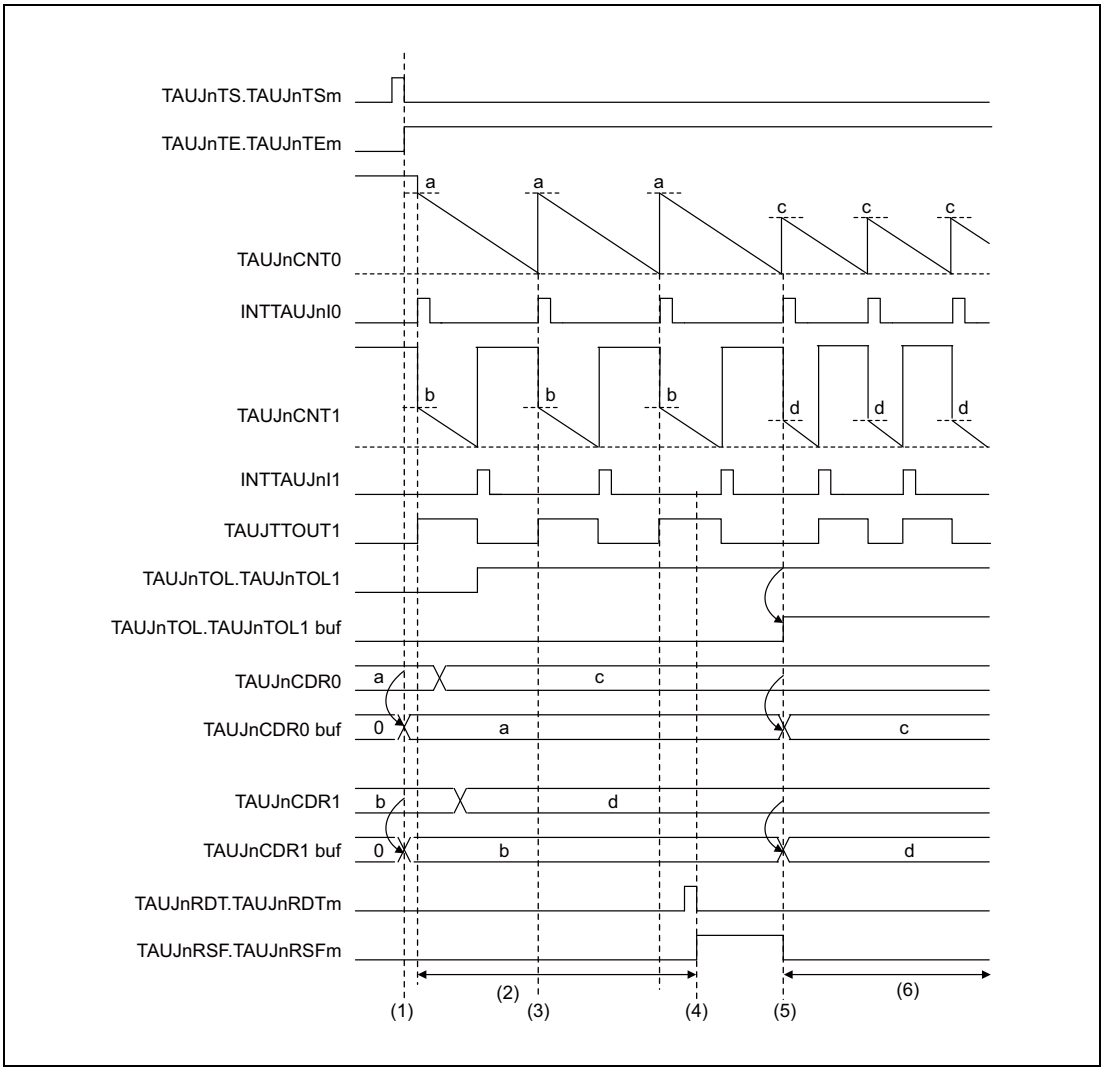

**Figure 26.6 Simultaneous Rewrite with PWM Output Function**

**Setting:**

CH0 is a master channel of PWM output function, and CH1 is a slave channel of PWM output function. Simultaneous rewrite is applied when the master channel starts counting.

**Description:**

(1) When TAUJnTS.TAUJnTSm = 1 is set, the value of TAUJnCDRm is copied to the TAUJnCDRm buffer and the value of TAUJnTOL.TAUJnTOLm is copied to the TAUJnTOL.TAUJnTOLm buffer.

(2) The TAUJnCDRm and TAUJnTOL.TAUJnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUJnRSF.TAUJnRSFm = 0).

(4) The reload data trigger bit (TAUJnRDT.TAUJnRDTm) is set to 1 which sets the status flag (TAUJnRSF.TAUJnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite is triggered when CH0 restarts counting, because simultaneous rewrite is enabled. The TAUJnCDRm value is loaded into the TAUJnCDRm buffer and the TAUJnTOL.TAUJnTOLm value is loaded into the TAUJnTOL.TAUJnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUJnCDRm and TAUJnTOL.TAUJnTOLm can be changed again.

## 26.7 Channel Output Modes

The output of the TAUJTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUJnTOE.TAUJnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUJnTO.TAUJnTOm) is sent to the output pin (TAUJTTOUTm).
- By TAUJ signals (TAUJnTOE.TAUJnTOEm = 1)
  When controlled by TAUJ signals, the output level of TAUJTTOUTm is set or reset or toggled by internal signals. The value of TAUJnTO.TAUJnTOm is updated accordingly to reflect the value of TAUJTTOUTm.
  - Independently (TAUJnTOM.TAUJnTOMm = 0)
    In case of independent operation, the output of the TAUJTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUJnTOM.TAUJnTOMm = 0).
  - Synchronously (TAUJnTOM.TAUJnTOMm = 1)
    In case of synchronous operation, the output of the TAUJTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUJnTOM.TAUJnTOMm = 1).

The TAUJnTO.TAUJnTOm bit can always be read to determine the current value of TAUJTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

### Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 26.37, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 26.7.2, Channel Output Modes Controlled Independently by TAUJn Signals**
- **Section 26.7.3, Channel Output Modes Controlled Synchronously by TAUJn Signals**

### Batch operation of TAUJnTOm bit

Whether a set value is reflected to the TAUJnTOm bit or not is controlled by the TAUJnTOE.TAUJnTOEm bit.

The TAUJnTOm setting is written only to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 0 when a write to the TAUJnTO register is attempted. No TAUJnTOm setting is reflected to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 1.

**NOTE**

TAUJnTO.TAUJnTOm bit is placed so that its bit number corresponds to a channel number.

### Output logic

Positive logic or negative logic of the output is specified by control bit TAUJnTOL.TAUJnTOLm.

The value of TAUJnTOL.TAUJnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function. Otherwise, changes to TAUJnTOL.TAUJnTOLm result in an undefined TAUJTTOUTm signal output.

See **Section 26.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 26.37**.

**Table 26.37 Channel Output Modes**

| Channel Output Mode | TAUJnTOE.TAUJnTOEm | TAUJnTOM.TAUJnTOMm |
|---|---|---|
| **By software** | | |
| Independent channel output mode controlled by software | 0 | x |
| **By TAUJ signals, independently** | | |
| Independent channel output mode 1 | 1 | 0 |
| **By TAUJ signals, synchronously** | | |
| Synchronous channel output mode 1 | 1 | 1 |

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

**NOTE**

The following bits cannot be changed during count operation (TAUJnTE.TAUJnTEm = 1):

- TAUJnTOM.TAUJnTOMm
- TAUJnTOC.TAUJnTOCm

### 26.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUJTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUJnTOE.TAUJnTOEm = 0).

(1) Set TAUJnTO.TAUJnTOm to specify the initial level of the TAUJTTOUTm output.

(2) Set channel output mode according to **Table 26.37, Channel Output Modes**, and the output logic using the TAUJnTOL.TAUJnTOLm bit.

(3) Start the counter (TAUJnTS.TAUJnTSm = 1).

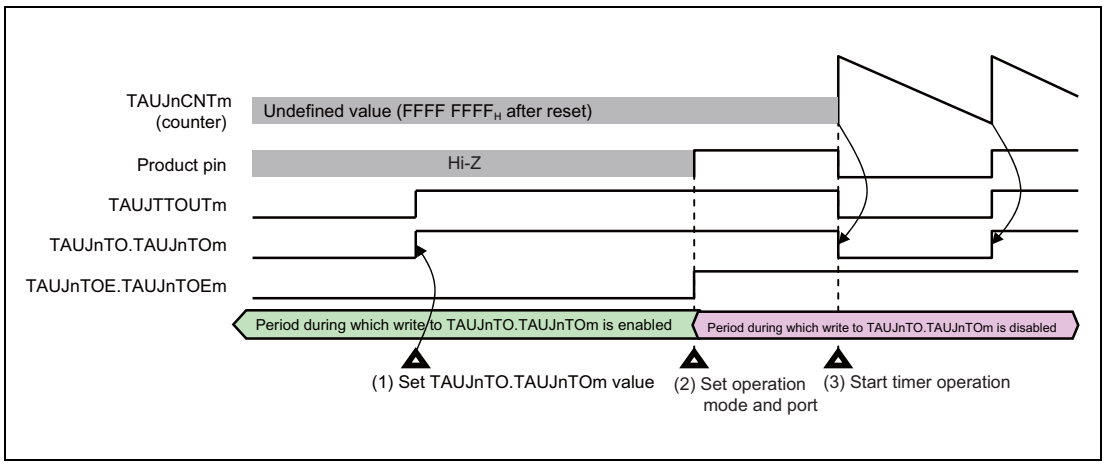

**Figure 26.7 General Procedure for Specifying a TAUJTTOUTm Channel Output Mode**

## 26.7.2 Channel Output Modes Controlled Independently by TAUJn Signals

This section lists the channel output modes that are controlled independently by TAUJn signals. The control bits used to specify a mode are listed in **Table 26.37, Channel Output Modes**.

### 26.7.2.1 Independent Channel Output Mode 1

#### Set/reset conditions

In this output mode, TAUJTTOUTm toggles when INTTAUJnIm is detected. The value of TAUJnTOL.TAUJnTOLm is ignored.

#### Prerequisites

There are no prerequisites other than those shown in **Table 26.37, Channel Output Modes**.

## 26.7.3 Channel Output Modes Controlled Synchronously by TAUJn Signals

This section lists the channel output modes that are controlled synchronously by TAUJn signals. The control bits used to specify a mode are listed in **Table 26.37, Channel Output Modes**.

### 26.7.3.1 Synchronous Channel Output Mode 1

#### Set/reset conditions

In this output mode, INTTAUJnIm of master channel serves as a set signal and INTTAUJnIm of the slave channel as a reset signal. If INTTAUJnIm of the master channel and INTTAUJnIm of the slave channel are generated at the same time, INTTAUJnIm of the slave channel (reset signal) has priority over INTTAUJnIm (set signal) of the master channel, i.e., the master channel is ignored.

#### Prerequisites

There are no prerequisites other than those shown in **Table 26.37, Channel Output Modes**.

## 26.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUJnTS.TAUJnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

**CAUTION**

**The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.**

### 26.8.1 Interval Timer Mode, Capture Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUJnTS.TAUJnTSm is set to 1. The value of data register is also loaded when the counter starts.

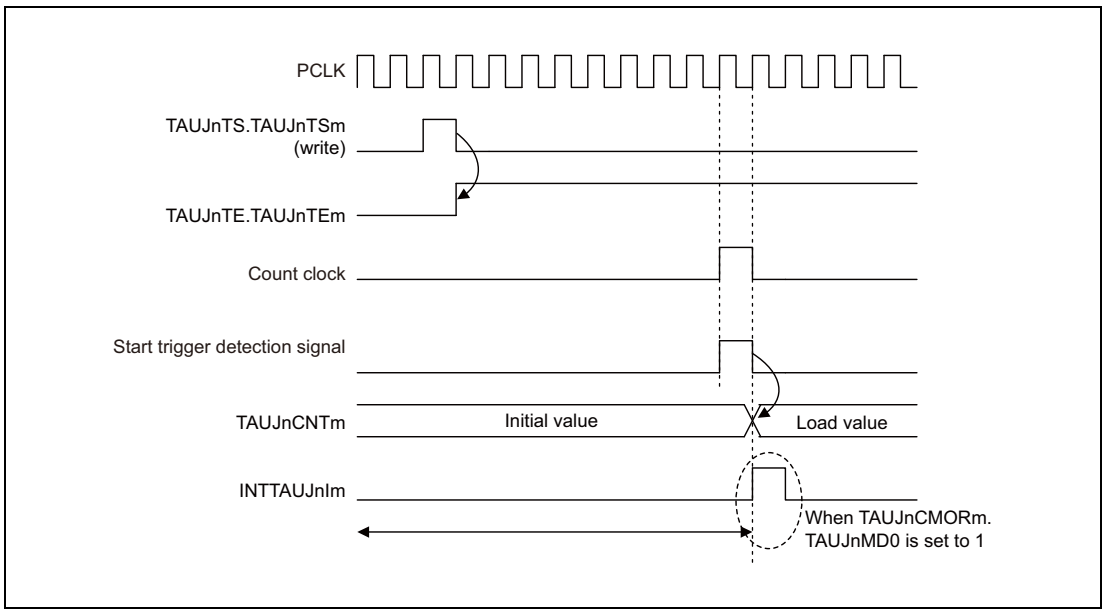

**Figure 26.8 Start Timing in Interval Timer Mode, Capture Mode, and Count Capture Mode**

### 26.8.2 Other Operating Modes

In other operating modes, count clock cycle is irrelevant to start of counter operation. The counter operation start timing is triggered only upon detection of a valid edge of TAUJTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which is irrelevant to start of counter operation, determine the frequency with which all operations take place.

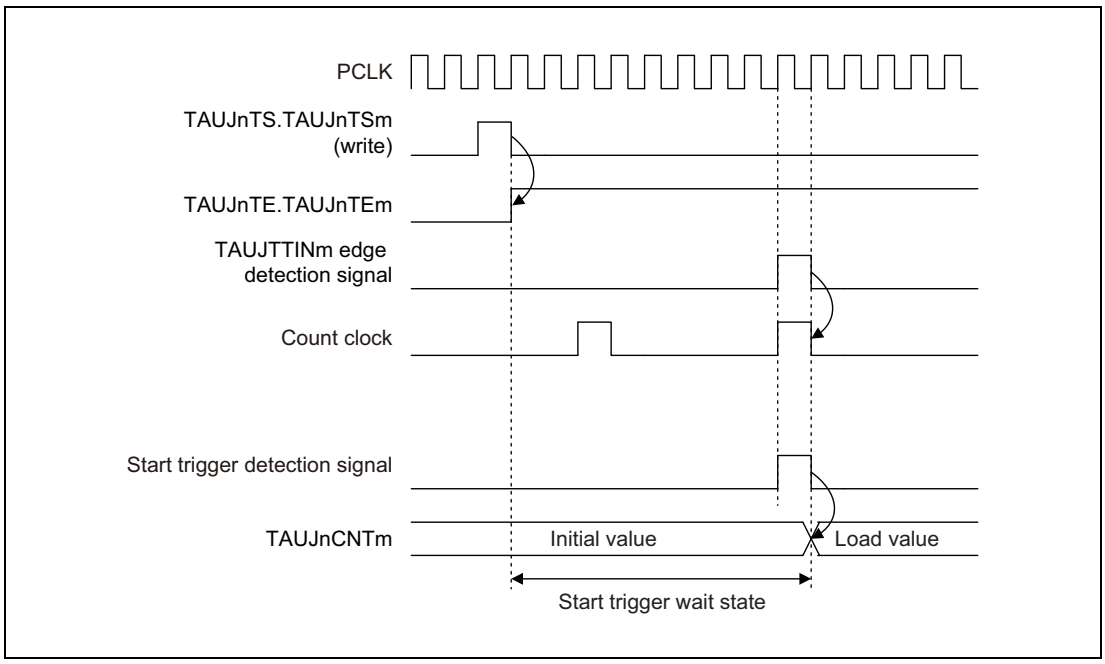

**Figure 26.9 Count Start Timing in Other Operating Modes**

## 26.9 TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUJnIm is generated using the TAUJnCMORm.TAUJnMD0 bit. The generation of INTTAUJnIm when the TAUJnCMORm.TAUJnMD0 bit starts counting and the effect to TAUJTTOUTm depend on the selected function. For details, refer to the description of TAUJnCMORm.TAUJnMD0 of each function.

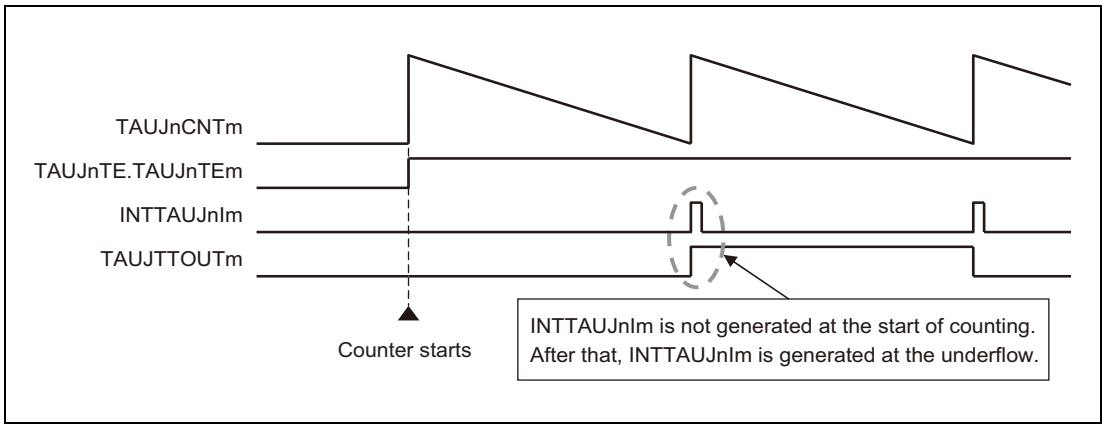

**Figure 26.10 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 0)**

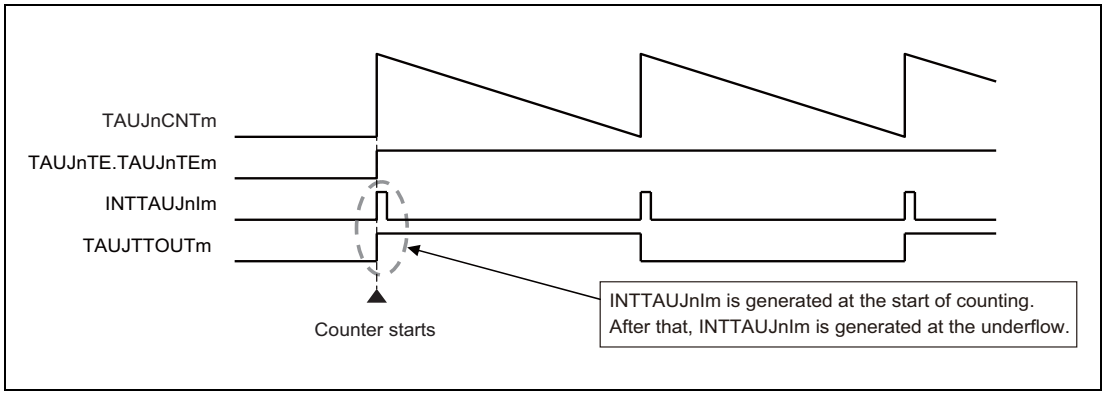

**Figure 26.11 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 1)**

## 26.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches FFFF $FFFF_H$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operations in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000 $0000_H$ at the same time as the first channel overflows (TAUJnCNTm = FFFF $FFFF_H$).
- Set TAUJnCDRm of the second channel to FFFF $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUJTTINm input.
- The trigger detection settings (TAUJnCMORm.TAUJnSTS[2:0] and TAUJnCMURm.TAUJnTIS[1:0]) must be identical for both channels.

**Result:**

The down-counter of the second channel reaches 0000 $0000_H$ at exactly the same time as the up-counter of the first channel overflows (TAUJnCNTm = FFFF $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

### 26.10.1 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

When the capture trigger is input simultaneously to TAUJTTINm of both channels, INTTAUJnIm of the interval timer function can detect the overflow when TAUJnCNTm of the TAUJTTINm input position detection function exceeds FFFF $FFFF_H$.

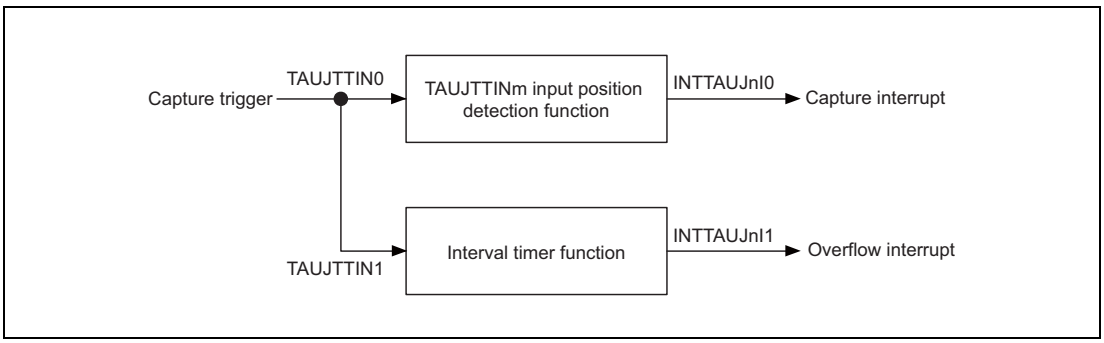

**Figure 26.12 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function**

**Timing diagram**

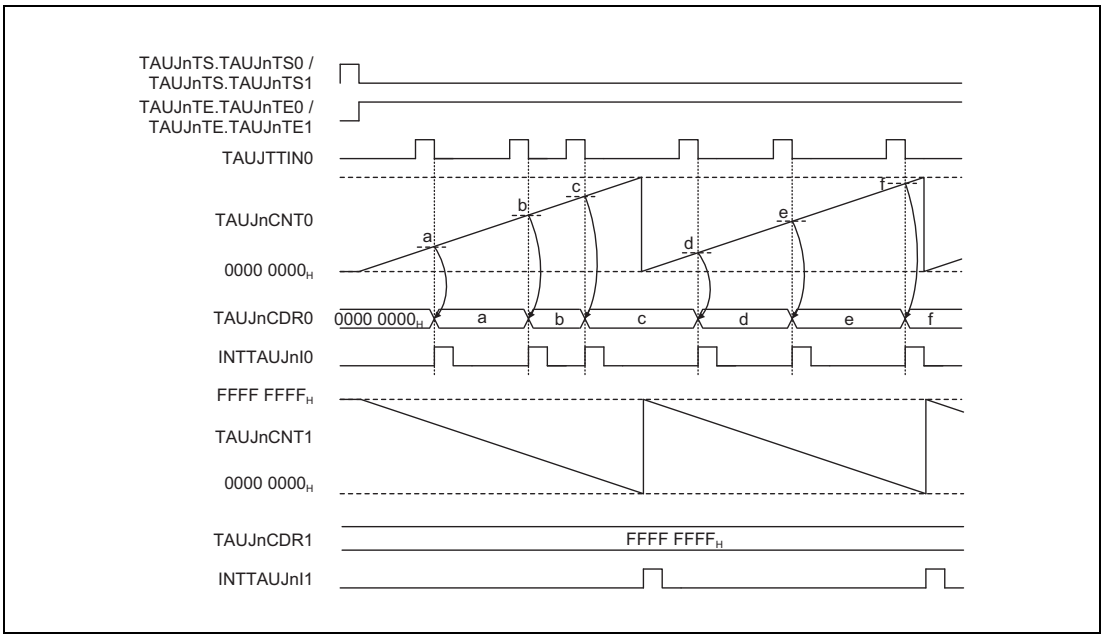

**Figure 26.13 Interrupt Generation via Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function**

## 26.11 TAUJTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

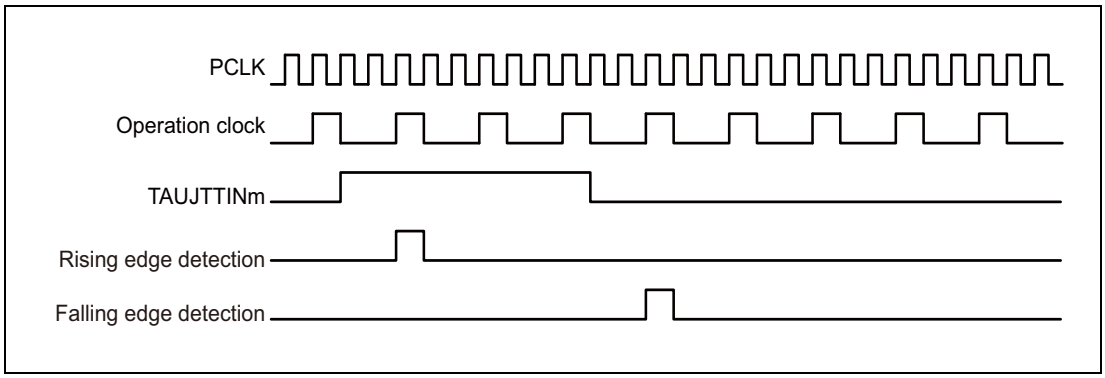

**Figure 26.14 Basic Edge Detection Timing**

**Figure 26.14** shows an image of operation timing. In the actual operation, delay time occurs due to noise filter and synchronization circuit between the TAUJnIm pin and TAUJn.

## 26.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUJ. For a general overview of independent channel operation functions, see **Section 26.2, Overview**.

### 26.12.1 Interval Timer Function

#### 26.12.1.1 Overview

**Summary**

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave.

**Functional description**

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counter starts to count down from this value.

When the counter reaches 0000 $0000_H$, INTTAUJnIm is generated and the TAUJTTOUTm signal toggles. TAUJnCNTm then loads the TAUJnCDRm value and subsequently continues operation.

The value of TAUJnCDRm can be rewritten at any time, and the changed value of TAUJnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm stop but retain their values. The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.

**Conditions**

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUJTTOUTm does not toggle. This results in a reverted TAUJTTOUTm signal compared to when TAUJnCMORm.TAUJnMD0 is set to 1.

#### 26.12.1.2 Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm+1) × 2

### 26.12.1.3 Block Diagram and General Timing Diagram

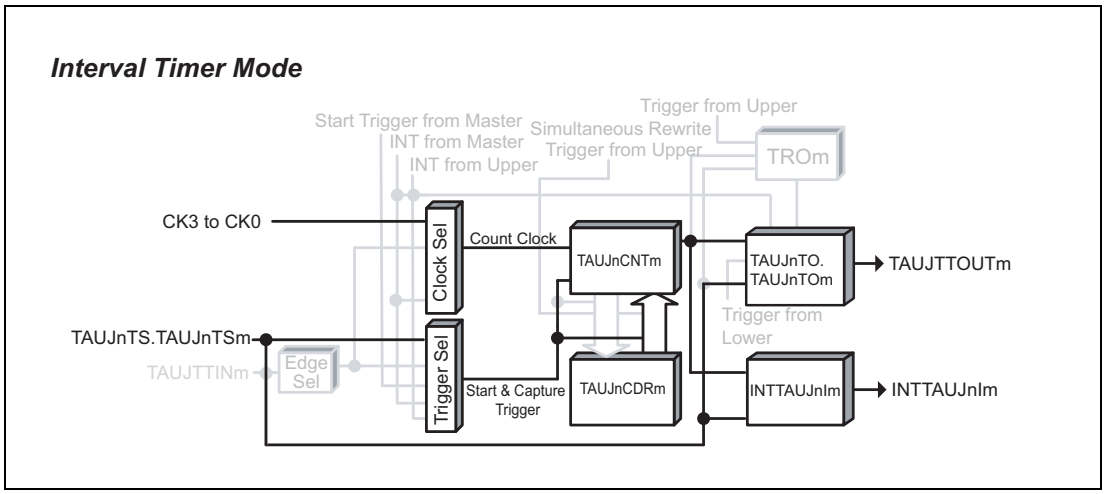

**Figure 26.15 Block Diagram for Interval Timer Function**

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).

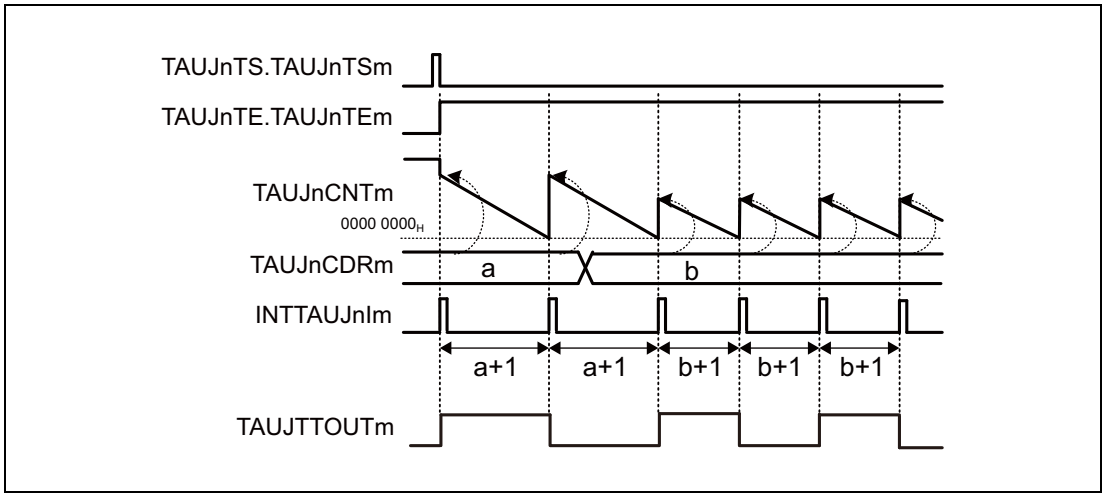

**Figure 26.16 General Timing Diagram for Interval Timer Function**

### 26.12.1.4 Register Settings

#### (1) TAUJnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUJnCKS[1:0] | | TAUJnCCS[1:0] | | TAUJn MAS | TAUJnSTS[2:0] | | | TAUJnCOS[1:0] | | — | TAUJnMD[4:1] | | | | TAUJn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUJnTIS[1:0] | 00: Not used, so set to 00. |

### (3) Channel output mode

Table 26.40 Control Bit Settings in Independent Channel Output Mode 1

| Bit name | Setting |
|---|---|
| TAUJnTOE.TAUJnTOEm | Write $1_B$. |
| TAUJnTOM.TAUJnTOMm | Write $0_B$. |
| TAUJnTOC.TAUJnTOCm | Write $0_B$. |
| TAUJnTOL.TAUJnTOLm | Write $0_B$. |

**NOTE**

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details see **Section 26.7, Channel Output Modes**.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the interval timer function. Therefore, these registers must be set to 0.

Table 26.41 Simultaneous Rewrite Settings for Interval Timer Function

| Bit Name | Setting |
|---|---|
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0. |

### 26.12.1.5 Operating Procedure for Interval Timer Function

Table 26.42 Operating Procedure for Interval Timer Function

| | Operation | Status of TAUJn |
|---|---|---|
| Initial channel setting | Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.38, Contents of the TAUJnCMORm register for Interval Timer Function** and **Table 26.39, Contents of the TAUJnCMURm register for Interval Timer Function**.<br><br>Set the value of the TAUJnCDRm register.<br><br>Set the channel output mode by setting the control bits as described in **Table 26.40, Control Bit Settings in Independent Channel Output Mode 1**. | Channel operation is stopped. |
| Start operation | Set TAUJnTS.TAUJnTSm to 1.<br>TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is set to 1 and the counter starts.<br>TAUJnCNTm loads the TAUJnCDRm value.<br>When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTTOUTm toggles. |
| During operation | The TAUJnCDRm register value can be changed at any time.<br>The TAUJnCNTm register can be read at all times. | TAUJnCNTm counts down. When the counter reaches 0000 $0000_H$:<br>• TAUJnCNTm reloads the TAUJnCDRm value and continues count operation.<br>• INTTAUJnIm is generated and TAUJTTOUTm toggles. |
| Stop operation | Set TAUJnTT.TAUJnTTm to 1.<br>TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops.<br>TAUJnCNTm and TAUJTTOUTm stop and retain their current values. |

Restart operation

### 26.12.1.6 Specific Timing Diagrams

#### (1) TAUJnCDRm = 0000 $0000_H$, count clock = PCLK/2

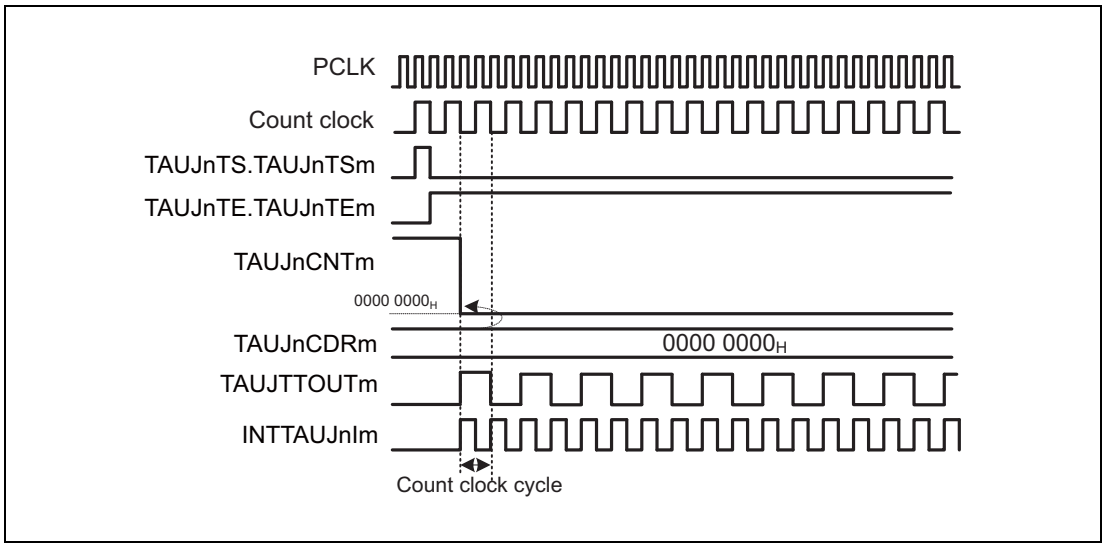

Figure 26.17 TAUJnCDRm = 0000 $0000_H$, Count Clock = PCLK/2

- If TAUJnCDRm = 0000 $0000_H$ and the count clock = PCLK/2, the TAUJnCDRm value is loaded to TAUJnCNTm every count clock, meaning that TAUJnCNTm is always 0000 $0000_H$.
- INTTAUJnIm is generated every count clock, resulting in TAUJTTOUTm toggling every count clock.

### (2) TAUJnCDRm = 0000 0000$_H$, count clock = PCLK

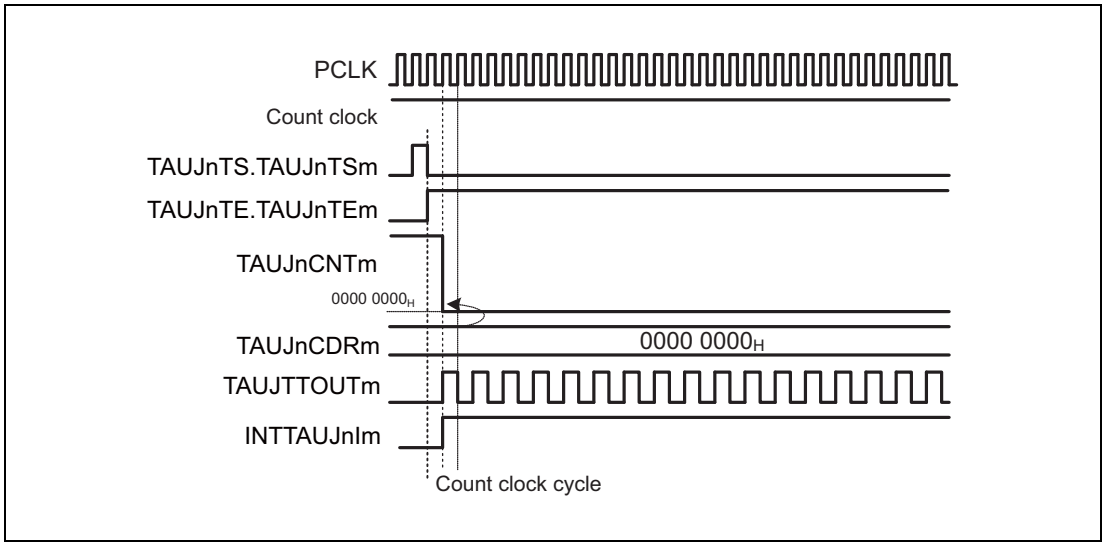

Figure 26.18 TAUJnCDRm = 0000 0000$_H$, Count Clock = PCLK

- If TAUJnCDRm = 0000 0000$_H$ and the count clock = PCLK, the TAUJnCDRm value is loaded to TAUJnCNTm every PCLK clock, meaning that TAUJnCNTm is always 0000 0000$_H$.
- INTTAUJnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
  TAUJTTOUTm is toggled every PCLK clock.

### (3) Operation stop and restart

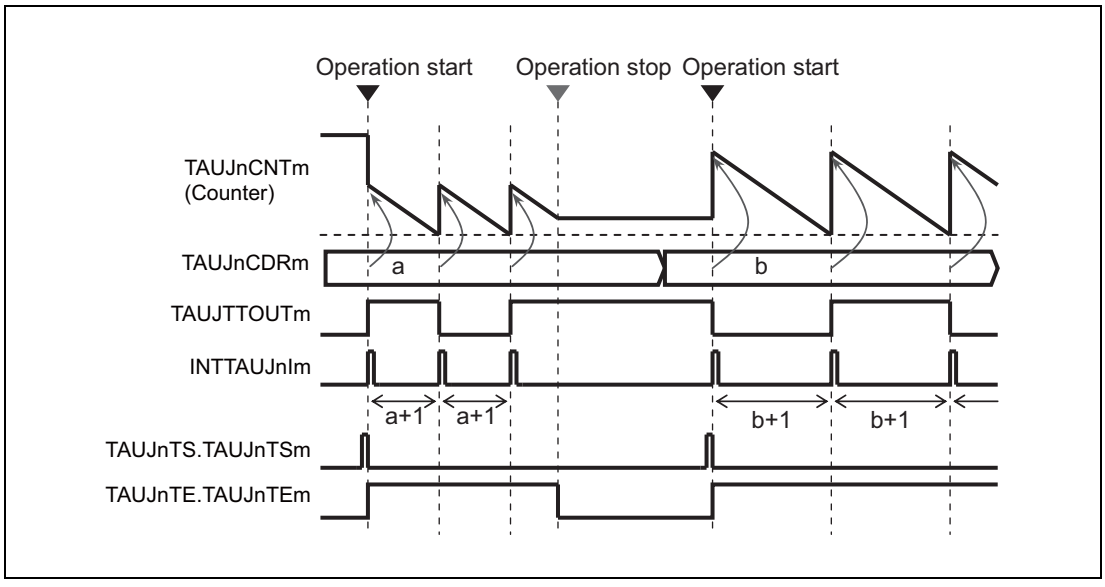

Figure 26.19 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 1)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1.

**(4) Forced restart**

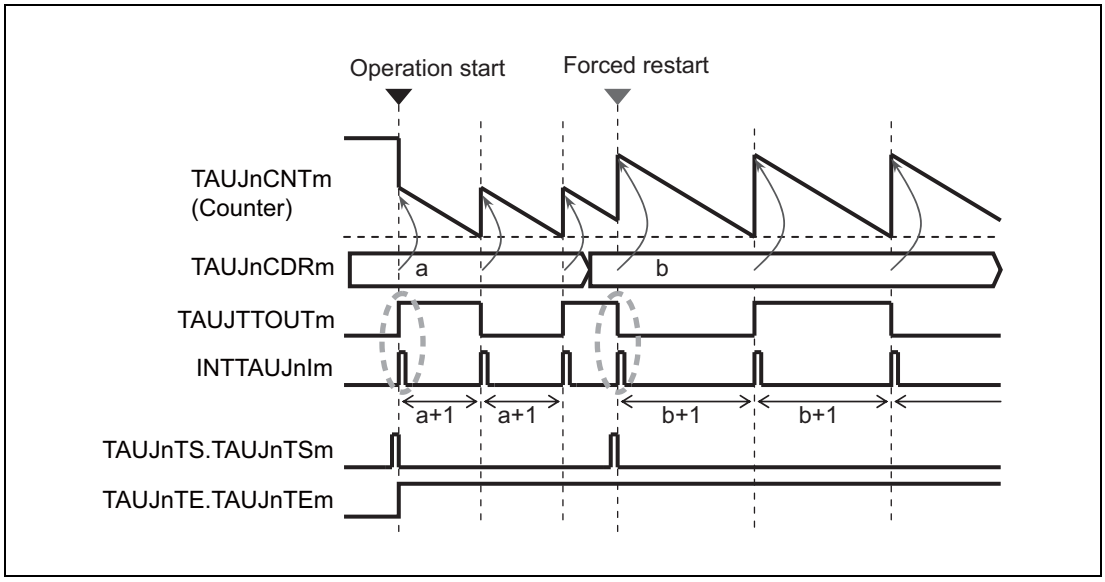

**Figure 26.20 Forced Restart Operation (TAUJnCMORm.TAUJnMD0 = 1)**

- The counter can be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.
- If the TAUJnCMORm.TAUJnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUJnCDRm value is reflected to TAUJnCNTm and counting starts. Execute a forced restart to reflect the changed TAUJnCDRm value immediately.

## 26.12.2 TAUJTTINm Input Interval Timer Function

### 26.12.2.1 Overview

#### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals or when a valid TAUJTTINm input edge is detected. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave. Output of square waves is only supported for TAUJ0.

#### Description

This function operates in an identical manner to the interval timer function (see **Section 26.12.1, Interval Timer Function**), except that this function is restarted by a valid TAUJTTINm input edge. The type of edge used as the trigger is specified using the TAUJnCMURm.TAUJnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

### 26.12.2.2 Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm + 1) × 2

### 26.12.2.3 Block Diagram and General Timing Diagram

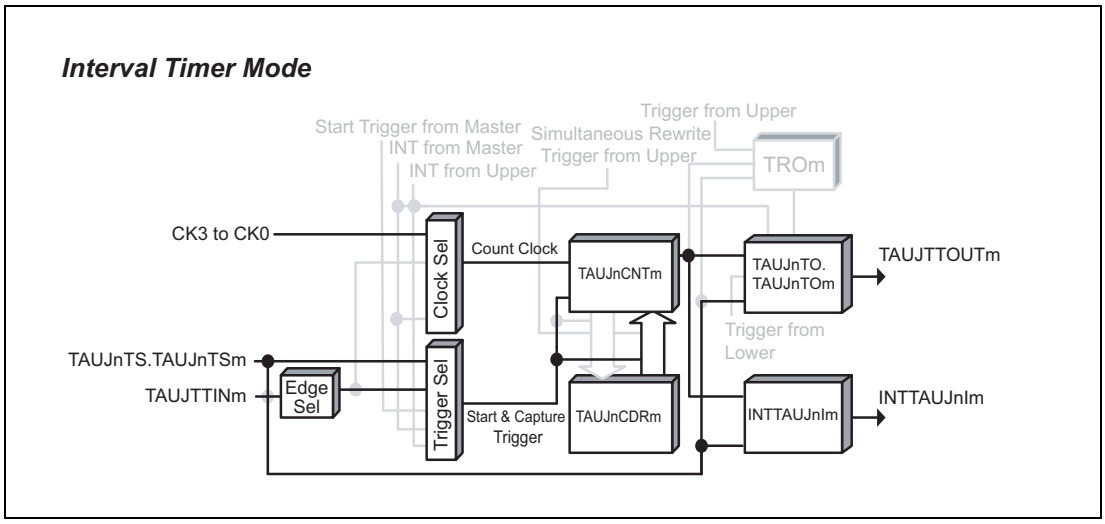

**Figure 26.21 Block Diagram for TAUJTTINm Input Interval Timer Function**

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).
- Rising edge detection (TAUJnCMURm.TAUJnTIS[1:0] = $01_B$)

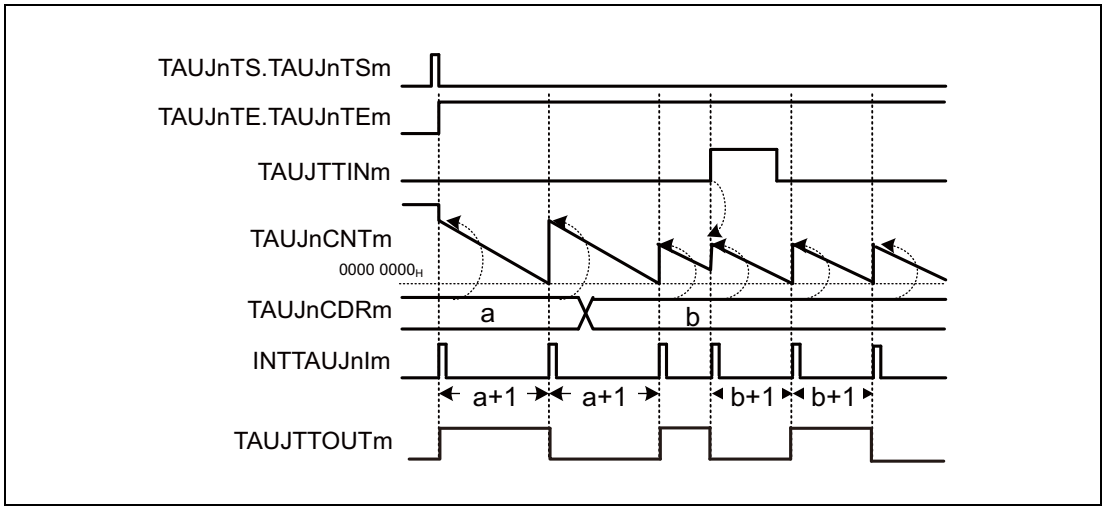

**Figure 26.22 General Timing Diagram for TAUJTTINm Input Interval Timer Function**

### 26.12.2.4 Register Settings

|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUJnTIS[1:0] | 00: Falling edge detection<br>01: Rising edge detection<br>10: Rising and falling edge detection<br>11: Setting prohibited |

### (3) Channel output mode

Table 26.45 Control Bit Settings for Independent Channel Output Mode 1

| Bit name | Setting |
|---|---|
| TAUJnTOE.TAUJnTOEm | Write $1_B$. |
| TAUJnTOM.TAUJnTOMm | Write $0_B$. |
| TAUJnTOC.TAUJnTOCm | Write $0_B$. |
| TAUJnTOL.TAUJnTOLm | Write $0_B$. |

**NOTE**

The channel output mode can also be set to channel output mode controlled by software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details see **Section 26.7, Channel Output Modes**.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input interval timer function. Therefore, these registers must be set to 0.

Table 26.46 Simultaneous Rewrite Settings for TAUJTTINm Input Interval Timer Function

| Bit Name | Setting |
|---|---|
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0. |

### 26.12.2.5 Operating Procedure for TAUJTTINm Input Interval Timer Function

Table 26.47 Operating Procedure for TAUJTTINm Input Interval Timer Function

| | Operation | Status of TAUJn |
|---|---|---|
| Initial channel setting | Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.43, Contents of the TAUJnCMORm register for TAUJTTINm Input Interval Timer Function** and **Table 26.44, Contents of the TAUJnCMURm register for TAUJTTINm Input Interval Timer Function**.<br><br>Set the value of the TAUJnCDRm register<br><br>Set the channel output mode by setting the control bits as described in **Table 26.45, Control Bit Settings for Independent Channel Output Mode 1**. | Channel operation is stopped. |

| During operation | The values of the TAUJnCMURm.TAUJnTIS[1:0] and TAUJnCDRm registers can be changed at any time.<br>The TAUJnCNTm register can be read at all times.<br><br>Detection of TAUJTTINm edge | TAUJnCNTm counts down. When the counter reaches 0000 $0000_H$:<br>• TAUJnCNTm reloads the TAUJnCDRm value and continues count operation.<br>• INTTAUJnIm is generated and TAUJTTOUTm toggles.<br>When a TAUJTTINm input valid edge is detected during count operation, TAUJnCNTm reloads the TAUJnCDRm value and continues count operation.<br>Afterwards, this procedure is repeated. |
| Stop operation | Set TAUJnTT.TAUJnTTm to 1.<br>TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops.<br>TAUJnCNTm and TAUJTTOUTm stop and retain their current values. |

Restart operation

### 26.12.2.6 Specific Timing Diagrams

The timing diagrams in **Section 26.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by a valid TAUJTTINm input edge.

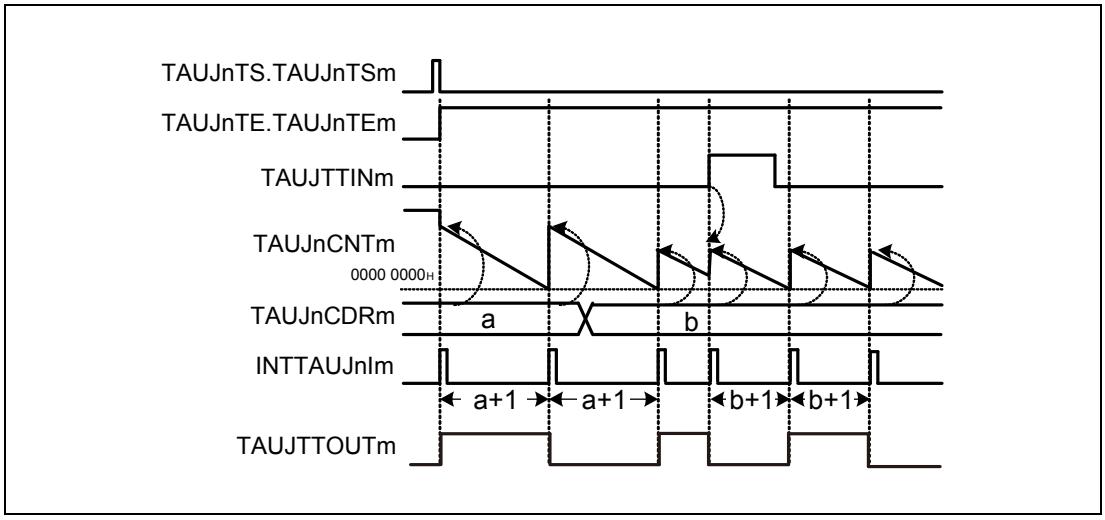

**Figure 26.23 Counter Triggered By Rising TAUJTTINm input edge (TAUJnCMURm.TAUJnTIS[1:0] = $01_B$), TAUJnCMORm.TAUJnMD0 = 1**

If a valid TAUJTTINm input edge is detected, an interrupt is generated which causes TAUJTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUJnCMURm.TAUJnTIS[1:0] = $01_B$).

## 26.12.3 TAUJTTINm Input Pulse Interval Measurement Function

### 26.12.3.1 Overview

#### Summary

This function captures the count value and uses this value and the overflow bit TAUJnCSRm.TAUJnOVF to measure the interval of the TAUJTTINm input signals.

#### Prerequisites

TAUJTTOUTm is not used for this function.

#### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter TAUJnCNTm starts counting up from 0000 $0000_H$. When a valid TAUJTTINm edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter resets to 0000 $0000_H$ and subsequently continues operation.

If the counter reaches FFFF $FFFF_H$ before a valid TAUJTTINm edge is detected, it overflows to 0000 $0000_H$. The counter is reset to 0000 $0000_H$ and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

**Table 26.48 Effects of an Overflow**

| TAUJnCMORm.TAUJnCOS[1:0] | When Overflow Occurs | | When a Valid TAUJTTINm Input is then Detected | |
|---|---|---|---|---|
| | TAUJnCDRm | TAUJnCSRm.TAUJnOVF | TAUJnCDRm and TAUJnCNTm | TAUJnCSRm.TAUJnOVF |
| 00 | Unchanged | 0 | TAUJnCNTm loaded to TAUJnCDRm | 1 |
| 01 | | 1 | | |
| 10 | Set to FFFF $FFFF_H$ | 0 | TAUJnCNTm set to 0, TAUJnCDRm unchanged | Unchanged |
| 11 | | 1 | | |

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV = 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the interval of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

The function can be stopped by setting TAUJnTT.TAUJnTTm = 1, which in turn sets TAUJnTE.TAUJnTEm = 0. TAUJnCNTm stops but retains its value. While the function is stopped, TAUJTTINm input valid edge detection and TAUJnCNTm capture are not performed.

#### Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **26.9, TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts**.

**NOTE**

When TAUJnCMORm.TAUJnCOS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 26.12.3.2 Equations

TAUJTTINm input pulse interval = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF $FFFF_H$ + 1)) + TAUJnCDRm capture value + 1]

### 26.12.3.3 Block Diagram and General Timing Diagram

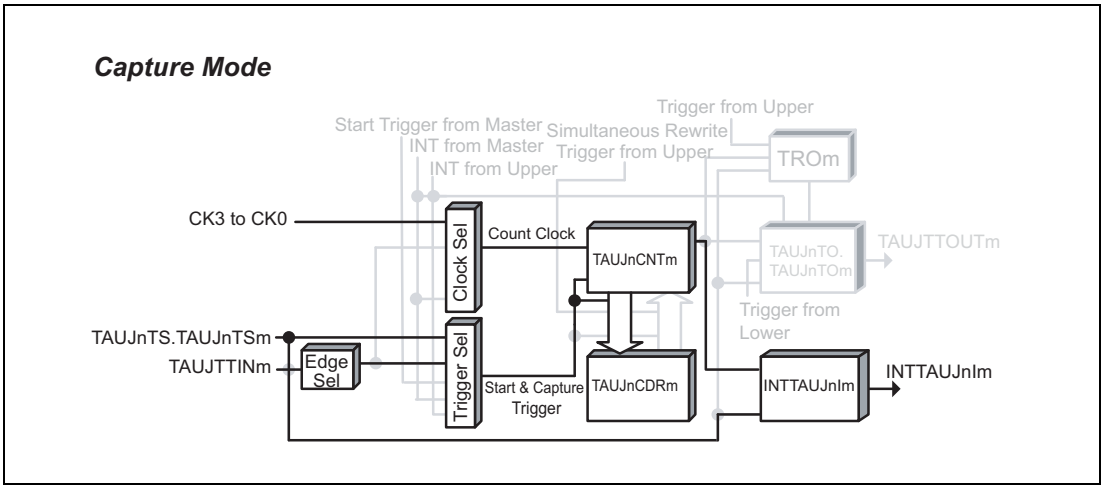

**Figure 26.24 Block Diagram for TAUJTTINm Input Pulse Interval Measurement Function**

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = $00_B$)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = $00_B$).

| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUJnTIS[1:0] | 00: Falling edge detection<br>01: Rising edge detection<br>10: Rising and falling edge detection<br>11: Setting prohibited |

#### (3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used by this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input pulse interval measurement function. Therefore, these registers must be set to 0.

**Table 26.51 Simultaneous Rewrite Settings for TAUJTTINm Input Pulse Interval Measurement Function**

| Bit name | Setting |
|---|---|
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0. |

### 26.12.3.5 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

**Table 26.52 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function**

| | Operation | Status of TAUJn |

Restart operation

### 26.12.3.6 Specific Timing Diagrams: Overflow Behavior

#### (1) TAUJnCMORm.TAUJnCOS[1:0] = $00_B$

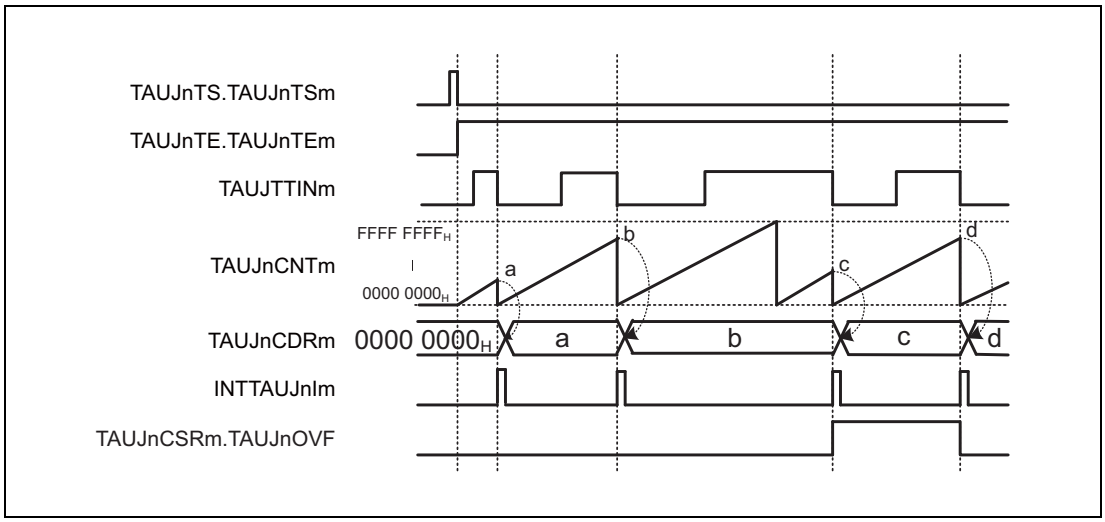

**Figure 26.26 TAUJnCMORm.TAUJnCOS[1:0] = $00_B$, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = $00_B$**

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- If the next valid TAUJTTINm input edge is detected when no overflow occurs, TAUJnCSRm.TAUJnOVF is cleared to 0.

### (2) TAUJnCMORm.TAUJnCOS[1:0] = $01_B$

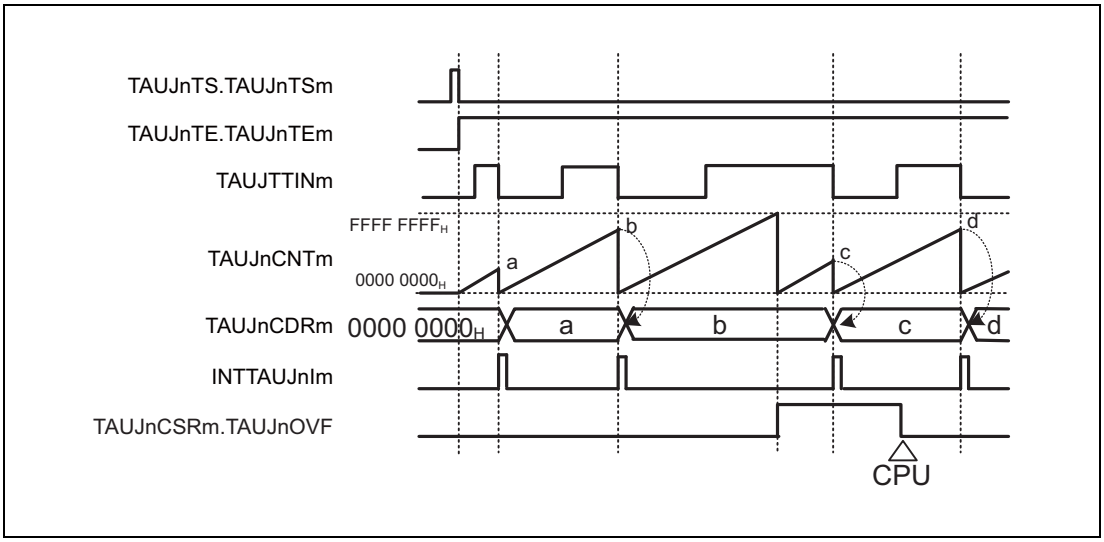

**Figure 26.27 TAUJnCMORm.TAUJnCOS[1:0] = $01_B$, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = $00_B$**

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

### (3) TAUJnCMORm.TAUJnCOS[1:0] = $10_B$

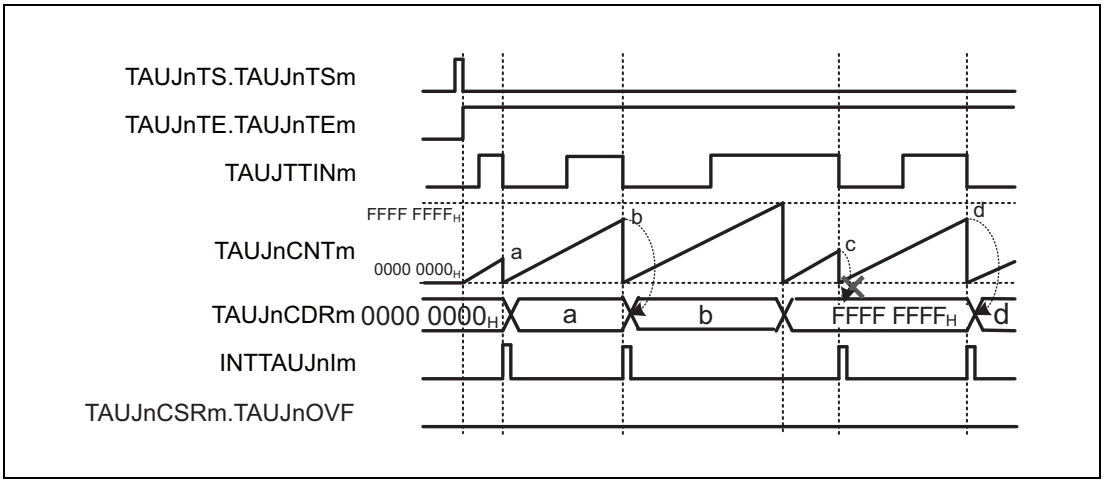

**Figure 26.28 TAUJnCMORm.TAUJnCOS[1:0] = $10_B$, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = $00_B$**

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$ and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

### (4) TAUJnCMORm.TAUJnCOS[1:0] = $11_B$

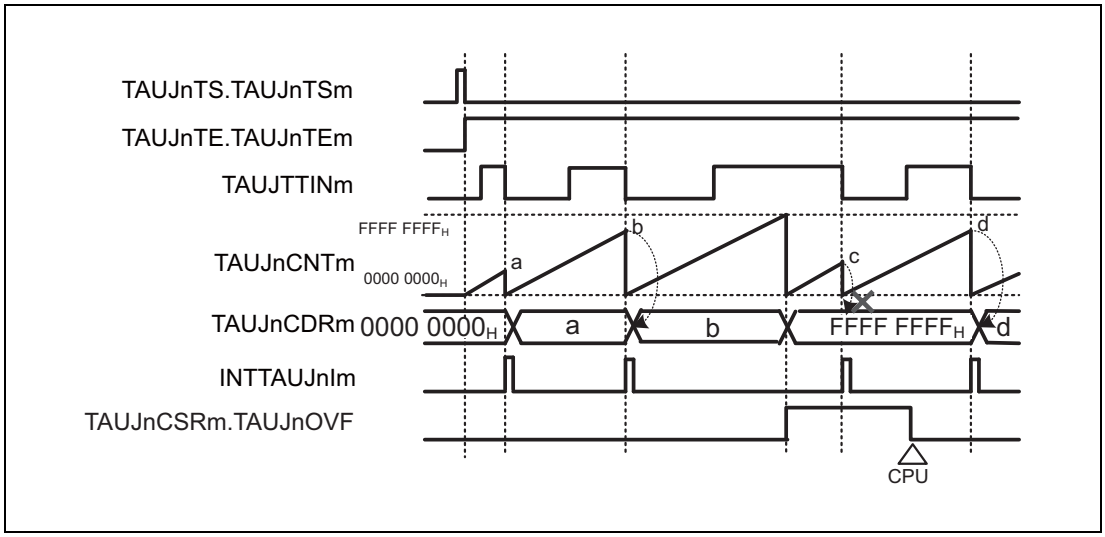

**Figure 26.29 TAUJnCMORm.TAUJnCOS[1:0] = $11_B$, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = $00_B$**

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

## 26.12.4 TAUJTTINm Input Signal Width Measurement Function

### 26.12.4.1 Overview

#### Summary

This function measures the width of a TAUJTTINm signal by starting counting on one edge of the TAUJTTINm signal and capturing the counter value on the opposite edge.

#### Prerequisites

TAUJTTOUTm is not used for this function.

#### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. When a valid TAUJTTINm start edge is detected, the counter TAUJnCNTm starts counting up from 0000 $0000_H$. When a valid TAUJTTINm stop edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter retains its value and awaits the next valid TAUJTTINm input start edge.

If the counter reaches FFFF $FFFF_H$ before a valid TAUJTTINm stop edge is detected, it overflows. The counter is reset to 0000 $0000_H$ and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

**Table 26.53 Effects of an Overflow**

| TAUJnCMORm. TAUJnCOS[1:0] | When Overflow Occurs | | When a Valid TAUJTTINm Input Stop Edge is Detected | |
|---|---|---|---|---|
| | TAUJnCDRm | TAUJnCSRm. TAUJnOVF | TAUJnCDRm and TAUJnCNTm | TAUJnCSRm. TAUJnOVF |
| 00 | Unchanged | 0 | TAUJnCNTm is loaded to TAUJnCDRm. | 1 |
| 01 | | 1 | | |
| 10 | Set to FFFF $FFFF_H$ | 0 | TAUJnCNTm stops counting, TAUJnCDRm unchanged | Unchanged |
| 11 | | 1 | | |

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV to 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the width of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

This function cannot be forcibly restarted.

**NOTE**

When TAUJnCMORm.COS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 26.12.4.2 Equations

TAUJTTINm input signal width = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF FFFF$_H$ + 1)) + TAUJnCDRm capture value + 1]

### 26.12.4.3 Block Diagram and General Timing Diagram

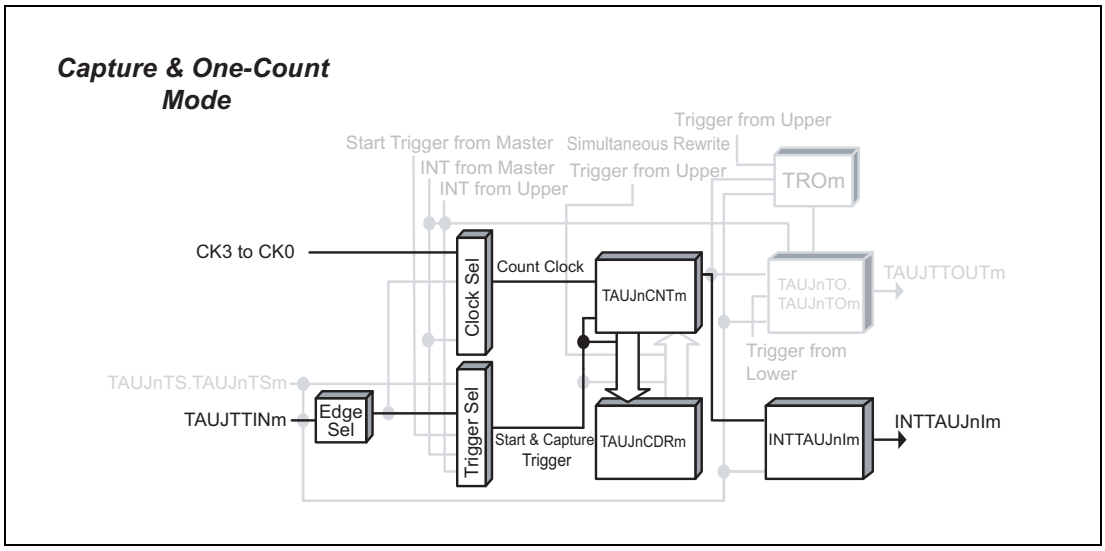

**Figure 26.30 Block Diagram for TAUJTTINm Input Signal Width Measurement Function**

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = $11_B$)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = $00_B$).

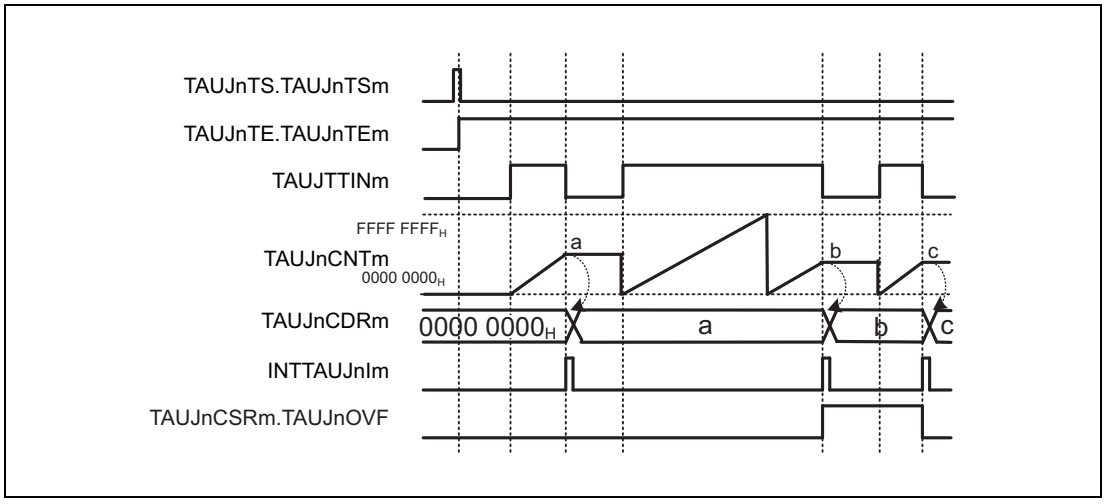

**Figure 26.31 General Timing Diagram for TAUJTTINm Input Signal Width Measurement Function**

### 26.12.4.4 Register Settings

#### (1) TAUJnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUJnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output CK0<br>01: Prescaler output CK1<br>10: Prescaler output CK2<br>11: Prescaler output CK3 |
| 13, 12 | TAUJnCCS[1:0] | Write $00_B$. |
| 11 | TAUJnMAS | Write $0_B$. |
| 10 to 8 | TAUJnSTS[2:0] | Write $010_B$. |
| 7, 6 | TAUJnCOS[1:0] | See **Table 26.53, Effects of an Overflow**. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUJnMD[4:1] | Write $0110_B$. |
| 0 | TAUJnMD0 | Write $0_B$. |

#### (2) TAUJnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUJnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 26.55 Contents of the TAUJnCMURm Register for TAUJTTINm Input Signal Width Measurement Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUJnTIS[1:0] | 10: Rising and falling edge detection (low width measurement)<br>11: Rising and falling edge detection (high width measurement) |

#### (3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input signal width measurement function. Therefore, these registers must be set to 0.

**Table 26.56 Simultaneous Rewrite Settings for TAUJTTINm Input Signal Width Measurement Function**

| Bit Name | Setting |
|---|---|
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0. |

### 26.12.4.5 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

**Table 26.57 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function**

| | Operation | Status of TAUJn |
|---|---|---|
| Initial channel setting | Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.54, Contents of the TAUJnCMORm Register for TAUJTTINm Input Signal Width Measurement Function** and **Table 26.55, Contents of the TAUJnCMURm Register for TAUJTTINm Input Signal Width Measurement Function**.<br><br>The TAUJnCDRm register functions as a capture register. | Channel operation is stopped. |
| Start operation | Set TAUJnTS.TAUJnTSm to 1.<br>TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge.<br>When a TAUJTTINm start edge is detected, TAUJnCNTm starts to count up. |
| During operation | The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time.<br>The TAUJnCSCm.TAUJnCLOV bit can be set to 1. | TAUJnCNTm starts to count up from 0000 $0000_H$.<br>When a TAUJTTINm valid edge is detected:<br>• TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and retains its value.<br>• INTTAUJnIm is then generated.<br>• Counting stops at the "value that transferred to TAUJnCDRm + 1" and TAUJnCNTm waits for detection of the TAUJTTINm start edge.<br>Afterwards, this procedure is repeated. |
| Stop operation | Set TAUJnTT.TAUJnTTm to 1.<br>TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops.<br>TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values. |

Restart operation

### 26.12.4.6 Specific Timing Diagrams: Overflow Behavior

#### (1) TAUJnCMORm.TAUJnCOS[1:0] = $00_B$

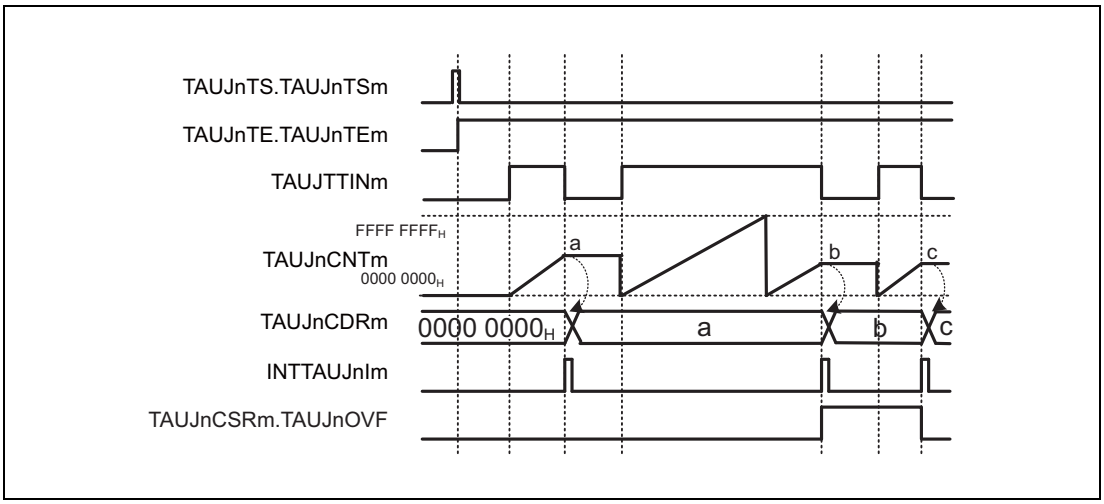

**Figure 26.32 TAUJnCMORm.TAUJnCOS[1:0] = $00_B$, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = $11_B$**

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge with no overflow occurring, TAUJnCSRm.TAUJnOVF is cleared to 0.

### (2) TAUJnCMORm.TAUJnCOS[1:0] = $01_B$

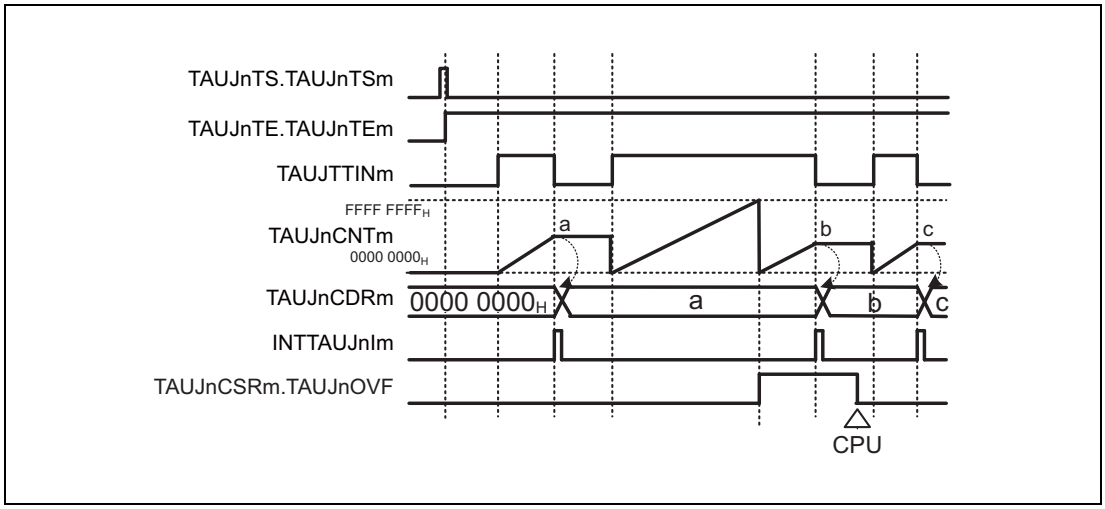

**Figure 26.33 TAUJnCMORm.TAUJnCOS[1:0] = $01_B$, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = $11_B$**

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

### (3) TAUJnCMORm.TAUJnCOS[1:0] = $10_B$

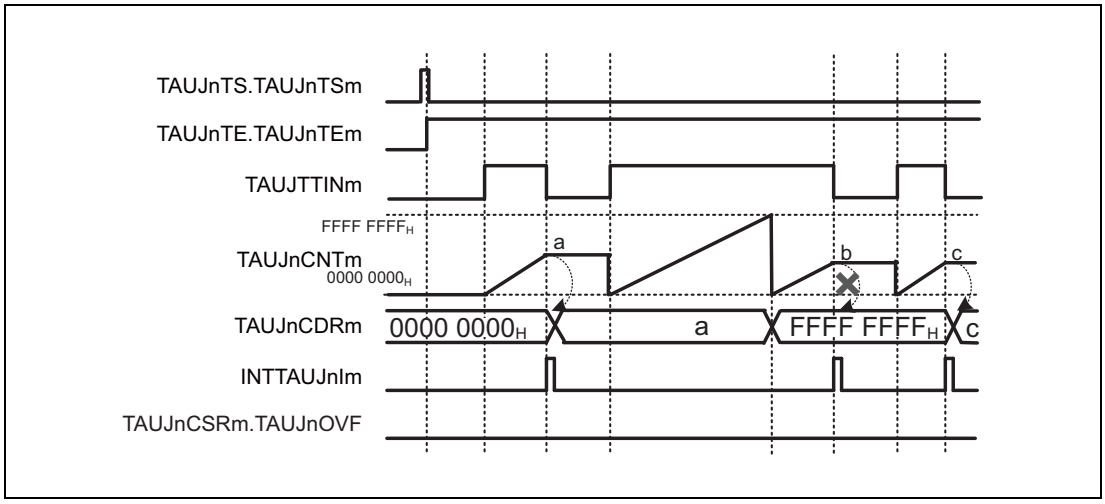

**Figure 26.34 TAUJnCMORm.TAUJnCOS[1:0] = $10_B$, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = $11_B$**

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$ and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

### (4) TAUJnCMORm.TAUJnCOS[1:0] = $11_B$

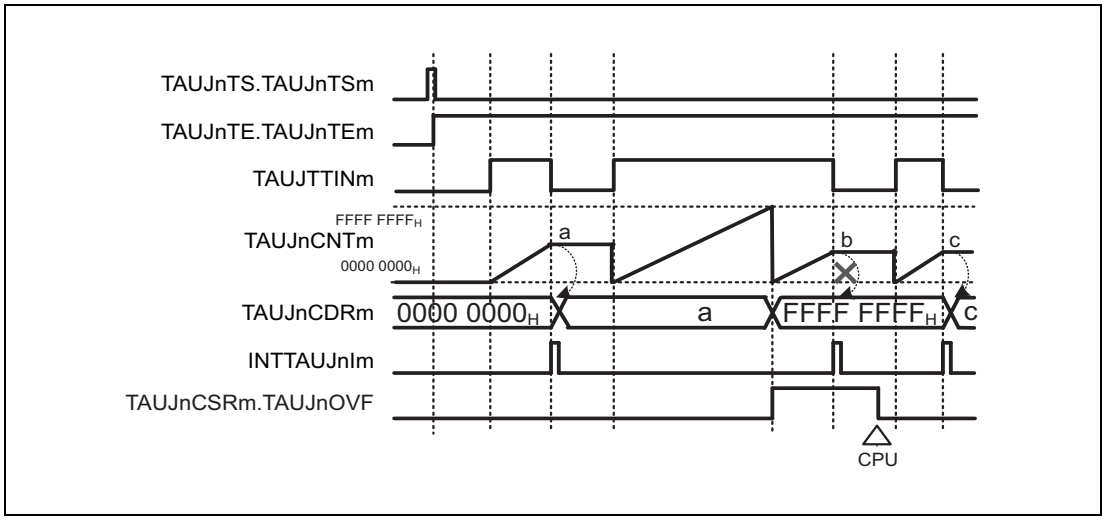

**Figure 26.35 TAUJnCMORm.TAUJnCOS[1:0] = $11_B$, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = $11_B$**

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

## 26.12.5 TAUJTTINm Input Position Detection Function

### 26.12.5.1 Overview

#### Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUJTTINm signal.

#### Prerequisites

TAUJTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter starts to count from 0000 $0000_H$. When a valid TAUJTTINm input edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter continues to count.

When the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 $0000_H$.

**NOTE**

The input TAUJTTINm is sampled at the frequency of the operation clock, specified by TAUJnCMORm.TAUJnCKS[1:0] bits. As a result, the output cycle of TAUJTTOUTm has an error of ± 1 operation clock cycle.

#### Conditions

If the TAUJnCMORm. TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated.

### 26.12.5.2 Equations

Function duration at a TAUJTTINm input pulse =
count clock cycle × (TAUJnCDRm capture value + 1)

### 26.12.5.3 Block Diagram and General Timing Diagram

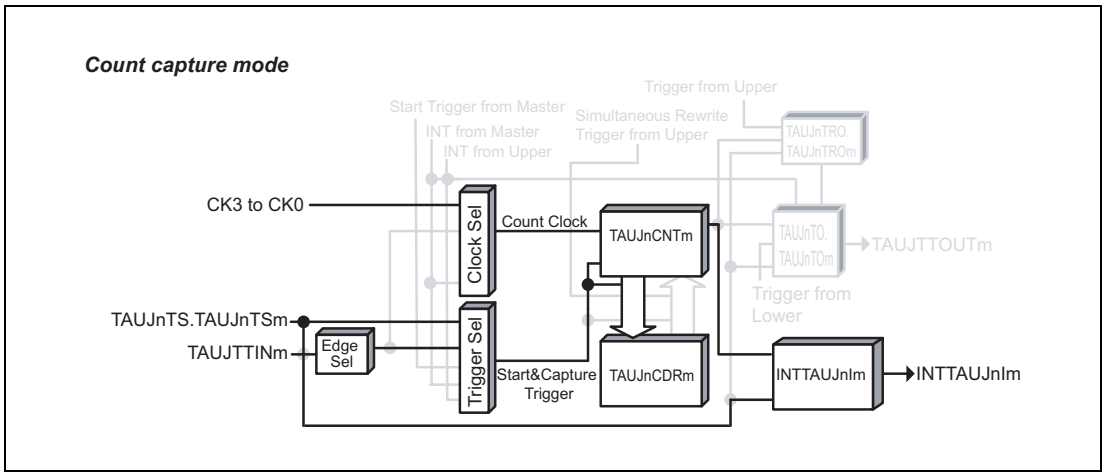

**Figure 26.36 Block Diagram of TAUJTTINm Input Period Count Detection Function**

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = $00_B$)

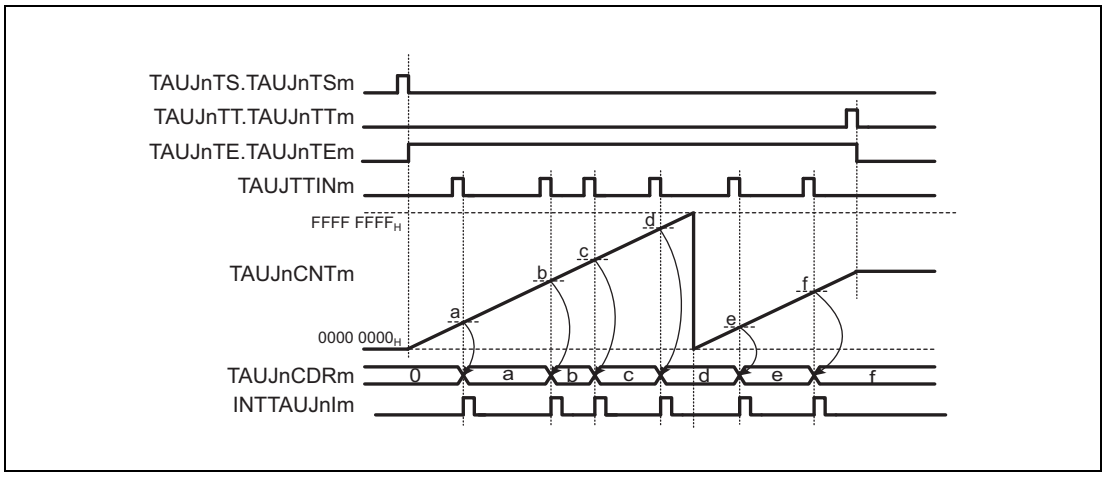

**Figure 26.37 General Timing Diagram for TAUJTTINm Input Position Detection Function**

| Stop operation | Set TAUJnTT.TAUJnTTm to 1.<br>TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops.<br>TAUJnCNTm stops and retains its current value. |

Restart operation

### 26.12.5.6 Specific Timing Diagrams

#### (1) Operation stop and restart

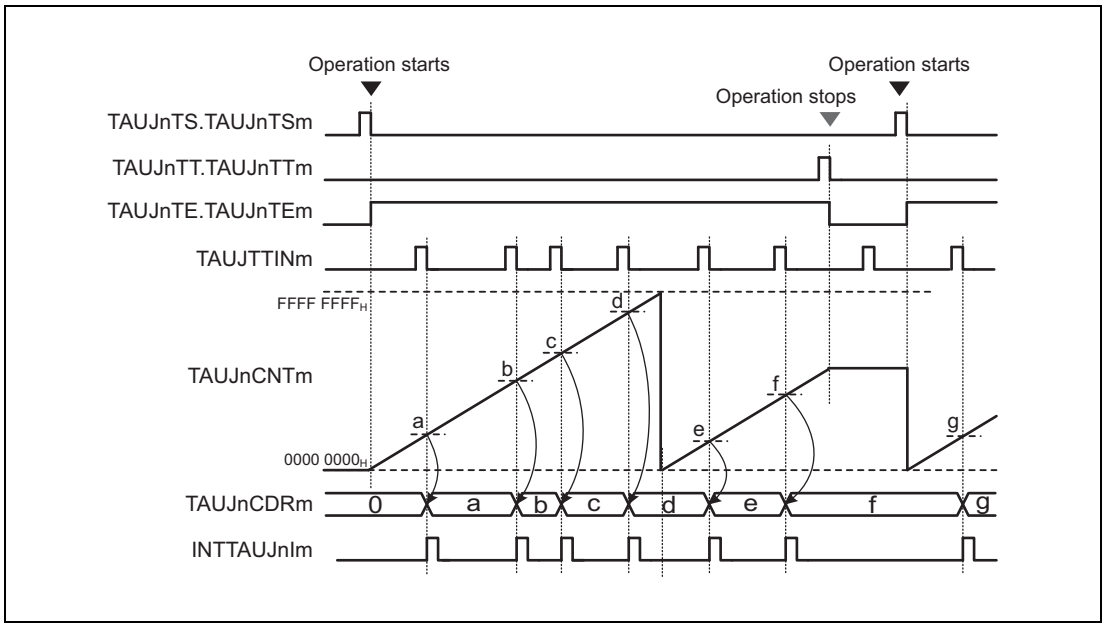

**Figure 26.38 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = $00_B$)**

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. TAUJnCNTm restarts to count from 0000 $0000_H$.

## 26.12.6 TAUJTTINm Input Period Count Detection Function

### 26.12.6.1 Overview

#### Summary

This function measures the cumulative width of a TAUJTTINm input signal.

#### Prerequisites

TAUJTTOUTm is not used for this function.

#### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter awaits a valid TAUJTTINm input edge.

When a valid TAUJTTINm input start edge is detected, the counter starts to count from 0000 $0000_H$.

When a valid TAUJTTINm input stop edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter stops and retains its value until the next valid TAUJTTINm input start edge is detected.

When the next valid TAUJTTINm input start edge is detected, the counter restarts counting from the stop value.

When the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 $0000_H$.

This function cannot be forcibly restarted.

**NOTE**

The input TAUJTTINm signal is sampled at the frequency of the operation clock, specified by the TAUJnCMORm.TAUJnCKS[1:0] bits.

#### Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = $10_B$, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = $11_B$, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

### 26.12.6.2 Equations

Cumulative TAUJTTINm input width =
count clock cycle × (TAUJnCDRm capture value + 1)

### 26.12.6.3 Block Diagram and General Timing Diagram

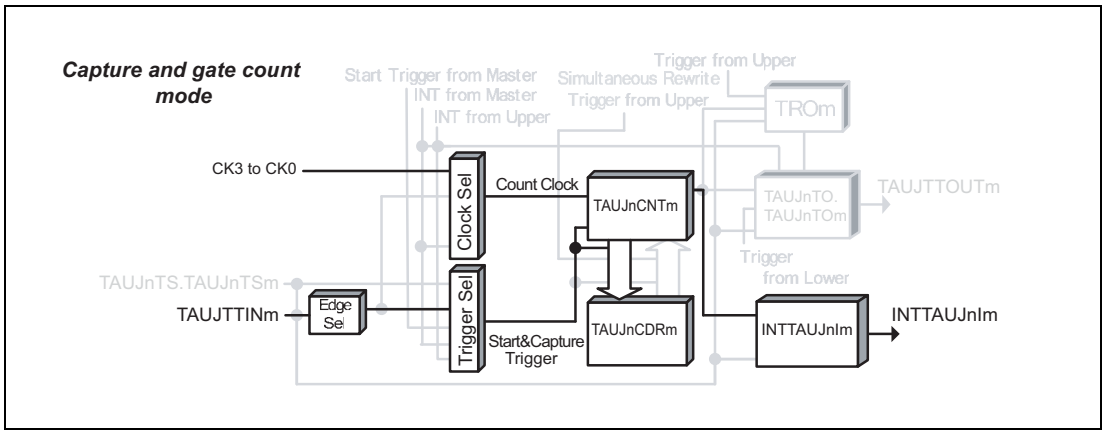

**Figure 26.39 Block Diagram for TAUJTTINm Input Period Count Detection Function**

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = $11_B$)

**Table 26.63 Contents of the TAUJnCMURm Register for TAUJTTINm Input Period Count Detection Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUJnTIS[1:0] | 10: Rising and falling edge detection (Low width measurement)<br>11: Rising and falling edge detection (High width measurement) |

#### (3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input period count detection function. Therefore, these registers must be set to 0.

**Table 26.64 Simultaneous Rewrite Settings for TAUJTTINm Input Period Count Detection Function**

| Bit Name | Setting |
|---|---|
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0 |

### 26.12.6.5 Operating Procedure for TAUJTTINm Input Period Count Detection Function

**Table 26.65 Operating Procedure for TAUJTTINm Input Period Count Detection Function**

| | Operation | Status of TAUJn |
|---|---|---|
| Initial channel setting | Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.62, Contents of the TAUJnCMORm Register for TAUJTTINm Input Period Count Detection Function** and **Table 26.63, Contents of the TAUJnCMURm Register for TAUJTTINm Input Period Count Detection Function**.<br><br>The TAUJnCDRm register functions as a capture register. | Channel operation is stopped. |
| Start operation | Set TAUJTS.TAUJnTSm to 1.<br>TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge. |
| During operation | TAUJTTINm edge detection<br><br>The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time. | When a TAUJTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUJnCNTm starts to count up from the stop value.<br>When TAUJnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUJnCDRm and INTTAUJnIm is generated.<br>Counting stops at the “value transferred to TAUJnCDRm + 1” and TAUJnCNTm waits for detection of the TAUJTTINm start edge.<br>When TAUJnCNTm reaches FFFF FFFF$_H$, the counter restarts from 0000 0000$_H$.<br>Afterwards, this procedure is repeated. |
| Stop operation | Set TAUJnTT.TAUJnTTm to 1.<br>TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops.<br>TAUJnCNTm stops and retains its current value. |

Restart operation

### 26.12.6.6 Specific Timing Diagrams

#### (1) Operation Stop and Restart

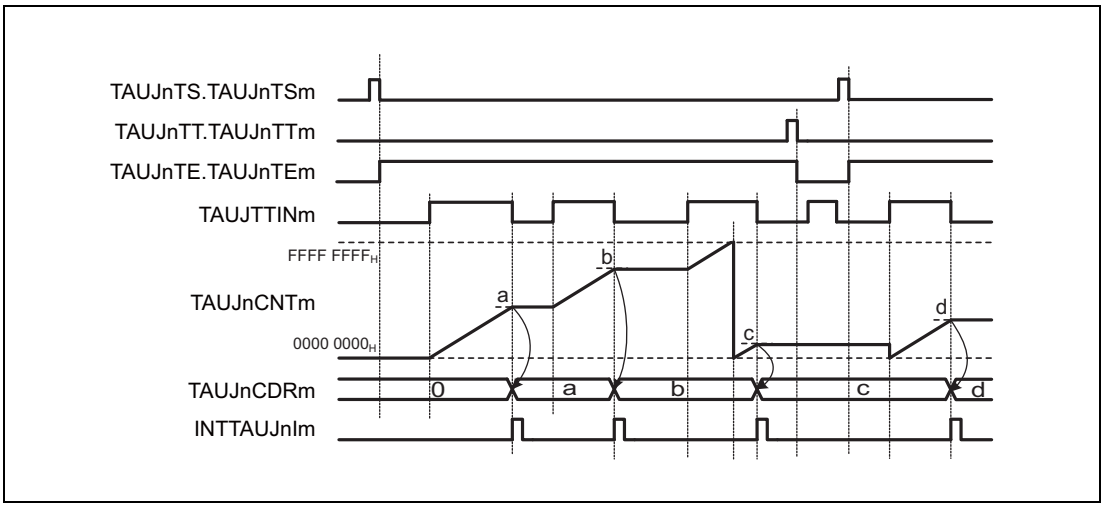

**Figure 26.41 Operation Stop and Restart (TAUJnCMURm.TAUJnTIS[1:0] = $11_B$)**

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. TAUJnCNTm restarts to count from $0000\ 0000_H$.

## 26.12.7 Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

### 26.12.7.1 Overview

#### Summary

This function measures the width of an individual TAUJTTINm input signal. An interrupt is generated if the TAUJTTINm input width is longer than FFFF $FFFF_H$ + 1.

#### Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF $FFFF_H$.

#### Description

he counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF $FFFF_H$ is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUJTTINm input start edge is detected, TAUJnCNTm loads FFFF $FFFF_H$ and starts to count down.

If the counter reaches 0000 $0000_H$ before a stop edge is detected, an interrupt is generated.

#### Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = $10_B$, the TAUJTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = $11_B$, the TAUJTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

**NOTE**

The counter cannot be restarted during operation.

### 26.12.7.2 Block Diagram and General Timing Diagram

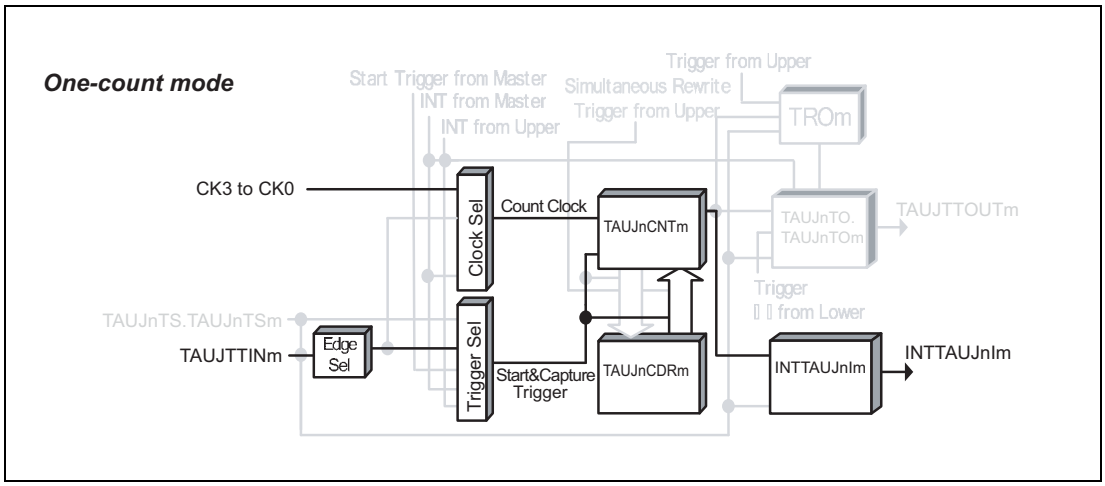

**Figure 26.42 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)**

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = $11_B$)

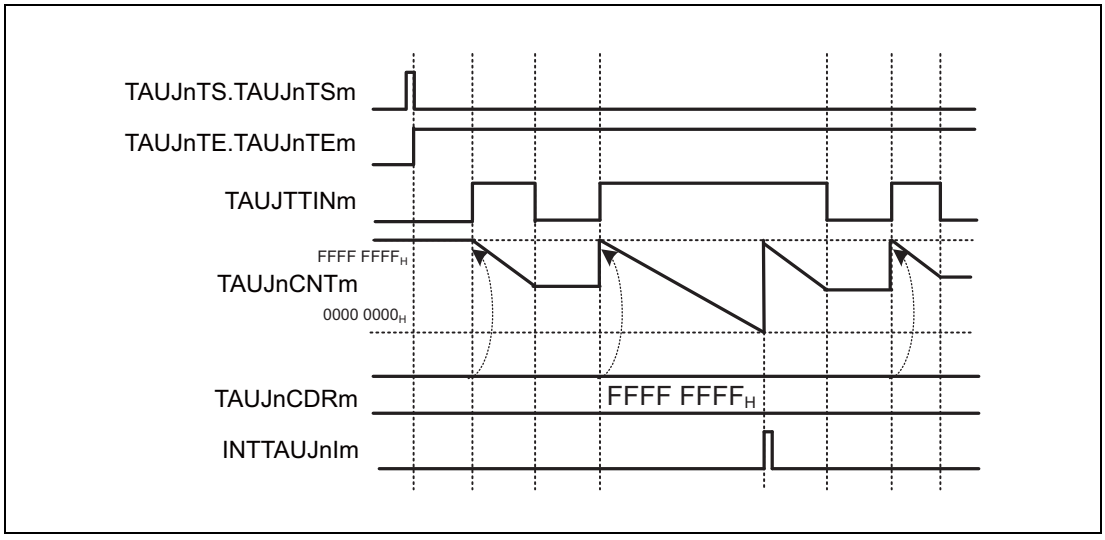

**Figure 26.43 General Timing Diagram for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)**

### 26.12.7.3 Register Settings

#### (1) TAUJnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 13, 12 | TAUJnCCS[1:0] | Write $00_B$. |
| 11 | TAUJnMAS | Write $0_B$. |
| 10 to 8 | TAUJnSTS[2:0] | Write $010_B$. |
| 7, 6 | TAUJnCOS[1:0] | Write $00_B$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUJnMD[4:1] | Write $0100_B$. |
| 0 | TAUJnMD0 | Write $0_B$. |

#### (2) TAUJnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUJnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 26.67 Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUJnTIS[1:0] | 10: Rising and falling edge detection (Low width measurement)<br>11: Rising and falling edge detection (High width measurement) |

#### (3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the overflow interrupt output function (during TAUJTTINm width measurement). Therefore, these registers must be set to 0.

**Table 26.68 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)**

| Bit name | Setting |
|---|---|
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0 |

Restart operation

## 26.12.8 Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

### 26.12.8.1 Overview

#### Summary

This function measures the cumulative width of a TAUJTTINm input signal. An interrupt is generated if the cumulative TAUJTTINm input width is longer than FFFF FFFF$_H$, and an overflow interrupt can be output.

#### Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF FFFF$_H$.

#### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF FFFF$_H$ is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUJTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000 0000$_H$ an interrupt is generated. FFFF FFFF$_H$ is loaded to TAUJnCNTm and the counter continues to count down until a TAUJTTINm input stop edge is detected.

#### Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10$_B$, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11$_B$, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

**NOTE**

The counter cannot be restarted during operation.

### 26.12.8.2 Block Diagram and General Timing Diagram

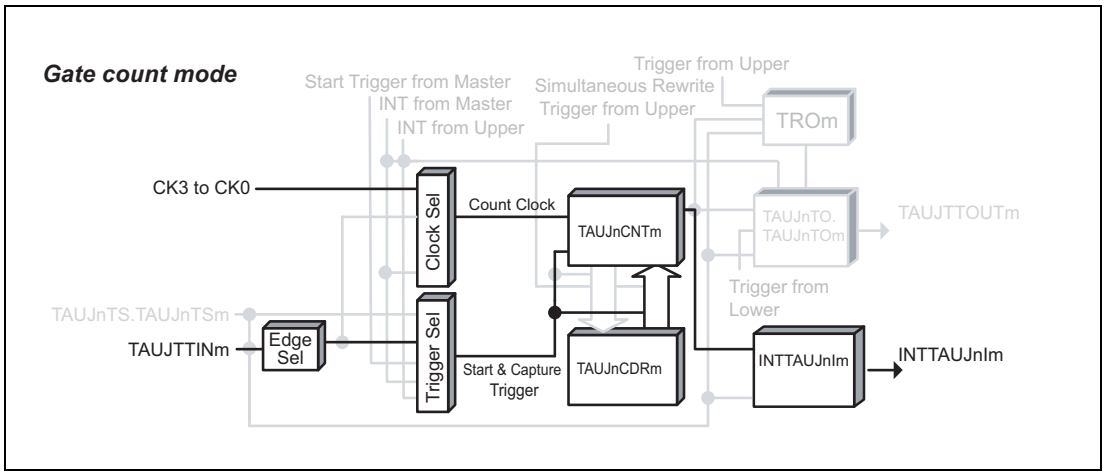

**Figure 26.44 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)**

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = $11_B$)

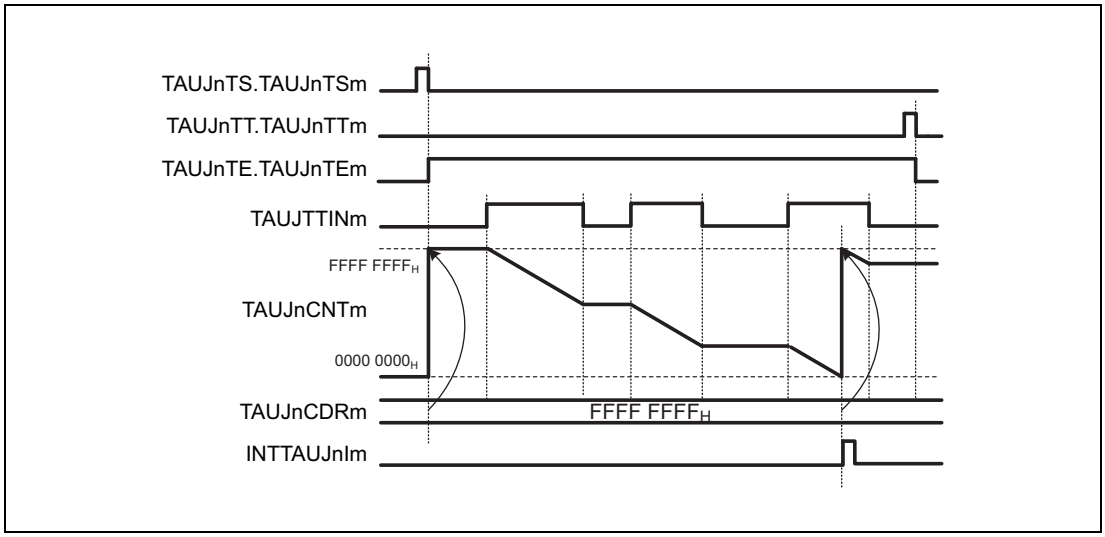

**Figure 26.45 General Timing Diagram For Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)**

### 26.12.8.3 Register Settings

#### (1) TAUJnCMORm

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

#### (3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the Overflow Interrupt Output Function (During TAUJTTINm Input Period Count Detection). Therefore, these registers must be set to 0.

**Table 26.72 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)**

| Bit Name | Setting |
|---|---|
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0. |

Restart operation

# 26.13 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the TAUJ. For a general overview of synchronous channel operation, see **Section 26.2, Overview**.

## 26.13.1 PWM Output Function

### 26.13.1.1 Overview

#### Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty of the TAUJTTOUTm to be set. The pulse cycle is set in the master channel. The duty is set in the slave channel.

#### Prerequisites

- Two channels
- The operation mode for the master channel should be set to the interval timer mode. (See **Table 26.74, Contents of the TAUJnCMORm Register for the Master Channel of the PWM Output Function**.)
- The operation mode for the slave channel should be set to the one-count mode. (See **Table 26.77, Contents of the TAUJnCMORm Register for the Slave Channel of the PWM Output Function**.)
- TAUJTTOUTm is not used for the master channel of this function.
- The channel output mode for the slave channels should be set to synchronous channel output mode 1. (See **26.7, Channel Output Modes**.)

#### Description

The counters are enabled by setting the channel trigger bits (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counters start to count down from these values. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set or reset to realize the PWM output.

- Master channel:

  When the counter of the master channel reaches 0000 $0000_H$ and pulse cycle time has elapsed, INTTAUJnIm is generated. The TAUJnCDRm value is loaded to TAUJnCNTm, and the counter counts down.

- Slave channel(s):

  INTTAUJnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUJnCDRm (slave) is loaded to TAUJnCNTm (slave) and the counter starts to count down from this value. The TAUJTTOUTm signal is set to the active level.
  When the counter reaches 0000 $0000_H$, i.e. duty time has elapsed, INTTAUJnIm is generated and the TAUJTTOUTm signal is set to the inactive level. The counter returns to FFFF $FFFF_H$ and awaits the next INTTAUJnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 for the master and slave channel(s), which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm of master and slave

channel(s) stop but retain their values. The counters can be restarted by setting TAUJnTS.TAUJnTSm to 1.

**Conditions**

Simultaneous rewrite can be used with this function. Please see **Section 26.6, Simultaneous Rewrite**.

### 26.13.1.2 Equations

Pulse cycle = (TAUJnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUJnCDRm (slave)/(TAUJnCDRm (master) +1 )) × 100

– Duty cycle = 0%
  TAUJnCDRm (slave) = $0000\ 0000_H$
– Duty cycle = 100%
  TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1

### 26.13.1.3 Block Diagram and General Timing Diagram

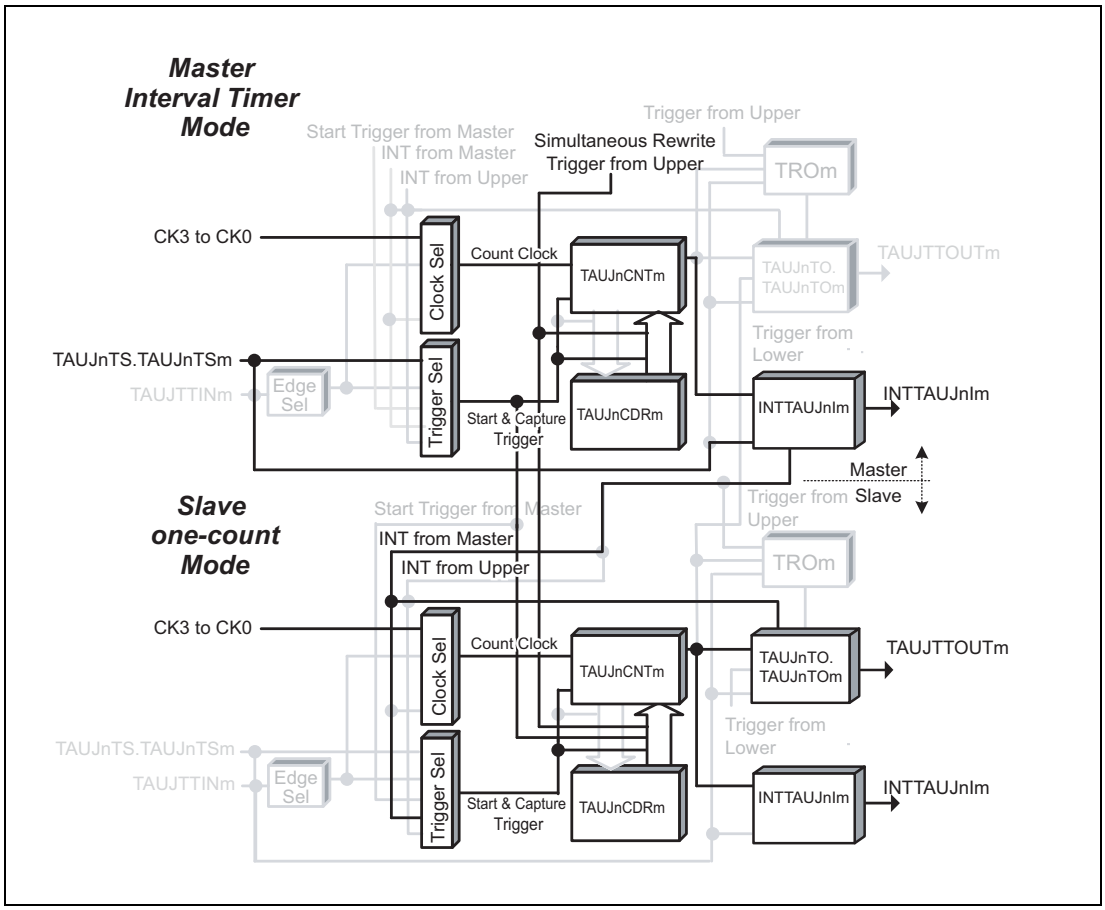

**Figure 26.46 Block Diagram for PWM Output Function**

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUJnTOL.TAUJnTOLm = 0)

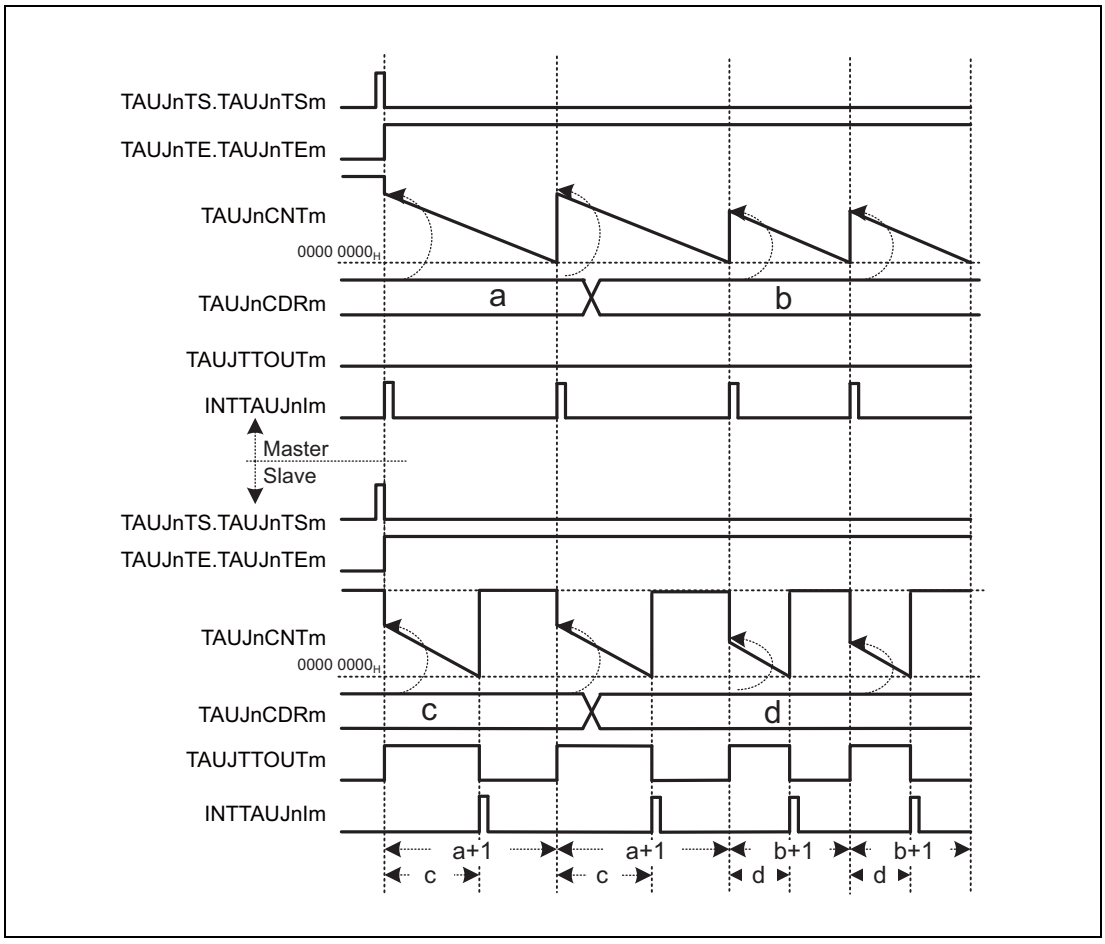

**Figure 26.47 General Timing Diagram for PWM Output Function**

**NOTE**

- The interval between the starting to count and an interrupt being generated is the value of corresponding TAUJnCDRm + 1.
- TAUJTTOUTm of the slave channel will rise with a delay of one count clock after the rising of INTTAUJnIm of the master channel.

### 26.13.1.4 Register Settings for the Master Channel

#### (1) TAUJnCMORm for the master channel

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUJnTIS[1:0] | 00: Not used, so set to 00. |

#### (3) Channel output mode for the master channel

The channel output mode is not used by this function.

### (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

**Table 26.76 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function**

| Bit name | Setting |
|---|---|
| TAUJnRDE.TAUJnRDEm | 1: Enables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts counting. |

### 26.13.1.5 Register Settings for the Slave Channel(s)

#### (1) TAUJnCMORm for the slave channel(s)

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TAUJnCKS[1:0] | | TAUJnCCS[1:0] | | TAUJn MAS | TAUJnSTS[2:0] | | | TAUJnCOS[1:0] | | — | TAUJnMD[4:1] | | | | TAUJn MD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

**Table 26.77 Contents of the TAUJnCMORm Register for the Slave Channel of the PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15, 14 | TAUJnCKS[1:0] | Operation Clock Selection<br>00: Prescaler output CK0<br>01: Prescaler output CK1<br>10: Prescaler output CK2<br>11: Prescaler output CK3<br>The value of the TAUJnCKS[1:0] bits of the master and slave channel(s) must be identical. |
| 13, 12 | TAUJnCCS[1:0] | Write $00_B$. |
| 11 | TAUJnMAS | Write $0_B$. |
| 10 to 8 | TAUJnSTS[2:0] | Write $100_B$. |
| 7, 6 | TAUJnCOS[1:0] | Write $00_B$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUJnMD[4:1] | Write $0100_B$. |
| 0 | TAUJnMD0 | Write $1_B$. |

#### (2) TAUJnCMURm for the slave channel(s)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TAUJnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 26.78 Contents of the TAUJnCMURm Register for the Slave Channel of the PWM Output Function**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TAUJnTIS[1:0] | 00: Not used, so set to 00. |

### (3) Channel output mode for the slave channel(s)

**Table 26.79 Control Bit Settings for Synchronous Channel Output Mode 1**

| Bit Name | Setting |
|---|---|
| TAUJnTOE.TAUJnTOEm | Write $1_B$. |
| TAUJnTOM.TAUJnTOMm | Write $1_B$. |
| TAUJnTOC.TAUJnTOCm | Write $0_B$. |
| TAUJnTOL.TAUJnTOLm | 0: Positive logic<br>1: Negative logic |

### (4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.

**Table 26.80 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function**

| Bit name | Setting |
|---|---|
| TAUJnRDE.TAUJnRDEm | 1: Enables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts counting. |

### 26.13.1.6 Operating Procedure for PWM Output Function

Table 26.81 Operating Procedure for PWM Output Function

| | Operation | Status of TAUJn |
|---|---|---|
| Initial channel setting | Master channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section 26.13.1.4, Register Settings for the Master Channel**.<br><br>Slave channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section 26.13.1.5, Register Settings for the Slave Channel(s)**.<br><br>Set the values of the TAUJnCDRm registers of all channels. | Channel operation is stopped. |
| Start operation | Set TAUJnTS.TAUJnTSm of the master and slave channels to 1 simultaneously.<br>TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start.<br>INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set. |
| During operation | TAUJnCDRm can be changed at any time.<br>TAUJnCNTm and TAUJnRSF.TAUJnRSFm can be read at any time.<br><br>TAUJnRDT.TAUJnRDTm can be changed during operation. | TAUJnCNTm of the master channel loads TAUJnCDRm and counts down. When the counter reaches 0000 $0000_H$:<br>• INTTAUJnIm (master) is generated.<br>• TAUJnCNTm (master) loads the TAUJnCDRm value and continues count operation.<br>• TAUJnCNTm (slave) loads the TAUJnCDRm value and counts down.<br>• TAUJTTOUTm (slave) is set to the active level.<br>When TAUJnCNTm (slave) reaches 0000 $0000_H$:<br>• INTTAUJnIm (slave) is generated.<br>• TAUJTTOUTm (slave) is set to the inactive level. |
| Stop operation | Set TAUJnTT.TAUJnTTm of the master and slave channels to 1 simultaneously.<br>TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops.<br>TAUJnCNTm and TAUJTTOUTm stop and retain their current values. |

Restart operation

### 26.13.1.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

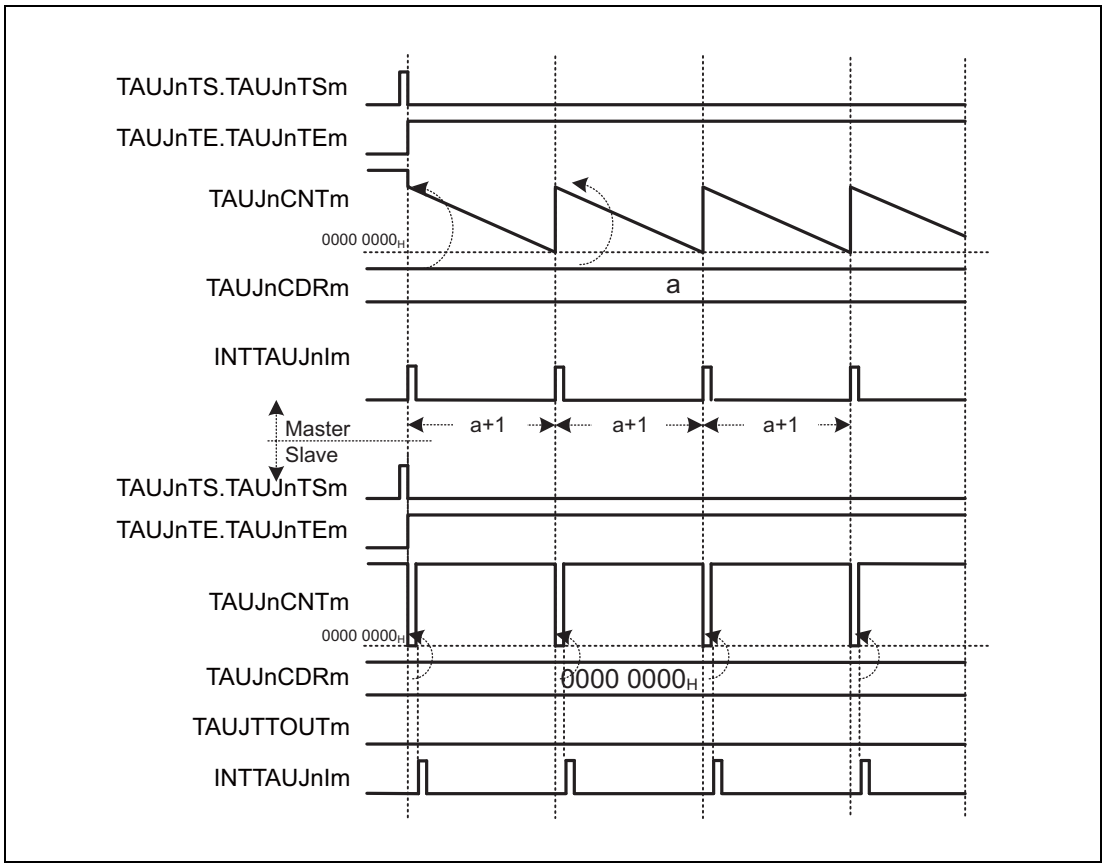

**Figure 26.48 TAUJnCDRm (slave) = 0000 0000$_H$, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)**

- Every time the master channel generates an interrupt (INTTAUJnIm), 0000 0000$_H$ is loaded to TAUJnCNTm (slave). As a result, a slave channel interrupt (INTTAUJnIm) is generated at the same time and TAUJTTOUTm remains inactive.
- The value of TAUJnCDRm is loaded into TAUJnCNTm (slave) to generate an interrupt.

**(2) Duty cycle = 100%**

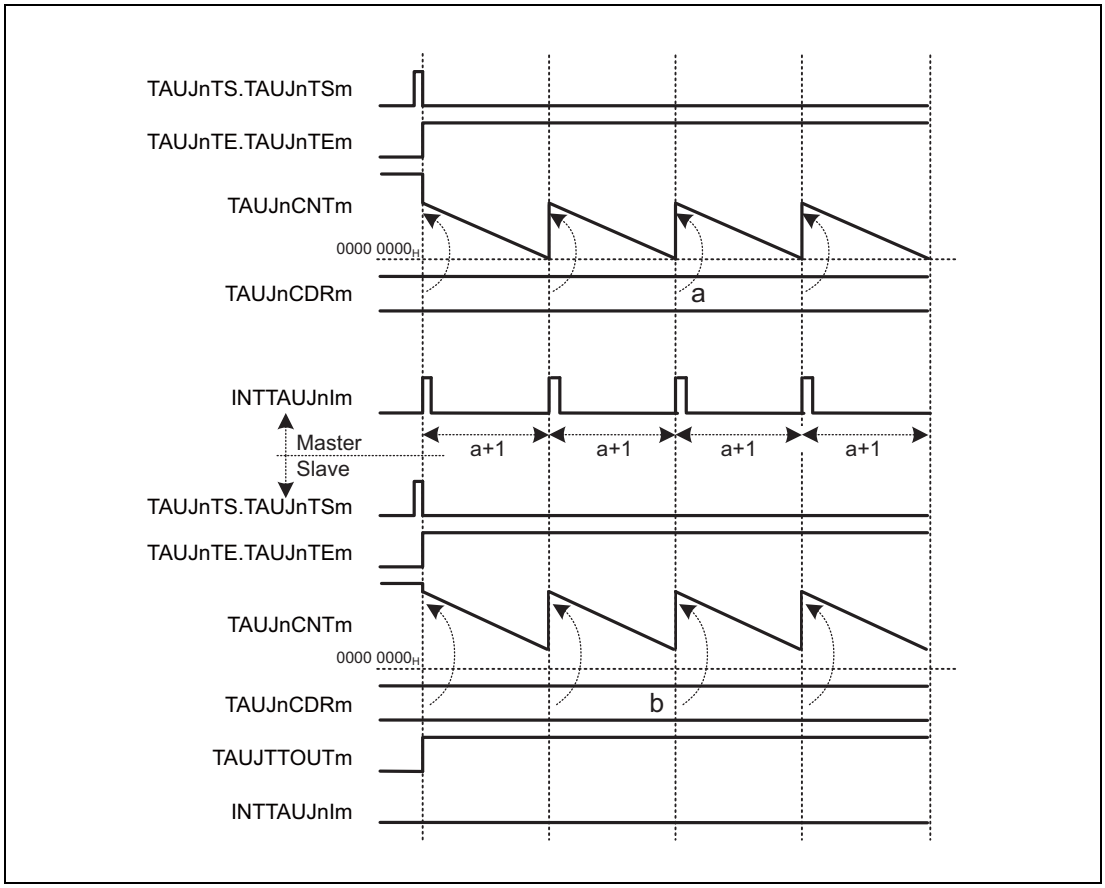

**Figure 26.49 TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)**

If the TAUJnCDRm (slave) value is greater than the TAUJnCDRm (master) value, no interrupt occurs because the counter of the slave channel does not reach 0000 $0000_H$. TAUJTTOUTm remains active.

### (3) Operation stop and restart

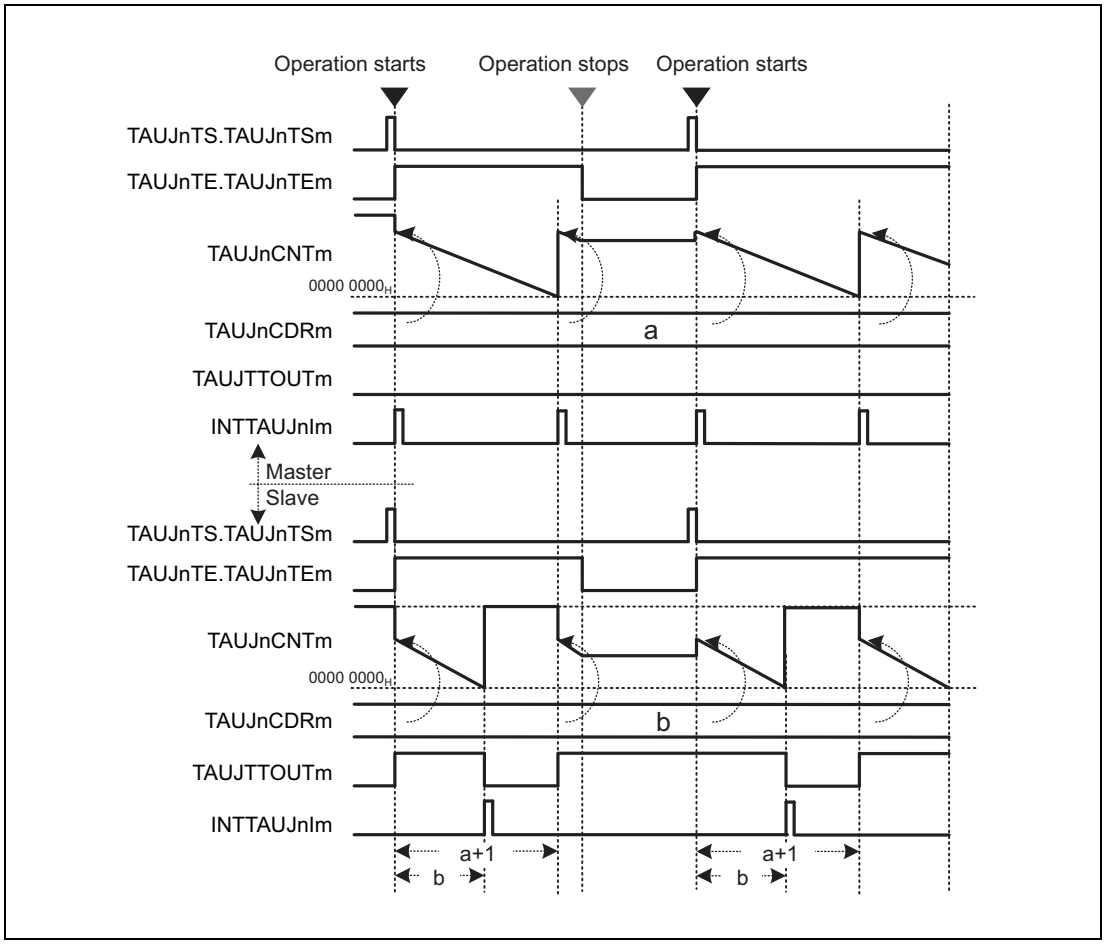

**Figure 26.50 Operation Stop and Restart, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)**

- The counter can be stopped by setting TAUJnTT.TAUJnTTm of master and slave channels to 1. This sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm of every channel stop and retain their current values. No interrupt occurs.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm of master and slave channels to 1. The TAUJnCDRm value of master and slave channels is loaded into TAUJnCNTm. The counter starts to count down from this value.

# Section 27 Real-Time Clock (RTCA)

This section contains a generic description of the Real-Time Clock (RTCA).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the RTCA.

## 27.1 Features of RH850/F1K RTCA

### 27.1.1 Number of Units and Channels

This microcontroller has the following number of RTCA units.

Each RTCA unit has one channel RTCA. “Number of channels” is used with the same meaning as “number of units” in this section.

**Table 27.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | — | 1 | |
| Name | — | RTCAn (n = 0) | |

**Table 27.2 Index**

| Index | Description |
|---|---|
| n | Throughout this section, the individual RTCA units are identified by the index “n” (n = 0); for example, RTCAnCTL0 is the RTCAn control register 0. |

### 27.1.2 Register Base Address

RTCAn base addresses are listed in the following table.

RTCAn register addresses are given as offsets from the base addresses.

**Table 27.3 Register Base Address**

| Base Address Name | Base Address |
|---|---|
| <RTCA0_base> | FFE7 $8000_H$ |

### 27.1.3 Clock Supply

The RTCAn clock supply is shown in the following table.

**Table 27.4 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| RTCA0 | RTCATCKI | CKSCLK_ARTCA | Macro clock |
| | PCLK | CPUCLK2 | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |

### 27.1.4 Interrupt Requests

RTCAn interrupt requests are listed in the following table.

**Table 27.5 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **RTCA0** | | | |
| RTCATINT1S | 1-second interval interrupt | 209 | — |
| RTCATINTAL | Alarm interrupt | 210 | — |
| RTCATINTR | Fixed interval interrupt | 211 | — |

### 27.1.5 Reset Sources

RTCAn reset sources are listed in the following table. RTCAn is initialized by these reset sources.

**Table 27.6 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| RTCA0 | Power-up reset (PURES) |

### 27.1.6 External Input/Output Signals

External input/output signals of RTCAn are listed below.

**Table 27.7 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **RTCA0** | | |
| RTCAT1HZ | 1-Hz pulse output | RTCA0OUT*1 |

Note 1. RTCA0OUT is connected to TAUJ0. For details, see **Section 26, Timer Array Unit J (TAUJ)**.

**CAUTION**

**When port P8_6 is used as RTCA0OUT, port P8_6 pin outputs a low-level RESETOUT signal while a reset is asserted and continues to output a low level after the reset is deasserted. For details, see Section 2.11.1.1, P8_6: RESETOUT.**

## 27.2 Overview

### 27.2.1 Functional Overview

The Real-Time Clock (RTCA) has the following features:

- Count clock selection from 32 kHz to 4.194304 MHz
- Counters for years, months, day of the month, day of the week, hours, minutes, seconds, and a sub-counter. The calendar covers 99 years. Leap years are handled by hardware automatically.
- One Hz pulse output function
- Fixed interval interrupt function
- Alarm interrupt function
- Clock error correction function if a 32.768-kHz count clock is used

### 27.2.2 Block Diagram

The block diagram shows the main components of the RTCA.

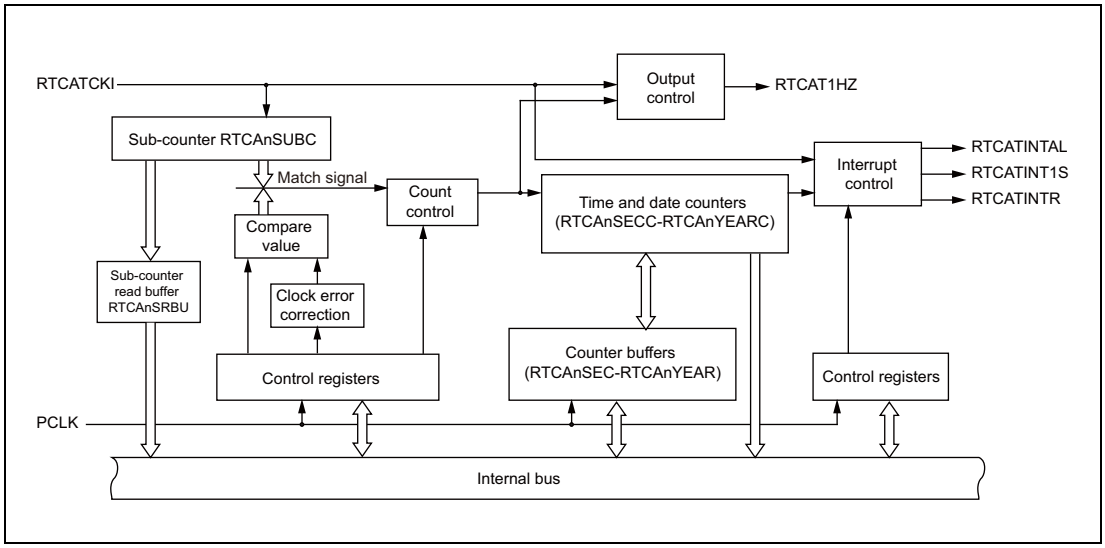

**Figure 27.1 Block Diagram of the RTCA**

### 27.2.3 Description of Blocks

The Real-Time Clock RTCA provides information about the present time and date and can generate wake-up signals (interrupts, alarms). This information is derived from the count clock RTCATCKI.

#### Sub-counter

RTCATCKI is the input to the sub-counter RTCAnSUBC. The sub-counter counts up from 0 until it reaches the compare value. The compare value is always defined as the frequency of RTCATCKI – 1 (in Hz). Thus, the sub-counter overflows after one second. It is then reset to 0 and triggers the seconds counter RTCAnSECC (and, if specified, the interrupt RTCATINT1S).

The sub-counter can generate a fixed interval interrupt every 0.25 seconds, 0.5 seconds, or 1 second, and a 1-Hz output pulse.

#### Time and date counters

The counters for minutes, hours, day of the week, day of the month, months, and years also count up. They have their own overflow limits. If all the lower counters overflow, the upper counter counts up.

The overflow limit of the counter for the day of the month (RTCAnDAYC) depends on the present month (28, 30, or 31 days) and (in February) on the year counter RTCAnYEARC (years 0, 4, 8, 12, etc. are considered leap years).

The hours counter RTCAnHOURC can be switched between 12- and 24-hour formats.

The counters for seconds, minutes, hours, day of the month, and months can generate a fixed interval interrupt upon overflow (RTCATINTR).

The counters for minutes, hours, and day of the week can also generate an alarm interrupt (RTCATINTAL), e.g. every Tuesday and Thursday at 10:32.

#### Counter buffers

All counters can be read directly at any time. The clock signal used to access the read/write registers and the count clock are usually asynchronous. An overflow of the sub-counter during the read operation can make all read values obsolete. Therefore, reading the counters must be performed using a special procedure. For details, see **Section 27.5.3, Reading Clock Counters**.

For reasons of synchronization, the counters cannot be written directly.

For reading and writing, all counters are accompanied by buffer registers. The buffer registers provide a synchronized way for reading the counters and for setting time and date. When they are used, the operation of the sub-counter must first be suspended and then re-activated (see also **Section 27.5.3, Reading Clock Counters** and **Section 27.5.2, Updating Clock Counters**.

The RTCAnTIMEC and RTCAnCALC registers and their corresponding buffer registers can be used to check and set the time (hours, minutes and seconds) or the date (day of the week, day of the month, month, and year) with one read/write operation.

# 27.3 Registers

## 27.3.1 List of Registers

RTCA registers are listed in the following table.

<RTCAn_base> is defined in **Section 27.1.2, Register Base Address**.

**Table 27.8 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| **Control registers** | | | |
| RTCAn | Control register 0 | RTCAnCTL0 | <RTCAn_base> + $00_H$ |
| | Control register 1 | RTCAnCTL1 | <RTCAn_base> + $04_H$ |
| | Control register 2 | RTCAnCTL2 | <RTCAn_base> + $08_H$ |
| **Sub-counter registers** | | | |
| RTCAn | Sub-count register | RTCAnSUBC | <RTCAn_base> + $0C_H$ |
| | Sub-count register read buffer | RTCAnSRBU | <RTCAn_base> + $10_H$ |
| | Clock error correction register | RTCAnSUBU | <RTCAn_base> + $38_H$ |
| | Sub-counter compare register | RTCAnSCMP | <RTCAn_base> + $3C_H$ |
| **Clock counter and buffer registers** | | | |
| RTCAn | Seconds count register | RTCAnSECC | <RTCAn_base> + $4C_H$ |
| | Seconds count buffer register | RTCAnSEC | <RTCAn_base> + $14_H$ |
| | Minute count register | RTCAnMINC | <RTCAn_base> + $50_H$ |
| | Minute count buffer register | RTCAnMIN | <RTCAn_base> + $18_H$ |
| | Hour count register | RTCAnHOURC | <RTCAn_base> + $54_H$ |
| | Hour count buffer register | RTCAnHOUR | <RTCAn_base> + $1C_H$ |
| | Day of the week count register | RTCAnWEEKC | <RTCAn_base> + $58_H$ |
| | Day of the week count buffer register | RTCAnWEEK | <RTCAn_base> + $20_H$ |
| | Day count register | RTCAnDAYC | <RTCAn_base> + $5C_H$ |
| | Day count buffer register | RTCAnDAY | <RTCAn_base> + $24_H$ |
| | Month count register | RTCAnMONC | <RTCAn_base> + $60_H$ |
| | Month count buffer register | RTCAnMONTH | <RTCAn_base> + $28_H$ |
| | Year count register | RTCAnYEARC | <RTCAn_base> + $64_H$ |
| | Year count buffer register | RTCAnYEAR | <RTCAn_base> + $2C_H$ |
| **Special counter and buffer registers** | | | |
| RTCAn | Time count register | RTCAnTIMEC | <RTCAn_base> + $68_H$ |
| | Time count buffer register | RTCAnTIME | <RTCAn_base> + $30_H$ |
| | Calendar count register | RTCAnCALC | <RTCAn_base> + $6C_H$ |
| | Calendar count buffer register | RTCAnCAL | <RTCAn_base> + $34_H$ |
| **Alarm time setting registers** | | | |
| RTCAn | Alarm minute setting register | RTCAnALM | <RTCAn_base> + $40_H$ |
| | Alarm hour setting register | RTCAnALH | <RTCAn_base> + $44_H$ |
| | Alarm day of the week setting register | RTCAnALW | <RTCAn_base> + $48_H$ |
| **Emulation register** | | | |
| RTCAn | Emulation register | RTCAnEMU | <RTCAn_base> + $74_H$ |

## 27.3.2 Details of RTCA Control Registers

### 27.3.2.1 RTCAnCTL0 — RTCA Control Register 0

This register controls the count operation of the sub-counter RTCAnSUBC, the format (12-hour/24-hour) of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH, and the operation mode.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** <RTCAn_base> + $00_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RTCAnCE | RTCAnCEST | RTCAnAMPM | RTCAnSLSB | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R/W | R/W | R | R | R | R |

**Table 27.9 RTCAnCTL0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | RTCAnCE | Starts/stops the sub-counter RTCAnSUBC operation.<br>0: Stops the sub-counter operation.<br>All output pins and all status flags in control register RTCAnCTL2 are cleared.<br>1: Starts the sub-counter operation.<br>The sub-counter counts up. |
| 6 | RTCAnCEST | Indicates the operation enabled/stopped status of the sub-counter:<br>0: Operation stopped status<br>1: Operation enabled status<br>For details on how to use this status flag, see **Section 27.5.1, Initial Setting of the RTCA**. |
| 5 | RTCAnAMPM | Selects the format of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH:<br>0: 12-hour format (1 to 12, am/pm)<br>1: 24-hour format (0 to 23, military time)<br>For details on the format, see **Table 27.21, 12- and 24-Hour Format**. |
| 4 | RTCAnSLSB | Selects the operation mode:<br>0: 32.768 kHz mode<br>1: Frequency selection mode<br>For details on the operation modes, see **Section 27.4, Operation**.<br>The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1).<br>For details on the initialization of RTCAn, see **Section 27.5.1, Initial Setting of the RTCA**. |
| 3 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 27.3.2.2 RTCAnCTL1 — RTCA Control Register 1

This register controls the interrupt request generation and the 1-Hz pulse output.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** <RTCAn_base> + $04_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | RTCAnEN1HZ | RTCAnENALM | RTCAnEN1S | RTCAnCT2 | RTCAnCT1 | RTCAnCT0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.10 RTCAnCTL1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | RTCAnEN1HZ | Enables/stops 1-Hz pulse output (RTCAT1HZ):<br>0: RTCAT1HZ disabled (RTCAT1HZ is fixed to 0)<br>1: RTCAT1HZ enabled |
| 4 | RTCAnENALM | Enables/disables alarm interrupt request generation (RTCATINTAL):<br>0: RTCATINTAL disabled<br>1: RTCATINTAL enabled |
| 3 | RTCAnEN1S | Enables/disables 1-second interrupt request generation (RTCATINT1S):<br>0: RTCATINT1S disabled<br>1: RTCATINT1S enabled |
| 2 to 0 | RTCAnCT[2:0] | Specifies the fixed interval interrupt request (RTCATINTR) setting: |

| RTCAnCT[2:0] | RTCATINTR Interrupt Request Generation | |
|---|---|---|
| | Interval | Timing |
| 000 | No interrupt request generation | |
| 001 | Every 0.25 seconds | Every 0.25, 0.5, 0.75 and 1 second |
| 010 | Every 0.5 seconds | Every 0.5 and 1 second |
| 011 | Every second | Every 1 second |
| 100 | Every minute | Every 1 minute 00 seconds |
| 101 | Every hour | Every 1 hour 00 minutes 00 seconds |
| 110 | Every day | Every 1 day 00 hours 00 minutes 00 seconds (i.e., every midnight) |
| 111 | Every month | Every 1 month first day 00 hours 00 minutes 00 seconds (i.e., every first midnight of a month) |

If the settings of RTCAnCT[2:0] are changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), a glitch may be output to RTCATINTR. Implement appropriate interrupt mask processing procedures.

### 27.3.2.3 RTCAnCTL2 — RTCA Control Register 2

This register contains status information and controls the data transfer from the sub-counter RTCAnSUBC to the dedicated sub-counter read buffer RTCAnSRBU and the operation setting of the clock counters (RTCAnSECC to RTCAnYEARC).

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** <RTCAn_base> + $08_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | RTCAnWUST | RTCAnWSST | RTCAnRSST | RTCAnRSUB | RTCAnWST | RTCAnWAIT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R | R/W |

**Table 27.11 RTCAnCTL2 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | RTCAnWUST | Indicates whether RTCAnSUBU write operation has been completed:<br>0: RTCAnSUBU write completed<br>1: RTCAnSUBU write in progress<br>The write operation ends with the next sub-counter overflow.<br>While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSUBU is completed, this bit is set to 1.<br><br>See **Section 27.5.5, Writing to RTCAnSUBU**, for details. |
| 4 | RTCAnWSST | Indicates whether RTCAnSCMP write operation has been completed:<br>0: RTCAnSCMP write completed<br>1: RTCAnSCMP write in progress<br>The write operation ends with the next sub-counter overflow.<br>While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSCMP is completed, this bit is set to 1.<br><br>See **Section 27.5.6, Writing to RTCAnSCMP**, for details. |
| 3 | RTCAnRSST | Indicates whether the value of the sub-counter (RTCAnSUBC) has been transferred to the sub-count register read buffer (RTCAnSRBU):<br>0: Transfer in progress, or waiting for a transfer trigger<br>1: Transfer completed<br>This bit is cleared (transfer is triggered) by RTCAnRSUB=1.This bit is automatically set when the transfer is completed.<br><br>See **Section 27.5.4, Reading RTCAnSRBU**, for details. |
| 2 | RTCAnRSUB | Triggers transfer of the value of the sub-counter (RTCAnSUBC) to the dedicated read buffer (RTCAnSRBU) or clears the transfer state of the sub-counter:<br>0: Transfer status (RTCAnRSST) is cleared.<br>1: Transfer is triggered.<br>This bit is used to read the value of RTCAnSRBU when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1). The value of RTCAnSUBC is synchronized with RTCATCKI and loaded to RTCAnSRBU.<br><br>For details, see **Section 27.5.4, Reading RTCAnSRBU**. |
| 1 | RTCAnWST | Indicates the status of all clock counters (RTCAnSECC to RTCAnYEARC):<br>0: All clock counters are running.<br>1: All clock counters are stopped<br>The sub-counter is still running.<br><br>The clock counters must be stopped before reading or writing clock counter values during sub-counter operation (RTCAnCTL0.RTCAnCE = 1). To stop the clock counters, set RTCAnWAIT = 1. |

**Table 27.11 RTCAnCTL2 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | RTCAnWAIT | Restarts/stops all clock counters (RTCAnSECC to RTCAnYEARC):<br>0: Restarts all clock counters either immediately or immediately after the clock counter write operation finishes.<br>1: Stops all clock counters temporarily. The sub-counter is still running.<br><br>The clock counters must be stopped before reading or writing counter buffers during sub-counter operation (RTCAnCTL0.RTCAnCE = 1).<br><br>**CAUTION**<br>Only one overflow can be held internally. When two overflows occur, the seconds counter is incremented only by one when it is restarted. Thus, the procedure must be completed within one second. |

## 27.3.3 Details of RTCA Sub-Counter Registers

### 27.3.3.1 RTCAnSUBC — RTCA Sub-Count Register

This counter counts the 1-second reference time. It operates using the count clock RTCATCKI.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RTCAn_base> + $0C_H$

**Value after reset:** $0000\ 0000_H$

This register is initialized:

– When write operation is performed to the seconds count buffer register (RTCAnSEC) or to the time count buffer register (RTCAnTIME) and the value is reflected to the seconds count register.

**Table 27.12 RTCAnSUBC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 0 | RTCAnSUBC [21:0] | Sub-counter value<br>The sub-counter only operates while RTCAnCTL0.RTCAnCEST = 1. |

**NOTES**

1. This sub-counter operates with RTCATCKI while the read operation is clocked by PCLK. Reading this sub-counter during operation (RTCAnCTL0.RTCAnCEST = 1) is asynchronous to RTCATCKI and can lead to wrong results.
   Use the sub-count register read buffer (RTCAnSRBU) to read the sub-counter value during operation.
   For details, see **Section 27.5.4, Reading RTCAnSRBU**.
2. The count-operation of this sub-counter depends on the selected operation mode. See **Section 27.4, Operation**, for details.

### 27.3.3.2 RTCAnSRBU — RTCA Sub-Count Register Read Buffer

This register is the read buffer for the sub-counter RTCAnSUBC.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RTCAn_base> + $10_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 27.13 RTCAnSRBU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 0 | RTCAnSRBU [21:0] | Sub-counter value at the time of the last RTCAnSUBC read.<br><br>When RTCAnCTL2.RTCAnRSUB is set to 1, the value of the RTCAnSUBC is loaded to the read buffer in synchronization with RTCATCKI. |

**NOTE**

Perform RTCAnSRBU read according to the flow described in **Section 27.5.4, Reading RTCAnSRBU**.

### 27.3.3.3 RTCAnSUBU — RTCA Clock Error Correction Register

This register enables and specifies clock error correction. This register only applies in 32.768-kHz mode (RTCAnCTL0.RTCAnSLSB = 0).

For details on clock error correction, see **Section 27.4.4, Clock Error Correction**.

**Access:** This register can be read or written in 8-bit units.
Note the following when writing this register during sub-counter operation:
- Previous RTCAnSUBU write must be completed (RTCAnCTL2.RTCAnWUST = 0).
- The write operation ends with the next sub-counter overflow.

**Address:** <RTCAn_base> + $38_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RTCAnDEV | RTCAnF6 | RTCAnF[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.14 RTCAnSUBU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | RTCAnDEV | Specifies how often clock error correction is performed per minute:<br>0: Three times every minute (when RTCAnSECC equals 00, 20, and 40)<br>1: Once every minute (when RTCAnSECC equals 00) |
| 6 | RTCAnF6 | Specifies whether the sub-counter value is incremented or decremented:<br>0: Incremented (+ correction)<br>Incrementation value = (RTCAnF[5:0] value – 1) × 2<br>1: Decremented (– correction)<br>Decrementation value = (inverted data of RTCAnF[5:0] value + 1) × 2 |
| 5 to 0 | RTCAnF[5:0] | Error correction value |

**NOTES**

1. When RTCAnF[5:1] = $00000_B$, clock error correction is not performed.
2. Perform RTCAnSUBU write as described in
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.5, Writing to RTCAnSUBU**.

### 27.3.3.4 RTCAnSCMP — RTCA Sub-Counter Compare Register

This register sets the compare value of the sub-counter RTCAnSUBC in frequency selection mode (RTCAnCTL0.RTCAnSLSB = 1).

When the sub-counter values matches the value of this register, an overflow signal is output to the seconds counter RTCAnSECC and the sub-counter is cleared.

Set the value for this register according to the frequency of the input clock RTCATCKI.

**Access:** This register can be read or written in 32-bit units.
Note the following when writing this register during sub-counter operation:
- Previous RTCAnSCMP write must be completed (RTCAnCTL2.RTCAnWSST = 0).
- The write operation ends with the next sub-counter overflow.

**Address:** <RTCAn_base> + $3C_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | RTCAnSCMP[21:16] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RTCAnSCMP[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.15 RTCAnSCMP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 21 to 0 | RTCAnSCMP [21:0] | Sub-counter compare value in frequency selection mode. |

#### Example

The following example illustrates the setting of RTCAnSCMP:

- RTCATCKI = 4 MHz = 4,000,000 Hz
- RTCAnSCMP = 4,000,000 – 1 = 3,999,999 (decimal code) = $3D08FF_H$
- The seconds counter RTCAnSECC is triggered when the sub-counter value changes from $3D08FF_H$ to $0_H$.

**NOTES**

1. The operation of the RTCA cannot be guaranteed if a value of 3198 (decimal code) or lower is set in this register.
2. Perform RTCAnSCMP write as described in **Section 27.5.1, Initial Setting of the RTCA** and **Section 27.5.6, Writing to RTCAnSCMP**.

## 27.3.4 Details of RTCA Clock Counter and Buffer Registers

### 27.3.4.1 RTCAnSECC — RTCA Seconds Count Register

This register is the seconds counter. It counts seconds from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the sub-counter RTCAnSUBC.

  If the sub-counter overflows while the seconds counter is stopped (RTCAnCTL2.RTCAnWST = 1), the seconds counter behaves as follows:

  – If one sub-counter overflow occurs while the seconds counter is stopped, the overflow is held internally.
  The seconds counter is incremented by one when it is restarted.

  – If two or more overflows occur while the seconds counter is stopped, the overflow count cannot be held internally.
  The seconds counter is incremented by one when it is restarted.

  – If the seconds counter was updated while the seconds counter is stopped, the sub-counter overflow(s) are ignored.

- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the minutes counter (RTCAnMINC).

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn_base> + $4C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | RTCAnSECC[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 27.16 RTCAnSECC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | RTCAnSECC [6:0] | Seconds in BCD |

**NOTES**

1. Perform RTCAnSECC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the seconds count buffer register RTCAnSEC or to the clock time setting register RTCAnTIME. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters**

### 27.3.4.2 RTCAnSEC — RTCA Seconds Count Buffer Register

This register is a buffer register to read/write the seconds counter RTCAnSECC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $14_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | RTCAnSEC[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.17 RTCAnSEC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | RTCAnSEC [6:0] | Seconds in BCD |

**NOTES**

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnSEC read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

### 27.3.4.3 RTCAnMINC — RTCA Minutes Count Register

This register is the minutes counter. It counts minutes from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the seconds counter RTCAnSECC.
- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the hours counter (RTCAnHOURC).

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn_base> + $50_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | RTCAnMINC[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 27.18 RTCAnMINC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | RTCAnMINC [6:0] | Minutes in BCD |

**NOTES**

1. Perform RTCAnMINC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the minutes count buffer register RTCAnMIN or to the time count buffer register RTCAnTIME. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

### 27.3.4.4 RTCAnMIN — RTCA Minutes Count Buffer Register

This register is a buffer register to read/write the minutes counter RTCAnMINC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $18_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | RTCAnMIN[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.19 RTCAnMIN Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | RTCAnMIN [6:0] | Minutes in BCD |

**NOTES**

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnMIN read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

### 27.3.4.5 RTCAnHOURC — RTCA Hours Count Register

This register is the hours counter. It counts the hours in BCD. The count range depends on the selected hour format. See **Table 27.21, 12- and 24-Hour Format**.

This register counts as follows.

- It is triggered by every overflow of the minutes counter RTCAnMINC.
- It outputs an overflow signal when the value changes from 23 to 00 (in 24-hour format) or from 31 to 12 (in 12-hour format). The overflow signal triggers two counters:
  - Day of the week counter (RTCAnWEEKC)
  - Day of the month counter (RTCAnDAYC)

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn_base> + $54_H$

**Value after reset:** $12_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | RTCAnHOURC[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 27.20 RTCAnHOURC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned. |
| 5 to 0 | RTCAnHOURC [5:0] | Hours in BCD.<br>See **Table 27.21, 12- and 24-Hour Format**, for details. |

**NOTES**

1. Perform RTCAnHOURC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the hours count buffer register RTCAnHOUR or to the time count buffer register RTCAnTIME. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

### 12- or 24-hour format

The count values of RTCAnHOURC depend on the selected hour format.

If 12-hour format is selected (RTCAnCTL0.RTCAnAMPM = 0), bit 5 in the RTCAnHOURC register is the am/pm indicator:

- RTCAnHOURC[5] = 0: am
- RTCAnHOURC[5] = 1: pm

The following table shows the count range of RTCAnHOURC in both 12- and 24-hour format.

**Table 27.21 12- and 24-Hour Format**

| 12-Hour Format (RTCAnAMPM = 0) | | | 24-Hour Format (RTCAnAMPM = 1) | |
|---|---|---|---|---|
| Time | RTCAnHOURC | | Time | RTCAnHOURC |
| 0 am | $12_H$ | | 0 | $00_H$ |
| 1 am | $01_H$ | | 1 | $01_H$ |
| 2 am | $02_H$ | | 2 | $02_H$ |
| 3 am | $03_H$ | | 3 | $03_H$ |
| 4 am | $04_H$ | | 4 | $04_H$ |
| 5 am | $05_H$ | | 5 | $05_H$ |
| 6 am | $06_H$ | | 6 | $06_H$ |
| 7 am | $07_H$ | | 7 | $07_H$ |
| 8 am | $08_H$ | | 8 | $08_H$ |
| 9 am | $09_H$ | | 9 | $09_H$ |
| 10 am | $10_H$ | | 10 | $10_H$ |
| 11 am | $11_H$ | | 11 | $11_H$ |
| 0 pm | $32_H$ | ↓ pm indicator in 12-hour format: RTCAnHOUR.RTCAnHOUR[5] = 1 | 12 | $12_H$ |
| 1 pm | $21_H$ | | 13 | $13_H$ |
| 2 pm | $22_H$ | | 14 | $14_H$ |
| 3 pm | $23_H$ | | 15 | $15_H$ |
| 4 pm | $24_H$ | | 16 | $16_H$ |
| 5 pm | $25_H$ | | 17 | $17_H$ |
| 6 pm | $26_H$ | | 18 | $18_H$ |
| 7 pm | $27_H$ | | 19 | $19_H$ |
| 8 pm | $28_H$ | | 20 | $20_H$ |
| 9 pm | $29_H$ | | 21 | $21_H$ |
| 10 pm | $30_H$ | | 22 | $22_H$ |
| 11 pm | $31_H$ | | 23 | $23_H$ |

### 27.3.4.6 RTCAnHOUR — RTCA Hours Count Buffer Register

This register is a buffer register to read/write the hours counter RTCAnHOURC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $1C_H$

**Value after reset:** $12_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | RTCAnHOUR[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.22 RTCAnHOUR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | RTCAnHOUR [5:0] | Hours in BCD<br>See **Table 27.21, 12- and 24-Hour Format**, for details. |

**NOTES**

1. When writing this register, only the following decimal values in BCD are allowed:
   - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0):
     01 to 12 or 21 to 32
   - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1):
     00 to 23
2. Perform RTCAnHOUR read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

### 27.3.4.7 RTCAnWEEKC — RTCA Day of the Week Count Register

This register is the day of the week counter. It counts from 0 to 6.

This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn_base> + $58_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | RTCAnWEEKC[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 27.23 RTCAnWEEKC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned. |
| 2 to 0 | RTCAnWEEKC [2:0] | Day of the week |

**NOTES**

1. Perform RTCAnWEEKC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the day of the week count buffer register RTCAnWEEK or to the calendar count buffer register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

### 27.3.4.8 RTCAnWEEK — RTCA Day of the Week Count Buffer Register

This register is a buffer register to read/write the day of the week counter RTCAnWEEKC.

There is no particular correspondence between the value of RTCAnWEEK and the day of the week. Set the correspondence according to the application to be used.

Example: 0 = Sunday, 1 = Monday, …, 6 = Saturday

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | RTCAnWEEK[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

**Table 27.24 RTCAnWEEK Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | RTCAnWEEK [2:0] | Day of the week |

**NOTES**

1. When writing this register, only decimal values between 0 and 6 in BCD are allowed.
2. Perform RTCAnWEEK read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

### 27.3.4.9 RTCAnDAYC — RTCA Day of the Month Count Register

This register is the day of the month counter. It counts from 01 to a maximum of 31 in BCD, depending on the value of the month counter (RTCAnMONC) and the year counter (RTCAnYEARC):

- 01 to 31 (January, March, May, July, August, October, December)
- 01 to 30 (April, June, September, November)
- 01 to 29 (February, leap year)
- 01 to 28 (February, non-leap year)

Years 0, 4, 8, 12, etc., are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.
- It outputs an overflow signal when the value changes from 28, 29, 30, or 31 to 01, depending on the current month and year. The overflow signal triggers the month counter (RTCAnMONC).

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn_base> + $5C_H$

**Value after reset:** $01_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | RTCAnDAYC[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

**Table 27.25 RTCAnDAYC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned. |
| 5 to 0 | RTCAnDAYC [5:0] | Day of the month in BCD |

**NOTES**

1. Perform RTCAnDAYC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the day of the month count buffer register RTCAnDAY or to the calendar count buffer register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

### 27.3.4.10 RTCAnDAY — RTCA Day of the Month Count Buffer Register

This register is a buffer register to read/write the day of the month counter RTCAnDAYC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $24_H$

**Value after reset:** $01_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | RTCAnDAY[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.26 RTCAnDAY Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | RTCAnDAY [5:0] | Day of the month in BCD |

**NOTES**

1. When writing this register, only decimal values between 01 and 31 in BCD are allowed:
   - 01 to 31 (January, March, May, July, August, October, December)
   - 01 to 30 (April, June, September, November)
   - 01 to 29 (February, leap year)
   - 01 to 28 (February, non-leap year)
2. Perform RTCAnDAY read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

### 27.3.4.11 RTCAnMONC — RTCA Month Count Register

This register is the month counter. It counts the month of the year, starting from 01 to 12 in BCD.

This register counts as follows.

- It is triggered by every overflow of the counter for the day of the month RTCAnDAYC.
- It outputs an overflow signal when the value changes from 12 to 01. The overflow signal triggers the year counter (RTCAnYEARC).

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn_base> + $60_H$

**Value after reset:** $01_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | RTCAnMONC[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R |

**Table 27.27 RTCAnMONC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 5 | Reserved | When read, the value after reset is returned. |
| 4 to 0 | RTCAnMONC [4:0] | Month of the year in BCD |

**NOTES**

1. Perform RTCAnMONC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the month count buffer register RTCAnMONTH or to the calendar count buffer register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

### 27.3.4.12 RTCAnMONTH — RTCA Month Count Buffer Register

This register is a buffer register to read/write the month counter RTCAnMONC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $28_H$

**Value after reset:** $01_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | RTCAnMONTH[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

**Table 27.28 RTCAnMONTH Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | RTCAnMONTH [4:0] | Month of the year in BCD |

**NOTES**

1. When writing this register, only decimal values between 01 and 12 in BCD are allowed.
2. Perform RTCAnMONTH read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

### 27.3.4.13 RTCAnYEARC — RTCA Year Count Register

This register is the year counter. It counts years from 00 to a maximum of 99 in BCD.

Years 00, 04, 08, …, 92, and 96 (every four years) are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the month counter RTCAnMONC.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn_base> + $64_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RTCAnYEARC[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 27.29 RTCAnYEARC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | RTCAnYEARC [7:0] | Year in BCD |

**NOTES**

1. Perform RTCAnYEARC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the year count buffer register RTCAnYEAR or to the calendar count buffer register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

### 27.3.4.14 RTCAnYEAR — RTCA Year Count Buffer Register

This register is a buffer register to read/write the year counter RTCAnYEARC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $2C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RTCAnYEAR[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.30 RTCAnYEAR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | RTCAnYEAR [7:0] | Year in BCD |

**NOTES**

1. When writing this register, only decimal values between 00 and 99 in BCD are allowed.
2. Perform RTCAnYEAR read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

## 27.3.5 Details of RTCA Special Counter and Buffer Registers

### 27.3.5.1 RTCAnTIMEC — RTCA Time Count Register

This register enables the RTCAnHOURC, RTCAnMINC, and RTCAnSECC counters to be read simultaneously.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RTCAn_base> + $68_H$

**Value after reset:** $0012\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | RTCAnHOURC[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | RTCAnMINC[6:0] | | | | | | | — | RTCAnSECC[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 27.31 RTCAnTIMEC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 16 | RTCAnHOURC [5:0] | Hours in BCD.<br>See **Table 27.21, 12- and 24-Hour Format**, for details. |
| 15 | Reserved | When read, the value after reset is returned. |
| 14 to 8 | RTCAnMINC [6:0] | Minutes in BCD |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | RTCAnSECC [6:0] | Seconds in BCD |

**NOTES**

1. Perform RTCAnTIMEC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the time count buffer register RTCAnTIME. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

### 27.3.5.2 RTCAnTIME — RTCA Time Count Buffer Register

This register enables the RTCAnHOUR, RTCAnMIN, and RTCAnSEC buffer registers to be read/written simultaneously.

**Access:** This register can be read or written in 32-bit units.

**Address:** <RTCAn_base> + $30_H$

**Value after reset:** $0012\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | RTCAnHOUR[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | RTCAnMIN[6:0] | | | | | | | — | RTCAnSEC[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.32 RTCAnTIME Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 to 16 | RTCAnHOUR [5:0] | Hours in BCD<br>See **Table 27.21, 12- and 24-Hour Format**, for details. |
| 15 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 to 8 | RTCAnMIN [6:0] | Minutes in BCD |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | RTCAnSEC [6:0] | Seconds in BCD |

**NOTE**

Perform RTCAnTIME read/write as described in

- **Section 27.5.1, Initial Setting of the RTCA,**
- **Section 27.5.2, Updating Clock Counters**, and
- **Section 27.5.3, Reading Clock Counters.**

### 27.3.5.3 RTCAnCALC — RTCA Calendar Count Register

This register enables the RTCAnYEARC, RTCAnMONC, RTCAnDAYC, and RTCAnWEEKC counters to be read simultaneously.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RTCAn_base> + $6C_H$

**Value after reset:** $0001\ 0100_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RTCAnYEARC[7:0] | | | | | | | | — | — | — | RTCAnMONC[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | RTCAnDAYC[5:0] | | | | | | — | — | — | — | — | RTCAnWEEKC[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 27.33 RTCAnCALC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RTCAnYEARC [7:0] | Year in BCD |
| 23 to 21 | Reserved | When read, the value after reset is returned. |
| 20 to 16 | RTCAnMONC [4:0] | Month of the year in BCD |
| 15, 14 | Reserved | When read, the value after reset is returned. |
| 13 to 8 | RTCAnDAYC [5:0] | Day of the month in BCD |
| 7 to 3 | Reserved | When read, the value after reset is returned. |
| 2 to 0 | RTCAnWEEKC [2:0] | Day of the week in BCD |

**NOTES**

1. Perform RTCAnCALC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the clock time setting register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

### 27.3.5.4 RTCAnCAL — RTCA Calendar Count Buffer Register

This register enables the RTCAnYEAR, RTCAnMONTH, RTCAnDAY, and RTCAnWEEK buffer registers to be read/written simultaneously.

**Access:** This register can be read or written in 32-bit units.

**Address:** <RTCAn_base> + $34_H$

**Value after reset:** $0001\ 0100_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RTCAnYEAR[7:0] | | | | | | | | — | — | — | RTCAnMONTH[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | RTCAnDAY[5:0] | | | | | | — | — | — | — | — | RTCAnWEEK[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R/W | R/W | R/W |

**Table 27.34 RTCAnCAL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RTCAnYEAR [7:0] | Year in BCD |
| 23 to 21 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 16 | RTCAnMONTH [4:0] | Month of the year in BCD |
| 15, 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 to 8 | RTCAnDAY [5:0] | Day of the month in BCD |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | RTCAnWEEK [2:0] | Day of the week in BCD |

**NOTE**

Perform RTCAnCAL read/write as described in

- **Section 27.5.1, Initial Setting of the RTCA.**
- **Section 27.5.2, Updating Clock Counters**, and
- **Section 27.5.3, Reading Clock Counters.**

## 27.3.6 Details of RTCA Alarm Setting Registers

### 27.3.6.1 RTCAnALM — RTCA Alarm Minute Setting Register

This register specifies the minute of the alarm interrupt.

For details and example settings, see **Section 27.4.3, Alarm Interrupt Function**.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $40_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | RTCAnALM[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.35 RTCAnALM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | RTCAnALM [6:0] | Minute of the alarm interrupt in BCD |

**NOTES**

1. If decimal values outside the range of 00 to 59 in BCD are set, no alarm interrupt request will be generated.
2. When the setting of RTCAnALM is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to RTCATINTAL. Implement appropriate interrupt mask processing procedures.

### 27.3.6.2 RTCAnALH — RTCA Alarm Hour Setting Register

This register specifies the hour of the alarm interrupt.

For details and example settings, see **Section 27.4.3, Alarm Interrupt Function**.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $44_H$

**Value after reset:** $12_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | RTCAnALH[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.36 RTCAnALH Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | RTCAnALH [5:0] | Hour of the alarm interrupt in BCD |

**NOTES**

1. If decimal values outside the following range are set, no alarm interrupt request will be generated:
   - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0): 01 to 12 or 21 to 32
   - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1): 00 to 23
2. When the setting of RTCAnALH is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to RTCATINTAL. Implement appropriate interrupt mask processing procedures.

### 27.3.6.3 RTCAnALW — RTCA Alarm Day of the Week Setting Register

This register specifies the day(s) of the week of the alarm interrupt.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn_base> + $48_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | RTCAnALW[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 27.37 RTCAnALW Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | RTCAnALW [6:0] | Specifies day of the week m (m = 0 to 6) as a day, when an alarm interrupt request is generated:<br>0: No alarm interrupt request is generated on day m.<br>1: Alarm interrupt request is generated on day m at the time set using RTCAnALM and RTCAnALH.<br>The bits of this register correspond to the count value of the day of the week counter (RTCAnWEEKC). |

**NOTE**

When the setting of RTCAnALW is changed during sub-counter operation (RTCAnCTL0.RTCAnCE = 1), a glitch may be output to RTCATINTAL. Implement appropriate interrupt mask processing procedures.

#### Example

If Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

- To set the alarm for Sunday, set RTCAnALW = $0000\ 0001_B$.
- To set the alarm for Monday and Wednesday, set RTCAnALW = $0000\ 1010_B$.
- To set the alarm for Tuesday, Thursday, and Saturday, set RTCAnALW = $0101\ 0100_B$.

For more examples, see **Section 27.4.3, Alarm Interrupt Function**.

## 27.3.7 RTCA Emulation Register

### 27.3.7.1 RTCAnEMU — RTCA Emulation Register

This register controls operation by SVSTOP.

**Access:** This register can be read or written in 8-bit or 1-bit units.
A write should be performed when EPC.SVSTOP = 0.

**Address:** <RTCAn_base> + $74_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RTCAnSVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 27.38 RTCAnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | RTCAnSVSDIS | When the EPC.SVSTOP bit is set to 0:<br>Count clock is supplied when the debugger gains microcontroller control (at a breakpoint, etc.) regardless of the value of this bit.<br><br>When the EPC.SVSTOP bit is set to 1:<br>0: Count clock is stopped when the debugger gains microcontroller control (as at a breakpoint).<br>1: Count clock continues to be supplied when the debugger gains microcontroller control (at a breakpoint, etc.). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## 27.4 Operation

The RTCA provides two operation modes:

- Frequency selection mode
- 32.768-kHz mode

The operation mode that can be used depends on the available input clock RTCATCKI. The operation mode specifies the sub-counter compare value that is used to trigger the seconds counter and thus all subsequent counters. Clock error correction is only possible in 32.768-kHz mode.

The following table provides an overview of the properties of the two operation modes.

**Table 27.39 RTCA Operation Mode Overview**

| | | 32.768-kHz Mode | |
|---|---|---|---|
| | **Frequency Selection Mode** | **Clock Correction Disabled** | **Clock Correction Enabled** |
| Allowed input clock RTCATCKI | Any frequency from 32 kHz to 4.194304 MHz | 32.768 kHz | Any frequency from 32.76180000 kHz to 32.77420000 kHz |
| Sub-counter RTCAnSUBC operation | • Counter overflow at value of RTCAnSCMP<br>• RTCAnSCMP must be set to RTCATCKI-1 (in Hz) | Counter overflow at $7FFF_H$ | Counter overflow at $7FFF_H$ or<br>Every 20 or 60 seconds: $7FFF_H$ ±RTCAnSUBU.RTCAnF[5:0] |

The operation mode is selected by control bit RTCAnCTL0.RTCAnSLSB. For details on how to set the operation mode during RTCA initialization, see **Section 27.5.1, Initial Setting of the RTCA**.

**CAUTIONS**

1. **The input clock RTCATCKI must not be outside the allowed frequency range.**
2. **The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1).**

### 27.4.1 Clock Counter Format

The clock counters (RTCAnSECC to RTCAnYEARC) operate on binary coded decimals (BCD): Each digit is represented by its own binary sequence.

Depending on the valid data range, the number of bits for a digit differs. For example, the tens digit of the month of the year counter has only one bit (for 0 and 1) whereas the tens digit of the minutes counter has 3 bits (for 0 to 5).

The following table lists the decimals 0 to 59 in binary and BCD.

**Table 27.40 Example of BCD Code – Seconds or Minutes Counter (0 to 59)**

| Decimal | Binary | BCD |
|---|---|---|
| 0 | 000000 | 000 0000 |
| 1 | 000001 | 000 0001 |
| 2 | 000010 | 000 0010 |
| 3 | 000011 | 000 0011 |
| 4 | 000100 | 000 0100 |
| 5 | 000101 | 000 0101 |
| 6 | 000110 | 000 0110 |
| 7 | 000111 | 000 0111 |
| 8 | 001000 | 000 1000 |
| 9 | 001001 | 000 1001 |
| 10 | 001010 | 001 0000 |
| 11 | 001011 | 001 0001 |
| 12 | 001100 | 001 0010 |
| : | : | : |
| 58 | 111010 | 101 1000 |
| 59 | 111011 | 101 1001 |

### 27.4.2 Fixed Interval Interrupt Function

Interrupt RTCATINTR can be specified to occur after every 0.25 seconds, 0.5 seconds, 1 (full) second, 1 (full) minute, 1 (full) hour, 1 (full) day, or 1 (full) month.

The fixed interval interrupt function is controlled by bits RTCAnCTL1.RTCAnCT[2:0].

### 27.4.3 Alarm Interrupt Function

Interrupt RTCATINTAL can be specified to occur at a certain time on one or several days of the week. This interrupt can be used as a wake-up signal.

The alarm interrupt function is enabled and disabled by bit RTCAnCTL1.RTCAnENALM.

The alarm setting is specified by the following control registers:

- RTCAnALW selects the weekday(s).

The allocation of bits to weekdays is defined by the day of the week count buffer register RTCAnWEEK.

- RTCAnALH and RTCAnALM specify the hour and minute in BCD.

### Examples

The following tables show some exemplary settings of the alarm control registers for both 12-hour and 24-hour format.

In this example, Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

**Table 27.41 Alarm Setting in 12-Hour Format (RTCAnCTL0.RTCAnAMPM = 0)**

| Alarm Setting Time | RTCAnALW | RTCAnALH | RTCAnALM |
|---|---|---|---|
| Sunday 7:00 am | $01_H$ | $07_H$ | $00_H$ |
| Sunday, Monday 12:15 pm | $03_H$ | $32_H$ | $15_H$ |
| Monday, Wednesday, Friday 5:30 pm | $2A_H$ | $25_H$ | $30_H$ |
| Daily, 10:45 pm | $7F_H$ | $30_H$ | $45_H$ |

**Table 27.42 Alarm Setting in 24-Hour Format (RTCAnCTL0.RTCAnAMPM = 1)**

| Alarm Setting Time | RTCAnALW | RTCAnALH | RTCAnALM |
|---|---|---|---|
| Sunday 7:00 | $01_H$ | $07_H$ | $00_H$ |
| Sunday, Monday 12:15 | $03_H$ | $12_H$ | $15_H$ |
| Monday, Wednesday, Friday 17:30 | $2A_H$ | $17_H$ | $30_H$ |
| Daily, 22:45 | $7F_H$ | $22_H$ | $45_H$ |

## 27.4.4 Clock Error Correction

Clock error correction compensates for deviations of the oscillator from the nominal clock rate. With clock error correction input clock rates from 32.76180 kHz to 32.77420 kHz are possible.

The clock error correction function is only available in 32.768-kHz operation mode. In this operation mode, a nominal clock rate of 32.768 kHz is expected and the sub-counters overflow value is fixed to $7FFF_H$.

The following figures illustrate the clock error when the input clock rate deviates from the nominal clock.

### RTCATCKI = 32.768 kHz

**Figure 27.2, RTCATCKI = 32.768 kHz, No Clock Error Correction Required** shows the timing diagram if RTCATCKI matches the nominal clock rate of 32.768 kHz. No clock error correction is required.

Counting from 0 to 32767 (0 to $7FFF_H$) with a 32.768-kHz clock is exactly equal to one second.

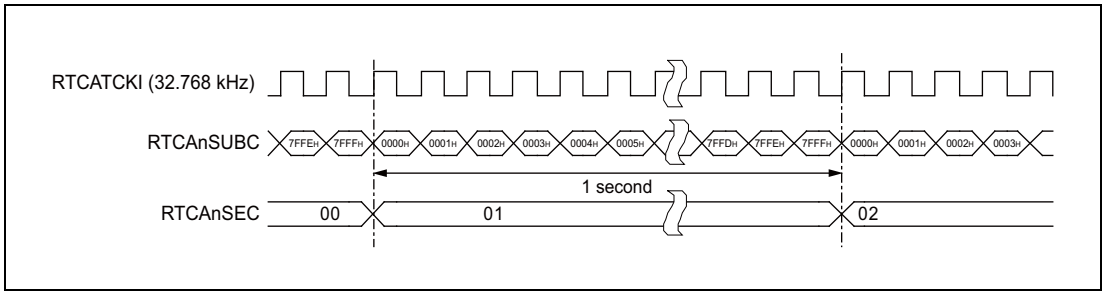

**Figure 27.2 RTCATCKI = 32.768 kHz, No Clock Error Correction Required**

### RTCATCKI = 32.769 kHz

**Figure 27.3, RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled** shows the timing diagram if RTCATCKI deviates from the nominal clock rate of 32.768 kHz. In this example, RTCATCKI is connected to a 32.769-kHz oscillator. Clock error correction is not enabled.

Counting from 0 to 32767 (0 to $7FFF_H$) with a 32.769-kHz clock is equal to approximately 0.99997 seconds (32768/32769). A "+ error" (faster than 32.768-kHz) occurs. In one month, RTCA deviates approximately –79 seconds from the real time.

Error = (32768/32769 - 1) × 60 (s) × 60 (min) × 24 (h) × 30 (d)

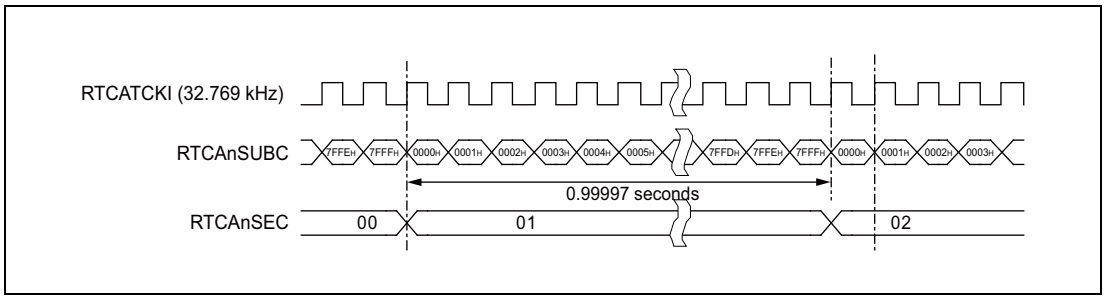

**Figure 27.3 RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled**

Clock error correction is performed by stretching/reducing the 1-second period of the sub-counter at regular intervals. The sub-counter's upper limit of $7FFF_H$ is increased or decreased by setting the following parameters in register RTCAnSUBU:

- A correction value greater than one
- An operator (add/subtract)
- An interval (20 or 60 seconds)

The corrected overflow value becomes effective every 20 or 60 seconds, so that on the average RTCAnSECC is triggered exactly every second.

#### 27.4.4.1 Setting the Correction Value and the Operator

The correction value and operator are specified by the RTCAnF6, RTCAnF[5:0] bits of the RTCAnSUBU register:

- RTCAnF6 specifies whether the overflow value is incremented or decremented.
- RTCAnF[5:0] specifies the correction value.

The correction values are calculated as follows:

**Table 27.43 Correction Value Settings**

| RTCAnF6 | Increment/Decrement | Correction Value |
|---|---|---|
| 0 | Increment | (Value of RTCAnF[5:0] – 1) × 2 |
| 1 | Decrement | (Inverted value of RTCAnF[5:0] + 1) × 2 |

Some examples are given in the following table:

**Table 27.44 Correction Value Examples**

| RTCAnF6 | RTCAnF[5:0] | Correction Value | Count Limit of RTCAnSUBC |
|---|---|---|---|
| 0 | $15_H$ | $(15_H - 1) \times 2 = 40$ | 32768 + 40 = 32808 |
| 1 | $15_H$ | $(\overline{15}_H + 1) \times 2$<br>$= (2A_H + 1) \times 2$<br>$= 86$ | 32768 – 86 = 32682 |

#### 27.4.4.2 Impact of the Repetition Interval

The correction value set by RTCAnF6, RTCAnF[5:0] does not change the count limit of RTCAnSUBC every second. The repetition interval at which the correction value becomes effective is specified by bit RTCAnDEV.

This bit also influences the size of the correctable frequency range and the correction accuracy.

The following table summarizes the RTCAnDEV settings.

**Table 27.45 Setting of Bit RTCAnSUBU.RTCAnDEV**

| RTCAnDEV | Count Limit of RTCAnSUBC is Changed | Frequency Range that can be Corrected | Correction Accuracy |
|---|---|---|---|
| 0 | Every 20 seconds<br>when RTCAnSECC = 00, 20, or 40 | 32.76180000 to 32.77420000 kHz | |
| 1 | Every 60 seconds<br>when RTCAnSECC = 00 | 32.76593333 to 32.77006667 kHz | Three times higher than for RTCAnDEV = 0 |

### 27.4.4.3 Sample Settings

The frequencies that can be corrected, as well as the setting values of bits RTCAnDEV, RTCAnF6, and RTCAnF[5:0], are listed in the following table.

**Table 27.46 Correctable Frequency Range when RTCAnDEV = 0**

| Input Clock Frequency | RTCAnF6 | RTCAnF[5:0] | Correction Value of RTCAnSUBC |
|---|---|---|---|
| — | 0 | 000000 | No correction |
| — | 0 | 000001 | No correction |
| 32.76810000 kHz | 0 | 000010 | Once every 20 s,<br>RTCAnSUBC count value + 2 |
| 32.76820000 kHz | 0 | 000011 | Once every 20 s,<br>RTCAnSUBC count value + 4 |
| 32.76830000 kHz | 0 | 000100 | Once every 20 s,<br>RTCAnSUBC count value + 6 |
| : | : | : | : |
| 32.77400000 kHz | 0 | 111101 | Once every 20 s,<br>RTCAnSUBC count value + 120 |
| 32.77410000 kHz | 0 | 111110 | Once every 20 s,<br>RTCAnSUBC count value + 122 |
| 32.77420000 kHz<br>(upper limit) | 0 | 111111 | Once every 20 s,<br>RTCAnSUBC count value + 124 |
| — | 1 | 000000 | No correction |
| — | 1 | 000001 | No correction |
| 32.76180000 kHz<br>(lower limit) | 1 | 000010 | Once every 20 s,<br>RTCAnSUBC count value – 124 |
| 32.76190000 kHz | 1 | 000011 | Once every 20 s,<br>RTCAnSUBC count value – 122 |
| 32.76200000 kHz | 1 | 000100 | Once every 20 s,<br>RTCAnSUBC count value – 120 |
| : | : | : | : |
| 32.76770000 kHz | 1 | 111101 | Once every 20 s,<br>RTCAnSUBC count value – 6 |
| 32.76780000 kHz | 1 | 111110 | Once every 20 s,<br>RTCAnSUBC count value – 4 |
| 32.76790000 kHz | 1 | 111111 | Once every 20 s,<br>RTCAnSUBC count value – 2 |

**Table 27.47 Correctable Frequency Range when RTCAnDEV = 1**

| Input Clock Frequency | RTCAnF6 | RTCAnF[5:0] | Correction Value of RTCAnSUBC |
|---|---|---|---|
| — | 0 | 000000 | No correction |
| — | 0 | 000001 | No correction |
| 32.76803333 kHz | 0 | 000010 | Once every 60 s,<br>RTCAnSUBC count value + 2 |
| 32.76806667 kHz | 0 | 000011 | Once every 60 s,<br>RTCAnSUBC count value + 4 |
| 32.76810000 kHz | 0 | 000100 | Once every 60 s,<br>RTCAnSUBC count value + 6 |
| : | : | : | : |
| 32.77000000 kHz | 0 | 111101 | Once every 60 s,<br>RTCAnSUBC count value + 120 |
| 32.77003333 kHz | 0 | 111110 | Once every 60 s,<br>RTCAnSUBC count value + 122 |
| 32.77006667 kHz<br>(upper limit) | 0 | 111111 | Once every 60 s,<br>RTCAnSUBC count value + 124 |
| — | 1 | 000000 | No correction |
| — | 1 | 000001 | No correction |
| 32.76593333 kHz<br>(lower limit) | 1 | 000010 | Once every 60 s,<br>RTCAnSUBC count value – 124 |
| 32.76596667 kHz | 1 | 000011 | Once every 60 s,<br>RTCAnSUBC count value – 122 |
| 32.76600000 kHz | 1 | 000100 | Once every 60 s,<br>RTCAnSUBC count value – 120 |
| : | : | : | : |
| 32.76790000 kHz | 1 | 111101 | Once every 60 s,<br>RTCAnSUBC count value – 6 |
| 32.76793333 kHz | 1 | 111110 | Once every 60 s,<br>RTCAnSUBC count value – 4 |
| 32.76796667 kHz | 1 | 111111 | Once every 60 s,<br>RTCAnSUBC count value – 2 |

## 27.5 Procedures for Setup, Writing and Reading

The following subsections provide flow charts that illustrate the procedures for RTCA setup and for reading and writing the RTCA clock counters.

### 27.5.1 Initial Setting of the RTCA

The RTCA must be stopped before setting the initial setting value of each counter.

#### 27.5.1.1 RTCA Stop Procedure

Stop the RTCA according to the following flow.

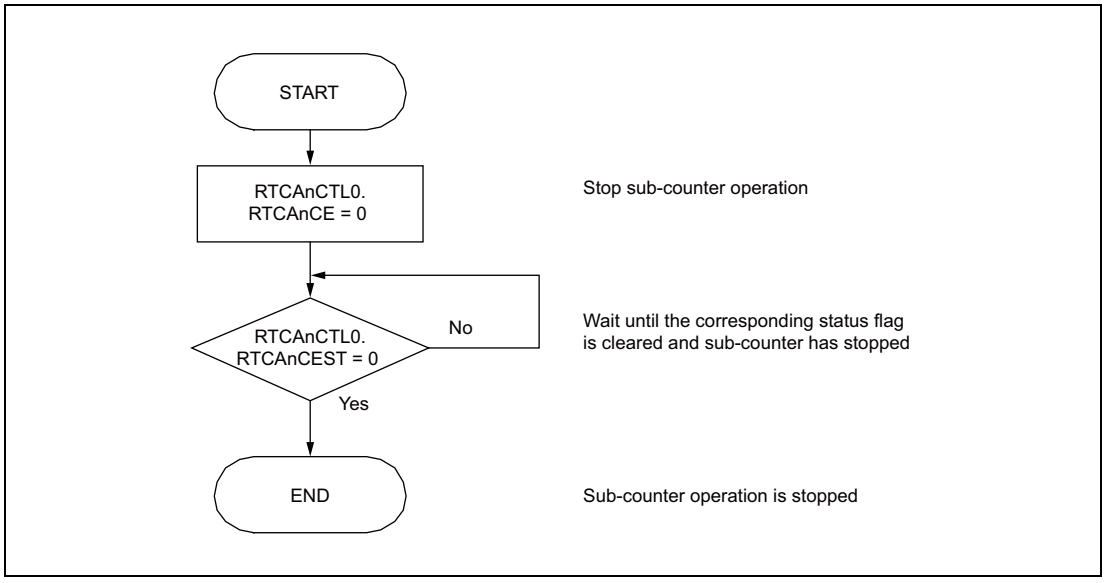

**Figure 27.4 RTCA Stop Procedure**

### 27.5.1.2 RTCA Initialization Procedure

Perform the initial setting of the RTCA according to the following flow:

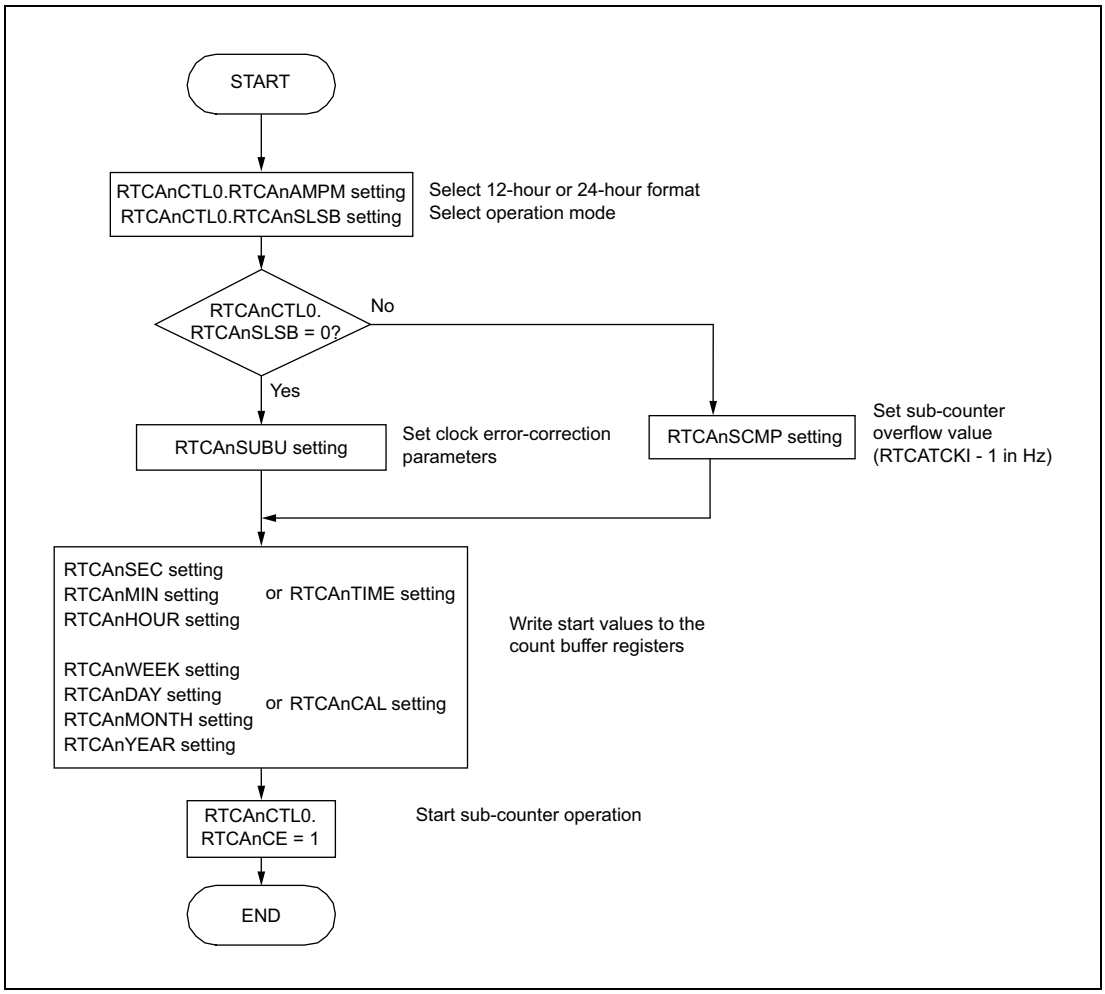

**Figure 27.5 RTCA Initial Setup Procedure**

**CAUTION**

**The internal clock counter is synchronized with RTCATCKI.**

**In addition, two RTCATCKI periods are required before the clock counter starting behind END of the above flow.**

**Therefore, PCLK must be continuously supplied until the completion of the initial setting.**

**Check that RTCAnCTL0.RTCAnCEST = 1, when the supply of PCLK is stopped after setting the initial setting value of RTCA.**

### 27.5.2 Updating Clock Counters

The clock counters RTCAnSECC to RTCAnYEARC can be stopped and updated while the sub-counter is running.

To update the clock counter when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

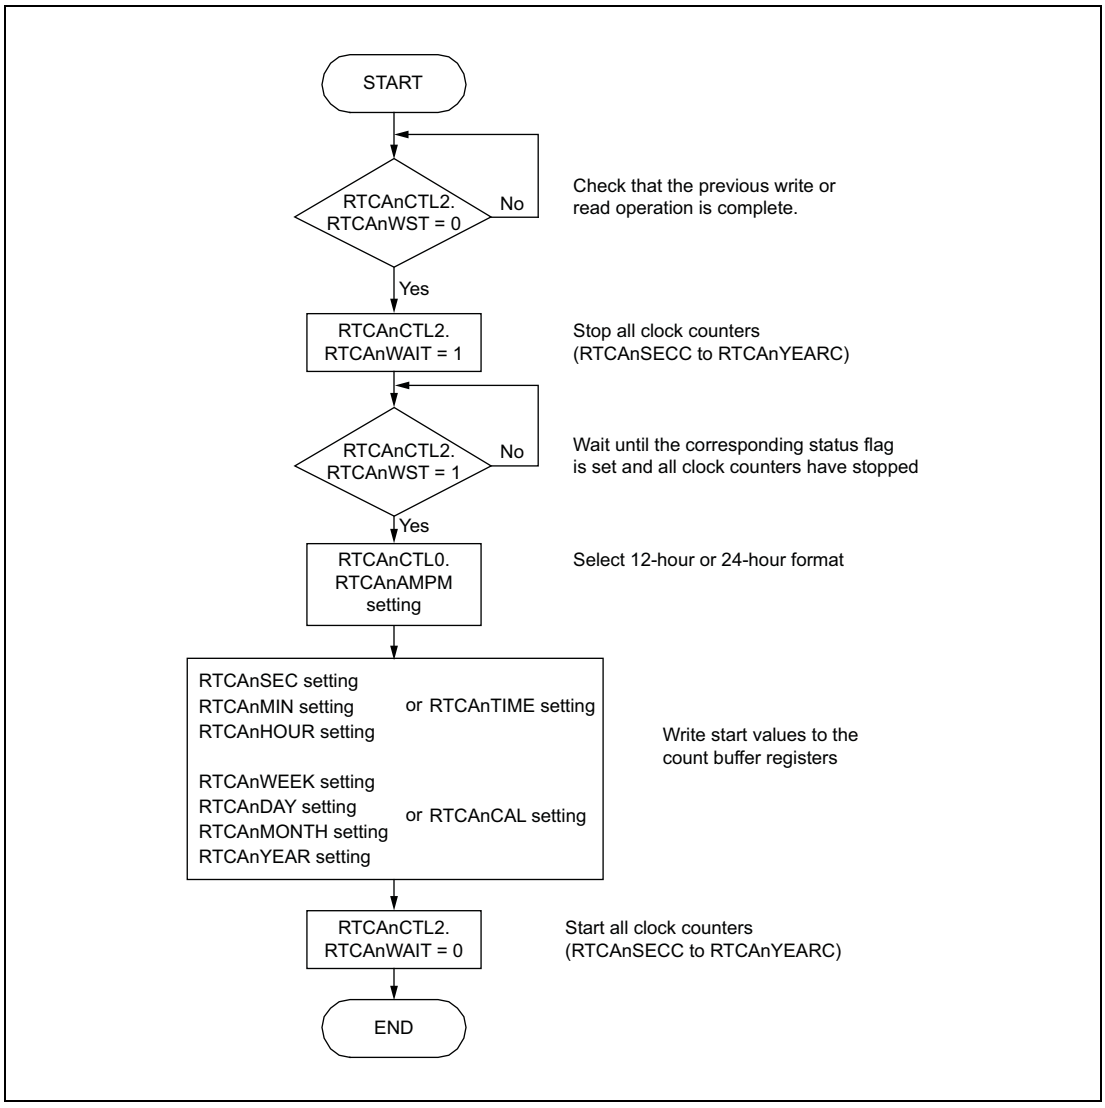

**Figure 27.6 Updating Clock Counter Values**

**CAUTIONS**

1. **The internal clock counter is synchronized with RTCATCKI.**
   **In addition, two RTCATCKI periods are required before the clock counter updating behind END of the above flow.**
   **Therefore, PCLK must be continuously supplied until the completion of the clock counter updating.**
   **Check that RTCAnCTL2.RTCAnWST = 0 before stopping the supply of PCLK after the completion of clock counter updating.**
2. **The update procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more:**

3. **Only one sub-counter overflow can be held internally and increment the seconds counter after restarting the clock counters if the value is held.**
4. **If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.**

### 27.5.3 Reading Clock Counters

There are two methods to read the clock counters while sub-counter operation is enabled:

- Reading count buffer registers
- Reading counter registers

The advantages and disadvantages of the two methods are summarized in the following table.

**Table 27.48 Comparison of the Two Read Methods**

| | Advantage | Disadvantage |
|---|---|---|
| Reading count buffer registers | It is unnecessary to read clock counters several times because the clock counters are read synchronously. | A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer. |
| Reading count registers | Program wait state does not occur. | If the sub-counter increments, the clock counters must be read several times because they are read asynchronously to RTCATCKI. |

#### 27.5.3.1 Procedure for Reading Count Buffer Registers

The following operations are necessary:

1. Stop all clock counters (RTCAnCTL2.RTCAnWAIT = 1). The value of the clock counters is transferred to the corresponding count buffer registers.
2. Read the count buffer registers.

A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer.

The maximum delay is three PCLK periods plus two RTCATCKI periods. For example, if the RTCA operates with PCLK = 40 MHz and RTCATCKI = 32.768 kHz, the delay is about 61 µs.

To read the count buffer register when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1), follow the flowchart shown below.

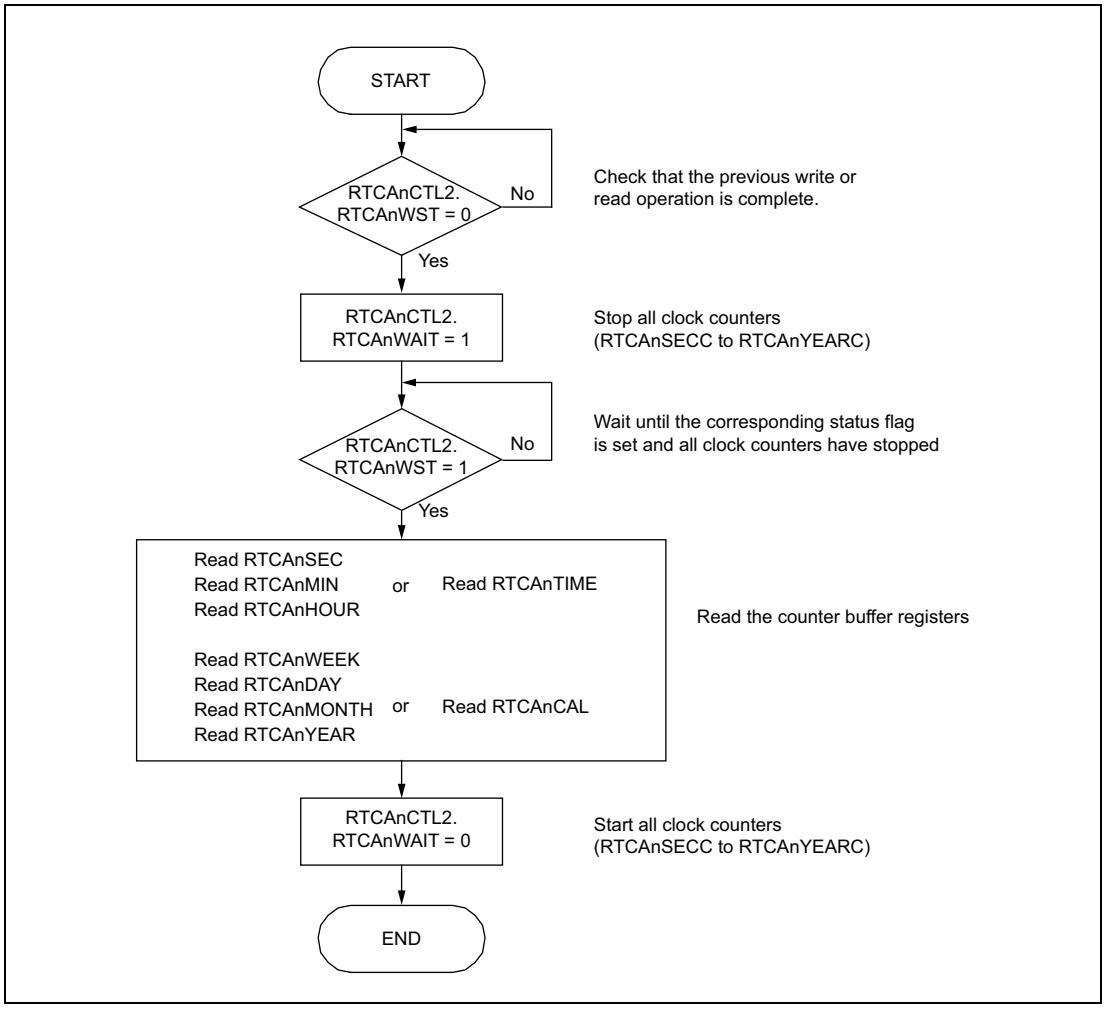

**Figure 27.7 Reading Clock Count Buffer Registers**

**CAUTIONS**

1. **The internal clock counter is synchronized with RTCATCKI.**
   **In addition, two RTCATCKI periods are required before resuming counter behind END of the above flow.**
   **Therefore, PCLK must be continuously supplied until the counter resuming.**
   **Check that RTCAnCTL0.RTCAnCEST = 1 first to stop the supply of PCLK after count buffer register reading.**
2. **The reading procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more.**
3. **Only one sub-counter overflow can be held internally. If there is a value held internally when the clock counter restarts, the seconds counter will be incremented by 1.**
4. **If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.**

### 27.5.3.2 Procedure for Reading Counter Registers Directly

To ensure that the sub-counter did not overflow while reading the counters, the seconds counter RTCAnSECC must be read twice in the beginning and at the end of the procedure. The first read value is compared with the second read value.

- First read value = second read value:
  No overflow of sub-counter occurred during counter read operation.
- First read value ≠ second read value:
  Overflow of the sub-counter occurred during counter read operation. The counters must be read again to get the current counter values.

To read the counter register directly when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

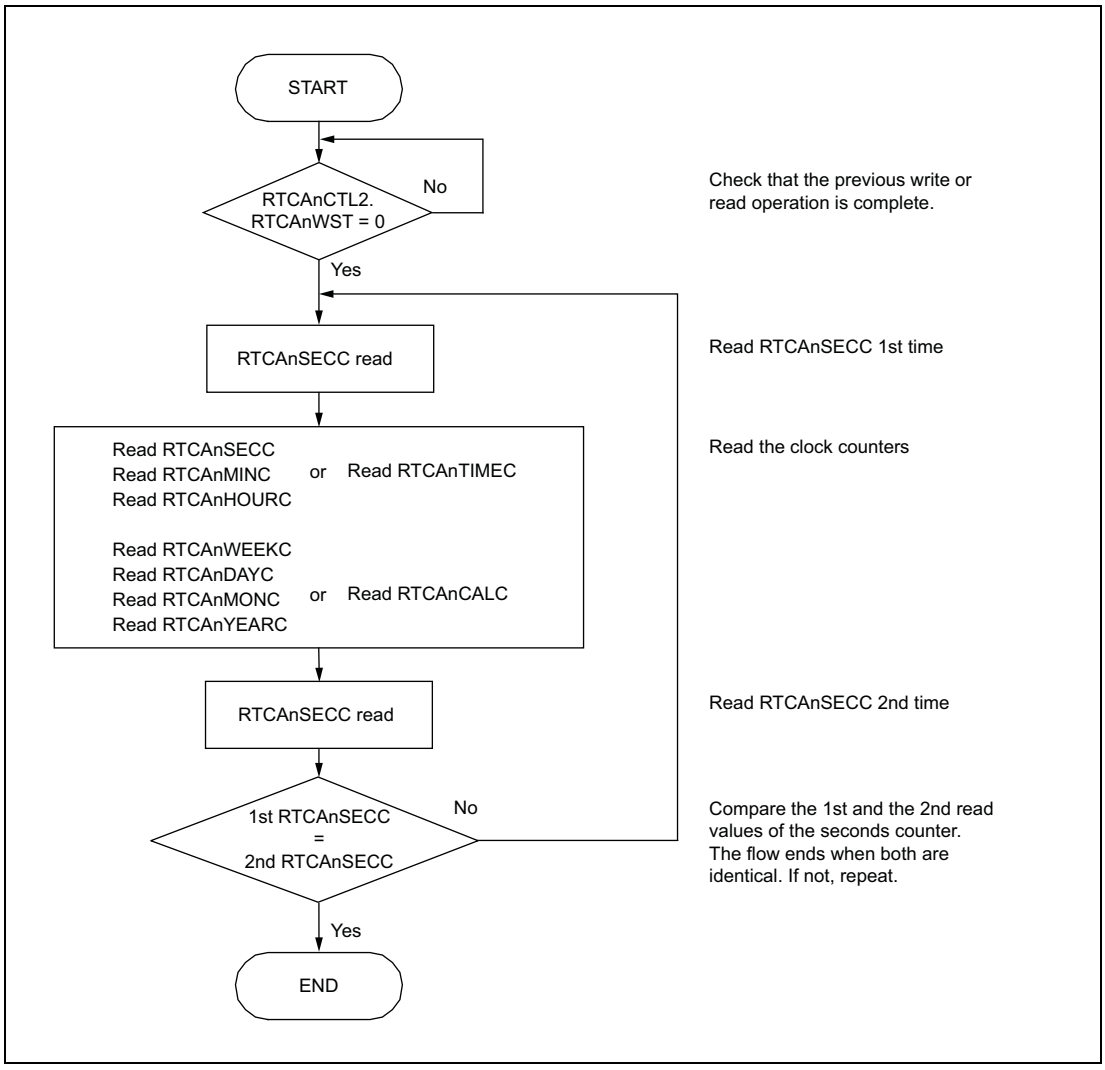

**Figure 27.8 Reading Clock Counter Registers**

**NOTE**

The procedure must be completed within one second.

### 27.5.4 Reading RTCAnSRBU

RTCAnSRBU is the read buffer register for the sub-counter.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), read RTCAnSRBU according to the following flow.

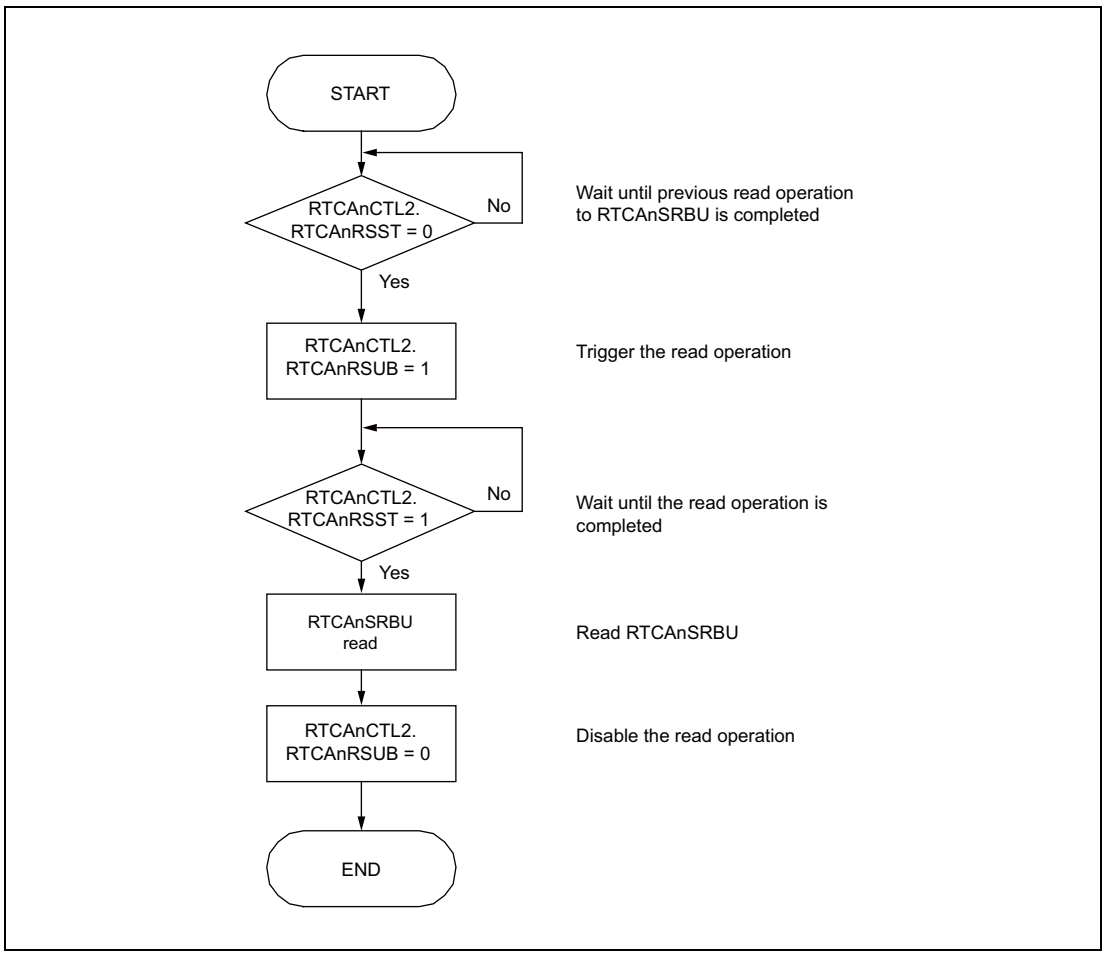

**Figure 27.9 Reading the RTCAnSRBU Register**

### 27.5.5 Writing to RTCAnSUBU

RTCAnSUBU is the clock error correction register for the sub-counter.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), write to RTCAnSUBU according to the flow described below.

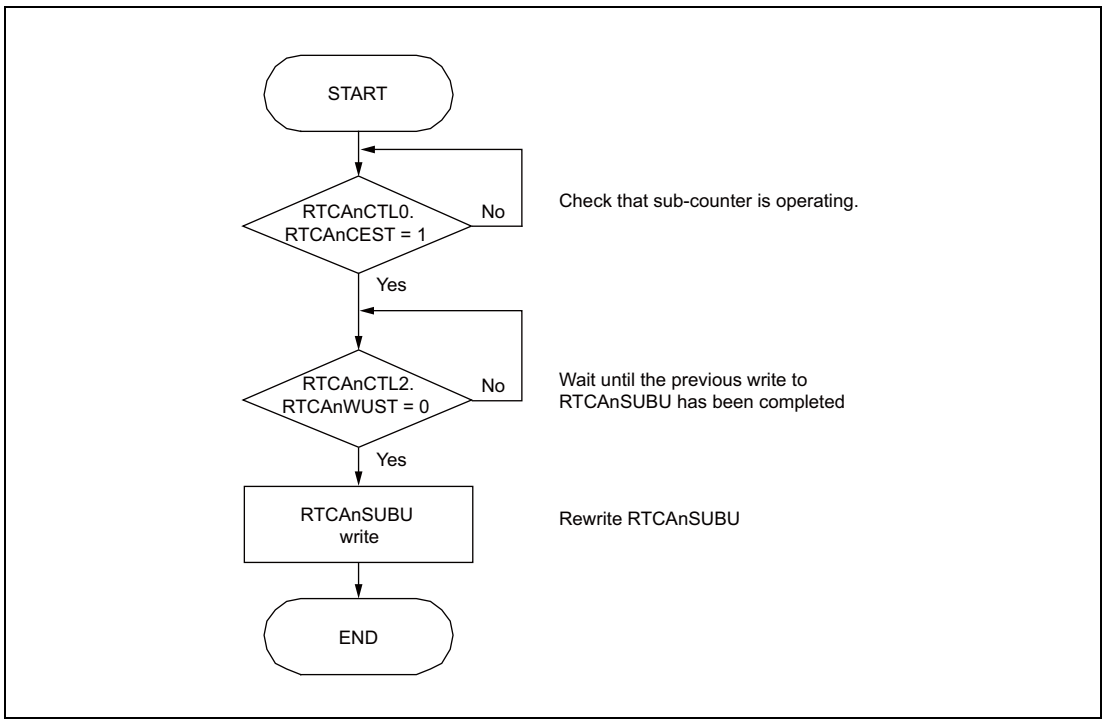

**Figure 27.10 Writing to the RTCAnSUBU Register**

**NOTE**

While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), the status flag RTCAnCTL2.RTCAnWUST is set when RTCAnSUBU is written to. It is cleared when the write operation to RTCAnSUBU is completed. This is synchronous with the next RTCAnSUBC overflow.
RTCAnCTL2.RTCAnWUST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWUST = 1 at the beginning of this flow).

### 27.5.6 Writing to RTCAnSCMP

RTCAnSCMP is the sub-counter compare register.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), write to RTCAnSCMP according to the flow described below.

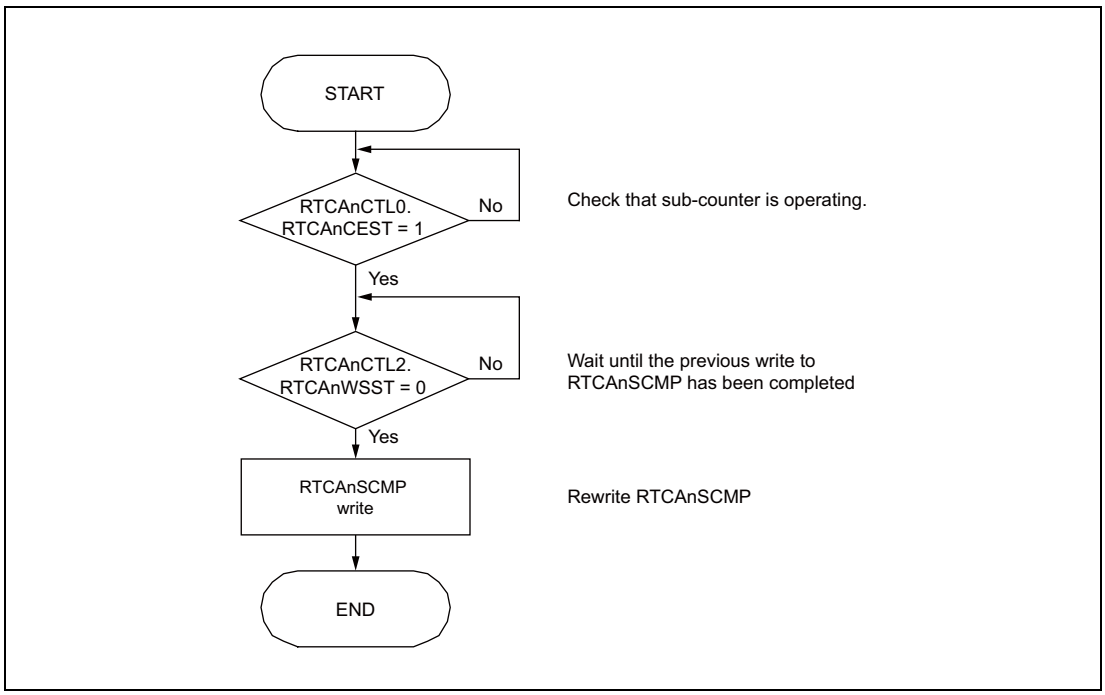

**Figure 27.11 Writing the RTCAnSCMP Register**

**NOTE**

While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), the status flag RTCAnCTL2.RTCAnWSST is set when RTCAnSCMP is written to. It is cleared when the write operation to RTCAnSCMP is completed. This is synchronous with the next RTCAnSUBC overflow.

RTCAnCTL2.RTCAnWSST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWSST = 1 at the beginning of this flow).

# 27.6 Timing Diagrams

## 27.6.1 Timing of Counter Start

The following diagram illustrates the counter start after setting the time in the buffer registers.

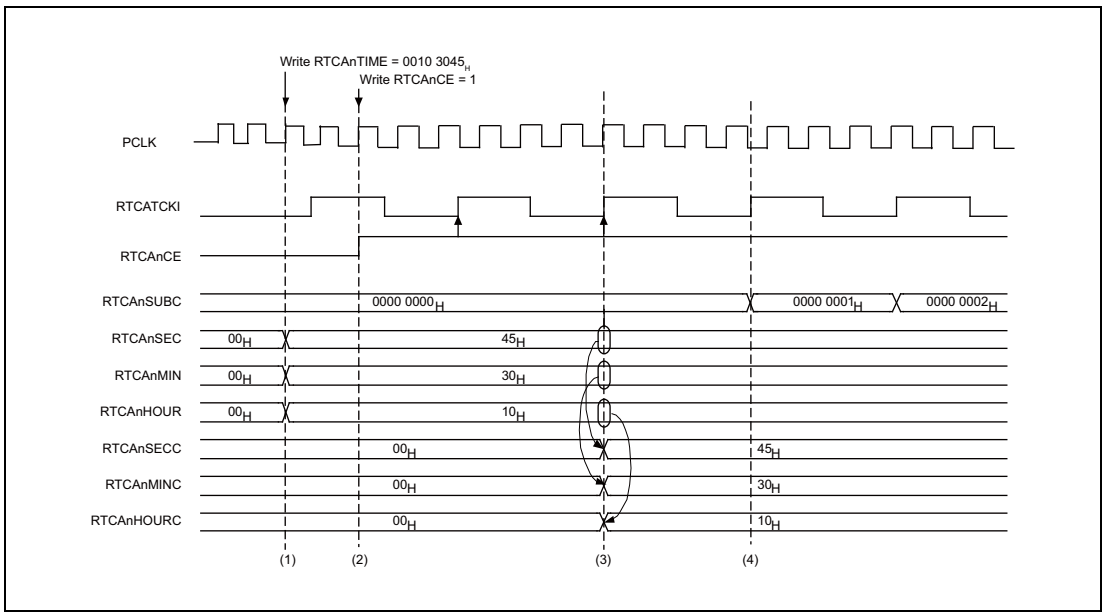

**Figure 27.12 Counter Start Timing**

The timing diagram above shows the following:

(1) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME = 0010 $3045_H$.
Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(2) Sub-counter operation is started by setting RTCAnCTL0.RTCAnCE = 1.

(3) When the second rising edge of RTCATCKI occurs, the buffer register values are loaded to the corresponding count registers.

(4) When the next rising edge of RTCATCKI occurs, count up of the sub-counter starts.

### 27.6.2 Timing of Clock Counter Update while Counter Is Enabled

The following diagram illustrates the counter restart after setting the time in the buffer registers.

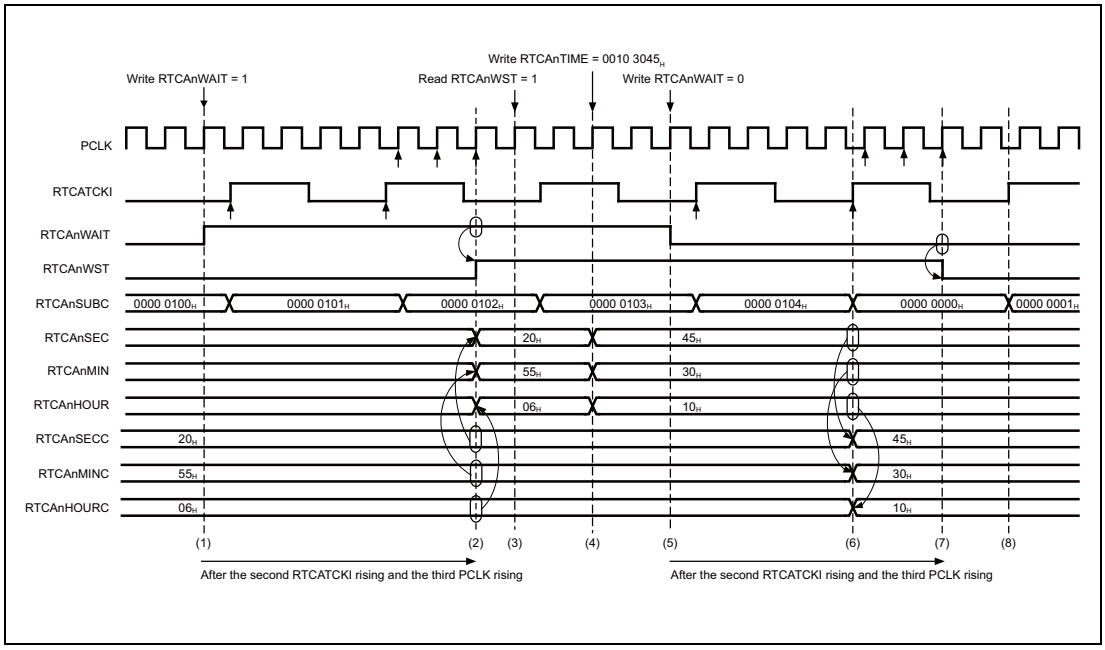

**Figure 27.13 Clock Counter Update Timing**

The timing diagram above shows the following:

(1) Trigger the clock counters stop (RTCAnCTL2.RTCAnWAIT = 1).

(2) RTCAnCTL2.RTCAnWST is set to 1 after the second rising edge of RTCATCKI and the third rising edge of PCLK, and the counter clock stops. The sub-counter continues counting.

(3) RTCAnCTL2.RTCAnWST = 1 can be readable.

(4) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME to 0010 $3045_H$.
Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(5) Trigger the clock counters restart (RTCAnCTL2.RTCAnWAIT = 0).

(6) When the second rising edge of RTCATCKI occurs, the values of the buffer registers are loaded to the corresponding count registers. Write operation to RTCAnSECC is performed and RTCAnSUBC is cleared.

(7) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnWST is set to 0.

(8) Clock counter operation is resumed.

### 27.6.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled

The following diagram illustrates the timing when reading the sub-counter read buffer RTCAnSRBU.

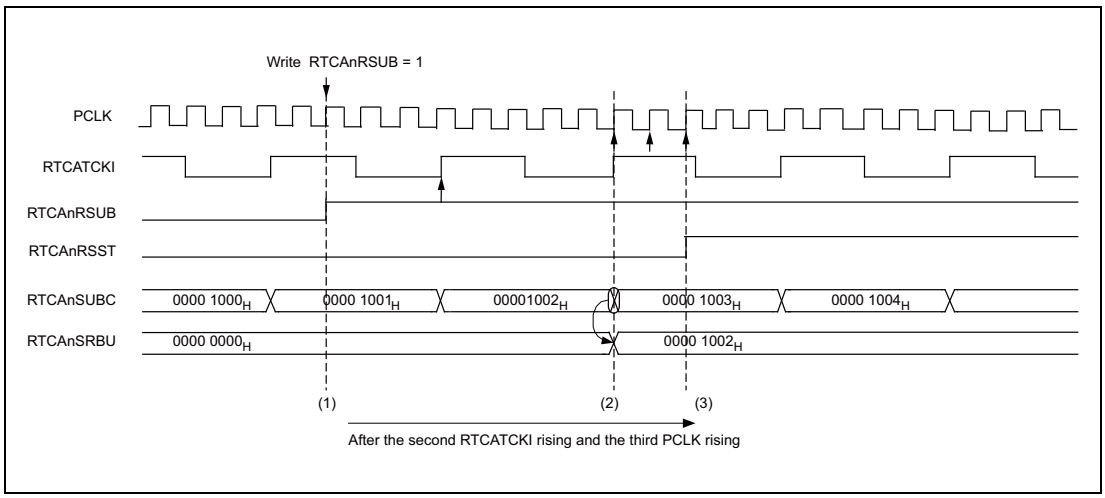

**Figure 27.14 Timing when Reading the Sub-Counter Read Buffer Register Value**

The timing diagram above shows the following:

(1) Setting RTCAnRSUB = 1 triggers loading of the sub-counter value to RTCAnSRBU.

(2) When the second rising edge of RTCATCKI occurs, the value of RTCAnSUBC is loaded to RTCAnSRBU.

(3) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnRSST is set to 1 and RTCAnSRBU can be read.

# Section 28 Encoder Timer (ENCA)

This section contains a generic description of the Encoder Timer (ENCA).

The first part in this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the ENCA.

## 28.1 Features of RH850/F1K ENCA

### 28.1.1 Number of Units and Channels

This microcontroller has the following number of ENCA units.

Each ENCA unit has one channel ENCA. “Number of channels” is used with the same meaning as “number of units” in this section.

**Table 28.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | | |
| Name | ENCAn (n = 0) | | |

**Table 28.2 Index**

| Index | Description |
|---|---|
| n | Throughout this section, the individual ENCA units are identified by the index “n” (n = 0); for example, ENCAnCTL is the ENCAn control register. |

### 28.1.2 Register Base Address

ENCAn base addresses are listed in the following table.

ENCAn register addresses are given as offsets from the base addresses.

**Table 28.3 Register Base Address**

| Base Address Name | Base Address |
|---|---|
| <ENCA0_base> | FFE8 $0000_H$ |

### 28.1.3 Clock Supply

The ENCAn clock supply is shown in the following table.

**Table 28.4 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| ENCA0 | PCLK | CKSCLK_IPERI1 | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_IPERI1 | |

### 28.1.4 Interrupt Requests

ENCAn interrupt requests are listed in the following table.

**Table 28.5 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **ENCA0** | | | |
| ENCATIOV | Overflow interrupt | 85 | — |
| ENCATIUD | Underflow interrupt | 86 | — |
| ENCATINT0 | Capture/compare match interrupt 0 | 87 | — |
| ENCATINT1 | Capture/compare match interrupt 1 | 88 | — |
| ENCATIEC | Encoder clear interrupt | 89 | — |

### 28.1.5 Reset Sources

ENCAn reset sources are listed in the following table. ENCAn is initialized by these reset sources.

**Table 28.6 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| ENCA0 | All reset sources (ISORES) |

### 28.1.6 External Input/Output Signals

External input/output signals of ENCAn are listed below.

**Table 28.7 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **ENCA0** | | |
| ENCATTIN0 | ENCAn capture trigger input 0*1 | ENCA0TIN0 |
| ENCATTIN1 | ENCAn capture trigger input 1*1 | ENCA0TIN1 |
| ENCAnE0 | ENCAn encoder input 0*1 | ENCA0E0 |
| ENCAnE1 | ENCAn encoder input 1*1 | ENCA0E1 |
| ENCAnEC | ENCAn encoder clear input*1 | ENCA0EC |

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

### 28.1.7 Internal Input/Output Signals

Input/output signals to be connected between ENCA and PIC are listed below.

**Table 28.8 Internal Input/Output Signals**

| Unit Signal Name | Description | Connected to |
|---|---|---|
| ENCATSST | Simultaneous start trigger | PIC |
| ENCATTIN1 | ENCAn capture trigger input 1 | PIC |

## 28.2 Overview

### 28.2.1 Functional Overview

- Generation of the counter control signal from the encoder input signal, and count operation in synchronization with PCLK
- Capture function for capturing the counter value with an external trigger signal
- Compare function for compare match judgment with the counter value
- Two capture/compare registers that can be set separately for capture operation and for compare operation
- Interrupt mask function for masking the interrupt request signal output as a result of compare match judgment during compare operation
- Function for loading the value of the capture/compare register to the counter upon underflow occurrence
- Encoder input signal can be used as the timer counter clear condition
- Edge or level can be selected for determining the presence of the encoder input signal that is used as the timer counter clear condition
- Detection of counter overflow and underflow and output of error flags and error occurrence interrupts
- Five interrupts: two capture/compare interrupts, one counter clear interrupt, one overflow interrupt, and one underflow interrupt

## 28.2.2 Block Diagram

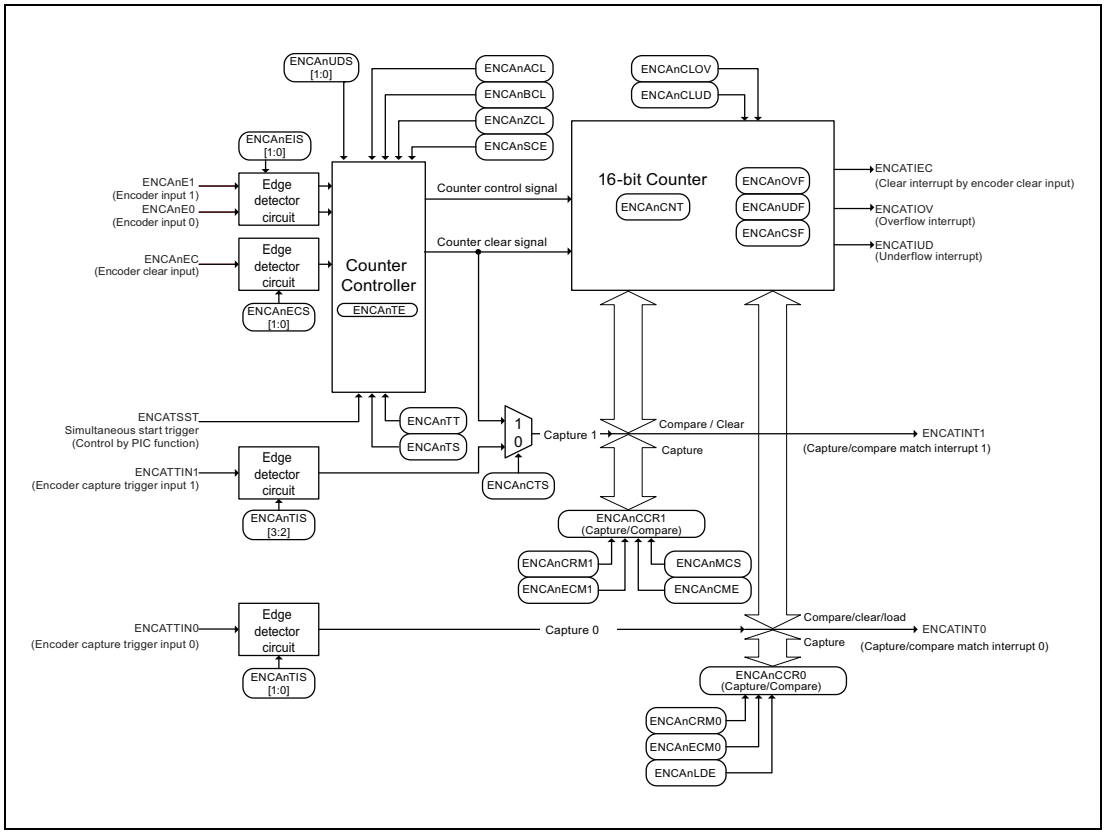

**Figure 28.1 ENCA Block Diagram**

# 28.3 Registers

## 28.3.1 List of Registers

ENCA registers are listed in the following table.

<ENCAn_base> is defined in **Section 28.1.2, Register Base Address**.

**Table 28.9 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| ENCAn | ENCAn capture/compare register 0 | ENCAnCCR0 | <ENCAn_base> |
| | ENCAn capture/compare register 1 | ENCAnCCR1 | <ENCAn_base> + $04_H$ |
| | ENCAn counter register | ENCAnCNT | <ENCAn_base> + $08_H$ |
| | ENCAn status flag register | ENCAnFLG | <ENCAn_base> + $0C_H$ |
| | ENCAn status flag clear register | ENCAnFGC | <ENCAn_base> + $10_H$ |
| | ENCAn timer enable status register | ENCAnTE | <ENCAn_base> + $14_H$ |
| | ENCAn timer start trigger register | ENCAnTS | <ENCAn_base> + $18_H$ |
| | ENCAn timer stop trigger register | ENCAnTT | <ENCAn_base> + $1C_H$ |
| | ENCAn I/O control register 0 | ENCAnIOC0 | <ENCAn_base> + $20_H$ |
| | ENCAn control register | ENCAnCTL | <ENCAn_base> + $40_H$ |
| | ENCAn I/O control register 1 | ENCAnIOC1 | <ENCAn_base> + $44_H$ |
| | ENCAn emulation register | ENCAnEMU | <ENCAn_base> + $48_H$ |

## 28.3.2 ENCAnCTL — ENCAn Control Register

This register is used to configure various operation settings of the Encoder Timer.

**Access:** This register can be read or written in 16-bit units.
Writing to this register during operation is prohibited.

**Address:** <ENCAn_base> + $40_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ENCAn CME | ENCAn MCS | — | — | — | — | ENCAn CRM1 | ENCAn CRM0 | ENCAn CTS | — | — | ENCAn LDE | ENCAn ECM1 | ENCAn ECM0 | ENCAnUDS [1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W |

**Table 28.10 ENCAnCTL Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | ENCAnCME | Encoder Clear Mask Enable<br>This bit is used to enable/disable masking of compare-match interrupt detection when the compare function is used.<br>0: Disables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register<br>1: Enables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register.<br>This bit is valid only when ENCAnCRM1 = 0.<br>When this bit is set to “1”, setting ENCAnECM1 to “1” is prohibited. |
| 14 | ENCAnMCS | Encoder Mask Clear Select<br>This bit is used to select the trigger for cancelling masking of compare-match interrupt detection ENCATINT1 when the compare function is used.<br>This bit is valid only when ENCAnCRM1 = 0.<br>0: Masking of compare-match interrupt detection is canceled when the ENCAnCCR1 register is written.<br>1: Masking of compare match interrupt detection is canceled when one of the following three operations is performed.<br>– Timer counter clear operation accompanying encoder clear input<br>– Timer counter clear operation upon compare-match between ENCAnCNT and ENCAnCCR0 when ENCAnECM0 = 1<br>– Loading from ENCAnCCR0 to the timer counter upon underflow detection when ENCAnLDE = 1 |
| 13 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | ENCAnCRM1 | ENCAnCCR1 Register Mode<br>0: ENCAnCCR1 used as compare register.<br>1: ENCAnCCR1 used as capture register. |
| 8 | ENCAnCRM0 | ENCAnCCR0 Register Mode<br>0: ENCAnCCR0 used as compare register.<br>1: ENCAnCCR0 used as capture register. |
| 7 | ENCAnCTS | ENCAnCCR1 Capture Trigger Select<br>This is a trigger selection bit for the capture operation to the ENCAnCCR1 register.<br>This bit is valid only when ENCAnCRM1 = 1.<br>0: Uses ENCATTIN1 of capture trigger 1 signal as the capture trigger for the ENCAnCCR1 register.<br>1: The counter clear signal selected with ENCAnSCE is used as the capture trigger for the ENCAnCCR1 register. |
| 6, 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**Table 28.10 ENCAnCTL Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 4 | ENCAnLDE | ENCAn Counter Load Enable<br>This bit is used to enable/disable setting value loading to the counter upon underflow occurrence.<br>This bit is valid only when ENCAnCRM0 = 0.<br>When ENCAnCRM0 = 1, loading of the ENCAnCCR0 register setting value to the counter upon occurrence of an underflow is not performed, regardless of the value of this bit.<br>0: Disables loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow.<br>1: Enables loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow. |
| 3 | ENCAnECM1 | Encoder Clear Mode 1<br>This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR1 setting value.<br>This bit is valid only when ENCAnCRM1 = 0.<br>0: Does not clear the counter to $0000_H$ upon match of timer counter value and ENCAnCCR1 setting value.<br>1: Clears the counter to $0000_H$ upon match of timer counter value and ENCAnCCR1 setting value if the next count is a down-count. |
| 2 | ENCAnECM0 | Encoder Clear Mode 0<br>This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR0 setting value.<br>This bit is valid only when ENCAnCRM0 = 0.<br>0: Does not clear the counter to $0000_H$ upon match of timer counter value and ENCAnCCR0 setting value.<br>1: Clears the counter to $0000_H$ upon match of timer counter value and ENCAnCCR0 setting value if the next count is a up-count. |
| 1, 0 | ENCAnUDS[1:0] | Up/down Count Selection 1 and 0<br>These are the counter up/down control bits using ENCAnE0 and ENCAnE1.<br>00: Upon detection of valid edge of ENCAnE0,<br>- down-count when ENCAnE1 = H,<br>- up-count when ENCAnE1 = L<br>01: Upon detection of valid edge of ENCAnE0, up-count,<br>Upon detection of valid edge of ENCAnE1, down-count<br>10: At rising edge of ENCAnE0, down-count<br>At falling edge of ENCAnE0, up-count<br>However, count operation is performed only when ENCAnE1 = L.<br>11: Detection of both edges of ENCAnE0, ENCAnE1.<br>The count operation is determined based on the combination of the detected edge and level. |

### 28.3.3 ENCAnIOC0 — ENCAn I/O Control Register 0

This register is used to select the input edge of capture triggers 0 and 1 (ENCATTIN0, ENCATTIN1).

**Access:** This register can be read or written in 8-bit units.

**Address:** <ENCAn_base> + $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | ENCAnTIS[3:2] | | ENCAnTIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 28.11 ENCAnIOC0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3, 2 | ENCAnTIS[3:2] | Input Edge Selection for Capture Trigger 1<br>These bits are valid only when ENCAnCTL.ENCAnCRM1 = 1 and ENCAnCTL.ENCAnCTS = 0.<br>All other settings of ENCAnCRM1 and ENCAnCTS are invalid.<br>00: No edge detection<br>01: Rising edge detection<br>10: Falling edge detection<br>11: Both edges detection |
| 1, 0 | ENCAnTIS[1:0] | Input Edge Selection for Capture Trigger 0<br>These bits are valid only when ENCAnCTL.ENCAnCRM0 = 1.<br>00: No edge detection<br>01: Rising edge detection<br>10: Falling edge detection<br>11: Both edges detection |

### 28.3.4 ENCAnIOC1 — ENCAn I/O Control Register 1

This register is used to perform the clear condition setting and edge selection for input from the encoder.

**Access:** This register can be read or written in 8-bit units.
Writing to this register during operation is prohibited.

**Address:** <ENCAn_base> + $44_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ENCAnSCE | ENCAnZCL | ENCAnBCL | ENCAnACL | ENCAnECS[1:0] | | ENCAnEIS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 28.12 ENCAnIOC1 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | ENCAnSCE | Encoder Special-Clear Enable<br>This is an encoder special clear enable bit.<br>When setting this bit to 1, set ENCAnUDS1 and ENCAnUDS0 to $10_B$ or $11_B$. The operation is not guaranteed if this bit is set to 1 with ENCAnUDS1 and ENCAnUDS0 set to $00_B$ or $01_B$.<br>0: Clears the counter upon detection of ENCAnEC valid edge (set with ENCAnECS1 and ENCAnECS0).<br>1: Clears the counter upon detection of input level condition of ENCAnE0, ENCAnE1 and ENCAnEC (set with ENCAnZCL bit, ENCAnBCL bit, and ENCAnACL bit). |
| 6 | ENCAnZCL | Input-Z Clear Condition Selection<br>This bit is used to set the condition for clearing the encoder clear input (ENCAnEC) when using the encoder special clear function.<br>This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0.<br>0: Clear condition: Low level<br>1: Clear condition: High level |
| 5 | ENCAnBCL | Input-B Clear Condition Selection<br>This bit is used to set the condition for clearing the encoder input 1 (ENCAnE1) when using the encoder special clear function.<br>This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0.<br>0: Clear condition: Low level<br>1: Clear condition: High level |
| 4 | ENCAnACL | Input-A Clear Condition Selection<br>This bit is used to set the condition for clearing the encoder input 0 (ENCAnE0) when using the encoder special clear function.<br>This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0.<br>0: Clear condition: Low level<br>1: Clear condition: High level |
| 3, 2 | ENCAnECS[1:0] | Encoder Clear Input Edge Selection 1 and 0<br>These are the encoder clear input edge selection bits.<br>These bits are valid only when ENCAnSCE = 0; they are invalid when ENCAnSCE = 1.<br>00: No edge detection<br>01: Rising edge detection<br>10: Falling edge detection<br>11: Both edges detection |

**Table 28.12 ENCAnIOC1 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 1, 0 | ENCAnEIS[1:0] | Encoder Edge Input Selection 1 and 0<br>These are the encoder input edge selection bits.<br>These bits are valid when ENCAnUDS1 and ENCAnUDS0 = $00_B$ or $01_B$, and are invalid when ENCAnUDS1 and ENCAnUDS0 = $10_B$ or $11_B$.<br>00: No edge detection<br>01: Rising edge detection<br>10: Falling edge detection<br>11: Both edges detection |

### 28.3.5 ENCAnFLG — ENCAn Status Flag Register

This register holds the status flags of the timer counter of ENCAn.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ENCAn_base> + $0C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | ENCAnCSF | ENCAnUDF | ENCAnOVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 28.13 ENCAnFLG Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | ENCAnCSF | Counter Status Flag<br>This bit reflects the current timer counter operation.<br>0: Timer counter in up-count status<br>1: Timer counter in down-count status |
| 1 | ENCAnUDF | Underflow Flag<br>This bit reflects the occurrence of an underflow during the timer counter operation. This bit is cleared to 0 at the start of count operation.<br>0: This flag is cleared upon any of the following events:<br>– “1” is written to ENCAnFGC.ENCAnCLUD<br>– The flag is cleared to 0 by setting ENCAnTS bit to “1” when ENCAnTE = 0 or by setting the simultaneous start trigger input (ENCATSST signal) to “High”.<br>1: This flag is set to “1” upon occurrence of an underflow during the encoder timer count operation. |
| 0 | ENCAnOVF | Overflow Flag<br>This bit reflects the occurrence of an overflow during the timer counter operation.<br>This bit is cleared to 0 at the start of count operation.<br>0: This flag is cleared upon any of the following events:<br>– “1” is written to ENCAnFGC.ENCAnCLOV<br>– The flag is cleared to 0 by setting ENCAnTS bit to “1” when ENCAnTE = 0 or by setting the simultaneous start trigger input (ENCATSST signal) to “High”.<br>1: This flag is set to “1” upon occurrence of an overflow during the encoder timer count operation. |

### 28.3.6 ENCAnFGC — ENCAn Status Flag Clear Register

This register is used to clear the timer counter status flags of ENCAnFLG.

**Access:** This register is a write-only register that can be written in 8-bit units.
This register always returns 0 when read.

**Address:** <ENCAn_base> + $10_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | ENCAnCLUD | ENCAnCLOV |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | W |

**Table 28.14 ENCAnFGC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When writing, write the value after reset. |
| 1 | ENCAnCLUD | Underflow Flag Clear<br>This bit clears the underflow flag.<br>0: Writing is ignored.<br>1: Clears ENCAnUDF of the ENCAnFLG register (clears underflow detection). |
| 0 | ENCAnCLOV | Overflow Flag Clear<br>This bit clears the overflow flag.<br>0: Writing is ignored.<br>1: Clears ENCAnOVF of the ENCAnFLG register (clears overflow detection). |

### 28.3.7 ENCAnCCR0 — ENCAn Capture/Compare Register 0

This register is a 16-bit capture/compare register 0.

**Access:** This register can be read or written in 16-bit units.
When this register functions as a capture register, only reading is possible. Write operation is ignored.
When this register functions as a compare register, reading and writing is possible.

**Address:** <ENCAn_base> + $00_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ENCAnCCR0[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 28.15 ENCAnCCR0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | ENCAnCCR0 [15:0] | Capture/Compare Register 0<br>Upon occurrence of an underflow, the setting value of this register may be loaded to the counter according to the ENCAnCTL.ENCAnLDE setting. See the description of the ENCAnLDE bit in ENCA control register ENCAnCTL for details.<br>• If ENCAnCTL.ENCAnCRM0 = 0: ENCAnCCR0 is a compare register. Set the value to be compared with the timer counter value.<br>• If ENCAnCTL.ENCAnCRM0 = 1: ENCAnCCR0 is a capture register. The captured timer counter value is stored. |

## 28.3.8 ENCAnCCR1 — ENCAn Capture/Compare Register 1

This register is a 16-bit capture/compare register 1.

**Access:** This register can be read or written in 16-bit units.
When this register functions as a capture register, only reading is possible. Write operation is ignored.
When this register functions as a compare register, reading and writing is possible.

**Address:** <ENCAn_base> + $04_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ENCAnCCR1[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 28.16 ENCAnCCR1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | ENCAnCCR1 [15:0] | Capture/Compare Register 1<br>During capture operation, the capture trigger to this register differs according to the ENCAnCTL.ENCAnCTS setting. See the description of the ENCAnCTS bit in ENCA control register ENCAnCTL for details.<br>• If ENCAnCTL.ENCAnCRM1 = 0: ENCAnCCR1 is a compare register. Set the value to be compared with the timer counter value.<br>• If ENCAnCTL.ENCAnCRM1 = 1: ENCAnCCR1 is a capture register. The captured timer counter value is stored. |

## 28.3.9 ENCAnCNT — ENCAn Counter Register

This register is the 16-bit timer counter register.

**Access:** This register can be read or written in 16-bit units.
This register can be written only when the operation is stopped.

**Address:** <ENCAn_base> + $08_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ENCAnCNT[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 28.17 ENCAnCNT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | ENCAnCNT [15:0] | Counter Register<br>• ENCAnTE.ENCAnTE status: 0 (initial setting): Count stop<br>An arbitrary value can be set to timer counter.<br>• ENCAnTE.ENCAnTE status: 0 → 1 (operation start): Count operation start<br>Up/down count operation is started with the set arbitrary value.<br>• ENCAnTE.ENCAnTE status: 1 (operating): Counting<br>Up/down count operation is performed.<br>• ENCAnTE.ENCAnTE status: 1 → 0 (stopped): Count stop<br>The counter value immediately before the operation was stopped is held, and the count operation is stopped. |

## 28.3.10 ENCAnTE — ENCAn Timer Enable Status Register

This register indicates the operating status of ENCAn.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ENCAn_base> + $14_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | ENCAnTE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 28.18 ENCAnTE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | ENCAnTE | Timer Status Enable<br>This is a status bit that indicates the operation enabled/stopped status of ENCAn.<br>This bit is cleared to 0 when “1” is written to ENCAnTT.ENCAnTT.<br>This bit is set to “1” when “1” is written to ENCAnTS.ENCAnTS, or when the input signal of ENCATSST is set to High level.<br>0: Operation stopped status<br>1: Operation enabled status |

### 28.3.11 ENCAnTS — ENCAn Timer Start Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation enabled state.

**Access:** This register is a write-only register that can be written in 8-bit units.
It is always read as $00_H$. This register can be written only when ENCAnTE.ENCAnTE is 0.

**Address:** <ENCAn_base> + $18_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | ENCAnTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 28.19 ENCAnTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | ENCAnTS | Timer Start Trigger<br>This is the trigger bit that sets the ENCAn to the operation enabled state.<br>0: Writing is ignored.<br>1: The ENCAn is set to the operation enabled state by setting ENCAnTE.ENCAnTE = 1. |

## 28.3.12 ENCAnTT — ENCAn Timer Stop Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation stopped state.

**Access:** This register is a write-only register that can be written in 8-bit units.
It is always read as $00_H$.

**Address:** <ENCAn_base> + $1C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | ENCAnTT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 28.20 ENCAnTT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | ENCAnTT | Timer Stop Trigger<br>This is the trigger bit that sets the ENCAn to the operation stopped state.<br>0: Writing is ignored.<br>1: Clears ENCAnTE.ENCAnTE to “0”, to set the ENCAn to the count operation stopped state. |

## 28.3.13 ENCAnEMU — ENCAn Emulation Register

This register controls operations by SVSTOP.

**Access:** This register can be read or written in 8-bit units.
Writing to this register should be performed in the counter operation stopped status (ENCAnTE.ENCAnTE = 0 and EPC.SVSTOP = 0).

**Address:** <ENCAn_base> + $48_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ENCAnSVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 28.21 ENCAnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | ENCAnSVSDIS | • When EPC.SVSTOP bit = 0:<br>The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.), regardless of the value of this bit (1 or 0).<br>• When EPC.SVSTOP bit = 1:<br>0: The count clock is stopped when the debugger assumes control of the microcontroller (at a break point, etc.).<br>1: The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## 28.4 Operation

The ENCAn operates the timer counter with counter up/down control and clear control by encoder inputs. The ENCAnCCR0 and ENCAnCCR1 registers can be used as dedicated compare registers or as dedicated capture registers.

### 28.4.1 Timer Counter Operation

The timer counter operations of the ENCAn are described below.

The figure below shows the operation phases. See the corresponding section with the section number for detailed descriptions on each operation.

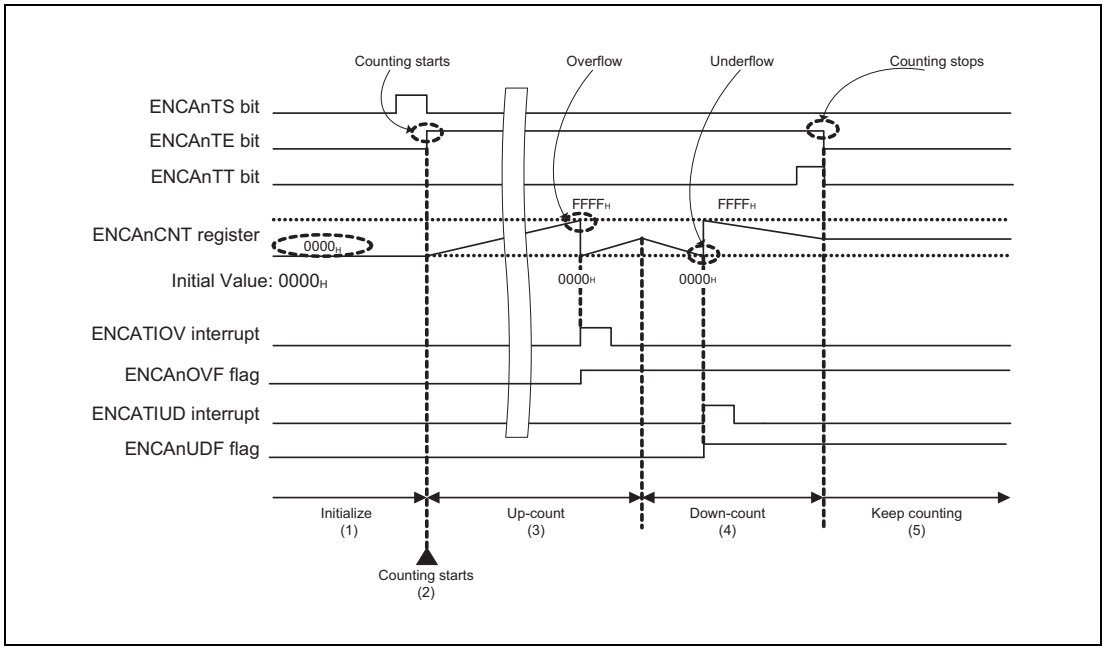

**Figure 28.2 Timer Counter Initial Value Setting/Start/Stop**

#### (1) Timer Counter Initial Value Setting

The initial value of the ENCAn counter register (ENCAnCNT) can be set in the counter operation stopped status (ENCAnTE = 0).

#### (2) Timer Counter Startup

By writing "1" to the timer start trigger bit (ENCAnTS), the timer status enable bit (ENCAnTE) is set to "1", the count operation is enabled, and counting operation is performed upon detection of the valid edge of the encoder input.

#### (3) Overflow Operation

An overflow occurs when up-counting is performed when the counter value is $FFFF_H$. If the counter value changes from $FFFF_H$ to $0000_H$, an overflow interrupt (ENCATIOV) is generated, and the overflow flag (ENCAnOVF) is set to "1". The overflow flag (ENCAnOVF) is cleared to "0" when "1" is set to the overflow flag clear bit (ENCAnCLOV). For details about the operation, see **Section 28.6.1, Overflow Occurrence and Overflow Flag Clear Operation**.

#### (4) Underflow Operation

An underflow occurs when down-counting is performed when the counter value is $0000_H$. If the counter value changes from $0000_H$ to $FFFF_H$, an underflow interrupt (ENCATIUD) is generated, and the underflow flag (ENCAnUDF) is set to “1”. The underflow flag (ENCAnUDF) is cleared to “0” when “1” is set to the underflow flag clear bit (ENCAnCLUD). For details about the operation, see **Section 28.6.2, Underflow Occurrence and Underflow Flag Clear Operation**.

#### (5) Timer Counter Stop

By writing “1” to the timer stop trigger bit (ENCAnTT), the timer status enable bit (ENCAnTE) is cleared to “0”, and the count operation is stopped. At this time, the timer counter is not reset to $0000_H$ and holds the value before count operation stop.

## 28.4.2 Up/Down Control of Timer Counter

Up/down control is performed by judging the phase of the encoder inputs (ENCAnE0, ENCAnE1) according to the settings of ENCAnUDS1 and ENCAnUDS0.

### 28.4.2.1 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $00_B$

Table 28.22 When ENCAnUDS1, ENCAnUDS0 Bits = $00_B$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description | | |
|---|---|---|---|---|
| | | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 0 | 0 | Rising edge | High level | Down |
| | | Falling edge | | |
| | | Rising and falling edges | | |
| | | Rising edge | Low level | Up |
| | | Falling edge | | |
| | | Rising and falling edges | | |

The valid edge for ENCAnE0 is specified by setting ENCAnEIS1 and ENCAnEIS0.

Up/down count operation is performed when the valid edges and levels of ENCAnE0 and ENCAnE1 match.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits = $00_B$.

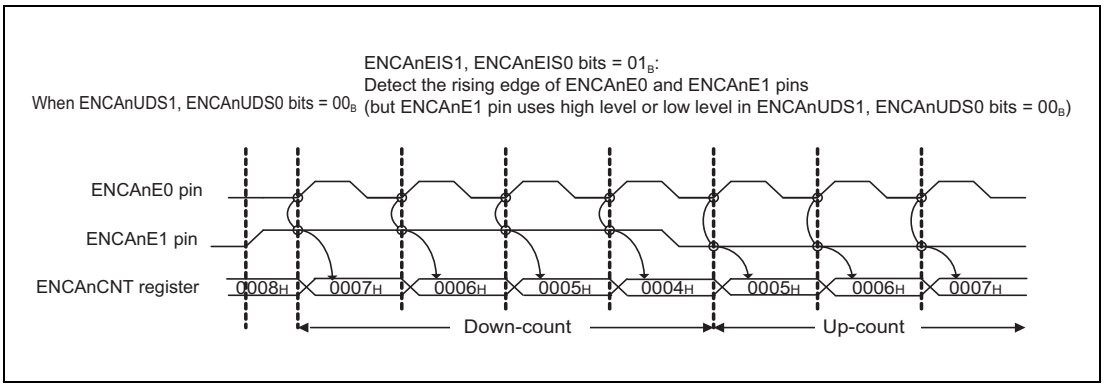

Figure 28.3 Count Operation when the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $00_B$

### 28.4.2.2 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $01_B$

Table 28.23 When the ENCAnUDS1, ENCAnUDS0 Bits = $01_B$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description | | |
|---|---|---|---|---|
| | | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 0 | 1 | Low level | Rising edge | Down |
| | | | Falling edge | |
| | | | Rising and falling edges | |
| | | High level | Rising edge | |
| | | | Falling edge | |
| | | | Rising and falling edges | |
| | | Rising edge | Low level | Up |
| | | Falling edge | | |
| | | Rising and falling edges | | |
| | | Rising edge | High level | |
| | | Falling edge | | |
| | | Rising and falling edges | | |
| | | Simultaneous input | | Hold |

The valid edges for ENCAnE0 and ENCAnE1 are specified by setting ENCAnEIS1 and ENCAnEIS0.

Up/down count operation is performed when the valid edges and levels of the ENCAnE0/ENCAnE1 pins match, and the count is held when the valid edges overlap.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits = $01_B$.

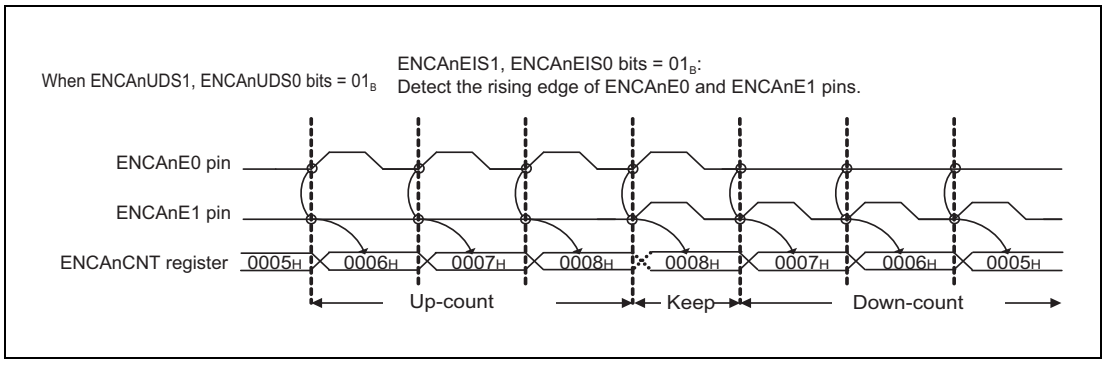

Figure 28.4 Count Operation when the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $01_B$

### 28.4.2.3 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $10_B$

Table 28.24 When the ENCAnUDS1, ENCAnUDS0 Bits = $10_B$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description | | |
|---|---|---|---|---|
| | | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 1 | 0 | Rising edge | Low level | Down |
| | | Rising edge | Falling edge | |
| | | Falling edge | Low level | Up |
| | | Falling edge | Falling edge | |
| | | Low level | Rising edge | Hold |
| | | Rising edge | Rising edge | |
| | | High level | Rising edge | |
| | | Falling edge | Rising edge | |
| | | Low level | Falling edge | |
| | | Rising edge | High level | |
| | | High level | Falling edge | |
| | | Falling edge | High level | |

The valid edge specification for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1 and ENCAnEIS0) is invalid.

The following timing chart shows the count operation when the ENCAnUDS1, ENCAnUDS0 bits = $10_B$.

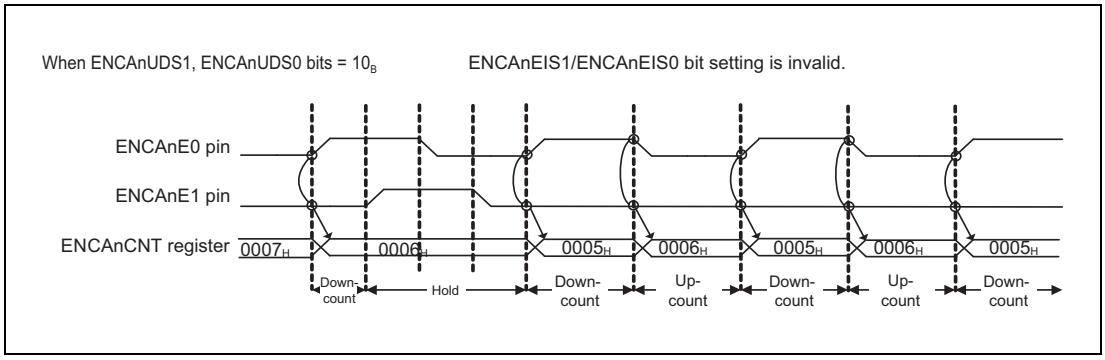

Figure 28.5 Count Operation when ENCAnUDS1, ENCAnUDS0 Bits in ENCAnCTL Register = $10_B$

### 28.4.2.4 When ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $11_B$

Table 28.25 When ENCAnUDS1, ENCAnUDS0 Bits = $11_B$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description | | |
|---|---|---|---|---|
| | | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 1 | 1 | Low level | Falling edge | Down |
| | | Rising edge | Low level | |
| | | High level | Rising edge | |
| | | Falling edge | High level | |
| | | Rising edge | High level | Up |
| | | High level | Falling edge | |
| | | Falling edge | Low level | |
| | | Low level | Rising edge | |
| | | Simultaneous input | | Hold |

Valid edge specification for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1 and ENCAnEIS0) is invalid.

The counter value is held when the valid edges of ENCAnE0 and ENCAnE1 overlap.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits = $11_B$.

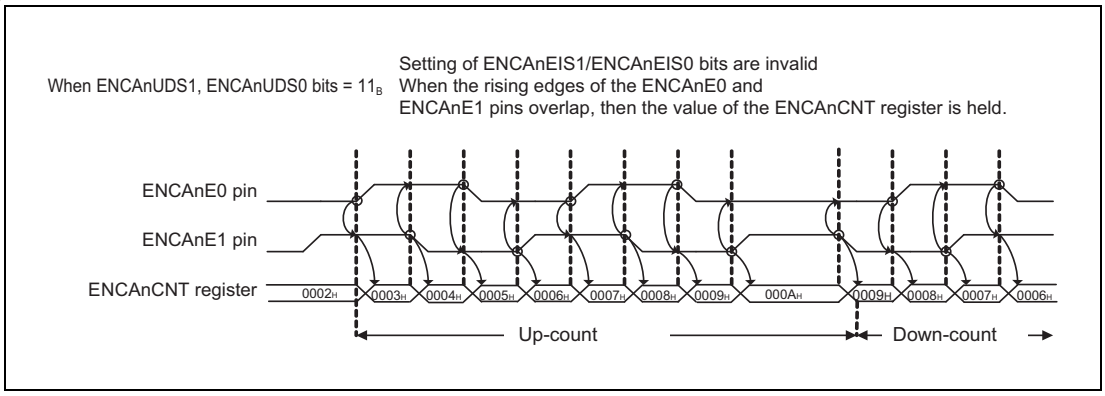

Figure 28.6 Count Operation when ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $11_B$

### 28.4.3 Timer Counter Clear Control by Encoder Input

The timer counter is cleared to $0000_H$ by encoder clear input (ENCAnEC).

Two types of clearing methods can be selected by controlling the ENCAnSCE, ENCAnZCL, ENCAnBCL, ENCAnACL, ENCAnECS1, and ENCAnECS0 bits of the ENCAnIOC1 register.

**Table 28.26 Timer Counter Clear Control by Encoder Input**

| Clearing method | ENCAnSCE | ENCAnZCL | ENCAnBCL | ENCAnACL | ENCAnECS1, ENCAnECS0 |
|---|---|---|---|---|---|
| (1) | 0 | Invalid | Invalid | Invalid | Valid |
| (2) | 1 | Valid | Valid | Valid | Invalid |

#### 28.4.3.1 Clearing Method when ENCAnSCE = 0

- Upon detection of the valid edge of ENCAnEC, the timer counter is cleared to $0000_H$ in synchronization with the operation clock.
- The valid edge of ENCAnEC is specified by the setting of the ENCAnECS1 and ENCAnECS0 bits.
- The settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

For details about clear operation when ENCAnSCE = 0, see the timing chart in **Section 28.6.19, Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0**.

#### 28.4.3.2 Clearing Method when ENCAnSCE = 1

- When the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs are detected, the timer counter is cleared to $0000_H$ in synchronization with the operating clock.
- Specify the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs by the settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits.
- The settings of the ENCAnECS1 and ENCAnECS0 bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

The clearing conditions of the timer counter according to the ENCAnZCL, ENCAnBCL, and ENCAnACL settings are listed in the table below.

**Table 28.27 Clearing Conditions of the Timer Counter**

| Counter Clear Condition Setting | | | Encoder Pin Input Level | | |
|---|---|---|---|---|---|
| ENCAnZCL | ENCAnBCL | ENCAnACL | ENCAnEC | ENCAnE1 | ENCAnE0 |
| 0 | 0 | 0 | Low | Low | Low |
| 0 | 0 | 1 | Low | Low | High |
| 0 | 1 | 0 | Low | High | Low |
| 0 | 1 | 1 | Low | High | High |
| 1 | 0 | 0 | High | Low | Low |
| 1 | 0 | 1 | High | Low | High |
| 1 | 1 | 0 | High | High | Low |
| 1 | 1 | 1 | High | High | High |

## 28.4.4 Functions of ENCAnCCR0

### 28.4.4.1 Compare Function

- When ENCAnCRM0 = 0, the ENCAnCCR0 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR0 setting value, a compare 0 match interrupt (ENCATINT0) is output.
- When ENCAnECM0 = 1, the timer counter is cleared to $0000_H$ in synchronization with the operating clock upon compare match if the next count operation is up-count.

**Table 28.28 Compare Function of ENCAnCCR0**

| ENCAnCCR0 Function | Compare Match Clear Control | Next Count Operation | Timer Counter Clearing Upon Compare Match with ENCAnCCR0 |
|---|---|---|---|
| ENCAnCRM0 | ENCAnECM0 | | |
| 0 (Compare) | 0 | Up-count | Does not clear (continues count operation). |
| | | Down-count | |
| | 1 | Up-count | Clears timer counter to $0000_H$. |
| | | Down-count | Does not clear (continues count operation). |

**When ENCAnLDE = 1**

- Upon occurrence of an underflow, the setting value of the ENCAnCCR0 register is loaded to the timer counter.
- An underflow interrupt (ENCATIUD) is output.

**NOTE**

For the timing chart when ENCAnLDE = 1, see **Section 28.6.8, Using the ENCAnLDE Function Immediately after Startup** to **Section 28.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input**.

### 28.4.4.2 Capture Function

- When ENCAnCRM0 = 1, the ENCAnCCR0 register functions as a dedicated capture register.
- Upon valid edge detection of the capture trigger input 0 (ENCATTIN0), the value of the timer counter is stored into ENCAnCCR0.
- A capture 0 interrupt (ENCATINT0) is output during capture operation.

**NOTE**

For details about capture operation for ENCAnCCR0, see the timing charts in **Section 28.6.14, Capture Operation between Count Clocks (ENCAnCCR0)** and **Section 28.6.17, Encoder Operation when Compare Match Clear Control is Disabled**.

## 28.4.5 Functions of ENCAnCCR1

### 28.4.5.1 Compare Function

- When ENCAnCRM1 = 0, the ENCAnCCR1 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR1 setting value, a compare 1 match interrupt (ENCATINT1) is output.
- When ENCAnECM1 = 1, the timer counter is cleared to $0000_H$ in synchronization with the operating clock upon compare match if the next count operation is down-count.

**Table 28.29 Compare Function of ENCAnCCR1**

| ENCAnCCR1 Function | Compare Match Clear Control | Next Count Operation | Timer Counter Clearing Upon Compare Match with ENCAnCCR1 |
|---|---|---|---|
| ENCAnCRM1 | ENCAnECM1 | | |
| 0 (Compare) | 0 | Up-count | Does not clear (continues count operation). |
| | | Down-count | |
| | 1 | Up-count | Does not clear (continues count operation). |
| | | Down-count | Clears timer counter to $0000_H$. |

#### Compare match interrupt mask function

- When ENCAnCME = 1, the compare 1 match interrupt mask function is enabled. In this state, the compare 1 match interrupt is output upon the first match of the value of the timer counter and the ENCAnCCR1 setting value, and interrupts are then masked for the second and subsequent compare matches.
- When ENCAnCME = 1 and ENCAnMCS = 0, a compare 1 match interrupt is output once upon the first compare match by writing to the ENCAnCCR1 register (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCAnCME = 1 and ENCAnMCS = 1, a compare 1 match interrupt is output once upon the first compare match by a timer counter clear operation accompanying encoder clear input or by a timer counter clear operation upon match between the ENCAnCCR0 register value and the timer counter value (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCAnCME = 1, ENCAnMCS = 1 and ENCAnLDE = 1, a compare 1 match interrupt is output once upon the first compare match by a loading operation of the ENCAnCCR0 register to the timer counter upon underflow detection (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- Setting ENCAnECM1 to “1” is prohibited when enabling the compare 1 match interrupt mask function.

Table 28.30 Compare Match Interrupt Mask Function of ENCAnCCR1

| ENCAnCCR1 Function | Compare 1 Match Interrupt Mask | Interrupt Mask Cancel Trigger | Compare 1 Match Interrupt Output upon Compare Match with ENCAnCCR1 |
|---|---|---|---|
| ENCAnCRM1 | ENCAnCME | ENCAnMCS | |
| 0 (Compare) | 0 (Mask function disabled) | — (Setting invalid) | Outputs compare 1 match interrupt upon each compare match. |
| | 1 (Mask function enabled) | 0 (Write operation to ENCAnCCR1) | Outputs compare 1 match interrupt once upon the first compare match. (Interrupts are masked for the second and subsequent matches until the cancel trigger occurs.) |
| | | 1 (Timer counter clear operation) (Loading from ENCAnCCR0 to the timer counter upon underflow occurrence when ENCAnLDE = 1) | |

### 28.4.5.2 Capture Function

When ENCAnCRM1 = 1, the ENCAnCCR1 register functions as a dedicated capture register.

**NOTE**

For details about capture operation to ENCAnCCR1, see the timing chart in **Section 28.6.13, Capture Operation between Count Clocks (ENCAnCCR1)**.

The operations for each of the ENCAnCTS settings are shown in the table below.

Table 28.31 Operations for Each of the ENCAnCTS Settings

| ENCAnCCR1 Function | Capture Trigger Selection | Capture Trigger Signal | Timer Counter Clearing | Interrupt Occurrence |
|---|---|---|---|---|
| ENCAnCRM1 | ENCAnCTS | | | |
| 1 (Capture) | 0 | Capture trigger 1 input (ENCATTIN1) | Does not clear timer counter. | (1) Capture 1 interrupt (ENCATINT1) |
| | 1 | Encoder clear input (set with ENCAnSCE) | Clears timer counter. | (1) Capture 1 interrupt (ENCATINT1)<br>(2) Encoder clear interrupt (ENCATIEC) |

**NOTE**

For details about the timing chart when ENCAnCTS = 0 or ENCAnCTS = 1, see the following:

**Section 28.6.3, Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)**, **Section 28.6.4, Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)**, **Section 28.6.5, Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)**, **Section 28.6.11, Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin)** and **Section 28.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input**.

#### 28.4.5.3 Timer Counter Clearing upon Compare Register Match

Timer counter clearing upon compare match between the value of the timer counter and the ENCAnCCR0/1 setting value, according to the settings of the ENCAnECM1 and ENCAnECM0 bits in the ENCAnCTL register, is detailed in the following table.

**Table 28.32 Timer Counter Clearing Operation upon Compare Register Match**

| ENCAnECM1 and ENCAnECM0 | Next Count Operation | Timer Counter Clearing upon Compare Match with ENCAnCCR1 | Timer Counter Clearing upon Compare Match with ENCAnCCR0 |
|---|---|---|---|
| 00 | Up-count | Does not clear (continues count operation). | Does not clear (continues count operation). |
| | Down-count | Does not clear (continues count operation). | Does not clear (continues count operation). |
| 01 | Up-count | Does not clear (continues count operation). | Clears timer counter to $0000_H$. |
| | Down-count | Does not clear (continues count operation). | Does not clear (continues count operation). |
| 10 | Up-count | Does not clear (continues count operation). | Does not clear (continues count operation). |
| | Down-count | Clears timer counter to $0000_H$. | Does not clear (continues count operation). |
| 11 | Up-count | Does not clear (continues count operation). | Clears timer counter to $0000_H$. |
| | Down-count | Clears timer counter to $0000_H$. | Does not clear (continues count operation). |

### 28.4.6 Startup/Stop of Timer Counter

#### 28.4.6.1 Startup of Timer

The timer operation can be started by setting the ENCAnTS bit to “1”.

PIC setting enables simultaneous start with other timers. For details, see Section 29.8, Simultaneous Start Trigger Function.

#### 28.4.6.2 Stop of Timer

When the ENCAnTT bit is set to “1”, the ENCAnTE bit becomes “0” and the timer stops.

# 28.5 ENCAn Setting Sequences

## 28.5.1 ENCAn Setting Procedure

The ENCAn setting procedure is described below.

**Table 28.33 ENCAn Setting Procedure**

| Initial Setting | Action | Setting status |
|---|---|---|
| Initial setting | Reset deassertion | Power-on status, operation stopped status. (Writing to each register is enabled) |
| ENCAn initial setting | Perform the following initial settings.<br>• Setting for counter<br>• Setting for counter clear<br>• Setting for ENCAnCCR0 register<br>• Setting for ENCAnCCR1 register | This is the count operation stopped status. The value of the ENCAnTE bit indicating the operating status is 0. |
| | Perform the counter initial value settings.<br>• Set any 16-bit value to ENCAnCNT register. (When, after setting this register, the ENCAnTS bit is set to “1”, the counter operation starts from the set count value.) | The set value is set as the initial value of the counter register. |
| Operation start | Perform the counter operation start setting.<br>• Set the ENCAnTS bit to “1”. | This is the counter operation starts status. The value of the ENCAnTE bit indicating the operating status is 1, and the count clock is supplied to the internal circuit. |
| Operating | Only those registers whose setting can be changed during operation can be rewritten.<br>• ENCAnCCR0 register setting.<br>• ENCAnCCR1 register setting.<br>• ENCAnIOC0 register setting. | The count operation set with the initial setting is performed, and up/down counting is performed according to ENCAnE0 and ENCAnE1 pins. |
| Operation stop | Perform the counter operation stop setting during operation.<br>• Set the ENCAnTT bit to “1”. | This is the counter operation stopped status. The value of the ENCAnTE bit indicating the operating status is 0. |
| ENCAn stop | Reset | The setting registers are initialized. |

### 28.5.1.1 Initial Setting Procedure for the Counter

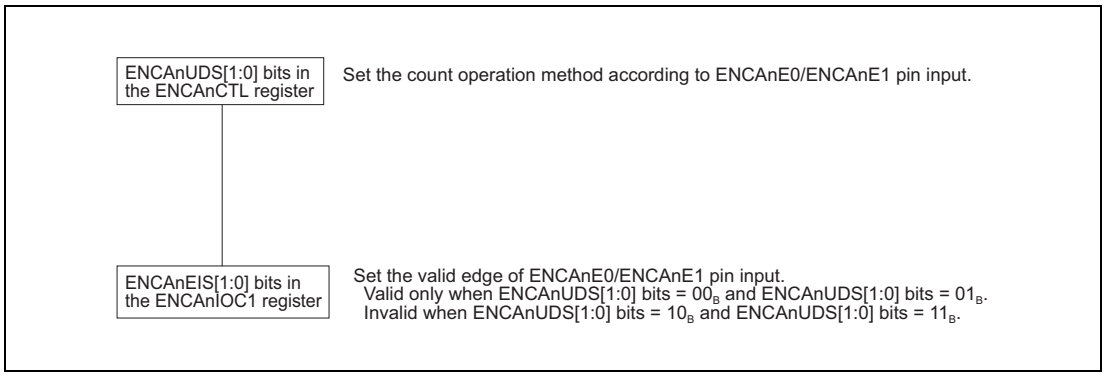

**Figure 28.7 Initial Setting Procedure for the Counter**

### 28.5.1.2 Initial Setting Procedure for Counter Clear

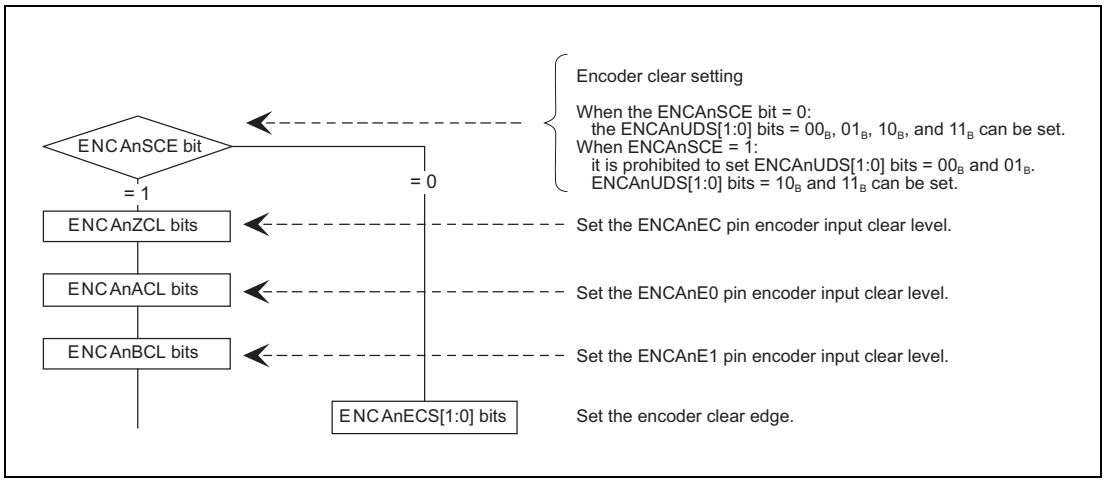

**Figure 28.8 Initial Setting Procedure for Counter Clear**

### 28.5.1.3 Setting Procedure for ENCAnCCR0 Register

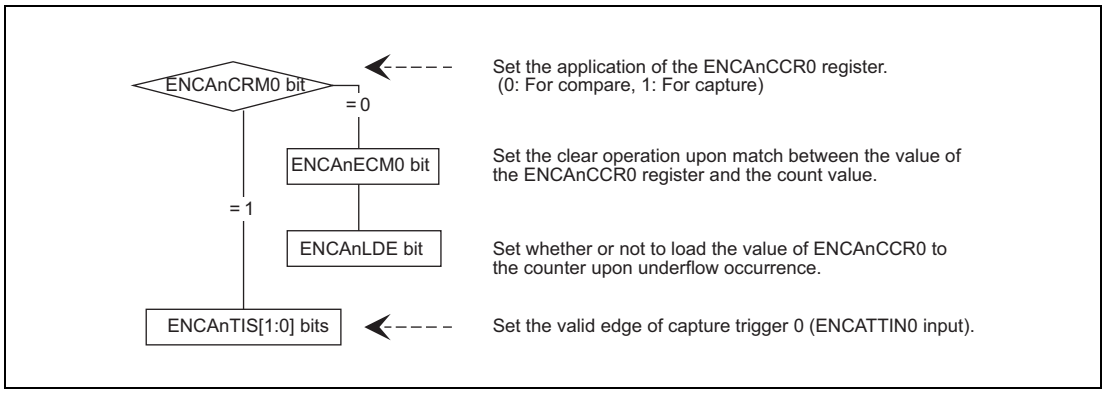

**Figure 28.9 Setting Procedure for ENCAnCCR0 Register**

### 28.5.1.4 Setting Procedure for ENCAnCCR1 Register

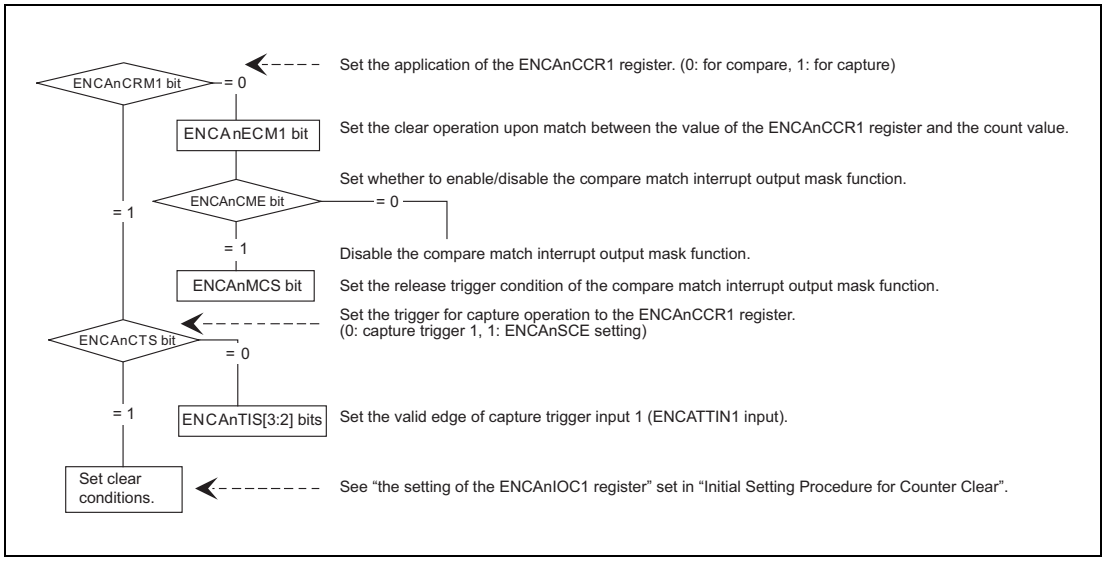

**Figure 28.10 Setting Procedure for ENCAnCCR1 Register**

# 28.6 Timing Chart

## 28.6.1 Overflow Occurrence and Overflow Flag Clear Operation

An overflow occurs when up-counting is performed when the counter value is $FFFF_H$. Once an overflow occurs, an overflow interrupt (ENCATIOV) is output and the overflow flag (ENCAnOVF) is set to 1. When the overflow clear bit (ENCAnCLOV) is set to 1, the overflow flag (ENCAnOVF) is cleared to 0.

The operations of overflow occurrence and overflow flag clearing are described below.

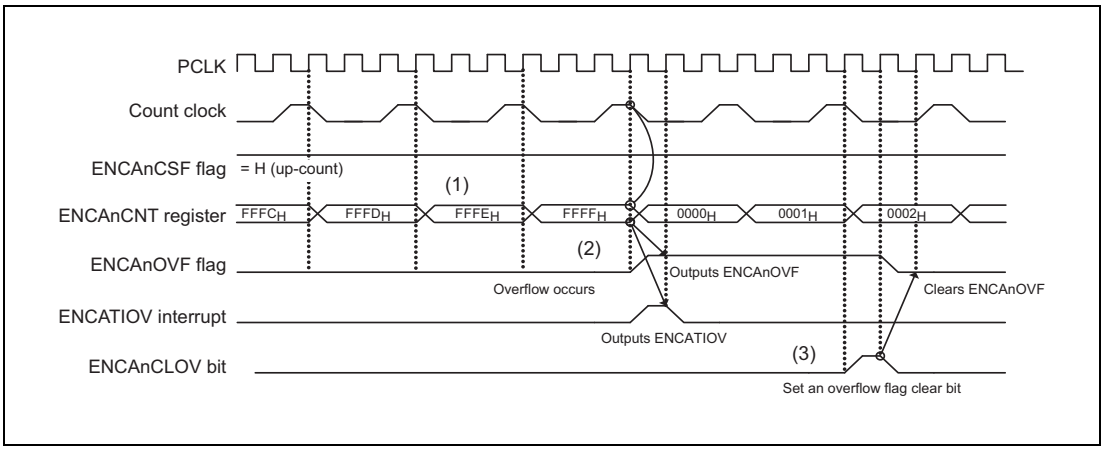

**Figure 28.11 Settings of Overflow Occurrence and Overflow Flag Clear**

(1) The count value is counted up from $FFFE_H$ to $FFFF_H$.

(2) When the count value changes from $FFFF_H$ to $0000_H$, an overflow occurs. At the same time, an overflow interrupt is output and the overflow flag is set to 1.

(3) By setting the ENCAnCLOV bit in the ENCAnFGC register to 1 by the overflow flag clearing method, the overflow flag is cleared to 0. The overflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0, or setting the input signal of ENCATSST (simultaneous start trigger input) to “High”.

### 28.6.2 Underflow Occurrence and Underflow Flag Clear Operation

An underflow occurs when down-counting is performed when the counter value is $0000_H$.
Once an underflow occurs, an underflow interrupt (ENCATIUD) is output and the underflow flag (ENCAnUDF) is set to 1. When the underflow clear bit (ENCAnCLUD) is set to 1, the underflow flag (ENCAnUDF) is cleared to 0.

The operations of underflow occurrence and underflow flag clearing are described below.

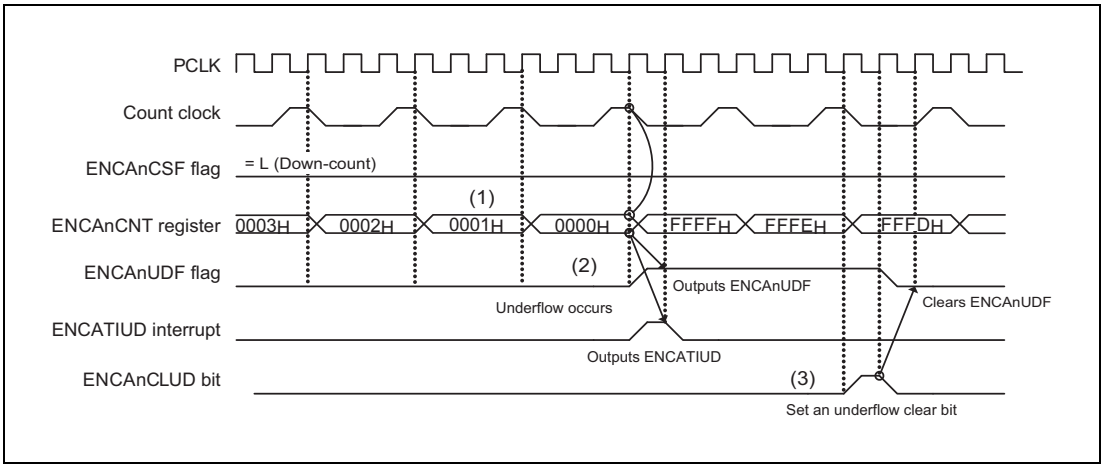

**Figure 28.12 Settings of Underflow Occurrence and Underflow Flag Clear**

(1) The count value is counted down from $0001_H$ to $0000_H$.

(2) When the count value changes from $0000_H$ to $FFFF_H$, an underflow occurs. At the same time, an underflow interrupt is output and the underflow flag is set to 1.

(3) By setting the ENCAnCLUD bit in the ENCAnFGC register to 1 by the underflow flag clearing method, the underflow flag is cleared to 0. The underflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0, or by setting the input signal of ENCATSST (simultaneous start trigger) to “High”.

### 28.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

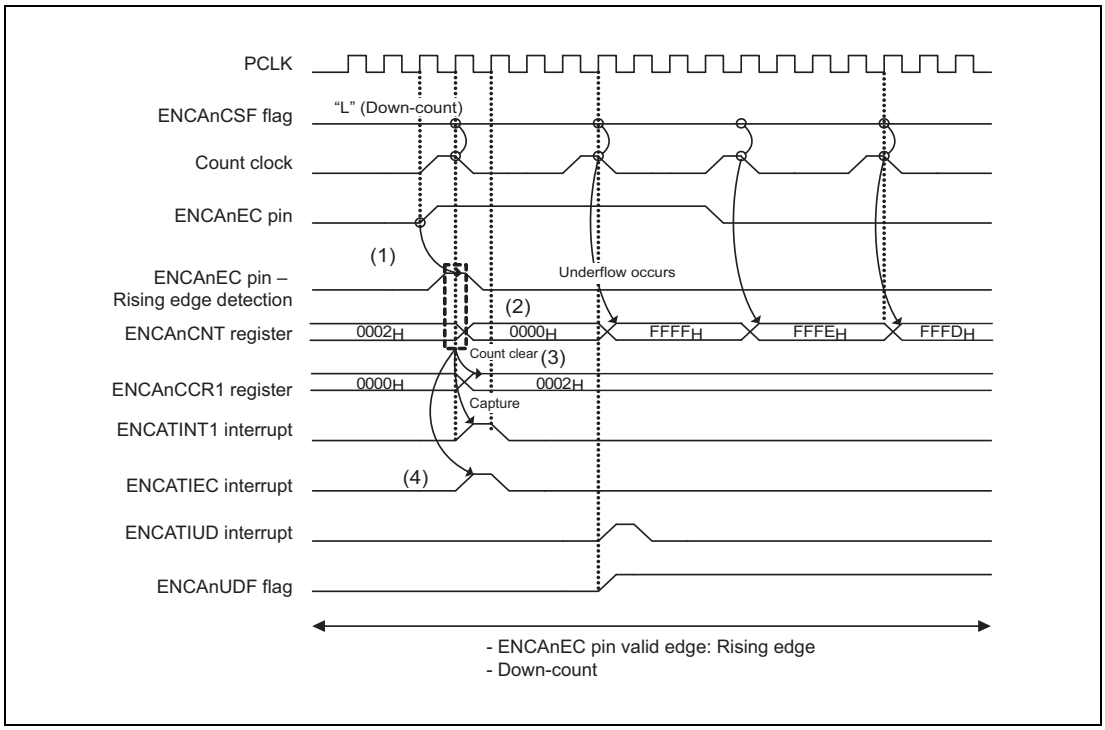

**Figure 28.13 Timing Chart of Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)**

#### Setting conditions

- ENCAnCRM1 bit in the ENCAnCTL register = 1
  (Select the ENCAnCCR1 register as capture.)
- ENCAnCTS bit in the ENCAnCTL register = 1
  (Select the ENCAnEC pin input as capture trigger input.)
- ENCAnECS1 and ENCAnECS0 bits in the ENCAnIOC1 register = $01_B$
  (Select the ENCAnEC pin input as rising edge detection.)

(1) Capture operation is performed by the rising edge of the ENCAnEC pin input trigger.

(2) Clearing is performed by the ENCAnEC pin input and the count value is set to $0000_H$.

(3) The counter value ($0002_H$) is captured in the ENCAnCCR1 register by the rising edge of the ENCAnEC pin input.

(4) At the same time, a clear interrupt (ENCATIEC) and capture interrupt (ENCATINT1) due to the ENCAnEC pin input are output.

### 28.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

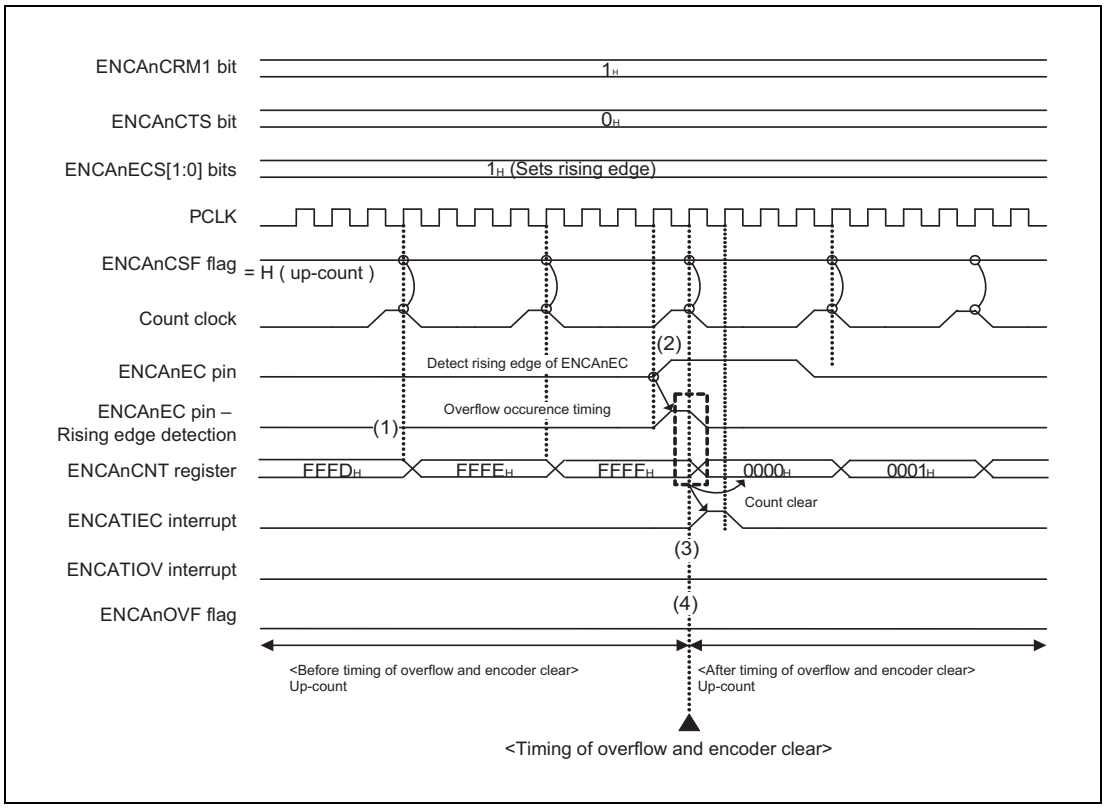

**Figure 28.14 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)**

(1) An up-count from $FFFD_H$ is continuously performed.

(2) When an overflow occurs if the count value is $FFFF_H$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. The counter value is cleared to $0000_H$.

(3) When the counter value is cleared by the encoder clear input, a clear interrupt (ENCATIEC) by encoder clear input is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the overflow occurrence, an overflow interrupt is not output (An overflow does not occur. Clear operation is performed by the encoder clear input).

(4) Because an overflow does not occur as is the case with step 3, the overflow flag is not set.

### 28.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

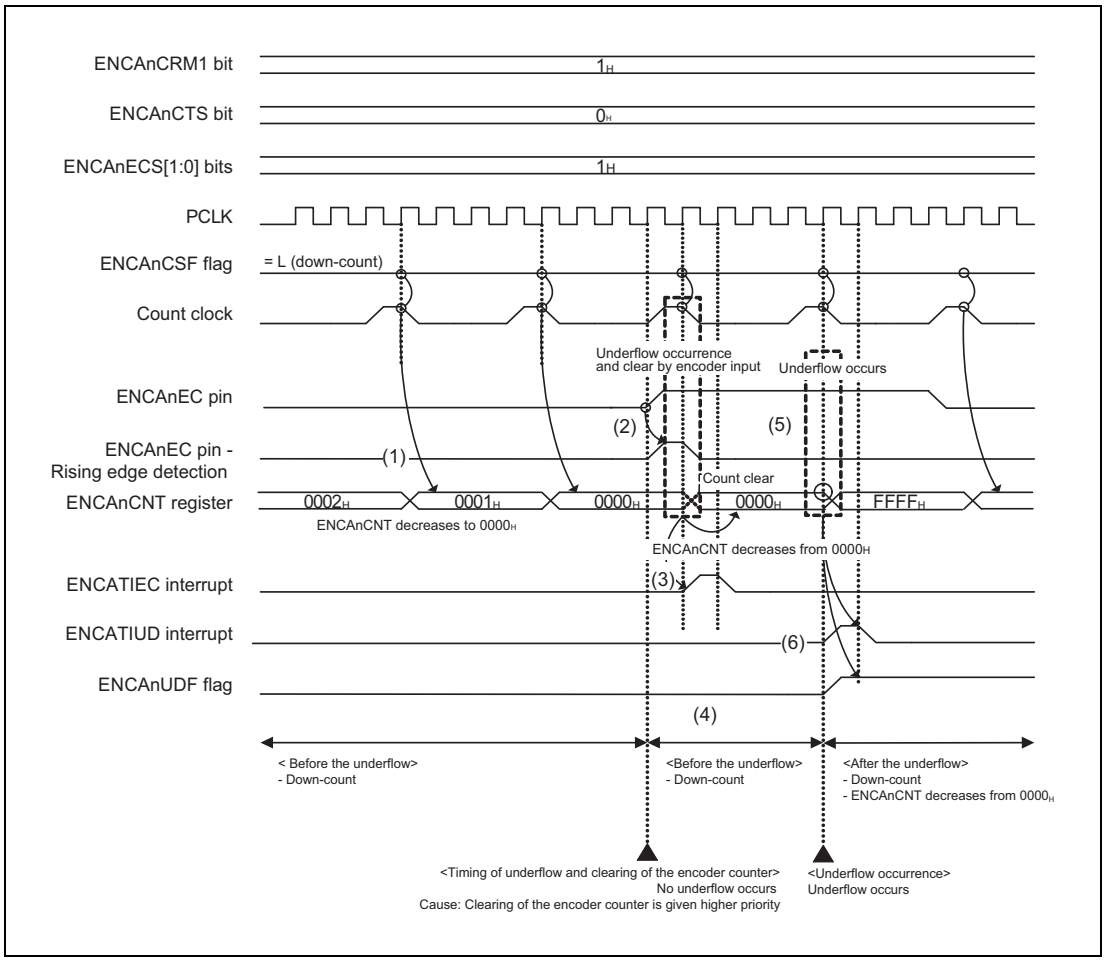

**Figure 28.15 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)**

(1) A down-count from $0002_H$ is continuously performed.

(2) When an underflow occurs if the count value is $0000_H$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. Even if the next clock signal is input during clear operation, the counter value remains at $0000_H$.

(3) When the counter value is cleared by the encoder clear input, an encoder clear interrupt (ENCATIEC) is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the underflow occurrence, an underflow interrupt is not output (An underflow does not occur. Clear operation is performed by the encoder clear input).

(4) Because an underflow does not occur as is the case with step 3, the underflow flag is not set.

(5) When a further down-count is performed after the counter value changes to $0000_H$ by clear operation by the encoder clear input, the counter value changes from $0000_H$ to $FFFF_H$, and an underflow occurs.

(6) When an underflow occurs, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

### 28.6.6 Overflow Operation Immediately after Startup

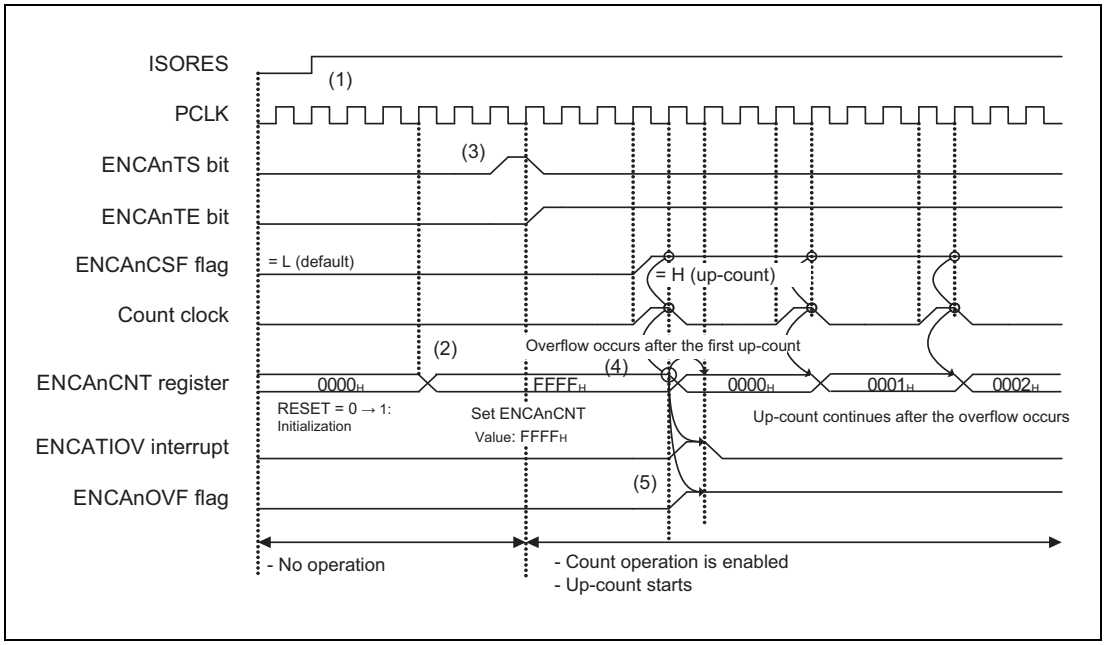

**Figure 28.16 Overflow Operation Immediately after Startup**

(1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.

(2) The timer counter is set to $FFFF_H$ as the initial value.

(3) ENCAnTS is set to “1”, and operation starts. ENCAnTE changes to “1”, which indicates that operation is enabled.

(4) When an up-count is performed from $FFFF_H$ which is the initially set count value, the counter value changes from $FFFF_H$ to $0000_H$, and an overflow occurs immediately after operation starts.

(5) At the same time, by an overflow occurrence immediately after operation starts, an overflow interrupt (ENCATIOV) is output, and the overflow flag (ENCAnOVF) is set.

### 28.6.7 Underflow Operation Immediately after Startup

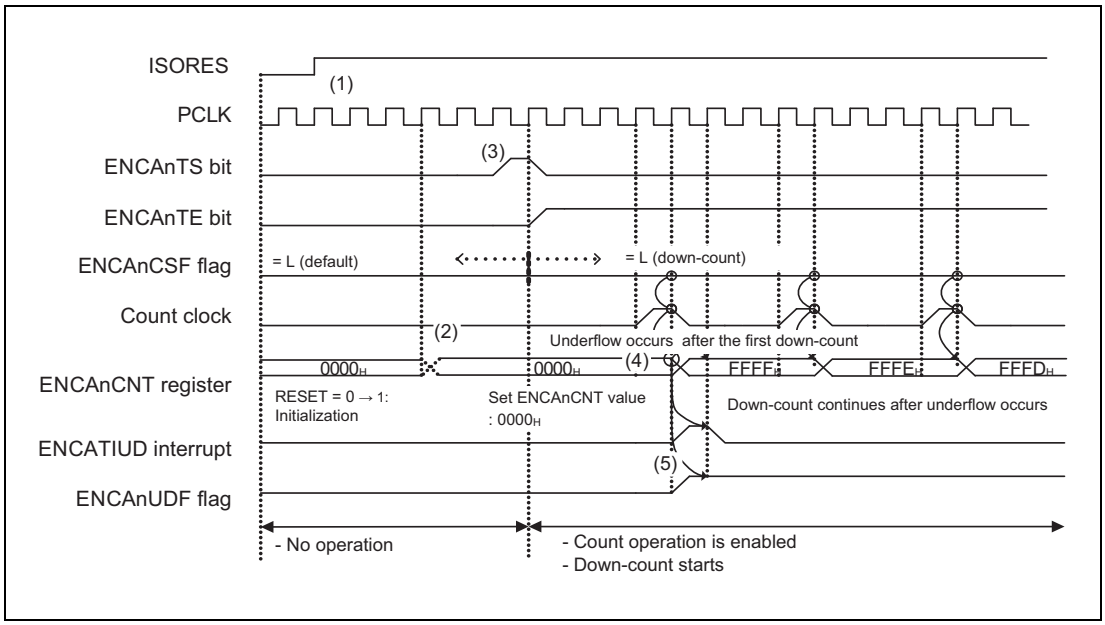

**Figure 28.17 Underflow Operation Immediately after Startup**

(1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.

(2) The timer counter is set to $0000_H$ as the initial value.

(3) ENCAnTS is set to “1”, and operation starts. ENCAnTE changes to “1”, which indicates that operation is enabled.

(4) When a down-count is performed from $0000_H$ which is the initially set count value, the counter value changes from $0000_H$ to $FFFF_H$, and an underflow occurs immediately after operation starts.

(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

### 28.6.8 Using the ENCAnLDE Function Immediately after Startup

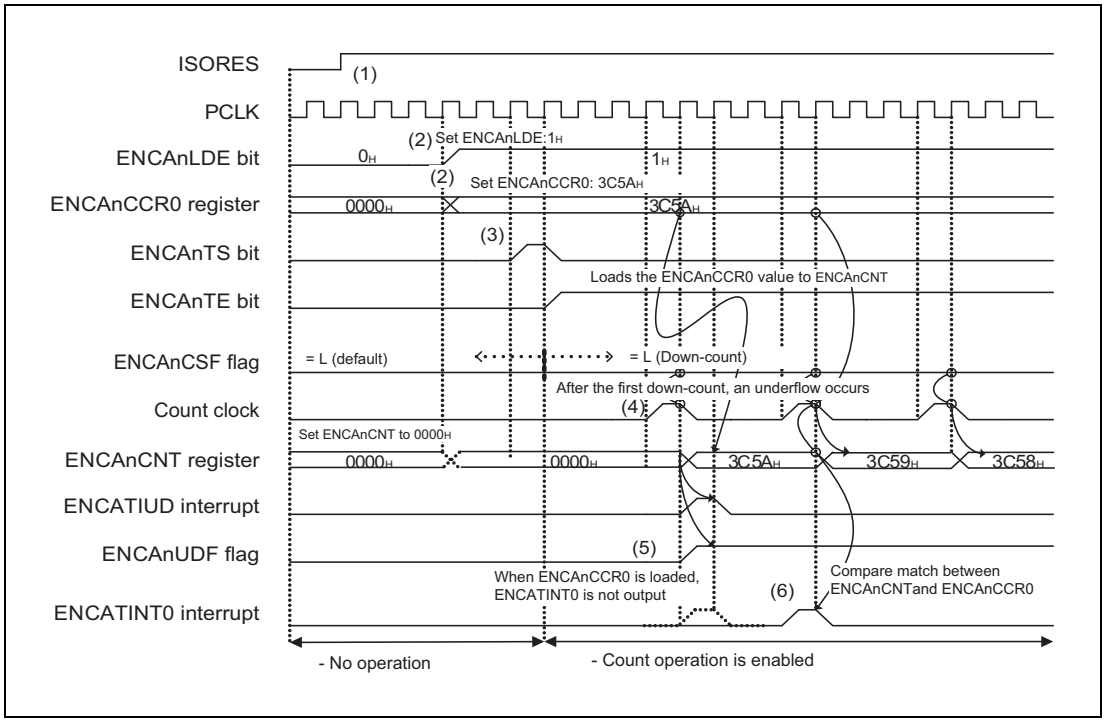

**Figure 28.18 Using the ENCAnLDE Function Immediately after Startup**

(1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.

(2) The load enable bit (ENCAnLDE) is set to “1”, capture/compare register 0 (ENCAnCCR0) is set to $3C5A_H$, and the timer counter is set to the initial value $0000_H$.

(3) ENCAnTS is set to “1”, and operation starts. ENCAnTE changes to “1”, which indicates that operation is enabled.

(4) When a down-count is performed from $0000_H$ which is the initially set count value, an underflow occurs immediately after operation starts. Because ENCAnLDE is set to “1”, the ENCAnCCR0 value, $3C5A_H$, is loaded to the timer counter (ENCATINT0 is not output during loading).

(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set (after an underflow occurs, down-count operation from the loaded value ($3C5A_H$) continues).

(6) After the ENCAnCCR0 value is loaded to ENCAnCNT, a match with ENCAnCCR0 is detected, and ENCATINT0 is output.

## 28.6.9 ENCAnLDE Function (Loading Count Value)

### (1) <When ENCAnLDE = 0>

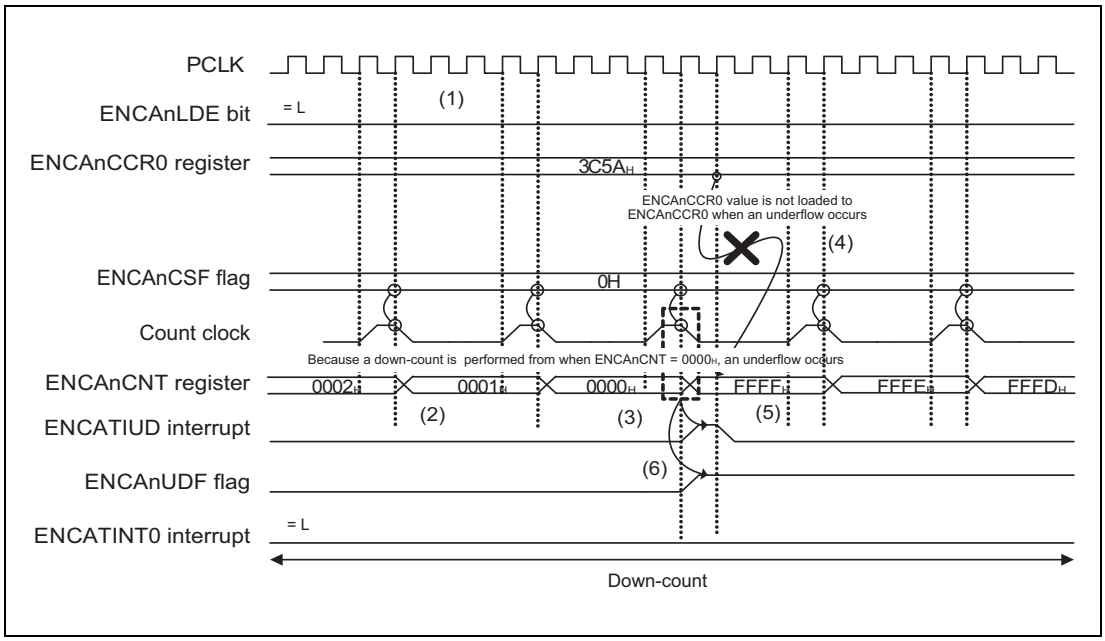

**Figure 28.19 ENCAnLDE Function (when ENCAnLDE = 0)**

(1) ENCAnLDE is set to “0” (even if an underflow occurs, the ENCAnCCR0 value is not loaded).

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When a further down-count is performed after the counter value changes to $0000_H$, an underflow occurs.

(4) Because ENCAnLDE is set to “0”, the setting value of the ENCAnCCR0 register is not loaded to the counter even if an underflow occurs.

(5) Operation changes to underflow operation (counter value: $0000_H \rightarrow FFFF_H$).

(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

**(2) <When ENCAnLDE = 1>**

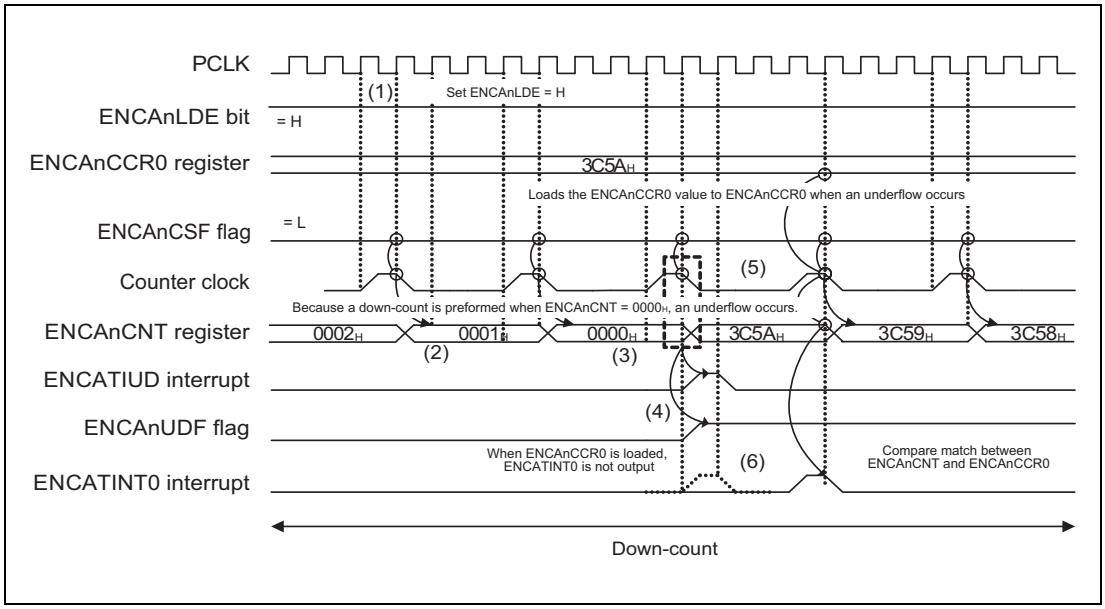

**Figure 28.20 ENCAnLDE Function (when ENCAnLDE = 1)**

(1) ENCAnLDE is set to “1” (if an underflow occurs, the ENCAnCCR0 value is loaded to the counter).

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When a further down-count is performed after the counter value changes to $0000_H$, an underflow occurs.

(4) An underflow interrupt is output, and the underflow flag is set.

(5) Because ENCAnLDE is set to “1”, the setting value of the ENCAnCCR0 register is loaded to the counter if an underflow occurs. ENCAnCNT is set to $3C5A_H$.

(6) After the ENCAnCCR0 value is set to ENCAnCNT, if the ENCAnCNT value matches the ENCAnCCR0 value on a count clock, a compare match interrupt (ENCATINT0) is output.

### 28.6.10 Conflict between ENCAnLDE Function (Loading Counter Value) and Rewrite of ENCAnCCR0 Register

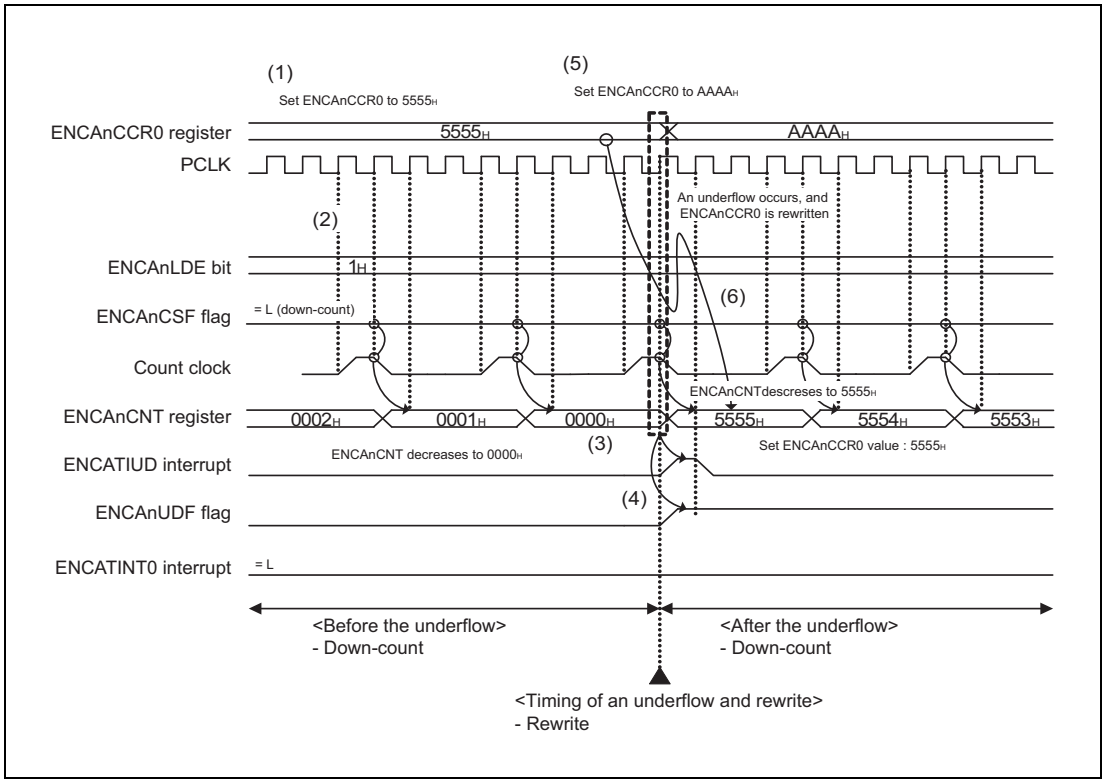

**Figure 28.21 Conflict between ENCAnLDE Function and Rewrite of ENCAnCCR0 Register**

(1) The ENCAnCCR0 register is currently set to $5555_H$.

(2) ENCAnLDE is currently set to “1”.

(3) A down-count is performed ($0002_H \rightarrow 0001_H \rightarrow 0000_H$), and an underflow occurs.

(4) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

(5) When an underflow occurs, the ENCAnCCR0 register value is changed from $5555_H$ to $AAAA_H$.

(6) Additionally, when an underflow occurs, the ENCAnCCR0 value before the rewrite was performed ($5555_H$) is set in ENCAnCNT.

### 28.6.11 Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

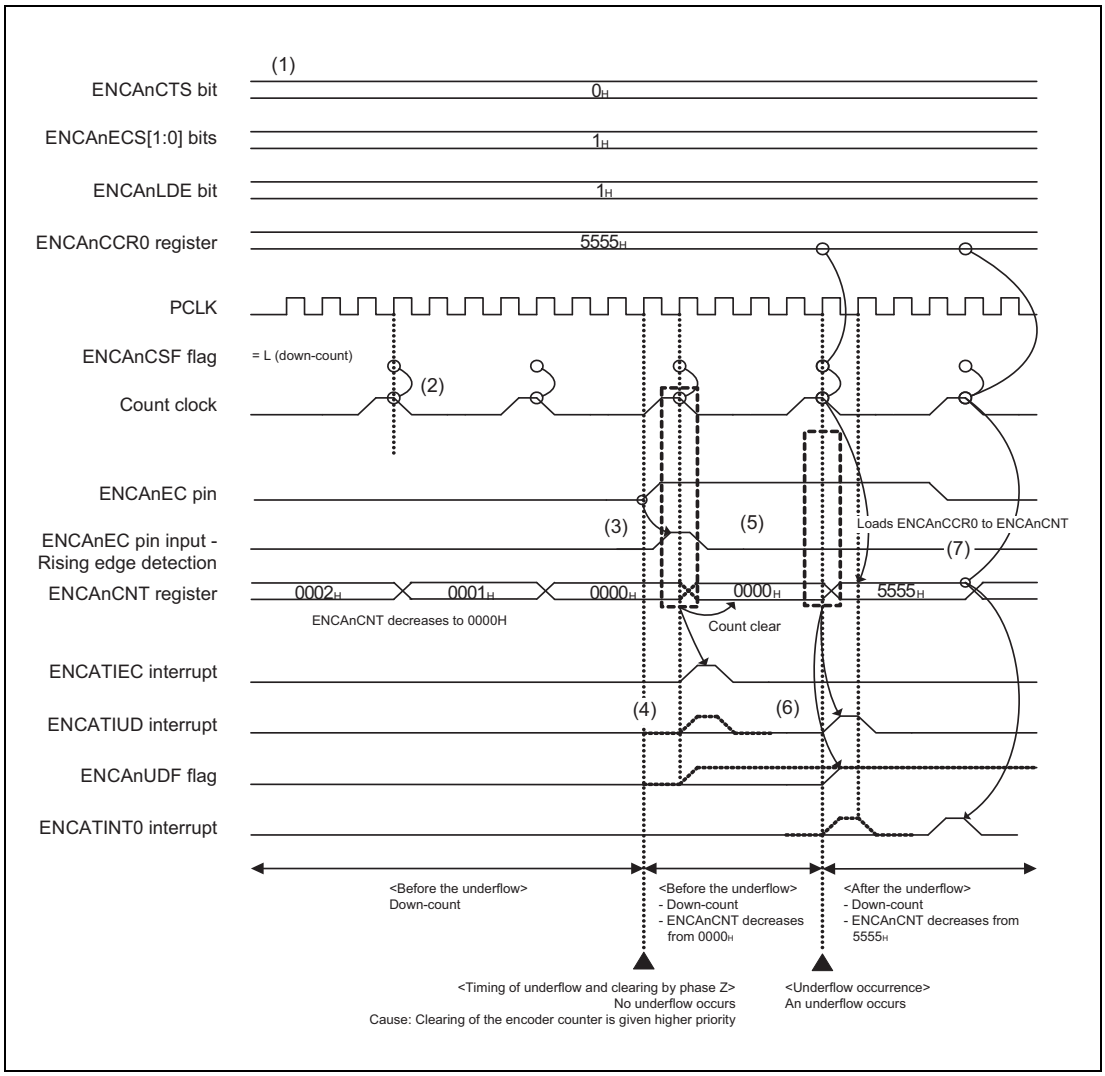

**Figure 28.22 Conflict between ENCAnLDE Function and Clear Operation by Encoder Clear Input**

(1) The values are set as follows: ENCAnCTS = 0, ENCAnECS[1:0] = $01_B$, ENCAnLDE = 1, and ENCAnCCR0 = $5555_H$.

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When the count value becomes $0000_H$, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.

(4) Because a count clear is performed when the count value reaches $0000_H$, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is $0000_H$. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

(5) After the count value is cleared to $0000_H$ by clear operation by the encoder clear input, a down-count is performed and an underflow occurs.

(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

(7) Because ENCAnLDE = “1”, if an underflow occurs, the ENCAnCCR0 value is loaded to ENCAnCNT.

(8) After the ENCAnCCR0 value is set to ENCAnCNT, a compare match is detected according to the count clock. If the ENCAnCNT value matches the ENCAnCCR0 value, a compare match interrupt (ENCATINT0) is output.

### 28.6.12 Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input

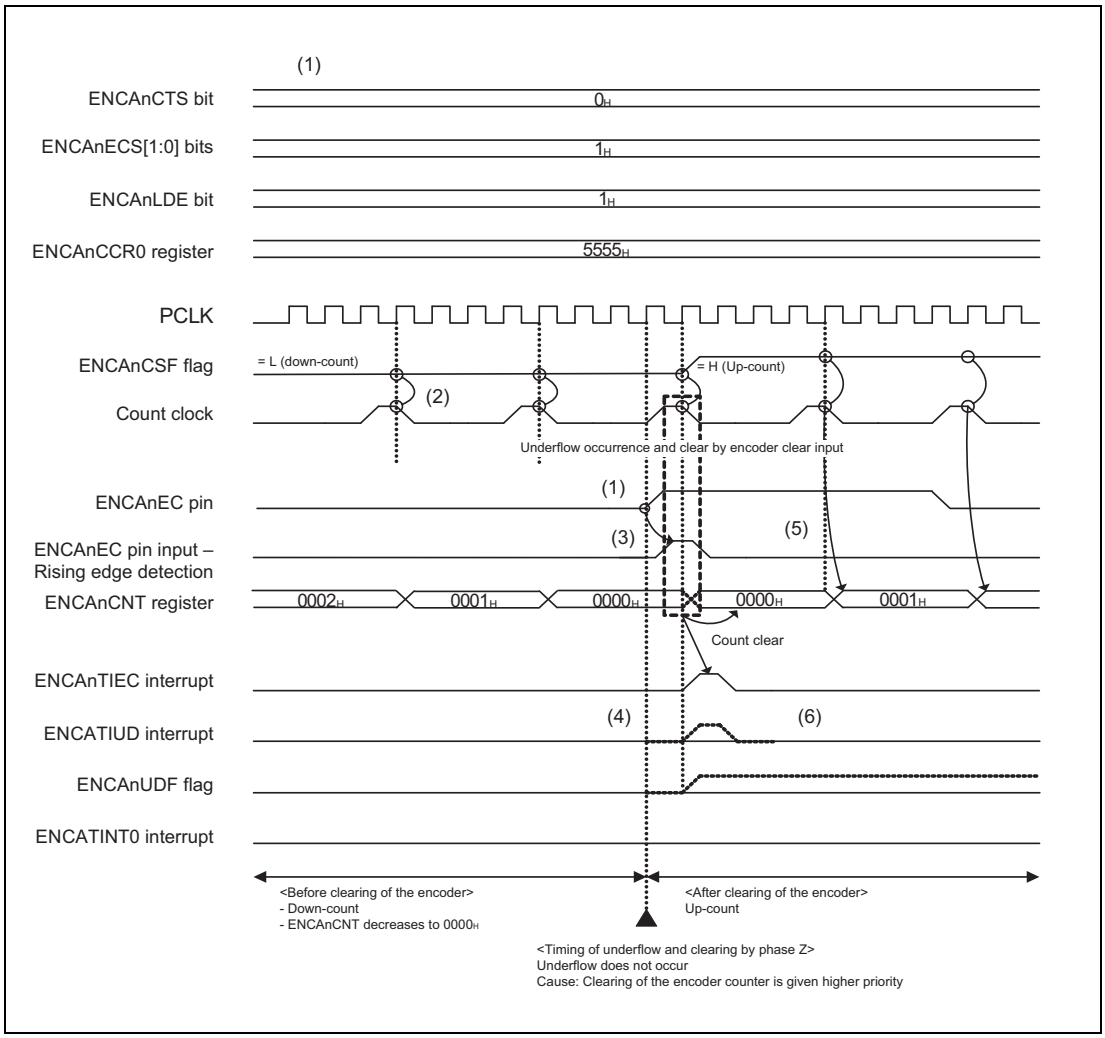

**Figure 28.23 Up-count after Conflict between ENCAnLDE Function and Encoder Clear**

(1) The values are set as follows: ENCAnCTS = 0, ENCAnECS[1:0] = $01_B$, ENCAnLDE = 1, and ENCAnCCR0 = $5555_H$.

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When the count value becomes $0000_H$, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.

(4) Because a count clear is performed when the count value reaches $0000_H$, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is $0000_H$. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

(5) After the count value is cleared to $0000_H$ by clear operation by the encoder clear input, an up-count is performed.

(6) An underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

### 28.6.13 Capture Operation between Count Clocks (ENCAnCCR1)

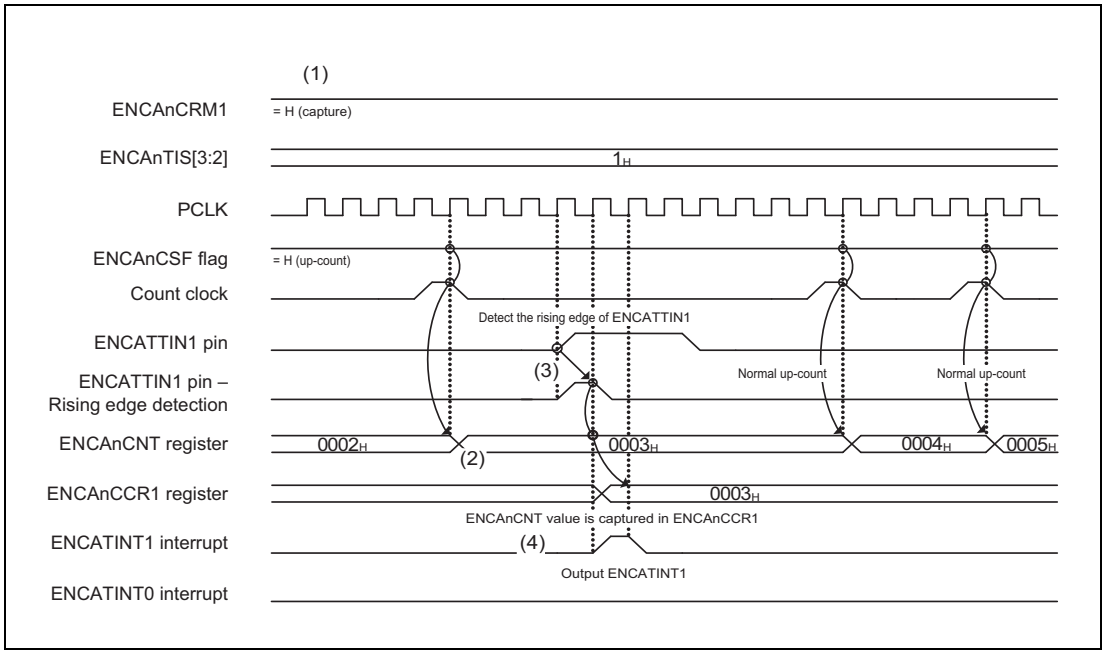

**Figure 28.24 Capture Operation between Count Clocks (ENCAnCCR1)**

(1) The values are set as follows: ENCAnCRM1 = 1, and ENCAnTIS[3:2] = $01_B$.

(2) An up-count is performed.

(3) The rising edge of the ENCATTIN1 input is detected, and the count value is captured in ENCAnCCR1.

(4) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.

### 28.6.14 Capture Operation between Count Clocks (ENCAnCCR0)

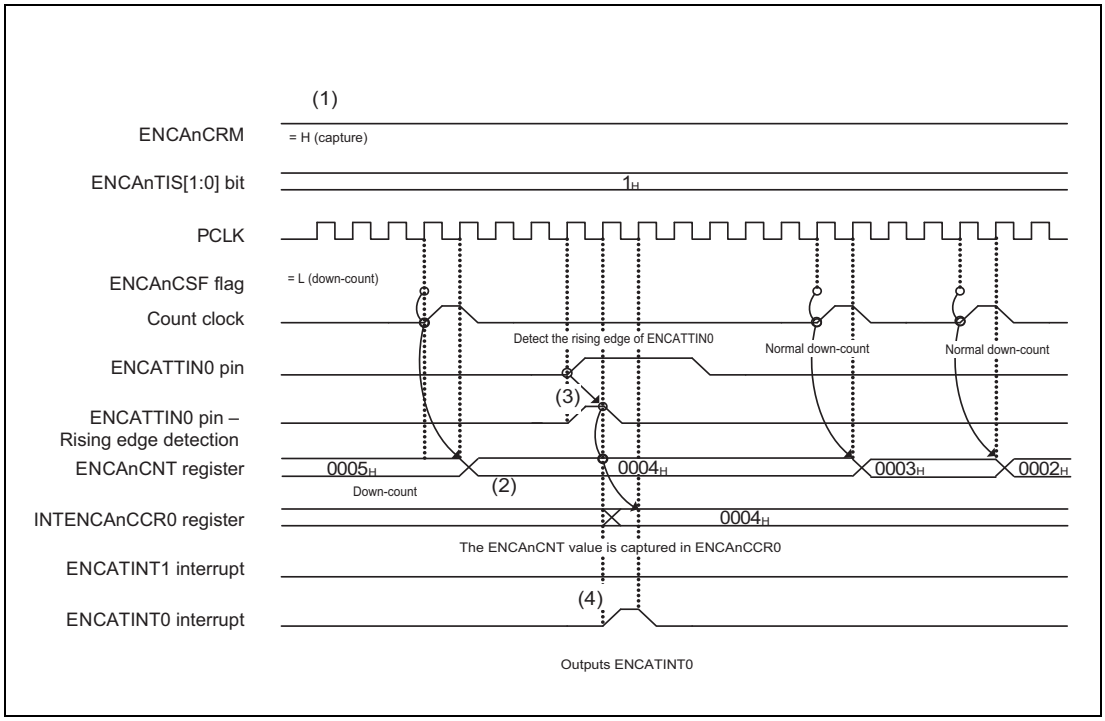

**Figure 28.25 Capture Operation between Count Clocks (ENCAnCCR0)**

(1) The values are set as follows: ENCAnCRM0 = 1, and ENCAnTIS[1:0] = $01_B$.

(2) A down-count is performed.

(3) The rising edge of the ENCATTIN0 input is detected, and the count value is captured in ENCAnCCR0.

(4) An interrupt (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.

### 28.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0

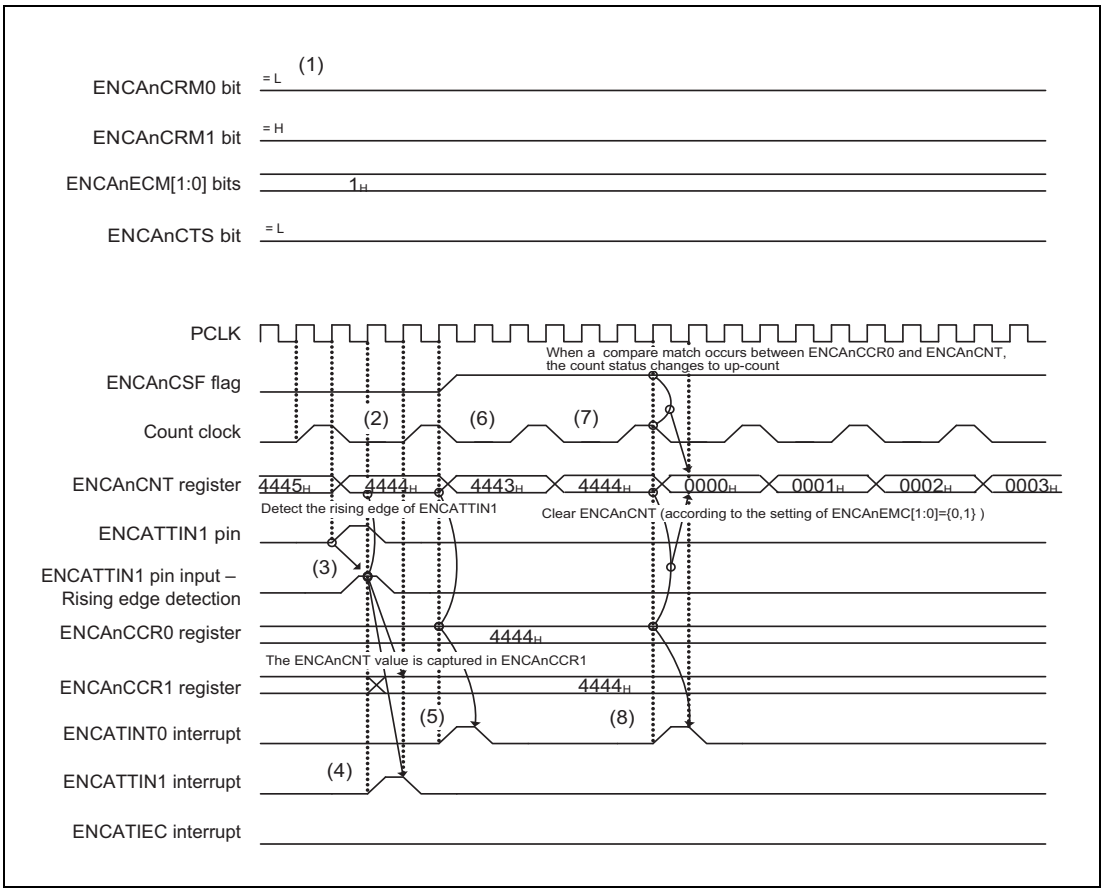

**Figure 28.26 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0**

(1) The values are set as follows: ENCAnCCR0 = $4444_H$, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = $01_B$, and ENCAnCTS = 0.

(2) A down-count is performed.

(3) The rising edge of the ENCATTIN1 input is detected, and the ENCAnCNT value ($4444_H$) is captured in the ENCAnCCR1 register.

(4) An interrupt signal (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.

(5) When a compare match occurs between ENCAnCNT (counted down from $4445_H$ to $4444_H$) and ENCAnCCR0 ($4444_H$), a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

(6) The count operation changes to up-count.

(7) When ENCAnCNT is counted up from $4443_H$ to $4444_H$, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 ($01_B$), and the ENCAnCNT value changes to $0000_H$.

(8) When ENCAnCNT changes to $4444_H$, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

### 28.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1

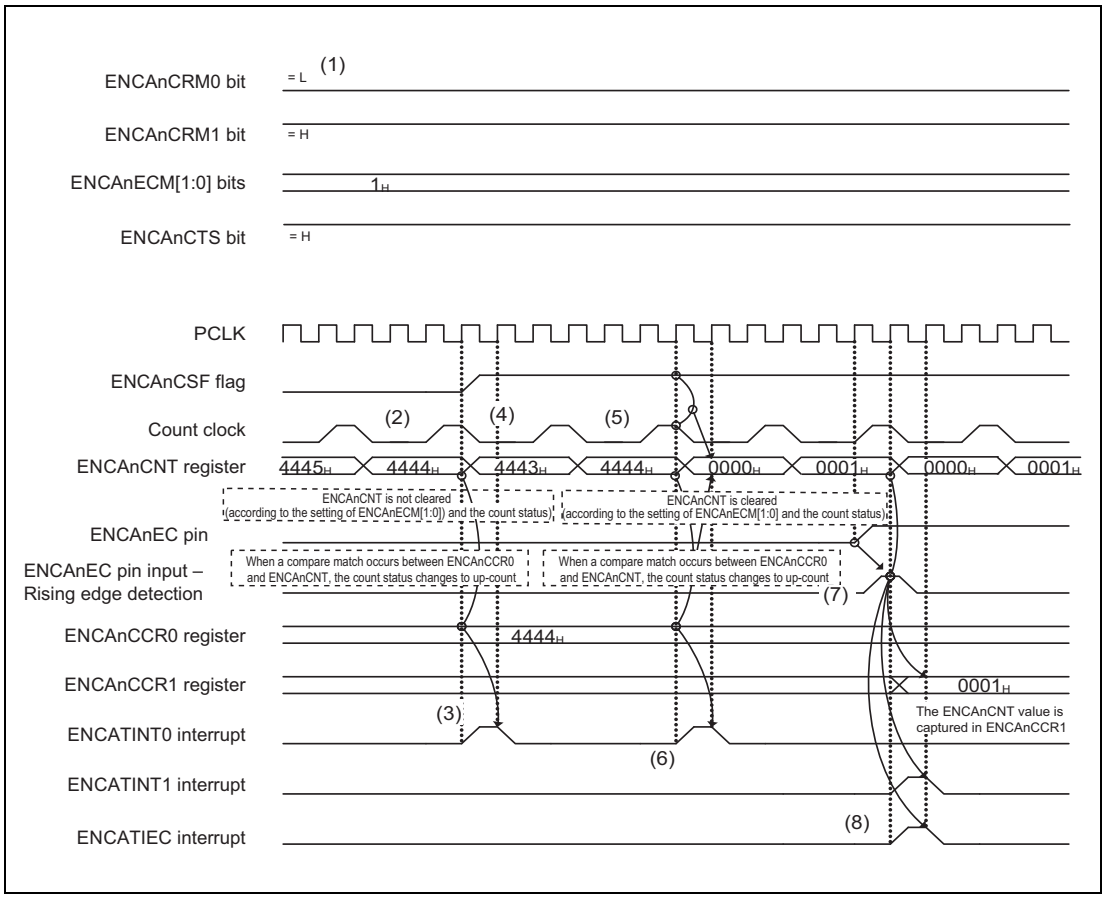

**Figure 28.27 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1**

(1) The values are set as follows: ENCAnCCR0 = $4444_H$, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = $01_B$, and ENCAnCTS = 1.

(2) A down-count is performed.

(3) When a compare match occurs between ENCAnCNT (counted down from $4445_H$ to $4444_H$) and ENCAnCCR0 ($4444_H$), a compare/capture interrupt (ENCATINT0) is output.

(4) The count operation changes to up-count.

(5) When ENCAnCNT is counted up from $4443_H$ to $4444_H$, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 ($01_B$), and the ENCAnCNT value changes to $0000_H$.

(6) When ENCAnCNT changes to $4444_H$, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

(7) After the count value is cleared, an up-count is performed, and the count value changes to $0001_H$. At this point, the ENCAnCNT value ($0001_H$) is captured in ENCAnCCR1 by detecting the rising edge of the ENCAnEC signal, and the counter is cleared to $0000_H$.

(8) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.

### 28.6.17 Encoder Operation when Compare Match Clear Control is Disabled

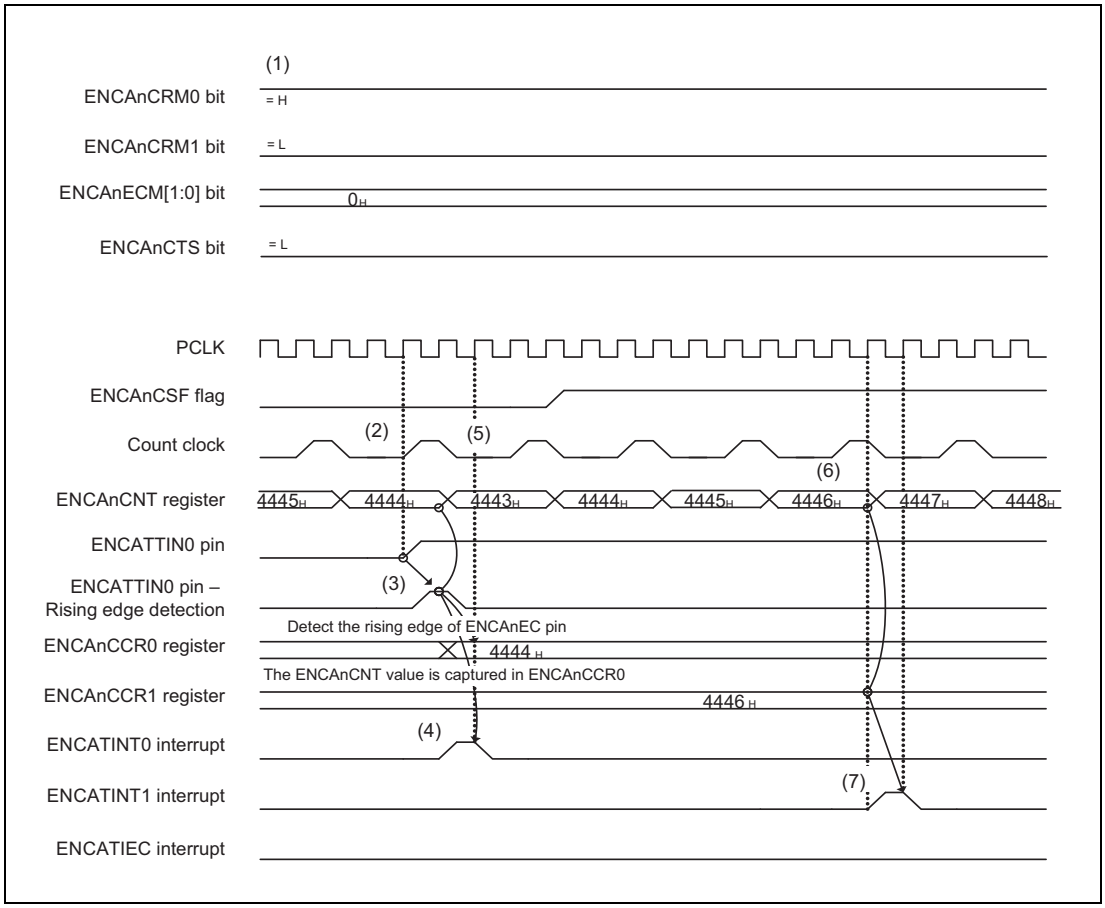

**Figure 28.28 Encoder Operation when Compare Match Clear Control is Disabled**

(1) The values are set as follows: ENCAnCCR1 = $4446_H$, ENCAnCRM0 = 1, ENCAnCRM1 = 0, ENCAnECM[1:0] = $00_B$, and ENCAnCTS = 0.

(2) A down-count is performed.

(3) When the rising edge of ENCATTIN0 is detected, the ENCAnCNT value ($4444_H$) is captured in ENCAnCCR0.

(4) An interrupt signal (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.

(5) The count operation changes to up-count.

(6) When ENCAnCNT changes to $4446_H$, a compare match with ENCAnCCR1 is detected.

(7) A compare match interrupt (ENCATINT1) with ENCAnCCR1 is output.

## 28.6.18 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE = 1

### 28.6.18.1 Accompanying capture operation

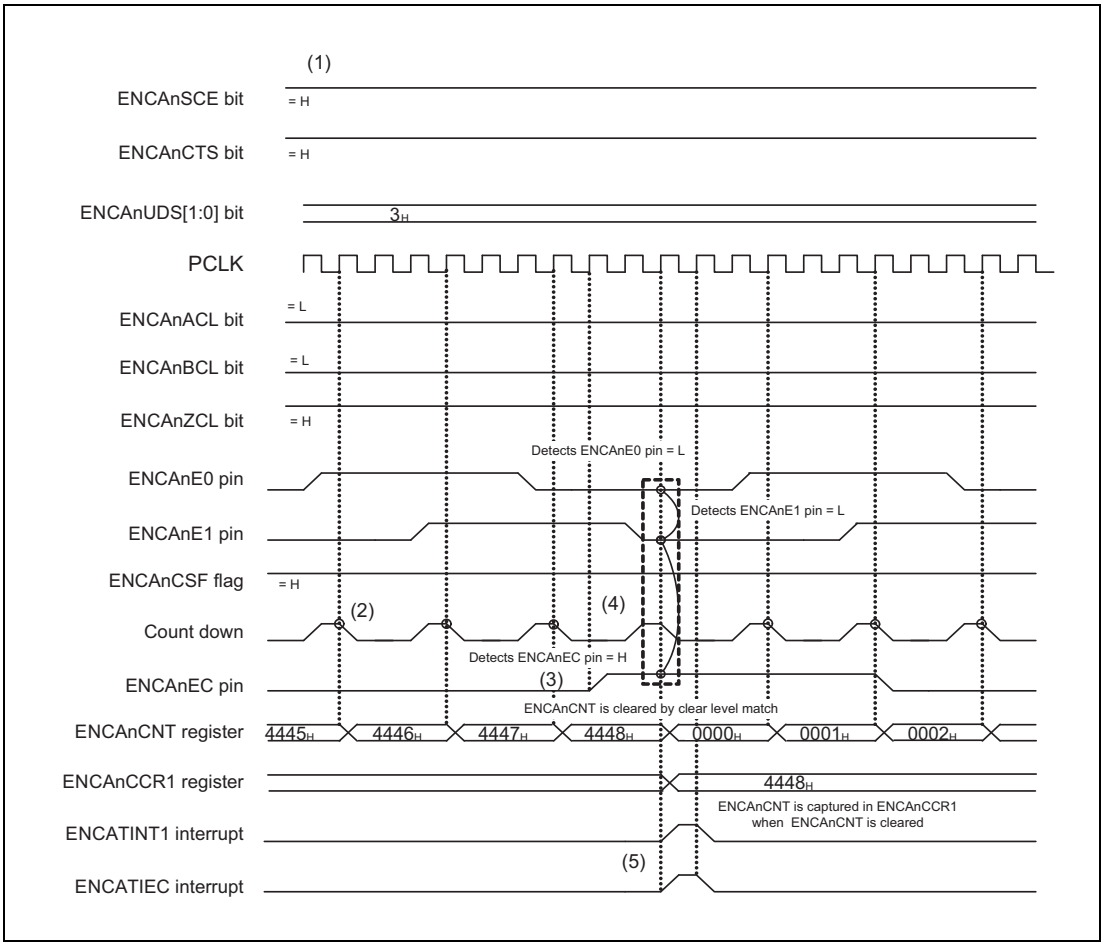

**Figure 28.29 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE = 1**

(1) The values are set as follows: ENCAnSCE = 1, ENCAnCTS = 1, ENCAnUDS[1:0] =$11_B$, ENCAnACL = 0, ENCAnBCL = 0, and ENCAnZCL = 1.

(2) An up-count is performed.

(3) The count value is not cleared upon the rising edge of ENCAnEC.

(4) When ENCAnE0, ENCAnE1 and ENCAnEC reach the set clear level, the count value is cleared. The count value is captured in ENCAnCCR1 at the time of the clearing.

(5) At the time of the clearing, an interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.

### 28.6.18.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = $11_B$)

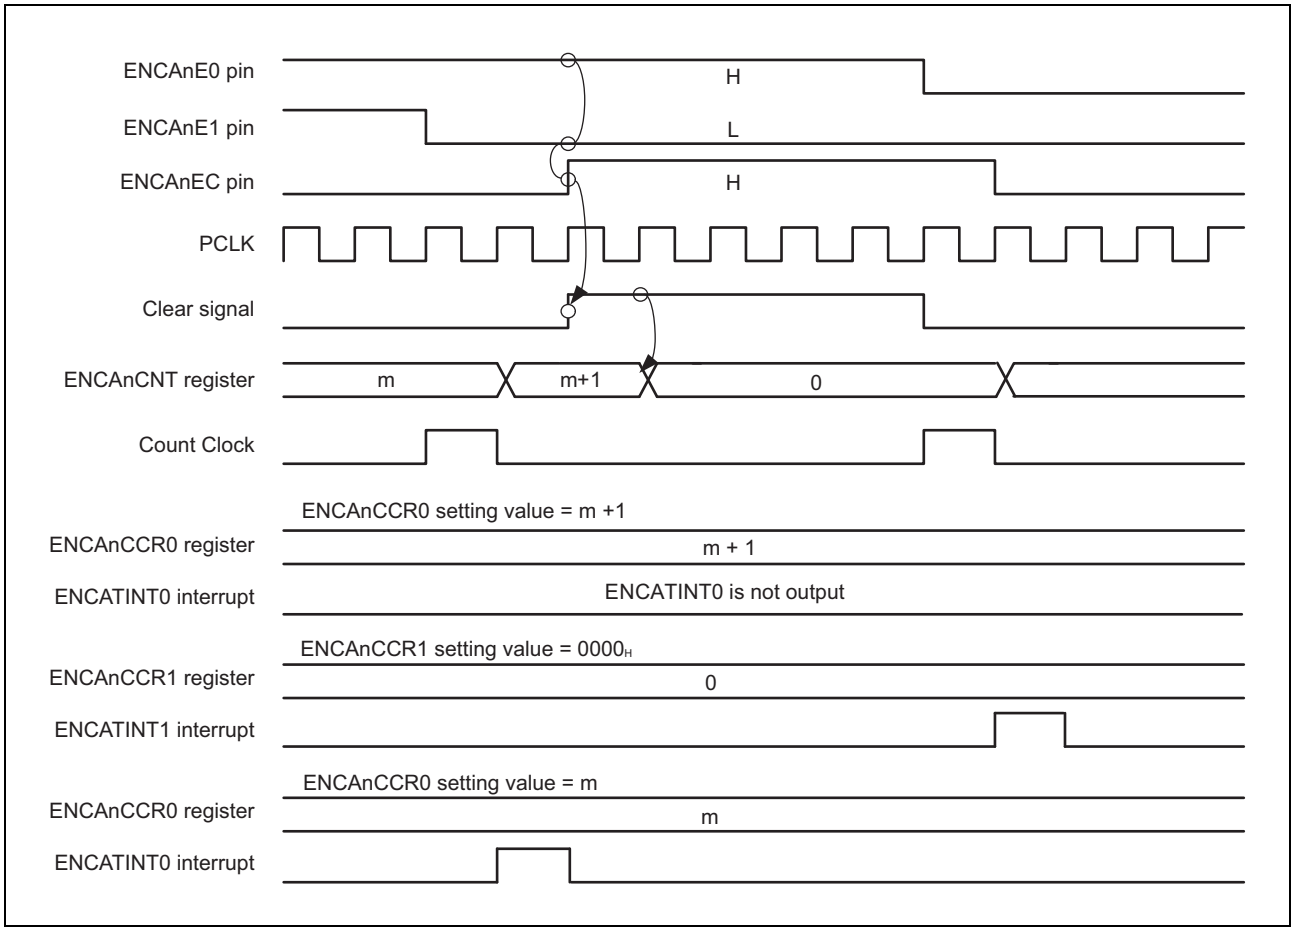

**Figure 28.30 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count**

### 28.6.18.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = $11_B$)

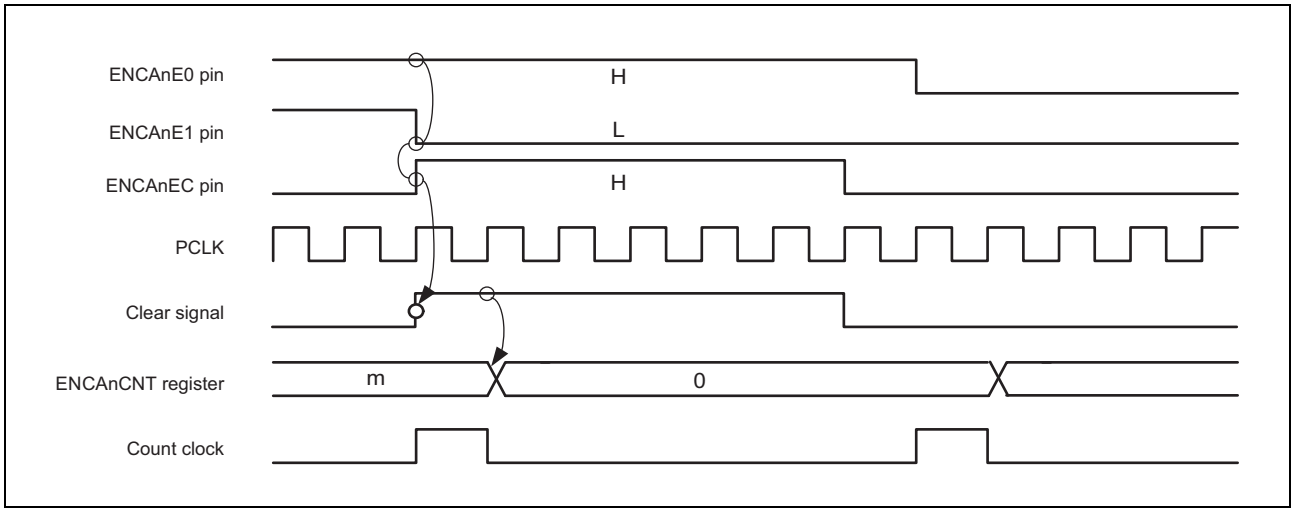

Figure 28.31 Clearing Timing for when the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count

### 28.6.18.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = $11_B$)

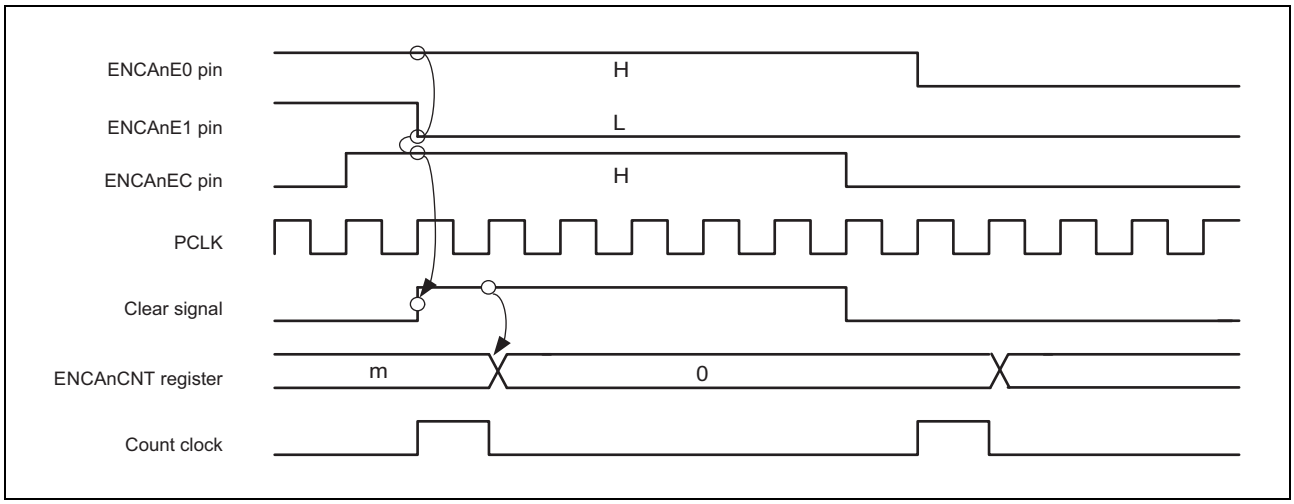

Figure 28.32 Clearing Timing for when the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count

### 28.6.18.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = $11_B$)

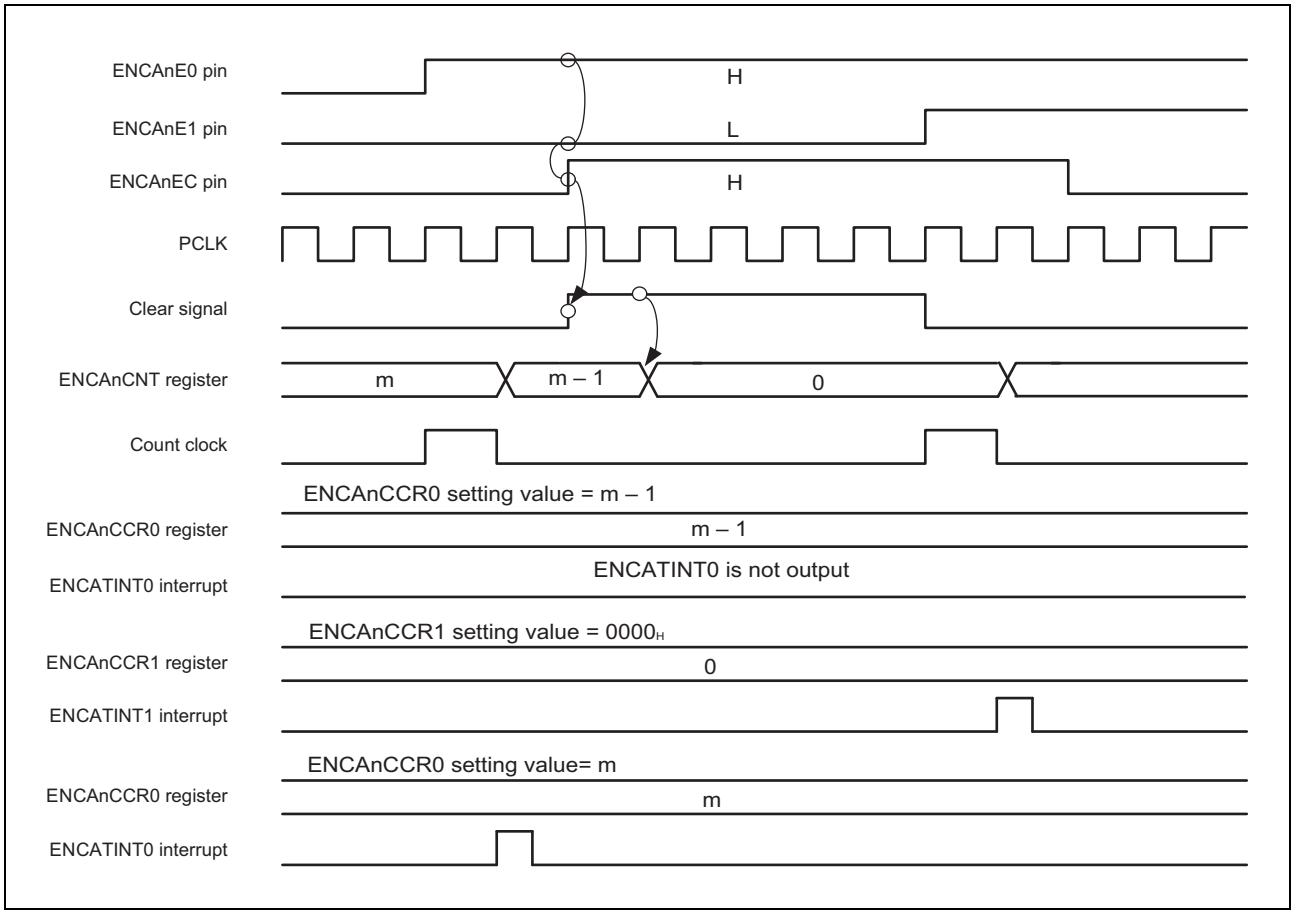

**Figure 28.33 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count**

### 28.6.19 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

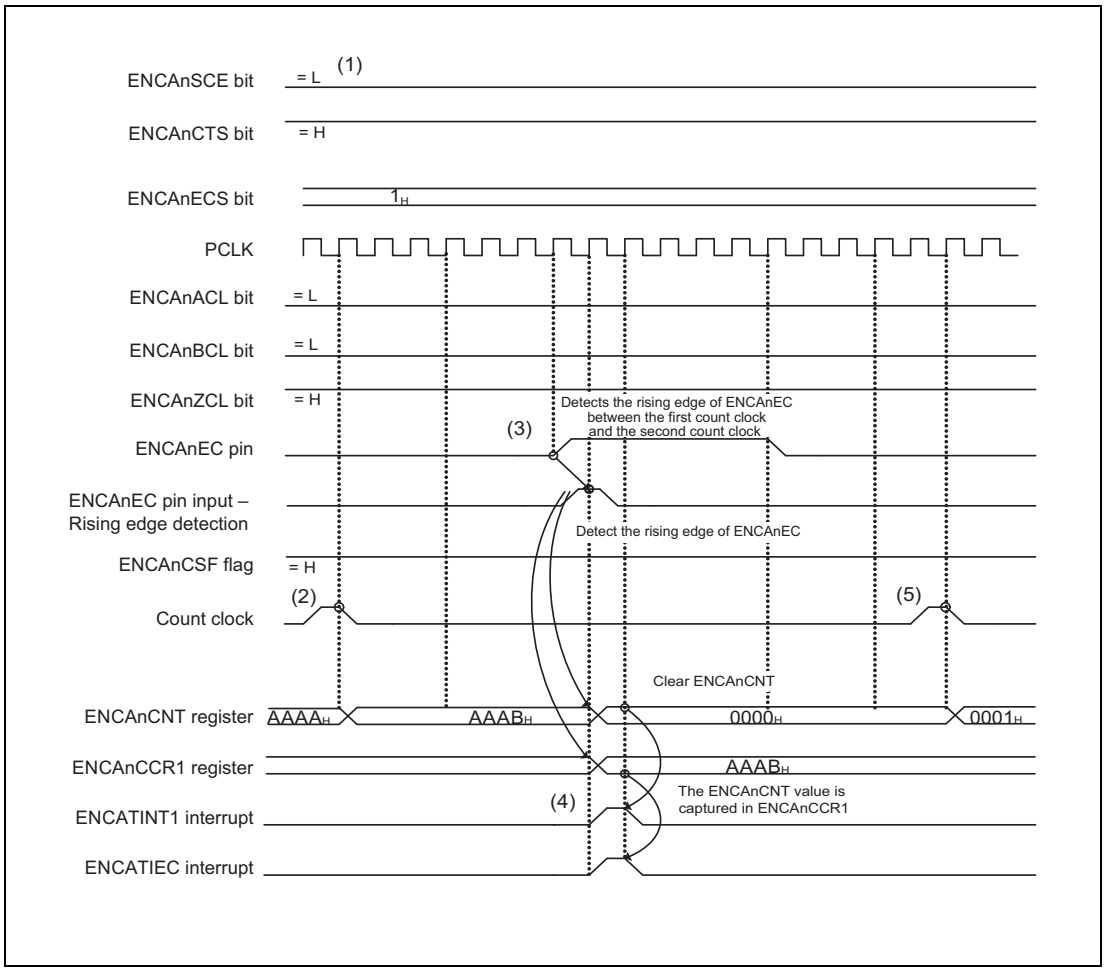

**Figure 28.34 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0**

(1) The values are set as follows: ENCAnSCE = 0, ENCAnCTS = 1, and ENCAnECS[1:0] = $01_B$.

(2) An up-count is performed.

(3) The rising edge of the ENCAnEC input is detected, and the ENCAnCNT value ($AAAB_H$) is captured in the ENCAnCCR1 register. Concurrently, clear operation by ENCAnEC is performed, and ENCAnCNT is cleared to $0000_H$.

(4) A capture interrupt 1 (ENCATINT1) to the ENCAnCCR1 register and an encoder clear interrupt (ENCATIEC) by ENCAnEC are output.

(5) After the count value is cleared, an up-count is performed, and the count value changes to $0001_H$.

# Section 29 Motor Control

This section contains a generic description of the Motor Control.

The first part in this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the Motor Control.

## 29.1 Features of RH850/F1K Motor Control

### 29.1.1 Number of Units and Channels

Motor control function comprises the timer motor control units (TAPA) and the peripheral interconnection unit (PIC) to connect the TAPA unit to peripheral timers, and generates motor control waveforms by using a combination of peripheral timers and A/D converters.

This microcontroller has the following number of units of the TAPA and PIC units.

**Table 29.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| **TAPA** | | | |
| Number of Units | 1 | | |
| Name | TAPAn (n = 0) | | |
| **PIC** | | | |
| Number of Units | 1 | | |
| Name | PIC0 | | |

**Table 29.2 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the unit of a timer and A/D converter used by TAPA and the motor control function is identified by the index “n” (n = 0): for example, TAPAnCTL0 is TAPAn control register 0. |
| m | The channel of a used timer and A/D converter is identified by the index “m”. For example, the TAUDn channel is described as CHm. |
| x | The scan group of an A/D converter is identified by the index “x” (x = 1 to 3). |
| j | The scan trigger number of an A/D converter is identified by the index “j” (j = 0 to 2). |

The following table lists the values indicated by the indices of each product.

**Table 29.3 Indices of Products**

| Indices of Each Product |
|---|
| **All Products** |
| m = 0 to 15<br>(e.g. TAUDn) |
| x = 1 to 3 |
| j = 0 to 2 |

### 29.1.2 Register Base Address

Base addresses of TAPAn and PIC0 are listed in the following table.

Register addresses of TAPAn and PIC0 are given as offsets from the base addresses.

**Table 29.4 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <TAPA0_base> | FFE9 $0000_H$ |
| <PIC0_base> | FFDD $0000_H$ |

### 29.1.3 Clock Supply

The TAPAn and PIC0 clock supplies are listed in the following table.

**Table 29.5 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| TAPAn | PCLK | CKSCLK_IPERI1 | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_IPERI1 | |
| PIC0 | PCLK | CKSCLK_IPERI1 | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_IPERI1 | |

### 29.1.4 Interrupt Request

TAPA0 interrupt requests are listed in the following table.

**Table 29.6 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **TAPA0** | | | |
| TAPATIPEK0 | Peak interrupt 0 | 16, 116 | — |
| TAPATIVLY0 | Valley interrupt 0 | 17, 117 | — |

### 29.1.5 Reset Sources

Reset sources of TAPAn and PIC0 are listed in the following table. TAPAn and PIC0 are initialized by these reset sources.

**Table 29.7 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| TAPA0 | All reset sources (ISORES) |
| PIC0 | All reset sources (ISORES) |

### 29.1.6 External Input/Output Signal

External output signals of TAPAn and PIC0 are listed below.

**Table 29.8 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **PIC** | | |
| TOUTU | Motor control output U phase (positive) | TAPA0UP |
| TOUTUB | Motor control output U phase (negative) | TAPA0UN |
| TOUTV | Motor control output V phase (positive) | TAPA0VP |
| TOUTVB | Motor control output V phase (negative) | TAPA0VN |
| TOUTW | Motor control output W phase (positive) | TAPA0WP |
| TOUTWB | Motor control output W phase (negative) | TAPA0WN |
| **TAPA** | | |
| TAPATHASIN | Motor control output Hi-Z control input | TAPA0ESO |

**CAUTION**

For the port pins that are used as TAPA0UP, TAPA0UN, TAPA0VP, TAPA0VN, TAPA0WP, and TAPA0WN, set the output driving ability to high (PDSCn_m = 1).

### 29.1.7 Internal Output Signal

The internal output signals of TAPAn and PIC0 are listed below.

**Table 29.9 Internal Output Signals**

| Unit Signal Name | Description | Connected to |
|---|---|---|
| **TAPA0** | | |
| $\overline{\text{TAPATHZOUT0}}$ | TAPA0UP/TAPA0UN output buffers Hi-Z control output*1 | Port |
| $\overline{\text{TAPATHZOUT1}}$ | TAPA0VP/TAPA0VN output buffers Hi-Z control output*1 | Port |
| $\overline{\text{TAPATHZOUT2}}$ | TAPA0WP/TAPA0WN output buffers Hi-Z control output*1 | Port |
| TAPATADOUT0 | A/D trigger signal 0 output*2 | ADCA0 hardware trigger expansion |
| TAPATADOUT1 | A/D trigger signal 1 output*2 | ADCA0 hardware trigger expansion |
| **PIC0** | | |
| TAPATHASIN | TAPA0 asynchronous Hi-Z control signal*1,*3 | TAPA0 |
| TAPATSIM0 | TAUD master channel interrupt signal<br>(TAUD0: INTTAUD0I0,INTTAUD0I2, INTTAUD0I8) | TAPA0 |
| TAPATUDCM0 | TAUD master up/down signal<br>(TAUD0: TAUD0UDC0, TAUD0UDC2, TAUD0UDC8) | TAPA0 |
| TAPATCDENS0 | TAUD slave 0 match detect*4<br>(ADCA0 hardware trigger expansion: ADOPA1ADCATTIN00) | TAPA0 |
| TAPATCDENS1 | TAUD slave 1match detect*4<br>(ADCA0 hardware trigger expansion: ADOPA2ADCATTIN00) | TAPA0 |

Note 1. See **Section 29.4.6, TAPA0 Hi-Z Control Input Selection** for details.

Note 2. These signals can be used to as a trigger source to start the A/D converter. See **Table 31.49, List of A/D Conversion Hardware Triggers**.

Note 3. This input signal is passed through a noise filter. See **Section 2.12, Noise Filter & Edge/Level Detector** and **Section 2.13, Description of Port Noise Filter & Edge/Level Detection**.

Note 4. These signals are selected by the H/W trigger selection bit of the ADCA0 A/D converter. See **Table 31.49, List of A/D Conversion Hardware Triggers**.

## 29.2 Overview

### 29.2.1 Functional Overview

The motor control function provides the following functions by combining the motor control unit (TAPA) and Timer Array Unit D (TAUDn) or A/D (ADCAn):

- Asynchronous Hi-Z control function
  Hi-Z control for TAUDn output can be performed by using pin input or error signals.
- Interrupt signal output function
  Request signals for two types of interrupts, peak interrupts and valley interrupts, can be output by the INTn signals output by TAUDn.
- A/D conversion start trigger selection function
  An A/D conversion start trigger can be output by the INTn signals output by TAUDn.

Additionally, the motor control function provides also the following functions by combining the motor control unit (TAPA) and the peripheral interconnection (PIC):

- Timer simultaneous start trigger function
  The respective channels of TAUD0 and TAUJ1, and the ENCAn timer can be started simultaneously.
- Trigger and pulse width measuring function
  Measurement of trigger periods can be performed by inputting ENCAn interrupt signals to TAUDn or TAUJ1.
- A/D trigger encoder capture function
  The value of the ENCAn counter can be captured at the A/D conversion start trigger timing.
- Three-phase PWM output with dead time / High-accuracy triangle PWM output with dead time
  Three-phase PWM output with dead time can be performed by TAUDn.
- Delay pulse output with dead time
  Delay pulses (with dead time) for the cycle timing can be output.

### 29.2.2 Basic Structure of Motor Control

The peripheral block configuration of the motor control function is shown below.

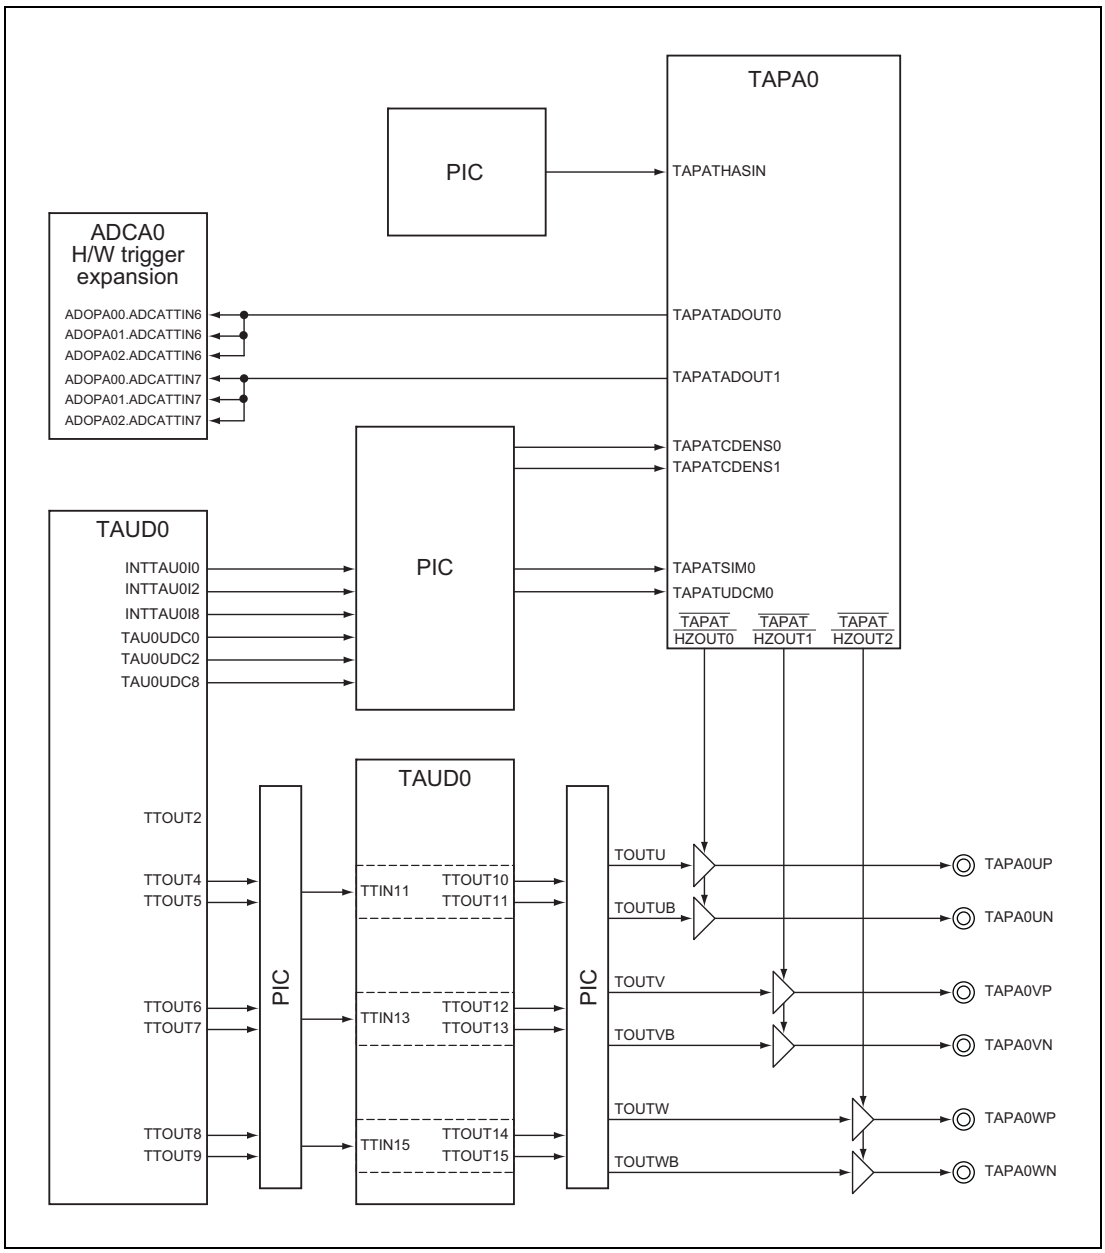

**Figure 29.1 Configuration of Motor Control**

TAUDn and PIC are used to generate the motor control output signals (three-phase PWM output signals with dead time).

The timer control unit (TAPA) performs Hi-Z control for the motor control output.

Additionally, PIC can provide functions specific to the motor by combining respective channels of TAUDn and TAUJ1, ENCAn, and TAPA.

### 29.2.3 Block Diagram

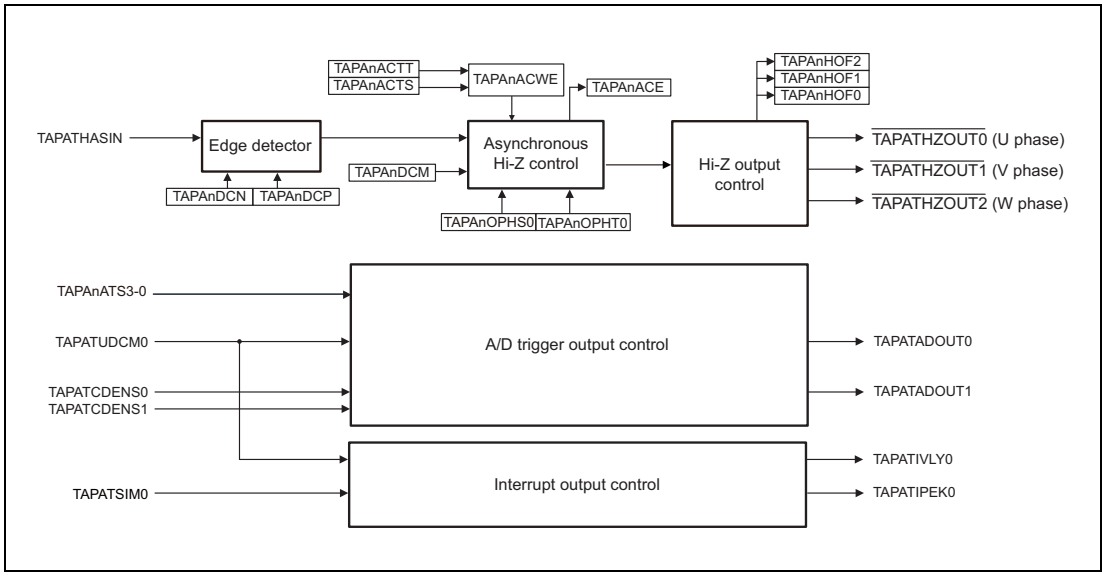

**Figure 29.2 TAPA Peripheral Block Diagram**

**NOTE**

For the PIC peripheral block diagram, see the respective section describing each function.

### 29.2.4 Definition of Terms

**Peak and valley interrupts - Peak and valley of timer counter**

In this document, the period from a TAUD counting-up status to generation of INT from the master channel is defined as a peak period, and this INT is defined as a peak interrupt.

In contrast, the period from a TAUD counting-down status to generation of INT from the master channel is defined as a valley period, and this INT is defined as a valley interrupt.

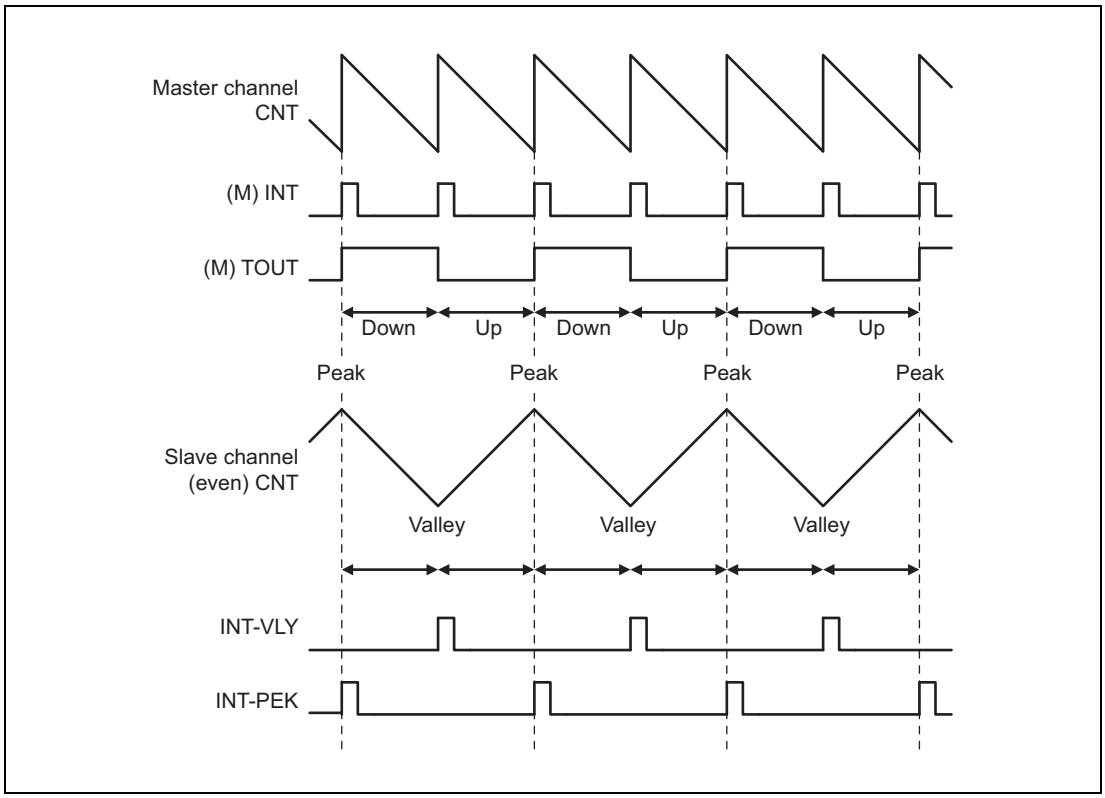

**Figure 29.3 Peak and Valley Interrupts**

# 29.3 Registers

## 29.3.1 List of Registers

The registers of TAPAn and PIC0 are listed in the following table.

For details about <TAPAn_base> and <PIC0_base>, see **Section 29.1.2, Register Base Address**.

**Table 29.10 Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| TAPAn | Control register 0 | TAPAnCTL0 | <TAPAn_base> + $20_H$ |
| | Control register 1 | TAPAnCTL1 | <TAPAn_base> + $24_H$ |
| | Flag register | TAPAnFLG | <TAPAn_base> + $00_H$ |
| | Asynchronous Hi-Z control write enable register | TAPAnACWE | <TAPAn_base> + $04_H$ |
| | Asynchronous Hi-Z control start trigger register | TAPAnACTS | <TAPAn_base> + $08_H$ |
| | Asynchronous Hi-Z control stop trigger register | TAPAnACTT | <TAPAn_base> + $0C_H$ |
| | Hi-Z start trigger register | TAPAnOPHS | <TAPAn_base> + $14_H$ |
| | Hi-Z stop trigger register | TAPAnOPHT | <TAPAn_base> + $18_H$ |
| | Emulation register | TAPAnEMU | <TAPAn_base> + $28_H$ |
| PIC0 | Simultaneous start trigger control register | PIC0SST | <PIC0_base> + $04_H$ |
| | Simultaneous start control register 0 | PIC0SSER0 | <PIC0_base> + $10_H$ |
| | Simultaneous start control register 2 | PIC0SSER2 | <PIC0_base> + $18_H$ |
| | Hi-Z output control register 0 | PIC0HIZCEN0 | <PIC0_base> + $80_H$ |
| | A/D conversion trigger output control register 400 | PIC0ADTEN400 | <PIC0_base> + $90_H$ |
| | A/D conversion trigger output control register 401 | PIC0ADTEN401 | <PIC0_base> + $94_H$ |
| | A/D conversion trigger output control register 402 | PIC0ADTEN402 | <PIC0_base> + $98_H$ |
| | Timer I/O control register 200 | PIC0REG200 | <PIC0_base> + $C0_H$ |
| | Timer I/O control register 201 | PIC0REG201 | <PIC0_base> + $C4_H$ |
| | Timer I/O control register 202 | PIC0REG202 | <PIC0_base> + $C8_H$ |
| | Timer I/O control register 203 | PIC0REG203 | <PIC0_base> + $CC_H$ |
| | Timer I/O control register 30 | PIC0REG30 | <PIC0_base> + $E8_H$ |
| | Timer I/O control register 31 | PIC0REG31 | <PIC0_base> + $EC_H$ |

**NOTE**

For details about PIC-related registers, see the respective section describing each function.

### 29.3.2 TAPAnCTL0 — TAPA Control Register 0

This register is used to set up the asynchronous Hi-Z control function.

The values of this register can be rewritten only when TAPAnFLG.TAPAnACE is 0 and TAUDnTEm for the corresponding TAUD's master channel is 0.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAPAn_base> + $20_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | TAPAn DCM | TAPAn DCN | TAPAn DCP | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R | R |

**Table 29.11 TAPAnCTL0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | TAPAnDCM | Clear Condition Configuration<br>This control bit specifies the clear conditions for Hi-Z control output.<br>0: Enables manipulation of TAPAnOPHT0 regardless of the TAPATHASIN signal input level.<br>1: Enables manipulation of TAPAnOPHT0 only if the TAPATHASIN signal input is inactive. |
| 3, 2 | TAPAnDCN, TAPAnDCP | Hi-Z Input Edge Selection<br>These are control bits that specify the valid edge of TAPATHASIN. |

| TAPAn DCN | TAPAn DCP | Description |
|---|---|---|
| 0 | 0 | Does not detect valid edges. |
| 0 | 1 | Detects a rising edge as the valid edge (active level = high). |
| 1 | 0 | Detects a falling edge as the valid edge (active level = low). |
| 1 | 1 | Setting prohibited |

| | | |
|---|---|---|
| 1, 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

### 29.3.3 TAPAnCTL1 — TAPA Control Register 1

This register is used to specify the A/D conversion trigger.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAPAn_base> + $24_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TAPAnATS3 | TAPAnATS2 | TAPAnATS1 | TAPAnATS0 |

### 29.3.4 TAPAnFLG — TAPA Flag Register

This flag register is for asynchronous Hi-Z control.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAPAn_base> + $00_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 0 | TAPAnACE | Asynchronous Hi-Z Control Enable<br>0: Indicates that the asynchronous Hi-Z control is stopped.<br>1: Indicates that the asynchronous Hi-Z control is enabled.<br>The conditions for setting or clearing this bit are as follows:<br>Clear condition: Writing 1 to TAPAnACTT while TAPAnACWE = 1<br>Set condition: Writing 1 to TAPAnACTS while TAPAnACWE = 1 |

### 29.3.5 TAPAnACWE — TAPA Asynchronous Hi-Z Control Write Enable Register

This register is used to enable writing for asynchronous Hi-Z control.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAPAn_base> + $04_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TAPAnACWE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 29.14 TAPAnACWE Register Contents**

| Bit Position | Bit Name | Function |

| 0 | TAPAnACWE | Asynchronous Control Write Enable<br>This is a write enable bit for asynchronous Hi-Z control.<br>After 1 is written, this bit is automatically cleared to 0 by writing 1 to TAPAnACTS and TAPAnACTT.<br>0: Disables writing to TAPAnACTS and TAPAnACTT.<br>1: Enables writing to TAPAnACTS and TAPAnACTT. |

### 29.3.6 TAPAnACTS — TAPA Asynchronous Hi-Z Control Start Trigger Register

This register is used to enable the start trigger for asynchronous Hi-Z control.

**Access:** This register is a write-only register that can be written in 8-bit units. This register is always read as $00_H$.

**Address:** <TAPAn_base> + $08_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TAPAnACTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAPAnACTS | Asynchronous Hi-Z Control Start Trigger<br>This bit enables the start trigger for asynchronous Hi-Z control.<br>The setting of this bit is valid only when TAPAnACWE = 1.<br>0: Writing 0 is ignored (no function).<br>1: Enables asynchronous Hi-Z control when TAPAnACE is 1. |

## 29.3.7 TAPAnACTT — TAPA Asynchronous Hi-Z Control Stop Trigger Register

This bit enables the stop trigger for asynchronous Hi-Z control.

**Access:** This register is a write-only register that can be written in 8-bit units. This register is always read as $00_H$.

**Address:** <TAPAn_base> + $0C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TAPAnACTT |

## 29.3.8 TAPAnOPHS — TAPA Hi-Z Start Trigger Register

This software trigger register is used to start Hi-Z control for motor control output pins.

**Access:** This register is a write-only register that can be written in 8-bit units. This register is always read as $00_H$.

**Address:** <TAPAn_base> + $14_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TAPAnOPHS0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAPAnOPHS0 | Hi-Z Control Start Trigger<br>This bit starts Hi-Z control for motor control output pins.<br>0: Writing 0 is ignored (no function).<br>1: Starts Hi-Z control. |

### 29.3.9 TAPAnOPHT — TAPA Hi-Z Stop Trigger Register

This software trigger register is used to stop Hi-Z control for motor control output pins.

**Access:** This register is a write-only register that can be written in 8-bit units. This register is always read as $00_H$.

**Address:** <TAPAn_base> + $18_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TAPAnOPHT0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 29.18 TAPAnOPHT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAPAnOPHT0 | Hi-Z Control Stop Trigger<br>This bit stops Hi-Z control for motor control output pins.<br>0: Writing 0 is ignored (no function).<br>1: Stops Hi-Z control. Whether the setting of this bit is valid or invalid depends on the setting of TAPAnCTL0.TAPAnDCM. |

### 29.3.10 TAPAnEMU — TAPA Emulation Register

This register controls SVSTOP for emulation.

**Access:** This register can be read or written in 8-bit units. (when EPC.SVSTOP = 0, rewritten only)

**Address:** <TAPAn_base> + $28_H$

**Value after reset:** Reading this register returns always $00_H$.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TAPAnSVSDIS | — | — | — | — | — | — | — |

**Table 29.19 TAPAnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | TAPAnSVSDIS | This bit is used to control disabling of SVSTOP.<br>0: SVSTOP is valid. (Sets Hi-Z control output to low level when SVSTOP = 1 is input).<br>1: SVSTOP is invalid. (Hi-Z control output level does not change according to the level of SVSTOP input). |
| 6 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

## 29.4 Asynchronous Hi-Z Control Function

If the operation of the timer motor control function controlled by the MCU becomes abnormal, the rotation of the external motor also becomes abnormal. This function can forcibly set the motor control output to the Hi-Z state upon detection of abnormal motor operation, independent of MCU control.

### 29.4.1 Overview

This function forcibly stops TAPAn output through asynchronous Hi-Z control.

- When the TAPATHASIN signal becomes active, the levels of the motor control output pins are set to Hi-Z, and motor control output is forcibly stopped.
- Motor control output in a Hi-Z state can be resumed by writing the Hi-Z stop trigger register (TAPAnOPHT0).
- The Hi-Z state of motor control output can also be specified by writing the Hi-Z control start trigger register (TAPAnOPHS).
- Setting PIC can enable or disable Hi-Z control input when an error occurs.

### 29.4.2 System Configuration Example

A system configuration example is shown below, where an external error detection signal (the TAPA0ESO signal) is used for Hi-Z control of the motor control outputs (TAPA0UP / TAPA0UN / TAPA0VP / TAPA0VN / TAPA0WP / TAPA0WN).

When valid edges of the external error detection signal are detected, the level of the motor control outputs is set to Hi-Z.

Because the microcontroller might freeze when an error occurs, external error detection signals are continuously processed so that the motor control timer outputs can be set to Hi-Z even if no clock is supplied.

Note that an error is detected only when the valid edge of the error detection signal is detected. Therefore, no error is detected if the output level is fixed and the signal level does not change.

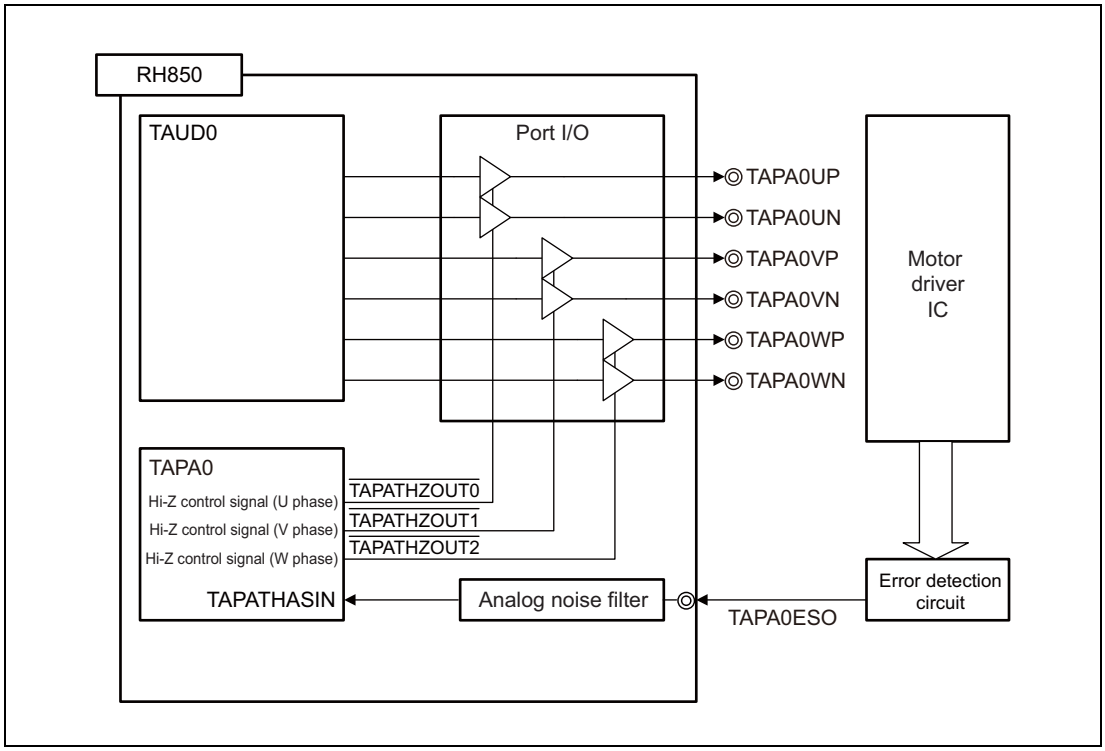

**Figure 29.4 System Configuration Example of Asynchronous Hi-Z Control for Pin Input**

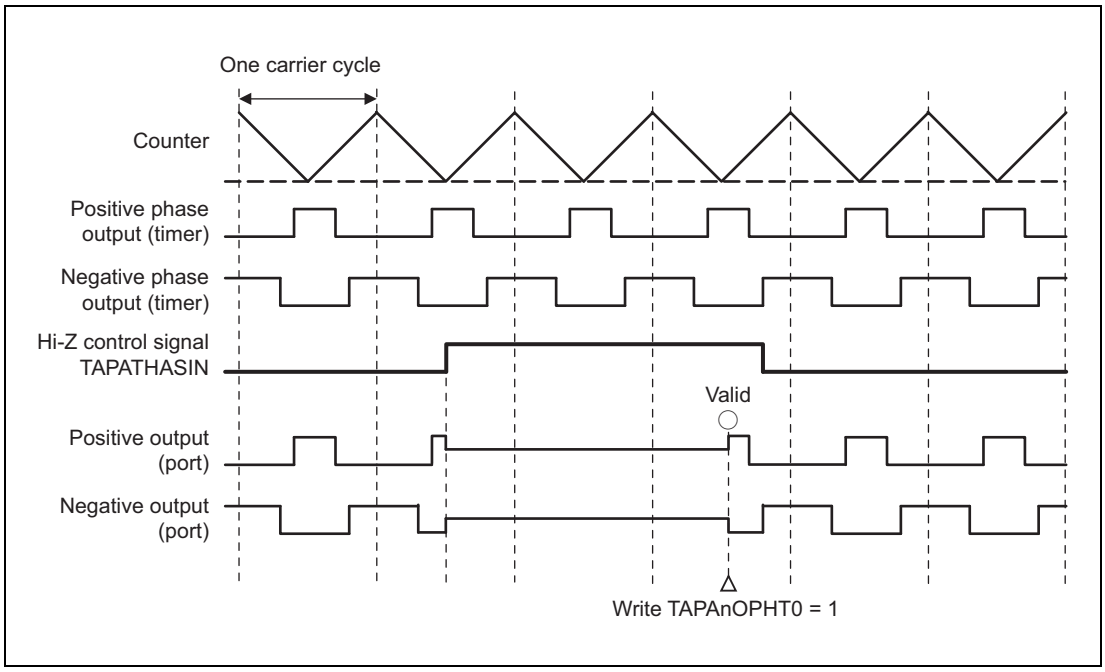
### 29.4.3 Basic Operation

Hi-Z control for motor control output pins can be started as follows:

- Detecting the valid edge of asynchronous Hi-Z control signal (TAPATHASIN)
- Setting the start trigger bit TAPAnOPHS.TAPAnOPHS0 of the Hi-Z control signal

The levels of the motor control output pins are set to Hi-Z until the stop trigger bit of the Hi-Z control signal (TAPAnOPHT.TAPAnOPHT0) is set. Note that whether the setting of TAPAnOPTH0 is valid or invalid depends on the setting of TAPAnCTL0.TAPAnDCM.

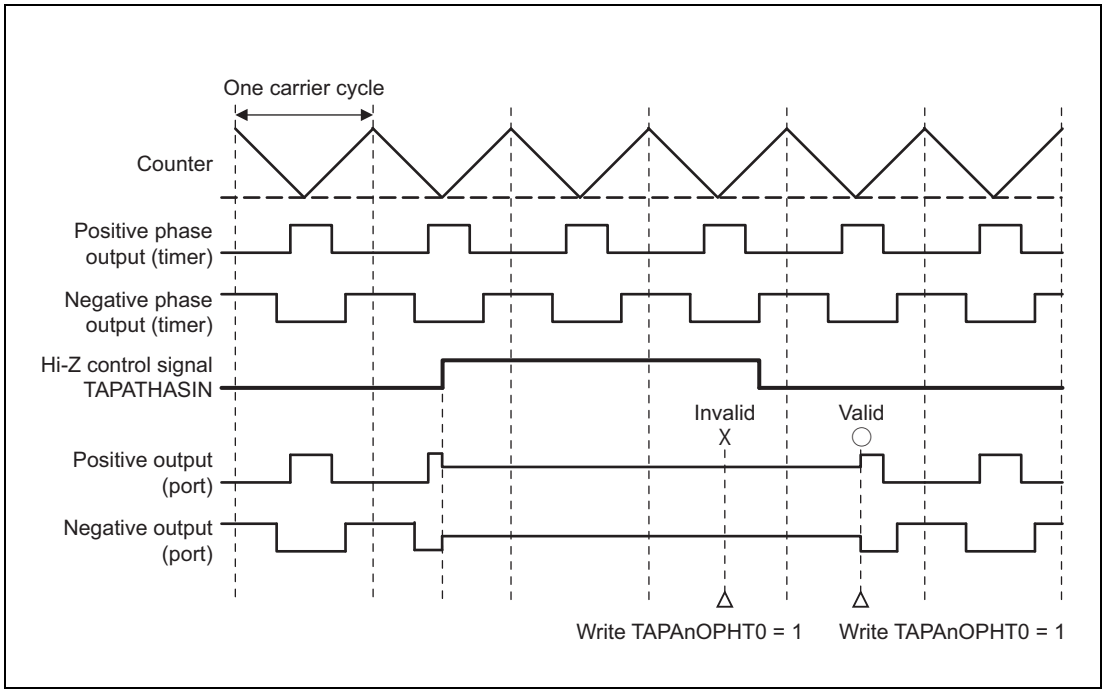
#### (1) Operation when TAPAnCTL0.TAPAnDCM = 0, TAPAnDCP = 1, and TAPAnDCN = 0



The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.

The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0, regardless of the level of TAPATHASIN.

### (2) Operation when TAPAnCTL0.TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0



The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.

Writing 1 to the stop trigger bit (TAPAnOPHT.TAPAnOPHT0) of the Hi-Z control signal is ignored while TAPATHASIN is active (high level because TAPAnCTL0.TAPAnDCP is 1).

The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0 after TAPATHASIN becomes inactive (low level because TAPAnCTL0.TAPAnDCP is 1).

### 29.4.4 Asynchronous Hi-Z Control Using Software Trigger

Hi-Z control for motor control output is possible by using the Hi-Z control start trigger bit TAPAnOPHS.TAPAnOPHS0 and Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHT0.

#### (1) Function of Hi-Z control start trigger bit TAPAnOPHS.TAPAnOPHS0

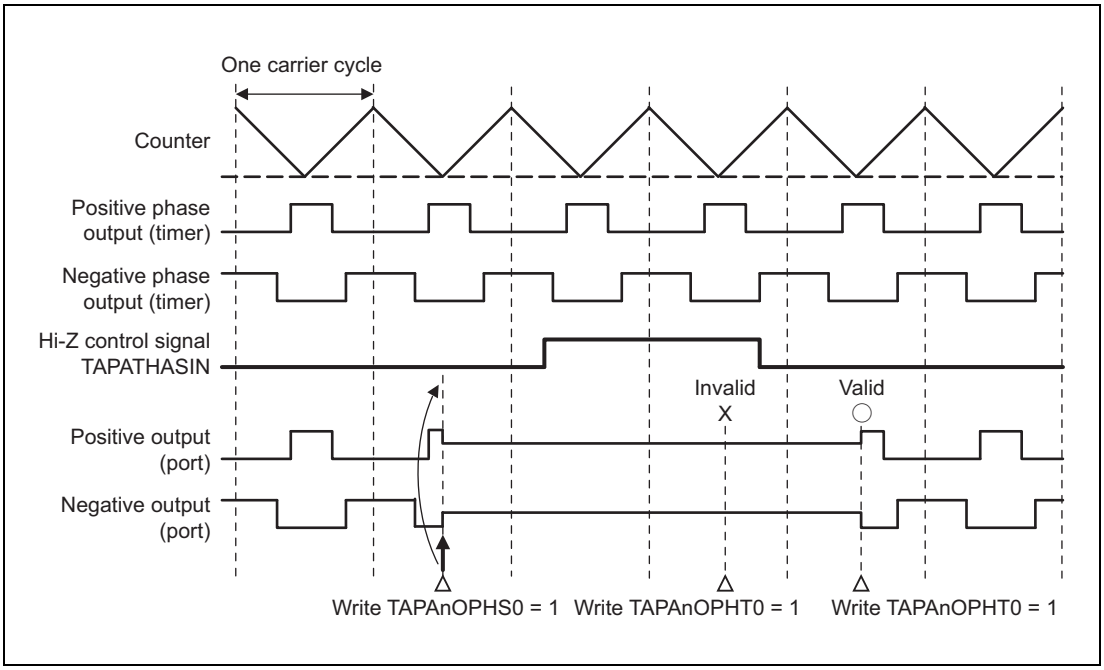
| TAPAnDCM | Function |
|---|---|
| 0/1 | Writing 1 to TAPAnOPHS0 starts Hi-Z control and forcibly stops the motor control output (Hi-Z output). |

#### (2) Function of Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHT0

Whether the Hi-Z control stop trigger is valid or invalid depends on the conditions below:

| TAPAnDCM | Function |
|---|---|
| 0 | Writing 1 to TAPAnOPHT0 stops Hi-Z control and restarts motor control output. |
| 1 | If TAPATHASIN is inactive, writing 1 to TAPAnOPHT0 stops Hi-Z control and restarts motor control output.<br>If TAPATHASIN is active, writing 1 to TAPAnOPHT0 is ignored. |

#### (3) Operation when TAPAnCTL0.TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0



The motor control output (Hi-Z output) is forcibly stopped when 1 is written to TAPAnOPHS0.

After that, the level of the motor control output remains Hi-Z even if the rising edge of TAPATHASIN is detected.

Writing to TAPAnOPHT0 is ignored while TAPATHASIN is active (high level because TAPAnDCN is 0 and TAPAnDCP is 1).

After detection of the falling edge of TAPATHASIN, the motor control output restarts when 1 is written to TAPAnOPHT0 while TAPATHASIN is inactive (low level because TAPAnDCN is 0 and TAPAnDCP is 1).

### 29.4.5 Operating Procedure

The operating procedure for the asynchronous input Hi-Z control function is shown below:

| | Operation | Status of TAPA |
|---|---|---|
| Initial setup | Set up the TAPAnCTL0 register.<br>Specify TAPAnDCP and TAPAnDCN to select the input edge.<br>Specify TAPAnDCM to select the clear mode. | Asynchronous Hi-Z control stopped<br>(TAPAnFLG.TAPAnACE = 0) |
| Start operation | Set up the TAPAnACWE register.<br>Set TAPAnACWE to 1.<br><br>Set up the TAPAnACTS register.<br>Set TAPAnACTS to 1. | <br>Writing to TAPAnACTS is enabled.<br><br>Asynchronous Hi-Z control enabled<br>(TAPAnFLG.TAPAnACE = 1) |
| During operation | Hi-Z control for the timer function outputs can be started by controlling the following:<br>• TAPAnOPHS register<br>• Asynchronous Hi-Z control signal (TAPATHASIN)<br><br>Hi-Z control for the timer function outputs can be stopped by controlling the following:<br>• TAPAnOPHT register<br>(If TAPAnDCM is 1, control by the TAPAnOPHT register is enabled only while TAPATHASIN is inactive.)<br><br>The TAPA operating status can always be read using the TAPAnFLG register. | Hi-Z control for the motor control output pins is started by detecting the valid edge of the asynchronous Hi-Z control signal (TAPATHASIN) or by setting the Hi-Z control start trigger bit TAPAnOPHS0 to 1.<br>Hi-Z control for the motor control output pins is stopped by setting the Hi-Z control stop trigger bit TAPAnOPHT0 to 1 according to the operation mode specified by the TAPAnDCM bit. |
| Stop operation | Set up the TAPAnACWE register.<br>Set TAPAnACWE to 1.<br><br>Set up the TAPAnACTT register.<br>Set TAPAnACTT to 1. | <br>Writing to TAPAnACTT is enabled.<br><br>Asynchronous Hi-Z control stopped<br>(TAPAnFLG.TAPAnACE = 0) |

Restart

### 29.4.6 TAPA0 Hi-Z Control Input Selection

In order to stop the motor control output in case of errors, error events are selected in PIC and the level of the motor control output is set to Hi-Z in TAPA0, as shown in the diagram below.

The TAPA function can be stopped by setting TAPA0ACTT = $01_H$ after setting PIC0HIZCEN0 = $00_H$ or TAPA0ACWE = $01_H$.

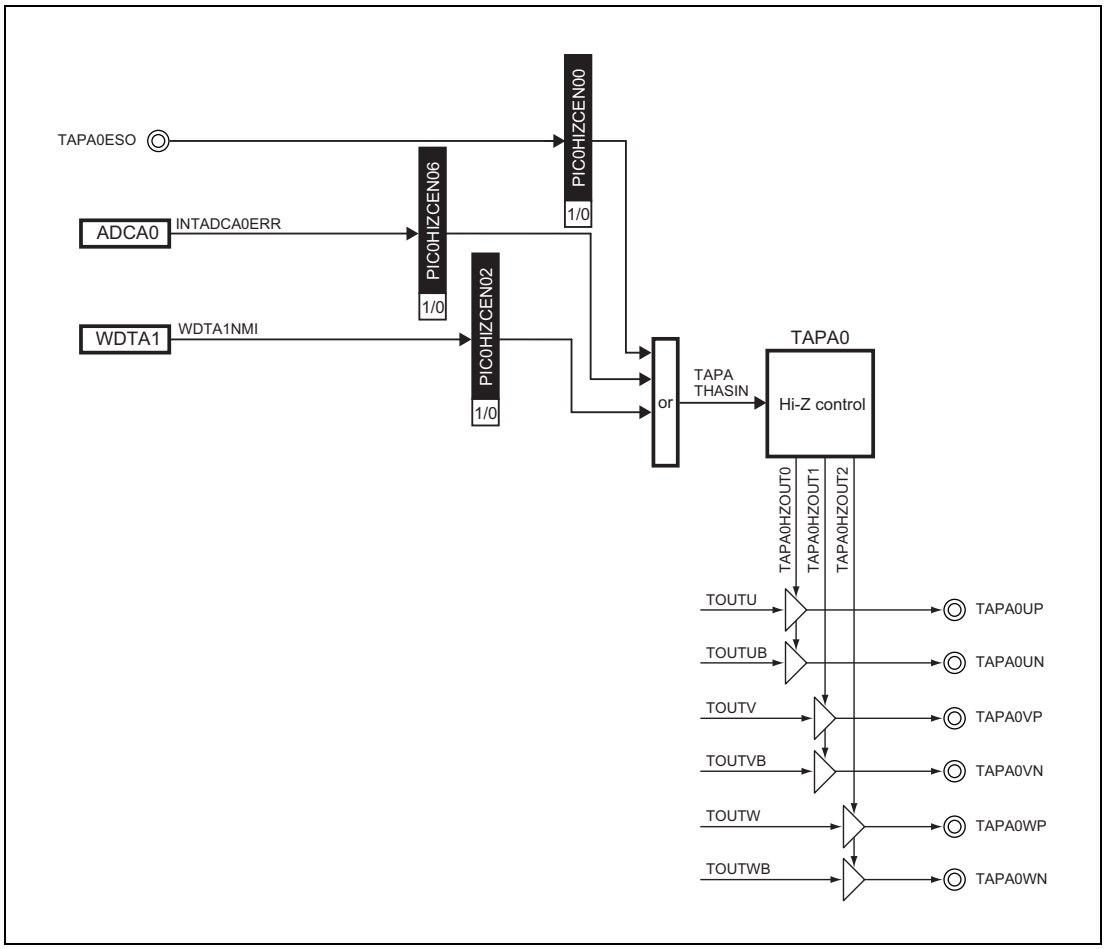


**Figure 29.5 Hi-Z Control Block Diagram**

Switching into a Hi-Z state can be performed by the following:

- TAPA0ESO pin input
- A/D converter ADCA0 error signal ADCA0ERR
- Window Watchdog Timer WDTA1 non maskable interrupt WDTA1NMI

For details about these signals, see the respective descriptions.

## 29.4.7 Registers

### 29.4.7.1 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0)

The PIC0HIZCENn register selects the Hi-Z output control signal of TAPAn.

**Access:** This register can be read or written in 8-bit units.

**Address:** <PIC0_base> + $80_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | PIC0HIZCENn6 | — | — | — | PIC0HIZCENn2 | — | PIC0HIZCENn0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R | R | R | R/W | R | R/W |

**Table 29.20 PIC0HIZCENn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 6 | PIC0HIZCENn6 | Selects whether to enable or disable Hi-Z output control by the INTADCA0ERR interrupt signal.<br>0: Disable<br>1: Enable |
| 5 to 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 | PIC0HIZCENn2 | Selects whether to enable or disable Hi-Z output control by the WDTA1NMI interrupt signal.<br>0: Disable<br>1: Enable |
| 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | PIC0HIZCENn0 | Selects whether to enable or disable Hi-Z output control by the TAPA0ESO pin input.<br>0: Disable<br>1: Enable |

# 29.5 INT Signal Output Selection Function

## 29.5.1 Configuration of the INT Signal Output Selection Function

This function generates the peak interrupt TAPATIPEK0 and valley interrupt TAPATIVLY0 by using the TAPATSIM0 signal, which is connected to the INT signal on the TAUD's triangular carrier cycle generation channel (master) and TAPATUDCM0 signal, which is connected to the counter up/down signal.

For the connection destination of TAPATSIM0, see **Section 29.1.7, Internal Output Signal**.

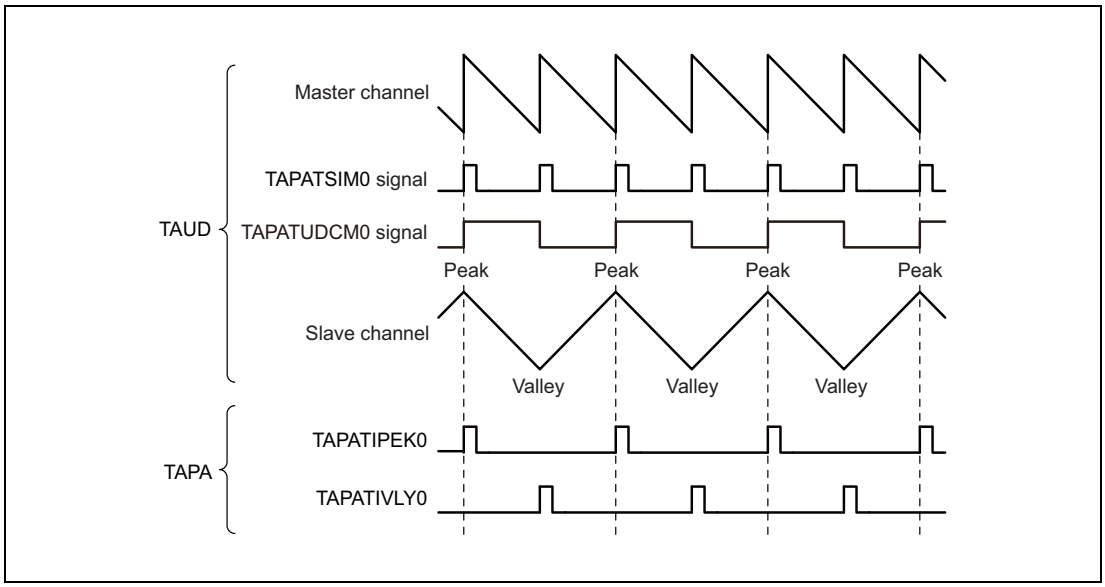

**Figure 29.6 Basic Timing of Signals for the INT Signal Output Selection Function**

Triangular carrier cycles are generated on the master channel.

The INT signal generated on the master channel in each half triangular carrier cycle is input to TAPAn as the TAPATSIM0 signal. TAPAn generates the TAPATIPEK0 signal (peak interrupt) during high level of the TAPATUDCM0 signal and the TAPATIVLY0 signal (valley interrupt) during low level of the TAPATUDCM0 signal by using the TAPATSIM0 and TAPATUDCM0 input signals.

**CAUTION**

**The peak interrupt TAPATIPEK0 and valley interrupt TAPATIVLY0 are generated regardless of the function of the master channel of TAUD.**

**When not using these peak and valley interrupts, mask them by using the ICTAPAnIPEK0 and ICTAPAnIVLY0 registers, respectively.**

### 29.5.2 Block Diagram

TAUDn and TAPAn are connected in the registers shown below by the INT signal output selection function.

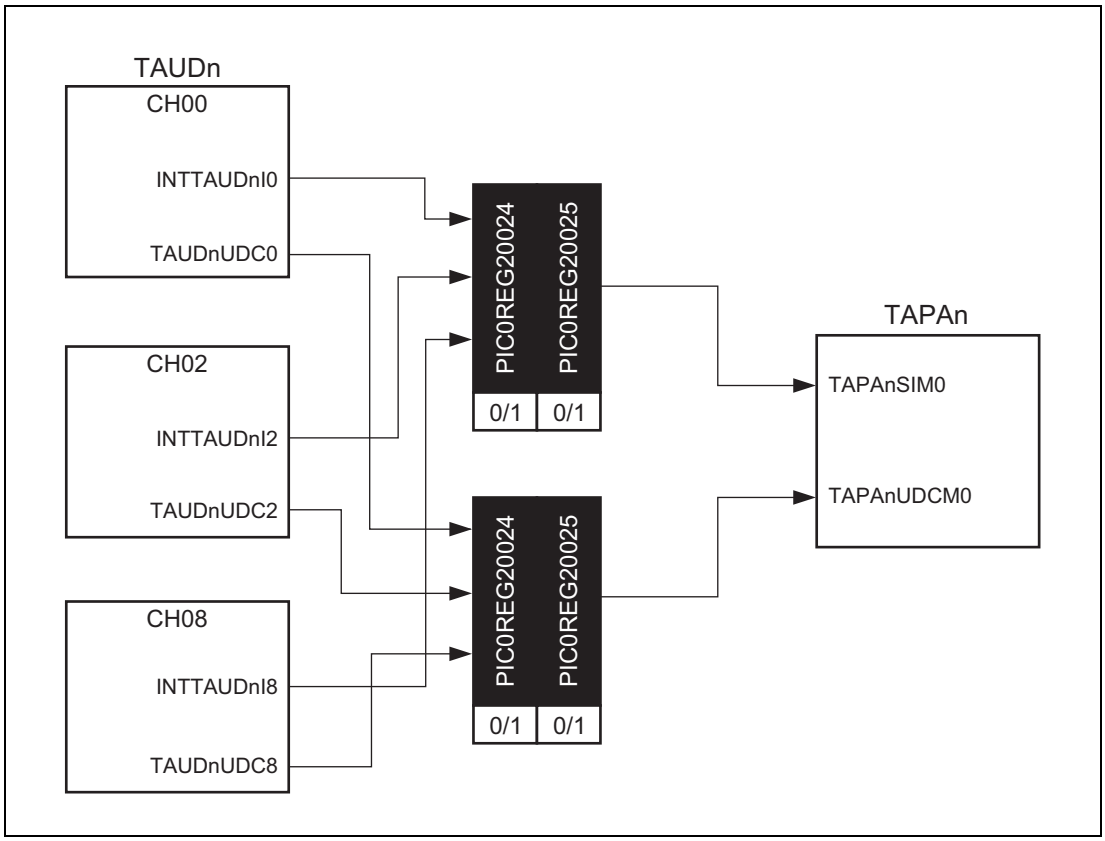

**Figure 29.7 Connection of the INT Signals**

## 29.5.3 Registers

### 29.5.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0)

This register selects the TAPA0 input.

**Access:** This register can be read or written in 32-bit units.

**Address:** PIC0REG200: FFDD 00C0$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 29.21 PIC0REG2n0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 26 | Reserved | *1 |
| 25, 24 | PIC0REG2n025<br>PIC0REG2n024 | Select the TAUDn channel used by TAPATSIM0 and TAPATUDCM0.<br>00: Not selected<br>01: TAUD0 channel 0 selected<br>10: TAUD0 channel 2 selected<br>11: TAUD0 channel 8 selected |
| 23 to 0 | Reserved | *1 |

Note 1. Some of the bits defined as 0 in the PIC0REG2n0 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

## 29.6 A/D Converter Conversion Trigger Selection Function

This function outputs the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1 from the TAPATCDENS0 and TAPATCDENS1 signals, which are connected to a compare match interrupt based on the triangular carrier cycle of TAUD, or a valley interrupt signal (TAPATIVLY0).

### 29.6.1 Configuration of A/D Converter Conversion Trigger Selection Function

**Table 29.22 Signals Used for TAPATADOUT Generation**

| Output Signal | Slave Match Detection Signal | Valley Interrupt Signal |
|---|---|---|
| TAPATADOUT0 | TAPATCDENS0 | TAPATIVLY0 |
| TAPATADOUT1 | TAPATCDENS1 | TAPATIVLY0 |

**Table 29.23 Operation of TAPATADOUT1 According to the Setting of TAPAnCTL1.TAPAnATS[3:2]**

| TAPAnATS3 | TAPAnATS2 | Description |
|---|---|---|
| 0 | 0 | Outputs the INT signal from TAPATADOUT1 while the triangle wave is falling (counting down). |
| 0 | 1 | Outputs the INT signal from TAPATADOUT1 while the triangle wave is rising (counting up). |
| 1 | 0 | Outputs the INT signal from TAPATADOUT1 while the triangle wave is rising (counting up) or falling (counting down). |
| 1 | 1 | Outputs the INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt TAPATIVLY0 from TAPATADOUT1. |

**Table 29.24 Operation of TAPATADOUT0 According to the Setting of TAPAnCTL1.TAPAnATS[1:0]**

| TAPAnATS1 | TAPAnATS0 | Description |
|---|---|---|
| 0 | 0 | Outputs the INT signal from TAPATADOUT0 while the triangle wave is falling (counting down). |
| 0 | 1 | Outputs the INT signal from TAPATADOUT0 while the triangle wave is rising (counting up). |
| 1 | 0 | Outputs the INT signal from TAPATADOUT0 while the triangle wave is rising (counting up) or falling (counting down). |
| 1 | 1 | Outputs the INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt TAPATIVLY0 from TAPATADOUT0. |

## 29.6.2 Block Diagram

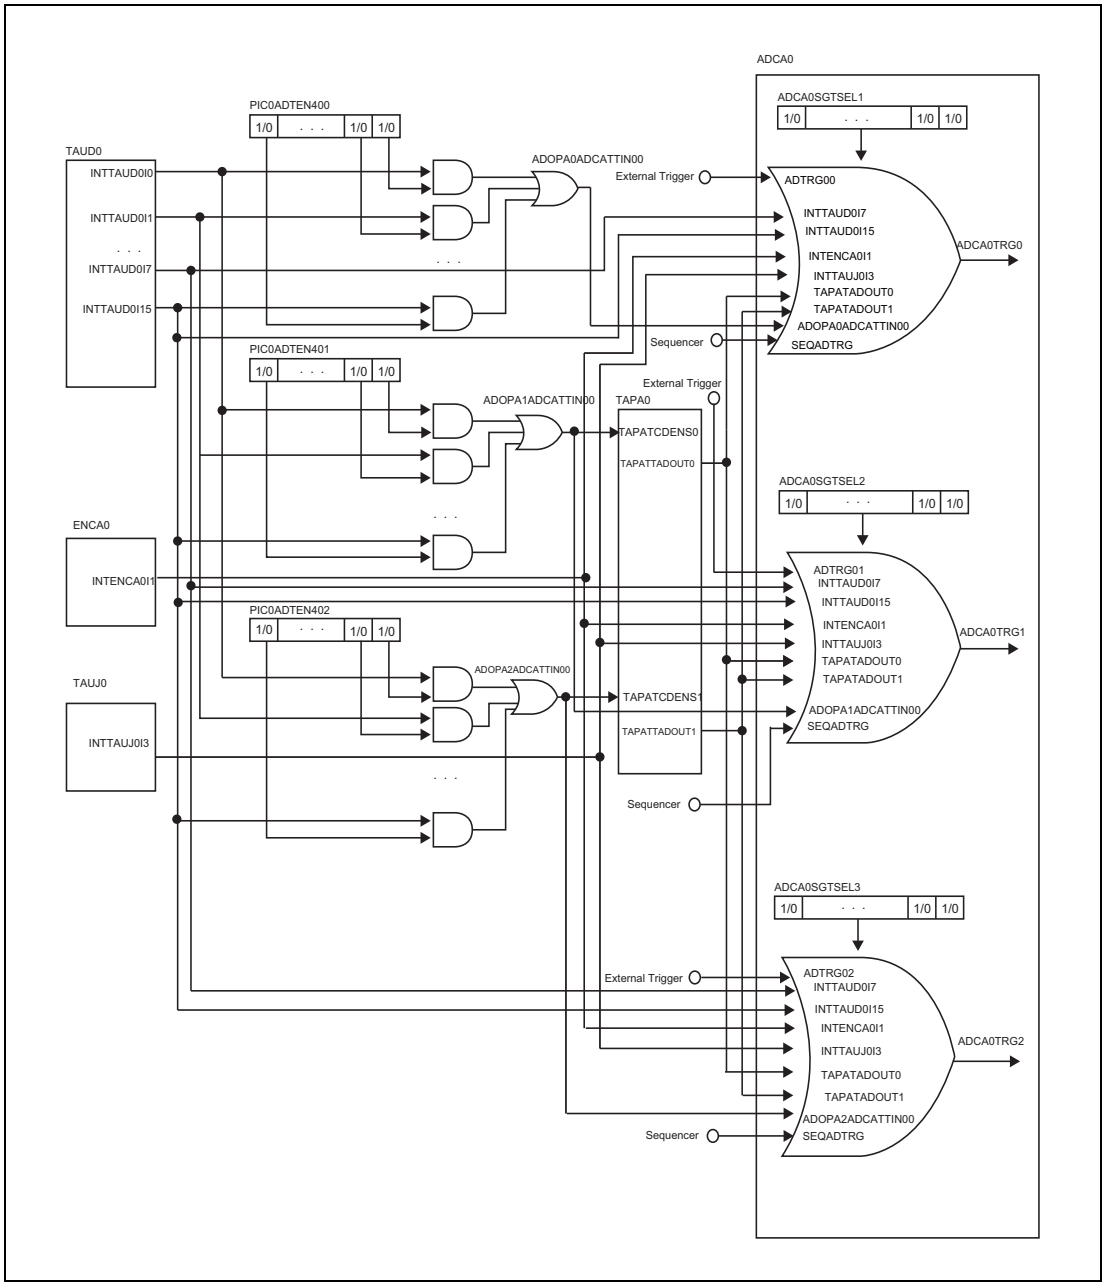

**Figure 29.8 Block Diagram of A/D Conversion Trigger Selection Function**

**NOTE**

See **Section 31.3.4.1, ADCAnSGTSELx — Scan Group x Start Trigger Control Register x** for details on the settings of the ADCA0SGTSEL register.

### 29.6.3 Waveforms of A/D Converter Conversion Trigger Output Control Operation in Triangle PWM Mode

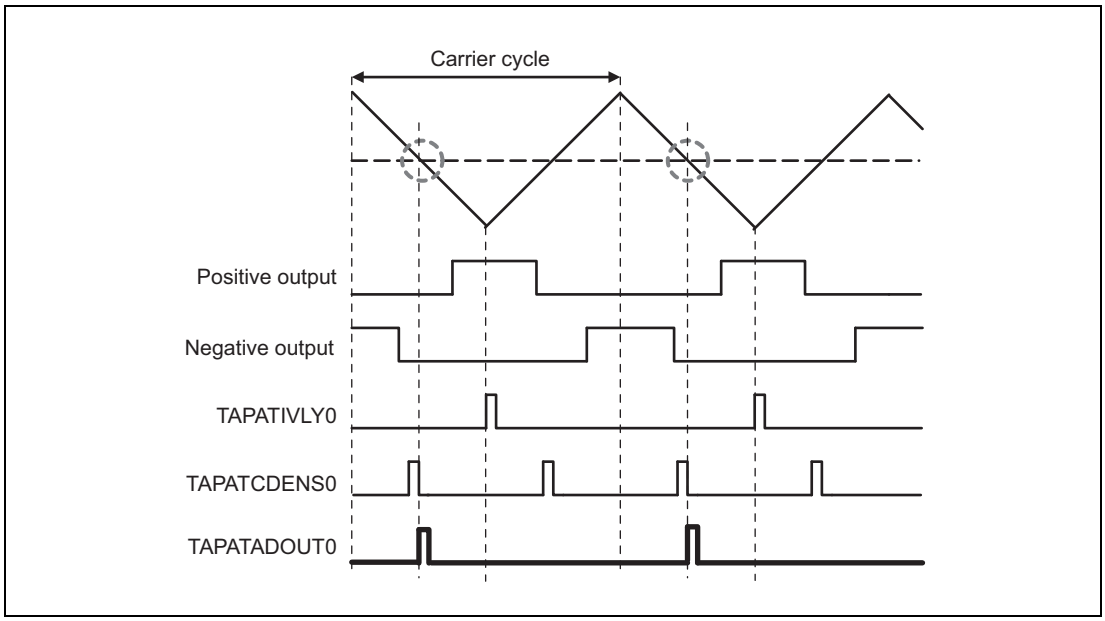

**Figure 29.9 TAPAnATS[1:0] bits = $00_B$: Output INT Signal while the Triangle Wave is Falling (Counting Down)**

While the triangle wave is falling (counting down), the signals TAPATCDENS0 and TAPATCDENS1 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

In this case, no A/D converter conversion trigger signal is output while the triangle wave is rising (counting up).

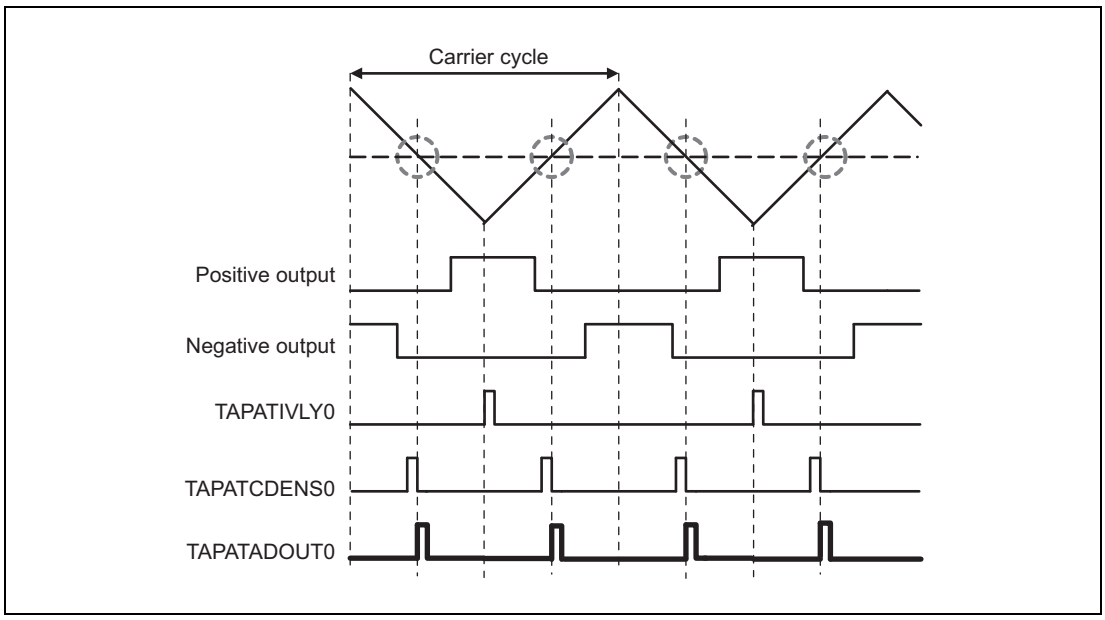

**Figure 29.10 TAPAnATS[1:0] bits = $10_B$: Output INT Signal while the Triangle Wave is Rising (Counting Up) or Falling (Counting Down)**

The signals TAPATCDENS0 and TAPATCDENS1 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

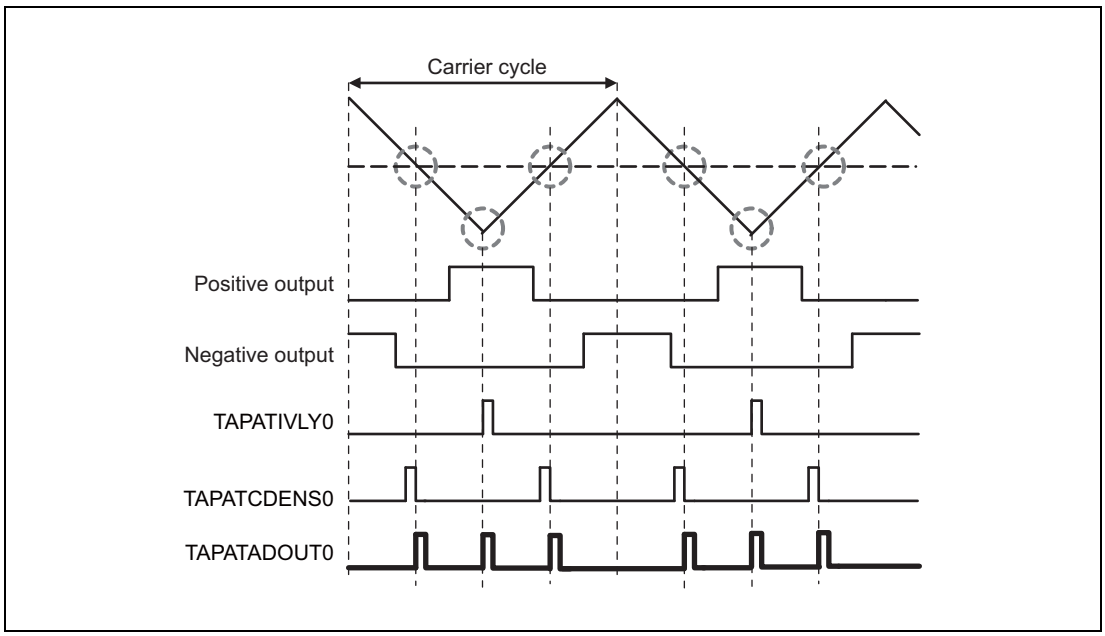

**Figure 29.11 TAPAnATS[1:0] bits = $11_B$: Output of INT Signal and Valley Interrupt while the Triangle Wave is Rising (Counting Up) or Falling (Counting Down)**

The signals TAPATCDENS0 and TAPATCDENS1 and valley interrupt TAPATIVLY0 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

### 29.6.4 Operating Procedure for A/D Converter Conversion Trigger Selection Function

The operating procedure for the A/D converter conversion trigger selection function is shown below.

| | Operation | Status of TAUD and TAPA |
|---|---|---|
| Initial setup | Initialize TAUD.<br>Specify the timer operation mode.<br><br>Set up the TAPAnCTL1 register.<br>Specify TAPAnATS[1:0] (TAPATADOUT0 setting).<br>Specify TAPAnATS[3:2] (TAPATADOUT1 setting).<br><br>Set up the PIC0ADTEN4nj and PIC0REG2n0 registers according to the signal to be used.<br>Specify PIC0ADTEN4nj (TAPATCDENS0 or TAPATCDENS1 setting).<br>Specify PIC0REG2n0 (TAPATIVLY0 setting). | TAUD and TAPA stop the operation. |
| Start operation | Start the TAUD operation. | TAUD starts the count operation. |
| During operation | TAUD operates according to the setting of each function. | The A/D conversion trigger selection function outputs either TAPATADOUT0 according to the setting of TAPAnATS[1:0] or TAPATADOUT1 according to the setting of TAPAnATS[3:2], based on the interrupt TAPATCDENS1 or TAPATCDENS0, which is input from TAUD, and the valley interrupt TAPATIVLY0, which is generated by TAPA. |
| Stop operation | Stop the TAUD operation. | TAUD stops the count operation. |

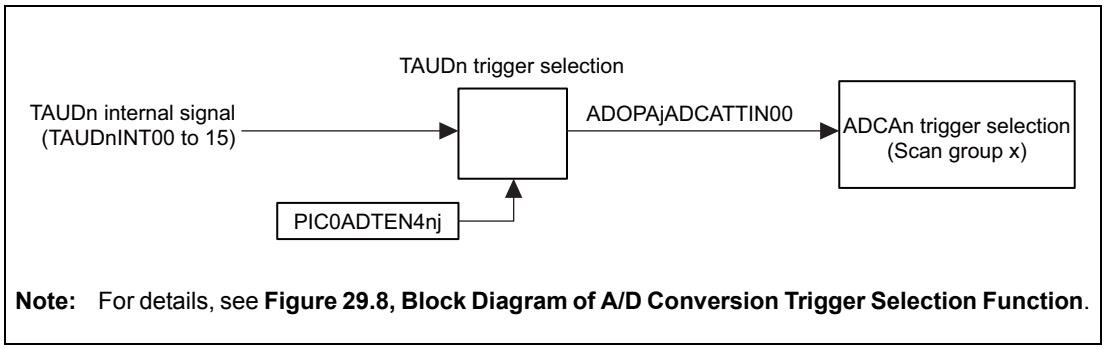
Restart

# 29.7 ADCA Trigger Selection Function

## 29.7.1 Functional Overview

This function generates ADCA hardware trigger signals by using TAUDn channel output.

## 29.7.2 Configuration



**Note:** For details, see **Figure 29.8, Block Diagram of A/D Conversion Trigger Selection Function**.

**Figure 29.12 Block Diagram of ADCA Trigger Selection Function**

## 29.7.3 Registers

### 29.7.3.1 PIC0ADTEN4nj — A/D Conversion Trigger Output Control Register 4nj (n = 0, j = 0 to 2)

This register selects an ADCA0 start trigger source from TAUDn channel m. (m = 0 to 15)

**Access:** This register can be read or written in 16-bit units.

**Address:** <PIC0_base> + 90H + 4 × j

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PIC0ADTEN4nj15 | PIC0ADTEN4nj14 | PIC0ADTEN4nj13 | PIC0ADTEN4nj12 | PIC0ADTEN4nj11 | PIC0ADTEN4nj10 | PIC0ADTEN4nj09 | PIC0ADTEN4nj08 | PIC0ADTEN4nj07 | PIC0ADTEN4nj06 | PIC0ADTEN4nj05 | PIC0ADTEN4nj04 | PIC0ADTEN4nj03 | PIC0ADTEN4nj02 | PIC0ADTEN4nj01 | PIC0ADTEN4nj00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 29.25 PIC0ADTEN4nj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PIC0ADTEN4nj 15 to PIC0ADTEN4nj 00 | Sets a trigger source of CHm (m = 0 to 15) in the TAUDn timer.<br>0: A/D trigger source of CHm in the TAUDn timer is disabled.<br>1: A/D trigger source of CHm in the TAUDn timer is enabled. |

### 29.7.4 Example of Operation

(1) Initial setting: Set the function of each channel of the TAUD0 to be used.

(2) Setting of the A/D conversion trigger output control register 4nj (PIC0ADTEN4nj):
Setting the bits of A/D conversion trigger output control register 4nj ((PIC0ADTEN4nj) to 1 enables selection of an interrupt request signal from each channel of the TAUD0 as the trigger of the A/D conversion scan group.

– Register setting should be performed when A/D conversion is stopped.

(3) Setting of the A/D conversion trigger selection control register (ADCA0SGTSELx):
Setting the bits corresponding to each trigger to 1 enables to use the signal generated by executing the logical OR of each trigger as the start trigger of the A/D conversion scan group.

– Register setting should be performed when the A/D conversion is stopped.

(4) Enabling of TAUD0 timer operation
Each channel of the TAUD0 timer set in (1) starts.

### 29.7.5 Setup Flow

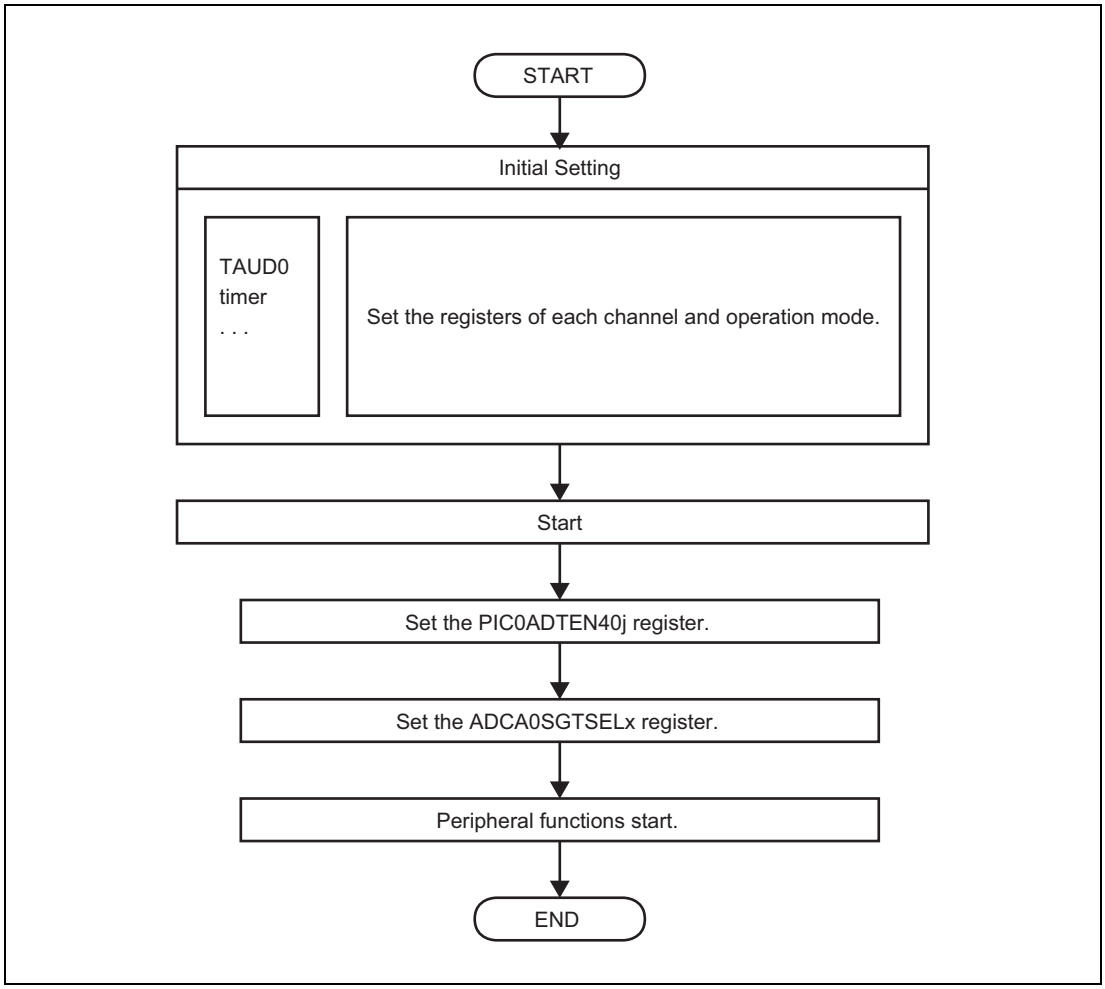


**Figure 29.13 Setup Flow (j = 0 to 2)**

# 29.8 Simultaneous Start Trigger Function

## 29.8.1 Functional Overview

The timers (TAUD0, TAUJ1, ENCA0) can be simultaneously started in any combination.

## 29.8.2 Configuration

### (1) Configuration

Table 29.26 Configuration of Simultaneous Start Trigger Function

| Configuration/Timer Function | Timer |
|---|---|
| Configuration of Timer | TAUD0, TAUJ1, ENCA0 |

### (2) Block Diagram

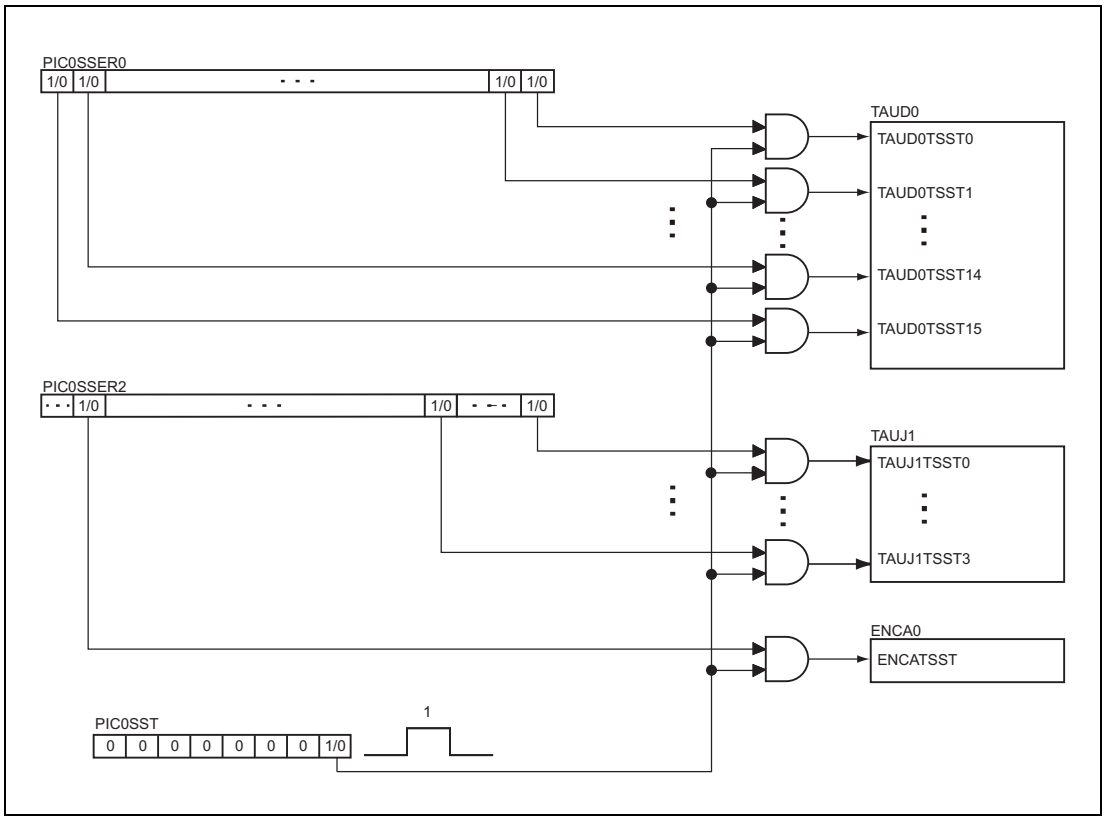

Figure 29.14 Block Diagram of Simultaneous Start Trigger

## 29.8.3 Registers

### 29.8.3.1 PIC0SSER0 — Simultaneous Start Control Register 0

The PIC0SSER0 register enables a start trigger for each channel of the TAUD0.

**Access:** This register can be read or written in 16-bit units

**Address:** <PIC0_base> + $10_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 14 | PIC0SSER214 | Enables a simultaneous start trigger for the ENCA0 timer.<br>0: Simultaneous start trigger is disabled.<br>1: Simultaneous start trigger is enabled. |
| 13 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 to 0 | PIC0SSER203 to PIC0SSER200 | Set a simultaneous start trigger for the CHm in the TAUJ1 timer.<br>0: Simultaneous start trigger is disabled.<br>1: Simultaneous start trigger is enabled. |

### 29.8.3.3 PIC0SST — Simultaneous Start Trigger Control Register

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <PIC0_base> + $04_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SYNCTRG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 29.29 PIC0SST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | SYNCTRG | Generates a start trigger for the timer whose simultaneous start is enabled.<br>When read, this bit is always read as 0.<br>0: Disabled.<br>1: Simultaneous start trigger is generated (the pulse in the width of 1PCLK is output). |

### 29.8.4 Example of Operation

(1) Operation example of timer configuration:
The timers that operates in operation mode to be selected can be simultaneously started in any combinations.

(2) Simultaneous start enable:
Setting the relevant bits in the PIC0SSER0 and PIC0SSER2 registers of the target timers to be simultaneously started to 1 enables these timers to simultaneously start.

(3) Start trigger output:
Writing 1 to the SYNCTRG bit in the PIC0SST register enables the target timers set in (2) to simultaneously start.

(4) Repeating (2) and (3) for the channels that have not started yet enables the different target timers to simultaneously start in multiple batches.

### 29.8.5 Setup Flow

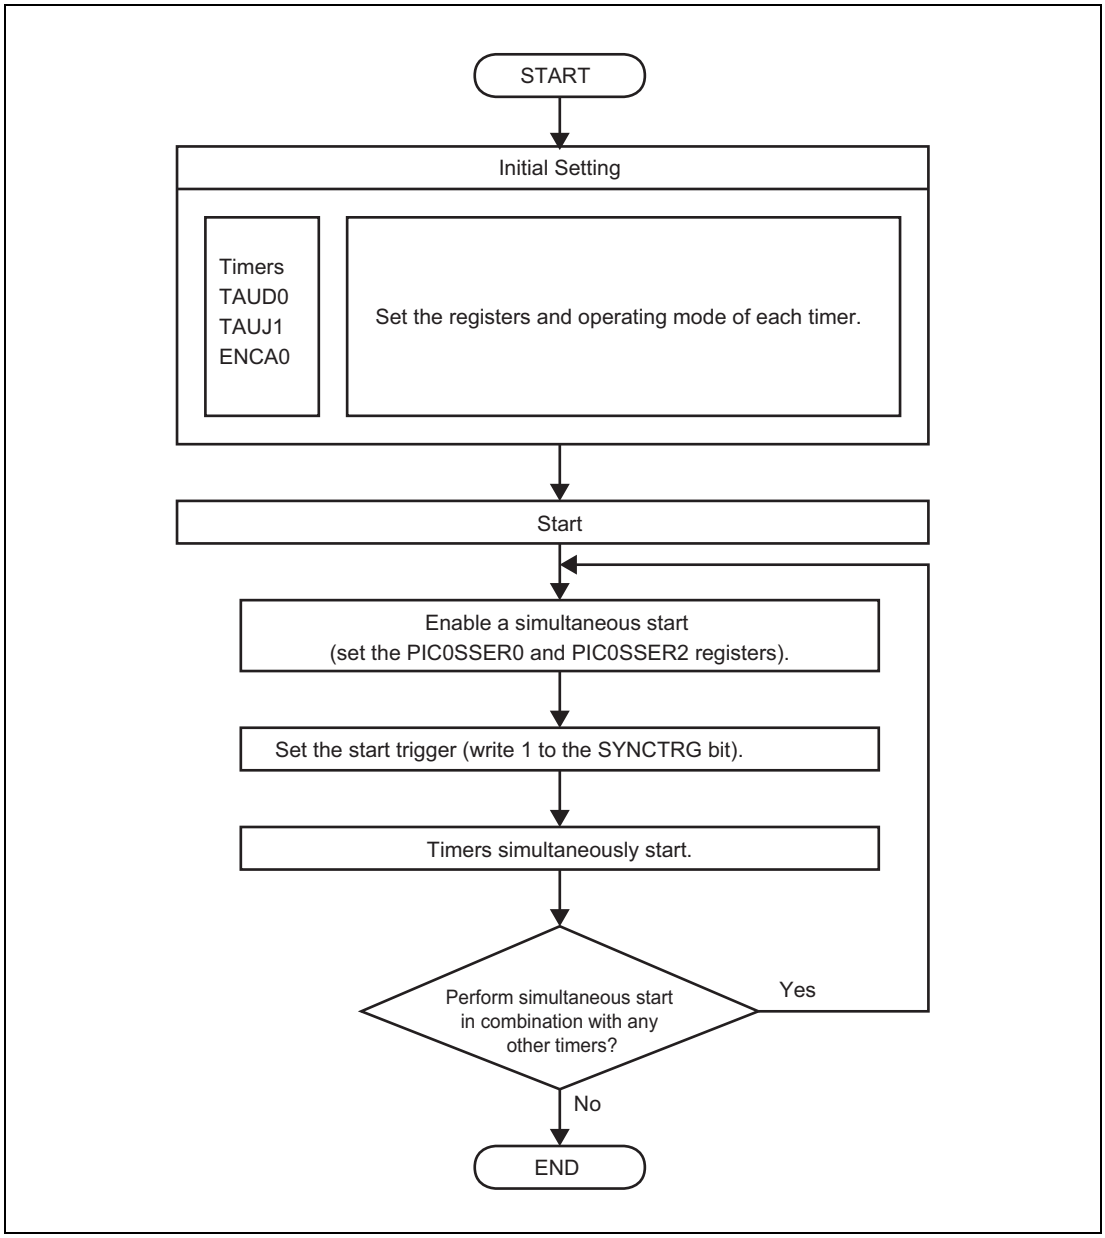

**Figure 29.15 Setup Flow**

# 29.9 Trigger & Pulse Width Measuring Function

## 29.9.1 Functional Overview

This function allows measurement of trigger periods by inputting the trigger signal output from ENCA0 to TAUJ1 and TAUD0.

## 29.9.2 Configuration

### (1) Configuration

**Table 29.30 Configuration of Trigger & Pulse Width Measuring Function**

| Configuration/Timer Function | Timer |
|---|---|
| Configuration of Timer | ENCA0, TAUD0, TAUJ1 |

**Table 29.31 Setting Functions of TAUJ1/TAUD0 Channels**

| TAU | Channels | Functions Name | M/S[*1] | Target Trigger of Pulse Width Measurement |
|---|---|---|---|---|
| TAUJ1 | 00 | TINm input pulse interval measurement function | S | ENCAT0IEC[*2] |
| | 01 | TINm input pulse interval measurement function | S | ENCAT0IEC[*2] |
| TAUD0 | 00 | TINm input pulse interval measurement function | S | ENCAT0EQ0, ENCAT0EQ1 |
| | 01 | TINm input pulse interval measurement function | S | ENCAT0EQ1 |
| | 02 | TINm input pulse interval measurement function | S | ENCAT0EQ0 |

Note 1. M: Master channel, S: Slave channel

Note 2. Read ENCAT0IEC as ENCATIEC (encoder clear interrupt) in **Table 28.5, Interrupt Requests**.

| 5 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Table 29.32 PIC0REG31 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 1 | PIC0REG3101 | Selects a TIN input signal to CH1 of TAUJ1.<br>0: CH1 of TAUJ1 is not used for trigger width measurement.<br>1: DT output signal of ENCAT0IEC |
| 0 | PIC0REG3100 | Selects a TIN input signal to CH0 of TAUJ1.<br>0: CH0 of TAUJ1 is not used for trigger width measurement.<br>1: DT output signal of ENCAT0IEC |

### 29.9.4 Example of Operation

The trigger and pulse width measurement function is achieved by combining the ENCA0 trigger signals (ENCAT0IEC, ENCAT0EQ0, ENCAT0EQ1) and the following functions of TAUD0 and TAUJ1.

- TAUDTTINm input pulse interval measurement function (TAUD0)
- TAUJTTINm input pulse interval measurement function (TAUJ1)

Also, the following function of PIC is used to convert the trigger signal input to TINm into a level-sensitive toggle signal.

- DT circuit

The trigger and pulse width measurement function implements measurement of the ENCA0 output trigger signal interval using the TAUDTTINm input pulse interval measurement function of TAUD0 and the TAUJTTINm input pulse interval measurement function of TAUJ1.

#### (1) TAUDTTINm input pulse interval measurement function, TAUJTTINm input pulse interval measurement function

When the valid TINm edge of TAUD0 or TAUJ1 is detected, the CNTm value is captured into CDRm and CNTm is cleared.

**CAUTION**

**Set both edges (rising and falling edges) of TINm to be detected as valid (TAUD0CMURm.TAUD0TIS[1:0] = $10_B$, TAUJ1CMURm.TAUJ1TIS[1:0] = $10_B$) for this function.**

For details of the TAUD and TAUJ functions, see the corresponding sections.

#### (2) DT circuit

The DT circuit is used to convert the trigger signal output from ENCA0 into a level-sensitive toggle signal.

As shown in **Figure 29.17, Operation of DT Circuit**, the output signal is toggled upon each input trigger signal generation.

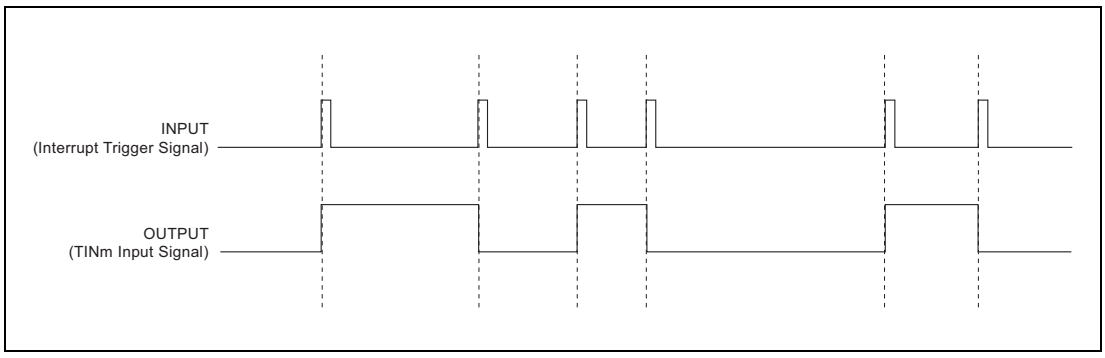

**Figure 29.17 Operation of DT Circuit**

PIC provides input signal conversion and signal connection to TAUD0 and TAUJ1 to measure the generation interval of trigger signals from ENCA0.

The timing chart of the trigger and pulse width measurement function is shown below.

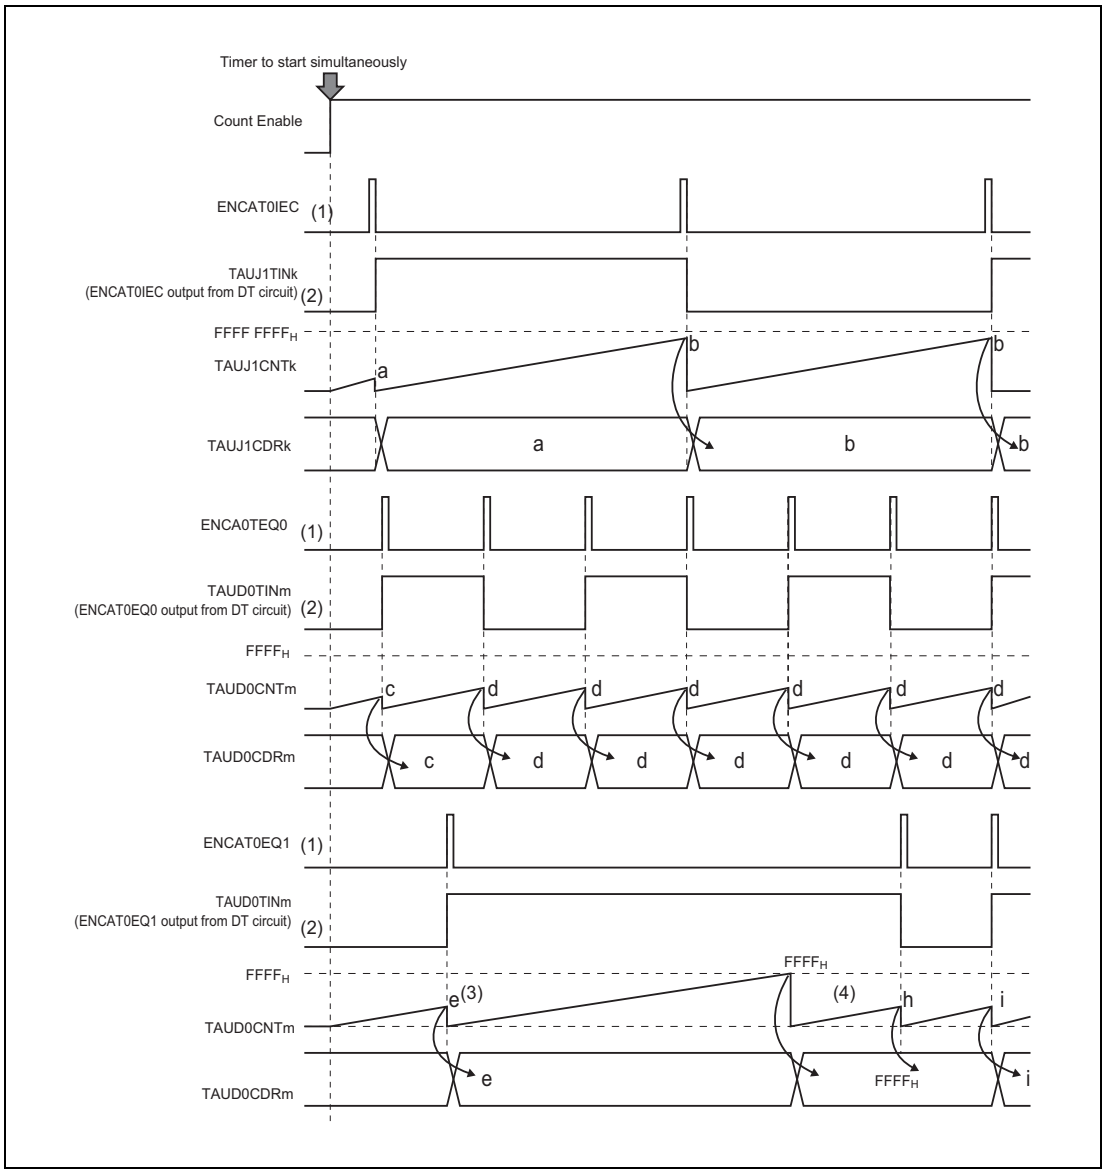

**Figure 29.18 Operation Example of the Function of Trigger and Pulse Width Measurement (m = 0 to 2, k = 0, 1)**

(1) The following signals are output from ENCA0 as triggers:

- ENCAT0IEC (interrupt trigger signal output when timer counter value is cleared by ENCA0EC input)
- ENCAT0EQ0 (trigger signal output according to timing of a match of timer counter value and value of compare register 0)
- ENCAT0EQ1 (trigger signal output according to timing of a match of timer counter value and value of compare register 1)

(2) The trigger signal output from ENCA0 is converted to a level-sensitive toggle signal by the DT circuit and is output to TINm of TAUD0 and TAUJ1.

(3) By setting both TINm edges (rising and falling edges) of TAUD0 and TAUJ1 as valid, the CNTm value is captured into CDRm at the TINm toggle timing and cleared to $0000_H$. This operation is repeated.

The first captured value (shown as “a” in the figure) from the start of operation indicates the interval from the start of TAUJ operation until trigger input.

(4) When an overflow occurs, the count value $FFFF_H$ (FFFF $FFFF_H$ for TAUJ) is captured but the count value is not captured at the first trigger after the overflow.

With the above operation, the trigger generation interval can be measured.

The following table shows the combinations of the trigger signals and measurement timers, and the bit settings of the pertinent PIC registers for setting the signal paths and the I/O selection registers. Appropriately set these bits according to the trigger signal to be measured and the measurement timer to be used.

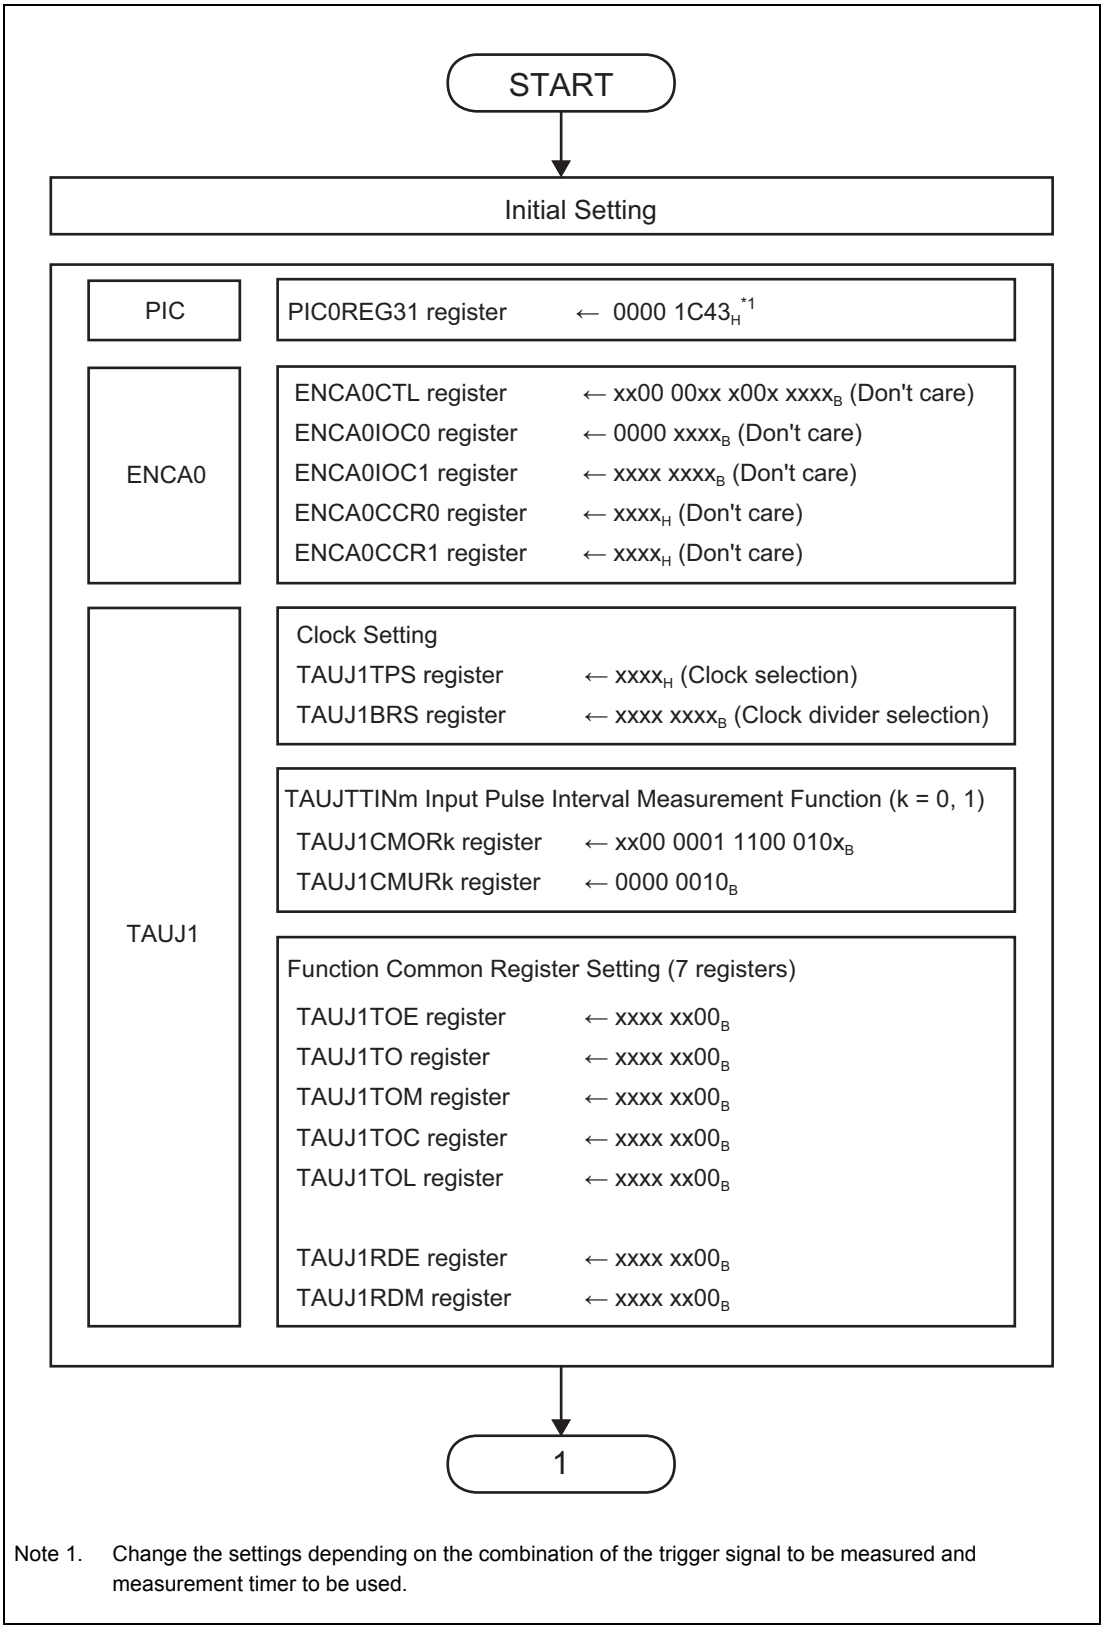
**Table 29.33 Combinations of Trigger Signals and Measurement Timers**

| Interrupt Trigger Signal | Measurement Timer | PIC Register Bit Setting | |
|---|---|---|---|
| ENCAT0IEC | TAUJ1 CH0 | PIC0REG3100 = 1 | |
| | TAUJ1 CH1 | PIC0REG3101 = 1 | |
| ENCAT0EQ0 | TAUD0 CH0 | PIC0REG3109 = 0<br>PIC0REG3110 = 1 | |
| | TAUD0 CH2 | PIC0REG3112 = 1<br>PIC0REG3113 = 0 | |
| ENCAT0EQ1 | TAUD0 CH0 | PIC0REG3106 = 1<br>PIC0REG3107 = 0<br>PIC0REG3108 = 0 | PIC0REG3109 = 0<br>PIC0REG3110 = 0 |
| | TAUD0 CH1 | | PIC0REG3111 = 1 |

## 29.9.5 Setup Flow

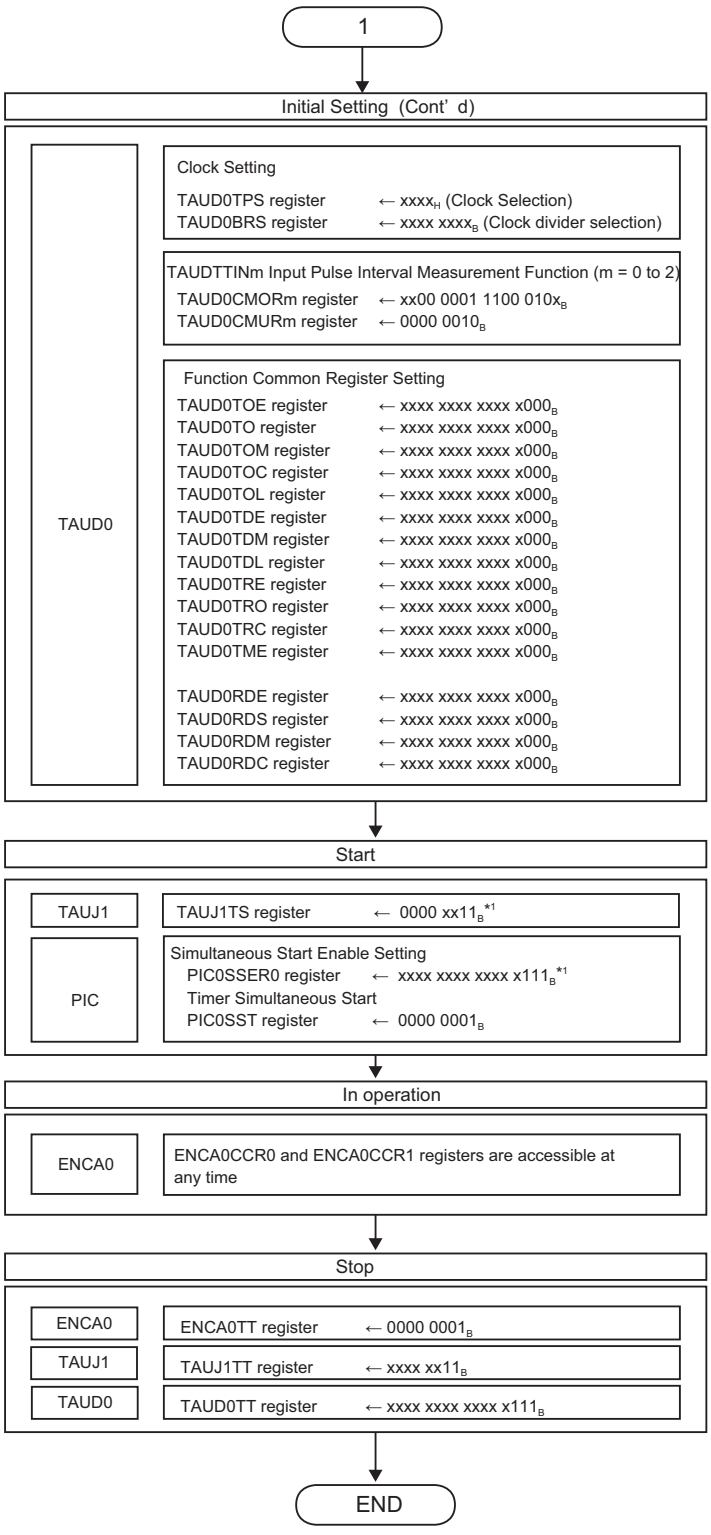
The setup flow in this section shows the general setup flow to measure the pulse interval, which applies to all the following combinations. For the combinations of the trigger signals and measurement timers, see **Table 29.33, Combinations of Trigger Signals and Measurement Timers**.

| Encoder Timer | Trigger Signal | Measurement Timer |
|---|---|---|
| ENCA0 | ENCAT0IEC | TAUJ1 CH0, TAUJ1 CH1 |
| | ENCAT0EQ0 | TAUD0 CH0, TAUD0 CH2 |
| | ENCAT0EQ1 | TAUD0 CH0, TAUD0 CH1 |



Note 1. Change the settings depending on the combination of the trigger signal to be measured and measurement timer to be used.

**Figure 29.19 Setup Flow**



Note 1. Change the settings depending on the combination of the trigger signal to be measured and measurement timer to be used.

**Figure 29.20 Setup Flow (Cont'd)**

### 29.9.6 Setting Examples for Operation Functions

This section provides example settings for each register.

The setup example shown in this section describes how to set up measurement of the pulse interval for all the combinations below. For the combinations of the trigger signals and measurement timers, see **Table 29.33, Combinations of Trigger Signals and Measurement Timers**.

| Encoder Timer | Trigger Signal | Measurement Timer |
|---|---|---|
| ENCA0 | ENCAT0IEC | TAUJ1 CH0, TAUJ1 CH1 |
| | ENCAT0EQ0 | TAUD0 CH0, TAUD0 CH2 |
| | ENCAT0EQ1 | TAUD0 CH0, TAUD0 CH1 |

**Table 29.34 ENCA0 Setting**

| Register | Bit Position | Bit Name | Setting Value | Note |
|---|---|---|---|---|
| ENCA0CTL | 15 | ENCA0CME | Don't care | Enables or disables compare match interrupt detection mask |
| | 14 | ENCA0MCS | Don't care | Selects a cancelation trigger for compare match interrupt detection mask |
| | 13 to 10 | | 0 | Fixed to 0 |
| | 9 | ENCA0CRM1 | Don't care | Selects the ENCA0CCR1 register function |
| | 8 | ENCA0CRM0 | Don't care | Selects the ENCA0CCR0 register function |
| | 7 | ENCA0CTS | Don't care | Selects trigger for capture operation of ENCA0CCR1. |
| | 6, 5 | | 0 | Fixed to 0 |
| | 4 | ENCA0LDE | Don't care | Enables or disables reload operation when underflow is generated |
| | 3 | ENCA0ECM1 | Don't care | Enables or disables clearing of the counter on compare match of ENCA0CCR1 |
| | 2 | ENCA0ECM0 | Don't care | Enables or disables clearing of the counter on compare match of ENCA0CCR0 |
| | 1, 0 | ENCA0UDS[1:0] | Don't care | Selects the counter up/down control by ENCA0E0 and ENCA0E1 |
| ENCA0IOC0 | 7 to 4 | | 0 | Fixed to 0 |
| | 3, 2 | ENCA0TIS[3:2] | Don't care | Selects the valid edge for capture trigger 1 (ENCA0I1) |
| | 1, 0 | ENCA0TIS[1:0] | Don't care | Selects the valid edge for capture trigger 0 (ENCA0I0) |
| ENCA0IOC1 | 7 | ENCA0SCE | Don't care | Enables encoder special-clear |
| | 6 | ENCA0ZCL | Don't care | Selects the clear level of Z phase for a encoder special-clear |
| | 5 | ENCA0BCL | Don't care | Selects the clear level of B phase for a encoder special-clear |
| | 4 | ENCA0ACL | Don't care | Selects the clear level of A phase for a encoder special-clear |
| | 3, 2 | ENCA0ECS[1:0] | Don't care | Selects encoder clear input (Z phase) edge |
| | 1, 0 | ENCA0EIS[1:0] | Don't care | Selects encoder input (A or B phase) edge |

**Table 29.35 TAUJ1 Setting (k = 0, 1)**
**TAUJ1 (TAUJTTINm Input Pulse Interval Measurement Function)**

| Register | Bit Position | Bit Name | Setting Value | Note |
|---|---|---|---|---|
| TAUJ1CMORk | 15,14 | TAUJ1CKS[1:0] | Don't care | Operation Clock Setting |
| | 13,12 | TAUJ1CCS[1:0] | 00 | |
| | 11 | TAUJ1MAS | 0 | |
| | 10, 9, 8 | TAUJ1STS[2:0] | 001 | |
| | 7, 6 | TAUJ1COS[1:0] | 11 | |
| | 5 | | 0 | Fixed to 0 |
| | 4, 3, 2, 1 | TAUJ1MD[4:1] | 0010 | |
| | 0 | TAUJ1MD0 | Don't care | |
| TAUJ1CMURk | 1, 0 | TAUJ1TIS[1:0] | 10 | |

**NOTE**

When TAUJ1CMORk is used for the TAUDTTINm input pulse interval measurement function, the TAUJ1CKS[1:0] (operating clock selection) and TAUJ1MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUJ1COS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 26, Timer Array Unit J (TAUJ)**.

For TAUJ common registers (TAUJ1TOE, TAUJ1TO, TAUJ1TOM, TAUJ1TOC, TAUJ1TOL,TAUJ1RDE, and TAUJ1RDM), only set the bits corresponding to the used channels to 0.

**Table 29.36 TAUD0 Setting (m = 0 to 2)**
**TAUD0 (TAUDTTINm Input Pulse Interval Measurement Function)**

| Register | Bit Position | Bit Name | Setting Value | Note |
|---|---|---|---|---|
| TAUD0CMORm | 15, 14 | TAUD0CKS[1:0] | Don't care | Operation Clock Setting |
| | 13, 12 | TAUD0CCS[1:0] | 00 | |
| | 11 | TAUD0MAS | 0 | |
| | 10 to 8 | TAUD0STS[2:0] | 001 | |
| | 7, 6 | TAUD0COS[1:0] | 11 | |
| | 5 | | 0 | Fixed to 0 |
| | 4 to 1 | TAUD0MD[4:1] | 0010 | |
| | 0 | TAUD0MD0 | Don't care | |
| TAUD0CMURm | 1, 0 | TAUD0TIS[1:0] | 10 | |

**NOTE**

When TAUD0CMORm is used for the TAUDTTINm input pulse interval measurement function, the TAUD0CKS[1:0] (operating clock selection) and TAUD0MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUD0COS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 25, Timer Array Unit D (TAUD)**

For TAUD common registers (TAUD0TOE, TAUD0TO, TAUD0TOM, TAUD0TOC,TAUD0TOL, TAUD0TDE, TAUD0TDM, TAUD0TDL, TAUD0TRE, TAUD0TRO,TAUD0TRC, TAUD0TME, TAUD0RDE, TAUD0RDS, TAUD0RDM, and TAUD0RDC), only set the bits corresponding to the used channels to 0.

**Table 29.37 PIC Setting**

| Register | Bit Position | Bit Name | Setting Value | Note |
|---|---|---|---|---|
| PIC0REG31 | 13, 12 | PIC0REG3113<br>PIC0REG3112 | 0<br>1 | Selects the DT output signal from ENCAT0EQ0 as TAUD0TTIN2 input signal |

# 29.10 A/D Trigger Encoder Capture Function

## 29.10.1 Functional Overview

The value of the encoder counter synchronized with A/D conversion can be obtained by using an A/D conversion trigger signal as a capture signal of ENCA0.

## 29.10.2 Configuration

### (1) Configuration

Table 29.38 Configuration of A/D Trigger Encoder Capture Function

| A/D Converter | Encoder Timer |
|---|---|
| ADCA0 | ENCA0 |

### (2) Block Diagram

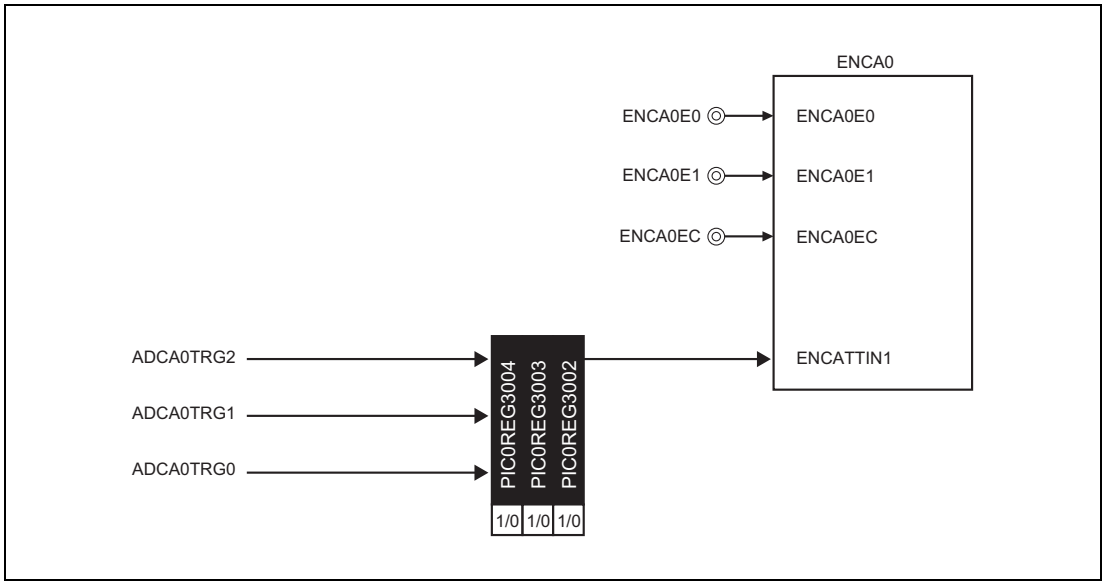

Figure 29.21 Block Diagram of A/D Trigger Encoder Capture Function

**CAUTIONS**

1. **It takes ENCA0 one additional clock cycle to capture the input signal of the ADCA0TRG0, ADCA0TRG1, and ADCA0TRG2 pins compared with the number of clock cycles it takes to capture the input signal of the ENCA0TIN1 pin when using CKSCLK_IPERI1, and three additional clock cycles when using CKSCLK_AADCA. Be sure to take this into account when configuring your system.**
2. **Configure the edge detection function by using the edge detection function registers of the digital noise filter, which are FCLA0CTL0_ADC0, FCLA0CTL1_ADC0, and FCLA0CTL2_ADC0 (see Section 2.12.1.4, Input Pins that Incorporate Digital Filter Type D, for details), and specify "rising edge" for edge detection of the ENCA0TIN1 capture trigger input of ENCA0 (ENCA0IOC0.ENCA0TIS [3:2] = $01_B$). Do not set ENCA0IOC0.ENCA0TIS [3:2] to $10_B$ (falling edge) or $11_B$ (both edges).**

## 29.10.3 Registers

### 29.10.3.1 PIC0REG30 — Timer I/O Control Register 30

**Access:** This register can be read or written in 32-bit units.

**Address:** <PIC0_base> + $E8_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 0 | 0 | 0 | Capture is not performed by an A/D trigger signal in ENCA0. |
| 0 | 1 | 0 | ADCA0TRG2 |
| 0 | 1 | 1 | ADCA0TRG1 |
| 1 | 0 | 0 | ADCA0TRG0 |
| Other than above | | | Setting prohibited |

### 29.10.4 Example of Operation

The A/D trigger encoder capture function is implemented by connecting A/D conversion trigger signal ADCAnTRGi (n = 0, i = 0 to 2) to ENCA0.

**CAUTION**

**When using this function, the ENCA0 interrupt signal ENCATINT1 should not be selected as the A/D converter trigger. If selected, the correct operation cannot be performed because the following loop occurs: ADCAnTRG1 generation → ENCA0 capture operation → ENCATINT1 generation by capture operation → ADCAnTRG1 generation.**

The following shows a timing chart of the A/D trigger encoder capture function using the ADCA0TRG1 as a trigger.

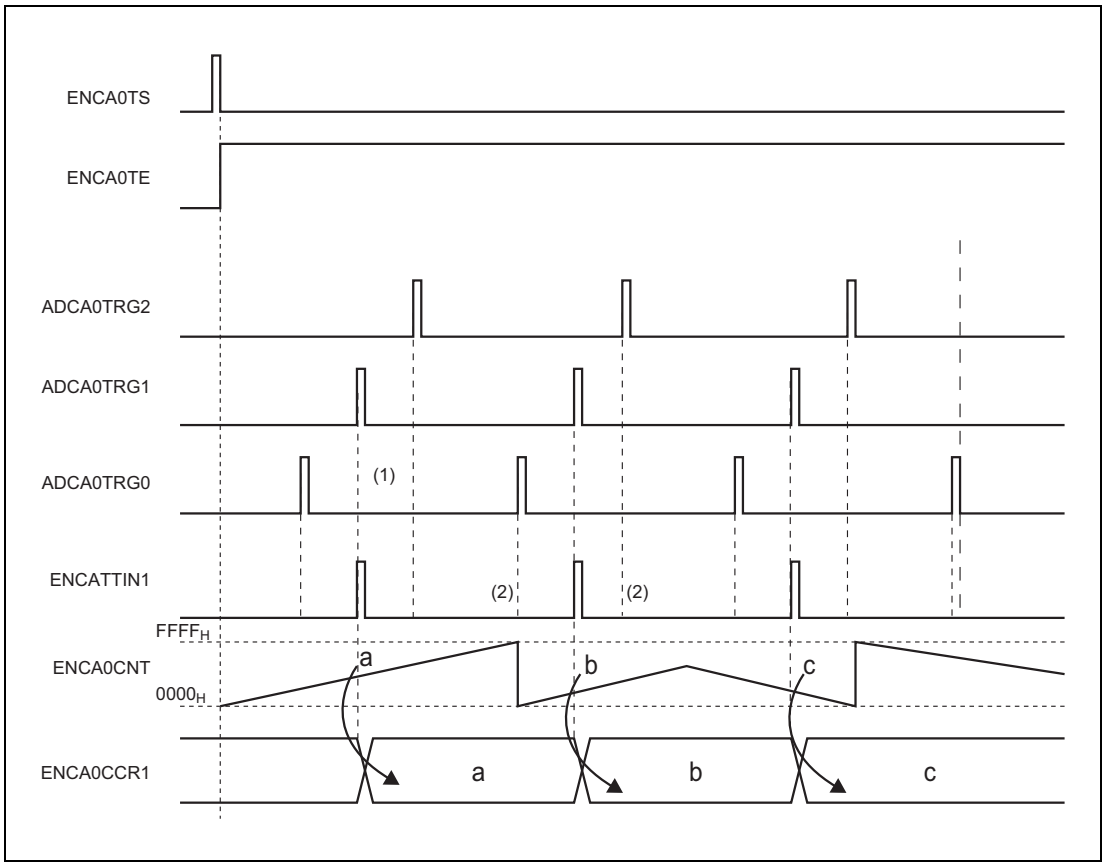

**Figure 29.22 Operation Example of Trigger Encoder Capture function**

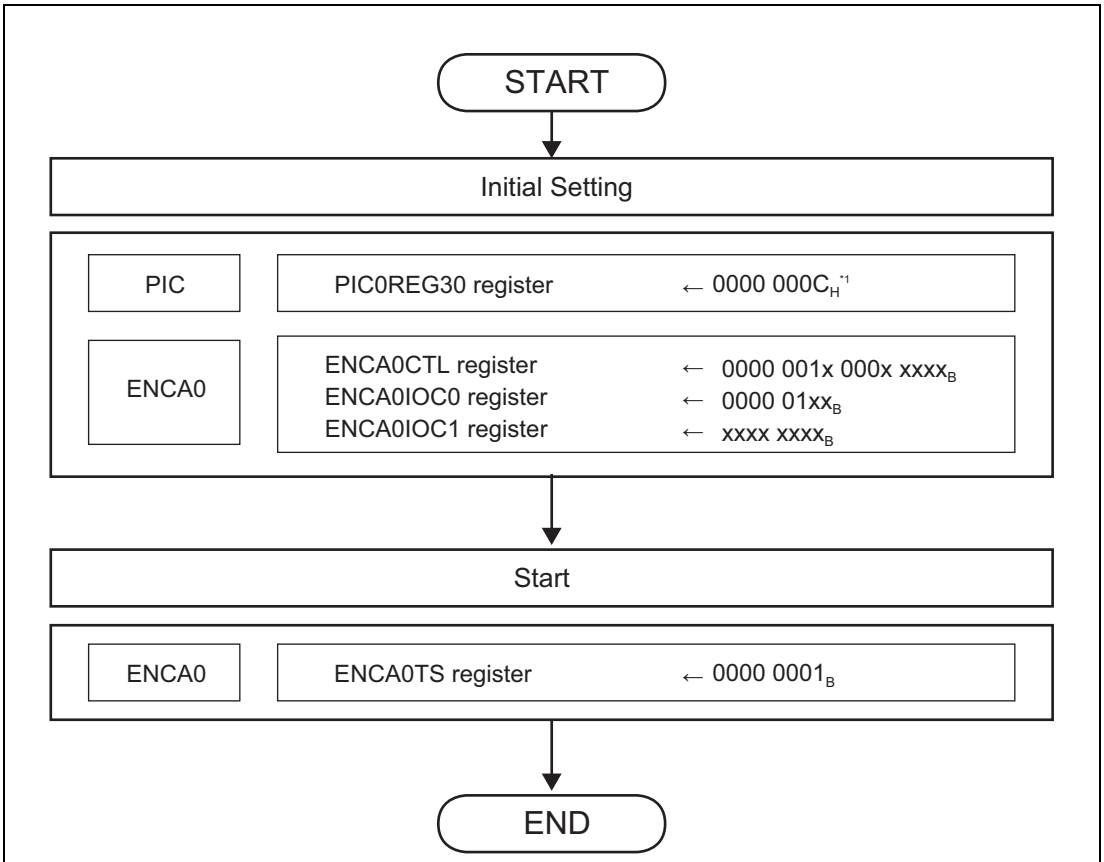
(1) When ADCA0TRG1 is selected as ENCA0 capture trigger 1 signal ENCATTIN1, the valid ADCA0TRG1 is input to ENCA0 as the ENCATTIN1 signal and ENCA0 is captured.

(2) When a hardware trigger signal (ADCA0TRG0, ADCA0TRG2) other than ADCA0TRG1 is generated, the ENCATTIN1 signal is not generated and ENCA0 is not captured.

### 29.10.5 Setup Flow

The setup flow in this section shows the general setup flow to perform the capture operation of encoder timer ENCA0 based on the ADCA0TRG1 signal.



Note 1. Change the settings depending on the hardware trigger to perform the capture operation.

**Figure 29.23 Setup Flow**

### 29.10.6 Setting Examples for Operation Functions

This section provides example settings for each register.

The setup example shown in this section describes how to set up capture operation of encoder timer ENCA0 based on the ADCA0TRG1 signal. Change the settings depending on the hardware trigger to perform the capture operation.

**Table 29.40 ENCAn Setting**

| Register | Bit Position | Bit Name | Setting Value | Remark |
|---|---|---|---|---|
| ENCAnCTL | 15 | ENCAnCME | 0 | Disables compare match interrupt detection masking |
| | 14 | ENCAnMCS | 0 | Selects release trigger for compare match interrupt detection masking |
| | 13 to 10 | | 0 | Fixed to 0 |
| | 9 | ENCAnCRM1 | 1 | Sets the ENCAnCCR1 register for capture operation |
| | 8 | ENCAnCRM0 | Don't care | Selects the function of ENCAnCCR0 register |
| | 7 | ENCAnCTS | 0 | Selects ENCATTIN1 as trigger for capture operation |
| | 6, 5 | | 0 | Fixed to 0 |
| | 4 | ENCAnLDE | Don't care | Enables or disables reload operation when ENCAnCCR0 register underflow occurs |
| | 3 | ENCAnECM1 | Don't care | Enables or disables clearing of the counter on compare match of ENCAnCCR1 register |
| | 2 | ENCAnECM0 | Don't care | Enables or disables clearing of the counter on compare match of ENCAnCCR0 register |
| | 1,0 | ENCAnUDS[1:0] | Don't care | Select the counter up/down control by ENCAnE0 and ENCAnE1 |
| ENCAnIOC0 | 7 to 4 | | 0 | Fixed to 0 |
| | 3, 2 | ENCAnTIS[3:2] | 0[*1]<br>1[*1] | Select the valid edge of capture trigger 1 (ENCATTIN1) for the rising edge detection |
| | 1, 0 | ENCAnTIS[1:0] | Don't care | Select the valid edge of capture trigger 0 (ENCATTIN0) |
| ENCAnIOC1 | 7 | ENCAnSCE | Don't care | Enables encoder special-clear |
| | 6 | ENCAnZCL | Don't care | Selects the clear level (input level) of Z phase for encoder special-clear |
| | 5 | ENCAnBCL | Don't care | Selects the clear level (input level) of B phase for encoder special-clear |
| | 4 | ENCAnACL | Don't care | Selects the clear level (input level) of A phase for encoder special-clear |
| | 3, 2 | ENCAnECS[1:0] | Don't care | Select encoder clear input (Z phase) edge |
| | 1, 0 | ENCAnEIS[1:0] | Don't care | Select encoder input (A or B phase) edge |
| PIC0REG30 | 4 | PIC0REG3004 | Don't care | Selects ADCA0 trigger signal of ENCATTIN1 |
| | 3 | PIC0REG3003 | Don't care | |
| | 2 | PIC0REG3002 | Don't care | |

Note 1. Change the setting depending on the hardware trigger to perform the capture operation.

**NOTE**

Bits ENCA0CRM1 and ENCA0CTS in ENCA0CTL are fixed: ENCA0CRM1 = 1 (ENCA0CCR1 register function) and ENCA0CTS = 0 (trigger source of capture to the ENCA0CCR1 register). All the other bits can be set arbitrarily.

# 29.11 Three-Phase PWM Output with Dead Time

## 29.11.1 Functional Overview

This feature generates each of the set signals (active level timing signals) and clear signals (inactive level timing signals) once or less per cycle and then uses the results to output a three-phase PWM waveform with dead time.

For the PWM output feature of TAUD, only the clear timing used during each cycle is specified by specifying the duty value, but for the feature described here, the set timing can also be specified, which makes more flexible PWM output with dead time possible.

## 29.11.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0)

**Table 29.41 Configuration of Three-Phase PWM Output with Dead Time**

| Timer | Timer Motor Control Function |
|---|---|
| TAUD0 CH2, CH4 to CH15 (used channels fixed) | TAPA0 |

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)

### (1) TAUDn configuration

Because CH10, CH12, and CH14 are only used for TOUTm, these channels can be used for features that do not use TOUTm (m = 10, 12, 14).

**Table 29.42 TAUDn Configuration (1/2)**

| CH | Function Name | M/S | CDR Setting | Description |
|---|---|---|---|---|
| 2 | PWM output (CH2 is the master channel for CH4 to CH9.) | M | Cycle | |
| 4 | | S | Duty (U phase signal setting) | |
| 5 | | S | Duty (U phase signal clearing) | |
| 6 | | S | Duty (V phase signal setting) | |
| 7 | | S | Duty (V phase signal clearing) | |
| 8 | | S | Duty (W phase signal setting) | |
| 9 | | S | Duty (W phase signal clearing) | |
| 10 | Any feature that does not use TOUT10 | S | | TOUT10: U phase output |
| 11 | One-phase PWM output | S | Dead time (U phase) | TOUT11: UB phase output |
| 12 | Any feature that does not use TOUT12 | S | | TOUT12: V phase output |

Table 29.42 TAUDn Configuration (2/2)

| CH | Function Name | M/S | CDR Setting | Description |
|---|---|---|---|---|
| 13 | One-phase PWM output | S | Dead time (V phase) | TOUT13: VB phase output |
| 14 | Any feature that does not use TOUT14 | S | | TOUT14: W phase output |
| 15 | One-phase PWM output | S | Dead time (W phase) | TOUT15: WB phase output |

**Note:** M: Master channel, S: Slave channel

## 29.11.4 Operation Example

This example shows how to generate each of the set signals and clear signals once or less per cycle and then use the results to output a three-phase PWM waveform with dead time.

This is achieved by combining the following TAUD features:

- PWM output
- One-phase PWM output

In addition, the following peripheral interconnections are used to create the PWM waveform supplied from the set and clear signals generated during PWM output to the input TINm signal (m = 11, 13, or 15) of one-phase PWM output:

- SR flip-flop circuit

Three-phase PWM output is achieved by assigning the one-phase PWM output with dead time achieved using the above features to the U, V, and W phases. Therefore, the set and clear signals of PWM output can be freely specified for each PWM phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

### 29.11.4.1 Pwm Output

PWM output uses a combination of CH2, CH4, and CH5.

By specifying the cycle for CDR02, the U phase set value for CDR04, and the U phase clear value for CDR05, a set/clear signal is generated for the SR flip-flop circuit that generates the input TIN11 signal of one-phase PWM output from INT04 and INT05.

Instead of CH4 and CH5, which are used for the above described U phase set/clear signal generation, the V phase uses CH6 and CH7, and the W phase uses CH8 and CH9.

### 29.11.4.2 One-Phase PWM Output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.

By specifying the dead time value for CDR11, a one-phase PWM signal with dead time is output for the TIN11 input.

Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM signal with dead time, while the W phase uses CH14 and CH15.

**CAUTION**

**Specify the same clock for each TAUDn channel that uses the PWM output and one-phase PWM output features.**

For details about the TAUD functions, see **Section 25, Timer Array Unit D (TAUD)**.

### 29.11.4.3 SR Flip-Flop Circuit

The PWM waveform supplied to input TIN11 of one-phase PWM output is generated by using the U phase set signal generated by CH4 of TAUD and the U phase clear signal generated by CH5.

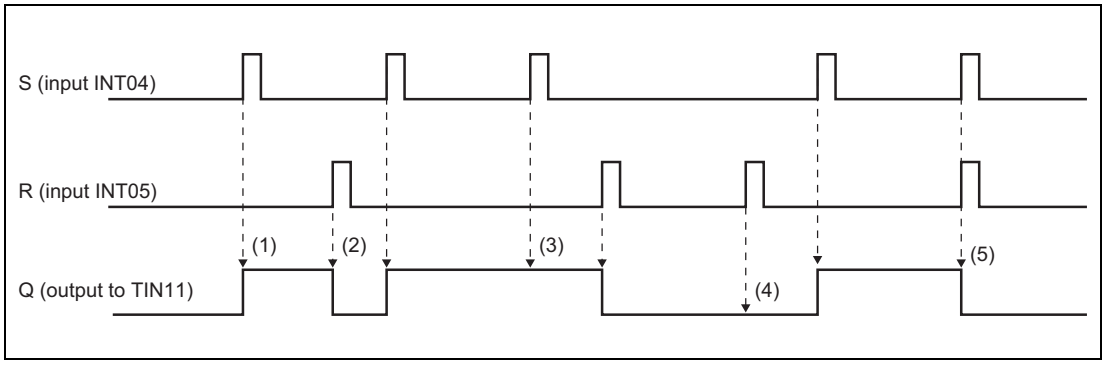

**Figure 29.26 SR Flip-Flop Circuit Operation Timing Chart (U phase example)**

(1) When a signal is input to input S, output Q goes to the high level at the rising edge of S.

(2) When a signal is input to input R, output Q goes to the low level at the rising edge of R.

(3) If a signal is input to input S while output Q is at the high level, output Q is not affected.

(4) If a signal is input to input R while output Q is at the low level, output Q is not affected.

(5) If a signal is input to input S and input R at the same time, input R is prioritized and output Q goes to the low level at the rising edge of R.

The V phase uses INT06 and INT07 as input to supply a PWM waveform to TIN13, and the W phase uses INT08 and INT09 as input to supply a PWM waveform to TIN15.

The output change timing of the PWM waveform generated during one-phase PWM output is based on PWM output.

The active level output timing set signal and inactive level output timing clear signal of PWM are generated during PWM output. By inputting these signals to the SR flip-flop circuit, a PWM signal that can be changed at any time is generated.

A one-phase PWM signal is output by generating a positive or negative PWM waveform and then adding dead time to it according to changes in the generated PWM signal.

PIC is used to set/clear signal generated during PWM output as the TIN input for one-phase PWM output through the SR flip-flop circuit.

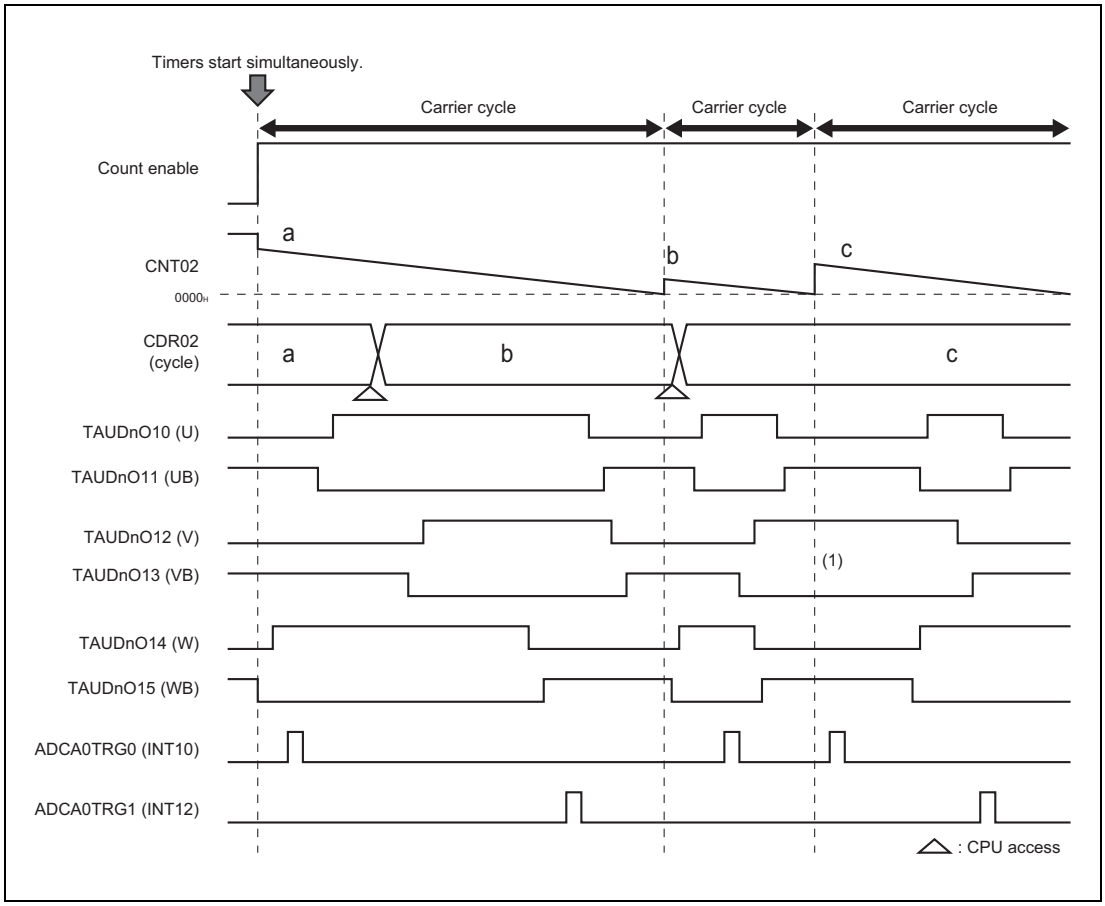

**Figure 29.27 Example of Three-Phase PWM (U/UB, V/VB, W/WB) Output with Dead Time**

**Figure 29.27** shows a typical example of three-phase PWM output with dead time.

By appropriately setting up the set/clear signal output timing, PWM output that extends across carrier cycles (point (1)) and other types of output are also possible.

In this example, ADCA0TRG0 and ADCA0TRG1 (which are at the bottom) use the CNT and INT signals of CH10 and CH12, which are not used for one-phase PWM output, and the A/D trigger signal is output by performing type-1 A/D trigger output.

In this way, because only the TOUTm signal that performs signal output for the channel performing positive phase output is used during one-phase PWM output, any feature that uses CNTm, CDRm, or INTm can be specified. For details, see **Section 25, Timer Array Unit D (TAUD)** (m = 10, 12, or 14).

The following figures show timing charts for outputting a three-phase PWM signal with dead time.

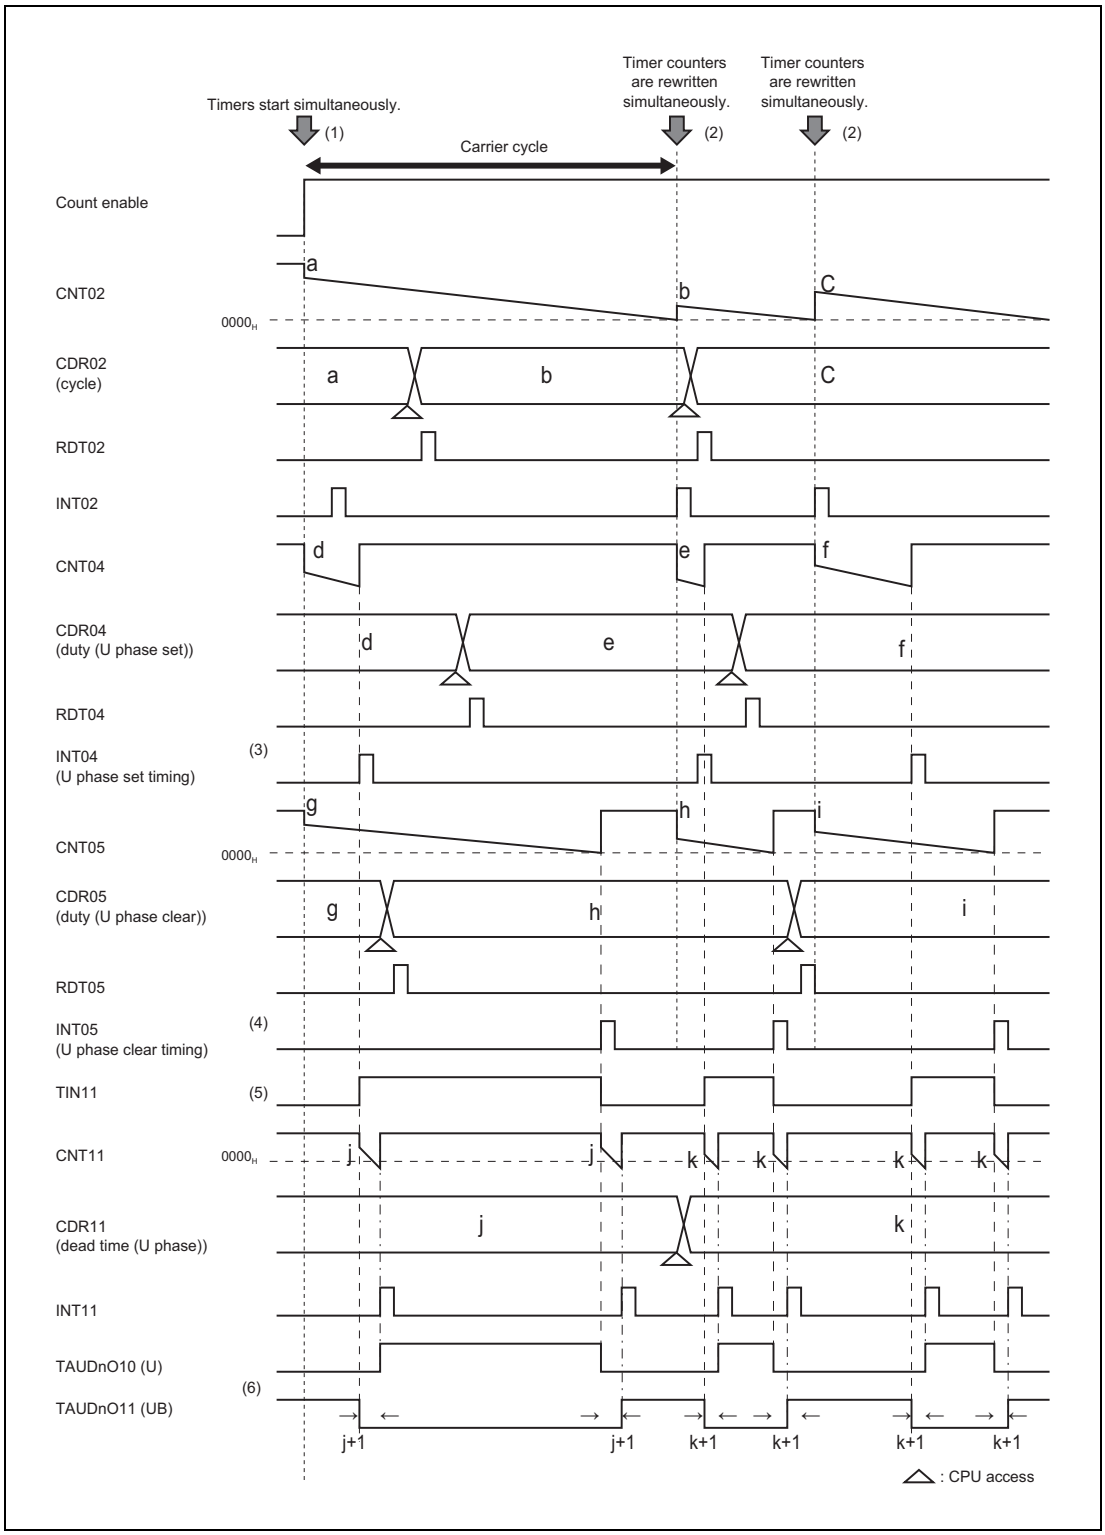

**Figure 29.28 Example of One-Phase PWM (U phase, UB phase) Output with Dead Time**

An operation example of the timer configuration for performing the U phase PWM output in **Figure 29.28** is provided below.

(1) By simultaneously starting timers, CH2 (the carrier cycle timer), CH4 (the U phase set signal output timing timer), and CH5 (the U phase clear signal output timing timer) are started simultaneously.
The CH11 timer is also enabled, but until a TIN11 edge is detected, which is the count start timing, counting is not performed.

(2) For CH4 and CH5, when there is a CH2 underflow, the settings from CDR04 and CDR05 are reloaded to CNT04 and CNT05.

(3) When there is a CH4 underflow, the U phase set timing signal (INT04) is generated.

(4) When there is a CH5 underflow, the U phase clear timing signal (INT05) is generated.

(5) The peripheral interconnections supply the output of the SR flip-flop circuit that uses INT04 (the set timing signal) and INT05 (the clear timing signal) as input to the input TIN11 signal of one-phase PWM output.

(6) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.

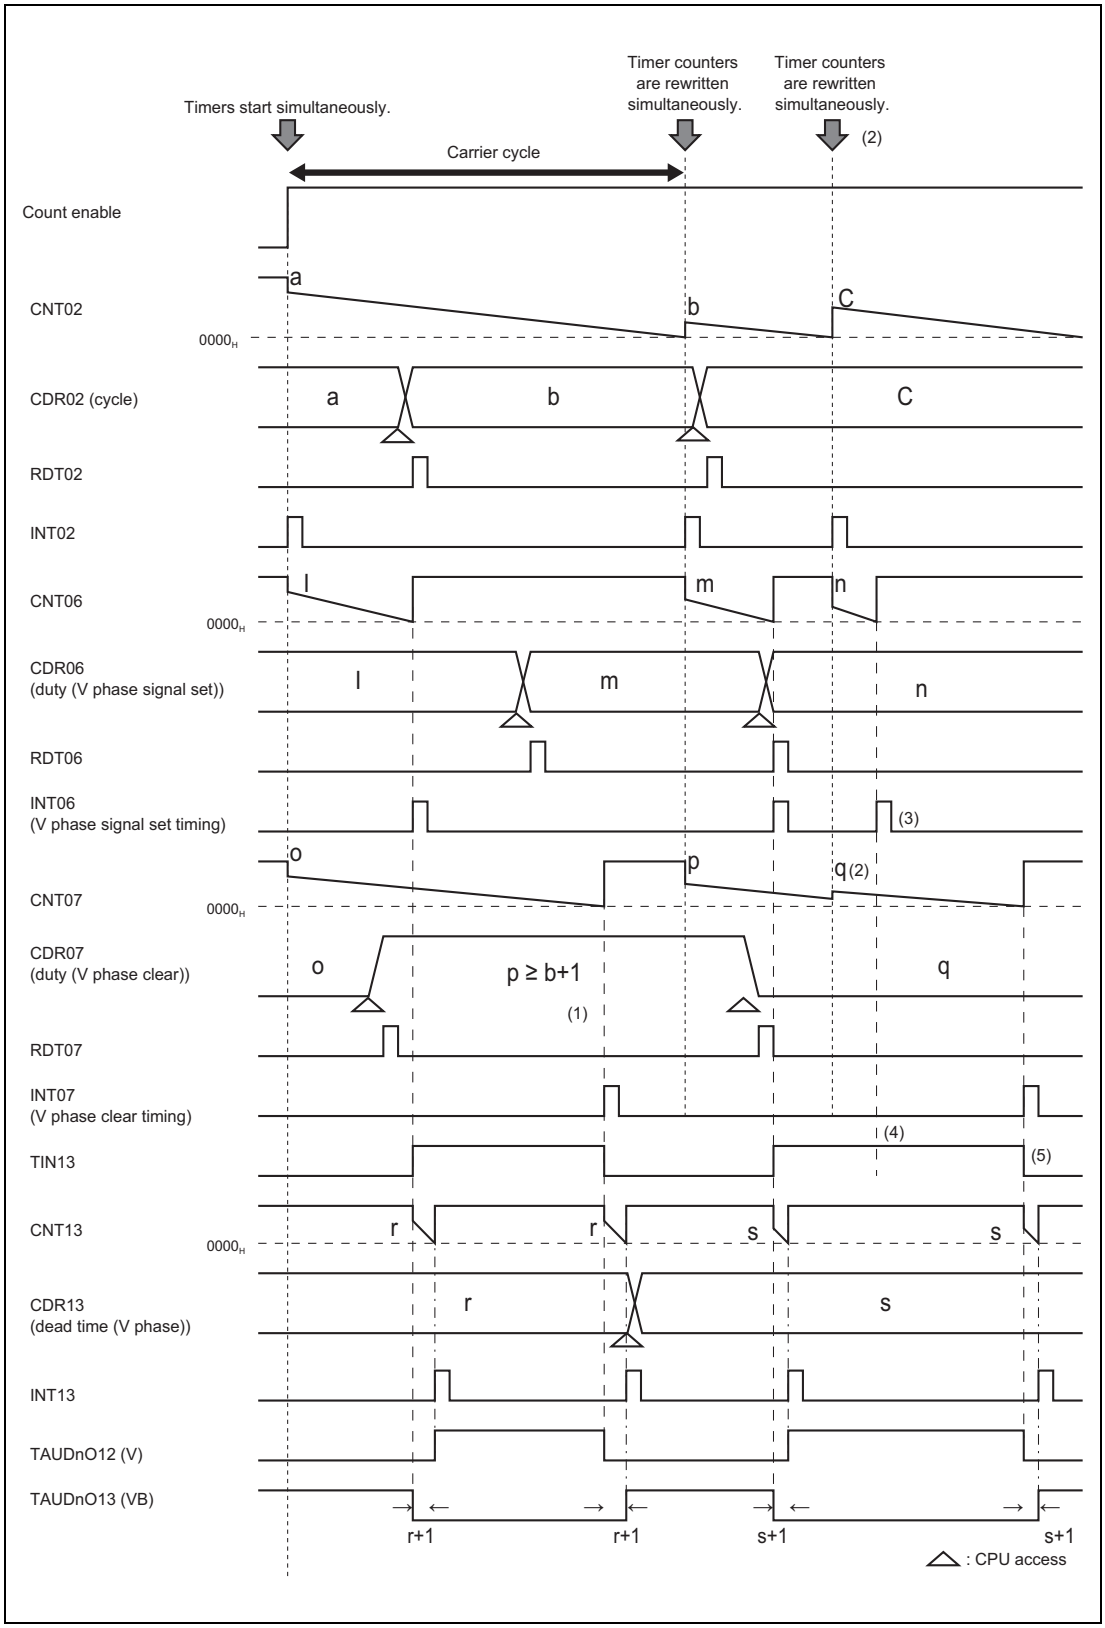

**Figure 29.29 Example of One-Phase PWM (V phase, VB phase) Output with Dead Time**

An operation example of the timer configuration for performing the V phase PWM output in **Figure 29.29** is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.

(1) If the setting of CH7 (the V phase clear signal output timing timer), which generates the V phase clear timing signal (INT07), is greater than the CH2 (the carrier cycle timer) setting.

(2) Before a V phase clear timing signal (INT07) is generated by a CH7 underflow, a CH2 (carrier cycle timer) underflow occurs, and the CH7 setting is reloaded.

(3) It causes the V phase clear timing signal (INT07) not to be generated, resulting in consecutive generation of the V phase set timing signal (INT06).

(4) In this case, because the V phase set timing signal (INT06) is ignored by the SR flip-flop circuit, there is no effect on the PWM output waveform. Therefore, a PWM waveform that extends across carrier cycles is output.

(5) The PWM output is changed at the timing of the next V phase clear timing signal (INT07).

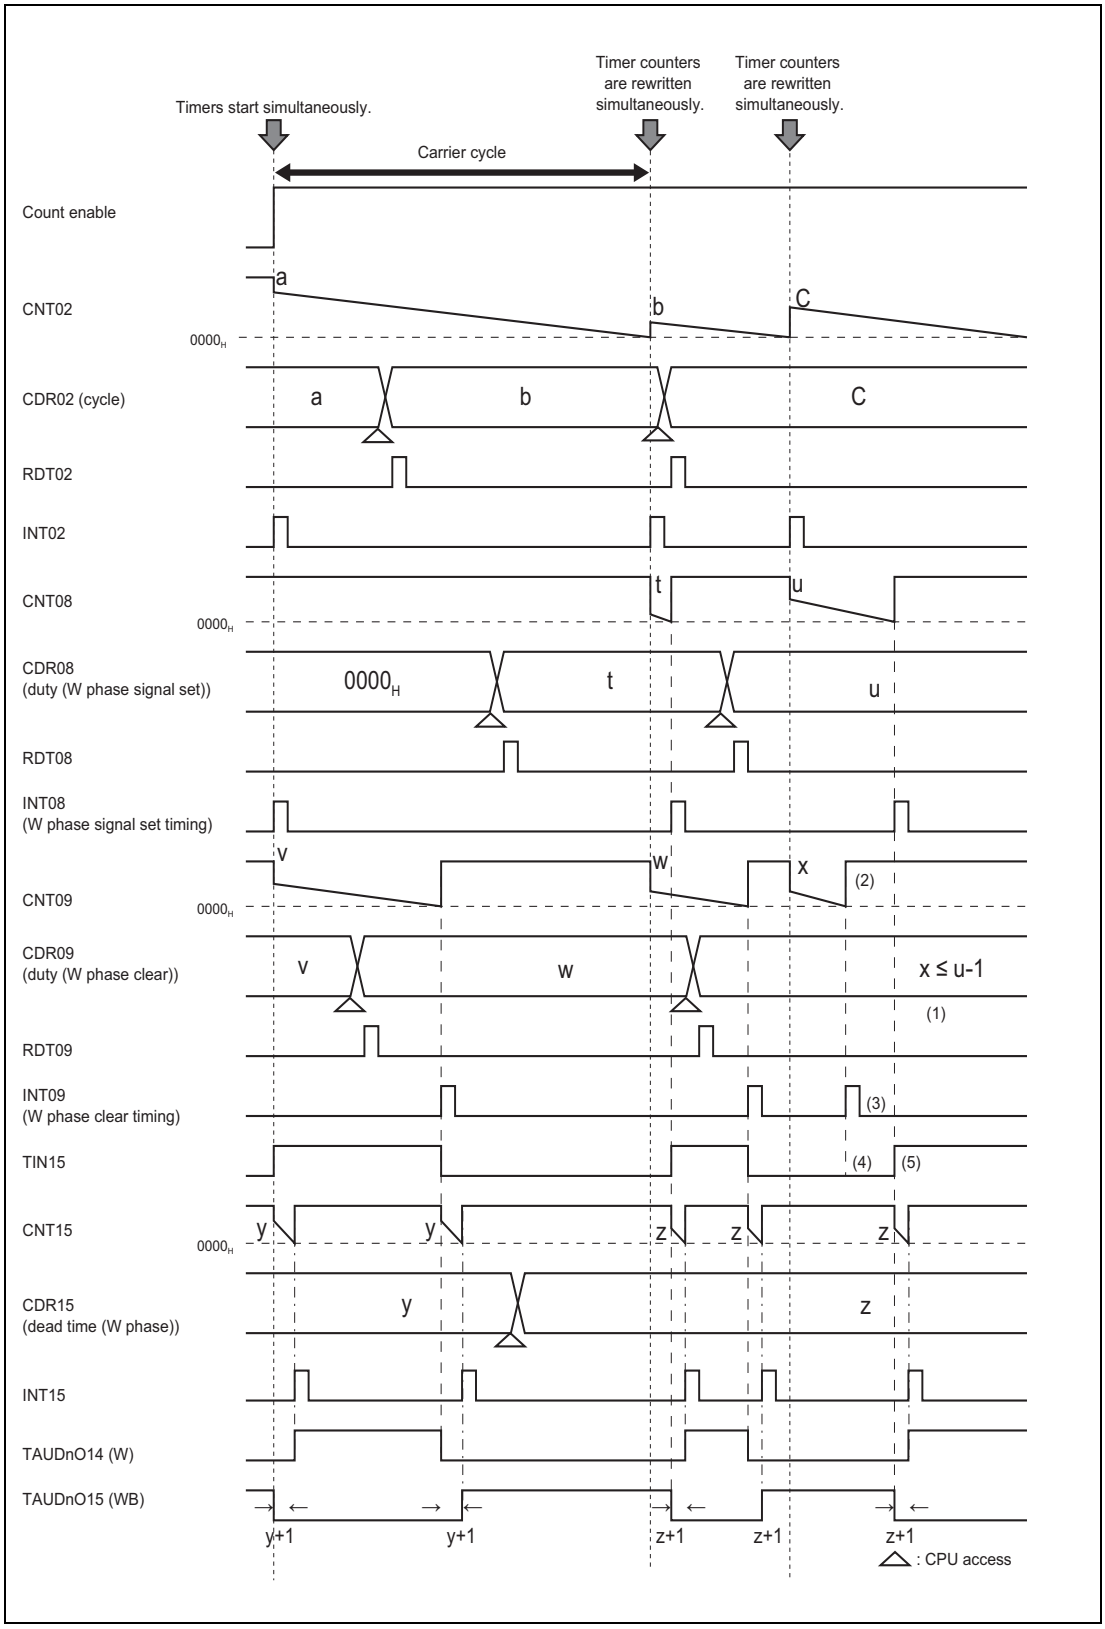

**Figure 29.30 Example of One-Phase PWM (W phase, WB phase) Output with Dead Time**

An operation example of the timer configuration for performing the W phase PWM output in **Figure 29.30** is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.

(1) If the setting of CH9 (the W phase clear signal output timing timer), which generates the W phase clear timing signal (INT09), is less than the CH8 (the W phase set signal output timing timer) setting.

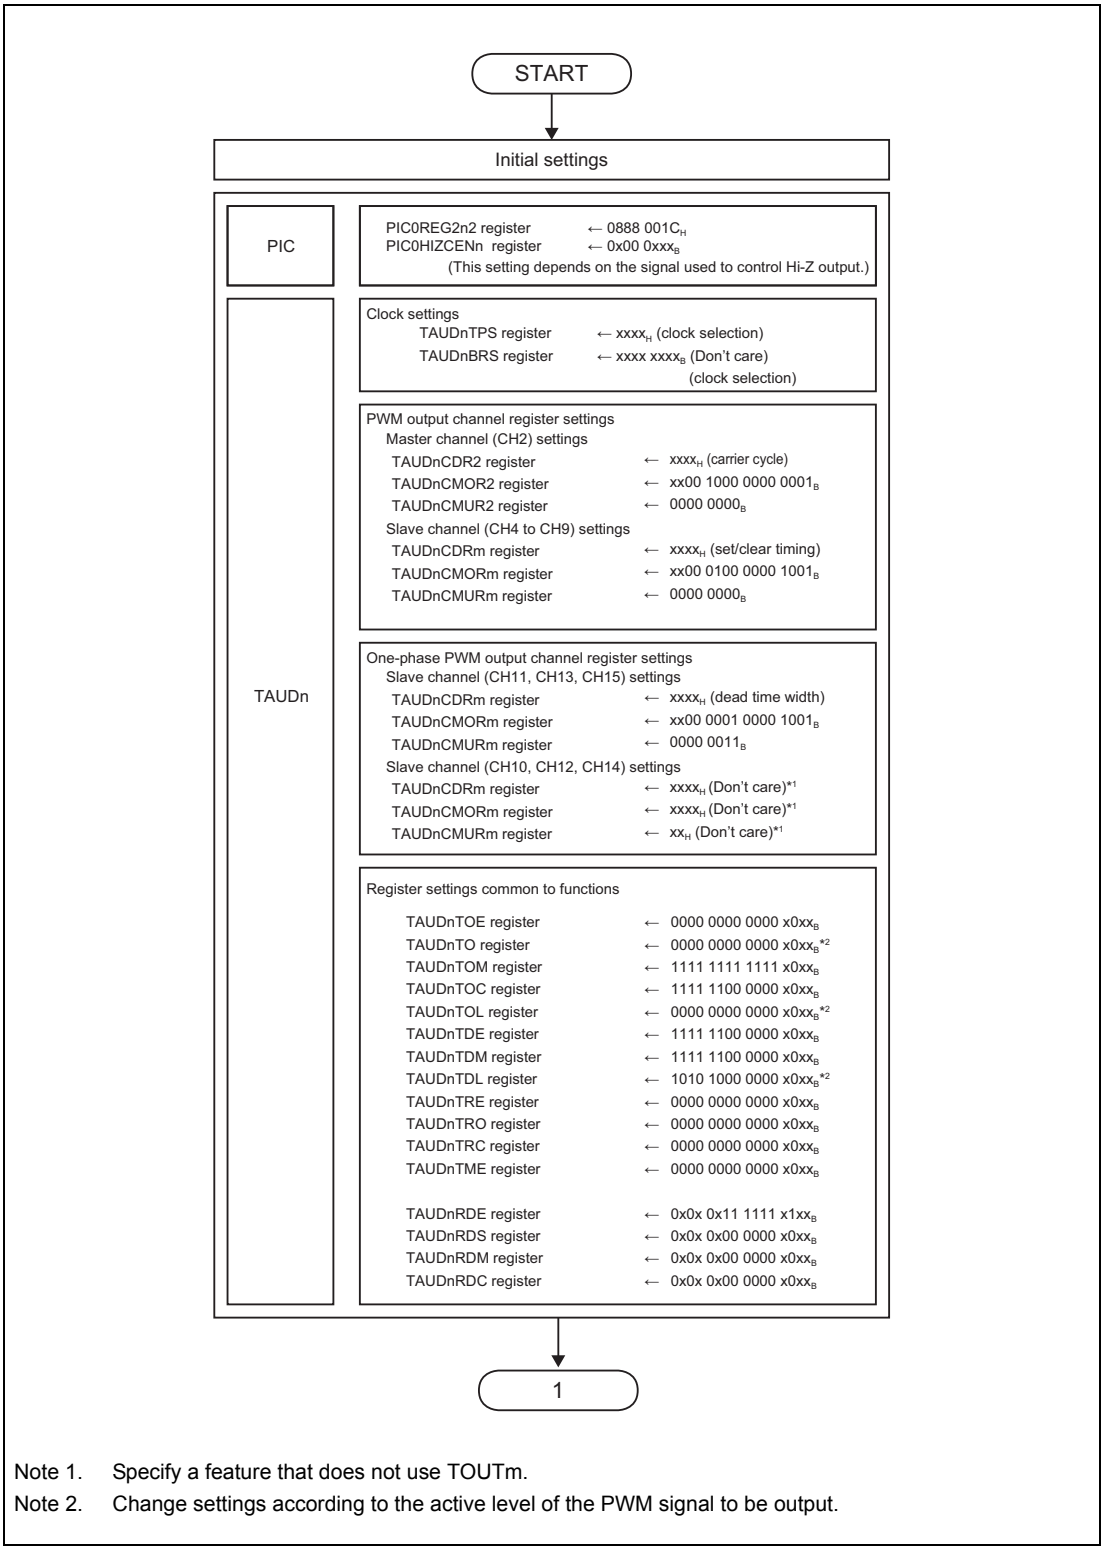
(2) Before a W phase set timing signal (INT08) is generated by a CH8 underflow, a CH9 (W phase clear signal output timing timer) underflow occurs, and the W phase clear timing signal (INT09) is generated.

(3) This results in consecutive W phase clear timing signals (INT09) being generated.

(4) In this case, because the consecutively generated W phase clear timing signals (INT09) are ignored by the SR flip-flop circuit, there is no effect on the PWM output waveform.

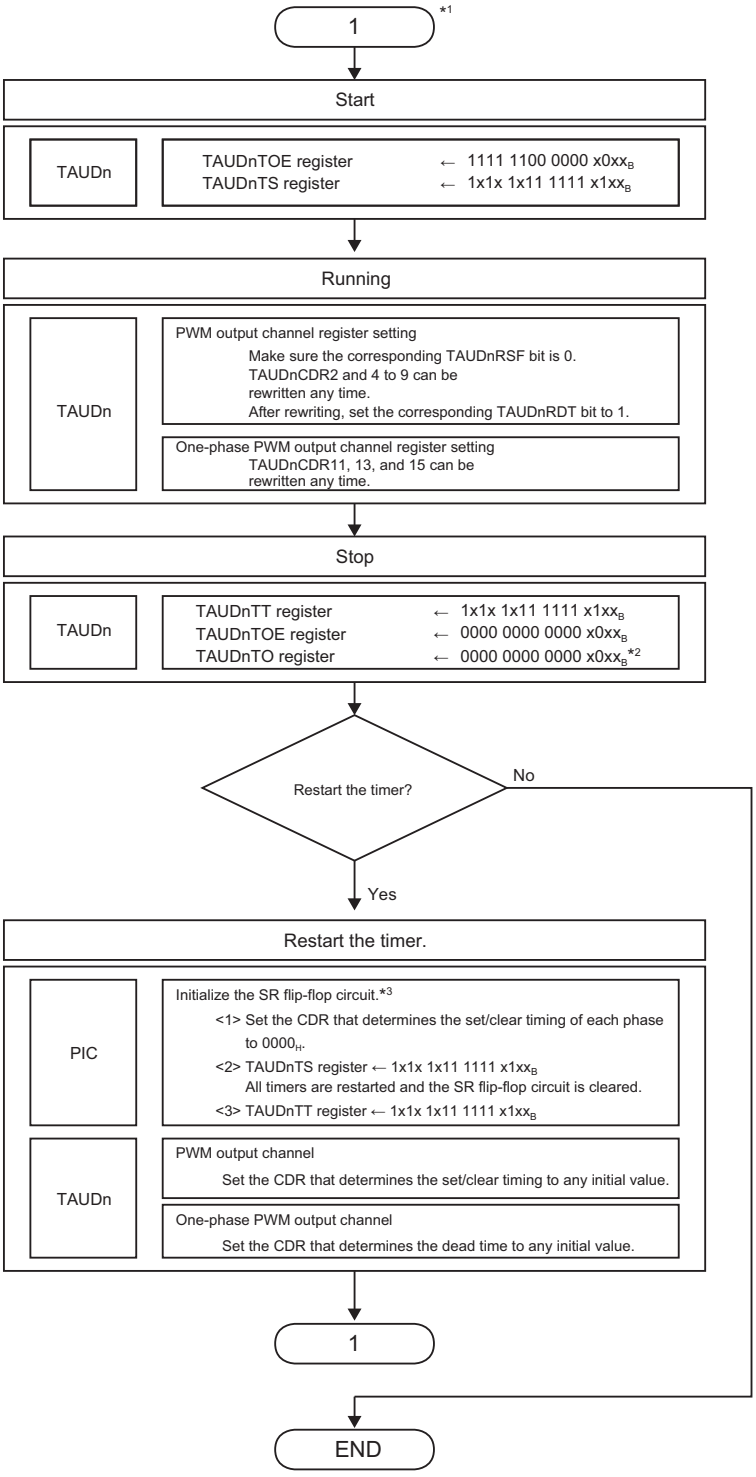
(5) The PWM output is changed at the timing of the next W phase set timing signal (INT08).

### 29.11.5 Setup Flow



Note 1. Specify a feature that does not use TOUTm.
Note 2. Change settings according to the active level of the PWM signal to be output.

**Figure 29.31 Setup Flow (Active High Example)**



Note 1. Specify the selection register and output port to use after specifying the initial settings for the peripheral interconnections and timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

Note 3. If initialization processing is not performed, the SR flip-flop circuit enters the timer-stopped state, and the timer restart output pulse might be output at an unintended level.

**Figure 29.32 Setup Flow (Active High Example) (continued)**

## 29.11.6 Setting Examples for Operation Functions

This section provides example settings for each register.

### 29.11.6.1 TAUDn Settings (Active High Example)

**Table 29.45 TAUDn: CH2-related (PWM Output Master Channel*1)**

| Register | Bit Position | Bit Name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMOR2 | 15, 14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |

| | 11 | TAUDnMAS | 1 | |
| | 10 to 8 | TAUDnSTS[2:0] | 000 | |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | Fixed to 0 |
| | 4 to 1 | TAUDnMD[4:1] | 0000 | |
| | 0 | TAUDnMD0 | 1 | |
| TAUDnCMUR2 | 1, 0 | TAUDnTIS[1:0] | 00 | |

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

**Table 29.46 TAUDn: CH4 to CH9-related (PWM Output Slave Channel*1) (m = 4 to 9)**

| Register | Bit Position | Bit Name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Any*2 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 0 | |
| | 10 to 8 | TAUDnSTS[2:0] | 100 | |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | Fixed to 0 |
| | 4 to 1 | TAUDnMD[4:1] | 0100 | |
| | 0 | TAUDnMD0 | 1 | |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 00 | |

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

**NOTE**

For the TAUDnCMORm register used during PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

**Table 29.47 TAUDn: CH11, CH13, and CH15-related (One-phase PWM Output) (m = 11, 13, or 15)**

| Register | Bit Position | Bit Name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Don't care*1 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 0 | |
| | 10 to 8 | TAUDnSTS[2:0] | 001 | |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | Fixed to 0 |
| | 4 to 1 | TAUDnMD[4:1] | 0100 | |
| | 0 | TAUDnMD0 | 1 | |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 11 | Both rising and falling TINm edges are detected as valid. (High width) |

Note 1. Specify the same operation clock settings as for the PWM output master channel (CH2).

**NOTE**

For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. CH10, CH12, and CH14 can be used with any feature that does not use TOUTm output (such as A/D trigger output). For details, see **Section 25, Timer Array Unit D (TAUD)**.

**Table 29.48 Common TAUDn Channel Settings (1/4)**

| Register | Bit Position | Bit Name | Setting | Remark |
|---|---|---|---|---|
| TAUDnTOE | 15 to 10 | TAUDnTOE15 to TAUDnTOE10 | 0<br>1 | Disable the timer.<br>Enable the timer. |
| | 9 to 4 | TAUDnTOE09 to TAUDnTOE04 | 0 | These are fixed to 0 because TOUT09 to TOUT04 are not used. |
| | 3 | TAUDnTOE03 | Don't care | |
| | 2 | TAUDnTOE02 | 0 | This is fixed to 0 because TOUT02 is not used. |
| | 1, 0 | TAUDnTOE01 TAUDnTOE00 | Don't care | |
| TAUDnTO | 15 to 10 | TAUDnTO15 to TAUDnTO10 | 0*1 | Output a low-level signal to TOUT15 to TOUT10. |

Table 29.48 Common TAUDn Channel Settings (2/4)

| Register | Bit Position | Bit Name | Setting | Remark |
|---|---|---|---|---|
| TAUDnTOC | 15 to 10 | TAUDnTOC15 to TAUDnTOC10 | 1 | Synchronous operation mode 2 |
| | 9 to 4 | TAUDnTOC09 to TAUDnTOC04 | 0 | Synchronous operation mode 1 |
| | 3 | TAUDnTOC03 | Don't care | |
| | 2 | TAUDnTOC02 | 0 | Operation mode 1 |
| | 1, 0 | TAUDnTOC01 TAUDnTOC00 | Don't care | |
| TAUDnTOL | 15 to 4 | TAUDnTOL15 to TAUDnTOL04 | 0*1 | Positive logic output (active high) |
| | 3 | TAUDnTOL03 | Don't care | |
| | 2 | TAUDnTOL02 | 0 | Positive logic output (active high) |
| | 1, 0 | TAUDnTOL01 TAUDnTOL00 | Don't care | |
| TAUDnTDE | 15 to 10 | TAUDnTDE15 to TAUDnTDE10 | 1 | Enable dead time control.*2 |
| | 9 to 4 | TAUDnTDE09 to TAUDnTDE04 | 0 | Disable dead time control. |
| | 3 | TAUDnTDE03 | Don't care | |
| | 2 | TAUDnTDE02 | 0 | Disable dead time control. |
| | 1, 0 | TAUDnTDE01 TAUDnTDE00 | Don't care | |
| TAUDnTDM | 15 to 10 | TAUDnTDM15 to TAUDnTDM10 | 1 | Output dead time upon detecting a TINm input edge at a lower odd channel. |
| | 9 to 4 | TAUDnTDM09 to TAUDnTDM04 | 0 | Invalid because dead time control is disabled. |
| | 3 | TAUDnTDM03 | Don't care | |
| | 2 | TAUDnTDM02 | 0 | Invalid because dead time control is disabled. |
| | 1, 0 | TAUDnTDM01 TAUDnTDM00 | Don't care | |
| TAUDnTDL | 15 | TAUDnTDL15 | 1*1 | Dead time is in the negative segment of the W phase output |
| | 14 | TAUDnTDL14 | 0*1 | Dead time is in the positive segment of the W phase output |
| | 13 | TAUDnTDL13 | 1*1 | Dead time is in the negative segment of the V phase output |
| | 12 | TAUDnTDL12 | 0*1 | Dead time is in the positive segment of the V phase output |
| | 11 | TAUDnTDL11 | 1*1 | Dead time is in the negative segment of the U phase output |
| | 10 | TAUDnTDL10 | 0*1 | Dead time is in the positive segment of the U phase output |
| | 9 to 4 | TAUDnTDL09 to TAUDnTDL04 | 0 | Invalid because dead time control is disabled. |
| | 3 | TAUDnTDL03 | Don't care | |
| | 2 | TAUDnTDL02 | 0 | Invalid because dead time control is disabled. |
| | 1, 0 | TAUDnTDL01 TAUDnTDL00 | Don't care | |

Table 29.48 Common TAUDn Channel Settings (3/4)

| Register | Bit Position | Bit Name | Setting | Remark |
|---|---|---|---|---|
| TAUDnTRE | 15 to 4 | TAUDnTRE15 to TAUDnTRE04 | 0 | Stop real-time output. |
| | 3 | TAUDnTRE03 | Don't care | |
| | 2 | TAUDnTRE02 | 0 | Stop real-time output. |
| | 1, 0 | TAUDnTRE01 TAUDnTRE00 | Don't care | |
| TAUDnTRO | 15 to 4 | TAUDnTRO15 to TAUDnTRO04 | 0 | Invalid because real-time output is disabled. |
| | 3 | TAUDnTRO03 | Don’t care | |
| | 2 | TAUDnTRO02 | 0 | Invalid because real-time output is disabled. |
| | 1, 0 | TAUDnTRO01 TAUDnTRO00 | Don’t care | |
| TAUDnTRC | 15 to 4 | TAUDnTRC15 to TAUDnTRC04 | 0 | Do not use this channel to generate the real-time output trigger. |
| | 3 | TAUDnTRC03 | Don’t care | |
| | 2 | TAUDnTRC02 | 0 | Do not use this channel to generate the real-time output trigger. |
| | 1, 0 | TAUDnTRC01 TAUDnTRC00 | Don’t care | |
| TAUDnTME | 15 to 4 | TAUDnTME15 to TAUDnTME04 | 0 | Disable modulation output for timer output and real-time output. |
| | 3 | TAUDnTME03 | Don’t care | |
| | 2 | TAUDnTME02 | 0 | Disable modulation output for timer output and real-time output. |
| | 1, 0 | TAUDnTME01 TAUDnTME00 | Don’t care | |
| TAUDnRDE | 15 | TAUDnRDE15 | 0 | Disable simultaneous rewriting. |
| | 14 | TAUDnRDE14 | Don’t care | |
| | 13 | TAUDnRDE13 | 0 | Disable simultaneous rewriting. |
| | 12 | TAUDnRDE12 | Don’t care | |
| | 11 | TAUDnRDE11 | 0 | Disable simultaneous rewriting. |
| | 10 | TAUDnRDE10 | Don’t care | |
| | 9 to 4 | TAUDnRDE09 to TAUDnRDE04 | 1 | Enable simultaneous rewriting. |
| | 3 | TAUDnRDE03 | Don’t care | |
| | 2 | TAUDnRDE02 | 1 | Enable simultaneous rewriting. |
| | 1, 0 | TAUDnRDE01 TAUDnRDE00 | Don’t care | |

Table 29.48 Common TAUDn Channel Settings (4/4)

| Register | Bit Position | Bit Name | Setting | Remark |
|---|---|---|---|---|
| TAUDnRDS | 15 | TAUDnRDS15 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
| | 14 | TAUDnRDS14 | Don't care | |
| | 13 | TAUDnRDS13 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
| | 12 | TAUDnRDS12 | Don't care | |
| | 11 | TAUDnRDS11 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
| | 10 | TAUDnRDS10 | Don't care | |
| | 9 to 4 | TAUDnRDS09 to TAUDnRDS04 | 0 | Enable simultaneous rewriting by using a master channel. |
| | 3 | TAUDnRDS03 | Don't care | |
| | 2 | TAUDnRDS02 | 0 | Enable simultaneous rewriting by using a master channel. |
| | 1, 0 | TAUDnRDS01 TAUDnRDS00 | Don't care | |
| TAUDnRDM | 15 | TAUDnRDM15 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 14 | TAUDnRDM14 | Don't care | |
| | 13 | TAUDnRDM13 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 12 | TAUDnRDM12 | Don't care | |
| | 11 | TAUDnRDM11 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 10 | TAUDnRDM10 | Don't care | |
| | 9 to 4 | TAUDnRDM09 to TAUDnRDM04 | 0 | Load the signal when the master channel starts counting. |
| | 3 | TAUDnRDM03 | Don't care | |
| | 2 | TAUDnRDM02 | 0 | Load the signal when the master channel starts counting. |
| | 1, 0 | TAUDnRDM01 TAUDnRDM00 | Don't care | |
| TAUDnRDC | 15 | TAUDnRDC15 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 14 | TAUDnRDC14 | Don't care | |
| | 13 | TAUDnRDC13 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 12 | TAUDnRDC12 | Don't care | |
| | 11 | TAUDnRDC11 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 10 | TAUDnRDC10 | Don't care | |
| | 9 to 4 | TAUDnRDC09 to TAUDnRDC04 | 0 | Do not use this channel to generate the simultaneous rewrite trigger. |
| | 3 | TAUDnRDC03 | Don't care | |
| | 2 | TAUDnRDC02 | 1 | Do not use this channel to generate the simultaneous rewrite trigger. |
| | 1, 0 | TAUDnRDC01 TAUDnRDC00 | Don't care | |

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 25, Timer Array Unit D (TAUD)**.

### 29.11.6.2 PIC Settings

**Table 29.49 PIC Settings**

| Register | Bit Position | Bit Name | Setting | Remark |
|---|---|---|---|---|
| PIC0REG2n2 | 27 | PIC0REG2n227 | 1 | Select the input selected by the PIC0REG2n204 bit. |
| | 23 | PIC0REG2n223 | 1 | Select the input selected by the PIC0REG2n203 bit. |
| | 19 | PIC0REG2n219 | 1 | Select the input selected by the PIC0REG2n202 bit. |
| | 4 | PIC0REG2n204 | 1 | Select the set/clear output according to INTTAUDnI8 and INTTAUDnI9. |
| | 3 | PIC0REG2n203 | 1 | Select the set/clear output according to INTTAUDnI6 and INTTAUDnI7. |
| | 2 | PIC0REG2n202 | 1 | Select the set/clear output according to INTTAUDnI4 and INTTAUDnI5. |

# 29.12 High-accuracy Triangle PWM Output with Dead Time

## 29.12.1 Functional Overview

Compared to the triangle PWM output with dead time of TAUD, this makes it possible to control the variable dead time areas near duties of 100% and 0%. This makes more accurate triangle PWM output possible.

For the triangle PWM output with dead time feature of TAUD, it is not possible to output a UB phase dead time pulse, such as when transitioning to U phase 0% triangular wave output. (See **Figure 29.33**)

For this feature, a pulse is generated in combination with the TAUD timer output, and a pseudo dead time pulse is added.

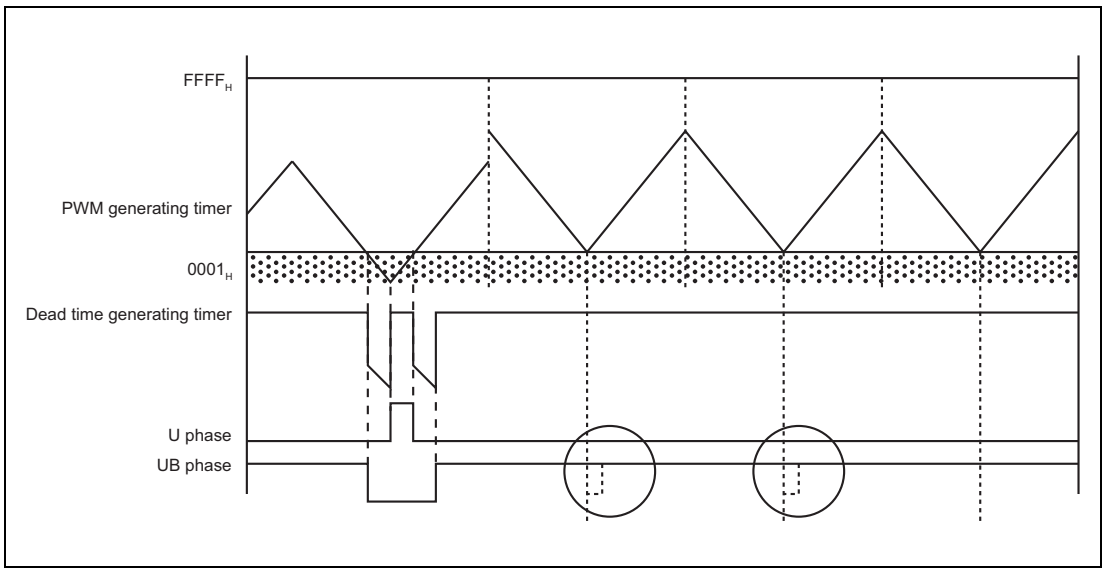

**Figure 29.33 Timing of Dead Time Output by the TAUD Feature for Outputting a Triangle PWM Signal with Dead Time**

## 29.12.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0)

**Table 29.50 Configuration of Delay Pulse Output with Dead Time**

| Timer | Timer Motor Control Function |
|---|---|
| TAUD0 CH2, CH4 to CH15 (used channels fixed) | TAPA0 |

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)

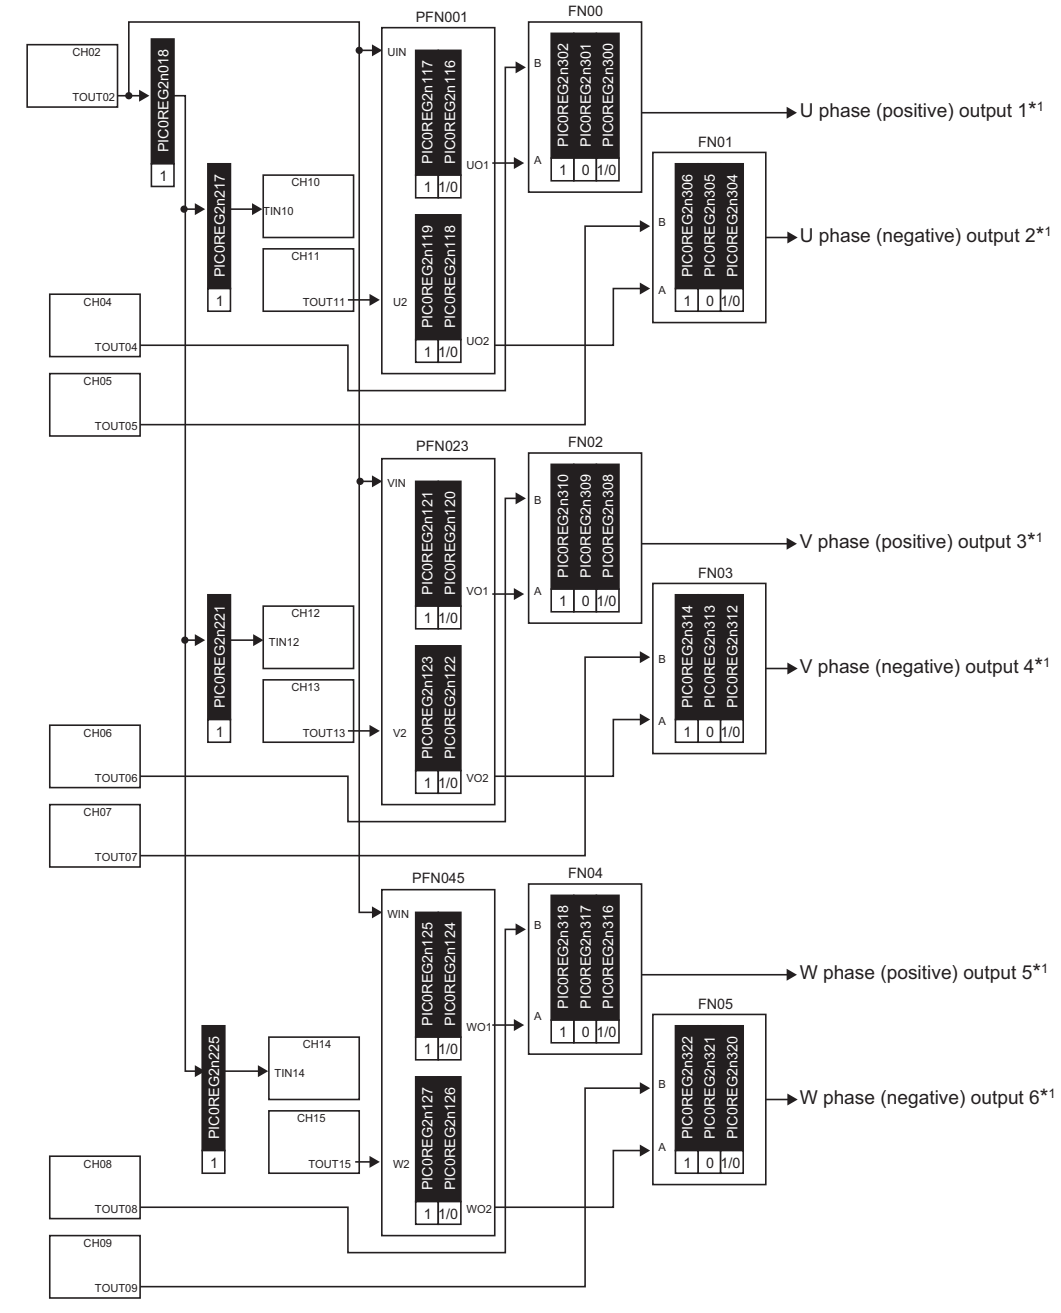
### (1) TAUDn configuration

**Table 29.51 TAUD Configuration**

| CH | Function Name | M/S*1 | CDR Setting | Description |
|---|---|---|---|---|
| 2 | Triangle PWM output with dead time (CH2 is the master channel for CH4 to CH9.) | M | Cycle | |
| 4 | | S | Duty (U phase) | |
| 5 | | S | Dead time (U phase) | |
| 6 | | S | Duty (V phase) | |
| 7 | | S | Dead time (V phase) | |
| 8 | | S | Duty (W phase) | |
| 9 | | S | Dead time (W phase) | |
| 10 | One-shot pulse output | M | Delay | Generate the pulse to be inserted into the variable dead time area for U phase PWM. |
| 11 | | S | Pulse width | |
| 12 | One-shot pulse output | M | Delay | Generate the pulse to be inserted into the variable dead time area for V phase PWM. |
| 13 | | S | Pulse width | |
| 14 | One-shot pulse output | M | Delay | Generate the pulse to be inserted into the variable dead time area for W phase PWM. |
| 15 | | S | Pulse width | |

Note 1. M: Master channel, S: Slave channel

### (2) Block diagram



Note 1. For the connection destination, see **Figure 29.25, Block Diagram: Motor Output Buffer Control**.

**Figure 29.34 Block Diagram: High-Accuracy Triangle PWM Output with Dead Time**

## 29.12.3 Registers

### 29.12.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0)

This register selects TAUDn input.

**Access:** This register can be read or written in 32-bit units.

**Address:** PIC0REG200: FFDD 00C0$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | PIC0REG2n018 | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R |

### 29.12.4 Operation Example

This is achieved by combining the following TAUD features:

- Triangle PWM output with dead time
- One-shot pulse output

In addition, the following PIC is also used because the pulse to be inserted into the variable dead time area is generated for the positive or negative phase:

- Combination circuit (PFN001, PFN023, and PFN045)

In addition, the following peripheral interconnections are also used because the pulse to be inserted into the variable dead time area is combined with the triangle PWM output waveform:

- Logical operation circuit (FN0i) (i = 0 to 5)

A high-accuracy triangle PWM signal with dead time is output by assigning the PWM output achieved using the above features to the U, V, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

#### 29.12.4.1 Triangle PWM Output with Dead Time

A triangle PWM signal with dead time is output from TOUT04 and TOUT05 by using CH2, CH4, and CH5 in combination.

#### 29.12.4.2 One-shot Pulse Output

A CDR11 pulse for which the width is delayed by the delay time (CDR10) from the valid edge of the TIN10 (TOUT02) signal of CH10 is output as TOUT11 by using CH10 and CH11 in combination.

This pulse is used as the variable dead time area pulse used near duties of 100% and 0%.

**CAUTION**

**Specify each CDR setting for one-shot pulse output such that the following condition is satisfied: CDR05 ≥ (CDR10 + CDR11)**

**If a value that does not satisfy the above condition is specified, the output waveform might be affected. To minimize this effect, in addition to satisfying the above setting condition, leave CDR11 set to $0000_H$ until the variable dead time area pulse is required. Detect both rising and falling edges as the valid TIN10 (TOUT02) edge, and set TAUDnTOL11 to 1 (active low).**
**Specify the same operation clock for each TAUDn channel used for outputting a triangle PWM signal with dead time or a one-shot pulse.**

For details about the TAUD functions, see **Section 25, Timer Array Unit D (TAUD)**.

### 29.12.4.3 U phase Combination Circuit (PFN001)

This circuit generates a variable dead time area pulse (FN00 A, FN01 A) for adding a generated one-shot pulse to a generated triangle PWM signal with dead time.

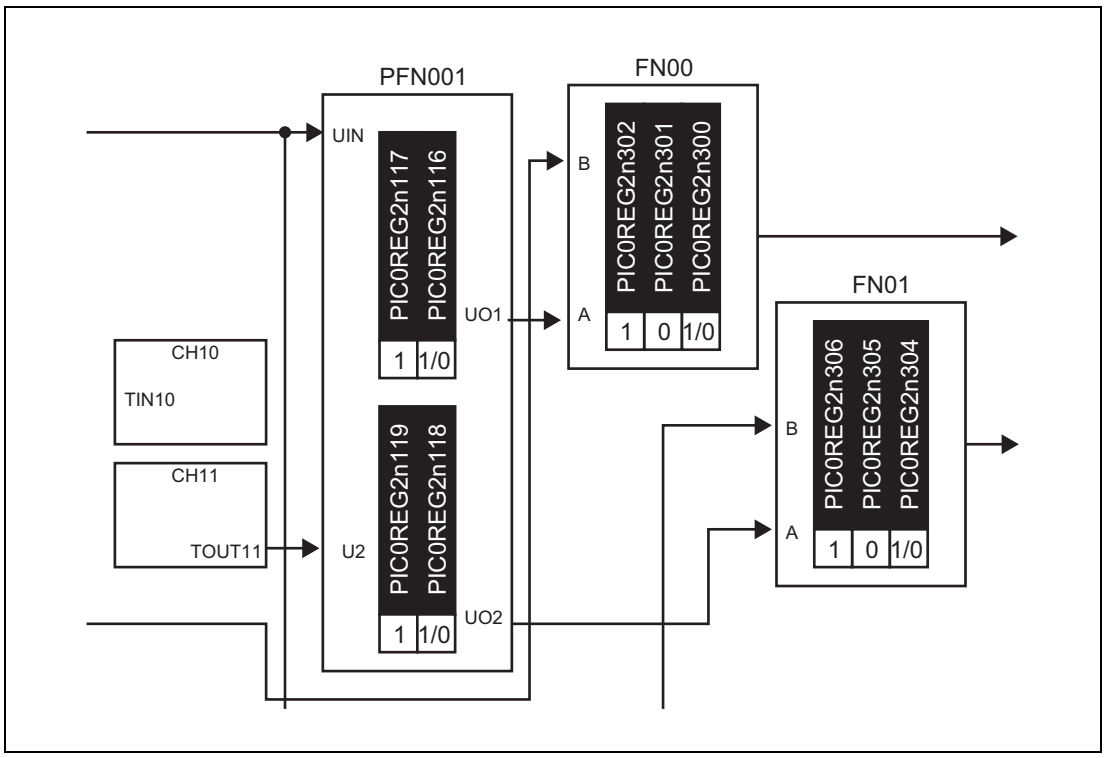

**Figure 29.35 Block Diagram Excerpt (PFN001, FN00, and FN01)**

The table below shows the relationships between combination circuit input (UIN, U2) and output (UO1, UO2).

**Table 29.57 U and UB Phase Combination Circuit (PFN001) I/O Table**

- **UO1 (U phase variable dead time area pulse) output**

| UIN (TOUT02) | U2 (TOUT11) | UO1 | |
|---|---|---|---|
| | | PIC0REG2n117, 16 = $10_B$ U phase output active high (TAUDnTOL04 = 0) | PIC0REG2n117, 16 = $11_B$ U phase output active low (TAUDnTOL04 = 1) |
| 0 | 0 | 1 | 0 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 0 | 1 |
| 1 | 1 | 1 | 0 |

- **UO2 (UB phase variable dead time area pulse) output**

| UIN (TOUT02) | U2 (TOUT11) | UO2 | |
|---|---|---|---|
| | | PIC0REG2n119, 18 = $10_B$ UB phase output active high (TAUDnTOL05 = 0) | PIC0REG2n119, 18 = $11_B$ UB phase output active low (TAUDnTOL05 = 1) |
| 0 | 0 | 0 | 1 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 1 | 0 |

**NOTE**

The PIC0REG2n116, PIC0REG2n117, PIC0REG2n118, and PIC0REG2n119 settings change depending on the active U phase and UB phase levels of the generated triangle PWM signal with dead time.

### 29.12.4.4 Logical Operation Circuit (FN0i) (i = 0 or 1)

This circuit combines an output triangle PWM signal with dead time (TOUT04, TOUT05) with combination circuit output (UO1 and UO2 of PFN001) and generates a PWM signal to which a variable dead time area pulse has been added.

The combination logic for the logical operation circuit is switched according to the PIC0REG2n3 register setting. (Bits 0 to 2 are specified for U phase output, and bits 4 to 6 are specified for UB phase output.)

Set up the logical operation circuit as shown in the table below. The combined signal is output from the TAPAnUP and TAPAnUM pins according to the specified combination logic.

**Table 29.58 Logical Operation Circuit (FN0i) (i = 0 or 1) Settings and TAPAnUP and TAPAnUM Pin Output**

- **U phase output (TOUT04)**

| Active level | PIC0REG2n302 to 00 | TAPAnUP pin output waveform |
|---|---|---|
| Active high (TAUDnTOL04 = 0) | $100_B$ | AND of FN00 B (TOUT04) and FN00 A (UO1) |
| Active low (TAUDnTOL04 = 1) | $101_B$ | OR of FN00 B (TOUT04) and FN00 A (UO1) |

- **UB phase output (TOUT05)**

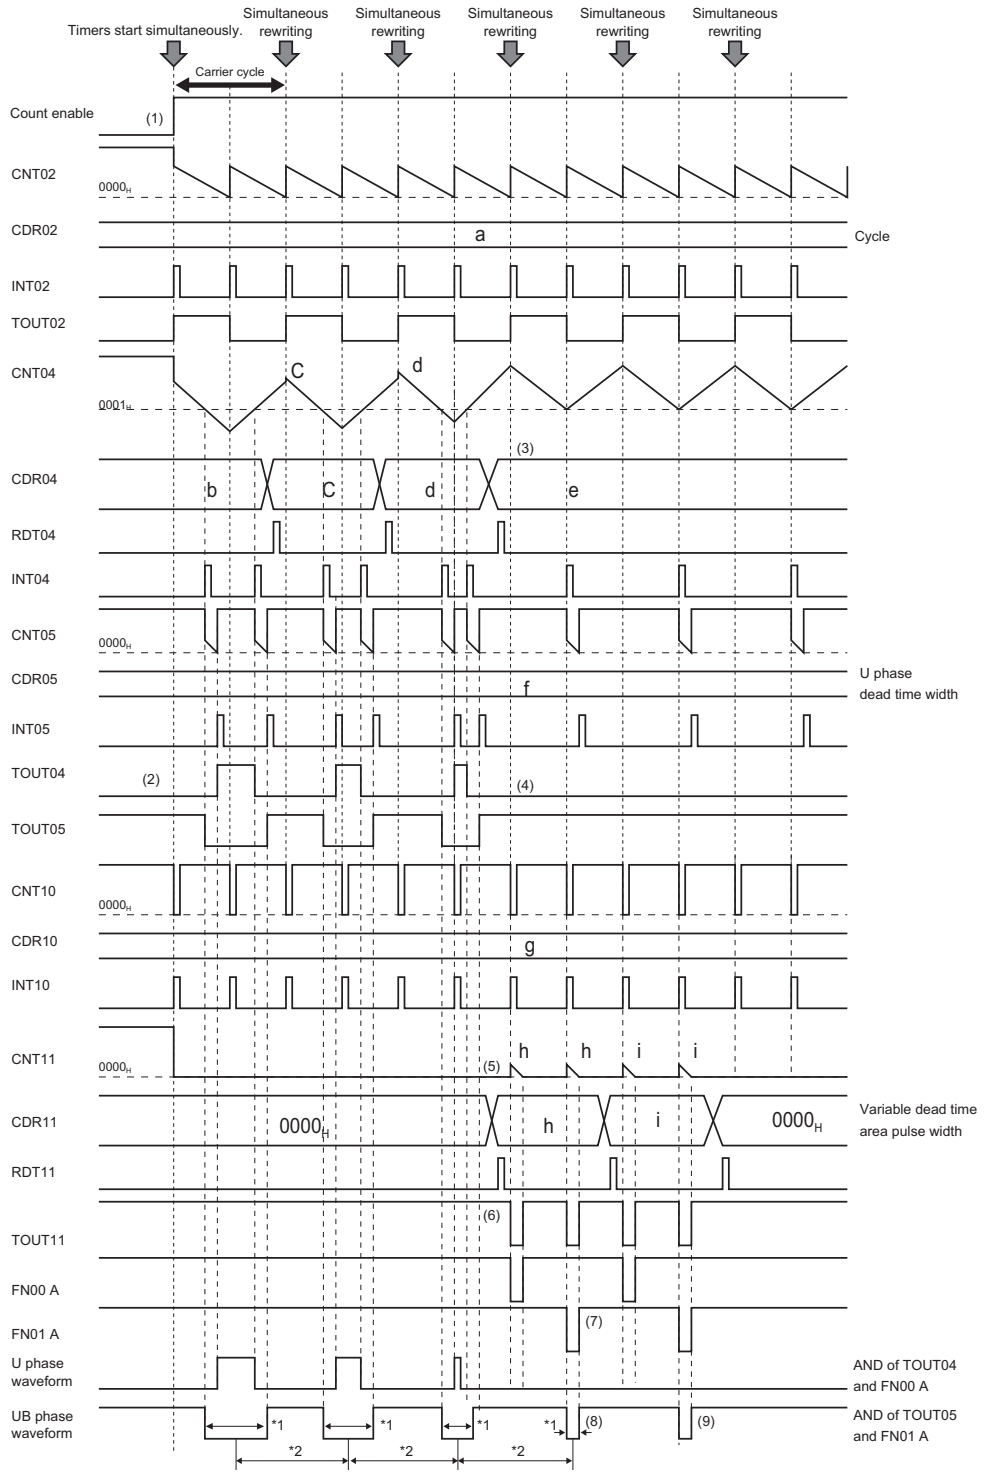
| Active level | PIC0REG2n306 to 04 | TAPAnUM pin output |
|---|---|---|
| Active high (TAUDnTOL05 = 0) | $100_B$ | AND of FN01 B (TOUT05) and FN01 A (UO2) |
| Active low (TAUDnTOL05 = 1) | $101_B$ | OR of FN01 B (TOUT05) and FN01 A (UO2) |

Because the above makes variable dead time control possible to ensure output accuracy near duties of 0% and 100% even for TAUD, a more accurate triangle PWM signal can be output than that output using the TAUD feature for outputting a triangle PWM signal with dead time.

For the V/VB phase and W/WB phase, the used channels and register bits differ, but the settings are the same, as shown in **Figure 29.34, Block Diagram: High-Accuracy Triangle PWM Output with Dead Time.**

The peripheral interconnections provide a connection for adding the pulse generated during one-shot pulse output to the PWM signal generated during output of a triangle PWM signal with dead time by using the combination circuit and logical operation circuit of the peripheral interconnections.

The following figures show timing charts for outputting a high-accuracy triangle PWM signal with dead time.



Note 1. The variable dead time area pulse uses a sawtooth wave and is therefore expanded on one side, unlike a pulse that uses a triangle wave, which is expanded on both sides.

Note 2. Because the variable dead time area pulse is expanded on one side, the length of the one-phase PWM output cycle for the variable dead time area increases by 1/2 the added variable dead time area pulse width.

**Figure 29.36 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**

An operation example in which the system transitions to a U phase of 0% and UB phase of 100% in the timer configuration for performing the U phase PWM output shown in **Figure 29.36** is provided below. Output of a triangle PWM signal with dead time is active high.

(1) When timer operation is started, output of a triangle PWM with dead time is started by the CH2, CH4, and CH5 channels of TAUDn.

(2) A triangle PWM waveform with dead time is generated from TOUT04 and TOUT05.

(3) A U phase duty output value of 0% is specified for CDR04.

(4) Due to the setting in (3), TOUT04 output is the inactive level, and TOUT05 output is the active level. However, no variable dead time area pulse is output during this operation.

(5) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 when specifying the 0% U phase duty in (3).
For this example, the CDR11 setting is fixed to $0000_H$ until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.

(6) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.

(7) The pulse output in (6) is converted to a variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).

(8) The pulse generated in (7) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).

(9) By later changing the CDR11 setting, which specifies the width of the variable dead time area pulse, the desired variable dead time area pulse can be added.

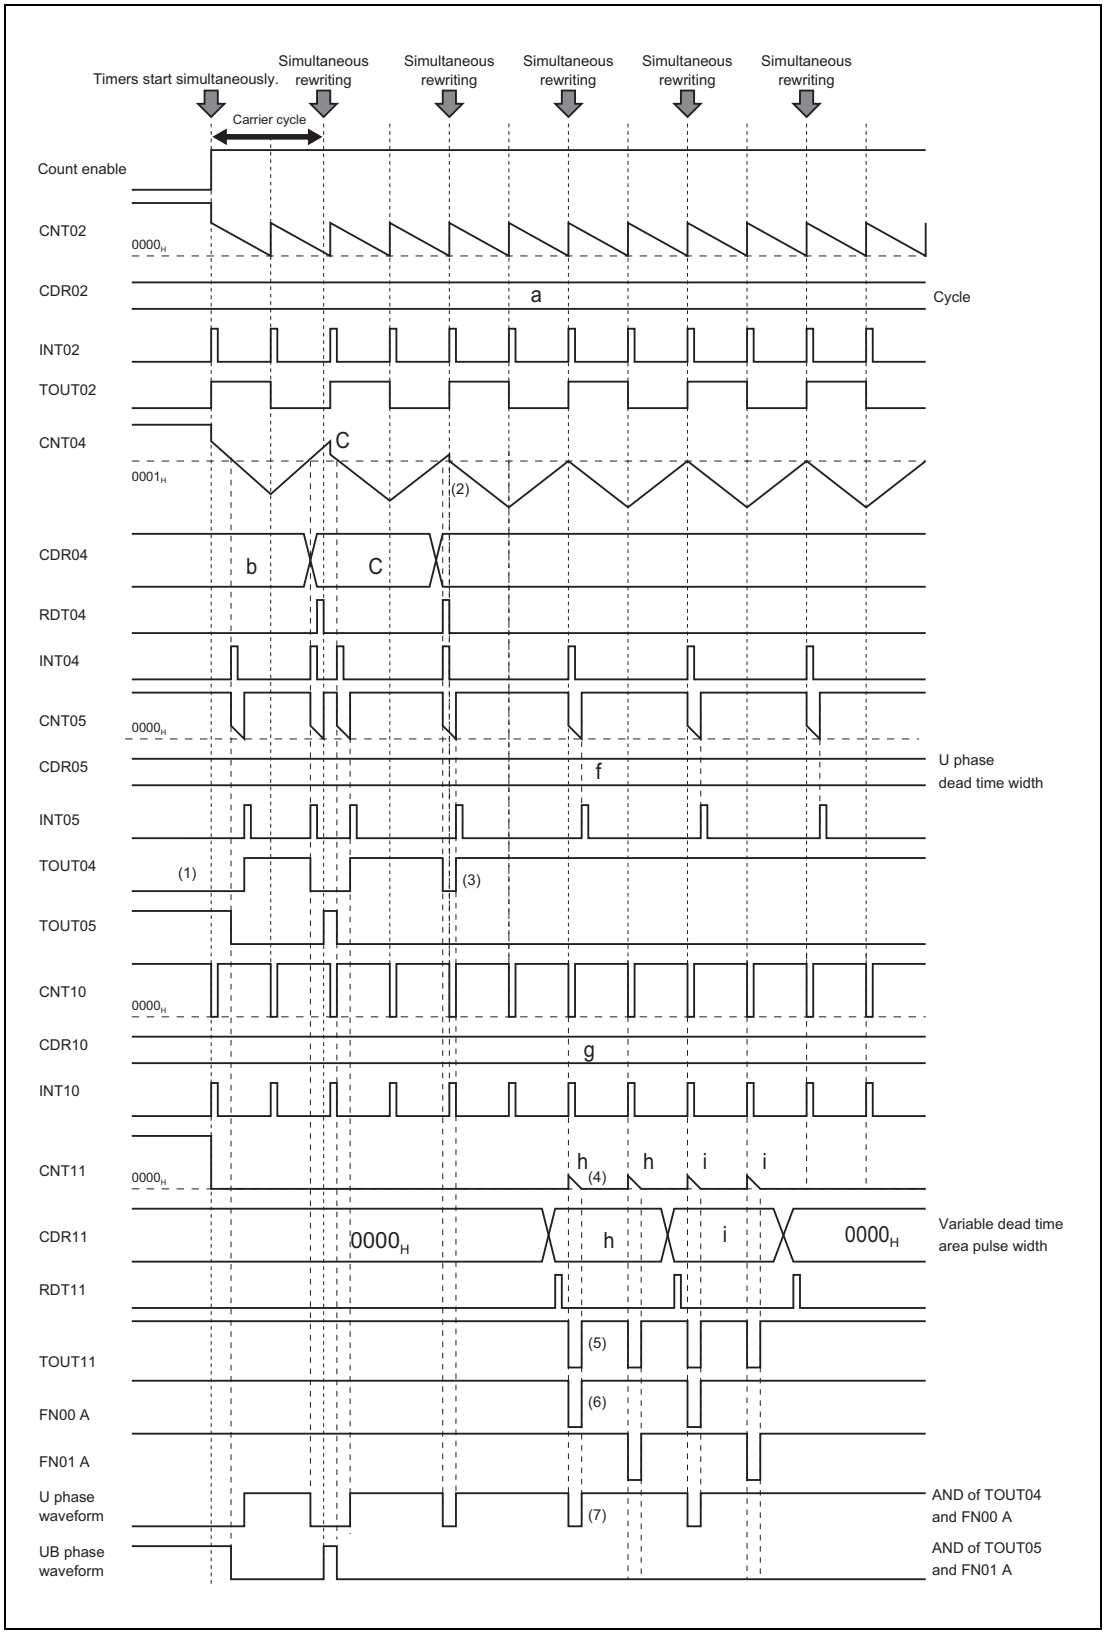


**Figure 29.37 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**

An operation example in which the system transitions to a U phase of 100% and UB phase of 0% in the timer configuration for performing the U phase PWM output shown in **Figure 29.37** is provided below. Output of a triangle PWM signal with dead time is active high.

(1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same.

(2) A U phase duty output value of 100% (CDR04 = $0000_H$) is specified for CDR04.

(3) Due to the setting in (2), TOUT04 output is the active level, and TOUT05 output is the inactive level. However, no variable dead time area pulse is output during this operation.

(4) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 one cycle after specifying the 100% U phase duty setting in (2).
For this example, the CDR11 setting is fixed to $0000_H$ until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.

(5) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.

(6) The pulse output in (5) is converted to a variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).

(7) The pulse generated in (6) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).

**CAUTION**

**If the 100% U phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the variable dead time area pulse is affected by the amount shown by (2) for the last PWM signal output from TOUT04 and shown by feature specification (1), as shown in Figure 29.37.**
**To cancel this effect, the CDR11 setting is delayed one cycle.**

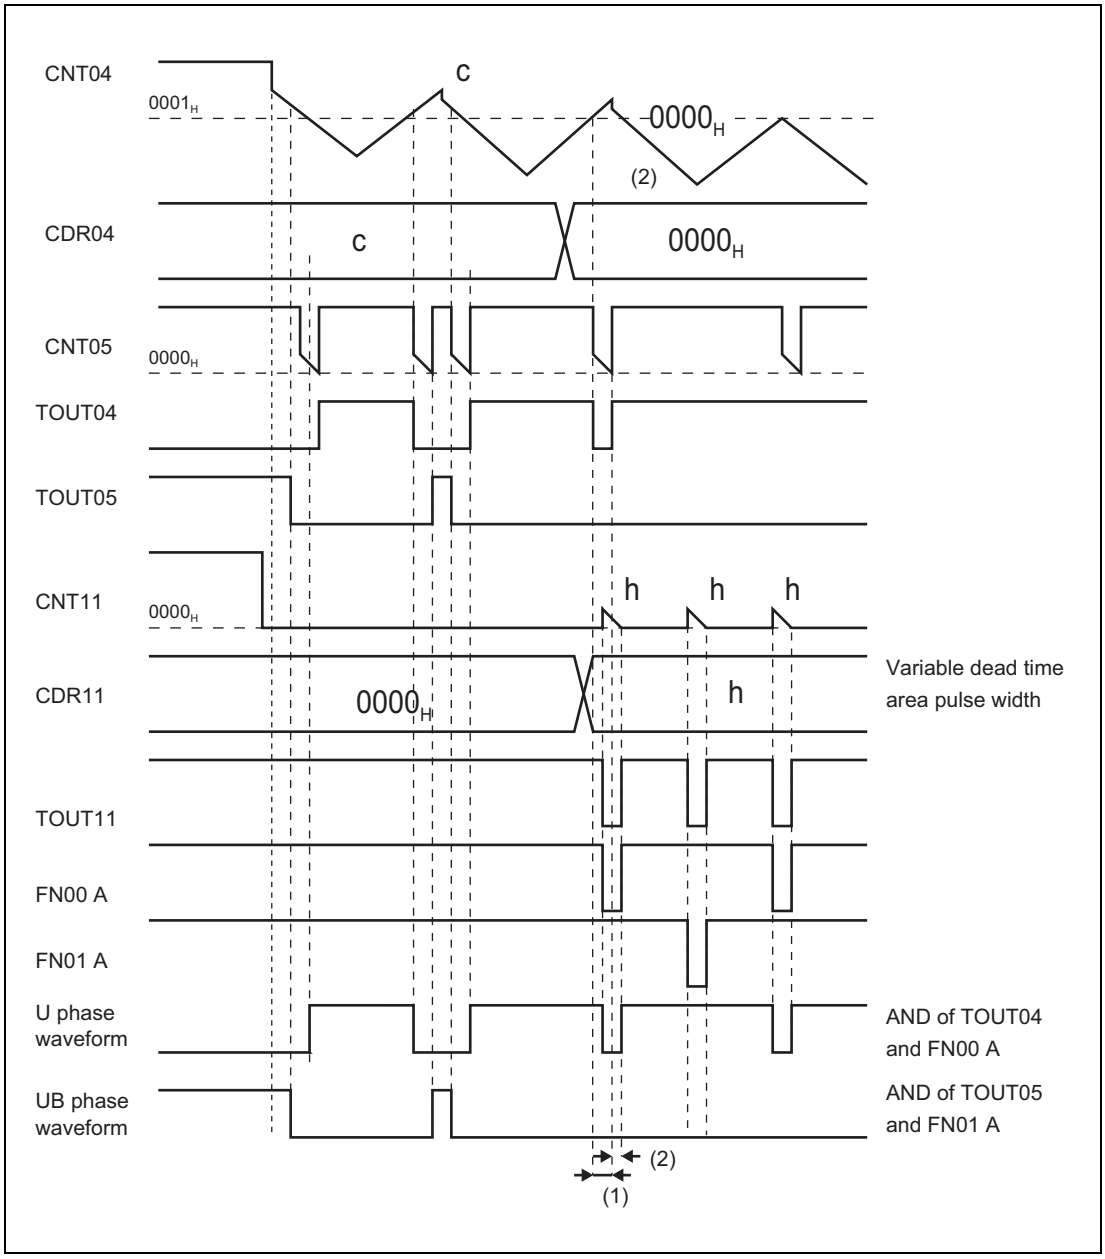

**Figure 29.38 Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse**

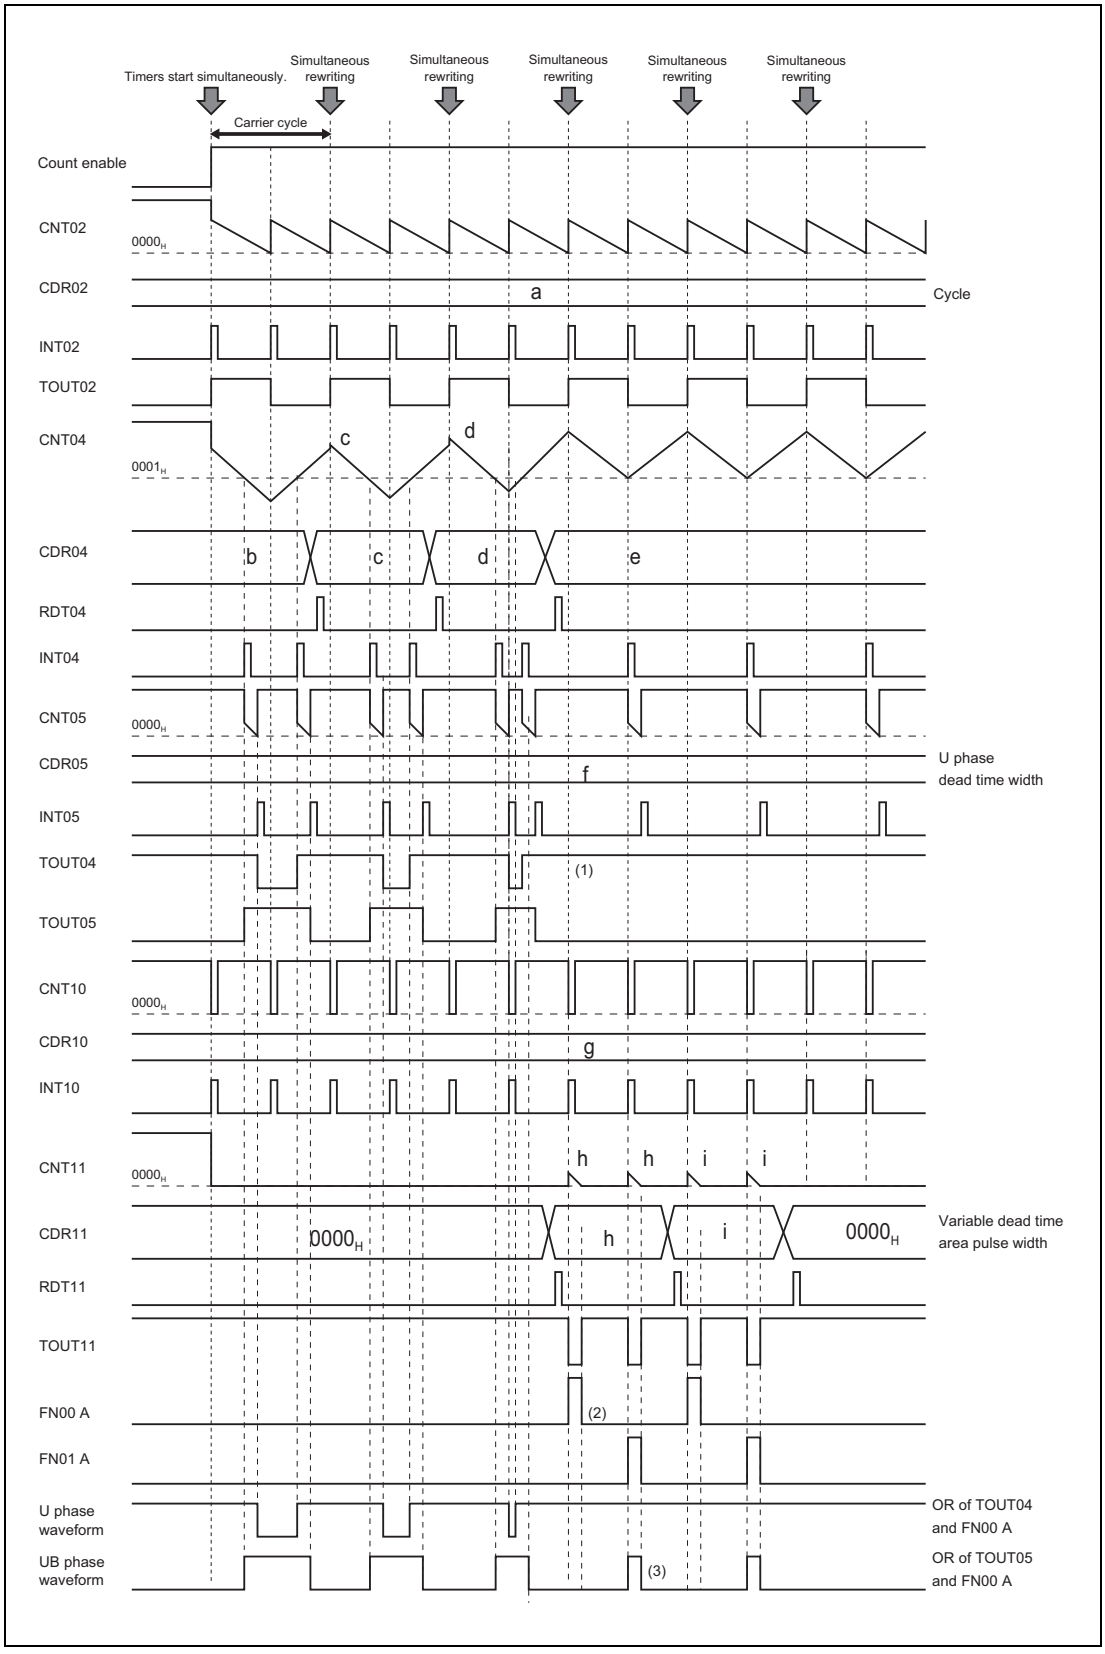

**Figure 29.39 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (TAUDnTOL04 = 1 (Active Low), TAUDnTOL05 = 1 (Active Low))**

An operation example in which the system transitions to a U phase of 100% and UB phase of 0% in the timer configuration for performing the U phase PWM output shown in **Figure 29.39** is provided below. Output of a triangle PWM signal with dead time is active low.

(1) The timer operation from the start of timer operation until the output of a triangle PWM with dead time is the same as in **Figure 29.36, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**. However, an active low PWM signal is output from TOUT04 and TOUT05.

(2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PIC0REG2n116 and PIC0REG2n117, and PIC0REG2n118 and PIC0REG2n119). This results in the output of an active low variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A).

(3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PIC0REG2n302 to PIC0REG2n300 and PIC0REG2n306 to PIC0REG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

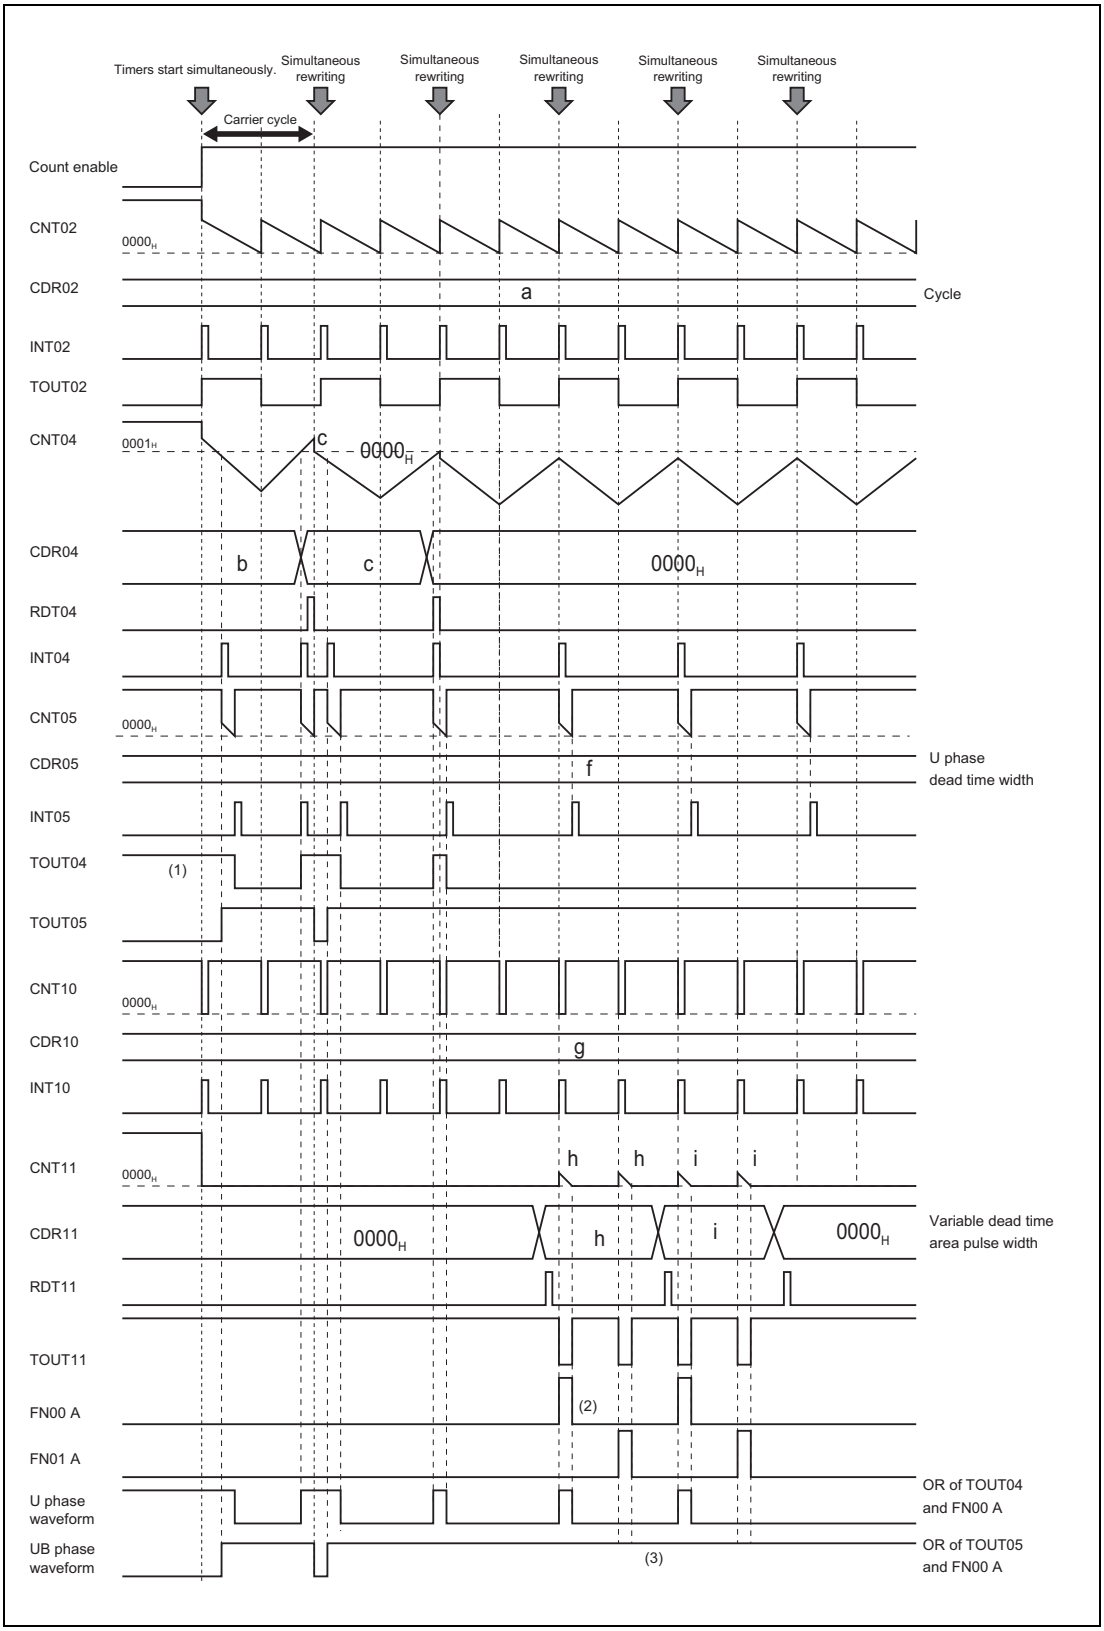

**Figure 29.40 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active Low) and TAUDnTOL05 = 0 (Active Low))**

An operation example in which the system transitions to a U phase of 0% and UB phase of 100% in the timer configuration for performing the U phase PWM output shown in **Figure 29.40** is provided below. Output of a triangle PWM signal with dead time is active low.

(1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same as in **Figure 29.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**. However, an active low PWM signal is output.

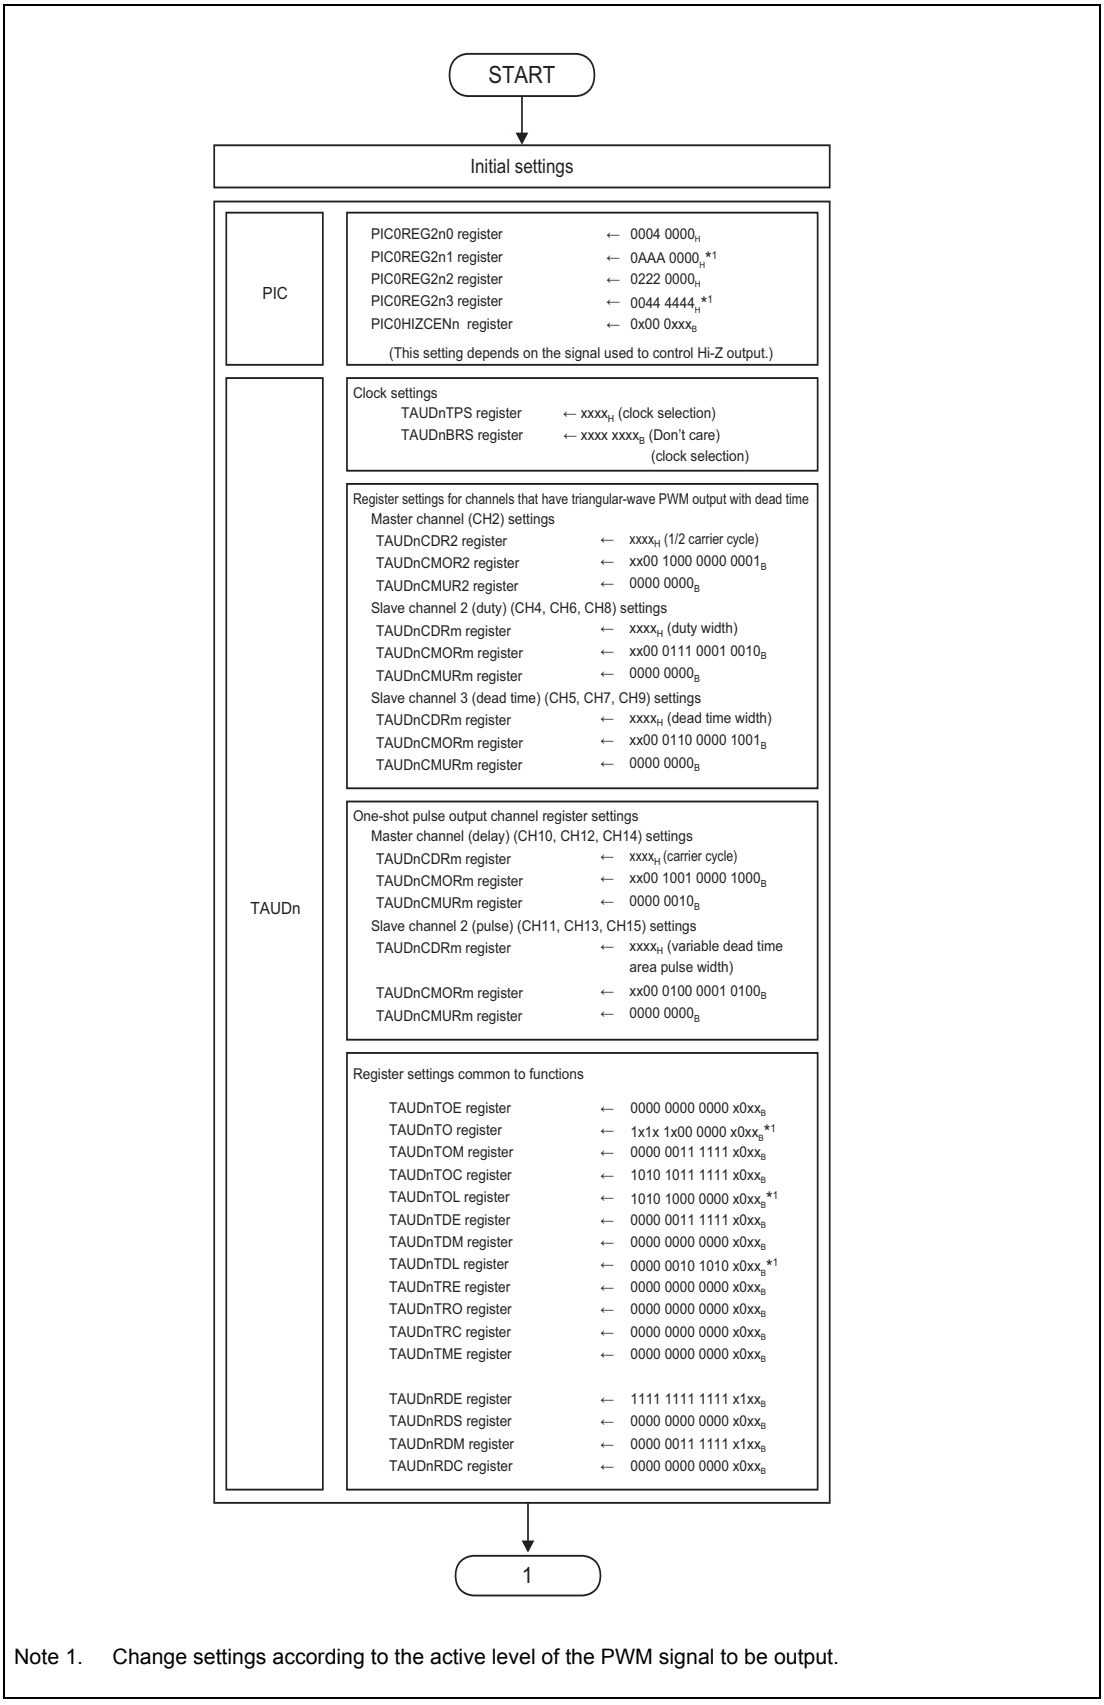
(2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PIC0REG2n116 and PIC0REG2n117, and PIC0REG2n118 and PIC0REG2n119). This results in the output of an active low variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A).

(3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PIC0REG2n302 to PIC0REG2n300 and PIC0REG2n306 to PIC0REG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

**CAUTION**

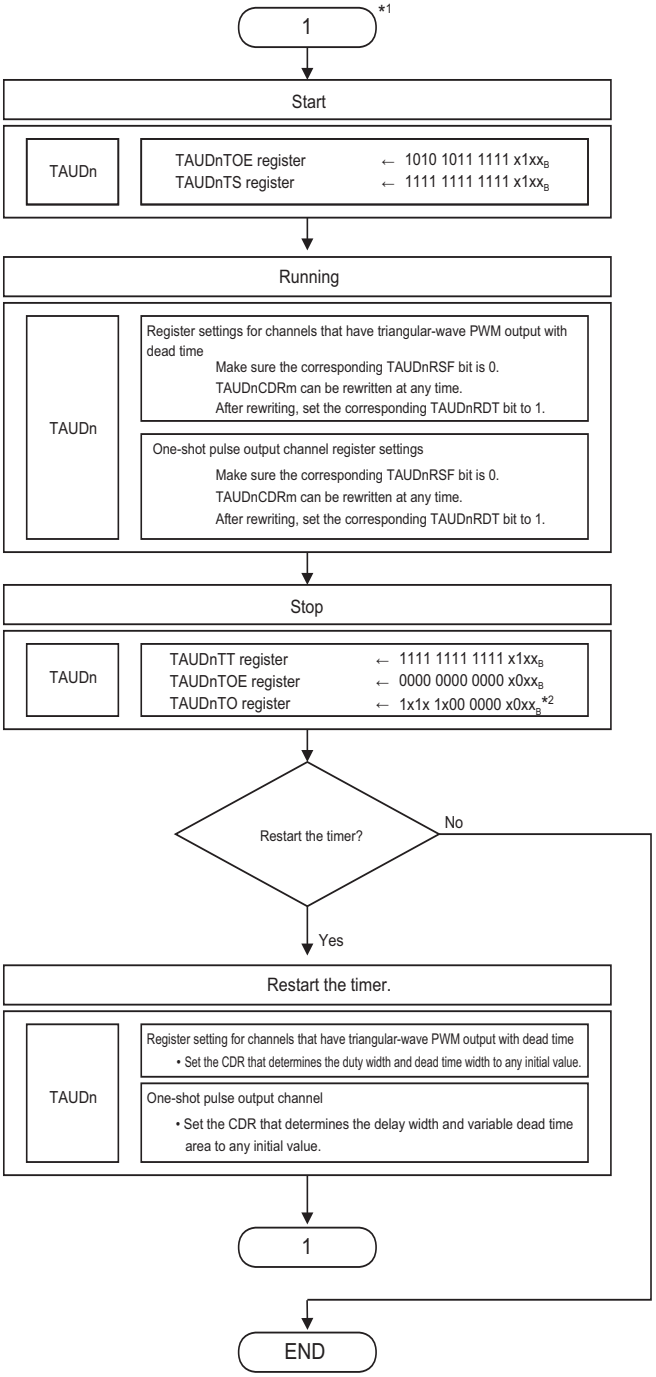
**If the 100% U phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the last PWM signal output from TOUT04 is adversely affected due to the feature specifications.**
**To cancel this effect, the CDR11 setting is delayed one cycle.**
**For details, see Figure 29.38, Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse.**

### 29.12.5 Setup Flow



Note 1. Change settings according to the active level of the PWM signal to be output.

**Figure 29.41 Setup Flow (Active High Example)**



Note 1. Specify the selection register and output port to use after specifying the initial settings for the peripheral interconnections and timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

**Figure 29.42 Setup Flow (Active High Example) (continued)**

## 29.12.6 Setting Examples for Operation Functions

This section provides example settings for each register.

### 29.12.6.1 TAUDn settings (active high example)

**Table 29.59 TAUDn: CH2-related (Master Channel Used To Output A Triangle PWM Signal with Dead Time*1)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMOR2 | 15, 14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 1 | |
| | 10 to 8 | TAUDnSTS[2:0] | 000 | |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | |
| | 4 to 1 | TAUDnMD[4:1] | 0000 | |
| | 0 | TAUDnMD0 | 1 | At the start of operation, output INTm and toggle TOUTm. |
| TAUDnCMUR2 | 1, 0 | TAUDnTIS[1:0] | 00 | Fixed |

Note 1. The master channel and slave channel names are defined for TAUD triangle PWM output with dead time. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

**NOTE**

For the TAUDnCMORm register of the master channel used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.
For this feature, set TAUDnMD0 to 1.

**Table 29.60 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Triangle PWM Signal with Dead Time*1) (m = 4, 6, or 8)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 0 | |
| | 10 to 8 | TAUDnSTS[2:0] | 111 | |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | |
| | 4 to 1 | TAUDnMD[4:1] | 1001 | |
| | 0 | TAUDnMD0 | 0 | |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 00 | |

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

**Table 29.61 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Triangle PWM Signal with Dead Time*1) (m = 5, 7, or 9)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 0 | |
| | 10 to 8 | TAUDnSTS[2:0] | 110 | |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | |
| | 4 to 1 | TAUDnMD[4:1] | 0100 | |
| | 0 | TAUDnMD0 | 1 | |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 00 | |

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

**Table 29.62 TAUDn: CH10, CH12, and CH14-related (Master Channel used to Output a One-shot Pulse*1) (m = 10, 12, or 14)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 1 | |
| | 10 to 8 | TAUDnSTS[2:0] | 001 | |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | |
| | 4 to 1 | TAUDnMD[4:1] | 0100 | |
| | 0 | TAUDnMD0 | 0 | Disable start triggers during counting. |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 10 | Detect both rising and falling edges as valid. |

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

**Table 29.63 TAUDn: CH11, CH13, and CH15-related (Slave Channel used to Output a One-Shot Pulse*1) (m = 11, 13, or 15)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 0 | |
| | 10 to 8 | TAUDnSTS[2:0] | 100 | |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | |
| | 4 to 1 | TAUDnMD[4:1] | 1010 | |
| | 0 | TAUDnMD0 | 0 | Disable start triggers during counting. |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 00 | |

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel. Specify the same clock setting as for the master channel (CH2) used to output a triangle PWM signal with dead time.

**NOTE**

For the TAUDnCMORm register used during one-shot pulse output, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.
For this feature clear TAUDnMD0 to 0.

**Table 29.64 Common TAUDn Channel Settings (1/4)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnTOE | 15 | TAUDnTOE15 | 0<br>1 | Disable the timer.<br>Enable the timer. |

**Table 29.64 Common TAUDn Channel Settings (3/4)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnTDE | 15 to 10 | TAUDnTDE15 to TAUDnTDE10 | 0 | Disable dead time control. |
| | 9 to 4 | TAUDnTDE09 to TAUDnTDE04 | 1 | Enable dead time control.*2 |
| | 3 | TAUDnTDE03 | Don't care | |
| | 2 | TAUDnTDE02 | 0 | Disable dead time control. |
| | 1, 0 | TAUDnTDE01 TAUDnTDE00 | Don't care | |
| TAUDnTDM | 15 to 9 | TAUDnTDM15 to TAUDnTDM09 | 0 | |
| | 3 | TAUDnTDM03 | Don't care | |
| | 2 | TAUDnTDM02 | 0 | Invalid because dead time control is disabled. |
| | 1, 0 | TAUDnTDM01 TAUDnTDM00 | Don't care | |
| TAUDnTDL | 15 to 10 | TAUDnTDL15 to TAUDnTDL10 | 0 | Invalid because dead time control is disabled. |
| | 9 | TAUDnTDL09 | 1*1 | Dead time is in the negative segment of the W phase output |
| | 8 | TAUDnTDL08 | 0*1 | Dead time is in the positive segment of the W phase output |
| | 7 | TAUDnTDL07 | 1*1 | Dead time is in the negative segment of the V phase output |
| | 6 | TAUDnTDL06 | 0*1 | Dead time is in the positive segment of the V phase output |
| | 5 | TAUDnTDL05 | 1*1 | Dead time is in the negative segment of the U phase output |
| | 4 | TAUDnTDL04 | 0*1 | Dead time is in the positive segment of the U phase output |
| | 3 | TAUDnTDL03 | Don't care | |
| | 2 | TAUDnTDL02 | 0 | Invalid because dead time control is disabled. |
| | 1, 0 | TAUDnTDL01 TAUDnTDL00 | Don't care | |
| TAUDnTRE | 15 to 4 | TAUDnTRE15 to TAUDnTRE04 | 0 | Disable real-time output. |
| | 3 | TAUDnTRE03 | Don't care | |
| | 2 | TAUDnTRE02 | 0 | Disable real-time output. |
| | 1, 0 | TAUDnTRE01 TAUDnTRE00 | Don't care | |
| TAUDnTRO | 15 to 4 | TAUDnTRO15 to TAUDnTRO04 | 0 | Invalid because real-time output is disabled. |
| | 3 | TAUDnTRO03 | Don't care | |
| | 2 | TAUDnTRO02 | 0 | Invalid because real-time output is disabled. |
| | 1, 0 | TAUDnTRO01 TAUDnTRO00 | Don't care | |
| TAUDnTRC | 15 to 4 | TAUDnTRC15 to TAUDnTRC04 | 0 | Do not use this channel to generate the real-time output trigger. |
| | 3 | TAUDnTRC03 | Don't care | |
| | 2 | TAUDnTRC02 | 0 | Do not use this channel to generate the real-time output trigger. |
| | 1, 0 | TAUDnTRC01 TAUDnTRC00 | Don't care | |

**Table 29.64 Common TAUDn Channel Settings (4/4)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnTME | 15 to 4 | TAUDnTME15 to TAUDnTME04 | 0 | Disable modulation output for timer output and real-time output. |
| | 3 | TAUDnTME03 | Don't care | |
| | 2 | TAUDnTME02 | 0 | Disable modulation output for timer output and real-time output. |
| | 1, 0 | TAUDnTME01 TAUDnTME00 | Don't care | |
| TAUDnRDE | 15 to 4 | TAUDnRDE15 to TAUDnRDE04 | 1 | Enable simultaneous rewriting. |
| | 3 | TAUDnRDE03 | Don't care | |
| | 2 | TAUDnRDE02 | 1 | Enable simultaneous rewriting. |
| | 1, 0 | TAUDnRDE01 TAUDnRDE00 | Don't care | |
| TAUDnRDS | 15 to 4 | TAUDnRDS15 to TAUDnRDS04 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
| | 3 | TAUDnRDS03 | Don't care | |
| | 2 | TAUDnRDS02 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
| | 1, 0 | TAUDnRDS01 TAUDnRDS00 | Don't care | |
| TAUDnRDM | 15 to 10 | TAUDnRDM15 to TAUDnRDM10 | 0 | Perform simultaneous rewriting when the master channel starts counting. |
| | 9 to 4 | TAUDnRDM09 to TAUDnRDM04 | 1 | Perform simultaneous rewriting after the master channel starts counting when there is a peak in the triangle wave on the corresponding slave channel. |
| | 3 | TAUDnRDM03 | Don't care | |
| | 2 | TAUDnRDM02 | 1 | Perform simultaneous rewriting after the master channel starts counting when there is a peak in the triangle wave on the corresponding slave channel. |
| | 1, 0 | TAUDnRDM01 TAUDnRDM00 | Don't care | |
| TAUDnRDC | 15 to 4 | TAUDnRDC15 to TAUDnRDC04 | 0 | Do not use this channel to generate the simultaneous rewrite trigger. |
| | 3 | TAUDnRDC03 | Don't care | |
| | 2 | TAUDnRDC02 | 0 | Do not use this channel to generate the simultaneous rewrite trigger. |
| | 1, 0 | TAUDnRDC01 TAUDnRDC00 | Don't care | |

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 25, Timer Array Unit D (TAUD)**.

### 29.12.6.2 PIC Settings (Active High Example)

Table 29.65 PIC Settings

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| PIC0REG2n0 | 18 | PIC0REG2n018 | 1 | Select the TOUT signal of CH2 of TAUDn. |

# 29.13 Delay Pulse Output with Dead Time

## 29.13.1 Functional Overview

This feature outputs a three-phase PWM with dead time that is later than the cycle timing by an amount equal to the delay amount.

Unlike the function of three-phase PWM output with dead time, a PWM signal that has a reset in the next cycle can be output.

## 29.13.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0, m = 0 to 15)

**Table 29.66 Configuration of Delay Pulse Output with Dead Time**

| Timer | Timer motor control function |
|---|---|
| TAUD0 CH2 to CH15 (used channels fixed) | TAPA0 |

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)

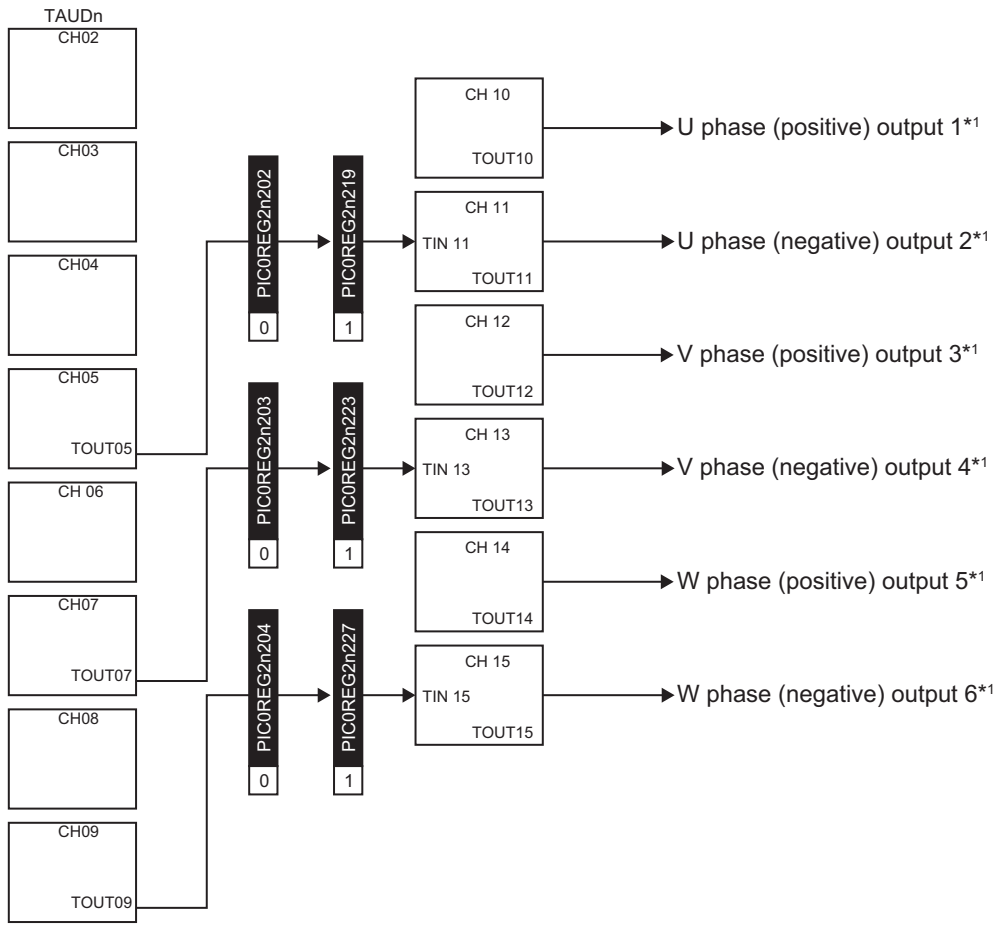
### 29.13.2.1 TAUDn configuration

Because the CDRm value of CH3 does not affect TOUT0 to TOUT15, the INTm signal of CH3 can also be used for other purposes such as A/D conversion trigger generation.

**Table 29.67 TAUDn configuration**

| CH | Function name | M/S*1 | CDR setting | Description |
|---|---|---|---|---|
| 2 | Delay pulse output function (CH2 is the master channel for CH3 to CH9.) | M | Cycle | |
| 3 | | S | | Reserved |
| 4 | | S | Delay (U phase) | |
| 5 | | S | Pulse width (U phase) | |
| 6 | | S | Delay (V phase) | |
| 7 | | S | Pulse width (V phase) | |
| 8 | | S | Delay (W phase) | |
| 9 | | S | Pulse width (W phase) | |
| 10 | Any feature that does not use TOUTm | S | | TOUT: U phase output |
| 11 | One-phase PWM output | S | Dead time (U phase) | TOUT: UB phase output |
| 12 | Any feature that does not use TOUTm | S | | TOUT: V phase output |
| 13 | One-phase PWM output | S | Dead time (V phase) | TOUT: VB phase output |
| 14 | Any feature that does not use TOUTm | S | | TOUT: W phase output |
| 15 | One-phase PWM output | S | Dead time (W phase) | TOUT: WB phase output |

Note 1. M: Master channel, S: Slave channel



Note 1. For the connection destination, see **Figure 29.25, Block Diagram: Motor Output Buffer Control**.

**Figure 29.43 Block Diagram: Delay Pulse Output with Dead Time**

## 29.13.3 Registers

### 29.13.3.1 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0)

This register selects CHm input signals of the TAUDn timer. This section describes the bits to be used in the delay pulse output with dead time.

**Access:** This register can be read or written in 32-bit units.

**Address:** PIC0REG202: FFDD 00C8$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PIC0REG2n227 | — | — | — | PIC0REG2n223 | — | — | — | PIC0REG2n219 | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | PIC0REG2n204 | PIC0REG2n203 | PIC0REG2n202 | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R | R |

**Table 29.68 PIC0REG2n2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | Reserved | *1 |
| 27 | PIC0REG2n227 | Select the TIN input signal to TAUDTTIN15.<br>**PIC0REG2n227** / **Input signal**<br>1 / Signal selected by the PIC0REG2n204 bit<br>Other than above / Setting prohibited |
| 26 to 24 | Reserved | *1 |

| 22 to 20 | Reserved | *1 |
| 19 | PIC0REG2n219 | Select the TIN input signal to TAUDTTIN11.<br>**PIC0REG2n219** / **Input signal**<br>1 / Signal selected by the PIC0REG2n202 bit<br>Other than above / Setting prohibited |
| 18 to 5 | Reserved | *1 |
| 4 | PIC0REG2n204 | Select the signal supplied to TAUDTTIN15.<br>0: Select TAUDTTOUT9.<br>1: Setting prohibited |
| 3 | PIC0REG2n203 | Select the signal supplied to TAUDTTIN13.<br>0: Select TAUDTTOUT7.<br>1: Setting prohibited |
| 2 | PIC0REG2n202 | Select the signal supplied to TAUDTTIN11.<br>0: Select TAUDTTOUT5.<br>1: Setting prohibited |
| 1, 0 | Reserved | *1 |

Note 1. Some of the bits defined as 0 in the PIC0REG2n2 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

### 29.13.3.2 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0)

This register selects the Hi-Z output control input signal of TAPAn.

**Access:** This register can be read or written in 8-bit units.

**Address:** PIC0HIZCEN0: FFDD $0080_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | PIC0HIZCENn6 | — | — | — | PIC0HIZCENn2 | — | PIC0HIZCENn0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R | R | R | R/W | R | R/W |

**Table 29.69 PIC0HIZCENn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 6 | PIC0HIZCENn6 | Select whether to enable or disable Hi-Z output control by the INTADCA0ERR interrupt signal.<br>0: Disable<br>1: Enable |
| 5 to 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

### 29.13.4 Operation Example

This is achieved by combining the following TAUD features:

- Delay pulse output function
- One-phase PWM output

The delay pulse output feature generates a PWM signal that is later than the cycle timing by an amount equal to the delay amount. Next, a one-phase PWM signal to which dead time has been added is output for the delayed PWM signal by one-phase PWM output feature.

A delay pulse with dead time is output by assigning the PWM output achieved using the above features to the U, V, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference between phases is the assigned channel, only one phase (the U phase) is described below.

#### 29.13.4.1 Delay pulse output function

By using a combination of CH2, CH4, and CH5, a basic PWM signal for one-phase PWM is output from TOUT05 delayed by the amount specified by CH4 with respect to the cycle specified by CH2.

Note that CH3 is a reserved timer for achieving this feature, so do not use it for other features.

**CAUTION**

**Do not specify a delay amount that exceeds the cycle.**

#### 29.13.4.2 One-phase PWM output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.

By specifying the dead time value for CDR11, a one-phase PWM with dead time is output for the TIN11 input.

Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM with dead time, while the W phase uses CH14 and CH15.

**CAUTION**

**Specify the same clock for each TAUDn channel that uses the delay pulse output and one-phase PWM output features.**

For details about the TAUD functions, see **Section 25, Timer Array Unit D (TAUD)**.

The differences between the delay pulse output with dead time and the three-phase PWM output with dead time are described below.

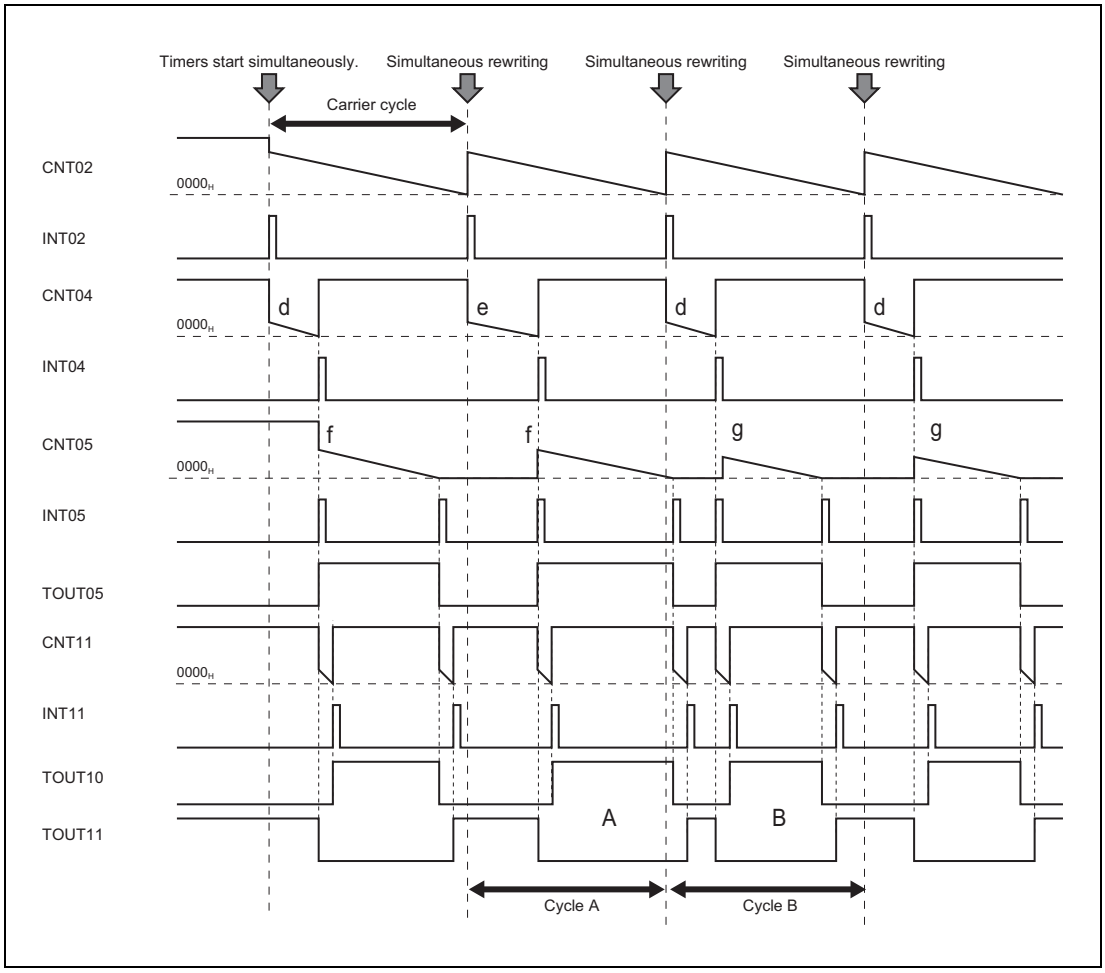

**Figure 29.44 PWM Output by Outputting a Delay Pulse with Dead Time**

In **Figure 29.44**, PWM waveform A is supposed to be output before cycle A ends, but because the delay timing is too long, the PWM clear position is after the end of cycle A. Next, PWM waveform B, which is for cycle B, is output.

The operations shown below occur when an attempt is made to achieve the operations shown in **Figure 29.44, PWM Output by Outputting a Delay Pulse with Dead Time** by the three-phase PWM output with dead time.

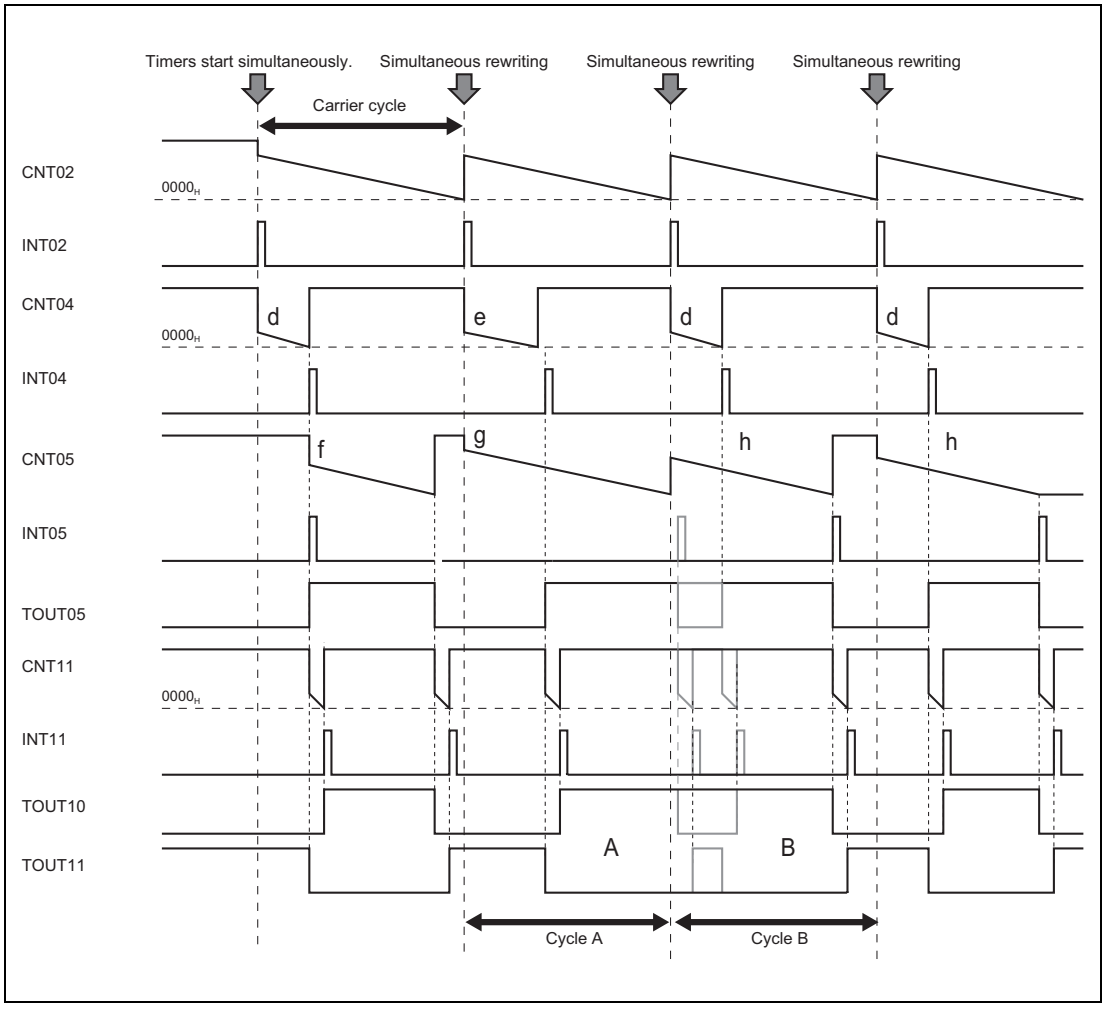

**Figure 29.45 Output of a Three-Phase PWM Signal with Dead Time (1)**

**Figure 29.45** shows an example in which the output PWM signal does not end before carrier cycle A because the set timing for outputting a three-phase PWM signal with dead time is delayed and the clear timing is after the end of the carrier cycle.

For cycle A, the set timing of PWM waveform A is the same as that in the figure on the previous page, but because the clear timing is after the end of cycle A, a reload operation occurs in cycle A before PWM waveform A is cleared, and the clear timing for PWM waveform A does not occur.

In addition, the set timing of PWM waveform B for cycle B is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle B, and a waveform that combines PWM waveform A and PWM waveform B is output.

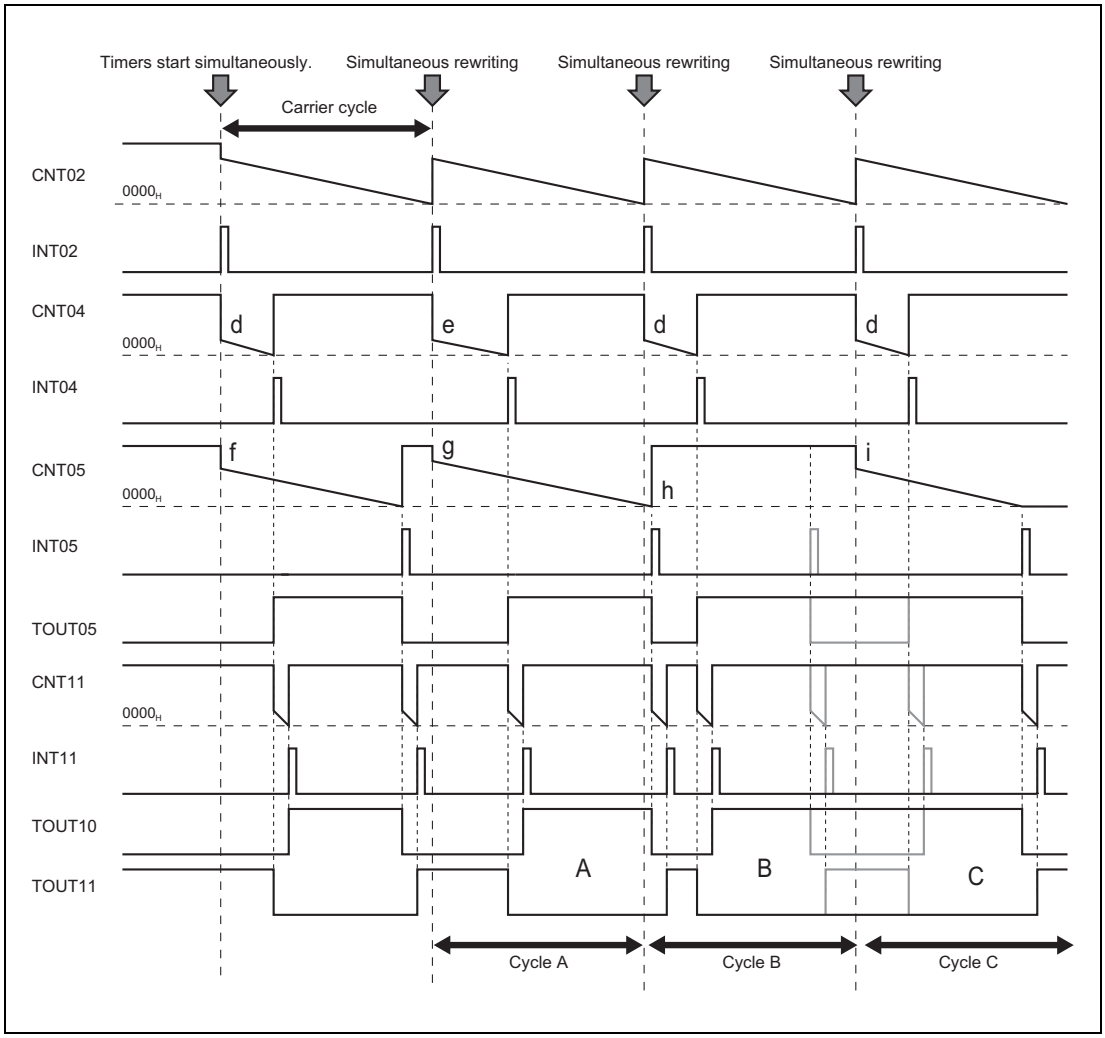

**Figure 29.46 Output of a Three-Phase PWM Signal with Dead Time (2)**

**Figure 29.46** shows an example of outputting a three-phase PWM signal with dead time in which counter operation for which the clear timing is longer than cycle A is continued in cycle B, and PWM output A is cleared at the beginning of cycle B.

The output of PWM waveform A for cycle A is the same as the output of a delay pulse with dead time, but because the clear timing is used at the beginning of cycle B, the clear timing of PWM output B, which is supposed to be output during cycle B, does not occur.

In addition, the set timing of PWM waveform C for cycle C is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle C, and a waveform that combines PWM waveform B and PWM waveform C is output.

In this way, it is possible to achieve freer PWM output timing when outputting a delay pulse with dead time than when outputting a three-phase PWM signal with dead time.

The peripheral interconnections provide a connection for using the PWM output timing of delay pulse output as input for one-phase PWM output.

**Figure 29.47** shows a timing chart for outputting a delay pulse with dead time.

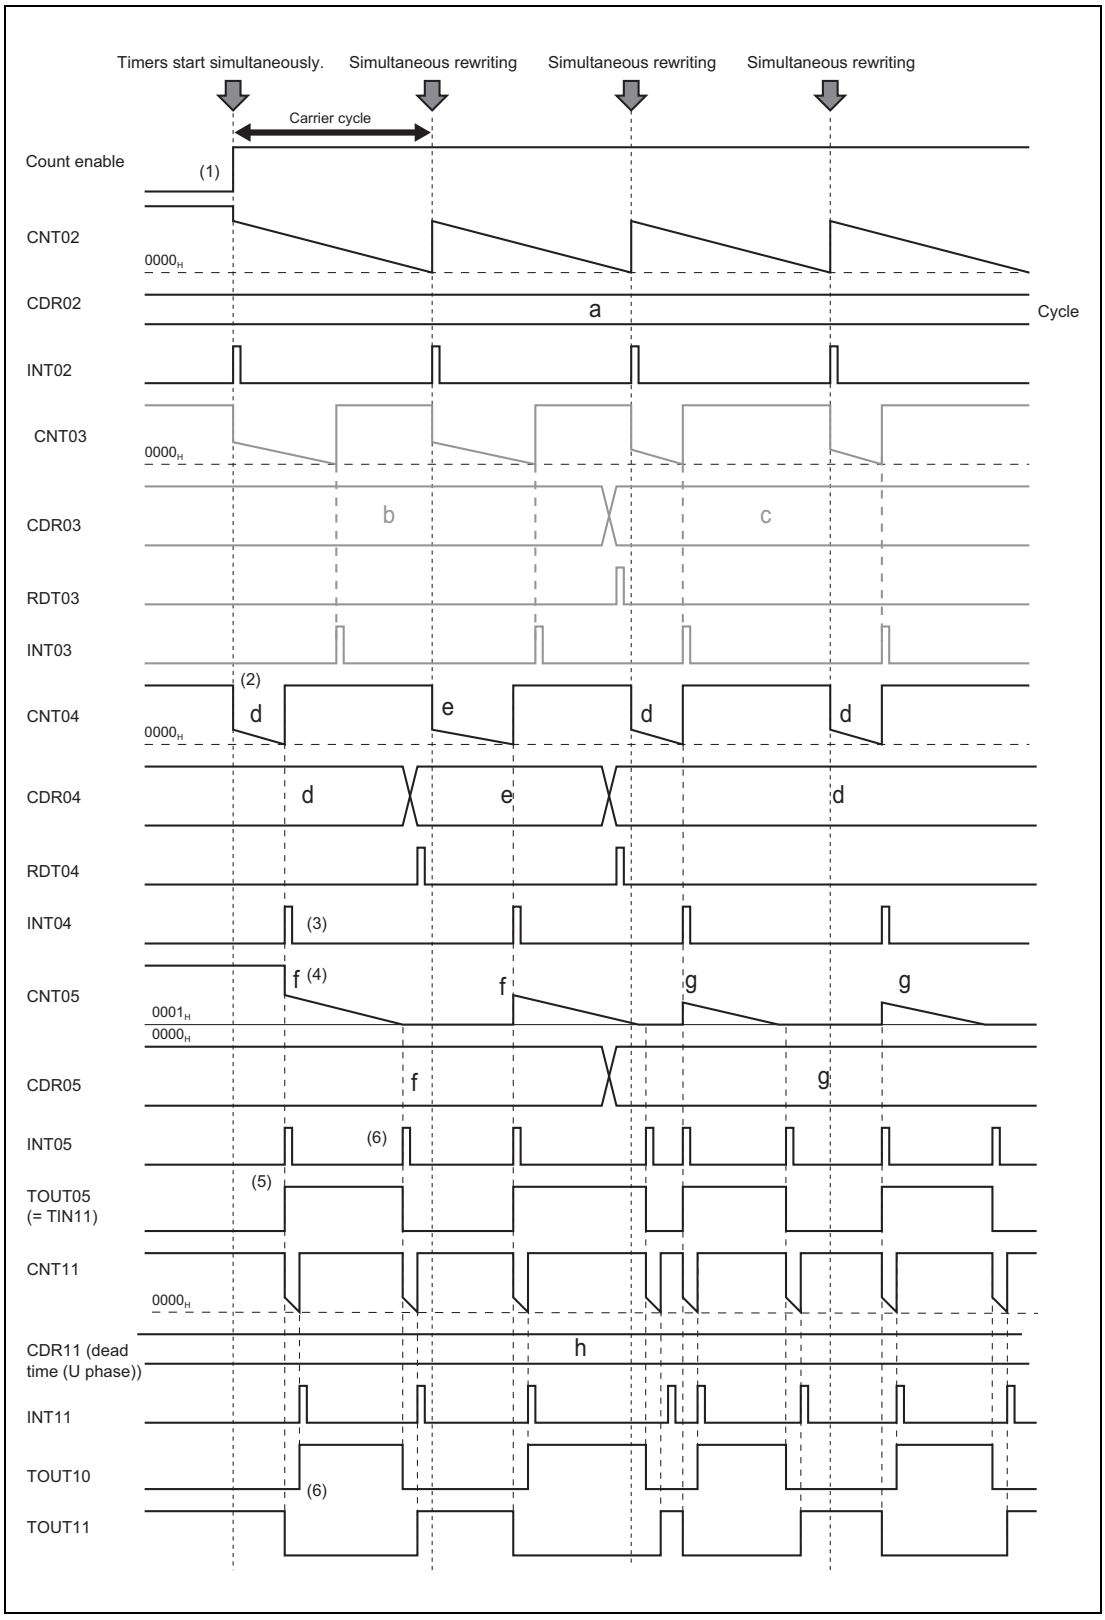

**Figure 29.47 Output of a Delay Pulse with Dead Time**

The output of a delay pulse with dead time shown in **Figure 29.47** is described below.

(1) CH2 (the carrier cycle timer) and CH4 (the delay timing timer) are started simultaneously by starting timers simultaneously.
CH5 (the PWM duty timer) and CH11 (the dead time timer) are also enabled, but no counting operations are performed until the edges of INT04, which indicates the count start timing for CH5, and TIN11, which indicates the count start timing for CH11, are detected.
Because CH3 does not affect PWM output for this function, the channel is not described.

(2) For CH4, when there is a CH2 underflow, the settings from CDR04 are reloaded to CNT04.

(3) The CH4 underflow generates the delay timing signal (INT04).

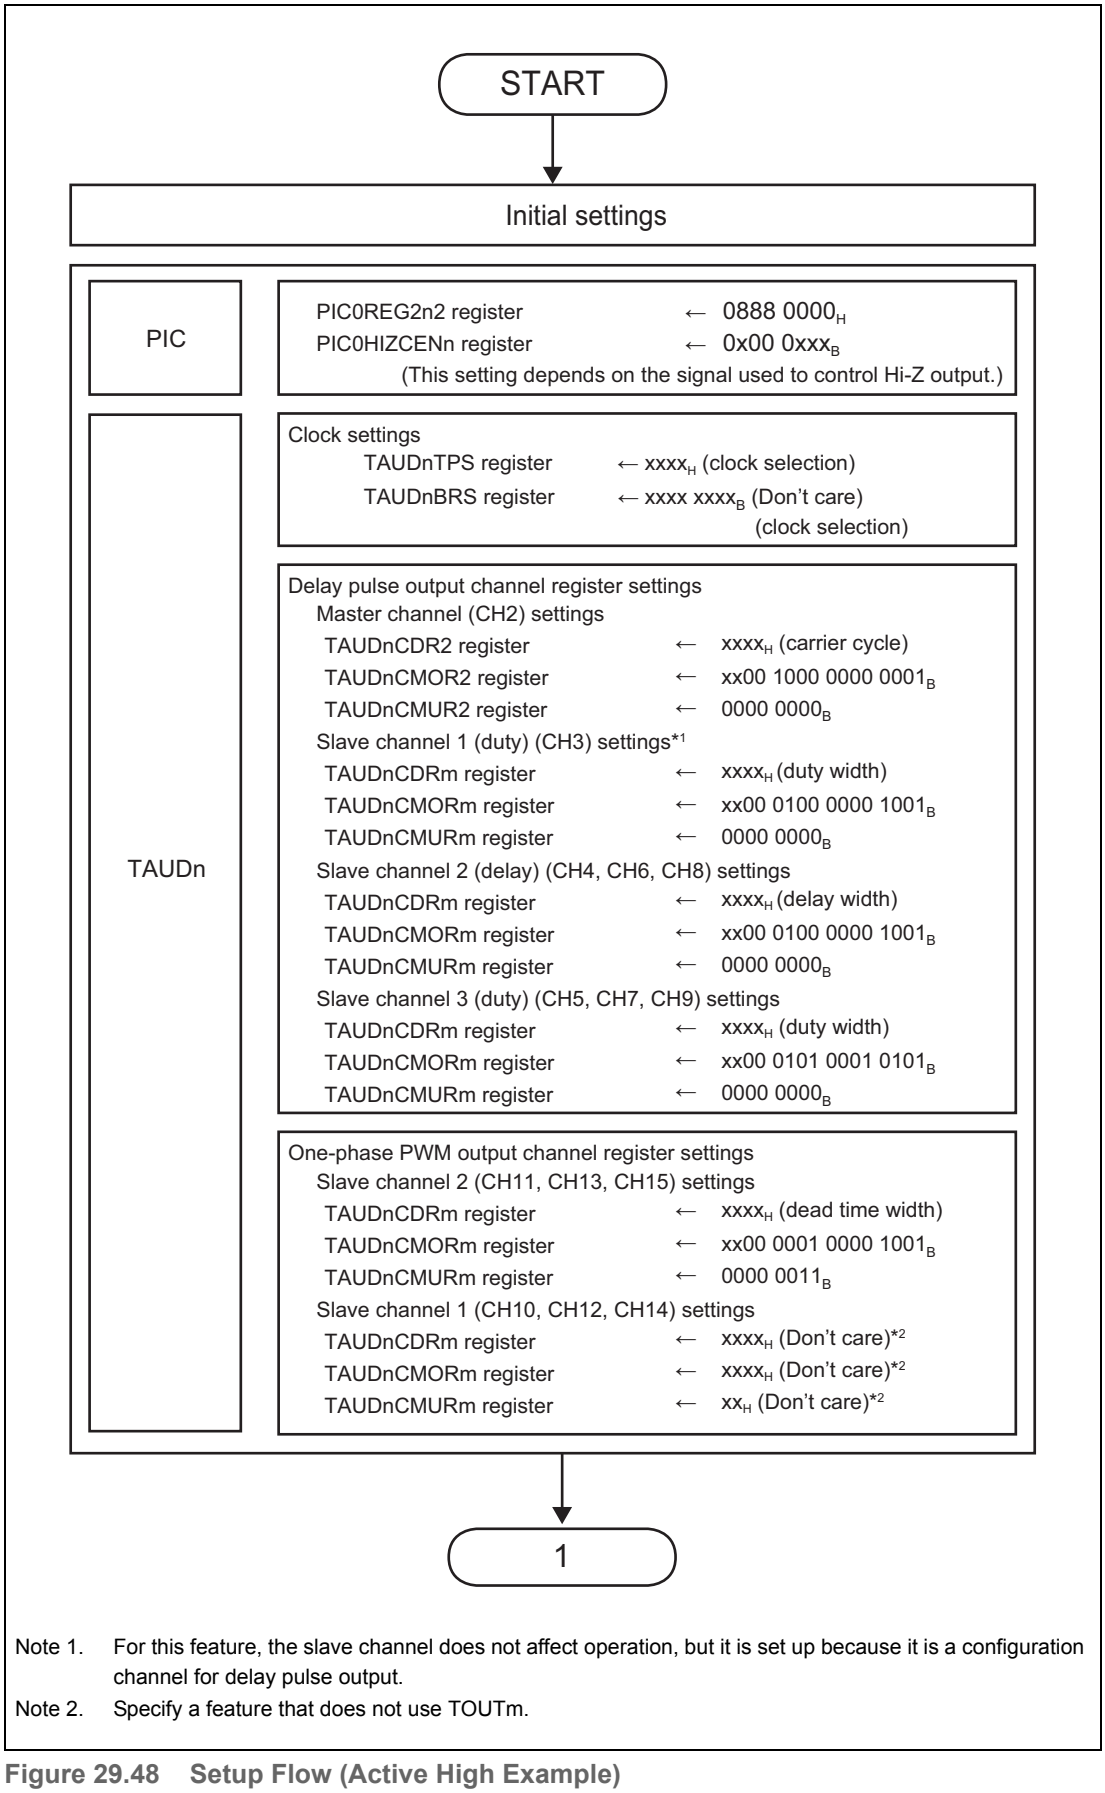
(4) When INT04 is generated, the settings from CDR05 are reloaded to CNT05, and then the CH5 (the PWM duty timer) operation starts.

(5) At this time, INT05 is generated and the TOUT05 output level changes to the active level.

(6) Due to the CH5 underflow, INT05 is generated again, and TOUT05 changes to the inactive level. TOUT05, which is changed by the CH4 and CH5 underflow, is supplied to the TIN11 input of one-phase PWM output.

(7) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.

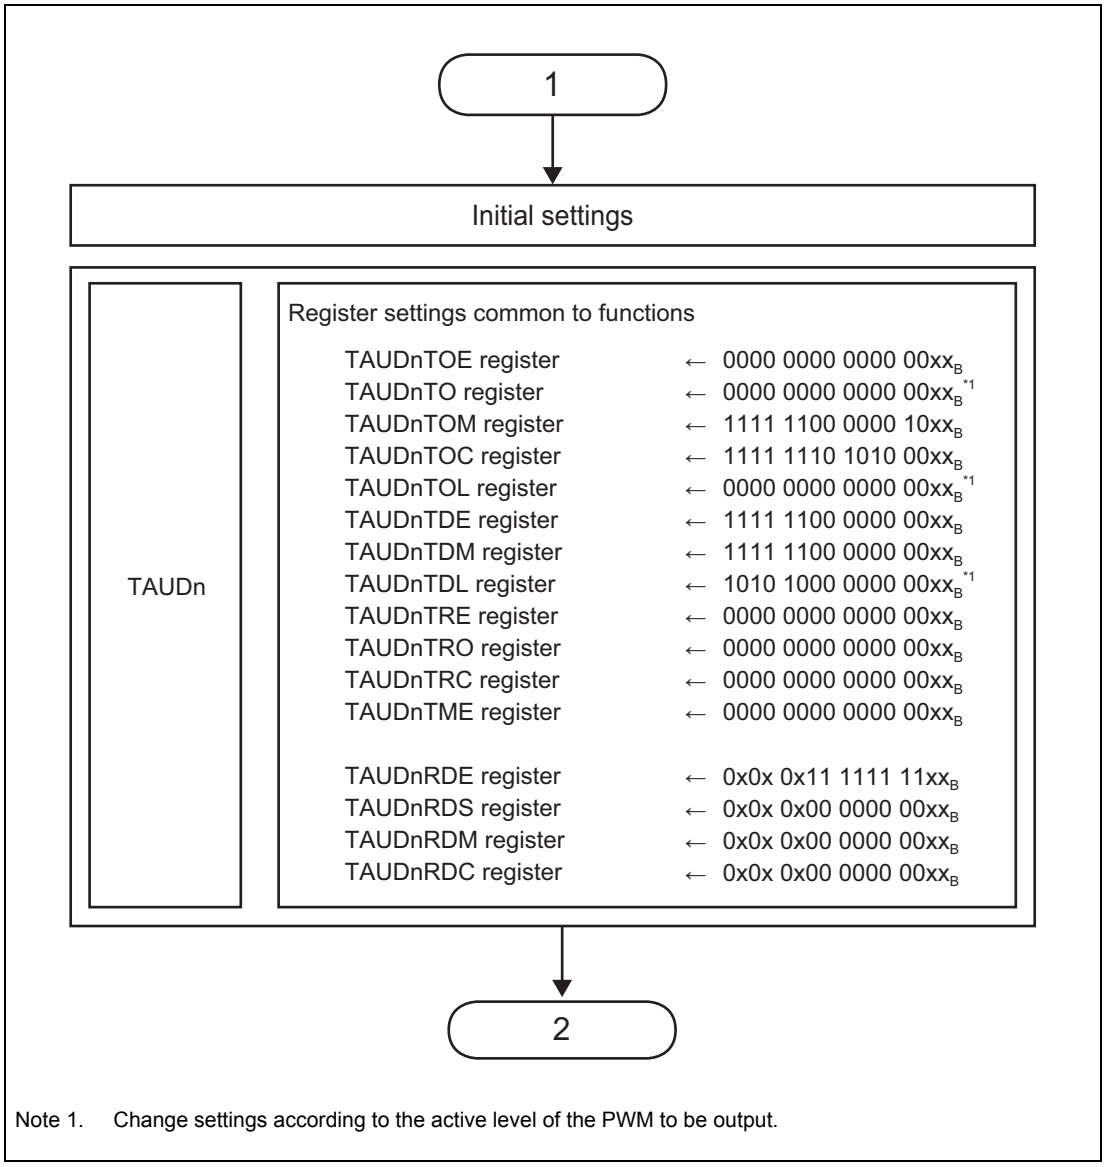
### 29.13.5 Setup Flow



Note 1. For this feature, the slave channel does not affect operation, but it is set up because it is a configuration channel for delay pulse output.

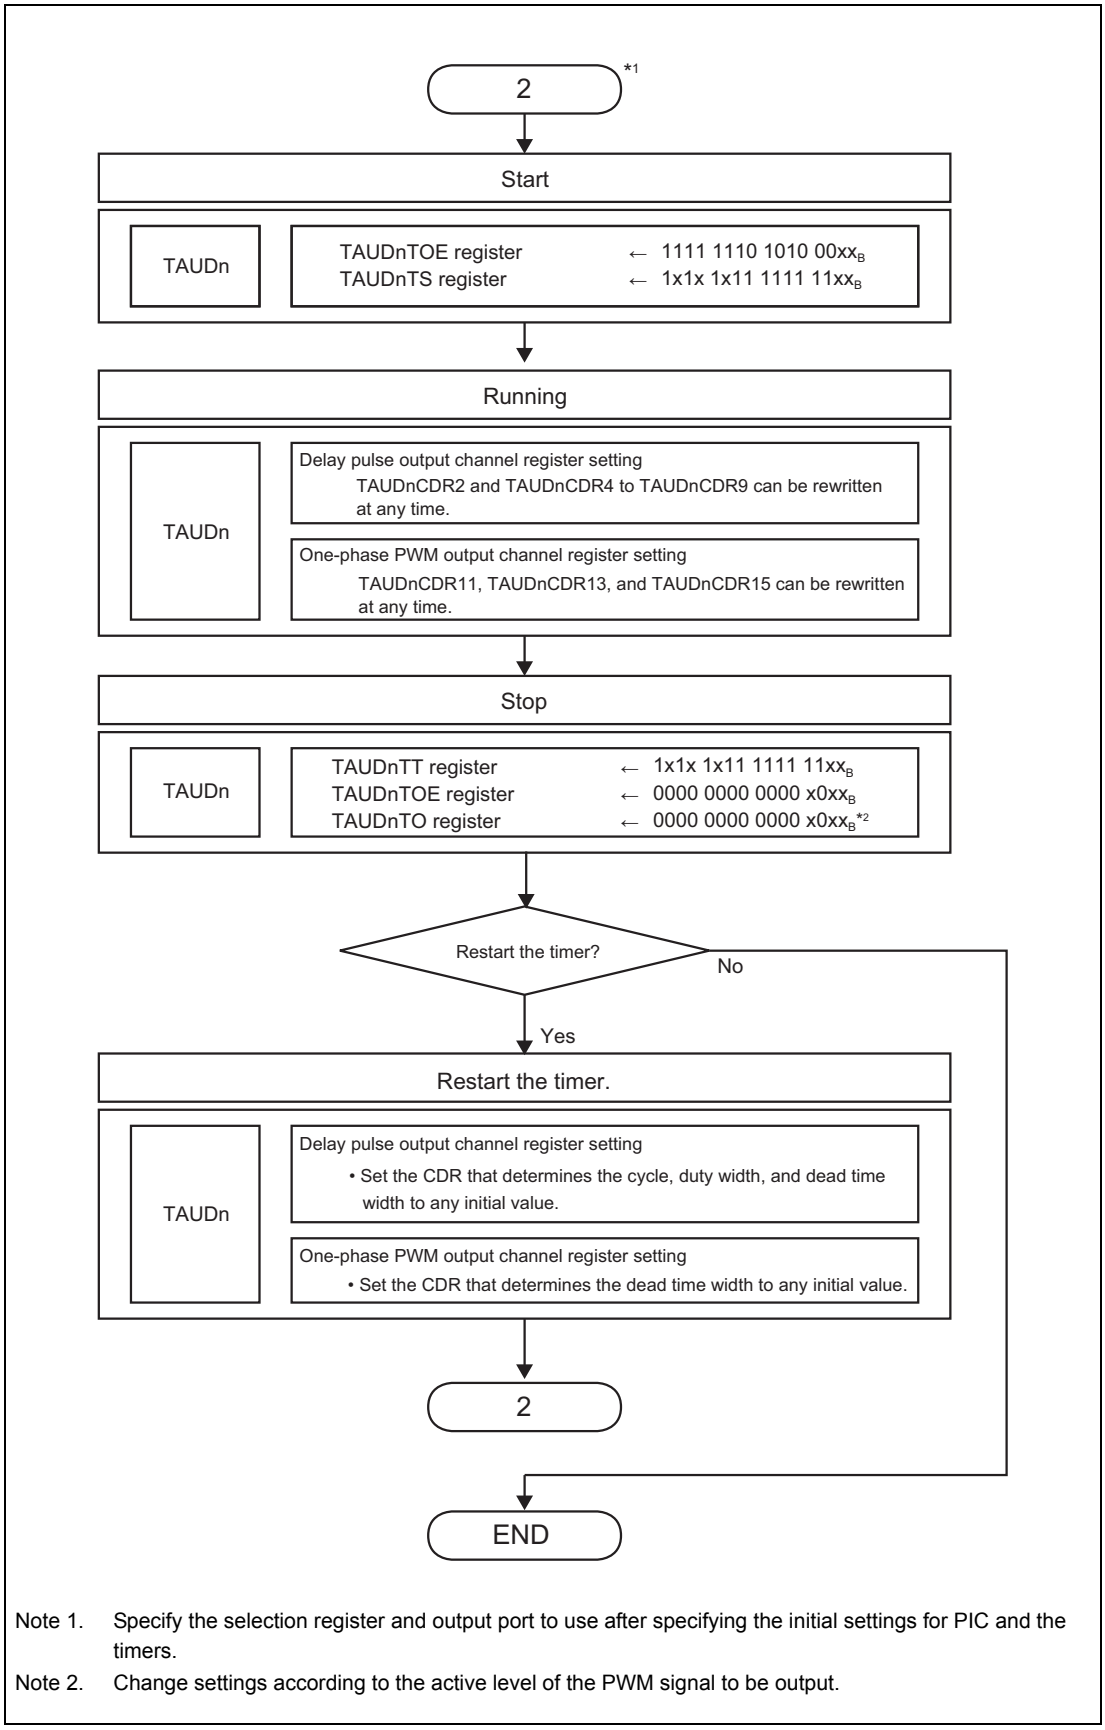
Note 2. Specify a feature that does not use TOUTm.

**Figure 29.48 Setup Flow (Active High Example)**



Note 1. Change settings according to the active level of the PWM to be output.

**Figure 29.49 Setup Flow (Active High Example) (continued)**



Note 1. Specify the selection register and output port to use after specifying the initial settings for PIC and the timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

**Figure 29.50 Setup Flow (Active High Example) (continued)**

## 29.13.6 Setting Examples for Operation Functions

This section provides example settings for each register.

### 29.13.6.1 TAUDn Settings

**Table 29.70 TAUDn: CH2-related (Master Channel used to Output a Delay Pulse*1)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMOR2 | 15, 14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 1 | |
| | 10 to 8 | TAUDnSTS[2:0] | 000 | |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | Fixed to 0 |
| | 4 to 1 | TAUDnMD[4:1] | 0000 | |
| | 0 | TAUDnMD0 | 1 | Output INTm at the start of operation. |
| TAUDnCMUR2 | 1, 0 | TAUDnTIS[1:0] | 00 | |

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

**Table 29.71 TAUDn: CH3-related (Slave Channel used to Output a Delay Pulse*1*2)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMOR3 | 15, 14 | TAUDnCKS[1:0] | Don't care*3 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 0 | |
| | 10 to 8 | TAUDnSTS[2:0] | 100 | Start trigger: INTm detection on the master channel |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | Fixed to 0 |
| | 4 to 1 | TAUDnMD[4:1] | 0100 | |
| | 0 | TAUDnMD0 | 1 | Enable start triggers during counting. |
| TAUDnCMUR3 | 1, 0 | TAUDnTIS[1:0] | 00 | |

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Note 3. For this feature, the channel does not affect operation, but it is set up because it is a configuration channel for delay pulse output.

**NOTE**

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

**Table 29.72 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Delay Pulse*1) (m = 4, 6, or 8)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 0 | |
| | 10 to 8 | TAUDnSTS[2:0] | 100 | Start trigger: INTm detection on the master channel |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | Fixed to 0 |
| | 4 to 1 | TAUDnMD[4:1] | 0100 | |
| | 0 | TAUDnMD0 | 1 | Enable start triggers during counting. |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 00 | |

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the slave channel and master channel.

**NOTE**

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

**Table 29.73 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Delay Pulse*1) (m = 5, 7, or 9)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 0 | |
| | 10 to 8 | TAUDnSTS[2:0] | 101 | Start trigger: INTm detection on an upper channel |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | Fixed to 0 |
| | 4 to 1 | TAUDnMD[4:1] | 1010 | |
| | 0 | TAUDnMD0 | 1 | Enable start triggers during counting. |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 00 | |

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the slave channel and master channel.

**NOTE**

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

**Table 29.74 TAUDn: CH11, CH13, and CH15-related (One-Phase PWM Output) (m = 11, 13, or 15)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Don't care*1 | Operation clock setting |
| | 13, 12 | TAUDnCCS[1:0] | 00 | |
| | 11 | TAUDnMAS | 0 | |
| | 10 to 8 | TAUDnSTS[2:0] | 001 | Start trigger: Detection of a TINm-input valid edge |
| | 7, 6 | TAUDnCOS[1:0] | 00 | |
| | 5 | | 0 | Fixed to 0 |
| | 4 to 1 | TAUDnMD[4:1] | 0100 | |
| | 0 | TAUDnMD0 | 1 | Enable start triggers during counting. |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 11 | Both rising and falling TINm edges are detected as valid. (High width) |

Note 1. Specify the same operation clock settings as for the PWM output master channel (CH2).

**NOTE**

For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.
CH10, CH12, and CH14 can be used with any feature that does not use TOUTm output (such as A/D trigger output).

**Table 29.75 Common TAUDn Channel Settings (1/4)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnTOE | 15 to 10 | TAUDnTOE15 to TAUDnTOE10 | 0<br>1 | Disable the timer.<br>Enable the timer. |
| | 9 | TAUDnTOE09 | 0<br>1 | Disable the timer.<br>Enable the timer. |
| | 8 | TAUDnTOE08 | 0 | This is fixed to 0 because TOUT08 is not used. |
| | 7 | TAUDnTOE07 | 0<br>1 | Disable the timer.<br>Enable the timer. |
| | 6 | TAUDnTOE06 | 0 | This is fixed to 0 because TOUT06 is not used |
| | 5 | TAUDnTOE05 | 0<br>1 | Disable the timer.<br>Enable the timer. |
| | 4 | TAUDnTOE04 | 0 | This is fixed to 0 because TOUT04 is not used |
| | 3 | TAUDnTOE03 | 0 | This is fixed to 0 because TOUT03 is not used |
| | 2 | TAUDnTOE02 | 0 | This is fixed to 0 because TOUT02 is not used. |
| | 1, 0 | TAUDnTOE01<br>TAUDnTOE00 | Don't care | |
| TAUDnTO | 15 to 10 | TAUDnTO15 to TAUDnTO10 | 0*1 | Output a low-level signal to TOUT15 to TOUT10. |
| | 9 to 2 | TAUDnTO09 to TAUDnTO02 | 0 | Output a low-level signal to TOUT09 to TOUT02. |
| | 1, 0 | TAUDnTO01<br>TAUDnTO00 | Don't care | |

**Table 29.75 Common TAUDn Channel Settings (2/4)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnTOM | 15 to 10 | TAUDnTOM15 to TAUDnTOM10 | 1 | Synchronous operation mode |
| | 9 to 4 | TAUDnTOM09 to TAUDnTOM04 | 0 | Independent operation mode |
| | 3 | TAUDnTOM03 | 1 | Synchronous operation mode |
| | 2 | TAUDnTOM02 | 0 | Independent operation mode |
| | 1, 0 | TAUDnTOM01 TAUDnTOM00 | Don't care | |
| TAUDnTOC | 15 to 10 | TAUDnTOC15 to TAUDnTOC10 | 1 | Synchronous operation mode 2 |
| | 9 to 4 | TAUDnTOC09 to TAUDnTOC04 | 1, 0, 1, 0, 1, 0 | CH5, CH7, CH9: Operation mode 2<br>CH4, CH6, CH8: Operation mode 1 |
| | 3 | TAUDnTOC03 | 0 | Operation mode 1 |
| | 2 | TAUDnTOC02 | 0 | Operation mode 1 |
| | 1, 0 | TAUDnTOC01 TAUDnTOC00 | Don't care | |
| TAUDnTOL | 15 to 10 | TAUDnTOL15 to TAUDnTOL10 | 0*1 | Positive logic output (active high) |
| | 9 to 2 | TAUDnTOL09 to TAUDnTOL02 | 0 | Positive logic output (active high) |
| | 1, 0 | TAUDnTOL01 TAUDnTOL00 | Don't care | |
| TAUDnTDE | 15 to 10 | TAUDnTDE15 to TAUDnTDE10 | 1 | Enable dead time control.*2 |
| | 9 to 2 | TAUDnTDE09 to TAUDnTDE02 | 0 | Disable dead time control. |
| | 1, 0 | TAUDnTDE01 TAUDnTDE00 | Don't care | |
| TAUDnTDM | 15 to 10 | TAUDnTDM15 to TAUDnTDM10 | 1 | Output dead time upon detecting a TINm input edge at a lower odd channel. |
| | 9 to 2 | TAUDnTDM09 to TAUDnTDM02 | 0 | Invalid because dead time control is disabled. |
| | 1, 0 | TAUDnTDM01 TAUDnTDM00 | Don't care | |
| TAUDnTDL | 15 | TAUDnTDL15 | 1*1 | Add dead time to the negative W phase period. |
| | 14 | TAUDnTDL14 | 0*1 | Add dead time to the positive W phase period. |
| | 13 | TAUDnTDL13 | 1*1 | Add dead time to the negative V phase period. |
| | 12 | TAUDnTDL12 | 0*1 | Add dead time to the positive V phase period. |
| | 11 | TAUDnTDL11 | 1*1 | Add dead time to the negative U phase period. |
| | 10 | TAUDnTDL10 | 0*1 | Add dead time to the positive U phase period. |
| | 9 to 2 | TAUDnTDL09 to TAUDnTDL02 | 0 | Invalid because dead time control is disabled. |
| | 1, 0 | TAUDnTDL01 TAUDnTDL00 | Don't care | |
| TAUDnTRE | 15 to 2 | TAUDnTRE15 to TAUDnTRE02 | 0 | Disable real-time output. |
| | 1, 0 | TAUDnTRE01 TAUDnTRE00 | Don't care | |

**Table 29.75 Common TAUDn Channel Settings (3/4)**

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnTRO | 15 to 2 | TAUDnTRO15 to TAUDnTRO02 | 0 | Invalid because real-time output is disabled. |
| | 1, 0 | TAUDnTRO01 TAUDnTRO00 | Don't care | |
| TAUDnTRC | 15 to 2 | TAUDnTRC15 to TAUDnTRC02 | 0 | Do not use this channel to generate the real-time output trigger. |
| | 1, 0 | TAUDnTRC01 TAUDnTRC00 | Don't care | |
| TAUDnTME | 15 to 2 | TAUDnTME15 to TAUDnTME02 | 0 | Disable modulation output for timer output and real-time output. |
| | 1, 0 | TAUDnTME01 TAUDnTME00 | Don't care | |
| TAUDnRDE | 15 | TAUDnRDE15 | 0 | Disable simultaneous rewriting. |
| | 14 | TAUDnRDE14 | Don't care | |
| | 13 | TAUDnRDE13 | 0 | Disable simultaneous rewriting. |
| | 12 | TAUDnRDE12 | Don't care | |
| | 11 | TAUDnRDE11 | 0 | Disable simultaneous rewriting. |
| | 10 | TAUDnRDE10 | Don't care | |
| | 9 to 2 | TAUDnRDE09 to TAUDnRDE02 | 1 | Enable simultaneous rewriting. |
| | 1, 0 | TAUDnRDE01 TAUDnRDE00 | Don't care | |
| TAUDnRDS | 15 | TAUDnRDS15 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
| | 14 | TAUDnRDS14 | Don't care | |
| | 13 | TAUDnRDS13 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
| | 12 | TAUDnRDS12 | Don't care | |
| | 11 | TAUDnRDS11 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
| | 10 | TAUDnRDS10 | Don't care | |
| | 9 to 2 | TAUDnRDS09 to TAUDnRDS02 | 0 | Enable simultaneous rewriting by using a master channel. |
| | 1, 0 | TAUDnRDS01 TAUDnRDS00 | Don't care | |
| TAUDnRDM | 15 | TAUDnRDM15 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 14 | TAUDnRDM14 | Don't care | |
| | 13 | TAUDnRDM13 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 12 | TAUDnRDM12 | Don't care | |
| | 11 | TAUDnRDM11 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 10 | TAUDnRDM10 | Don't care | |
| | 9 to 2 | TAUDnRDM09 to TAUDnRDM02 | 0 | Load the signal when the master channel starts counting. |
| | 1, 0 | TAUDnRDM01 TAUDnRDM00 | Don't care | |

Table 29.75 Common TAUDn Channel Settings (4/4)

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| TAUDnRDC | 15 | TAUDnRDC15 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 14 | TAUDnRDC14 | Don't care | |
| | 13 | TAUDnRDC13 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 12 | TAUDnRDC12 | Don't care | |
| | 11 | TAUDnRDC11 | 0 | Invalid because simultaneous rewriting is not enabled. |
| | 10 | TAUDnRDC10 | Don't care | |
| | 9 to 2 | TAUDnRDC09 to TAUDnRDC02 | 0 | Do not use this channel to generate the simultaneous rewrite trigger. |
| | 1, 0 | TAUDnRDC01 TAUDnRDC00 | Don't care | |

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 25, Timer Array Unit D (TAUD)**.

### 29.13.6.2 Peripheral Interconnections Settings

Table 29.76 Peripheral Interconnections Settings

| Register | Bit position | Bit name | Setting | Remark |
|---|---|---|---|---|
| PIC0REG2n2 | 27 | PIC0REG2n227 | 1 | Select the input selected by the PIC0REG2n204 bit. |
| | 23 | PIC0REG2n223 | 1 | Select the input selected by the PIC0REG2n203 bit. |
| | 19 | PIC0REG2n219 | 1 | Select the input selected by the PIC0REG2n202 bit. |
| | 4 | PIC0REG2n204 | 0 | Select TAUDTTOUT9. |
| | 3 | PIC0REG2n203 | 0 | Select TAUDTTOUT7. |
| | 2 | PIC0REG2n202 | 0 | Select TAUDTTOUT5. |

# Section 30 PWM Output/Diagnostic (PWM-Diag)

This section contains a generic description of the PWM output/diagnostic function (PWM-Diag).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the units constituting PWM-Diag.

## 30.1 Features of RH850/F1K PWM-Diag

### 30.1.1 Number of Units and Channels

The PWM-Diag unit consists of a PWBA block for generating clock signals, PWGA blocks that generate PWM signals, and a PWSA block for generating triggers for A/D conversion. The numbers of individual units are listed below.

Each PWGA unit has one PWM channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

**Table 30.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| **PWBA** | | | |
| Number of Units | 1 | | |
| Name | PWBAn (n = 0) | | |
| **PWGA** | | | |
| Number of Units | 48 | 64 | 72 |
| Name | PWGAn (n = 0 to 47) | PWGAn (n = 0 to 63) | PWGAn (n = 0 to 71) |
| **PWSA** | | | |
| Number of Units | 1 | | |
| Name | PWSAn (n = 0) | | |

**Table 30.2 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, individual units constituting the PWM-Diag function are identified by the index “n”; for example, PWBAnTE indicates the PWBAn status register. |
| m | The PWBA generation clock is identified by the index “m” (m = 0 to 3); for example, PWBAnBRSm indicates the PWMCLKm clock cycle configuration register. |
| x, y | An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index “x, y”; for example, PWSAnPVCRx_y (x_y = 00_01, 02_03, ..., 70_71). |
| j | Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index “j”; for example, the PWSAnQUEj register (j = 0 to 7). |
| k | Sets of registers where each has the same function are identified by the index “k”; for example, the SLPWGAk register (k = 0 to 2). |

The following table shows values indicated by the indices of each product.

**Table 30.3 Indices of Products**

| Indices of each product | | |
|---|---|---|
| **100 pins** | **144 pins** | **176 pins** |
| x = 00, 02, ,,, 46<br>y = 01, 03, ,,, 47 | x = 00, 02, ,,, 62,<br>y = 01, 03, ,,, 63 | x = 00, 02, ,,, 70<br>y = 01, 03, ,,, 71 |
| j = 0 to 7 | j = 0 to 7 | j = 0 to 7 |
| k = 0, 1 | k = 0, 1 | k = 0 to 2 |

## 30.1.2 Register Base Address

PWM-Diag base addresses are listed in the following table.

PWM-Diag register addresses are given as offsets from the base addresses.

**Table 30.4 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <PWBAn_base> | FFE7 $2800_H$ |
| <PWGAn_base> | FFE7 $1000_H$ + $40_H$ × n |
| <PWSAn_base> | FFE7 $0000_H$ |
| <SLPW_base> | FFE7 $3000_H$ |

## 30.1.3 Clock Supply

The PWM-Diag clock supply is shown in the following table.

**Table 30.5 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| PWBAn | PCLK | CKSCLK_IPERI2 | Wave form clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_IPERI2 | |
| PWGAn | PCLK | CKSCLK_IPERI2 | Wave form clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_IPERI2 | |
| PWSAn | PCLK | CKSCLK_IPERI2 | Wave form clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_IPERI2 | |

### 30.1.4 Interrupt Requests

PWM-Diag interrupt requests are listed in the following table.

Table 30.6 Interrupt Requests (1/2)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| PWGA_INT0 | PWGA0 interrupt | 92 | — |
| PWGA_INT1 | PWGA1 interrupt | 93 | — |
| PWGA_INT2 | PWGA2 interrupt | 94 | — |
| PWGA_INT3 | PWGA3 interrupt | 95 | — |
| PWGA_INT4 | PWGA4 interrupt | 85 | — |
| PWGA_INT5 | PWGA5 interrupt | 86 | — |
| PWGA_INT6 | PWGA6 interrupt | 87 | — |
| PWGA_INT7 | PWGA7 interrupt | 88 | — |
| PWGA_INT8 | PWGA8 interrupt | 96 | — |
| PWGA_INT9 | PWGA9 interrupt | 97 | — |
| PWGA_INT10 | PWGA10 interrupt | 98 | — |
| PWGA_INT11 | PWGA11 interrupt | 99 | — |
| PWGA_INT12 | PWGA12 interrupt | 100 | — |
| PWGA_INT13 | PWGA13 interrupt | 101 | — |
| PWGA_INT14 | PWGA14 interrupt | 102 | — |
| PWGA_INT15 | PWGA15 interrupt | 103 | — |
| PWGA_INT16 | PWGA16 interrupt | 145 | — |
| PWGA_INT17 | PWGA17 interrupt | 147 | — |
| PWGA_INT18 | PWGA18 interrupt | 149 | — |
| PWGA_INT19 | PWGA19 interrupt | 151 | — |
| PWGA_INT20 | PWGA20 interrupt | 124 | — |
| PWGA_INT21 | PWGA21 interrupt | 125 | — |
| PWGA_INT22 | PWGA22 interrupt | 126 | — |
| PWGA_INT23 | PWGA23 interrupt | 127 | — |
| PWGA_INT24 | PWGA24 interrupt | 184 | — |
| PWGA_INT25 | PWGA25 interrupt | 185 | — |
| PWGA_INT26 | PWGA26 interrupt | 153 | — |
| PWGA_INT27 | PWGA27 interrupt | 186 | — |
| PWGA_INT28 | PWGA28 interrupt | 187 | — |
| PWGA_INT29 | PWGA29 interrupt | 188 | — |
| PWGA_INT30 | PWGA30 interrupt | 155 | — |
| PWGA_INT31 | PWGA31 interrupt | 157 | — |
| PWGA_INT32 | PWGA32 interrupt | 189 | — |
| PWGA_INT33 | PWGA33 interrupt | 190 | — |
| PWGA_INT34 | PWGA34 interrupt | 191 | — |
| PWGA_INT35 | PWGA35 interrupt | 192 | — |
| PWGA_INT36 | PWGA36 interrupt | 193 | — |
| PWGA_INT37 | PWGA37 interrupt | 194 | — |
| PWGA_INT38 | PWGA38 interrupt | 195 | — |
| PWGA_INT39 | PWGA39 interrupt | 196 | — |

Table 30.6 Interrupt Requests (2/2)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| PWGA_INT40 | PWGA40 interrupt | 197 | — |
| PWGA_INT41 | PWGA41 interrupt | 198 | — |
| PWGA_INT42 | PWGA42 interrupt | 199 | — |
| PWGA_INT43 | PWGA43 interrupt | 200 | — |
| PWGA_INT44 | PWGA44 interrupt | 201 | — |
| PWGA_INT45 | PWGA45 interrupt | 202 | — |
| PWGA_INT46 | PWGA46 interrupt | 203 | — |
| PWGA_INT47 | PWGA47 interrupt | 204 | — |
| PWGA_INT48 | PWGA48 interrupt | 240 | — |
| PWGA_INT49 | PWGA49 interrupt | 241 | — |
| PWGA_INT50 | PWGA50 interrupt | 242 | — |
| PWGA_INT51 | PWGA51 interrupt | 243 | — |
| PWGA_INT52 | PWGA52 interrupt | 244 | — |
| PWGA_INT53 | PWGA53 interrupt | 245 | — |
| PWGA_INT54 | PWGA54 interrupt | 246 | — |
| PWGA_INT55 | PWGA55 interrupt | 247 | — |
| PWGA_INT56 | PWGA56 interrupt | 248 | — |
| PWGA_INT57 | PWGA57 interrupt | 249 | — |
| PWGA_INT58 | PWGA58 interrupt | 250 | — |
| PWGA_INT59 | PWGA59 interrupt | 251 | — |
| PWGA_INT60 | PWGA60 interrupt | 252 | — |
| PWGA_INT61 | PWGA61 interrupt | 253 | — |
| PWGA_INT62 | PWGA62 interrupt | 254 | — |
| PWGA_INT63 | PWGA63 interrupt | 255 | — |
| PWGA_INT64 | PWGA64 interrupt | 277 | — |
| PWGA_INT65 | PWGA65 interrupt | 278 | — |
| PWGA_INT66 | PWGA66 interrupt | 279 | — |
| PWGA_INT67 | PWGA67 interrupt | 280 | — |
| PWGA_INT68 | PWGA68 interrupt | 281 | — |
| PWGA_INT69 | PWGA69 interrupt | 282 | — |
| PWGA_INT70 | PWGA70 interrupt | 283 | — |
| PWGA_INT71 | PWGA71 interrupt | 284 | — |
| PWSA_INT_QFULL | PWSA queue full interrupt | 91 | — |

### 30.1.5 Reset Sources

PWM-Diag reset sources are listed in the following table. The individual PWM-Diag units are initialized by these reset sources.

**Table 30.7 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| PWBAn<br>PWGAn<br>PWSAn | All reset sources (ISORES) |

### 30.1.6 External Input/Output Signals

External input/output signals of the PWM-Diag are listed below.

**Table 30.8 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| PWGA_TOUTn<br>(Unit: PWGA) | PWGA unit n output | PWGAnO |

**CAUTION**

When port P8_6 is used as PWGA38O, port P8_6 pin outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.
For details, see **Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

### 30.1.7 Internal Signals

The I/O signals for connecting two PWM-Diag channels or a PWM-Diag and another function are listed below.

**Table 30.9 Internal Output Signals**

| Unit Signal Name | Description | Connected to |
|---|---|---|
| **PWBA0** | | |
| PWMCLK0 | PWGA count clock 0 | PWGAn |
| PWMCLK1 | PWGA count clock 1 | PWGAn |
| PWMCLK2 | PWGA count clock 2 | PWGAn |
| PWMCLK3 | PWGA count clock 3 | PWGAn |
| **PWGAn** | | |
| PWGA_TRGOUTn | PWGAn trigger | PWSA0 |
| **PWSA0** | | |
| PWSA_ADTRG[1:0] | A/D converter unit select signal | ADCA0, ADCA1 |
| PWSA_PVCR_VALUE[11:0] | A/D converter control signal | ADCA0, ADCA1 |
| **ADCAn** | | |
| ADC_CONV_ENDn | A/D conversion completion signal | PWSA0 |

### 30.1.8 Functional Overview

This function is comprised of four types of units: clock divider (PWBA), PWM generator (PWGA), A/D conversion trigger select function (PWSA), and A/D converter (ADCA).

#### PWBA

- Clock divider
  PWBA generates a PWMCLKm count clock signal by frequency division of PCLK and supplies it to the PWM generator PWGA.
  The cycle of the PWMCLKm count clock signal can be calculated from the setting of the PWBAnBRSm register by the equation below.

  PWMCLKm count clock cycle = (PWBAnBRSm value × 2) × PCLK cycle

  In addition, PWBA can control operation when the on-chip debugger is in use by using the PWBAnEMU register.

#### PWGA

PWGA outputs PWM waveforms and A/D conversion trigger to PWSA by using the clock PWMCLKm input from PWBA.

- PWM waveform output PWGA_TOUTn
  This generator outputs PWM waveforms from the PWGA_TOUTn pin. The PWM cycle is the full count cycle of the PWGAnCNT register (12-bit free-running counter). Set the high-level period of PWM output in the PWGAnCSDR and PWGAnCRDR registers.

  The PWM waveform cycle and duty can be calculated by the equations below.

  PWM waveform cycle = PWGAnCNT (12-bit full count: $FFF_H$ + 1)
  × Count clock cycle
  = 4096 × PWMCLKm count clock cycle

  When PWGAnCRDR[11:0] > PWGAnCSDR[11:0],

  High-level period of PWM waveform =
  (PWGAnCRDR register value – PWGAnCSDR register value)
  × PWMCLKm count clock cycle

  PWM waveform duty (%) = High-level period of PWM waveform/PWM waveform cycle × 100 = (PWGAnCRDR register value – PWGAnCSDR register value)/4096 × 100

  Note that the PWM output is fixed to the low level when the PWGAnCRDR register value is equal to the PWGAnCSDR register value.

  When $1xxx_H$ is set in the PWGAnCRDR register (i.e. bit 12 is set to 1), the PWM output is fixed to the high level.

- A/D conversion trigger output PWGA_TRGOUTn
  The A/D conversion trigger signal PWGA_TRGOUTn for PWSA is generated when the PWGAnCTDR register value and the PWGAnCNT register value match while the PWM output PWGA_TOUTn is at the high level.
  The timing can be calculated by the equation below.

  A/D conversion trigger signal generation timing = PWGAnCTDR register value
  × PWMCLKm count clock cycle

- PWGA interrupt request signal PWGA_INTn
  PWGA generates the interrupt request signal PWGA_INTn at the falling edge of the PWM output PWGA_TOUTn.
  When the PWM output is fixed to the low level, PWGA_INTn is generated when the PWGAnCRDR register value and the PWGAnCNT register value (free-running counter value) match; when the PWM output is fixed to the high level, PWGA_INTn is generated at the timing of overflow of the PWGAnCNT register.

### PWSA

PWSA transmits the required setting information to the A/D converter and outputs the A/D conversion start trigger, based on the A/D conversion trigger signal PWGA_TRGOUTn from the PWM generator (PWGA).

- A/D conversion control by PWSA
  PWSA outputs the information required for the A/D conversion, which is set in the corresponding PWSAnPVCRx_y register for the channel number of the trigger input from PWGAn, (i.e., information on ADC physical channel, external MPX control, and error detection level selection) to the A/D converter.
  At the same timing, A/D conversion trigger (PWSA_ADTRG) is output to ADCA0 or ADCA1.
  (A maximum of eight input trigger signal PWGA_TRGOUTn data received during A/D conversion are stored and kept in PWSAnQUE.)
  The setting information to be output to the A/D converter is kept until the next trigger is generated.
  When the A/D conversion triggered by the PWM-Diag function is completed in the A/D converter, PWSA triggers the next A/D conversion based on the data stored in the PWSAnQUE register.
- Queuing of A/D conversion triggers from PWGA
  The A/D conversion trigger signal (PWGA_TRGOUTn) input from PWGAn is stored in the PWSAnQUEj register as a channel number. The PWSAnQUEj register stores a maximum of eight channel numbers of the A/D conversion trigger signal PWGA_TRGOUTn received during A/D conversion in a queue structure.
  A PWSA queue full interrupt occurs in the following states, when the queue of the PWSAnQUEj register becomes full
  - A trigger number is written to PWSAnQUE7
  - A trigger number has already been written to PWSAnQUE7 and cannot be written when PWGA_TRGOUTn is input.

### ADCA

A/D conversion is executed upon receipt of information required for A/D conversion and A/D conversion trigger from PWSA.

A/D conversion is executed using the PWM-Diag-dedicated scan group; on completion of the A/D conversion, it is reported to the PWSA.

For the basic operation of the A/D converter, see Section 31, A/D Converter (ADCA).

For the A/D converter operation with the PWM-Diag function, see Section 31.4.7.1, A/D Conversion with PWM-Diag Enabled.

### 30.1.9 Block Diagram

The following figure shows an example of connecting the LED control circuit combining the PWM-Diag and the A/D converter.

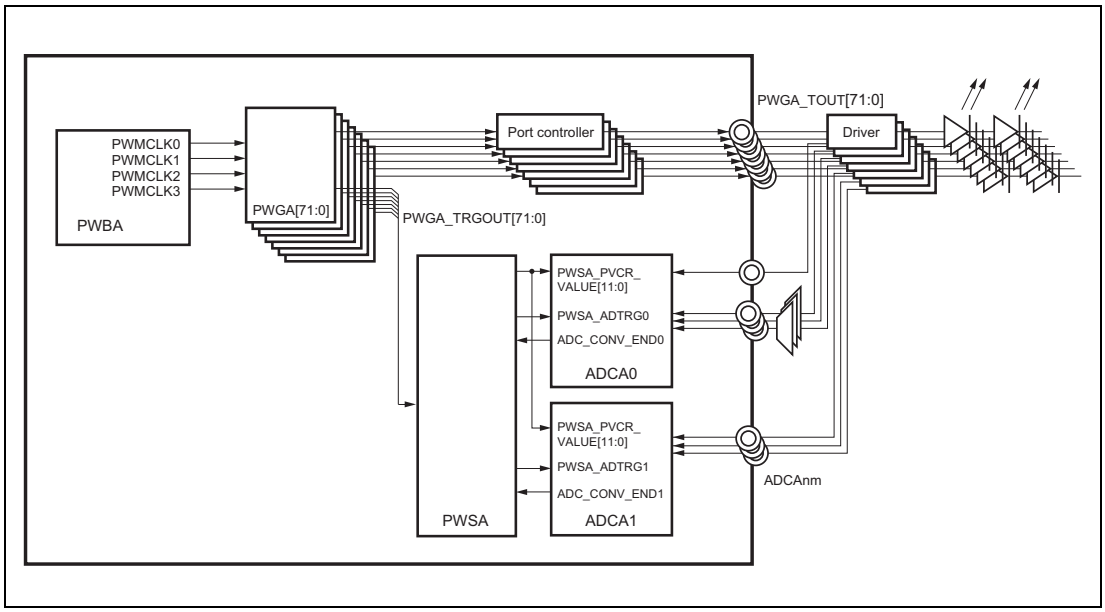


**Figure 30.1 Example of Connecting the LED Control Circuit using the PWM-Diag and the A/D Converter**

## 30.2 Registers

### 30.2.1 List of Registers

PWM Output/Diagnostic registers are listed in the following table.

<PWBAn_base>, <PWSAn_base>, and <PWGAn_base> are defined in **Section 30.1.2, Register Base Address**.

**Table 30.10 List of PWM Output/Diagnostic Registers**

| Module name | Register name | Symbol | Address |
|---|---|---|---|
| PWBAn | PWMCLKm cycle configuration register | PWBAnBRSm | <PWBAn_base> + $0004_H$ × m |
| | PWMCLKm enable status register | PWBAnTE | <PWBAn_base> + $0010_H$ |
| | PWMCLKm start trigger register | PWBAnTS | <PWBAn_base> + $0014_H$ |
| | PWMCLKm stop trigger register | PWBAnTT | <PWBAn_base> + $0018_H$ |
| | PWBA emulation register | PWBAnEMU | <PWBAn_base> + $001C_H$ |
| PWGAn | PWM output set condition register | PWGAnCSDR | <PWGAn_base> + $0000_H$ |
| | PWM output reset condition register | PWGAnCRDR | <PWGAn_base> + $0004_H$ |
| | PWGA_TRGOUTn generation condition register | PWGAnCTDR | <PWGAn_base> + $0008_H$ |
| | Buffer register reload trigger register | PWGAnRDT | <PWGAn_base> + $000C_H$ |
| | Buffer register reload status register | PWGAnRSF | <PWGAn_base> + $0010_H$ |
| | PWM cycle count register | PWGAnCNT | <PWGAn_base> + $0014_H$ |
| | PWGA control register | PWGAnCTL | <PWGAn_base> + $0020_H$ |
| | PWGAnCSDR buffer register | PWGAnCSBR | <PWGAn_base> + $0024_H$ |
| | PWGAnCRDR buffer register | PWGAnCRBR | <PWGAn_base> + $0028_H$ |
| | PWGAnCTDR buffer register | PWGAnCTBR | <PWGAn_base> + $002C_H$ |
| SLPWG | PWGA synchronous trigger register | SLPWGAk | <SLPW_base> + k × $4_H$ |
| PWSAn | PWSA control register | PWSAnCTL | <PWSAn_base> + $0000_H$ |
| | Trigger queue status register | PWSAnSTR | <PWSAn_base> + $0004_H$ |
| | Trigger queue status clear register | PWSAnSTC | <PWSAn_base> + $0008_H$ |
| | Trigger queue register | PWSAnQUEj | <PWSAn_base> + $0020_H$ + j × $4_H$ |
| | PWM-Diag mode A/D setting register | PWSAnPVCRx_y | <PWSAn_base> + $0040_H$ + x × $2_H$ |
| | PWSA emulation control register | PWSAnEMU | <PWSAn_base> + $000C_H$ |

### 30.2.1.1 PWBAnBRSm Register

This register sets the clock cycle of PWMCLKm.

**Access:** This register can be read or written in 16-bit units.

**Address:** <PWBAn_base> + $0004_H$ × m

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | PWBAnBRSm[10:0] | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 30.11 PWBAnBRSm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 0 | PWBAnBRSm [10:0] | Register for setting the clock cycle of PWMCLKm.<br>– PWBAnBRSm = 0: PWMCLKm = PCLK<br>– PWBAnBRSm = 1: PWMCLKm = PCLK / 2 × 1<br>– PWBAnBRSm = 2: PWMCLKm = PCLK / 2 × 2<br>...<br>– PWBAnBRSm = n: PWMCLKm = PCLK / 2 × n (n = 1 to 2047)<br>These bits can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0). |

### 30.2.1.2 PWBAnTE Register

This is a status register that indicates the output status of PWMCLKm (m = 0 to 3).

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <PWBAn_base> + $0010_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PWBAnTE3 | PWBAnTE2 | PWBAnTE1 | PWBAnTE0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 30.12 PWBAnTE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. |
| 3 | PWBAnTE3 | A status flag indicating the operation status of PWMCLK3<br>0: Not operating<br>1: Operating |
| 2 | PWBAnTE2 | A status flag indicating the operation status of PWMCLK2<br>0: Not operating<br>1: Operating |
| 1 | PWBAnTE1 | A status flag indicating the operation status of PWMCLK1<br>0: Not operating<br>1: Operating |
| 0 | PWBAnTE0 | A status flag indicating the operation status of PWMCLK0<br>0: Not operating<br>1: Operating |

### 30.2.1.3 PWBAnTS Register

This register is a start trigger register for PWMCLKm (m = 0 to 3).

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <PWBAn_base> + $0014_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PWBAnTS3 | PWBAnTS2 | PWBAnTS1 | PWBAnTS0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | W | W | W | W |

**Table 30.13 PWBAnTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When writing, write the value after reset. |
| 3 | PWBAnTS3 | Start Trigger for PWMCLK3<br>0: Writing 0 has no effect.<br>1: Starts the output of PWMCLK3. |
| 2 | PWBAnTS2 | Start Trigger for PWMCLK2<br>0: Writing 0 has no effect.<br>1: Starts the output of PWMCLK2. |
| 1 | PWBAnTS1 | Start Trigger for PWMCLK1<br>0: Writing 0 has no effect.<br>1: Starts the output of PWMCLK1. |
| 0 | PWBAnTS0 | Start Trigger for PWMCLK0<br>0: Writing 0 has no effect.<br>1: Starts the output of PWMCLK0. |

### 30.2.1.4 PWBAnTT Register

This register is a stop trigger register for PWMCLKm (m = 0 to 3).

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <PWBAn_base> + $0018_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PWBAnTT3 | PWBAnTT2 | PWBAnTT1 | PWBAnTT0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | W | W | W | W |

**Table 30.14 PWBAnTT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When writing, write the value after reset. |
| 3 | PWBAnTT3 | Stop Trigger for PWMCLK3<br>0: Writing 0 has no effect.<br>1: Stops the output of PWMCLK3. |
| 2 | PWBAnTT2 | Stop Trigger for PWMCLK2<br>0: Writing 0 has no effect.<br>1: Stops the output of PWMCLK2. |
| 1 | PWBAnTT1 | Stop Trigger for PWMCLK1<br>0: Writing 0 has no effect.<br>1: Stops the output of PWMCLK1. |
| 0 | PWBAnTT0 | Stop Trigger for PWMCLK0<br>0: Writing 0 has no effect.<br>1: Stops the output of PWMCLK0. |

### 30.2.1.5 PWBAnEMU Register

This register sets the operation during emulation.

**Access:** This register can be read or written in 8-bit units.

**Address:** <PWBAn_base> + $001C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PWBAnSVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 30.15 PWBAnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | PWBAnSVSDIS | (When the EPC.SVSTOP bit = 0)<br>The count clock is provided continuously when the debugger is controlling the microcontroller (by using break points, etc.), regardless of the value of this bit (1 or 0).<br><br>(When the EPC.SVSTOP bit = 1)<br>0: The count clock is stopped when the debugger is controlling the microcontroller (by using break points, etc.).<br>1: The count clock is provided continuously when the debugger is controlling the microcontroller (by using break points, etc.).<br>This bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 30.2.1.6 PWGAnCTL — PWGA Control Register

PWGAnCTL is used to select the count clock from PWBA.

**Access:** This register can be read or written in 8-bit units.

**Address:** <PWGAn_base> + $0020_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | PWGAnCKS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 30.16 PWGAnCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | PWGAnCKS [1:0] | Count Clock Enable Input PWMCLK3 to PWMCLK0 Select<br>00: Uses PWMCLK0 as count clock<br>01: Uses PWMCLK1 as count clock<br>10: Uses PWMCLK2 as count clock<br>11: Uses PWMCLK3 as count clock<br>These bits can only be rewritten when the PWGAn operation is stopped (SLPWGAk.SLPWGA[31:0] = 0). |

### 30.2.1.7 PWGAnCNT — PWM Cycle Count Register

This is a count register.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <PWGAn_base> + $0014_H$

**Value after reset:** $0FFF_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PWGAnCNT[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 30.17 PWGAnCNT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset is returned. |
| 11 to 0 | PWGAnCNT [11:0] | 12-bit counter value |

### 30.2.1.8 PWGAnCSDR — PWM Output Set Condition Register

This register sets the setting condition for PWGA_TOUTn output.

**Access:** This register can be read or written in 16-bit units.

**Address:** <PWGAn_base> + $0000_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PWGAnCSDR[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 30.18 PWGAnCSDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | PWGAnCSDR [11:0] | These bits set the setting condition for PWM output.<br>The set value is reflected to the PWGAnCSBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). |

### 30.2.1.9 PWGAnCRDR — PWM Output Reset Condition Register

This register sets the reset condition for PWGA_TOUTn output.

**Access:** This register can be read or written in 16-bit units.

**Address:** <PWGAn_base> + $0004_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | PWGAnCRDR[12:0] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 30.19 PWGAnCRDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 0 | PWGAnCRDR [12:0] | These bits set the reset condition for PWM output.<br>The set value is reflected to the PWGAnCRBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). |

### 30.2.1.10 PWGAnCTDR — PWGA_TRGOUTn Generation Condition Register

This register sets the generation condition for PWGA_TRGOUTn.

**Access:** This register can be read or written in 16-bit units.

**Address:** <PWGAn_base> + $0008_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PWGAnCTDR[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 30.20 PWGAnCTDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | PWGAnCTDR [11:0] | These bits set the A/D conversion trigger generation condition for PWSAn. The set value is reflected to the PWGAnCTBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). |

### 30.2.1.11 PWGAnCSBR — PWGAnCSDR Buffer Register

This is a buffer register for the PWGAnCSDR register.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <PWGAn_base> + $0024_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PWGAnCSBR[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 30.21 PWGAnCSBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset is returned. |
| 11 to 0 | PWGAnCSBR [11:0] | The set value is reflected to the PWGAnCSDR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, the pin output is driven high. |

### 30.2.1.12 PWGAnCRBR — PWGAnCRDR Buffer Register

This is a buffer register for the PWGA_TOUTn reset condition.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <PWGAn_base> + $0028_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | PWGAnCRBR[12:0] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 30.22 PWGAnCRBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 to 0 | PWGAnCRBR [12:0] | The set value is reflected to the PWGAnCRDR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).<br>When the value matches the PWGAnCNT register value, the pin output is driven low. |

### 30.2.1.13 PWGAnCTBR — PWGAnCTDR Buffer Register

This is a buffer register for the PWGA_TRGOUTn generation condition.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <PWGAn_base> + $002C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PWGAnCTBR[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 30.23 PWGAnCTBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset is returned. |
| 11 to 0 | PWGAnCTBR [11:0] | The set value is reflected to the PWGAnCTDR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).<br>When the value matches the PWGAnCNT register value, a trigger is transmitted to PWSAn. |

### 30.2.1.14 PWGAnRSF — Buffer Register Reload Status Register

This register is a status register for simultaneous rewrite control.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <PWGAn_base> + $0010_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | PWGAnRSF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 30.24 PWGAnRSF Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | PWGAnRSF | Simultaneous Rewrite Control Status<br>0: Simultaneous rewrite is enabled. This value indicates the completion of simultaneous rewrite after the generation of a simultaneous rewrite trigger signal.<br>1: Simultaneous rewrite is in progress. This value indicates the waiting state for completion. |

### 30.2.1.15 PWGAnRDT — Buffer Register Reload Trigger Register

This is a simultaneous rewrite request trigger register.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <PWGAn_base> + $000C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | PWGAnRDT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 30.25 PWGAnRDT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | PWGAnRDT | Simultaneous Rewrite Request Trigger<br>0: Writing 0 has no effect.<br>1: Triggers the simultaneous rewrite request for the compare registers (PWGAnCSDR, PWGAnCRDR, and PWGAnCTDR), and sets PWGAnRSF.PWGAnRSF to 1. |

### 30.2.1.16 SLPWGAk — PWGA Synchronous Trigger Register (k = 0 to 2)

This register triggers start and stop for multiple channels simultaneously.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SLPW_base> + k × $4_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SLPWGA[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SLPWGA[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 30.26 SLPWGAk Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | SLPWGA [31:0] | Trigger start and stop to multiple channels simultaneously.<br>0: Stops the corresponding channels.<br>1: Starts the corresponding channels.<br>The bits correspond to the following channels.<br>SLPWGA0.SLPWGA[31:0]: PWGA31 - PWGA0<br>SLPWGA1.SLPWGA[31:0]: PWGA63 - PWGA32<br>SLPWGA2.SLPWGA[7:0]: PWGA71 - PWGA64 |

### 30.2.1.17 PWSAnCTL Register

This register is used to control operations of PWSA.

**Access:** This register can be read or written in 8-bit units.

**Address:** <PWSAn_base> + $0000_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | PWSAnENBL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 30.27 PWSAnCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | PWSAnENBL | Operation Permission Control<br>0: Operation is prohibited (initial state).<br>Writing 0 initializes PWSAnSTR and PWSAnQUEj.<br>1: Operation is enabled. |

### 30.2.1.18 PWSAnSTR Register

This is a status register that indicates whether the number of a channel for which an A/D conversion trigger has been generated is stored in a PWSAnQUEj register.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <PWSAn_base> + $0004_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | PWSAnQFL | PWSAnQNE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 30.28 PWSAnSTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | PWSAnQFL | Indicates the queuing state of the A/D conversion trigger.<br>0: Some PWSAnQUEj registers do not store a channel number.<br>1: All of the PWSAnQUEj registers store a channel number. |
| 0 | PWSAnQNE | Bit indicating that there is a trigger in the trigger queue<br>0: A channel number is not stored in a PWSAnQUEj register, or A/D conversion is in progress while only PWSAnQUE0 stores a channel number.<br>1: The number of the channel waiting for conversion is stored in j = 1 and subsequent PWSAnQUEj registers. |

### 30.2.1.19 PWSAnSTC Register

This register clears the status of the PWSAnSTR register.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <PWSAn_base> + $0008_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | PWSAnCLFL | PWSAnCLNE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | W |

**Table 30.29 PWSAnSTC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When writing, write the value after reset. |
| 1 | PWSAnCLFL | PWSAnQFL Clear<br>0: PWSAnQFL retains the status (Writing 0 has no effect).<br>1: PWSAnQFL is cleared to 0. |
| 0 | PWSAnCLNE | PWSAnQNE Clear<br>0: PWSAnQNE retains the status (Writing 0 has no effect).<br>1: PWSAnQNE is cleared to 0. |

### 30.2.1.20 PWSAnQUEj (j = 0 to 7) Register

This register stores the channel number that received the trigger from PWGAn.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <PWSAn_base> + $0020_H + j \times 4_H$

**Value after reset:** $7F_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | PWSAnQUEj[6:0] | | | | | | |
| Value after reset | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R |

**Table 30.30 PWSAnQUEj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | PWSAnQUEj [6:0] | These bits hold the channel number (0 to 71) of the PWGA for which a trigger was generated in order from PWSAnQUE0 to PWSAnQUE7.<br>After the A/D conversion of PWSAnQUE0 is completed, the values in PWSAnQUE1 to PWSAnQUE7 shift to PWSAnQUE0 to PWSAnQUE6. |

**NOTE**

If a trigger occurs simultaneously for multiple channels, the trigger with the smaller channel number has priority.

### 30.2.1.21 PWSAnPVCRx_y (x = 00, 02, 04 ... 70, y = 01, 03, 05 ... 71) Register

This register is used to set the corresponding A/D converter for each channel.

Two consecutive channels are set such as PWSA0PVCR02_03, and the 16 higher-order bits of each register correspond to an odd-numbered channel while the 16 lower-order bits correspond to an even-numbered channel.

At the generation of a trigger, the set value is transmitted to the ADCAnPWDVCR register of the A/D converter.

For the ADCAnPWDVCR register, see Section 31, A/D Converter (ADCA).

**Access:** This register can be read or written in 32-bit units.

**Address:** <PWSAn_base> + $0040_H$ + x × $2_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | PWSAnSLADy | PWSAnVRDTy[27] | PWSAnVRDTy[26:24] | | | PWSAnVRDTy[23:22] | | PWSAnVRDTy[21:16] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | PWSAnSLADx | PWSAnVRDTx[11] | PWSAnVRDTx[10:8] | | | PWSAnVRDTx[7:6] | | PWSAnVRDTx[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 30.31 PWSAnPVCRx_y Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 29 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 28 | PWSAnSLADy | RH850/F1K 100 pin products:<br>When writing, write the value after reset.<br>RH850/F1K 144 and 176 pin products:<br>ADCA Select (odd-numbered channel)<br>0: Output to ADCA0.<br>1: Output to ADCA1. |
| 27 | PWSAnVRDTy[27] | This bit indicates the set value of the ADCAnPWDVCR.MPXE bit (odd-numbered channel). |
| 26 to 24 | PWSAnVRDTy[26:24] | These bits indicate the set value of the ADCAnPWDVCR.MPXV[2:0] bits (odd-numbered channel). |
| 23, 22 | PWSAnVRDTy[23:22] | These bits indicate the set value of the ADCAnPWDVCR.ULS[1:0] bits (odd-numbered channel). |
| 21 to 16 | PWSAnVRDTy[21:16] | These bits indicate the set value of the ADCAnPWDVCR.GCTRL[5:0] bits (odd-numbered channel). |
| 15 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | PWSAnSLADx | RH850/F1K 100 pin products:<br>When writing, write the value after reset.<br><br>RH850/F1K 144 and 176 pin products:<br>ADCA Select (even-numbered channel)<br>0: Output to ADCA0.<br>1: Output to ADCA1. |
| 11 | PWSAnVRDTx[11] | This bit indicates the set value of the ADCAnPWDVCR.MPXE bit. (even-numbered channel) |

**Table 30.31 PWSAnPVCRx_y Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 10 to 8 | PWSAnVRDTx [10:8] | These bits indicate the set value of the ADCAnPWDVCR.MPXV[2:0] bits. (even-numbered channel) |
| 7, 6 | PWSAnVRDTx [7:6] | These bits indicate the set value of the ADCAnPWDVCR.ULS[1:0] bits. (even-numbered channel) |
| 5 to 0 | PWSAnVRDTx [5:0] | These bits indicate the set value of the ADCAnPWDVCR.GCTRL[5:0] bits. (even-numbered channel) |

### 30.2.1.22 PWSAnEMU — Emulation Control Register

This register is used to set the operation for emulation.

**Access:** This register can be read or written in 8-bit units.

**Address:** <PWSAn_base> + $000C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | PWSAnSVSDIS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 30.32 PWSAnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | PWSAnSVSDIS | (When the EPC.SVSTOP bit = 0)<br>The operation continues when the debugger is controlling the microcontroller (by using break points, etc.), regardless of the value of this bit (1 or 0).<br><br>(When the EPC.SVSTOP bit = 1)<br>0: When the debugger is controlling the microcontroller (by using break points, etc.);<br>– The output state to A/D is retained, the ADC_CONV_ENDn input at a break point is internally retained, and PWSAnQUEj is updated after break release.<br>– The PWGA_TRGOUTn input is accepted even at a break, and PWSA_INT_QFULL is also output.<br>– Reading and writing to the register is possible.<br>1: The operation continues when the debugger is controlling the microcontroller (by using break points, etc.).<br><br>The above bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0), the operation of all channels PWGAn has stopped (SLPWGAk.SLPWGA), and no trigger has been generated from any of the channels PWGAn (PWSAnQUE0 is the value after reset). |

## 30.3 Operating Procedure

Procedures for setting when starting and stopping operation of PWM-Diag are illustrated below.

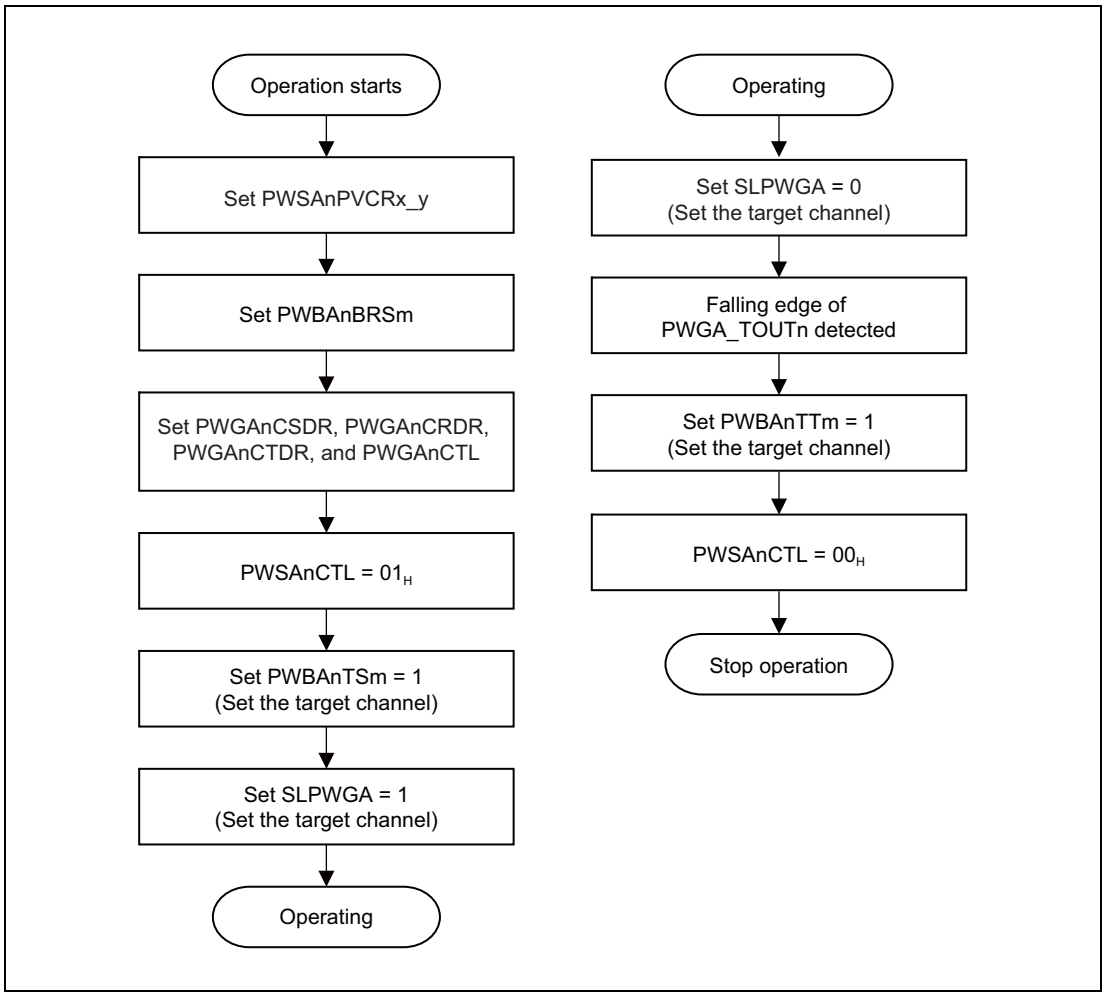

**Figure 30.2 PWM-Diag Operating Procedure**

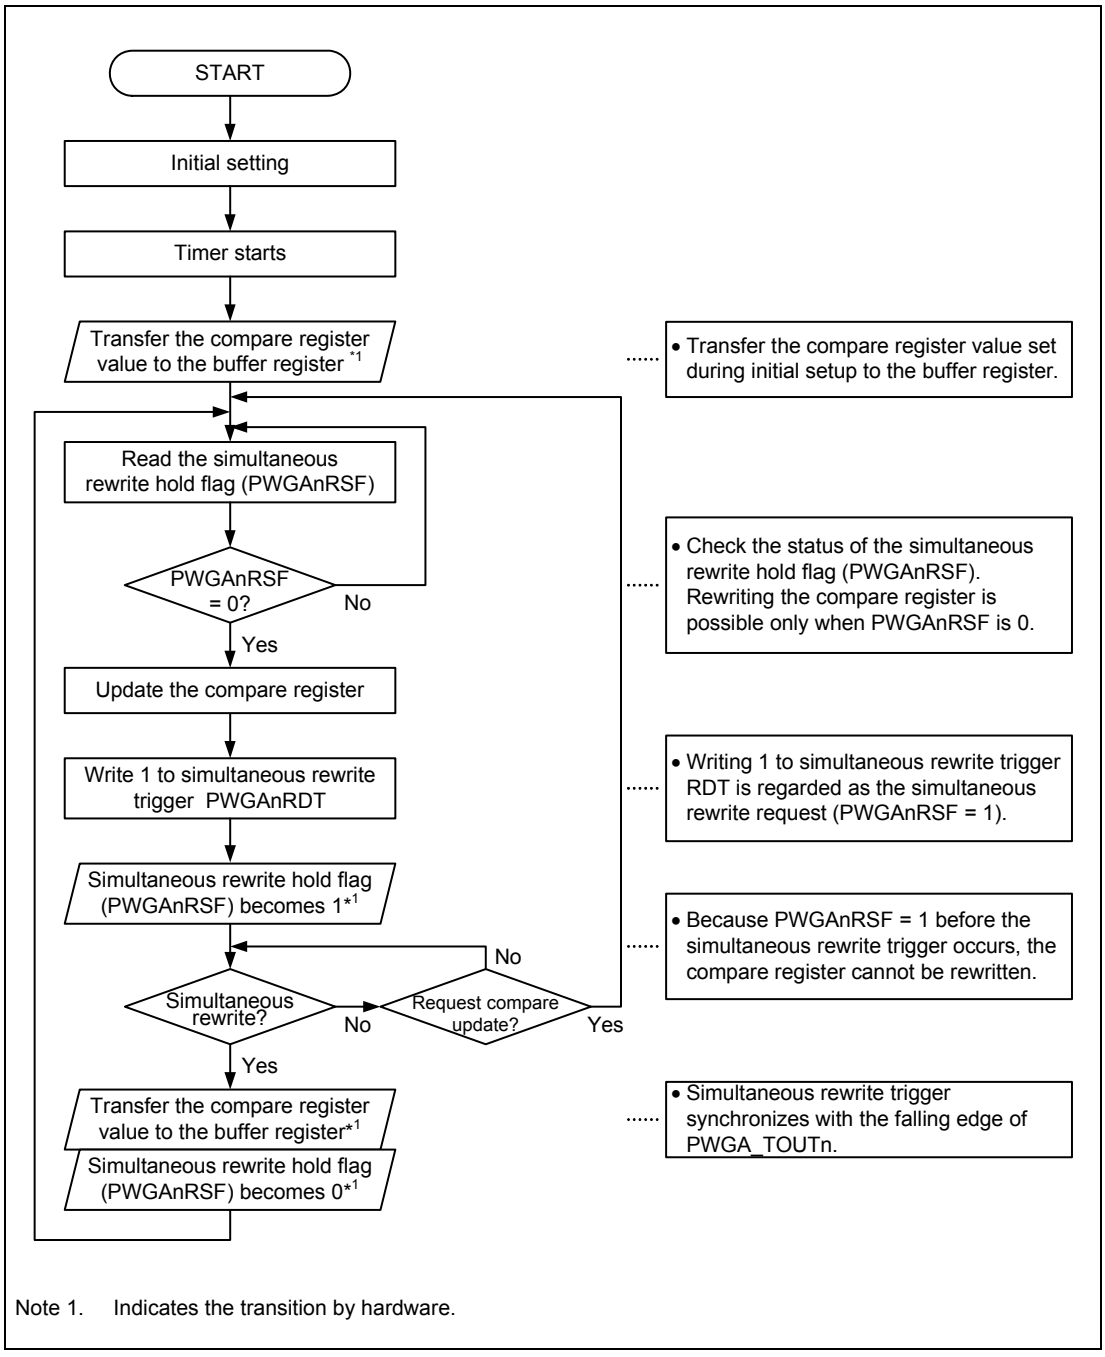
Procedures for simultaneous rewrite of PWGA are illustrated below.

The described term “compare register” indicates PWGAnCSDR, PWGAnCRDR, or PWGAnCTDR.

In addition, the described term “buffer register” indicates PWGAnCSBR, PWGAnCRBR, or PWGAnCTBR.



Note 1. Indicates the transition by hardware.

**Figure 30.3 Simultaneous Rewrite Procedure**

# 30.4 Operation Waveform of PWM-Diag

## 30.4.1 PWM Waveform Output by PWGA and Operation Waveform for A/D Conversion Trigger Output

### 30.4.1.1 Basic Operation Waveform of PWGA

The basic operation waveforms of PWGA are illustrated below.

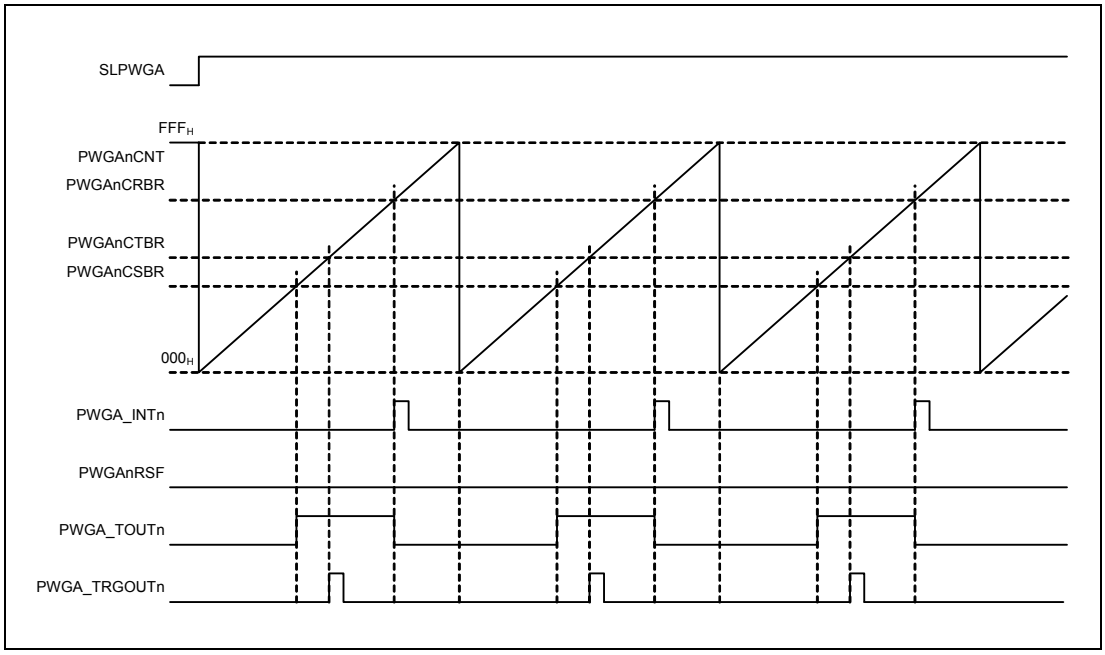


**Figure 30.4 Basic Waveform**

### 30.4.1.2 Operation Waveform when Simultaneous Rewrite for PWGA is Executed

The following figure illustrates the operation waveforms when simultaneous rewrite for PWGA is executed.

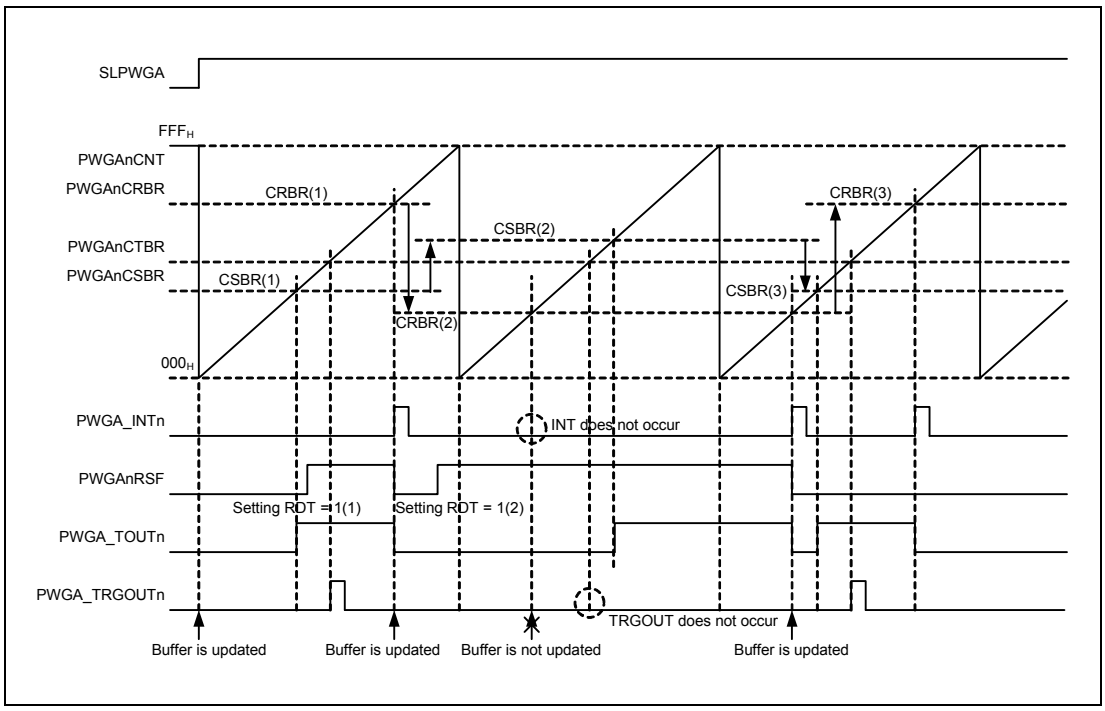

**Figure 30.5 Waveform when Simultaneous Rewrite is Executed**

Simultaneous rewrite is executed by re-setting the PWGAnCSDR and PWGAnCRDR registers, then setting either the PWGAnRDT or SLPWGAk register.

Moreover, if the relationship between set values in one interval is PWGAnCSDR > PWGAnCRDR, a falling edge in that interval is meaningless, and the falling edge in the next interval is valid.

Moreover, PWGA_TRGOUTn does not become valid unless PWGA_TOUTn is at the high level.

### 30.4.1.3 Operation Waveform when Stopping and Restarting PWGA Operation

The following figure illustrates the operation waveforms when stopping and restarting PWGA operation.

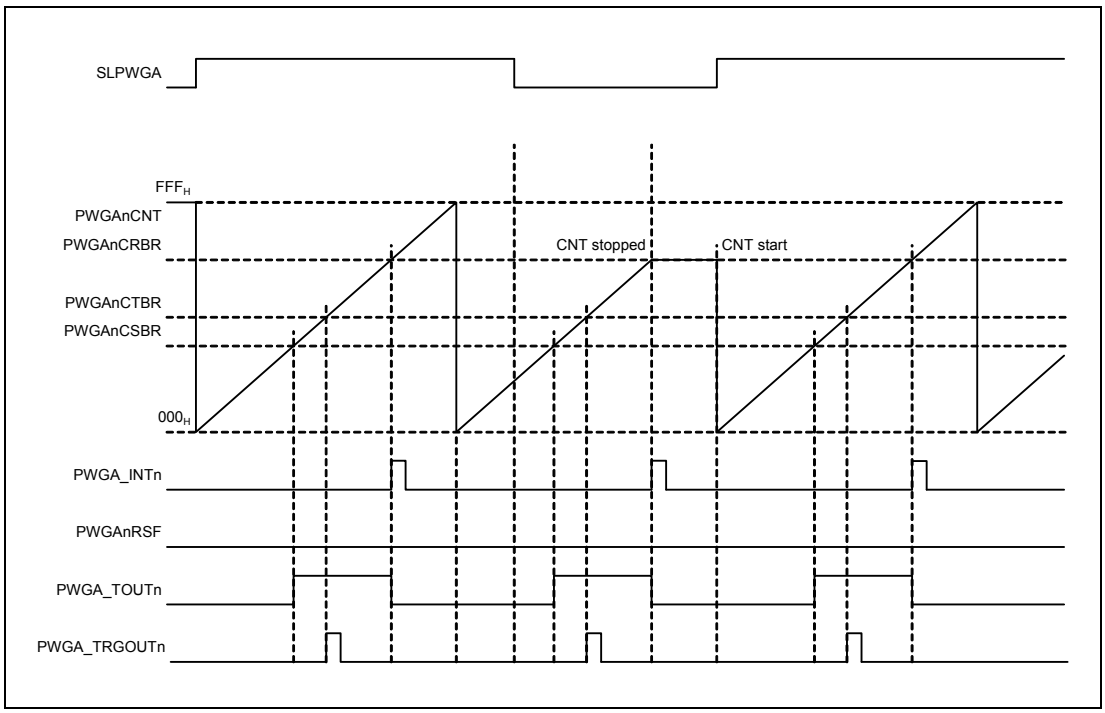

**Figure 30.6 Stopping and Resuming Operation (1)**

After the setting of SLPWGA has been changed from 1 to 0, PWGAnCNT stops operation because PWGA_INTn is generated.

After PWGA_INTn has been generated, by changing the setting of SLPWGA from 0 to 1, PWGAnCNT resumes counting from $000_H$.

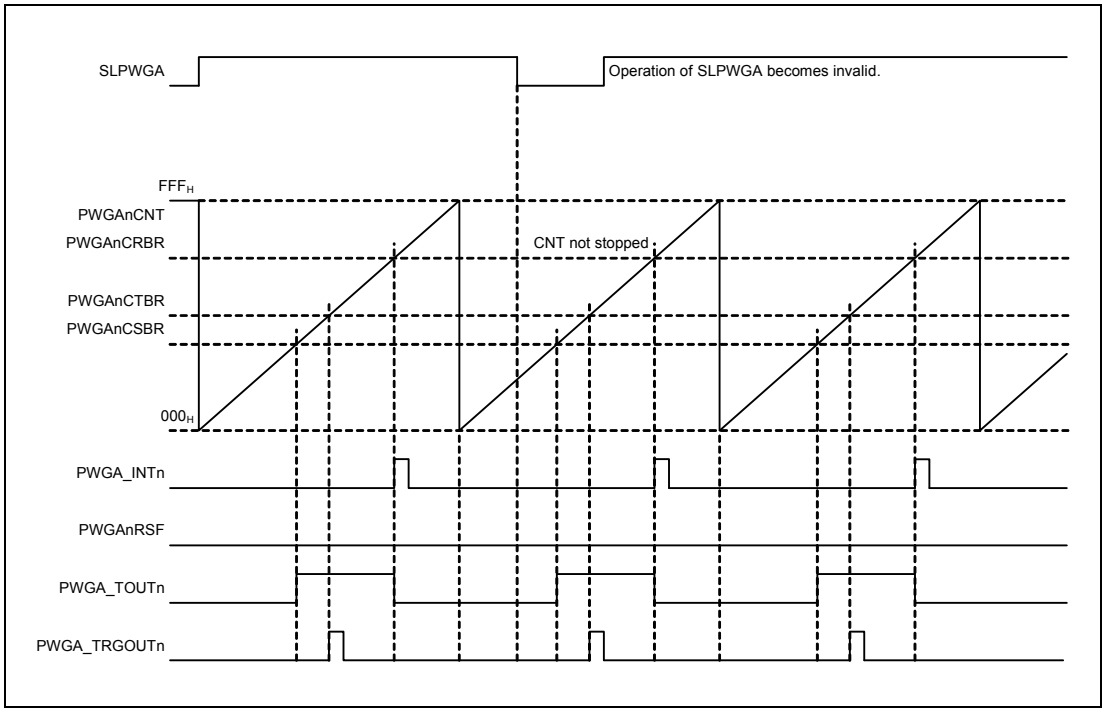

**Figure 30.7 Stopping and Resuming Operation (2)**

After the setting of SLPWGA has been changed from 1 to 0, if the setting of SLPWGA is changed from 0 to 1 before PWGA_INTn is generated, operations of SLPWGA become invalid, and PWGAnCNT continues counting.

### 30.4.1.4 Waveforms of PWGA Operation with Specific Settings

The following figures illustrate the waveforms of PWGA operation with specific settings.

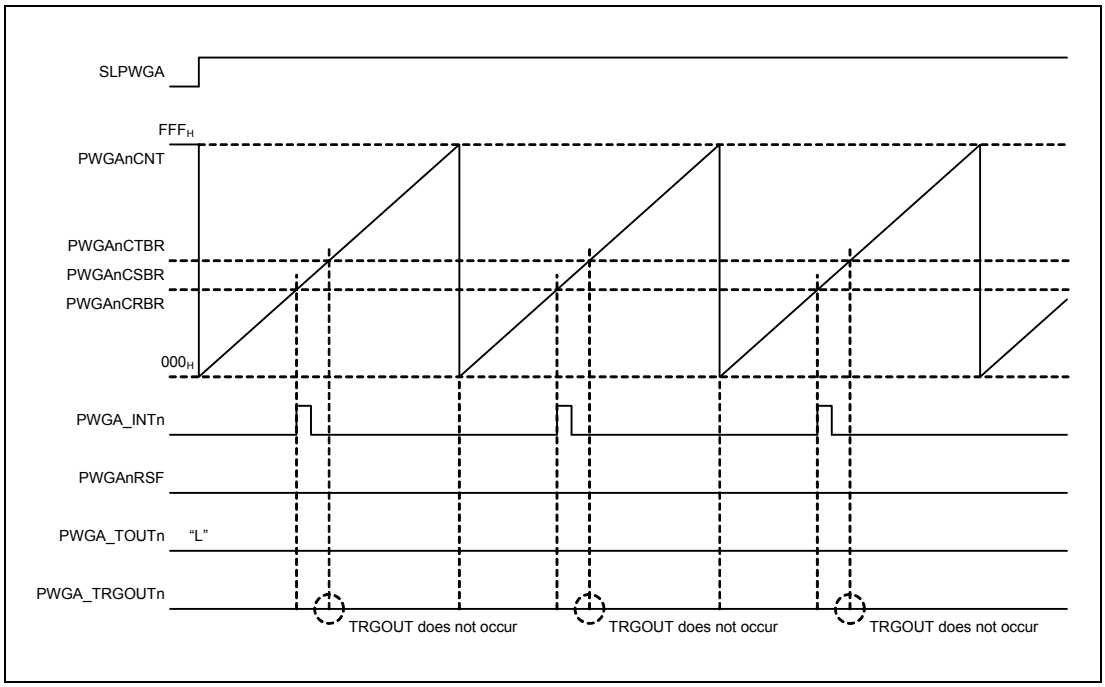

**Figure 30.8 PWGA_TOUTn = 0% Output Waveform**

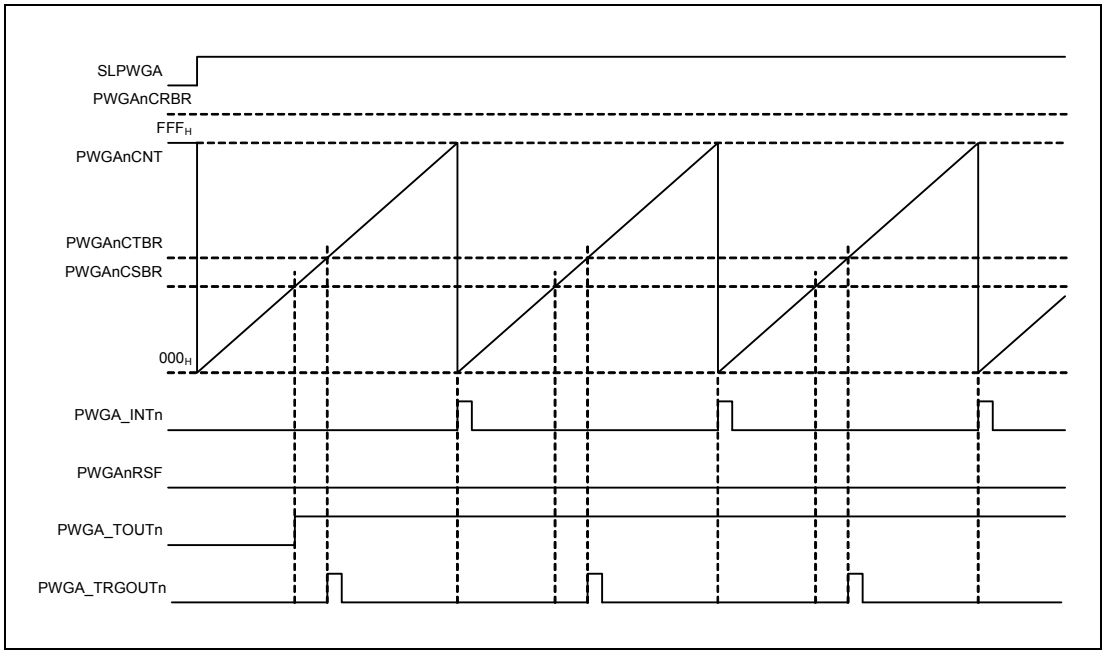

**Figure 30.9 PWGA_TOUTn = 100% Output Waveform**

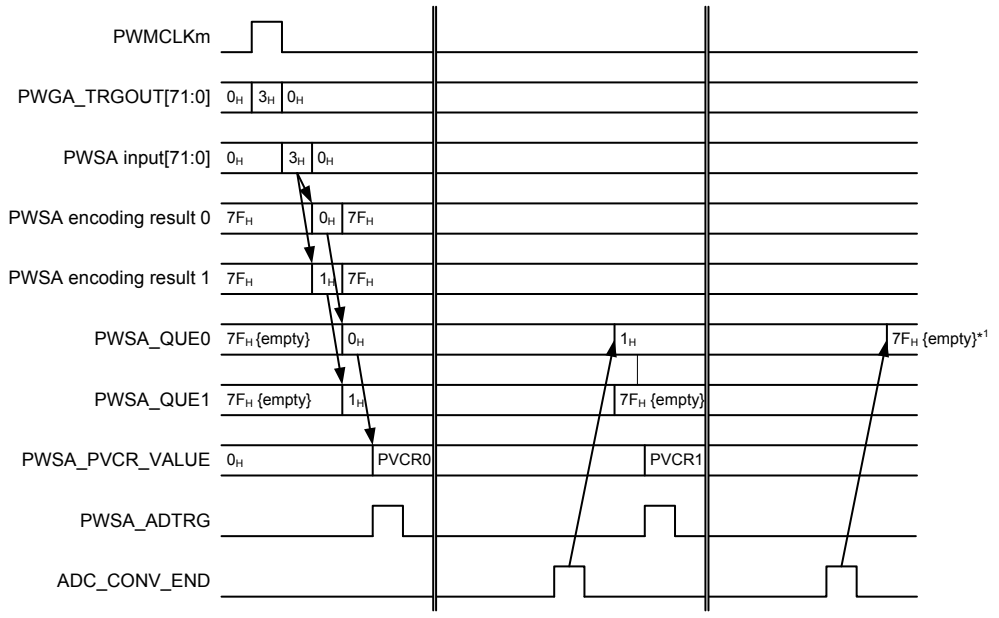
### 30.4.2 Operation Waveform when A/D Conversion Trigger Occurs in PWSA

An example of the PWSA operation is shown below.



Note 1. QUE0 indicates the PWGA_TRG number while the A/D conversion is executed. The initial value (while the A/D conversion is not executed) is $7F_H$.

**Figure 30.10 Example of PWSA Operation**

(1) Triggers occur simultaneously in channels 0 and 1 of PWGA. Channel 0 with the smaller channel number is stored in PWSAnQUE0, and channel 1 with the larger channel number is stored in PWSAnQUE1. The lower 16-bit data of PWSAnPVCR00_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter. At this time, as the A/D conversion for channel 1 is in the waiting state, the PWSAnSTR.PWSAnQNE bit is set.

(2) On completion of A/D conversion executed in step (1), the channel number of PWSAnQUE1 shifts to PWSAnQUE0 and PWSAnQUE1 enters the empty state.
After that, as similar to step (1), the upper 16-bit data of PWSAnPVCR00_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter.

(3) On completion of A/D conversion executed in step (2), PWSAnQUE0 enters the empty state.

## 30.5 PWM-Diag Related Function in A/D Converter (ADCA)

This section describes the A/D converter used in the PWM-Diag function.

### 30.5.1 ADCA Registers when the PWM-Diag Function is Used

- Before starting PWSA operation, the A/D converter must be set using the following register.
  - PWM-Diag scan group control register (ADCAnPWDSGCR)
- When the PWM-Diag is running, the PWSAnPVCRx_y value corresponding to the channel under conversion is set in the following register of the A/D converter.
  - PWM-Diag virtual channel register (ADCAnPWDVCR)
- After completion of A/D conversion, the conversion result can be checked by reading the following registers.
  - PWM-Diag data register (ADCAnPWDTSNDR)
  - PWM-Diag data supplementary information register (ADCAnPWDDIR)
- When A/D conversion result is outside the expected range, it can be confirmed using the upper/lower limit error detection function. The upper/lower limit error detection function is set by the following register.
  - Upper limit/lower limit error register (ADCAnULER)
- The scan end flag of the PWM-Diag scan group can be cleared using the following register.
  - PWM-Diag scan end flag clear register (ADCAnPWDSGSEFCR)

# Section 31 A/D Converter (ADCA)

This section contains a generic description of the A/D Converter (ADCA).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the ADCA.

## 31.1 Features of RH850/F1K ADCA

### 31.1.1 Number of Units and Channels

This microcontroller has the following number of ADCA units.

**Table 31.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | 2 | 2 |
| Name | ADCAn (n = 0) | ADCAn (n = 0, 1) | ADCAn (n = 0, 1) |

An ADCAn unit has the same number of physical channels as the number of A/D input pins and the same number of virtual channels as the number of addresses where the results of A/D conversion will be stored. The numbers of channels on individual products are as listed below.

**Table 31.2 Unit Configurations and Physical Channels**

| Unit Name (Number of Channels) ADCAn | | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|---|
| ADCA0 | 12 bit pin for conversion*1 | 16 | 16 | 16 |
| | 10 bit pin for conversion*2 | 20 | 20 | 20 |
| ADCA1 | 12 bit pin for conversion*1 | — | 8 | 16 |
| | 10 bit pin for conversion*2 | — | 4 | 8 |

Note 1. When 10-bit mode is selected, this pin can be used for 10-bit conversion.

Note 2. When 12-bit mode is selected but a pin is for 10-bit conversion, the 2 low-order bits of the result of conversion must be masked before use.

**Table 31.3 Unit Configurations and Virtual Channels**

| Unit Name (Number of Channels) ADCAn | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| ADCA0 | 50 | 50 | 50 |
| ADCA1 | — | 36 | 36 |

Table 31.4 Indices

| Index | Description |
|---|---|
| n | Throughout this section, the individual ADCA units are identified by the index “n” (n = 0, 1); for example, ADCAnPWDVCR indicates the PWM-Diag virtual channel register. |
| m | Throughout this section, the individual physical channels (channels in the unit) of ADCAn are identified by the index “m”; for example, ANInm. |
| j | Throughout this section, the individual virtual channels of ADCAn are identified by the index “j”; for example, ADCAnVCRj indicates the virtual channel register. |
| x | Throughout this section, the individual scan groups (SG) of ADCAn are identified by the index “x” (x = 1 to 3); for example, ADCAnSGSTCRx indicates the scan group x start control register. |
| k | Throughout this section, the individual physical channel numbers for T&H are identified by the index “k” (k = 0 to 5); for example, THkE is T&H enable bit of the T&H enable register (ADCAnTHER). |

The following table shows values indicated by the indices of each product.

Table 31.5 Indices of Products

| Indices of Each Product | | |
|---|---|---|
| **RH850/F1K 100 pins** | **RH850/F1K 144 pins** | **RH850/F1K 176 pins** |
| m = 0 to 35 (ADCA0) | m = 0 to 35 (ADCA0)<br>m = 0 to 7 (ADCA1)<br>16 to 19 (ADCA1) | m = 0 to 35 (ADCA0)<br>m = 0 to 23 (ADCA1) |
| j = 00 to 49 (ADCA0) | j = 00 to 49 (ADCA0)<br>j = 00 to 35 (ADCA1) | j = 00 to 49 (ADCA0)<br>j = 00 to 35 (ADCA1) |
| x = 1 to 3 (ADCA0) | x = 1 to 3 (ADCA0)<br>x = 1 to 3 (ADCA1) | x = 1 to 3 (ADCA0)<br>x = 1 to 3 (ADCA1) |
| k = 0 to 5 (ADCA0) | k = 0 to 5 (ADCA0) | k = 0 to 5 (ADCA0) |

## 31.1.2 Register Base Address

ADCAn base addresses are listed in the following table.

ADCAn register addresses are given as offsets from the base addresses.

Table 31.6 Register Base Addresses

| Base Address Name | Base Address |
|---|---|
| <ADCA0_base> | FFF2 $0000_H$ |
| <ADCA1_base> | FFD6 $D000_H$ |

### 31.1.3 Clock Supply

The ADCAn clock supply is shown in the following table.

**Table 31.7 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| ADCA0 | ADCLK | CKSCLK_AADCA | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_AADCA | |
| ADCA1 | ADCLK | CKSCLK_IADCA | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |

### 31.1.4 Interrupt Requests

ADCAn interrupt requests are listed in the following table.

**Table 31.8 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number | Other Trigger Signals |
|---|---|---|---|---|
| **ADCA0** | | | | |
| INT_ADE | A/D error interrupt | 56 | — | Motor control |
| INT_SG1 | Scan group 1 (SG1) end interrupt | 18 | 4 | LPS |
| INT_SG2 | Scan group 2 (SG2) end interrupt | 19 | 5 | LPS |
| INT_SG3 | Scan group 3 (SG3) end interrupt | 20, 32 | 6 | LPS |
| ADC_CONV_END0 | Scan group 4 (SG4) A/D conversion end signal | — | 7 | — |
| **ADCA1** | | | | |
| INT_ADE | A/D error interrupt | 212 | — | — |
| INT_SG1 | Scan group 1 (SG1) end interrupt | 213 | 103 | — |
| INT_SG2 | Scan group 2 (SG2) end interrupt | 214 | 104 | — |
| INT_SG3 | Scan group 3 (SG3) end interrupt | 215 | 105 | — |
| ADC_CONV_END1 | Scan group 4 (SG4) A/D conversion end signal | — | 106 | — |

### 31.1.5 Reset Sources

ADCAn reset sources are listed in the following table. ADCAn is initialized by these reset sources.

**Table 31.9 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| ADCA0 | Reset sources other than transition to DeepSTOP mode (AWORES) |
| ADCA1 | All reset sources (ISORES) |

### 31.1.6 External Input/Output Signals

External input/output signals of ADCAn are listed below.

**Table 31.10 ADCA0 Analog Input Signals**

| Unit Signal Name | Alternative Port Pin Signal | Resolution | T&H | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|---|---|---|
| ANI000 | ADCA0I0 | 12 | √ | √ | √ | √ |
| ANI001 | ADCA0I1 | 12 | √ | √ | √ | √ |
| ANI002 | ADCA0I2 | 12 | √ | √ | √ | √ |
| ANI003 | ADCA0I3 | 12 | √ | √ | √ | √ |
| ANI004 | ADCA0I4 | 12 | √ | √ | √ | √ |
| ANI005 | ADCA0I5 | 12 | √ | √ | √ | √ |
| ANI006 | ADCA0I6 | 12 | — | √ | √ | √ |
| ANI007 | ADCA0I7 | 12 | — | √ | √ | √ |
| ANI008 | ADCA0I8 | 12 | — | √ | √ | √ |
| ANI009 | ADCA0I9 | 12 | — | √ | √ | √ |
| ANI010 | ADCA0I10 | 12 | — | √ | √ | √ |
| ANI011 | ADCA0I11 | 12 | — | √ | √ | √ |
| ANI012 | ADCA0I12 | 12 | — | √ | √ | √ |
| ANI013 | ADCA0I13 | 12 | — | √ | √ | √ |
| ANI014 | ADCA0I14 | 12 | — | √ | √ | √ |
| ANI015 | ADCA0I15 | 12 | — | √ | √ | √ |
| ANI016 | ADCA0I0S | 10 | — | √ | √ | √ |
| ANI017 | ADCA0I1S | 10 | — | √ | √ | √ |
| ANI018 | ADCA0I2S | 10 | — | √ | √ | √ |
| ANI019 | ADCA0I3S | 10 | — | √ | √ | √ |
| ANI020 | ADCA0I4S | 10 | — | √ | √ | √ |
| ANI021 | ADCA0I5S | 10 | — | √ | √ | √ |
| ANI022 | ADCA0I6S | 10 | — | √ | √ | √ |
| ANI023 | ADCA0I7S | 10 | — | √ | √ | √ |
| ANI024 | ADCA0I8S | 10 | — | √ | √ | √ |
| ANI025 | ADCA0I9S | 10 | — | √ | √ | √ |
| ANI026 | ADCA0I10S | 10 | — | √ | √ | √ |
| ANI027 | ADCA0I11S | 10 | — | √ | √ | √ |
| ANI028 | ADCA0I12S | 10 | — | √ | √ | √ |
| ANI029 | ADCA0I13S | 10 | — | √ | √ | √ |
| ANI030 | ADCA0I14S | 10 | — | √ | √ | √ |
| ANI031 | ADCA0I15S | 10 | — | √ | √ | √ |
| ANI032 | ADCA0I16S | 10 | — | √ | √ | √ |
| ANI033 | ADCA0I17S | 10 | — | √ | √ | √ |
| ANI034 | ADCA0I18S | 10 | — | √ | √ | √ |
| ANI035 | ADCA0I19S | 10 | — | √ | √ | √ |

Table 31.11 ADCA0 External Input/Output Signals

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **ADCA0** | | |
| ADCA0TRG0 | External trigger pin (scan group 1)*1 | ADCA0TRG0 |
| ADCA0TRG1 | External trigger pin (scan group 2)*1 | ADCA0TRG1 |
| ADCA0TRG2 | External trigger pin (scan group 3)*1 | ADCA0TRG2 |
| ADCA0SEL0 | External analog multiplexer (MPX) output pin 0 | ADCA0SEL0 |
| ADCA0SEL1 | External analog multiplexer (MPX) output pin 1 | ADCA0SEL1 |
| ADCA0SEL2 | External analog multiplexer (MPX) output pin 2 | ADCA0SEL2 |

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

**CAUTION**

**When port P8_6 is used as ADCA0I8S, port P8_6 pin outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.**
**For details, see Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$.**

Table 31.12 ADCA1 Analog Input Signals

| Unit Signal Name | Alternative Port Pin Signal | Resolution | T&H | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|---|---|---|
| ANI100 | ADCA1I0 | 12 | — | — | √ | √ |
| ANI101 | ADCA1I1 | 12 | — | — | √ | √ |

Table 31.13 ADCA1 External Input/Output Signals

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **ADCA1** | | |
| ADCA1TRG0 | External trigger pin (scan group 1)*1 | ADCA1TRG0 |
| ADCA1TRG1 | External trigger pin (scan group 2)*1 | ADCA1TRG1 |
| ADCA1TRG2 | External trigger pin (scan group 3)*1 | ADCA1TRG2 |

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

## 31.2 Overview

### 31.2.1 Functional Overview

ADCA has the following features.

- 10-bit/12-bit resolution
- Successive approximation conversion method
- Number of A/D input channels
  A/D conversion is available for a maximum of 36 ADCA0 channels and 24 ADCA1 channels. Additionally, ADCA0 supports the connection of an external analog multiplexer (MPX) to extend the number of analog input channels.
- Internal track and hold (T&H) circuit
  ANI000 to ANI005 (ADCA0I0 to ADCA0I5) of ADCA0 include the track and hold circuit. The track and hold circuit can sample up to 6 channels of analog input simultaneously.
- A/D conversion control by scan groups
  The A/D conversion channel or conversion mode (scan mode) can be set for each scan group.
- Two scan modes
  Multi-cycle scan mode: Specified number of scans are executed.
  Continuous scan mode: Scans are executed repeatedly and continuously.
- Asynchronous/synchronous suspend and resume function
  A processing for a scan group can be interrupted to run the processing for another scan group.
- Start trigger for each scan group
  Software, hardware, and external trigger can start processing of each scan group.
- Scan end interrupt and DMA transfer are supported.
  For each scan group, an interrupt request to INTC can be issued or DMA transfer can be started, each time a processing for the virtual channel indicated by the end virtual channel pointer ends, or a virtual channel ends.
- A/D conversion channel repeat function
  A/D conversion is performed for the same channel two or four times sequentially, and the result is stored in the data register.
- Abundant safety functions
  Abundant safety functions are provided, such as A/D converter diagnosis, diagnosis of the channel multiplexer, diagnosis of open pins, diagnosis of the T&H circuit, upper limit/lower limit check for the A/D converter, overwrite check for data registers, and read and clear function for data registers.
- Shortest A/D conversion time per channel
  1.15 µs (when MPX is not used)
  2.30 µs (when MPX is used)

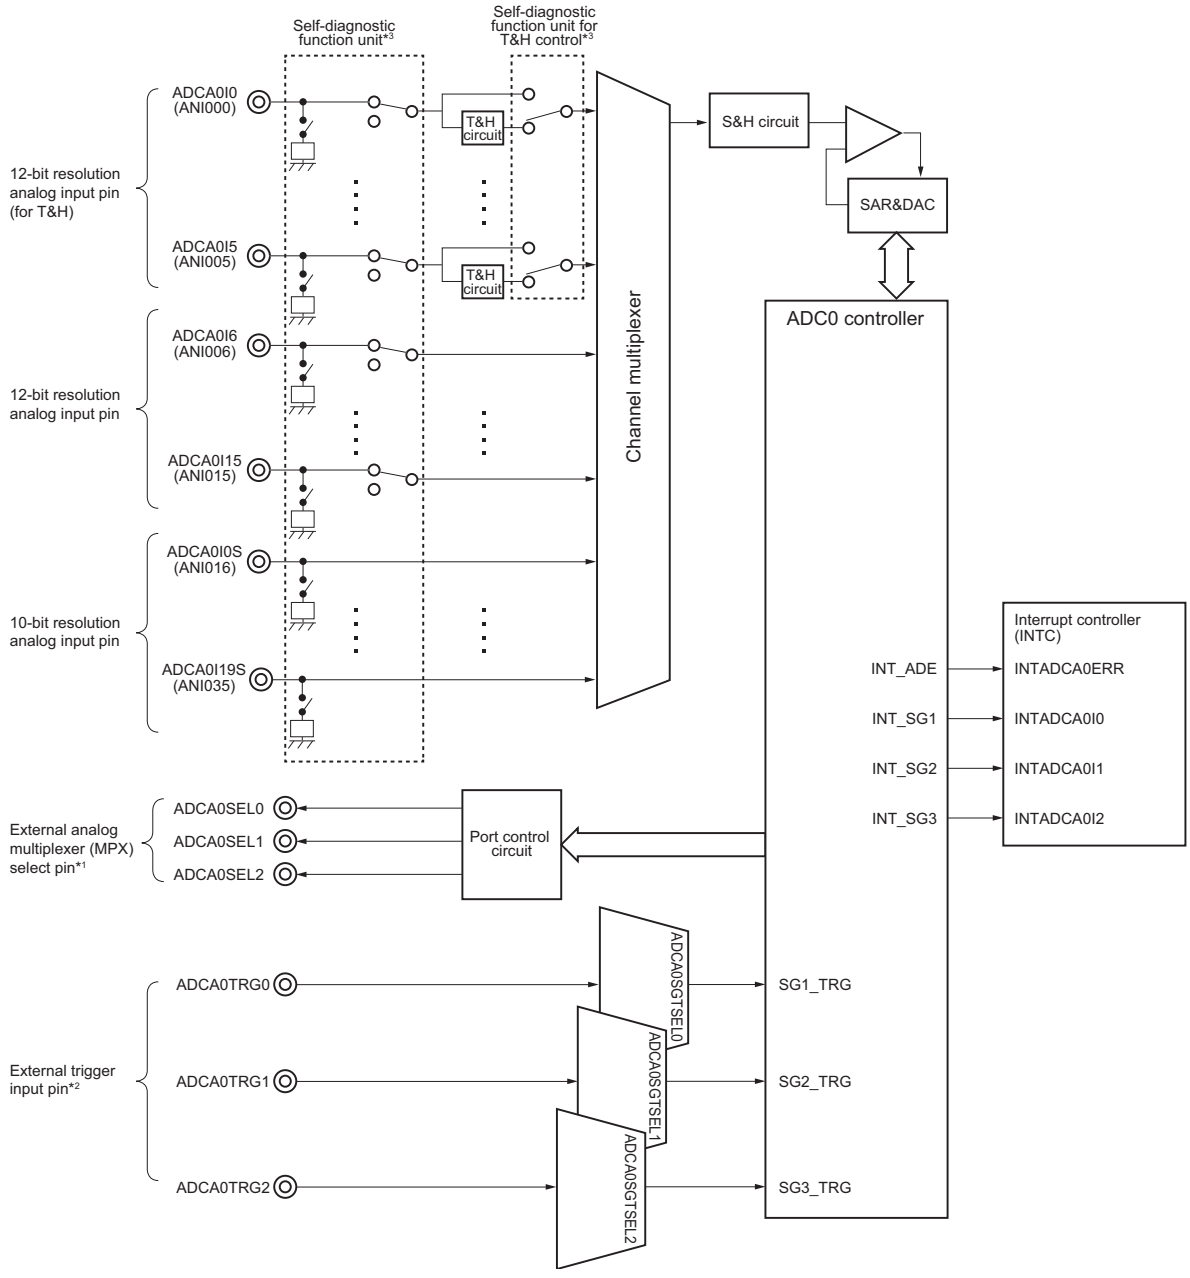
**NOTE**

- Physical channel (ANInm)
  Each A/D input channel of ADCA0 and ADCA1 units is called a physical channel. The physical channel of each unit is represented as ANI0m (m = 0 to 35) for ADCA0 and ANI1m (m = 0 to 23) for ADCA1.
  In RH850/F1K, the alternative port pins for 12-bit resolution A/D input channel and 10-bit resolution A/D input channel are represented as ADCAnIm and ADCAnImS, respectively. In this section, the physical channels and the corresponding alternative port pins are listed together.
- Virtual channel (ADCAnVCRj)
  ADCA0 has a maximum of 50 virtual channels, and ADCA1 has a maximum of 36 virtual channels. The virtual channel specifies the physical channel to be scanned.
  Scans are executed in sequence from the smallest virtual channel number. The scan order can be arbitrarily-specified by using virtual channels. In addition, the scanned result is stored in the data register (ADCAnDRj) corresponding to the virtual channel.
- Scan group (SGx)
  ADCA has three scan groups (SG1, SG2, SG3) and one PWM-Diag group (SG4). A/D conversion is executed in scan group unit. The channel to be scanned can be selected for each group by specifying the scan range, that is, the conversion start virtual channel and the conversion end virtual channel.

## 31.2.2 Block Diagram

The block diagram of ADCA0 is shown in **Figure 31.1**. The block diagram of ADCA1 is shown in **Figure 31.2**.

### (1) Configuration of ADCA0



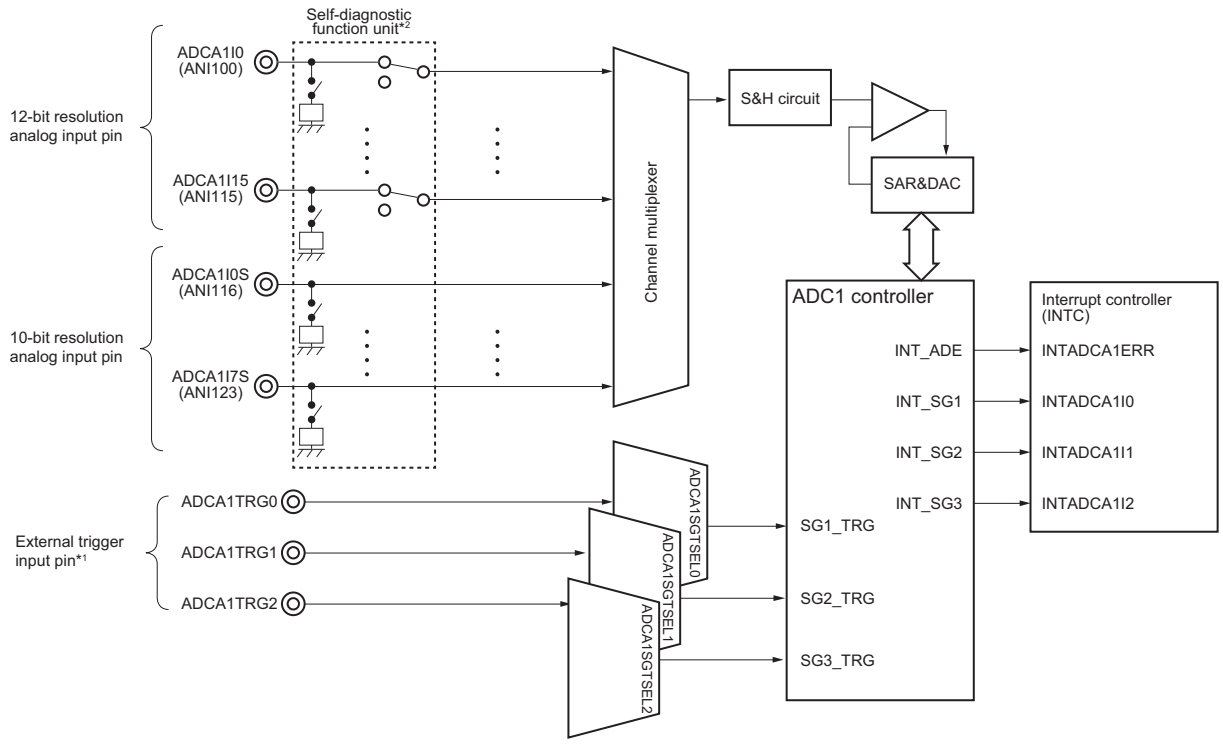
Note 1. For an example of external analog multiplexer connection, see **Figure 31.4, Example of External Analog Multiplexer Connection**.

Note 2. For details, see **Figure 31.3, Internal Connection Diagram of External Trigger Input Pins**.

Note 3. For the self-diagnostic function unit, see **Section 31.5, Self-Diagnostic Function**.

**Figure 31.1 ADCA0 Block Diagram (RH850/F1K with 176 Pins)**

### (2) Configuration of ADCA1



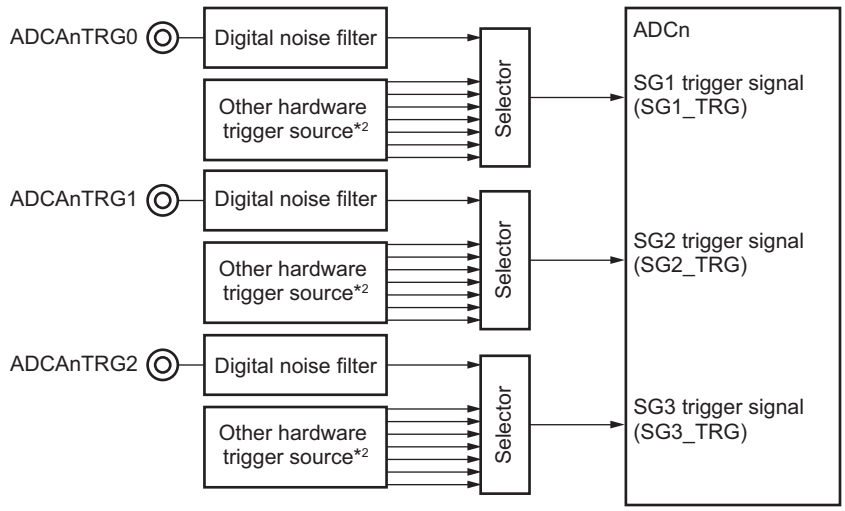
Note 1. For details, see **Figure 31.3, Internal Connection Diagram of External Trigger Input Pins**.
Note 2. For the self-diagnostic function unit, see **Section 31.5, Self-Diagnostic Function**.

**Figure 31.2 ADCA1 Block Diagram (RH850/F1K with 176 Pins)**

### (3) Configuration of external trigger input pins

An external trigger input pin is a hardware trigger source to activate ADCAn.

The configuration of external trigger input pins is shown below.



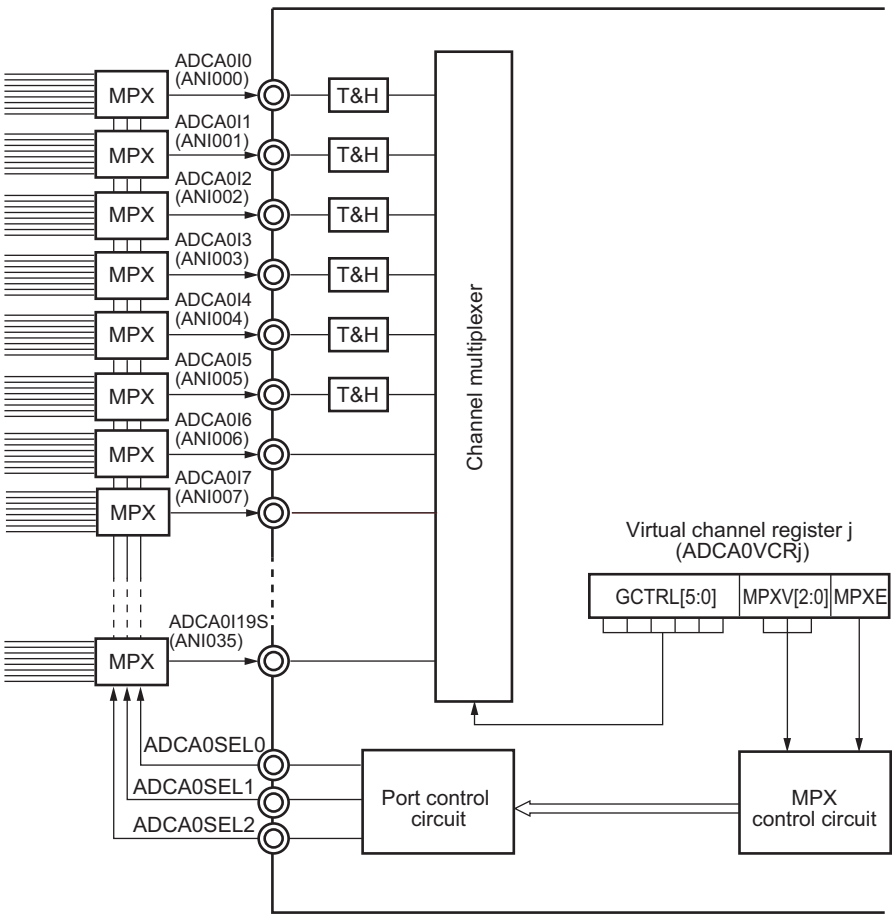
Note 1. For the condition setting to accept a trigger from an external trigger input pin, see **Section 2.12, Noise Filter & Edge/Level Detector**.

Note 2. For the hardware trigger sources, see **Table 31.49, List of A/D Conversion Hardware Triggers**.

**Figure 31.3 Internal Connection Diagram of External Trigger Input Pins**

### (4) Configuration of external analog multiplexer (MPX)

The external analog multiplexer (MPX) can be connected to any input signal pins ADCA0I0 to ADCA0I19S. An example of the external analog multiplexer connection is shown below.

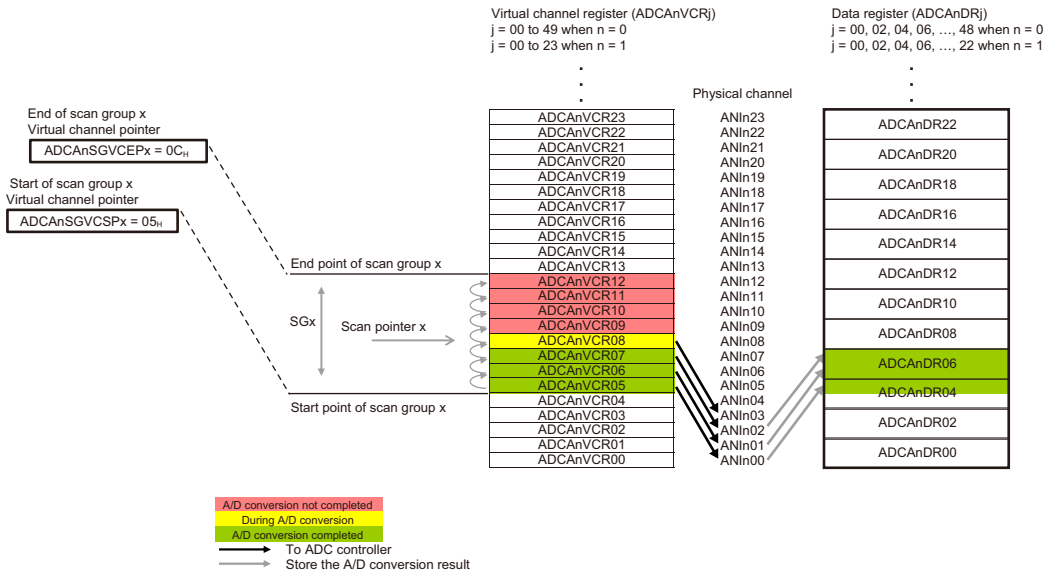


**Note:** The T&H function is disabled when the external analog multiplexer (MPX) is used.

**Figure 31.4 Example of External Analog Multiplexer Connection**

### (5) Virtual channel

The virtual channel specifies the physical address to be scanned.
The virtual channel is controlled by the ADCAnVCRj register.
A usage example of the virtual channel is shown below.



**Example)** When scan group x starts scanning 5th to 12th virtual channels

1. The ADCAnVCRj register specifies the physical channel (ANInm) for which virtual channel j executes the A/D conversion. The A/D conversion pins can be set in any order. (The figure above shows an example when ANIn0 to ANIn7 are selected.)
2. The scan pointer x sequentially reads the physical channels specified in the ADCAnVCRj register from “start point of scan group x” to “end point of scan group x”, and starts the A/D conversion for the read physical address.
3. The scanned result of virtual channel j is stored in data register j.

**Figure 31.5 Usage Example of Virtual Register**

# 31.3 Registers

## 31.3.1 List of Registers

The ADCA registers are listed in the following table.

For details about <ADCAn_base>, see **Section 31.1.2, Register Base Address**.

**Table 31.14 List of Registers (1/2)**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| **ADCA Specific Registers (Virtual Channel)** | | | |
| ADCAn | Virtual Channel Register j | ADCAnVCRj | <ADCAn_base> + j × $4_H$ |
| | PWM-Diag Virtual Channel Register | ADCAnPWDVCR | <ADCAn_base> + $0F4_H$ |
| | Data Register j | ADCAnDRj | <ADCAn_base> + $100_H$ + j × $2_H$ |
| | Data Supplementary Information Register j | ADCAnDIRj | <ADCAn_base> + $200_H$ + j × $4_H$ |
| | PWM-Diag data register | ADCAnPWDTSNDR | <ADCAn_base> + $178_H$ |
| | PWM-Diag Data Supplementary Information Register | ADCAnPWDDIR | <ADCAn_base> + $2F4_H$ |
| **ADCA Specific Registers (Control)** | | | |
| ADCAn | A/D Force Halt Register | ADCAnADHALTR | <ADCAn_base> + $300_H$ |
| | A/D Control Register | ADCAnADCR | <ADCAn_base> + $304_H$ |
| | MPX Current Register | ADCAnMPXCURR | <ADCAn_base> + $30C_H$ |
| | T&H Sampling Start Control Register | ADCAnTHSMPSTCR | <ADCAn_base> + $314_H$ |
| | T&H Control Register | ADCAnTHCR | <ADCAn_base> + $318_H$ |
| | T&H Group A Hold Start Control Register | ADCAnTHAHLDSTCR | <ADCAn_base> + $31C_H$ |
| | T&H Group B Hold Start Control Register | ADCAnTHBHLDSTCR | <ADCAn_base> + $320_H$ |
| | T&H Group A Control Register | ADCAnTHACR | <ADCAn_base> + $324_H$ |
| | T&H Group B Control Register | ADCAnTHBCR | <ADCAn_base> + $328_H$ |
| | T&H Enable Register | ADCAnTHER | <ADCAn_base> + $32C_H$ |
| | T&H Group Select Register | ADCAnTHGSR | <ADCAn_base> + $330_H$ |
| | Sampling Control Register | ADCAnSMPCR | <ADCAn_base> + $380_H$ |
| **ADCA Specific Registers (Safety-related)** | | | |
| ADCAn | Safety Control Register | ADCAnSFTCR | <ADCAn_base> + $334_H$ |
| | Upper Limit/Lower Limit Table Register 0 | ADCAnULLMTBR0 | <ADCAn_base> + $338_H$ |
| | Upper Limit/Lower Limit Table Register 1 | ADCAnULLMTBR1 | <ADCAn_base> + $33C_H$ |
| | Upper Limit/Lower Limit Table Register 2 | ADCAnULLMTBR2 | <ADCAn_base> + $340_H$ |
| | Error Clear Register | ADCAnECR | <ADCAn_base> + $344_H$ |
| | Upper Limit/Lower Limit Error Register | ADCAnULER | <ADCAn_base> + $348_H$ |
| | Overwrite Error Register | ADCAnOWER | <ADCAn_base> + $34C_H$ |
| **Scan Group Specific Registers** | | | |
| ADCAn | Scan Group x Start Control Register | ADCAnSGSTCRx | <ADCAn_base> + x × $40_H$ + $400_H$ |
| | PWM-Diag Scan Group Control Register | ADCAnPWDSGCR | <ADCAn_base> + $508_H$ |
| | Scan Group x Control Register | ADCAnSGCRx | <ADCAn_base> + x × $40_H$ + $408_H$ |
| | Scan Group x Start Virtual Channel Pointer | ADCAnSGVCSPx | <ADCAn_base> + x × $40_H$ + $40C_H$ |
| | Scan Group x End Virtual Channel Pointer | ADCAnSGVCEPx | <ADCAn_base> + x × $40_H$ + $410_H$ |
| | Scan Group x Multicycle Register | ADCAnSGMCYCRx | <ADCAn_base> + x × $40_H$ + $414_H$ |

## 31.3.2 ADCA Specific Registers

This section describes the registers that are equipped in each of ADCA0 and ADCA1.

### 31.3.2.1 ADCAnVCRj — Virtual Channel Register j

This register is used to control the virtual channel.

**Access:** ADCAnVCRj register can be read or written in 32-bit units.
ADCAnVCRjL register can be read or written in 16-bit units.
ADCAnVCRjLL and ADCAnVCRjLH registers can be read or written in 8-bit units.

**Address:** ADCAnVCRj: <ADCAn_base> + j × $4_H$
ADCAnVCRjL: <ADCAn_base> + j × $4_H$
ADCAnVCRjLL: <ADCAn_base> + j × $4_H$
ADCAnVCRjLH: <ADCAn_base> + j × $4_H$ + $1_H$

**Value after reset:** 0000 $0000_H$

**Table 31.15 ADCAnVCRj Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | MPXE*1 | MPX Enable<br>0: The use of MPX is prohibited.<br>No wait is inserted before A/D conversion is performed.<br>1: The use of MPX is permitted. The MPXV[2:0] bits are output from ADCAnSEL0 to ADCAnSEL2 when the virtual channel starts, and a wait of one A/D-conversion time is inserted before A/D conversion is performed. |
| 14 to 12 | MPXV[2:0]*1 | These bits are used to set the MPX value to be transferred to an external analog multiplexer. |
| 11, 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | CNVCLS*1, *2 | A/D Conversion Type Select for Self-Diagnosis<br>0: A/D conversion of the hold value is performed during a self-diagnosis.<br>1: Normal A/D conversion is performed during a self-diagnosis.<br>When normal A/D conversion is performed during a self-diagnosis and MPX is in use (MPXE is set), however, a wait of one A/D conversion time is inserted before A/D conversion is performed. On the other hand, MPX cannot be used when A/D conversion of the hold value is performed during a self-diagnosis. |
| 8 | ADIE | A/D Conversion End Interrupt Enable<br>0: A scan group x end interrupt (INT_SGx) is not generated when A/D conversion for virtual channel j ends in SGx.<br>1: A scan group x end interrupt (INT_SGx) is generated when A/D conversion for virtual channel j ends in SGx. |
| 7, 6 | ULS[1:0] | Upper Limit/Lower Limit Table Select<br>00: Upper limit and lower limit are not checked.<br>01: Upper limit and lower limit are checked for ADCAnULLMTBR0.<br>10: Upper limit and lower limit are checked for ADCAnULLMTBR1.<br>11: Upper limit and lower limit are checked for ADCAnULLMTBR2. |

**Table 31.15 ADCAnVCRj Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 5 to 0 | GCTRL[5:0] | Physical Channel Select<br>$0_H$ to $23_H$: Corresponding ANInm is selected.<br>$24_H$: Diagnosis channel for A/D converter is selected.<br>Others: Setting prohibit<br>**Note:** These bits shall set the physical channel which is supported. See **Table 31.5, Indices of Products**, **Table 31.10, ADCA0 Analog Input Signals** and **Table 31.12, ADCA1 Analog Input Signals**. |

Note 1. These bits are only supported for ADCA0. For ADCA1, when writing, write the value after reset.

Note 2. This bit is only supported when j = 33 to 35. Otherwise, when writing, write the value after reset.

**CAUTION**

To prevent malfunction, ADCAnVCRj should be set when SGACT of applicable scan groups is 0 (before scan groups are started) and TRGMD of applicable scan groups is 0.

| Other than above | | | | | | Setting prohibited |

Note 1. This setting only applies to ADCA0. Setting is prohibited in ADCA1 (RH850/F1K with 176 pins).
Note 2. This setting only applies to ADCA0. Setting is prohibited in ADCA1 (RH850/F1K with 144 pins).
Note 3. This setting only applies to ADCA0. Setting is prohibited in ADCA1 (RH850/F1K with 100 pins).

### 31.3.2.2 ADCAnPWDVCR — PWM-Diag Virtual Channel Register

This register is used to indicate virtual channel setting (PWSAnPVCRx_y register setting) of the PWM-Diag (SG4).

**Access:** ADCAnPWDVCR register is a read-only register that can be read in 32-bit units.
ADCAnPWDVCRL register is a read-only register that can be read in 16-bit units.
ADCAnPWDVCRLL register is a read-only register that can be read in 8-bit units.
ADCAnPWDVCRLH register is a read-only register that can be read in 8-bit units.

**Address:** ADCAnPWDVCR: <ADCAn_base> + $0F4_H$
ADCAnPWDVCRL: <ADCAn_base> + $0F4_H$
ADCAnPWDVCRLL: <ADCAn_base> + $0F4_H$
ADCAnPWDVCRLH: <ADCAn_base> + $0F4_H$ + $1_H$

**Value after reset:** $0000\ 0000_H$

Table 31.17 ADCAnPWDVCR Register Contents

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 | MPXE*1 | The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[27] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[11] (even channel) bit.<br><br>MPX Enable<br>Set this bit to 1 when an external analog multiplexer is used.<br>0: The use of MPX is prohibited.<br>1: The use of MPX is permitted. The MPXV[2:0] bits are output from ADCAnSEL0 to ADCAnSEL2 when the virtual channel starts, and a wait of one A/D-conversion time is inserted before A/D conversion is performed. |
| 14 to 12 | MPXV[2:0]*1 | These bits are used to set the MPX value to be transferred to an external analog multiplexer by using the PWSAnPVCRx_y.PWSAnVRDTy[26:24] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[10:8] (even channel) bit. |
| 11 to 8 | Reserved | When read, the value after reset is returned. |
| 7 to 6 | ULS[1:0] | The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[23:22] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[7:6] (even channel) bit.<br>Upper Limit/Lower Limit Table Select<br>00: Upper limit and lower limit are not checked.<br>01: Upper limit and lower limit are checked for ADCAnULLMTBR0.<br>10: Upper limit and lower limit are checked for ADCAnULLMTBR1.<br>11: Upper limit and lower limit are checked for ADCAnULLMTBR2. |
| 5 to 0 | GCTRL[5:0] | The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[21:16] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[5:0] (even channel) bit.<br><br>Physical Channel Select<br>These bits are used to specify a physical channel to be assigned to virtual channel j.<br>For the selection of the channel, see **Table 31.16, Selection of Physical Channels**. |

Note 1. These bits are only supported for ADCA0. For ADCA1, when read, the value after reset is returned.

### 31.3.2.3 ADCAnDRj — Data Register j

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to ADCAnVCRj and ADCAnVCR(j+1). As the A/D conversion results, the conversion result for ADCAnVCR(j+1) is stored in the upper bits (ADCAnDR(j+1)), and the conversion result for ADCAnVCRj is stored in the lower bits (ADCAnDRj).

**Access:** ADCAnDRj register is a read-only register that can be read in 32-bit units.
ADCAnDRjL and ADCAnDRjH registers are read-only registers that can be read in 16-bit units.

**Address:** ADCAnDRj: <ADCAn_base> + $100_H$ + j × $2_H$
ADCAnDRjL: <ADCAn_base> + $100_H$ + j × $2_H$
ADCAnDRjH: <ADCAn_base> + $100_H$ + j × $2_H$ + $2_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DR(j+1)[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DRj[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 31.18 ADCAnDRj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | DR(j+1)[15:0] | These bits are used to store the A/D conversion result data.<br>(The A/D conversion result for the channel set in ADCAnVCR(j+1) are transferred.) |
| 15 to 0 | DRj[15:0] | These bits are used to store the A/D conversion result data.<br>(The A/D conversion result for the channel set in ADCAnVCRj are transferred.) |

**CAUTION**

If the number of channels is odd, the higher-order bits (DR(j+1)[15:0]) in the ADCAnDRj register cannot be used. If virtual channels 33, 34, and 35 are used exclusively for self-diagnosis, the lower-order bits (DRj[15:0]) for channel 32 cannot be used.

**NOTES**

1. j = 00, 02, …, 46, 48 (for ADCA0)
   j = 00, 02, …, 32, 34 (for ADCA1 of the RH850/F1K with 176 pins and 144 pins)
2. By controlling ADCAnADCR.CRAC and ADCAnADCR.CTYP, the data format of this register becomes as follows:
   - ADCAnADCR.CTYP = 0 and ADCAnADCR.CRAC = 0 → Right alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 27 to 16, and the A/D conversion result for ADCAnVCRj is transferred to bits 11 to 0.
   - ADCAnADCR.CTYP = 0 and ADCAnADCR.CRAC = 1 → Left alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 31 to 20, and the A/D conversion result for ADCAnVCRj is transferred to bits 15 to 4.
   - ADCAnADCR.CTYP = 1 and ADCAnADCR.CRAC = 0 → Right alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 25 to 16, and the A/D conversion result for ADCAnVCRj is transferred to bits 9 to 0.
   - ADCAnADCR.CTYP = 1 and ADCAnADCR.CRAC = 1 → Left alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 31 to 22, and the A/D conversion result for ADCAnVCRj is transferred to bits 15 to 6.

### 31.3.2.4 ADCAnDIRj — Data Supplementary Information Register j

This register is a 32-bit read-only register that stores the A/D conversion result for ADCAnDRj and information incidental to the A/D converted value.

As the A/D conversion result, the ADCAnDRj value is transferred. As information incidental to the A/D converted value, information about the write flag (WFLG), the MPX value (MPXV[2:0]), and the physical channel (ID[5:0]) is transferred. The data format of the A/D conversion result stored in ADCAnDIRj is the same as that for the ADCAnDRj register.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ADCAn_base> + $200_H$ + j × $4_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 31.19 ADCAnDIRj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | MPXE*1 | MPX Enable Flag<br>0: MPX function is not used.<br>1: MPX function is used. |
| 30 to 28 | MPXV[2:0]*1 | These bits are used to store the MPX value.<br>The MPX value to be stored is the MPX value of the most recent conversion result. |
| 27, 26 | Reserved | When read, the value after reset is returned. |
| 25 | WFLG | Write Flag<br>0: ADCAnDRj or ADCAnDIRj is read (cleared when read).<br>1: A/D converted value is stored in ADCAnDRj (set when the value is stored). |
| 24 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 16 | ID[5:0] | These bits store the physical channel number (GCTRL) corresponding to the conversion result.<br>The physical channel number to be stored is the number corresponding to the most recent conversion result. |
| 15 to 0 | DR[15:0] | These bits are used to store the A/D conversion result. |

Note 1. These bits are only supported by ADCA0.
For ADCA1, when read, the value after reset is returned.

### 31.3.2.5 ADCAnPWDTSNDR — PWM-Diag Data Register

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to the PWM-Diag. As the A/D conversion results, the conversion result for the PWM-Diag (PWDDR) is stored in the upper bits.

**Access:** ADCAnPWDTSNDR register is a read-only register that can be read in 32-bit units.
ADCAnPWDTSNDRH register is a read-only register that can be read in 16-bit units.

**Address:** ADCAnPWDTSNDR: <ADCAn_base> + $178_H$
ADCAnPWDTSNDRH: <ADCAn_base> + $17A_H$

**Value after reset:** $0000\ 0000_H$

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | PWDDR[15:0] | These bits are used to store the A/D conversion result data for the PWM-Diag. |
| 15 to 0 | Reserved | When read, the value after reset is returned. |

**NOTE**

The data format of this register is controlled by ADCAnADCR.CRAC and ADCAnADCR.CTYP, as shown below.

- ADCAnADCR.CTYP = 0, ADCAnADCR.CRAC = 0 → Right alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 27 to 16.
- ADCAnADCR.CTYP = 0, ADCAnADCR.CRAC = 1 → Left alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 20.
- ADCAnADCR.CTYP = 1, ADCAnADCR.CRAC = 0 → Right alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 25 to 16.
- ADCAnADCR.CTYP = 1, ADCAnADCR.CRAC = 1 → Left alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 22.

### 31.3.2.6 ADCAnPWDDIR — PWM-Diag Data Supplementary Information Register

This register is a 32-bit read-only register that stores the A/D conversion result when PWM-Diag is used, and information incidental to the A/D converted value.

As the A/D conversion result, the ADCAnPWDSNDR.PWDDR[15:0] value is transferred. As supplementary information to the A/D converted value, the write flag (WFLG), MPX value (MPXV[2:0]), and physical channel (ID[5:0]) are transferred. The data format of the A/D conversion result stored in ADCAnPWDDIR is the same as that for the ADCAnPWDTSNDR register.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ADCAn_base> + $2F4_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MPXE*1 | MPXV[2:0]*1 | | | — | — | WFLG | — | — | — | ID[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 31.21 ADCAnPWDDIR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | MPXE*1 | MPX Enable Flag<br>0: The MPX function is not used.<br>1: The MPX function is used. |
| 30 to 28 | MPXV[2:0]*1 | These bits are used to store the MPX value.<br>The MPX value to be stored is the MPX value of the most recent conversion result. |
| 27, 26 | Reserved | When read, the value after reset is returned. |
| 25 | WFLG | Write Flag<br>0: ADCAnPWDTSNDR or ADCAnPWDDIR is read (cleared when read).<br>1: The A/D converted value is stored in ADCAnPWDTSNDR (set when the value is stored). |
| 24 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 16 | ID[5:0] | These bits are used to store the physical channel number (GCTRL) corresponding to the conversion result.<br>The physical channel number to be stored is the physical channel number corresponding to the most recent conversion result. |
| 15 to 0 | PWDDR[15:0] | These bits are used to store the A/D conversion result for PWM-Diag. |

Note 1. These bits are only supported for ADCA0.
For ADCA1, when read, the value after reset is returned.

### 31.3.2.7 ADCAnADHALTR — A/D Force Halt Register

This register is used to halt conversion for all SGs of ADCAn. The read value is always 0.

**Access:** ADCAnADHALTR register is a write-only register that can be written in 32-bit units.
ADCAnADHALTRL register is a write-only register that can be written in 16-bit units.
ADCAnADHALTRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnADHALTR:<ADCAn_base> + $300_H$
ADCAnADHALTRL:<ADCAn_base> + $300_H$
ADCAnADHALTRLL:<ADCAn_base> + $300_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W |

**Table 31.22 ADCAnADHALTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | HALT | ADCA Force Halt Trigger<br>All scan groups are halted and initialized, and ADCA becomes idle state.<br>Writing of 0: No effect<br>Writing of 1: Scan groups are halted. |

### 31.3.2.8 ADCAnADCR — A/D Control Register

This register is used for ADCAn common control.

**Access:** ADCAnADCR register can be read or written in 32-bit units.
ADCAnADCRL register can be read or written in 16-bit units.
ADCAnADCRLL register can be read or written in 8-bit units.

**Address:** ADCAnADCR: <ADCAn_base> + $304_H$
ADCAnADCRL: <ADCAn_base> + $304_H$
ADCAnADCRLL: <ADCAn_base> + $304_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R | R | R | R | R | R | R | R | R/W | R | R/W | R/W | R | R | R/W | R/W |

**Table 31.23 ADCAnADCR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | DGON | Self-Diagnostic Voltage Standby Control<br>0: The self-diagnostic voltage circuit is turned off.<br>1: The self-diagnostic voltage circuit is turned on, or the reference voltage is updated. |
| 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | CRAC | Alignment Control<br>0: The results of conversion to PWDDR and ADCAnDRj are stored right-aligned.<br>1: The results of conversion to PWDDR and ADCAnDRj are stored left-aligned. |
| 4 | CTYP | 12/10 Bit Select Mode<br>0: 12-bit mode<br>1: 10-bit mode |
| 3, 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | SUSMTD [1:0] | Suspend Mode Select<br>These bits are used to select the suspend method when a higher-priority scan group interrupts a lower-priority scan group.<br>00: Synchronous suspend when a higher-priority SG or SVSTOP interrupts.<br>01: Asynchronous suspend when a higher-priority SG (SG2, SG3, SG4) and SVSTOP interrupt SG1, and synchronous suspend when a higher-priority SG (SG3, SG4) and SVSTOP interrupt SG2, or when a higher-priority SG (SG4) and SVSTOP interrupt SG3.<br>10: Asynchronous suspend when a higher-priority SG or SVSTOP interrupts.<br>11: Setting prohibited |

**CAUTION**

To prevent malfunction, ADCAnADCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

**NOTE**

- Synchronous suspend:
  If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the A/D conversion for the higher-priority SG is performed after the on-going A/D conversion of a channel is completed. After processing for the higher-priority SG is completed, the suspended A/D channel processing for the lower-priority SG is resumed.
- Asynchronous suspend:
  If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the on-going channel processing is suspended, and then the A/D conversion for the higher-priority SG is performed. After processing for the higher-priority SG is completed, the suspended A/D channel conversion for the lower-priority SG is resumed.

For details, see **Figure 31.21, Example of Synchronous Suspend and Resume Operation** and **Figure 31.22, Example of Asynchronous Suspend and Resume Operation**.

### 31.3.2.9 ADCAnMPXCURR — MPX Current Register

This register is used to store the MPX value for an external analog multiplexer.

**Access:** ADCAnMPXCURR register is a read-only register that can be read in 32-bit units.
ADCAnMPXCURRL register is a read-only register that can be read in 16-bit units.
ADCAnMPXCURRLL register is a read-only register that can be read in 8-bit units.

**Address:** ADCAnMPXCURR: <ADCAn_base> + $30C_H$
ADCAnMPXCURRL: <ADCAn_base> + $30C_H$
ADCAnMPXCURRLL: <ADCAn_base> + $30C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | MPXCUR[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 31.24 ADCAnMPXCURR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 to 0 | MPXCUR[2:0] | These bits are used to store the current MPX value.<br>If conversion of a virtual channel starts after setting ADCAnVCRj.MPXE to 1, the setting of ADCAnVCRj.MPXV[2:0] is stored.<br>If conversion of a virtual channel starts after setting ADCAnPWDVCR.MPXE to 1, the setting of ADCAnPWDVCR.MPXV[2:0] is stored. |

**NOTE**

In RH850/F1K, only ADCA0 supports this function.

### 31.3.2.10 ADCAnTHSMPSTCR — T&H Sampling Start Control Register

This register is used to control the start of sampling for all T&Hk (k = 0 to 5). The bits are always read as 0.

**Access:** ADCAnTHSMPSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHSMPSTCRL register is a write-only register that can be written in 16-bit units.
ADCAnTHSMPSTCRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnTHSMPSTCR: <ADCAn_base> + $314_H$
ADCAnTHSMPSTCRL: <ADCAn_base> + $314_H$
ADCAnTHSMPSTCRLL: <ADCAn_base> + $314_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W |

**Table 31.25 ADCAnTHSMPSTCR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | SMPST | T&H Sampling Start Control Trigger<br>0: No effect<br>1: Sampling for all T&H is started.<br><br>The conditions to place the T&H circuit in the sampling state are as follows:<br>• Condition to start sampling while T&H is stopped:<br>1 being written to ADCAnTHSMPSTCR.SMPST while ADCAnTHER.THkE = 1 (k = 0 to 5).<br>• Condition to start continuous sampling in automatic sampling:<br>A/D conversion of the hold value for T&Hk being completed while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHCR.ASMPMSK = 1. |

**NOTE**

In RH850/F1K, only ADCA0 supports this function.

### 31.3.2.11 ADCAnTHCR — T&H Control Register

This register controls the sampling transition after A/D conversion of the hold value for T&H is completed.

Automatic start of sampling on the T&H circuit after A/D conversion of the hold value for T&H is completed shortens the time required for the generation of succeeding hold completion triggers.

**Access:** ADCAnTHCR register can be read or written in 32-bit units.
ADCAnTHCRL register can be read or written in 16-bit units.
ADCAnTHCRLL register can be read or written in 8-bit units.

**Address:** ADCAnTHCR: <ADCAn_base> + $318_H$
ADCAnTHCRL: <ADCAn_base> + $318_H$
ADCAnTHCRLL: <ADCAn_base> + $318_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ASMPMSK |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 31.26 ADCAnTHCR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ASMPMSK | Automatic Sampling Mask Control<br>0: Automatic sampling is not performed.<br>1: Automatic sampling is performed. |

**CAUTION**

To prevent malfunction, ADCAnTHCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

**NOTE**

In RH850/F1K, only ADCA0 supports this function.

### 31.3.2.12 ADCAnTHAHLDSTCR — T&H Group A Hold Start Control Register

This register is used to control the start of the hold for T&H group A. The bits are always read as 0.

**Access:** ADCAnTHAHLDSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHAHLDSTCRL register is a write-only register that can be written in 16-bit units.
ADCAnTHAHLDSTCRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnTHAHLDSTCR: <ADCAn_base> + $31C_H$
ADCAnTHAHLDSTCRL: <ADCAn_base> + $31C_H$
ADCAnTHAHLDSTCRLL: <ADCAn_base> + $31C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W |

**Table 31.27 ADCAnTHAHLDSTCR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | HLDST | T&H Group A Hold Start Control Trigger<br>0: No effect<br>1: Hold for T&H group A is started.<br><br>The condition to place T&H group A in the hold state is as follows:<br>• 1 being written to ADCAnTHAHLDSTCR.HLDST while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHGSR.THkGS = 0 (k = 0 to 5). |

**NOTE**

In RH850/F1K, only ADCA0 supports this function.

### 31.3.2.13 ADCAnTHBHLDSTCR — T&H Group B Hold Start Control Register

This register is used to control the start of the hold for T&H group B. The bits are always read as 0.

**Access:** ADCAnTHBHLDSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHBHLDSTCRL register is a write-only register that can be written in 16-bit units.
ADCAnTHBHLDSTCRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnTHBHLDSTCR: <ADCAn_base> + $320_H$
ADCAnTHBHLDSTCRL: <ADCAn_base> + $320_H$
ADCAnTHBHLDSTCRLL: <ADCAn_base> + $320_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W |

**Table 31.28 ADCAnTHBHLDSTCR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | HLDST | T&H Group B Hold Start Control Trigger<br>0: No effect<br>1: Hold for T&H group B is started.<br><br>The condition to place T&H group B in the hold state is as follows:<br>• 1 being written to ADCAnTHBHLDSTCR.HLDST while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHGSR.THkGS = 1 (k = 0 to 5). |

**NOTE**

In RH850/F1K, only ADCA0 supports this function.

### 31.3.2.14 ADCAnTHACR — T&H Group A Control Register

This register is used to control T&H group A.

**Access:** ADCAnTHACR register can be read or written in 32-bit units.
ADCAnTHACRL register can be read or written in 16-bit units.
ADCAnTHACRLL register can be read or written in 8-bit units.

**Address:** ADCAnTHACR: <ADCAn_base> + $324_H$
ADCAnTHACRL: <ADCAn_base> + $324_H$
ADCAnTHACRLL: <ADCAn_base> + $324_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 31.29 ADCAnTHACR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | HLDCTE | T&H Group A Hold Completion Trigger Enable<br>This bit is used when self-diagnosis of the T&H circuit is to proceed.<br>0: Self-diagnosis does not proceed.<br>1: Self-diagnosis proceeds.<br><br>**Note:** The SGx_TRG (x = 1 to 3) trigger is selected for the trigger input of the scan group that is not selected in SGS[1:0] of ADCAnTHACR and SGS[1:0] of ADCAnTHBCR. |
| 4 | HLDTE | T&H Group A Hold Trigger Enable<br>0: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is selected for the hold start trigger of T&H group A.<br>1: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is not selected for the hold start trigger of T&H group A.<br>**Note:** ADCAnTHAHLDSTCR.HLDST becomes a hold start trigger regardless of the ADCAnTHACR.HLDTE setting.<br>Set this bit to 0 when self-diagnosis of the T&H circuit is to proceed. |
| 3, 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | SGS[1:0] | T&H Group A Scan Group Select<br>00: No scan group is selected for T&H group A.<br>01: SG1 is selected for T&H group A.<br>10: SG2 is selected for T&H group A.<br>11: SG3 is selected for T&H group A.<br>**Note:**<br>1. If ADCAnTHACR.SGS[1:0] is set to $0_H$, T&H does not operate. When you enable T&Hk in ADCAnTHER.THkE, make sure that a scan group is specified in SGS[1:0].<br>2. Selecting the same scan group as T&H group B is prohibited. |

**CAUTION**

To prevent malfunction, ADCAnTHACR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

**NOTE**

In RH850/F1K, only ADCA0 supports this function.

### 31.3.2.15 ADCAnTHBCR — T&H Group B Control Register

This register is used to control T&H group B.

**Access:** ADCAnTHBCR register can be read or written in 32-bit units.
ADCAnTHBCRL register can be read or written in 16-bit units.
ADCAnTHBCRLL register can be read or written in 8-bit units.

**Address:** ADCAnTHBCR: <ADCAn_base> + $328_H$
ADCAnTHBCRL: <ADCAn_base> + $328_H$
ADCAnTHBCRLL: <ADCAn_base> + $328_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

**Table 31.30 ADCAnTHBCR Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | HLDCTE | T&H Group B Hold Completion Trigger Enable<br>This bit is used when self-diagnosis of the T&H circuit is to proceed.<br>0: Self-diagnosis does not proceed.<br>1: Self-diagnosis proceeds.<br><br>**Note:** The SGx_TRG (x = 1 to 3) trigger is selected for the trigger input of the scan group that is not selected in SGS[1:0] of ADCAnTHACR and SGS[1:0] of ADCAnTHBCR. |
| 4 | HLDTE | T&H Group B Hold Trigger Enable<br>0: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is selected for the hold start trigger of T&H group B.<br>1: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is not selected for the hold start trigger of T&H group B.<br><br>**Note:** ADCAnTHBHLDSTCR.HLDST becomes a hold start trigger regardless of the ADCAnTHBCR.HLDTE setting.<br>Set this bit to 0 when self-diagnosis of the T&H circuit is to proceed. |
| 3, 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 31.30 ADCAnTHBCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 1 to 0 | SGS[1:0] | T&H Group B Scan Group Select<br>00: No scan group is selected for T&H group B.<br>01: SG1 is selected for T&H group B.<br>10: SG2 is selected for T&H group B.<br>11: SG3 is selected for T&H group B.<br><br>**Note:**<br>1. If ADCAnTHBCR.SGS[1:0] is set to $0_H$, T&H does not operate. When you enable T&Hk in ADCAnTHER.THkE, make sure that a scan group is specified in SGS[1:0].<br>2. Selecting the same scan group as T&H group A is prohibited. |

**CAUTION**

To prevent malfunction, ADCAnTHBCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

**NOTE**

In RH850/F1K, only ADCA0 supports this function.

### 31.3.2.16 ADCAnTHER — T&H Enable Register

This register controls enabling and disabling of each T&H.

**Access:** ADCAnTHER register can be read or written in 32-bit units.
ADCAnTHERL register can be read or written in 16-bit units.
ADCAnTHERLL register can be read or written in 8-bit units.

**Address:** ADCAnTHER: <ADCAn_base> + $32C_H$
ADCAnTHERL: <ADCAn_base> + $32C_H$
ADCAnTHERLL: <ADCAn_base> + $32C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 31.31 ADCAnTHER Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | TH5E | T&H5 Enable<br>0: T&H5 is disabled.<br>1: T&H5 is enabled.<br>**Note:** If TH5E is set to 0, T&H5 is always stopped. |
| 4 | TH4E | T&H4 Enable<br>0: T&H4 is disabled.<br>1: T&H4 is enabled.<br>**Note:** If TH4E is set to 0, T&H4 is always stopped. |
| 3 | TH3E | T&H3 Enable<br>0: T&H3 is disabled.<br>1: T&H3 is enabled.<br>**Note:** If TH3E is set to 0, T&H3 is always stopped. |
| 2 | TH2E | T&H2 Enable<br>0: T&H2 is disabled.<br>1: T&H2 is enabled<br>**Note:** If TH2E is set to 0, T&H2 is always stopped. |
| 1 | TH1E | T&H1 Enable<br>0: T&H1 is disabled.<br>1: T&H1 is enabled.<br>**Note:** If TH1E is set to 0, T&H1 is always stopped. |
| 0 | TH0E | T&H0 Enable<br>0: T&H0 is disabled.<br>1: T&H0 is enabled<br>**Note:** If TH0E is set to 0, T&H0 is always stopped. |

**CAUTION**

To prevent malfunction, ADCAnTHER should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

**NOTE**

In RH850/F1K, only ADCA0 supports this function.

### 31.3.2.17 ADCAnTHGSR — T&H Group Select Register

This register is used to select a T&H group for each T&H.

**Access:** ADCAnTHGSR register can be read or written in 32-bit units.
ADCAnTHGSRL register can be read or written in 16-bit units.
ADCAnTHGSRLL register can be read or written in 8-bit units.

**Address:** ADCAnTHGSR: <ADCAn_base> + $330_H$
ADCAnTHGSRL: <ADCAn_base> + $330_H$
ADCAnTHGSRLL: <ADCAn_base> + $330_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | TH5GS | TH4GS | TH3GS | TH2GS | TH1GS | TH0GS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 31.32 ADCAnTHGSR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | TH5GS | T&H5 Group Select<br>0: T&H5 is selected to group A.<br>1: T&H5 is selected to group B. |
| 4 | TH4GS | T&H4 Group Select<br>0: T&H4 is selected to group A.<br>1: T&H4 is selected to group B. |
| 3 | TH3GS | T&H3 Group Select<br>0: T&H3 is selected to group A.<br>1: T&H3 is selected to group B. |
| 2 | TH2GS | T&H2 Group Select<br>0: T&H2 is selected to group A.<br>1: T&H2 is selected to group B. |
| 1 | TH1GS | T&H1 Group Select<br>0: T&H1 is selected to group A.<br>1: T&H1 is selected to group B. |
| 0 | TH0GS | T&H0 Group Select<br>0: T&H0 is selected to group A.<br>1: T&H0 is selected to group B. |

**CAUTION**

- Do not set T&H0 to T&H2 to the same group as T&H3 to T&H5.
  Example
  - Group A: 0ch, 1ch, 2ch
    Group B: 3ch, 4ch, 5ch → Setting allowed
  - Group A: 0ch
    Group B: 1ch, 2ch → Setting allowed
  - Group A: 0ch, 1ch, 3ch
    Group B: 2ch, 4ch → Setting prohibited
- To prevent malfunction, ADCAnTHGSR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

**NOTE**

In RH850/F1K, only ADCA0 supports this function.

### 31.3.2.18 ADCAnSMPCR — Sampling Control Register

This register controls sampling.

ADCTLnSMPCR controls the sampling time for SG4 (PWM-Diag) and SG1 to SG3.

**Access:** ADCAnSMPCR register can be read or written in 32-bit units.
ADCAnSMPCRL register can be read or written in 16-bit units.
ADCAnSMPCRLL register can be read or written in 8-bit units.

**Address:** ADCAnSMPCR: <ADCAn_base> + $380_H$
ADCAnSMPCRL: <ADCAn_base> + $380_H$
ADCAnSMPCRLL: <ADCAn_base> + $380_H$

**Value after reset:** 0000 $0018_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | SMPT[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 31.33 ADCAnSMPCR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | SMPT[7:0] | These bits are used to set the sampling time (the number of cycles).<br>$12_H$: 18 cycles (ADCLK = 8 MHz to 32 MHz)<br>$18_H$: 24 cycles (ADCLK = 8 MHz to 40 MHz)<br>Settings other than above are prohibited. |

**CAUTION**

- To prevent malfunction, ADCATLnSMPCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
- When SMPT is changed, the A/D conversion wait time is also changed when MPX is used by virtual channel register j (ADCAnVCRj) or PWM-Diag virtual channel register (ADCAnPWDVCR).

### 31.3.2.19 ADCAnSFTCR — Safety Control Register

This is a register for safety control.

**Access:** ADCAnSFTCR register can be read or written in 32-bit units.
ADCAnSFTCRL register can be read or written in 16-bit units.
ADCAnSFTCRLL register can be read or written in 8-bit units.

**Address:** ADCAnSFTCR: <ADCAn_base> + $334_H$
ADCAnSFTCRL: <ADCAn_base> + $334_H$
ADCAnSFTCRLL: <ADCAn_base> + $334_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | RDCLRE | ULEIE | OWEIE | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R | R |

**Table 31.34 ADCAnSFTCR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | RDCLRE | Read & Clear Enable<br>When the A/D conversion result is read, this bit selects whether the A/D conversion result is cleared by hardware.<br>0: ADCAnPWDTSNDR/ADCAnDRj and ADCAnPWDDIR/ADCAnDIRj are not cleared when ADCAnPWDTSNDR/ADCAnDRj or ADCAnPWDDIR/ADCAnDIRj is read.<br>1: ADCAnPWDTSNDR/ADCAnDRj and ADCAnPWDDIR/ADCAnDIRj are cleared when ADCAnPWDTSNDR/ADCAnDRj or ADCAnPWDDIR/ADCAnDIRj is read.<br><br>WFLG of ADCAnDIRj is cleared regardless of the RDCLRE setting when ADCAnDRj or ADCAnDIRj is read. |
| 3 | ULEIE | A/D Error Interrupt (INT_ADE) Enable on Upper/Lower Limit Error Detection<br>0: Disabled<br>1: Enabled |
| 2 | OWEIE | A/D Error Interrupt (INT_ADE) Enable on Overwrite Error Detection<br>0: Disabled<br>1: Enabled |
| 1, 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**CAUTION**

To prevent malfunction, ADCAnSFTCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

### 31.3.2.20 ADCAnULLMTBR0 to 2 — Upper Limit/Lower Limit Table Registers 0 to 2

These registers are used to set the threshold for detection of an upper limit or lower limit error in the A/D converted value. Any of ADCAnULLMTBR0 to ADCAnULLMTBR2 is specified by setting ADCAnPWDVCR.ULS[1:0] and ADCAnVCRj.ULS[1:0] and compared with ADCAnPWDTSNDR and ADCAnDRj.

**Access:** ADCAnULLMTBR0 to 2 register can be read or written in 32-bit units.
ADCAnULLMTBR0L to 2L and ADCAnULLMTBR0H to 2H registers can be read or written in 16-bit units.

**Address:** ADCAnULLMTBR0: <ADCAn_base> + $338_H$
ADCAnULLMTBR1: <ADCAn_base> + $33C_H$
ADCAnULLMTBR2: <ADCAn_base> + $340_H$

ADCAnULLMTBR0L: <ADCAn_base> + $338_H$
ADCAnULLMTBR1L: <ADCAn_base> + $33C_H$
ADCAnULLMTBR2L: <ADCAn_base> + $340_H$

ADCAnULLMTBR0H: <ADCAn_base> + $338_H$ + $2_H$
ADCAnULLMTBR1H: <ADCAn_base> + $33C_H$+ $2_H$
ADCAnULLMTBR2H: <ADCAn_base> + $340_H$ + $2_H$

**Value after reset:** $FFF0\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ULMTB[11:0] | | | | | | | | | | | | — | — | — | — |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LLMTB[11:0] | | | | | | | | | | | | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R |

**Table 31.35 ADCAnULLMTBR0 to 2 Registers Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 20 | ULMTB[11:0] | Upper Limit Table<br>Specify the threshold for detection of an upper limit error in the A/D converted value. The upper limit error (ADCAnULER.UE) is set when the following condition is met:<br>ULMTB[11:0] < A/D converted value |
| 19 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 4 | LLMTB[11:0] | Lower Limit Table<br>Specify the threshold for detection of a lower limit error in the A/D converted value. The lower limit error (ADCAnULER.LE) is set when the following condition is met:<br>LLMTB[11:0] > A/D converted value |
| 3 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**CAUTION**

- When A/D conversion is executed in 10-bit mode (ADCAnADCR.CTYP = 1), ULMTB[1:0] and LLMTB[1:0] should be set to $11_B$ and $00_B$, respectively.
- To prevent malfunction, ADCAnULLMTBR0 to 2 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
- The upper-limit table (ULMTB[11:0]) must be greater than the lower-limit table (LLMTB[11:0]).

### 31.3.2.21 ADCAnECR — Error Clear Register

This register is used to control clearing of an error. The read value is always 0.

**Access:** ADCAnECR register is a write-only register that can be written in 32-bit units.
ADCAnECRL register is a write-only register that can be written in 16-bit units.
ADCAnECRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnECR: <ADCAn_base> + $344_H$
ADCAnECRL: <ADCAn_base> + $344_H$
ADCAnECRLL: <ADCAn_base> + $344_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 31.36 ADCAnECR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When writing, write the value after reset. |
| 3 | ULEC | Upper Limit Error Flag (ADCAnULER.UE) / Lower Limit Error Flag (ADCAnULER.LE) Clear, Upper/Lower Limit Error Capture (ADCAnULER.ULECAP[5:0]), Scan Group Bit (ULSG[1:0]) When Upper/Lower Limit Error Occurs, MPX Usage Bit (MPXE), and the MPX Value Storing Bit (MPXV[2:0]) Clear When Upper/Lower Limit Error Occurs<br>0: No effect.<br>1: Clears the flag. |
| 2 | OWEC | Overwrite Error Flag (ADCAnOWER.OWE) and Overwrite Error Capture (ADCAnOWER.OWECAP[5:0]) Clear<br>0: No effect.<br>1: Clears the flag. |
| 1, 0 | Reserved | When writing, write the value after reset. |

### 31.3.2.22 ADCAnULER — Upper Limit/Lower Limit Error Register

This register is a read-only register that indicates information regarding the upper limit/lower limit errors.

**Access:** ADCAnULER register is a read-only register that can be read in 32-bit units.
ADCAnULERL register is a read-only register that can be read in 16-bit units.

ADCAnULERLH register is a read-only register that can be read in 8-bit units.
ADCAnULERLL register is a read-only register that can be read in 8-bit units.

**Address:** ADCAnULER: <ADCAn_base> + $348_H$
ADCAnULERL: <ADCAn_base> + $348_H$

ADCAnULERLL: <ADCAn_base> + $348_H$
ADCAnULERLH: <ADCAn_base> + $348_H$ + $1_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 31.37 ADCAnULER Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 | UE | Upper Limit Error Flag<br>0: An upper limit error is not detected.<br>1: An upper limit error is detected.<br>Setting condition:<br>The A/D converted value exceeds the upper limit threshold specified by the upper limit/lower limit table registers 0 to 2 (ADCAnULLMTBR0 to 2).<br>If a subsequent upper limit error is detected in A/D conversion while this bit is set to 1, the ADCAnULER register is not updated.<br>Clearing condition:<br>1 is written to ADCAnECR.ULEC. |
| 14 | LE | Lower Limit Error Flag<br>0: A lower limit error is not detected.<br>1: A lower limit error is detected.<br>Setting condition:<br>The A/D converted value is lower than the lower limit threshold specified by the upper limit/lower limit table registers 0 to 2 (ADCAnULLMTBR0 to 2).<br>If a subsequent lower limit error is detected in A/D conversion while this bit is set to 1, the ADCAnULER register is not updated.<br>Clearing condition:<br>1 is written to ADCAnECR.ULEC. |
| 13, 12 | ULSG[1:0] | Scan Group where an Upper Limit/Lower Limit Error Occurs<br>00: No upper limit/lower limit error occurred.<br>01: The scan group where an upper limit/lower limit error occurred is SG1 to SG3.<br>10: The scan group where an upper limit/lower limit error occurred is PWM-Diag.<br>Capture condition:<br>When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0.<br>Clearing condition:<br>When 1 is written to ADCAnECR.ULEC. |

**Table 31.37 ADCAnULER Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 11 | MPXE*1 | MPX Usage<br>0: The MPX function was not used when an upper limit/lower limit error occurred.<br>1: The MPX function was used when an upper limit/lower limit error occurred.<br>Capture condition:<br>When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0<br>Clearing condition:<br>When 1 is written to ADCAnECR.ULEC. |
| 10 to 8 | MPXV[2:0]*1 | The value of MPX is stored when the errors of the upper and lower limit occurred<br>Capture condition:<br>When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0.<br>Clearing condition:<br>When 1 is written to ADCAnECR.ULEC. |
| 7 | Reserved | When read, an undefined value is read. |
| 6 | Reserved | When read, the value after reset is returned. |
| 5 to 0 | ULECAP[5:0] | Upper Limit/Lower Limit Error Capture<br>The physical channel is captured when an upper limit/lower limit error occurred.<br>Capturing condition:<br>When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0.<br>Clearing condition:<br>1 is written to ADCAnECR.ULEC. |

Note 1. These bits are only supported for ADCA0.
For ADCA1, when read, the value after reset is returned.

**NOTE**

ADCAnULER is updated when the A/D converted value is set in ADCAnDRj or ADCAnPWDTSNDR.

### 31.3.2.23 ADCAnOWER — Overwrite Error Register

This register is a 32/16/8-bit read-only register that indicates an overwrite error. The target for overwrite errors is SG1 to SG3, and not PWM-Diag.

**Access:** ADCAnOWER register is a read-only register that can be read in 32-bit units.
ADCAnOWERL register is a read-only register that can be read in 16-bit units.
ADCAnOWERLL register is a read-only register that can be read in 8-bit units.

**Address:** ADCAnOWER: <ADCAn_base> + $34C_H$
ADCAnOWERL: <ADCAn_base> + $34C_H$
ADCAnOWERLL: <ADCAn_base> + $34C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | OWE | — | OWECAP[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 31.38 ADCAnOWER Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned. |
| 7 | OWE | Overwrite Error Flag<br>0: An overwrite error is not detected.<br>1: An overwrite error is detected.<br>Setting condition:<br>ADCAnDIRj.WFLG = 1, and the A/D converted value is written to ADCAnDRj. If a subsequent overwrite error is detected in A/D conversion while this bit is set to 1, the ADCAnOWER register is not updated.<br>Clearing condition:<br>1 is written to ADCAnECR.OWEC. |
| 6 | Reserved | When read, the value after reset is returned. |
| 5 to 0 | OWECAP[5:0] | Overwrite Error Capture<br>The virtual channel number is captured when an overwrite error occurs.<br>Capturing condition:<br>OWE = 0 and ADCAnDIRj.WFLG = 1, and the A/D converted value is written to ADCAnDRj<br>Clearing condition:<br>1 is written to ADCAnECR.OWEC. |

**NOTE**

ADCAnOWER is updated when the A/D converted value is set in ADCAnDRj.

## 31.3.3 Scan Group (SG) Specific Registers

This section describes the registers provided for each scan group.

### 31.3.3.1 ADCAnSGSTCRx — Scan Group x Start Control Register

This register is used to control the start of scan group x. The read value is always 0.

**Access:** ADCAnSGSTCRx is a write-only register that can be written in 32-bit units.
ADCAnSGSTCRxL is a write-only register that can be written in 16-bit units.
ADCAnSGSTCRxLL is a write-only register that can be written in 8-bit units.

**Address:** ADCAnSGSTCRx: <ADCAn_base> + $400_H$ + x × $40_H$
ADCAnSGSTCRxL: <ADCAn_base> + $400_H$ + x × $40_H$
ADCAnSGSTCRxLL: <ADCAn_base> + $400_H$ + x × $40_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SGST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W |

**Table 31.39 ADCAnSGSTCRx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | SGST | Scan Group Start Trigger<br>Writing 1 to SGST while ADCAnSGSTR.SGACT[3:1] = 0 starts the target SGx. |

### 31.3.3.2 ADCAnSGCRx — Scan Group x Control Register

This register controls scan group x.

**Access:** ADCAnSGCRx register can be read or written in 32-bit units.
ADCAnSGCRxL register can be read or written in 16-bit units.
ADCAnSGCRxLL register can be read or written in 8-bit units.

**Address:** ADCAnSGCRx: <ADCAn_base> + x × $40_H$ + $408_H$
ADCAnSGCRxL: <ADCAn_base> + x × $40_H$ + $408_H$
ADCAnSGCRxLL: <ADCAn_base> + x × $40_H$ + $408_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | SCANMD | ADIE | SCT[1:0] | | — | TRGMD |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R | R/W |

**Table 31.40 ADCAnSGCRx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | SCANMD | Scan Mode<br>0: Multicycle scan mode<br>1: Continuous scan mode<br>Write 0 to this bit for SG2 and SG3. |
| 4 | ADIE | Scan End Interrupt Enable<br>0: INT_SGx is not output when the scan for SGx ends.<br>1: INT_SGx is output when the scan for SGx ends. |
| 3, 2 | SCT[1:0] | Channel Repeat Times Select<br>00: The selected number of channel repeat times is one.<br>01: The selected number of channel repeat times is two.<br>10: The selected number of channel repeat times is four.<br>11: Setting prohibited |
| 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TRGMD | Trigger Mode<br>0: Trigger input to SGx_TRG is disabled (Hardware trigger disabled).<br>1: SGx_TRG start trigger or hold complete trigger A/B is selected for the trigger input to SGx.<br>**NOTE**<br>The software trigger is valid regardless of the TRGMD bit setting. |

**CAUTION**

To prevent malfunction, ADCAnSGCRx should be set (except clearing TRGMD upon completion of A/D conversion) when SGACT of all scan groups is 0 (before the scan group is started) and TRGMD of all scan groups is 0.

### 31.3.3.3 ADCAnPWDSGCR — PWM-Diag Scan Group Control Register

This register is used to control PWM-Diag.

**Access:** ADCAnPWDSGCR register can be read or written in 32-bit units.
ADCAnPWDSGCRL register can be read or written in 16-bit units.
ADCAnPWDSGCRLL register can be read or written in 8-bit units.

**Address:** ADCAnPWDSGCR: <ADCAn_base> + $508_H$
ADCAnPWDSGCRL: <ADCAn_base> + $508_H$
ADCAnPWDSGCRLL: <ADCAn_base> + $508_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PWDTRGMD |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 31.41 ADCAnPWDSGCR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | PWDTRGMD | PWM-Diag Trigger Mode Select<br>0: PWSA_ADTRG trigger input is disabled.<br>1: PWSA_ADTRG is selected for the trigger input to the PWM-Diag scan group. |

**CAUTION**

To prevent malfunction, ADCAnPWDSGCR should be set when SGACT of the PWM-Diag scan group (SG4) is 0 (before the scan group is started).

### 31.3.3.4 ADCAnSGVCSPx — Scan Group x Start Virtual Channel Pointer

This register specifies the start pointer of a virtual channel.

**Access:** ADCAnSGVCSPx register can be read or written in 32-bit units.
ADCAnSGVCSPxL register can be read or written in 16-bit units.
ADCAnSGVCSPxLL register can be read or written in 8-bit units.

**Address:** ADCAnSGVCSPx: <ADCAn_base> + x × $40_H$ + $40C_H$
ADCAnSGVCSPxL: <ADCAn_base> + x × $40_H$ + $40C_H$
ADCAnSGVCSPxLL: <ADCAn_base> + x × $40_H$ + $40C_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | VCSP[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 31.42 ADCAnSGVCSPx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | VCSP[5:0] | Start Virtual Channel Pointer<br>These bits are used to specify the virtual channel from which the SGx scan is to be started. |

**CAUTION**

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When writing to the channel pointers, be sure to write in the following order: ADCAnSGVCSPx → ADCAnSGVCEPx. When SGx is started, the A/D conversion for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.
- Though ADCAnSGVCSPx can be written during the A/D conversion, the register is updated at the time when ADCAnSGVCEPx is written. The new setting is applied when SGx is started next time.
- When the hardware trigger is used, writing to this register during operation is prohibited.

### 31.3.3.5 ADCAnSGVCEPx — Scan Group x End Virtual Channel Pointer

This register specifies the end pointer of a virtual channel.

**Access:** ADCAnSGVCEPx register can be read or written in 32-bit units.
ADCAnSGVCEPxL register can be read or written in 16-bit units.
ADCAnSGVCEPxLL register can be read or written in 8-bit units.

**Address:** ADCAnSGVCEPx: <ADCAn_base> + x × $40_H$ + $410_H$
ADCAnSGVCEPxL: <ADCAn_base> + x × $40_H$ + $410_H$
ADCAnSGVCEPxLL: <ADCAn_base> + x × $40_H$ + $410_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | VCEP[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 31.43 ADCAnSGVCEPx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | VCEP[5:0] | End Virtual Channel Pointer<br>These bits are used to specify the virtual channel at which the SGx scan is to be ended. |

**CAUTION**

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When SGx is started, processing for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.
  ADCAnSGVCEPx can be rewritten even when SGx is being processed. The new setting is applied when SGx is started next time.

### 31.3.3.6 ADCAnSGMCYCRx — Scan Group x Multicycle Register

This register is a 32/16/8-bit read/write register that indicates the number of scan times in multicycle scan mode.

**Access:** ADCAnSGMCYCRx register can be read or written in 32-bit units.
ADCAnSGMCYCRxL register can be read or written in 16-bit units.
ADCAnSGMCYCRxLL register can be read or written in 8-bit units.

**Address:** ADCAnSGMCYCRx: <ADCAn_base> + x × $40_H$ + $414_H$
ADCAnSGMCYCRxL: <ADCAn_base> + x × $40_H$ + $414_H$
ADCAnSGMCYCRxLL: <ADCAn_base> + x × $40_H$ + $414_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 31.44 ADCAnSGMCYCRx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | MCYC[1:0] | Multicycle Number Specification<br>These bits are used to specify the number of scan times in multicycle scan mode.<br>$00_B$: Number of scans = 1<br>$01_B$: Number of scans = 2<br>$10_B$: Setting prohibited<br>$11_B$: Number of scans = 4 |

**CAUTION**

- To prevent malfunction, ADCAnSGMCYCRx should be set when SGACT of scan group x is 0 (before the scan group is started) and TRGMD is 0.
- When SGx is started, the scan for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is repeatedly executed as many times as specified in ADCAnSGMCYCRx.

### 31.3.3.7 ADCAnPWDSGSEFCR — PWM-Diag Scan End Flag Clear Register

This register is used to control the clearing of PWM-Diag scan end flag (SEF). The bits are always read as 0.

**Access:** ADCAnPWDSGSEFCR register is a write-only register that can be written in 32-bit units.
ADCAnPWDSGSEFCRL register is a write-only register that can be written in 16-bit units.
ADCAnPWDSGSEFCRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnPWDSGSEFCR: <ADCAn_base> + $518_H$
ADCAnPWDSGSEFCRL: <ADCAn_base> + $518_H$
ADCAnPWDSGSEFCRLL: <ADCAn_base> + $518_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | PWDSEFC | PWM-Diag Scan End Flag Clear Trigger<br>0: No effect.<br>1: Clears the PWM-Diag scan end flag (ADCAnSGSTR.SEF[4]). |

### 31.3.3.8 ADCAnSGSEFCRx — Scan Group x Scan End Flag Clear Register

This register is a write-only register that clears the scan end flag (ADCAnSGSTR.SEFx). The read value is always 0.

**Access:** ADCAnSGSEFCRx register is a write-only register that can be written in 32-bit units.
ADCAnSGSEFCRxL register is a write-only register that can be written in 16-bit units.
ADCAnSGSEFCRxLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnSGSEFCRx: <ADCAn_base> + x × $40_H$ + $418_H$
ADCAnSGSEFCRxL: <ADCAn_base> + x × $40_H$ + $418_H$
ADCAnSGSEFCRxLL: <ADCAn_base> + x × $40_H$ + $418_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | SEFC | Scan End Flag Clear Trigger<br>0: No effect.<br>1: Clears the target SG scan end flag (ADCAnSGSTR.SEF[3:1]). |

### 31.3.3.9 ADCAnSGSTR — Scan Group Status Register

This register indicates the state of T&H, SVSTOP, scan group x, and PWM-Diag scan group. The SHACT and SGACT bits are cleared when HALT is executed.

**Access:** ADCAnSGSTR register is a read-only register that can be read in 32-bit units.
ADCAnSGSTRL register is a read-only register that can be read in 16-bit units.

**Address:** ADCAnSGSTR: <ADCAn_base> + $308_H$
ADCAnSGSTRL: <ADCAn_base> + $308_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 31.47 ADCAnSGSTR Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 15 | Reserved | When read, the value after reset is returned. |
| 14 | SHACT | T&H Status Flag<br>0: T&H is stopped.<br>1: T&H conversion or sampling is in progress. |
| 13 | SGACT[5] | SVSTOP Status Flag<br>0: SVSTOP is canceled.<br>1: SVSTOP is accepted. |
| 12 | SGACT[4] | PWM-Diag Scan Group (SG4) Status Flag<br>0: A/D conversion for PWM-Diag (SG4) is completed.<br>1: A/D conversion for PWM-Diag (SG4) is in processing or suspension. |
| 11 | SGACT[3] | Scan Group 3 (SG3) Status Flag<br>0: A/D conversion for SG3 is completed.<br>1: A/D conversion for SG3 is in processing or suspension. |
| 10 | SGACT[2] | Scan Group 2 (SG2) Status Flag<br>0: A/D conversion for SG2 is completed.<br>1: A/D conversion for SG2 is in processing or suspension. |
| 9 | SGACT[1] | Scan Group 1 (SG1) Status Flag<br>0: A/D conversion for SG1 is completed.<br>1: A/D conversion for SG1 is in processing or suspension. |
| 8 to 5 | Reserved | When read, the value after reset is returned. |
| 4 | SEF[4] | PWM-Diag Scan End Flag<br>Indicates the status of the scan result data.<br>0: The flag is cleared when any of the following operations is performed:<br>• ADCAnPWDTSNDR for PWM-Diag is read.<br>• ADCAnPWDDIR for PWM-Diag is read.<br>• ADCAnPWDSGSEFCR.PWDSEFC is written as 1.<br>1: The A/D conversion result is written to ADCAnPWDTSNDR for PWM-Diag. |

Table 31.47 ADCAnSGSTR Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 | SEF[3] | SG3 Scan End Flag<br>Indicates the status of the scan result data.<br>0: The flag is cleared when any of the following operations is performed:<br>• ADCAnDRj for the virtual channel which ADCAnSGVCEP3 indicates is read.<br>• ADCAnDIRj for the virtual channel which ADCAnSGVCEP3 indicates is read.<br>• ADCAnSGSEFCRx.SEFC is written as 1.<br>1: The A/D conversion result is written to ADCAnDRj for the virtual channel which ADCAnSGVCEP3 indicates. |
| 2 | SEF[2] | SG2 Scan End Flag<br>Indicates the status of the scan result data.<br>0: The flag is cleared when any of the following operations is performed:<br>• ADCAnDRj for the virtual channel which ADCAnSGVCEP2 indicates is read.<br>• ADCAnDIRj for the virtual channel which ADCAnSGVCEP2 indicates is read.<br>• ADCAnSGSEFCRx.SEFC is written as 1.<br>1: The A/D conversion result is written to ADCAnDRj for the virtual channel which ADCAnSGVCEP2 indicates. |
| 1 | SEF[1] | SG1 Scan End Flag<br>Indicates the status of the scan result data.<br>0: The flag is cleared when any of the following operations is performed:<br>• ADCAnDRj for the virtual channel which ADCAnSGVCEP1 indicates is read.<br>• ADCAnDIRj for the virtual channel which ADCAnSGVCEP1 indicates is read.<br>• ADCAnSGSEFCRx.SEFC is written as 1.<br>1: The A/D conversion result is written to ADCAnDRj for the virtual channel which ADCAnSGVCEP1 indicates. |
| 0 | Reserved | When read, the value after reset is returned. |

## 31.3.4 Hardware Trigger Specific Register

### 31.3.4.1 ADCAnSGTSELx — Scan Group x Start Trigger Control Register x

This register is used to select the A/D conversion trigger (hardware trigger) for SGx.

**Access:** ADCAnSGTSELx register can be read or written in 32-bit units.
ADCAnSGTSELxL register can be read or written in 16-bit units.

**Address:** ADCAnSGTSELx: <ADCAn_base> + x × $40_H$ + $41C_H$
ADCAnSGTSELxL: <ADCAn_base> + x × $40_H$ + $41C_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TxSEL8 *1 | TxSEL7 *1 | TxSEL6 *1 | TxSEL5 *1 | TxSEL4 *1 | TxSEL3 *1 | TxSEL2 *1 | TxSEL1 *1 | TxSEL0 *1 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. ADCA1 supports only TxSEL0 to TxSEL3. When writing to the other bits, write the value after reset.

**Table 31.48 ADCAnSGTSELx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 to 0 | TxSELp (p = 0 to 8) | A/D Conversion Trigger (Hardware Trigger) Select<br>0: Hardware trigger is disabled.<br>1: Hardware trigger is enabled.<br>**CAUTION**<br>When setting TxSELp to 1, set only one of the bits to 1. |

The list below shows the hardware triggers to be selected.

**Table 31.49 List of A/D Conversion Hardware Triggers (1/2)**

| Unit | Control Register/Bit | | Trigger Input Signal | |
|---|---|---|---|---|
| | Register Name | Bit Name | Symbol | Connection Destination Unit |
| ADCA0 | ADCA0SGTSEL1 | T1SEL0 | ADCA0TRG0 | External trigger pin |
| | | T1SEL1 | INTTAUJ0I3 | TAUJ0 |
| | | T1SEL2 | INTTAUD0I7 | TAUD0 |
| | | T1SEL3 | INTTAUD0I15 | TAUD0 |

| | | T3SEL1 | INTTAUJ1I3 | TAUJ1 |
| | | T3SEL2 | INTTAUB0I7 | TAUB0 |
| | | T3SEL3 | INTTAUB0I15 | TAUB0 |

**CAUTIONS**

1. When enabling the LPS trigger factor (SEQADTRG), select and enable only one of ADCA0SGTSEL1.T1SEL4, ADCA0SGTSEL2.T2SEL4, and ADCA0SGTSEL3.T3SEL4.
2. To prevent malfunction, ADCAnSGTSELx should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

## 31.3.5 Self-Diagnosis Specific Registers

### 31.3.5.1 ADCAnDGCTL0 — Self-Diagnosis Control Register 0

This register controls the self-diagnostic voltage level.

**Access:** ADCAnDGCTL0 register can be read or written in 32-bit units.
ADCAnDGCTL0L register can be read or written in 16-bit units.
ADCAnDGCTL0LL register can be read or written in 8-bit units.

**Address:** ADCAnDGCTL0: <ADCAn_base> + $350_H$
ADCAnDGCTL0L: <ADCAn_base> + $350_H$
ADCAnDGCTL0LL: <ADCAn_base> + $350_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 31.3.5.2 ADCAnDGCTL1 — Self-Diagnosis Control Register 1

This register controls the self-diagnostic channel.

**Access:** ADCAnDGCTL1 register can be read or written in 32-bit units.
ADCAnDGCTL1L register can be read or written in 16-bit units.

**Address:** ADCAnDGCTL1: <ADCAn_base> + $354_H$
ADCAnDGCTL1L: <ADCAn_base> + $354_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 31.51 ADCAnDGCTL1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15, 12, 9, 6, 3, 0 | CDG [15, 12, 9, 6, 3, 0] | Self-Diagnostic Channel Select<br>0: ANInm is selected.<br>1: DIAGOUT0 is selected. |
| 13, 10, 7, 4, 1 | CDG [13, 10, 7, 4, 1] | Self-Diagnostic Channel Select<br>0: ANInm is selected.<br>1: DIAGOUT1 is selected. |
| 14, 11, 8, 5, 2 | CDG [14, 11, 8, 5, 2] | Self-Diagnostic Channel Select<br>0: ANInm is selected.<br>1: DIAGOUT2 is selected. |

**CAUTION**

To prevent malfunction, ADCAnDGCTL1 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

### 31.3.5.3 ADCAnPDCTL1 — Pull Down Control Register 1

This register specifies the channel to which the pull down resistor is connected.

For details, see **Section 31.5.3, Diagnosis of Open Pins**.

**Access:** ADCAnPDCTL1 register can be read or written in 32-bit units.
ADCAnPDCTL1L register can be read or written in 16-bit units.

**Address:** ADCAnPDCTL1: <ADCAn_base> + $358_H$
ADCAnPDCTL1L: <ADCAn_base> + $358_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 31.52 ADCAnPDCTL1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | PDNA[15:0] | Pull Down Enable Control<br>These bits set whether an on-chip pull-down resistor is to be connected to the corresponding physical channel (ANIn[00:15]).<br>0: An on-chip pull-down resistor is not connected.<br>1: An on-chip pull-down resistor is connected. |

**CAUTION**

To prevent malfunction, ADCAnPDCTL1 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

**NOTE**

For on-chip pull-down resistor values, see the Electrical Characteristics section in the Data Sheet document.

### 31.3.5.4 ADCAnPDCTL2 — Pull Down Control Register 2

This register specifies the channel to which the pull down resistor is connected.

For details, see **Section 31.5.3, Diagnosis of Open Pins**.

**Access:** ADCAnPDCTL2 register can be read or written in 32-bit units.
ADCAnPDCTL2H and ADCAnPDCTL2L registers can be read or written in 16-bit units.
ADCAnPDCTL2HL, ADCAnPDCTL2LH, and ADCAnPDCTL2LL registers can be read or written in 8-bit units.

**Address:** ADCAnPDCTL2: <ADCAn_base> + $35C_H$
ADCAnPDCTL2L: <ADCAn_base> + $35C_H$
ADCAnPDCTL2H: <ADCAn_base> + $35C_H$ + $2_H$
ADCAnPDCTL2HL: <ADCAn_base> + $35C_H$ +$2_H$
ADCAnPDCTL2LL: <ADCAn_base> + $35C_H$
ADCAnPDCTL2LH: <ADCAn_base> + $35C_H$ + $1_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. ADCA1 supports only PDNB[7:0]. When writing to the other bits, write the value after reset.

**Table 31.53 ADCAnPDCTL2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 20 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 19 to 0 | PDNB[19:0] | Pull Down Enable Control<br>These bits set whether the on-chip pull-down resistor is to be connected with the corresponding physical channel (ANIn[16:35]).<br>0: The on-chip pull-down resistor is not connected.<br>1: The on-chip pull-down resistor is connected. |

**CAUTION**

To prevent malfunction, ADCAnPDCTL2 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

**NOTE**

For on-chip pull-down resistor values, see the Electrical Characteristics section in the Data Sheet document.

## 31.3.6 Emulation Specific Register

### 31.3.6.1 ADCAnEMU — Emulation Control Register

This register controls the SVSTOP disable signal.

**Access:** This register can be read or written in 8-bit units.

**Address:** <ADCAn_base> + $388_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 31.54 ADCAnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | SVSDIS | SVSTOP Disable<br>0: SVSTOP is enabled<br>1: SVSTOP is disabled<br>For the A/D conversion when SVSTOP is enabled, see **Section 31.4.10.3, SVSTOP Operation**. |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

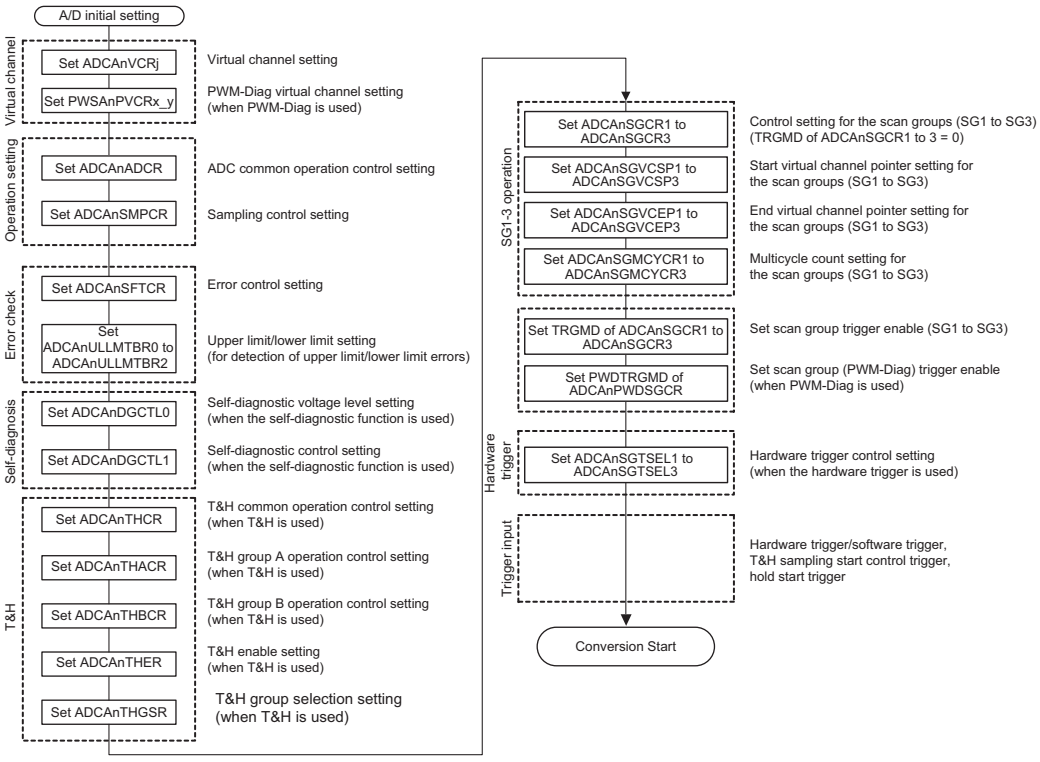
**CAUTION**

To prevent malfunction, SVSDIS should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

# 31.4 Operation

## 31.4.1 Initial Setting

**Figure 31.6** shows an initial setting example of the A/D conversion. For trigger input, see **Figure 31.7** in the next section. For interrupt request signals, see **Section 31.4.12, Scan End Interrupt Request**.



**Note:** Set these registers as necessary.

**Figure 31.6 Flowchart for Initial Setting**

### 31.4.2 Trigger Input

The following figure shows the flowchart for trigger input.

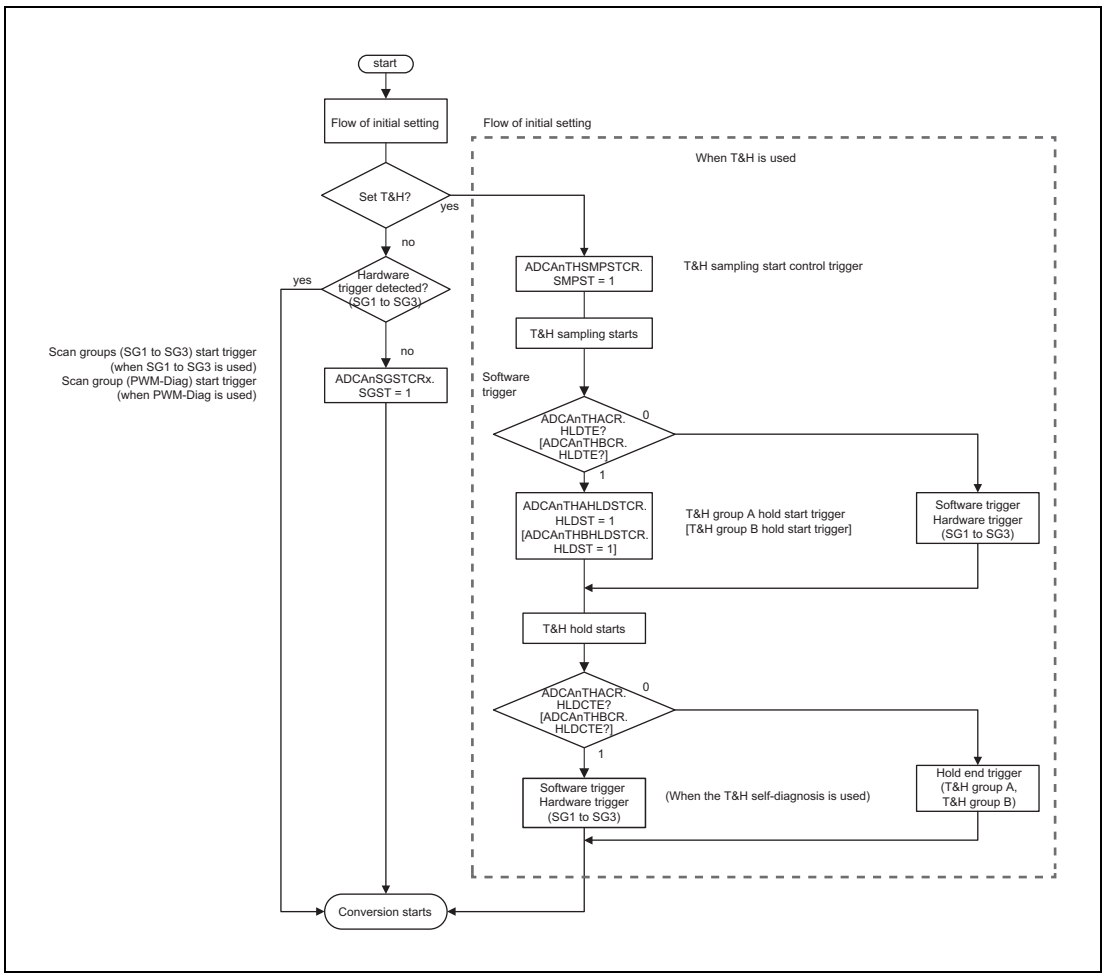


**Figure 31.7 Flowchart for Trigger Input**

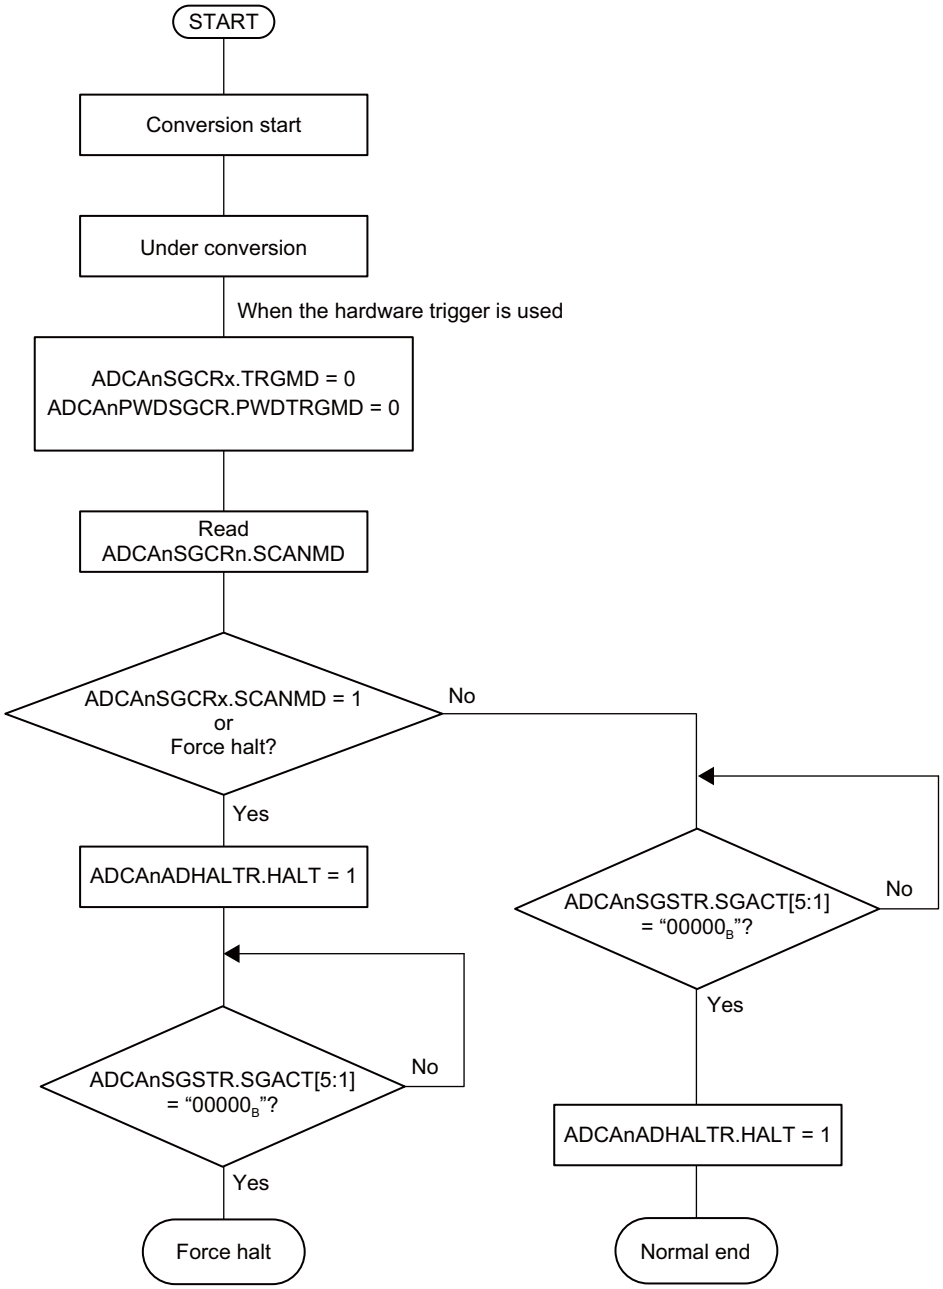
**NOTE**

When an SG start trigger is generated during scanning, the SG start trigger is ignored.

### 31.4.3 Ending A/D Conversion

The flow for ending A/D conversion is shown below.



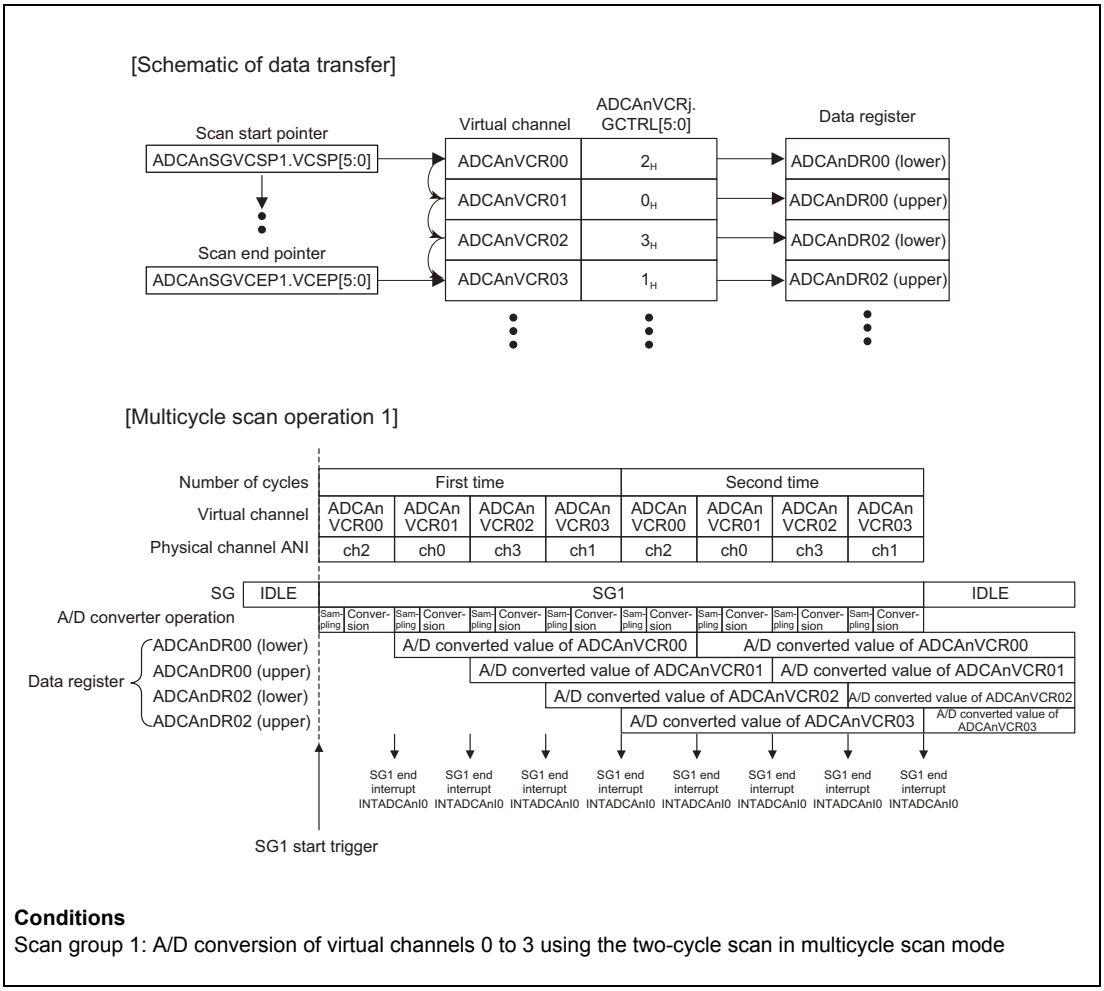
**Note:** The final setting of HALT when A/D conversion ends normally is done to clarify whether the status is "Conversion" or "IDLE". Whether HALT is set or not when A/D conversion ends normally does not effect the A/D conversion accuracy.

**Figure 31.8 Flowchart for Ending A/D Conversion**

## 31.4.4 Example of Scan Group Operation

### (1) Multicycle scan mode

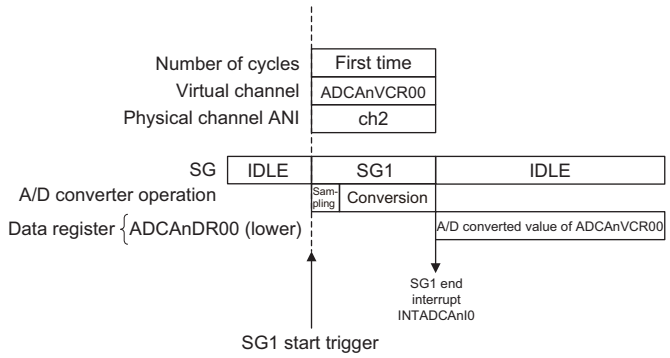
The following figure illustrates an operation example where four virtual channels of scan group 1 are converted using the two-cycle scan in multicycle scan mode.



**Conditions**
Scan group 1: A/D conversion of virtual channels 0 to 3 using the two-cycle scan in multicycle scan mode

**Figure 31.9 Example of Multicycle Scan Operation 1**

The following figure illustrates an operation example where a pin is scanned once in multicycle scan mode.



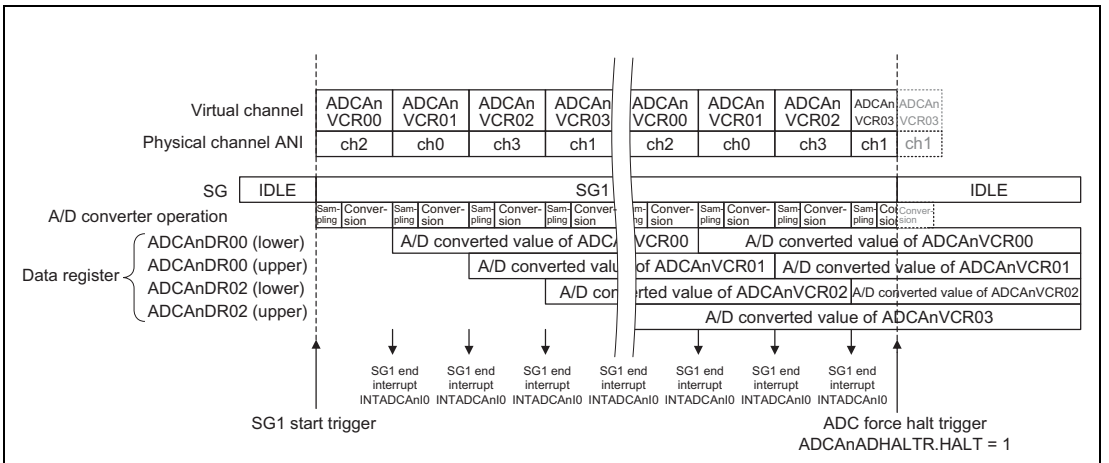
**Conditions**
Scan group 1: A/D conversion of virtual channel 0 in which a pin is scanned once in multicycle scan mode

**Figure 31.10 Example of Multicycle Scan Operation 2**

### (2) Continuous scan mode

Continuous scan mode allows A/D conversion of the SG channels indicated by the pointers specified by ADCAnSGVCSPx.VCSP[5:0] to ADCAnSGVCEPx.VCEP[5:0] to continue until ADCAnADHALTR.HALT is asserted. This mode can be used only with SG1.

The following figure shows an example of operation in continuous scan mode.



**Conditions**
Scan group 1: A/D conversion of virtual channels 0 to 3 in continuous scan mode

**Figure 31.11 Example of Continuous Scan Operation**

### 31.4.5 Channel Repeat Mode

Channel repeat mode allows A/D conversion of the SG channel indicated by the pointer specified by ADCAnSGVCSPx.VCSP[5:0] to ADCAnSGVCEPx.VCEP[5:0] to repeat number of channel repeat times specified by ADCAnSGCRx.SCT[1:0]. This mode operates exclusively in each SG. The number of channel repeat times is selectable from 1, 2, and 4.

The following figures show examples of operation under respective conditions.

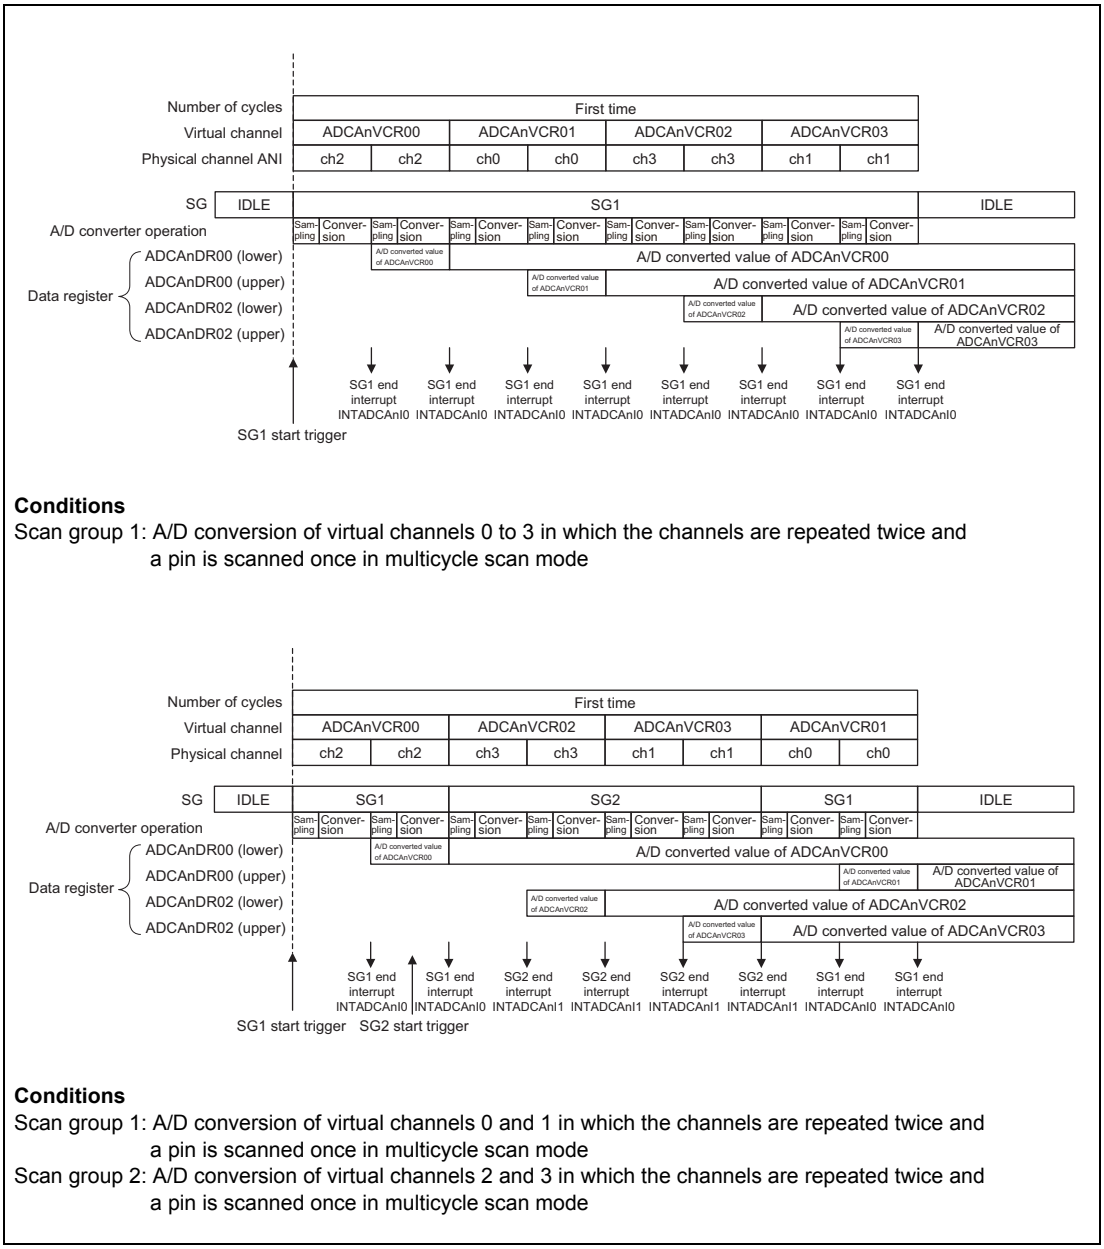


**Figure 31.12 Example of Channel Repeat Operation 1**

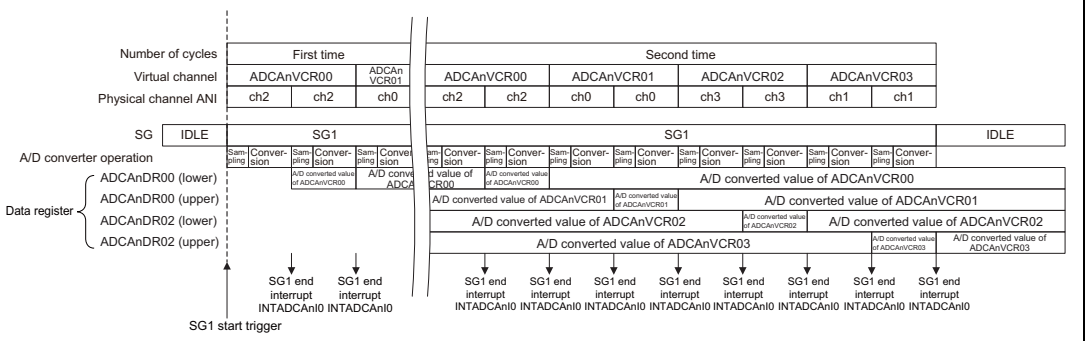
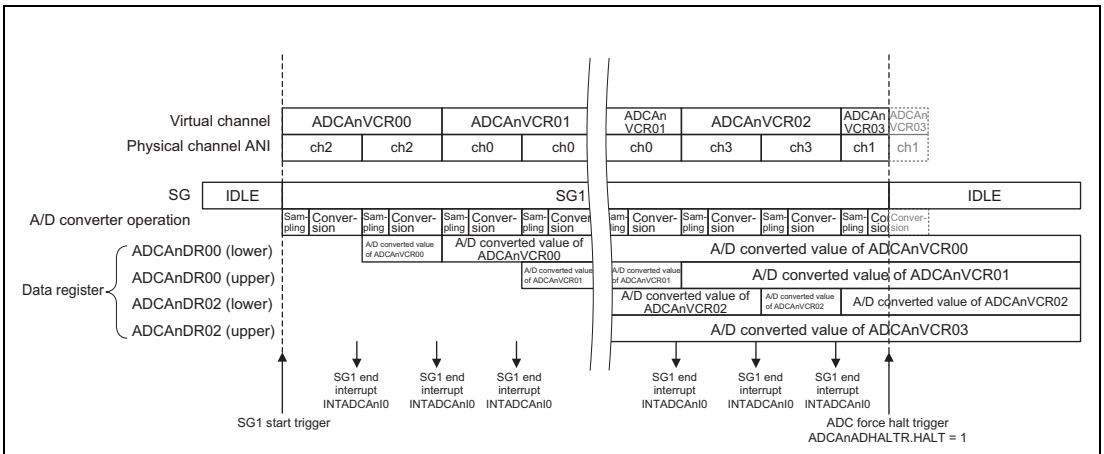


**Conditions**

Scan group 1: A/D conversion of virtual channels 0 to 3 in which the channels are repeated twice and the two-cycle scan is used in multicycle scan mode

**Figure 31.13 Example of Channel Repeat Operation 2**



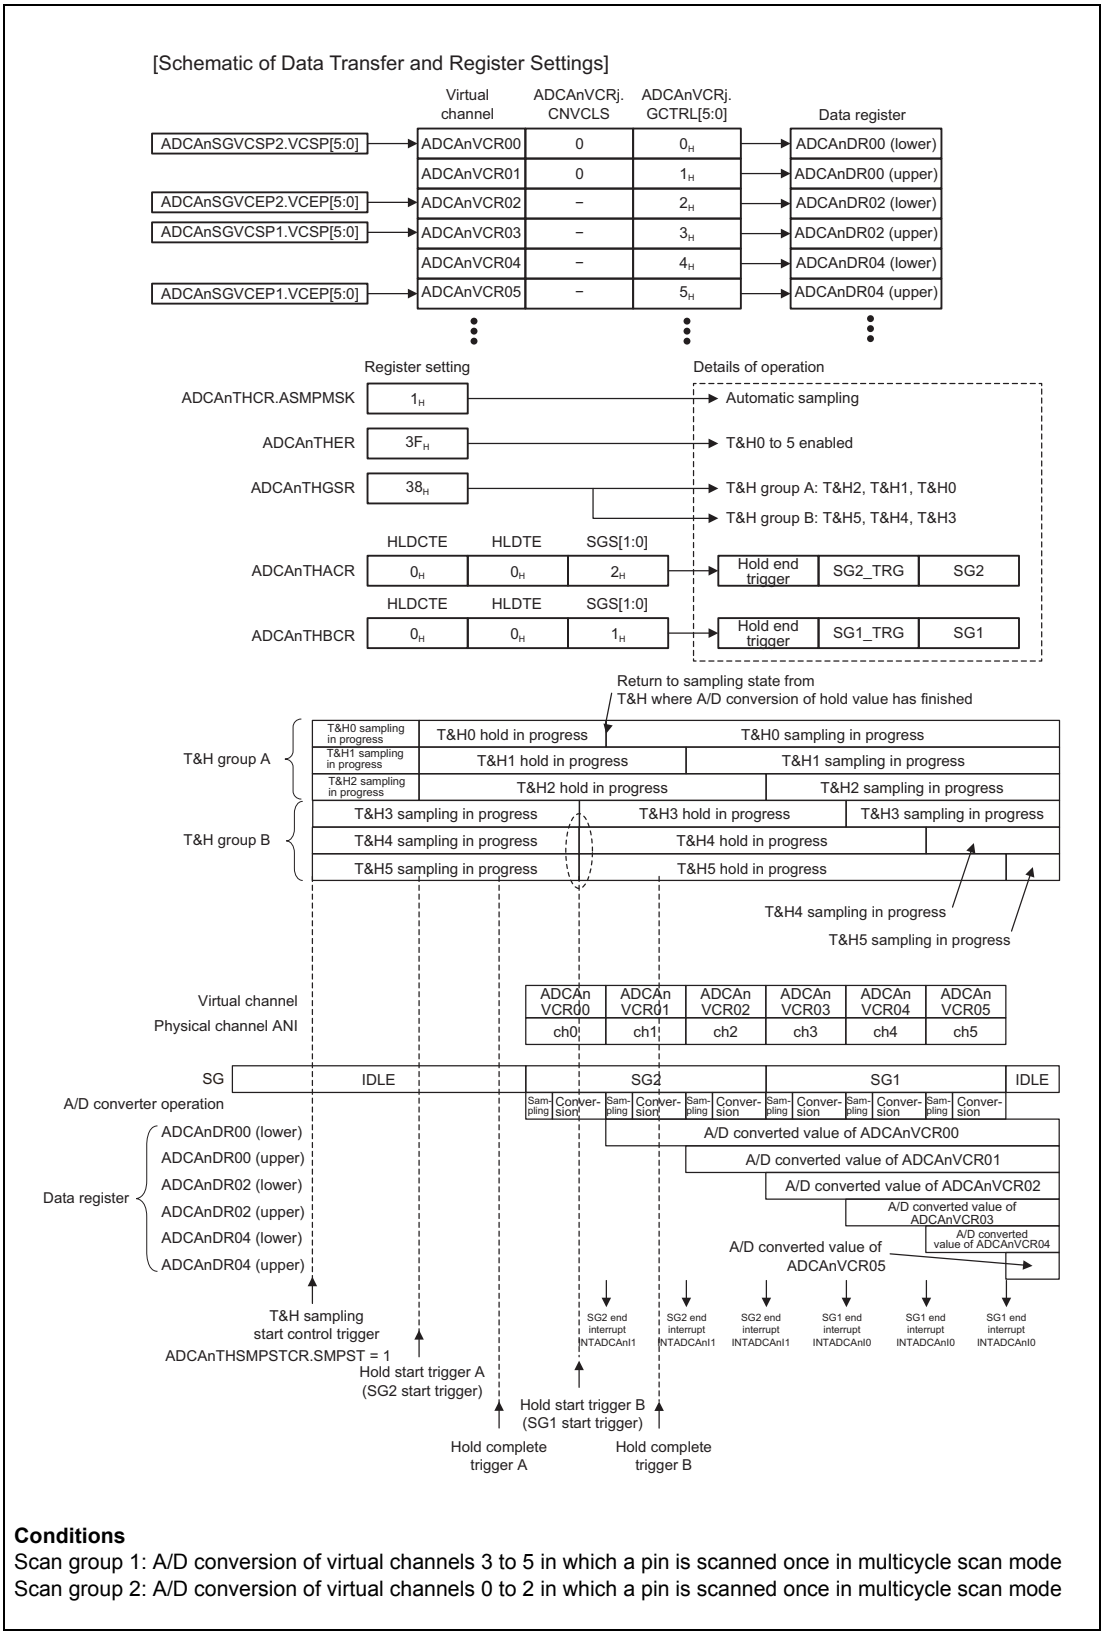
**Conditions**

Scan group 1: A/D conversion of virtual channels 0 to 3 in which the channels are repeated twice in continuous scan mode

**Figure 31.14 Example of Channel Repeat Operation 3**

### 31.4.6 Example of Simultaneous Track and Hold Operation

**Figure 31.15** shows an operation example of simultaneous track and hold.



**Conditions**
Scan group 1: A/D conversion of virtual channels 3 to 5 in which a pin is scanned once in multicycle scan mode
Scan group 2: A/D conversion of virtual channels 0 to 2 in which a pin is scanned once in multicycle scan mode

**Figure 31.15 Example of Simultaneous Track & Hold Operation 1**

**CAUTION**

- **Do not specify the same physical channel in different groups.**
- **Two-cycle (or more) scan in multicycle scan mode and track & hold operation using continuous scan mode are prohibited.**
- **Because ADCAnTHSMPSTCR.SMPST is common to group A and group B, set SMPST after T&H operation for both group A and group B has been completed.**
- **If the hardware trigger is asserted before HLDCTE = 1 and HLDTE = 1 of ADCAnTHACR register or ADCAnTHBCR register are set and HLDST of ADCAnTHAHLDSTCR register or ADCAnTHBHLDSTCR register is written to hold T&H, scan operation starts. In that case, the channel switch opens with T&H staying in the sampling state. Therefore, all scan results are undefined. Do not assert the hardware trigger by setting HLDCTE = 1 and HLDTE = 1 before writing HLDST.**
- **Setting any channel from among 0 to 2 and any channel from among 3 to 5 in the same scan group is prohibited.**
- **Set the interval between T&H sampling start control trigger and hold start trigger to be 450 ns or more.**
- **Set the interval between hold start trigger and completion of the group A/D conversion to be 10 µs or less.**
  **In suspend mode, do not use T&H for the channel of a scan group with low priority setting, if suspend time exceeds 10 µs.**

### 31.4.7 A/D Conversion with External Analog Multiplexer

The following figures show examples of A/D conversion in each case.

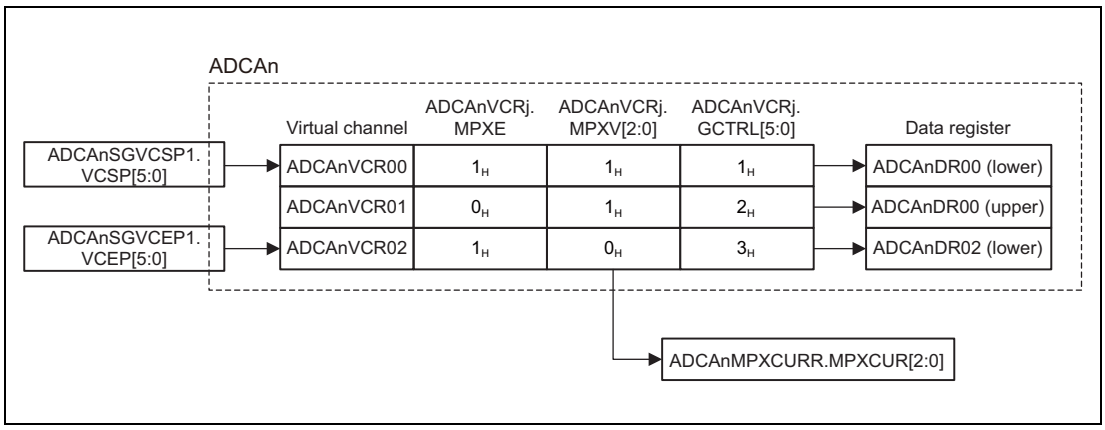


**Figure 31.16 Schematic of Data Transfer and Register Settings**

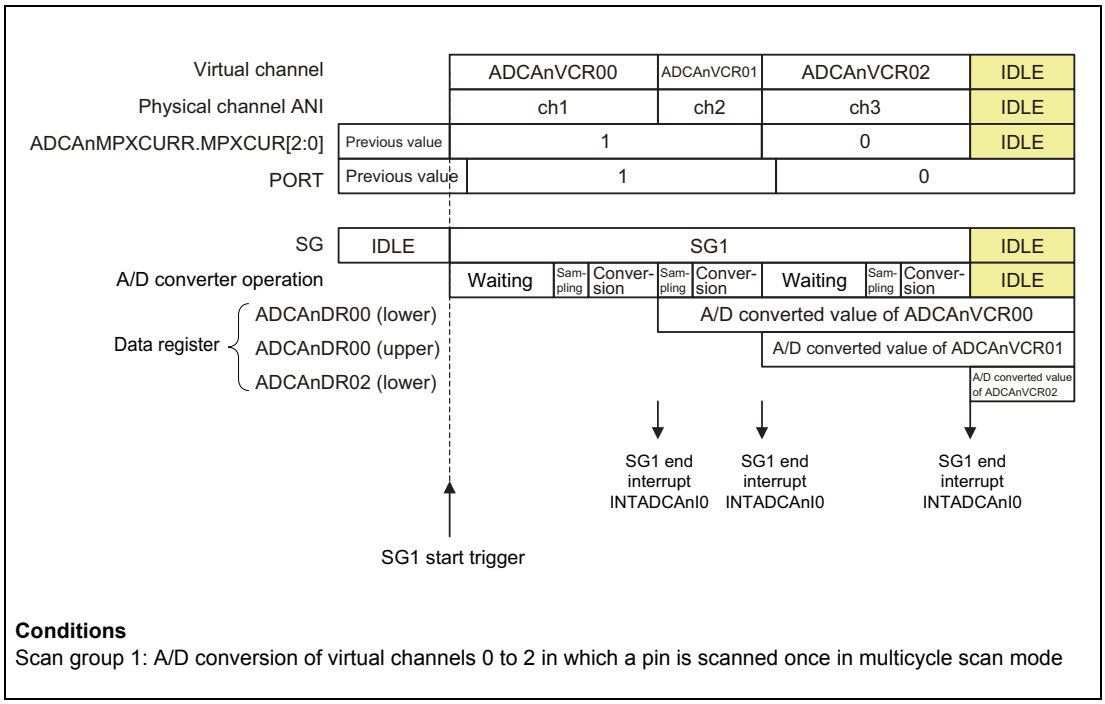
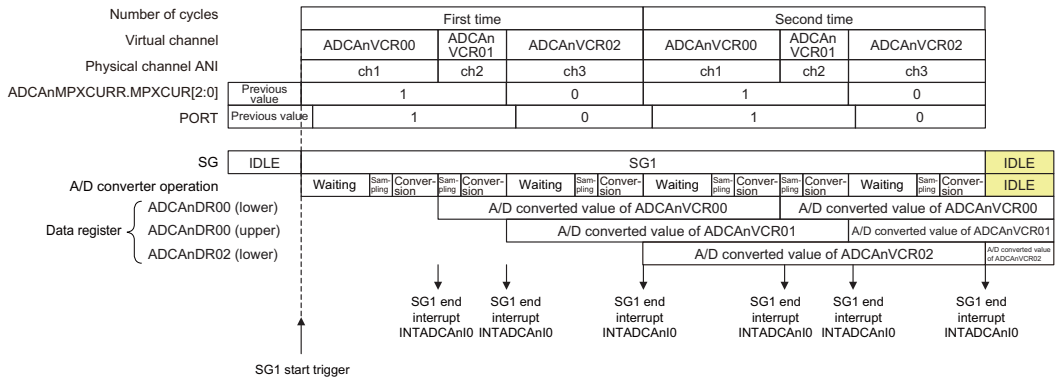


**Conditions**
Scan group 1: A/D conversion of virtual channels 0 to 2 in which a pin is scanned once in multicycle scan mode

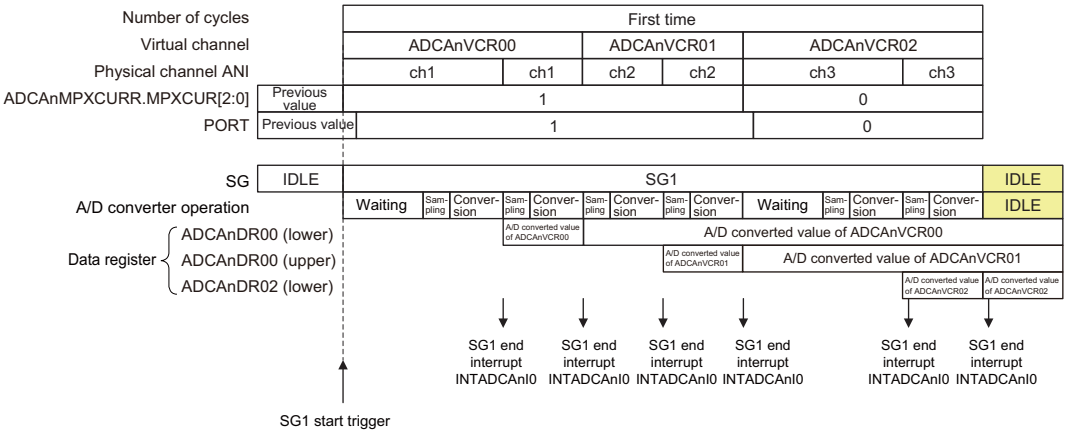
**Figure 31.17 A/D Conversion 1 at an External Analog Multiplexer**



**Conditions**
Scan group 1: A/D conversion of virtual channels 0 to 2 using the two-cycle scan in multicycle scan mode

**Note:** Waiting period is 1 A/D conversion time.

**Figure 31.18 A/D Conversion 2 at an External Analog Multiplexer**



**Conditions**
Scan group 1: A/D conversion of virtual channels 0 to 2 in which the channels are repeated twice and a pin is scanned once in multicycle scan mode

**Figure 31.19 A/D Conversion 3 at an External Analog Multiplexer**

#### 31.4.7.1 A/D Conversion with PWM-Diag Enabled

With the PWM-Diag function enabled, A/D conversion is performed by the signal from the PWM-Diag.

For details on the PWM-Diag function, see **Section 30, PWM Output/Diagnostic (PWM-Diag)**.

To control the A/D conversion, the A/D converter receives the setting information on the MPX by the A/D conversion trigger select (PWSA) signal. The flow of A/D conversion with PWM-Diag is as follows.

(1) Set the channel MPX value of the MPX to ADCAnPWDVCR.MPXV[2:0]. Up to 8 channels can be specified to the MPX.

(2) The A/D conversion is started by the trigger signal PWSA_ADTRG from the PWM-Diag. In addition, when the MPX enable bit (ADCAnPWDVCR.MPXE) is 1, a wait of one A/D-conversion time is inserted before A/D conversion is performed.

(3) At the end of A/D conversion, the scan end is notified to the PWM-Diag.

**CAUTION**

**As the trigger signal PWSA_ADTRG of PWM-Diag function has a higher-priority than SGx_TRG (x = 1 to 3), the operation of other scan groups may be kept waiting until the PWM-Diag function is ended.**

**Figure 31.20** shows an example of PWM-Diag operation using an MPX.

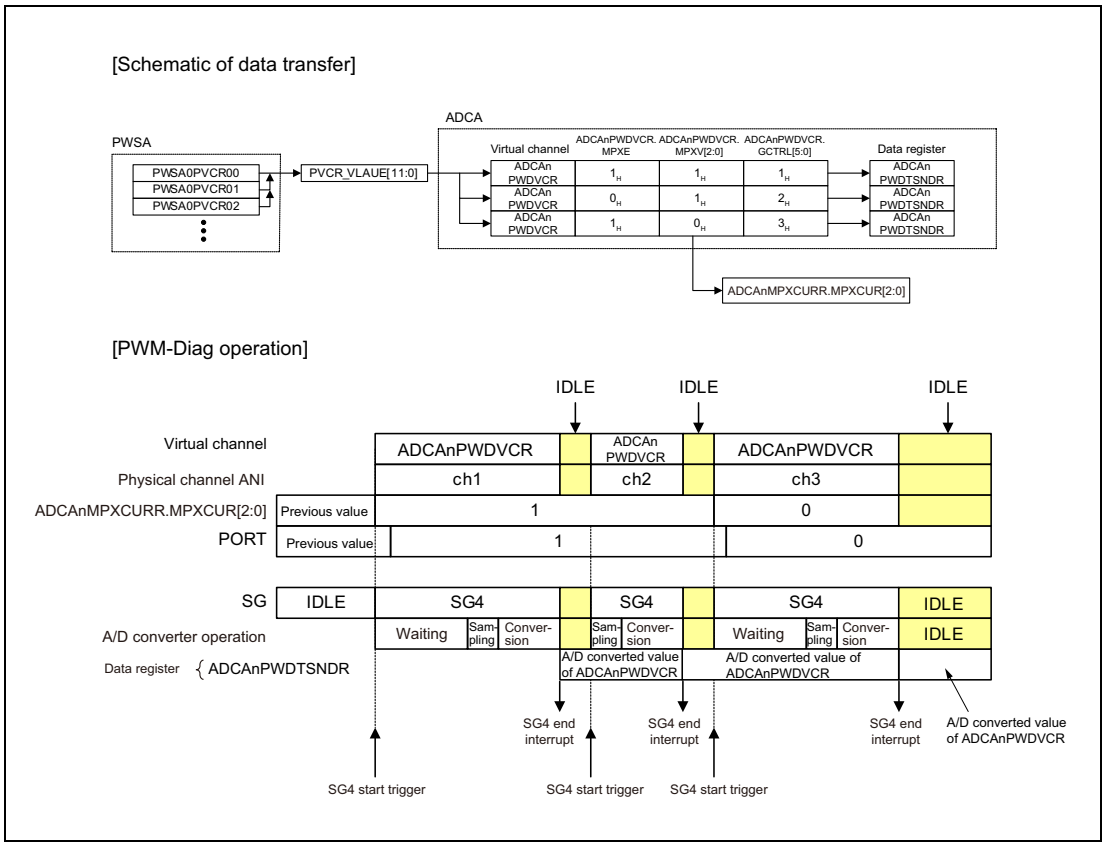


**Figure 31.20 PWM-Diag Operation**

### 31.4.8 Example of Synchronous Suspend and Resume Operation

**Figure 31.21** shows an example of synchronous suspend and resume operation. In this example, a higher-priority SG interrupts a lower-priority SG.

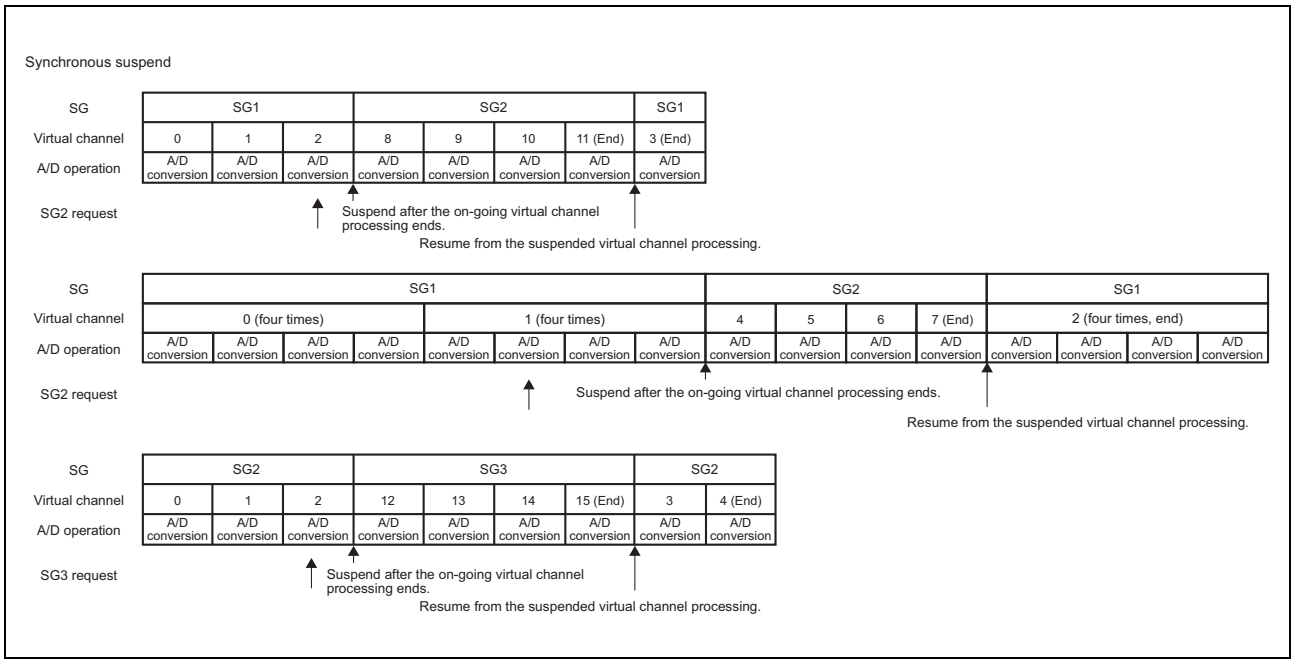

**Figure 31.21 Example of Synchronous Suspend and Resume Operation**

**NOTE**

Priority of scan groups is as follows.

Lower Higher

SG1 < SG2 < SG3 < PWM-Diag (SG4)

### 31.4.9 Example of Asynchronous Suspend and Resume Operation

**Figure 31.22** shows an example of asynchronous suspend and resume operation. In this example, a higher-priority SG interrupts a lower-priority SG.

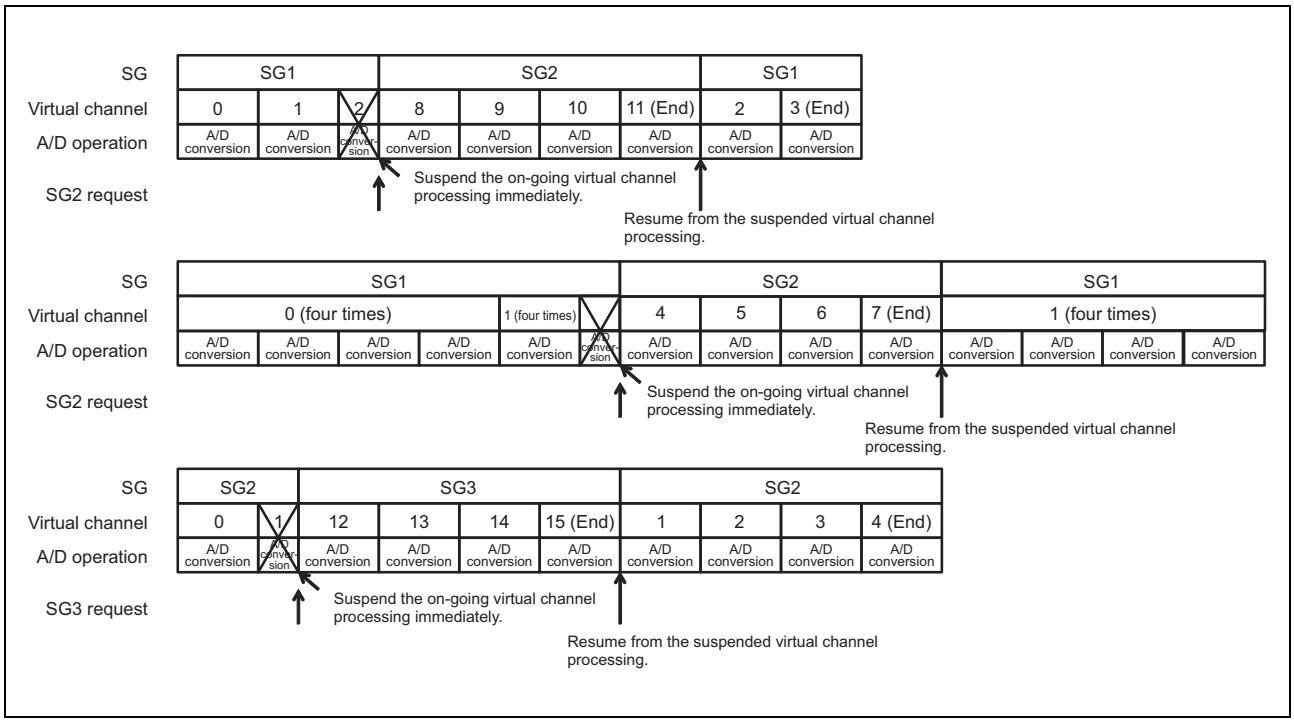

**Figure 31.22 Example of Asynchronous Suspend and Resume Operation**

**NOTE**

Priority of scan groups is as follows.

Lower Higher

SG1 < SG2 < SG3 < PWM-Diag (SG4)

## 31.4.10 Error Detecting Functions

ADCAn covers upper-limit error, lower-limit error, and overwrite error.

### 31.4.10.1 Upper-Limit/Lower-Limit Error Detecting Function

The upper-limit/lower-limit error detecting function determines whether the A/D converted data is larger than the upper-limit table ADCAnULLMTBR0.ULMTB[11:0] or smaller than the lower-limit table ADCAnULLMTBR0.LLMTB[11:0] at the end of A/D conversion.

### 31.4.10.2 Overwrite Error Detecting Function

If the ADCAnDIRj register or ADCAnDRj register of a virtual channel is not read while ADCAnDIRj.WFLG = 1 (A/D converted value is stored) and the next A/D converted value is written in the ADCAnDRj register, an overwrite error is detected.

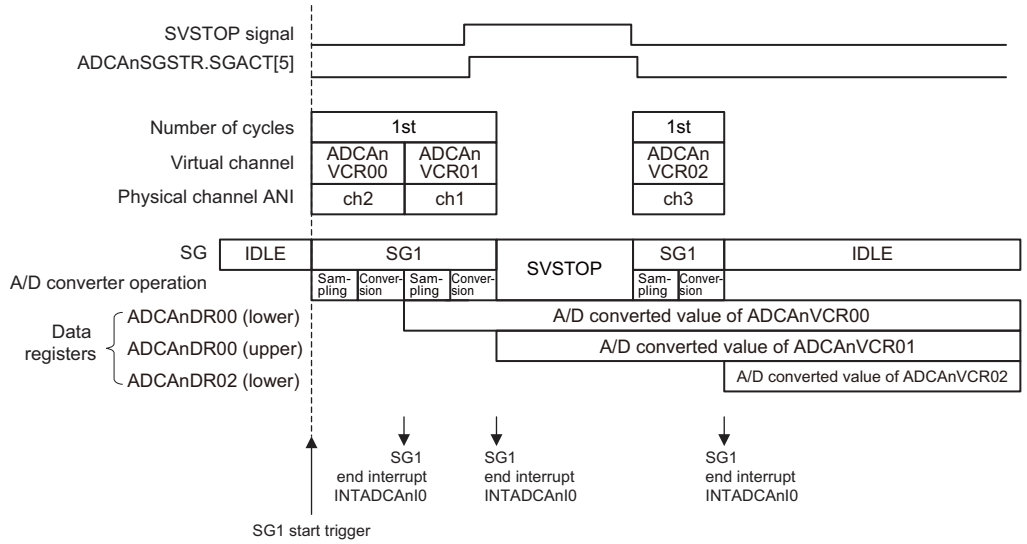
### 31.4.10.3 SVSTOP Operation

The SVSTOP function is supported by the SVSTOP signal sent from the on-chip debugger control unit. The SVSTOP function stops conversion of the A/D converter when the SVSTOP signal is input during an emulation break. While the SVSTOP signal is high, reading registers ADCAnDRj, ADCAnDIRj, ADCAnSGSTR, ADCAnULER, ADCAnOWER, ADCAnPWDTSNDR, and ADCAnPWDDIR by external access does not affect these registers.

When the high level is input to SVSTOP while ADCAnEMU.SVSDIS = 0, ADCAnSGSTR.SGACT[5] is set to 1 to make a transition to the SVSTOP state. Hardware triggers and software triggers are valid in the SVSTOP state. When the high level is input to SVSTOP while ADCAnEMU.SVSDIS = 1, the ADCA does not make a transition to the SVSTOP state. ADHALT (forced termination of A/D conversion) should not be performed in the SVSTOP state.

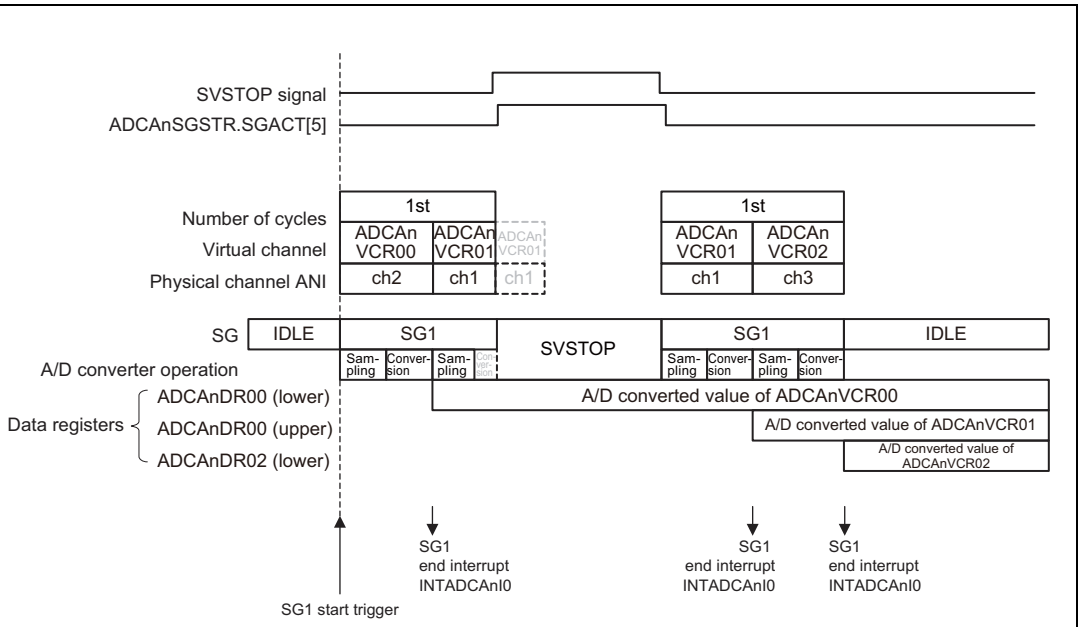
In operations for synchronous suspension, a new start trigger cannot be accepted over the time from when the high level is input to SVSTOP to the completion of conversion on the channel where conversion is currently proceeding. This time can be up to the time taken for one A/D conversion.

The following example illustrates a SVSTOP operation example.



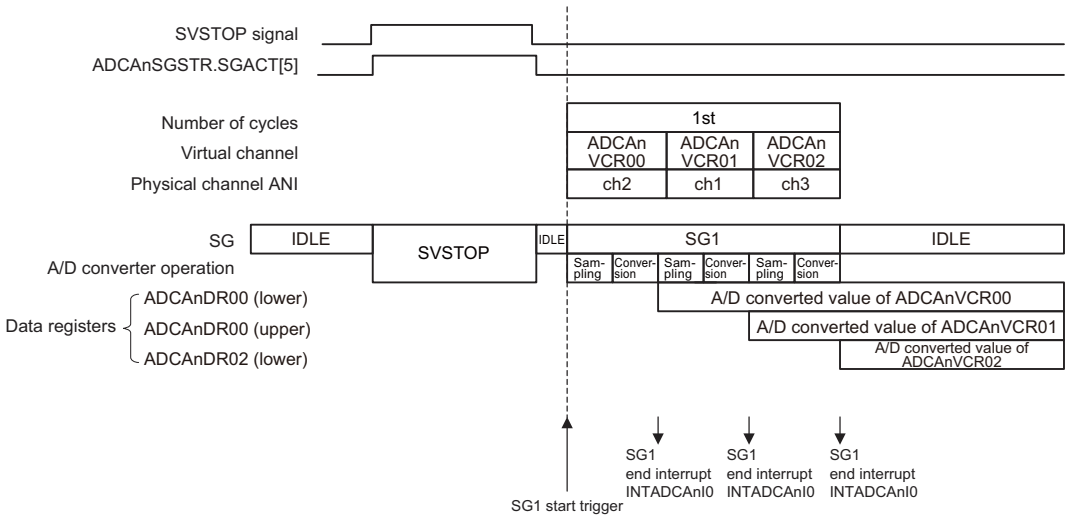
**Note:** An SG start trigger is accepted even during SVSTOP after the completion of conversion.

**Figure 31.23 Example of SVSTOP Operation (ADCAnADCR.SUSMTD = 00 and ADCAnEMU.SVSDIS = 0)**



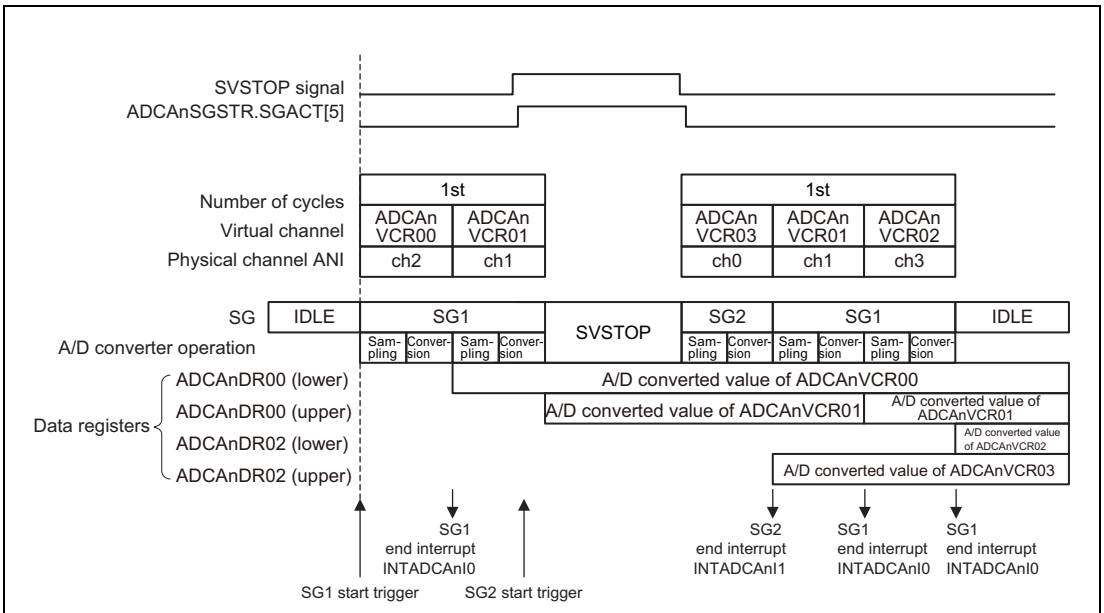
**Note:** An SG start trigger is accepted even during SVSTOP.

**Figure 31.24 Example of SVSTOP Operation (ADCAnADCR.SUSMTD = 10 and ADCAnEMU.SVSDIS = 0)**



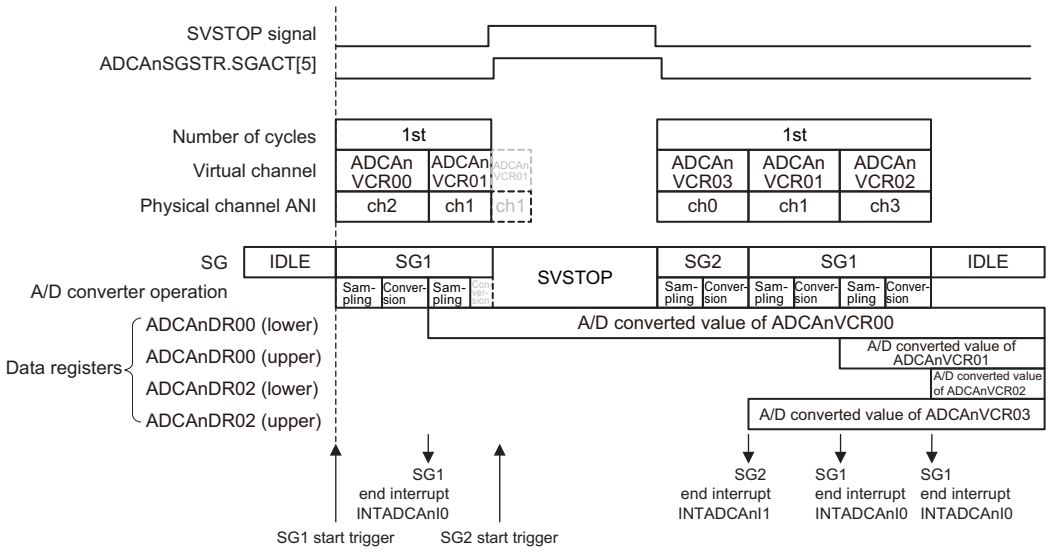
**Note:** An SG start trigger is accepted even during SVSTOP.

**Figure 31.25 Example of SVSTOP Operation in the IDLE State (ADCAnADCR.SUSMTD = 00 and ADCAnEMU.SVSDIS = 0)**



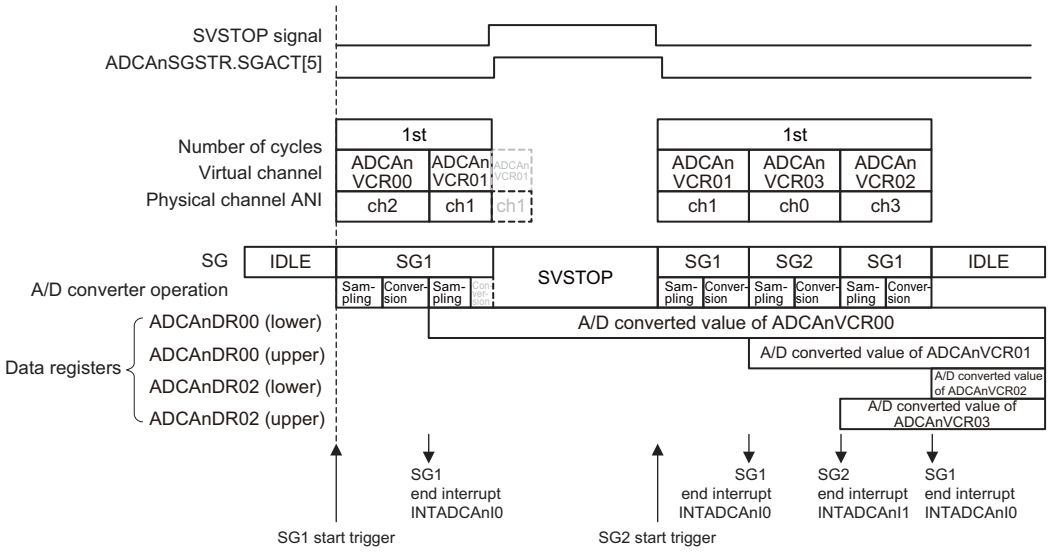
**Note:** Though the channel where conversion is currently proceeding is not stopped even after the acceptance of SVSTOP, an SG end interrupt is not generated.
This channel is converted again after SVSTOP has been cleared.
After the completion of conversion, the SG start trigger is accepted even during SVSTOP.

**Figure 31.26 Conflict of SVSTOP Start and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD = 00, ADCAnEMU.SVSDIS = 0)**



**Note:** An SG start trigger is accepted even during SVSTOP.

**Figure 31.27 Conflict of SVSTOP Start and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD = 10, ADCAnEMU.SVSDIS = 0)**



**Note:** An SG start trigger is accepted even during SVSTOP.
In cases of conflict between clearing of SVSTOP and setting of the scan group start trigger bit, conversion of the suspended scan group is resumed regardless of its priority.

**Figure 31.28 Conflict of SVSTOP Clear and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD = 10, ADCAnEMU.SVSDIS = 0)**

### 31.4.11 Activating Scan Group by a Hardware Trigger

Scan group x can be activated by the hardware trigger input to SGx_TRG. As for the hardware trigger sources to be used, see **Table 31.49, List of A/D Conversion Hardware Triggers**. When activating SGx_TRG by the hardware trigger, set the peripheral function to be used by the trigger and set the start trigger in the A/D conversion trigger select control register (ADCAnSGTSELx).
A hardware trigger from external trigger input pin requires digital filter setting. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**. More than one start trigger can be specified.

#### 31.4.11.1 Stopping Scan Group by ADHALT

Setting ADCAnADHALTR.HALT (A/D force halt trigger) to 1 forcibly halts the A/D conversion and clears the scan group status register (ADCAnSGSTR). The error flag of ADCAnULER (upper limit/ lower limit error register) is not cleared. When ADCAnADHALTR.HALT is set, make sure that ADCAnSGSTR.SGACT has been cleared.

### 31.4.12 Scan End Interrupt Request

Scan group x can issue a scan end interrupt request (INT_SGx) to INTC. If ADIE of ADCAnSGCRx is set to 1, INT_SGx can be output after the SGx scan ends. If ADIE of ADCAnSGCRx is set to 0, the INT_SGx output when the SGx scan ends can be disabled. If ADIE of ADCAnVCRj is set to 1, INT_SGx can be output when A/D conversion for virtual channel j in SGx ends. If ADIE of ADCAnVCRj is set to 0, the INT_SGx output when A/D conversion for virtual channel j in SGx ends can be disabled. Since SGx scan ending is simultaneous with A/D conversion ending for virtual channel j in SGx when ADIEs of both ADCAnSGCRx and ADCAnVCRj are set to 1, INT_SGx occurs only once.

Example 1: A scan is executed for virtual channel 0 or 1 in SG1 when ADIE of ADCAnSGCR1 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 0.
INT_SG1 is output when A/D conversion ends for virtual channel 0.

Example 2: A scan is executed for virtual channel 0 or 1 in SG2 when ADIE of ADCAnSGCR2 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 1.
INT_SG2 is output when A/D conversion ends for virtual channel 0 and virtual channel 1.

Example 3: A scan is executed for virtual channel 0 or 1 in SG3 when ADIE of ADCAnSGCR3 is 1, ADIE of VCR0 is 0, and ADIE of VCR1 is 0.
INT_SG3 is output when a scan ends (when A/D conversion for virtual channel 1 ends).

Furthermore, the DMAC can be started when scan ends.

For the setting of DMAC, see **Section 8, DMA Controller**.

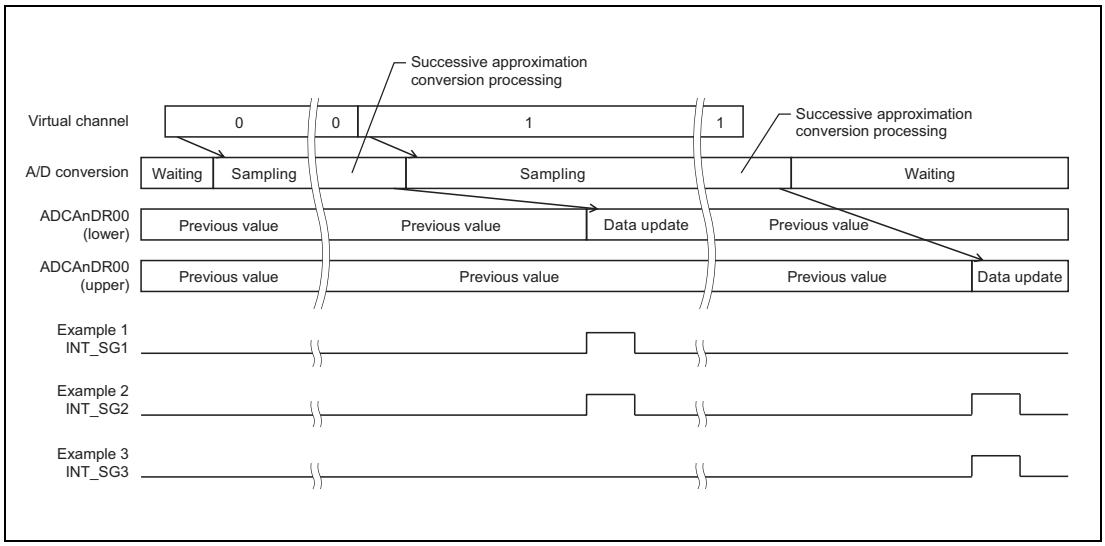


**Figure 31.29 Example of a Scan Conversion End Interrupt Occurrence**

### 31.4.13 A/D Error Interrupt Request

ADCA can issue an A/D error interrupt request (INT_ADE) to INTC. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 1, the OR condition of the error source is issued as INT_ADE. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 0, INT_ADE does not output an interrupt.

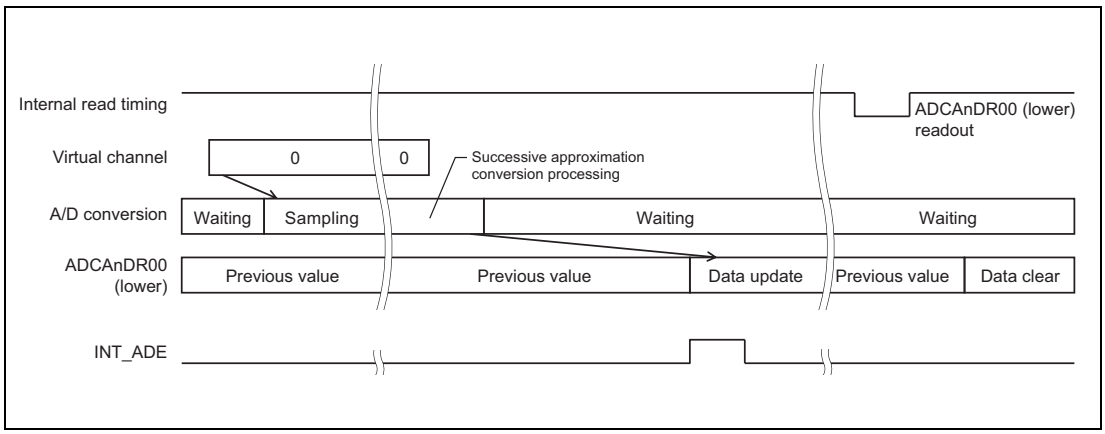

**Figure 31.30 A/D Error Interrupt (Example: Overwrite Error)**

## 31.5 Self-Diagnostic Function

To check the ADCAn function, the following self-diagnostic functions are available.

**Section 31.5.1, Diagnosis of A/D Conversion Circuit**

**Section 31.5.2, Diagnosis of Channel Multiplexer**

**Section 31.5.3, Diagnosis of Open Pins**

**Section 31.5.4, Diagnosis of T&H Circuit**

The overview of the self-diagnostic functions is shown in the figure below. A detailed description is given in the following sections.

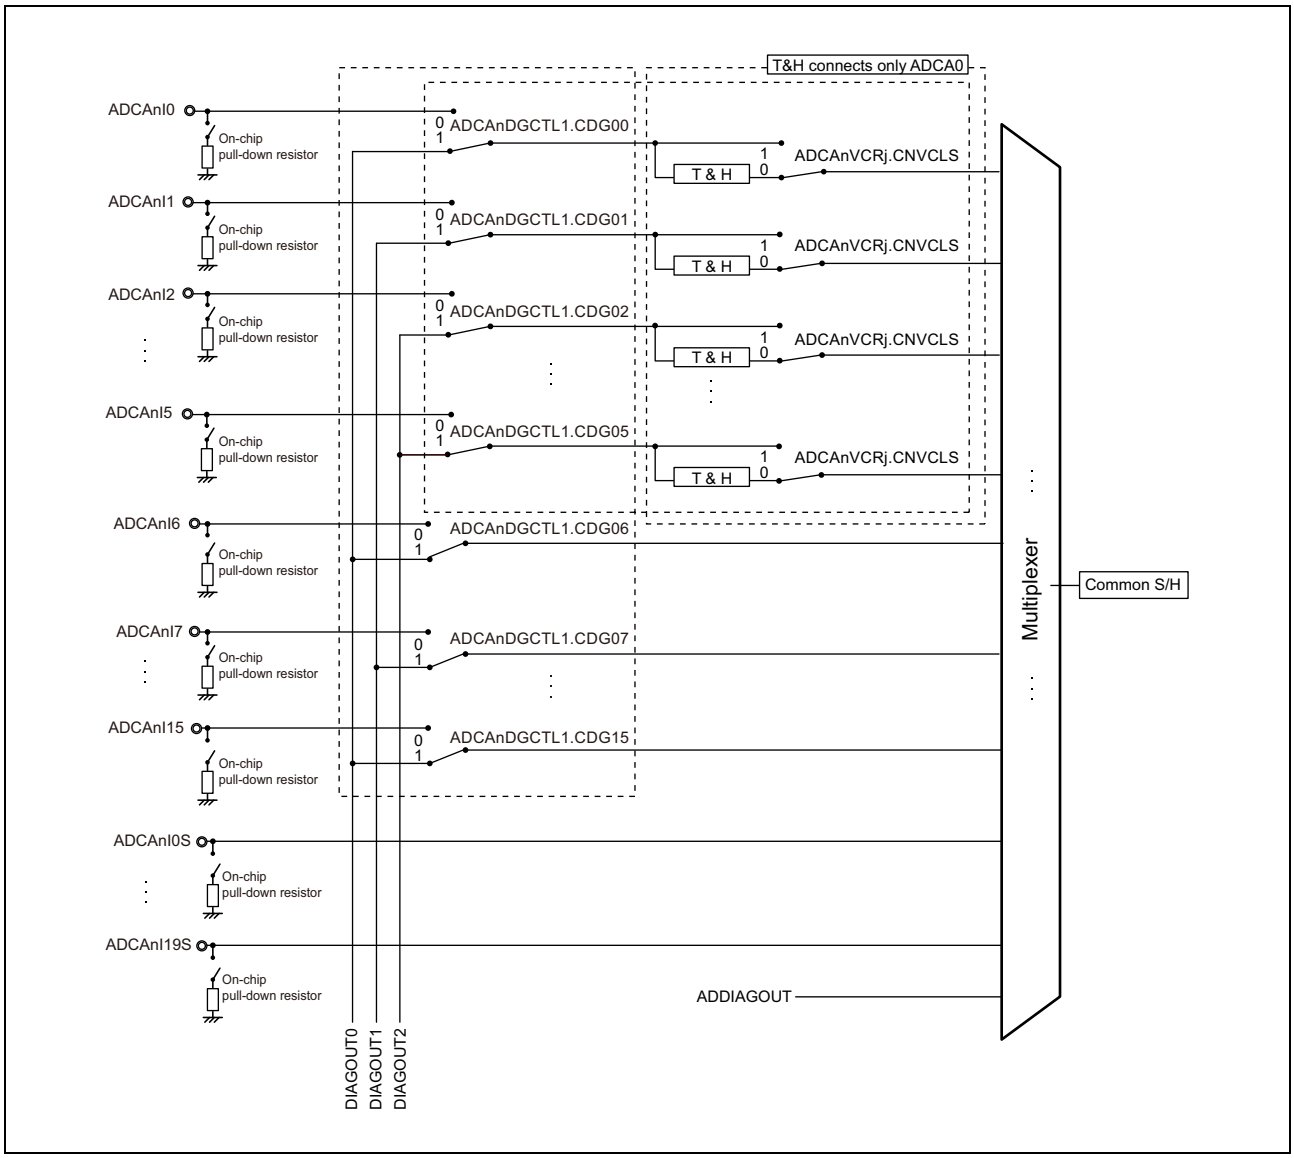

**Figure 31.31 Overview of Self-Diagnostic Functions**

**NOTE**

The functions in the dashed-line frames depend on the product.

### 31.5.1 Diagnosis of A/D Conversion Circuit

This function checks whether the A/D converter is operating normally by verifying the A/D conversion for self-diagnostic voltage (ADDIAGOUT) and the result of conversion. If the result of A/D conversion differs from the expected value, an internal circuit may be broken. The features of self-diagnosis of the A/D converter are as follows:

- As the self-diagnostic voltage (ADDIAGOUT) level, $AnV_{REF}$, $2/3AnV_{REF}$, $1/3AnV_{REF}$, $1/2AnV_{REF}$, and AnVSS are selectable by the PSEL[2:0] bits in the ADCAnDGCTL0 register.
- Self-diagnosis of the A/D converter is enabled by performing A/D conversion on one of SG1 to SG3.

#### 31.5.1.1 Diagnostic procedure

The diagnostic procedures are shown below.

Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set ADCAnADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCAnDGCTL0.PSEL[2:0] to select a self-diagnostic voltage level.
4. Set ADCAnADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Set an arbitrary bit of ADCAnVCRj.GCTRL[5:0] to $100100_B$ to select the diagnosis channel.
7. Set ADCAnVCRj.ADIE = 1 to enable the A/D conversion end interrupt.
8. Set ADCAnSGVCSPx to specify the start pointer of virtual channel.
9. Set ADCAnSGVCEPx to specify the end pointer of virtual channel.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

**NOTE**

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCAnDGCTL0.PSEL[2:0]. However, the value of ADCAnDGCTL0.PSEL[2:0] becomes effective from the next A/D conversion.
- To clear ADCAnADCR.DGON, follow the procedure below:
  1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
  2. Clear ADCAnDGCTL0.PSEL[2:0].
  3. Clear ADCAnADCR.DGON.

### 31.5.2 Diagnosis of Channel Multiplexer

This function checks whether the path from the analog input to the A/D converter is normal.
Set the A/D conversion reference voltage (DIAGOUT0, DIAGOUT1, DIAGOUT2) by ADCAnDGCTL0.PSEL[2:0] and the channels to be connected by the ADCAnDGCTL1 register to perform A/D conversion using multiple analog channels.
If the result of A/D conversion differs from the expected value, an internal circuit may be broken. The features of self-diagnosis of the channel multiplexer are as follows:

- Channels for diagnosis can be arbitrarily selected from among ADCA0I0 to ADCA0I15 and ADCA1I0 to ADCA1I15.
- As the self-diagnostic voltage level, $2/3AnV_{REF}$, $1/3AnV_{REF}$, and $1/2AnV_{REF}$ are selectable and one of the three reference voltage levels can be allocated to each channel.

**Table 31.55 Selection of Channel to be Diagnosed**

| Connection | Select Channel |
|---|---|
| DIAGOUT0 | Channels 0, 3, 6, 9, 12, and 15 |
| DIAGOUT1 | Channels 1, 4, 7, 10, and 13 |
| DIAGOUT2 | Channels 2, 5, 8, 11, and 14 |

- Self-diagnosis of the channel multiplexer is enabled by performing A/D conversion on one of SG1 to SG3 by using multiple channels.

#### 31.5.2.1 Diagnostic procedure

The diagnostic procedure is shown below.

Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set ADCAnADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCAnDGCTL0.PSEL[2:0] to select a self-diagnostic voltage level.
4. Set ADCAnADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Use two or more ADCAnVCRj registers.
   Set ADCAnVCRj.GCTRL[5:0] bits to select physical channels.
   Set ADCAnVCRj.ADIE bit to enable the A/D conversion end interrupt.
7. Set ADCAnSGVCSPx register to specify the start pointer of virtual channel.
8. Set ADCAnSGVCEPx register to specify the end pointer of virtual channel.
9. Set ADCAnDGCTL1 register to specify the physical channel to the self-diagnostic channel.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

**NOTE**

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCAnDGCTL0.PSEL[2:0]. However, the value of ADCAnDGCTL0.PSEL[2:0] becomes effective from the next A/D conversion.
- To clear ADCAnADCR.DGON, follow the procedure below:
  1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
  2. Clear ADCAnDGCTL0.PSEL[2:0].
  3. Clear ADCAnADCR.DGON.

### 31.5.3 Diagnosis of Open Pins

This function detects whether the analog input pin (ADCAnIm, ADCAnImS) is open due to disconnection, etc.
An internal pull-down resistor can be connected to diagnose the analog input pin.
Connect the analog input pin (ADCAnIm, ADCAnImS) with the pull-down resistor for self-diagnosis for A/D conversion of the target channels.

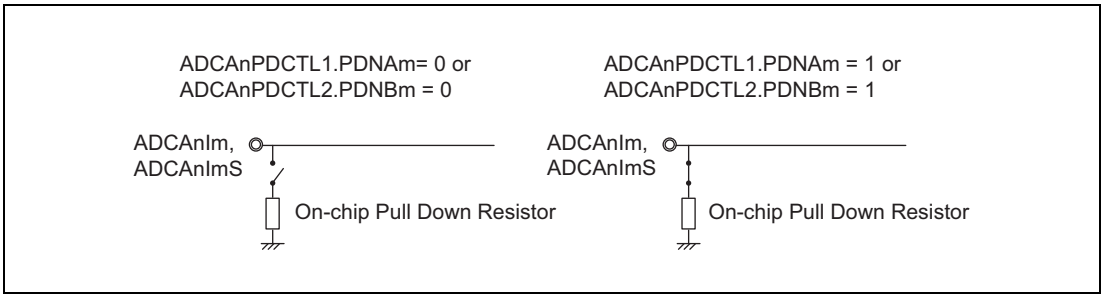

**Figure 31.32 Setting of On-chip Pull Down Resistor**

When there is a disconnection, the conversion result is almost 0 V and it indicates an open detection.

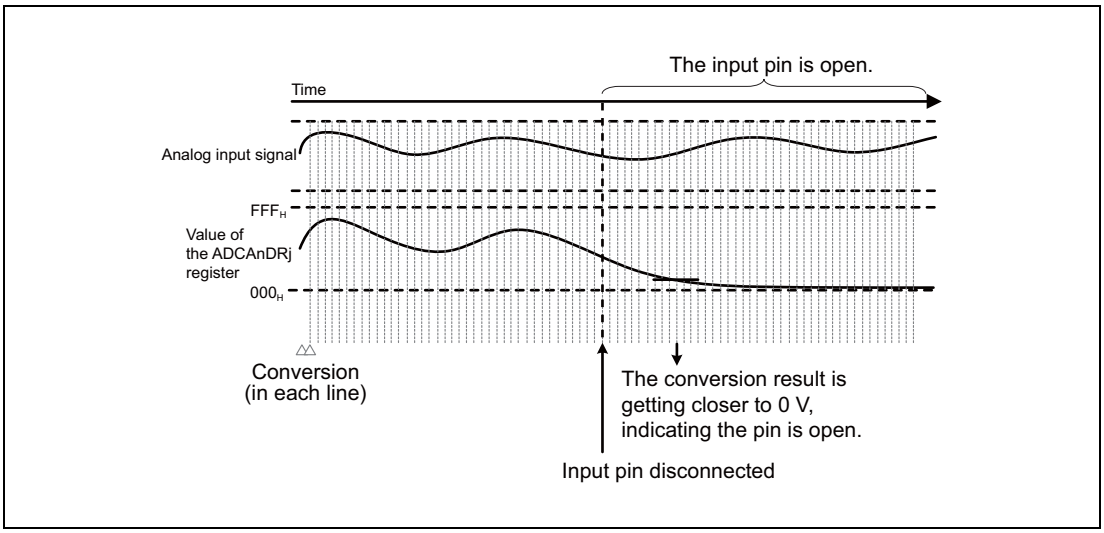

**Figure 31.33 Analog Input Signal Disconnection Detection**

**CAUTIONS**

1. **The pull-down resistors must not be connected during normal A/D conversion operation. Connected pull-down resistors may lead to a drop in the input voltage and result in erroneous A/D conversion results.**
2. **When the analog input voltage is nearly equal to the voltage level which is pulled down, a disconnection cannot be detected by this function.**

#### 31.5.3.1 Diagnostic procedure

1. Set the ADCAnPDCTL1.PDNA or ADCAnPDCTL2.PDNB bit which correspond to analog input pins (ADCAnIm, ADCAnImS) to be diagnosed to enable the pull down resistor.
2. Generate the start trigger of scan group to perform the A/D conversion.
3. Perform the A/D conversion multiple times on the same analog input.
4. Monitor the channel's A/D conversion results and check if any result declines to 0 V.

### 31.5.4 Diagnosis of T&H Circuit

This function is used to diagnose proper operation of the T&H0 to T&H5 circuits for ADCA0I0 to ADCA0I5.

Virtual channel registers 33 to 35 (ADCA0VCR33 to 35) are used exclusively for comparison of the potential conversion result using the T&H circuit and that obtained without using the T&H circuit to detect a failure of the T&H circuit.

For this diagnosis, the ADCA0THACR.HLDCTE is set to 1 (ADCA0THBCR.HLDCTE = 1) and ADCA0THACR.HLDTE to 0 (ADCA0THBCR.HLDTE = 0) and the A/D conversion trigger is used as the hold start/end trigger. Connect the reference voltage signal (DIAGOUT0, DIAGOUT1, or DIAGOUT2) selected by ADCAnDGCTL0.PSEL[2:0] to the target channels for diagnosis by using the ADCAnDGCTL1 register.

#### 31.5.4.1 Diagnostic Procedure (in case of T&H circuit ch0 diagnosis)

1. Set ADCA0ADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCA0DGCTL0.PSEL[2:0] = $001_B$ to select $1/3AnV_{REF}$ voltage level.
4. Set ADCA0ADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Set ADCA0DGCTL1.CDG0 = 1 to enable DIAGOUT0.
7. Set ADCA0VCR33.GCTRL[5:0] to ADCAVCR35.GCTRL[5:0] to $000000_B$ to select physical ch0.
8. Set ADCA0VCR33.CNVCLS and ADCA0VCR34.CNVCLS to1 to select normal conversion.
9. Set ADCA0VCR35.CNVCLS = 0 to select hold value conversion.
10. Set ADCA0THACR.SGS[1:0] = $01_B$ to select SG1 to “T&H group A”.
11. Set ADCA0THER.TH0E = 1 to enable T&H circuit ch0.
12. Set ADCA0THGSR.TH0GS = 0 to select T&H circuit ch0 to “T&H group A”.
13. Set ADCA0SGVCSP1.VCSP[5:0] =$100001_B$ to select SG1 start pointer to VCR33.
14. Set ADCA0SGVCEP1.VCEP[5:0] = $100011_B$ to select SG1 end pointer to VCR35.
15. Set ADCA0DGCTL0.PSEL[2:0] = $011_B$ to select $2/3AnV_{REF}$ voltage level.
16. Set ADCA0THSMPSTCR.SMPST = 1 to execute T&H sampling.
17. Wait for 500 ns.
18. Set ADCA0SGSTCR1.SGST = 1 to execute SG1 A/D conversion.
19. Read ADCA0DIR33 to ADCA0DIR35, and check A/D conversion result to see if SG1 A/D conversion has finished.

**NOTES**

To clear ADCAnADCR.DGON, follow the procedure below:

1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
2. Use the ADCAnTHER register to disable the diagnosed T&Hk.
3. Clear ADCAnDGCTL0.PSEL[2:0].
4. Clear ADCAnADCR.DGON.

### 31.5.4.2 Diagnosis Mechanism

(1) A reference voltage “A” is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T&H circuit holds the voltage “A” and an A/D conversion is performed without using the T&H circuit.

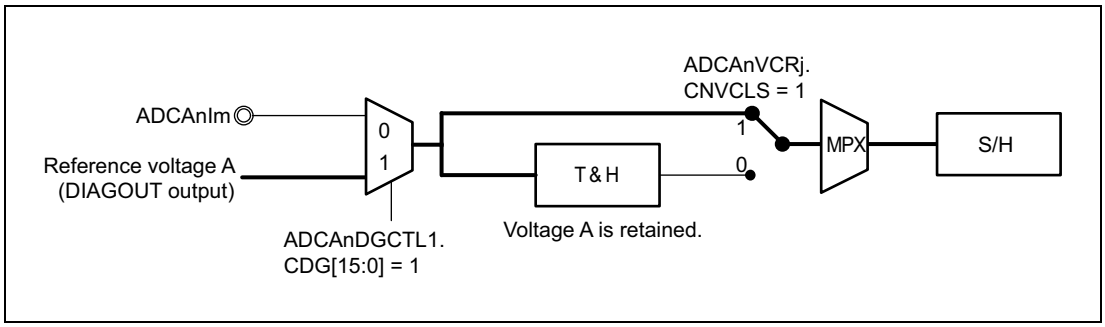

**Figure 31.34 T&H Circuit Diagnostic Mechanisms (1)**

(2) A reference voltage “B” is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T&H circuit still holds the voltage “A” and an A/D conversion is performed without using the T&H circuit.
Note that since reference voltage “A” is being held, reference voltage “B” is not held.

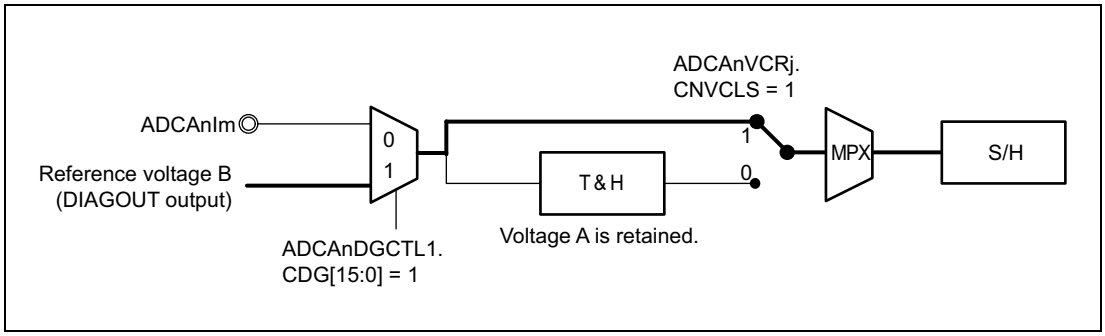

**Figure 31.35 T&H Circuit Diagnostic Mechanisms (2)**

(3) An A/D conversion is performed using the T&H circuit. The T&H circuit continues to hold the voltage A.

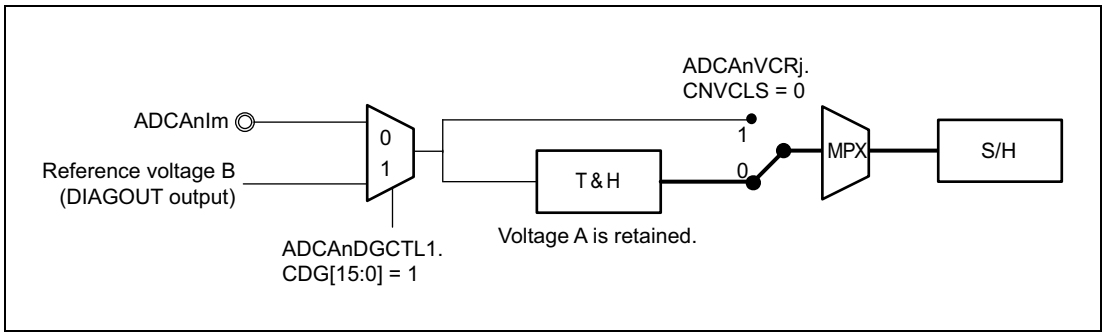

**Figure 31.36 T&H Circuit Diagnostic Mechanisms (3)**

(4) The diagnosis of T&H circuit is successful if the following results are obtained:
1. The first result (step 1) is voltage “A”.
2. The second result (step 2) is voltage “B”.
3. The last result (step 3) is voltage “A” again.

## 31.6 Definition of A/D Conversion Accuracy

A/D conversion accuracy is defined as follows:

- Resolution
  Digital output code value from the A/D converter
- Quantization error
  An error essentially contained in the A/D converter, which is assumed as 1/2 LSB (**Figure 31.37**).
- Offset error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from the minimum voltage value $000_H$ to $001_H$. However, the quantization error is not included.
- Full scale error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from $FFE_H$ to $FFF_H$. However, the quantization error is not included.
- DNL (Differential nonlinear error)
  Deviation between the ideal digital output code width (Vq) and the actual digital output code width (Va), which is assumed as (Va – Vq)/Vq. However, the offset error, the full scale error, and the quantization error are not included.
- INL (Integral nonlinear error)
  Deviation of the actual value from the ideal A/D conversion characteristics between the zero voltage and the full scale voltage, which is assumed as an integral of DNL from $000_H$ to a digital output code. However, the offset error, the full scale error, and the quantization error are not included.
- Absolute accuracy
  Deviation between the digital value and the analog input value. The offset error, the full scale error, the quantization error, DNL, and INL are included.

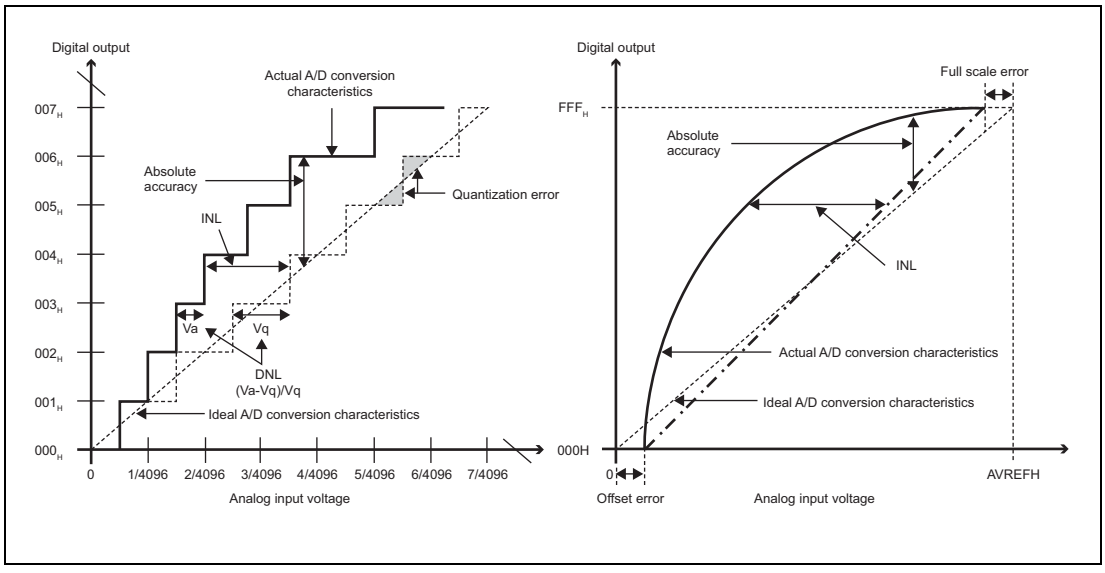

**Figure 31.37 Definition of A/D Conversion Accuracy**

## 31.7 Usage Notes

### 31.7.1 Range of Channel Input Voltage

**CAUTION**

**ADCAnIm and ADCAnImS input voltages should be used within the specification range. If the channel input voltage exceeds AnVREF or falls below AnVSS, the converted accuracy of the channel not guaranteed. When an over-voltage is applied to a pin ADCAnIm and at the same pin the ADC selfdiagnosis (diagnosis of channel multiplexer) is executed an offset voltage to the diagnosis voltage can be measured.**

**When ADCAnDGCTL1 include the pins over-voltage applied, self diagnosis show always over-voltage pin effect. For avoid this issue, ADCAnDGCTL1 should not select over-voltage applied pin.**

### 31.7.2 Notes on Application Design

**(1) Analog input pins (ADCAnIm, ADCAnImS)**

- Ensure that the input voltages on the ADCAnIm and ADCAnImS pins are within the specified ranges. We recommend using diodes with $V_F$ of 0.3V or below to form a clamp to avoid the input of voltages at or above AnVREF and at or below AnVSS. The results of conversion for input voltages at or above AnVREF and at or below AnVSS are undefined and so are not guaranteed. Input of such voltages can also affect the results of conversion on other channels.
- Reduce noise on the analog input pins (ADCAnIm and ADCAnImS) by connecting a resistor Re between the pins and the external sources of analog input signals for conversion and capacitor Ce to the AnVSS pins.
- Avoid analog signal lines crossing digital signal lines and vice versa, since this can introduce noise and reduce performance in A/D conversion.
- We recommend avoiding the driving of large currents through input and output pins near the ADCAnIm and ADCAnImS pins and toggled signals in particular should be kept away from these pins.
- If you are using the standby functions, confirm the stop of A/D conversion. Then, set the ADCAnSGCRx.TRGMD and ADCAnTHER.THkE bits, which are to be effective on standby, to 0.
- If you are using the LPS on ADCA0 (also when standby function is used), set the ADCA0SGCRx.TRGMD bit to 1 and the ADCA0SGTSELx.TxSEL bits to SEQTRG (LPS). For details, see **Section 15, Low-Power Sampler (LPS)**.
- Do not connect a channel to be used with the T&H function to an external analog multiplexer.
- Changes to physical and virtual channels during operation while the T&H function is in use is prohibited.
- Writing to PWM-Diag-related registers while PWM-Diag is not in use is prohibited.

### (2) Power Wiring

The following methods are recommended to minimize the influence of switching noise from digital circuits on A/D converter accuracy.

- Connect markedly thick wiring patterns to the mesh pattern or connect solid patterns to the power-supply lines.
- Insert bypass capacitors between power-supply pins (EVCC and AnVREF) and ground pins (EVSS and AnVSS).
- We recommend separating the analog power supply (AnVREF) from the digital power supplies (EVCC) and providing the voltages from a series regulator. If the analog power supply is to come from the same source as that of the digital power supplies, wire the analog and digital power supplies to an electrolytic capacitor, and provide separate wiring patterns on the board.
  We also recommend inserting a chip inductor in the input for the analog power supply.
  Furthermore, earth the analog and digital grounds to the same point on an electrolytic capacitor, and provide separate wiring patterns for the grounds on the board.
  The analog power supply also serves as the analog reference voltage for this product.

### (3) Variation in A/D converted data

The effects of noise and variations in the power supply voltages lead to dispersal of the results of A/D conversion. Furthermore, noise on the analog input pins (ADCAnIm and ADCAnImS) or on the reference voltage input pins (AnVREF and AnVSS) can lead to the results of A/D conversion being incorrect.

Apply software processing to avoid ill effects on the system of fluctuations in or incorrectness of the results of A/D conversion.

Examples of software handling are described below.

- Use averaged values from several rounds of A/D conversion
- Execute A/D conversion for several time and omit extreme results
- Repeat the processing for abnormalities to check for repeated abnormalities in the case of results of A/D conversion which will cause malfunctions of the system.

There is a possibility that A/D conversion accuracy of high priority SG become worse when following both conditions are applicable.

(1) During the A/D conversion of low priority SG (e.g. SG1), conversion trigger of the high priority SG (e.g. SG3) occur.

(2) The channel T&H function of high priority SG (e.g. SG3) is enabled.

The above case is one of an example of SG combination. The SG priority is SG4 > SG3 > SG2 > SG1. The fluctuation of conversion error depends on the external circuit and devices mounted on the customer board.

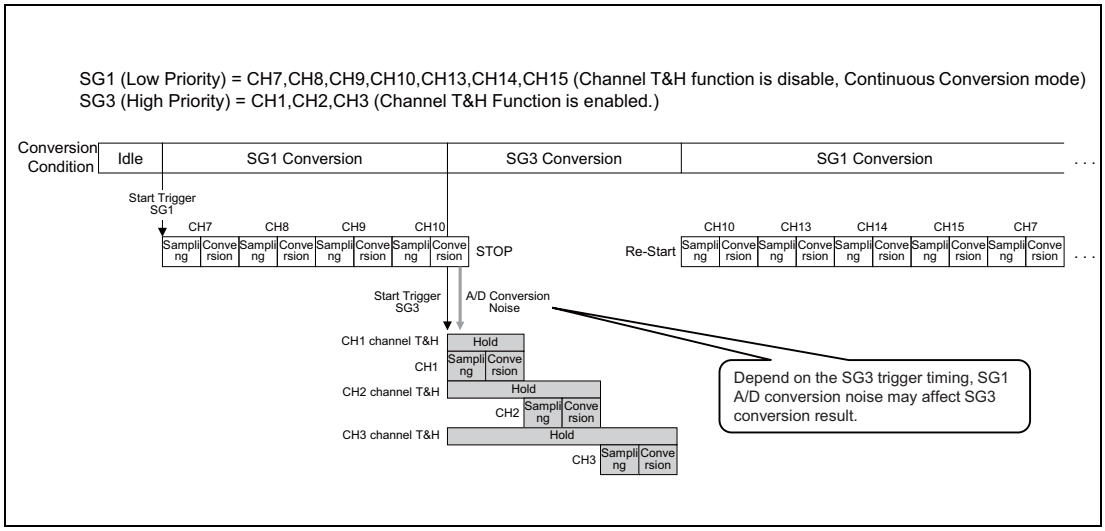

**Figure 31.38 SG priority**

Examples of software handling are described below.

- Low priority SG (e.g. SG1) A/D conversion have to be finished 3 ADCLK before the conversion trigger of high priority SG (e.g. SG3), if the SG3 contains the channels which channel T&H is available.
- If there is a case that high priority SG (e.g. SG3) conversion trigger occur during the conversion of low priority SG (e.g. SG1), disable the high priority SG channel T&H function.
- If the both conditions mentioned in previous page need to be used, adjust high priority SG (e.g. SG3) conversion trigger timing to synchronize with the following timing (the period shown by arrowed line in the following figure) during A/D conversion of low priority SG (e.g. SG1).

Even if trigger timing is adjusted above recommendation time, conversion error specified in Data Sheet cannot be removed.

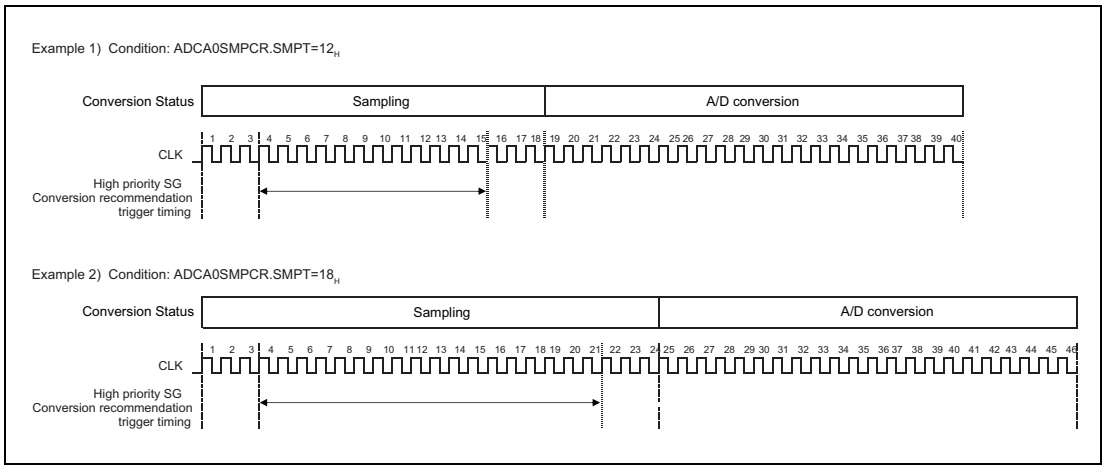

**Figure 31.39 SG conversion trigger timing**

When it is not possible to use the above 3 software handlings, following process is recommended.

- Doing A/D conversion several times and using average of several A/D conversion results.

- Doing continuous A/D conversion several times, remove abnormal conversion result and use only the other results.

- When abnormal A/D conversion result is detected, not to proceed abnormal operation immediately, doing one more A/D conversion before proceeding abnormal operation.

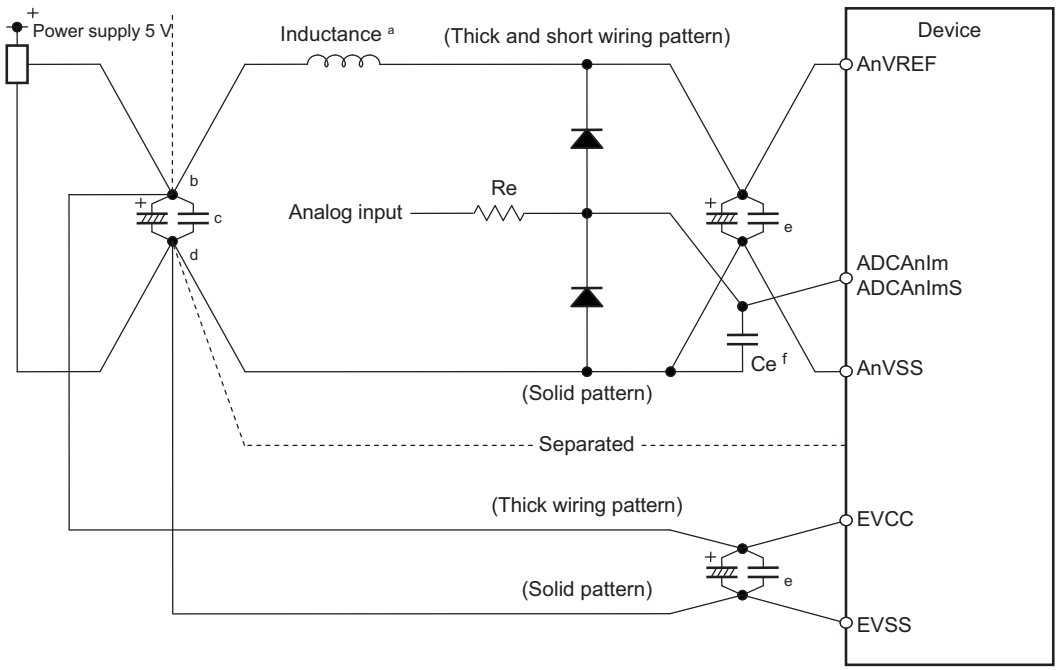
The effect of above process is depend on the external circuit and devices mounted on the customer board. Sufficient evaluation of the system is recommended.

### (4) Alternative Input/Output

Analog input (ADCAnIm, ADCAnImS) pins can be used as port pins.

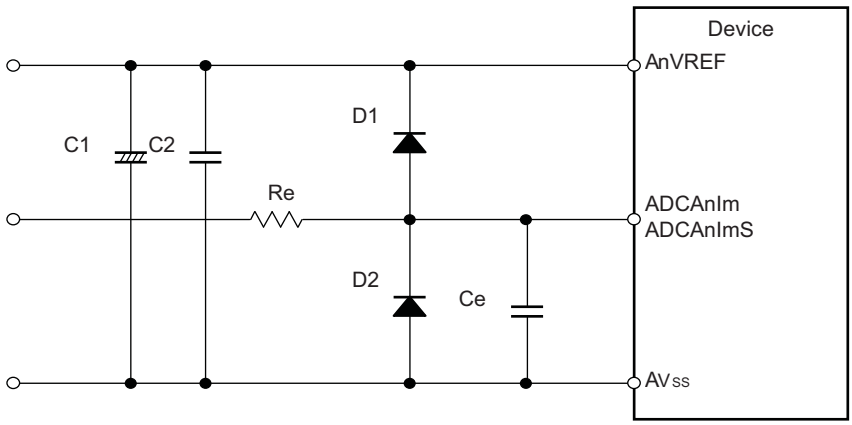
Do not read from input port pins or write to output port pins while an ADCAnIm or ADCAnImS pin function is selected and handling A/D conversion. Doing so may reduce the accuracy of conversion.

Fluctuations in output current from output port pins due to the effects of an external circuit connected to a port pin while A/D conversion is in progress may also reduce the accuracy of conversion. If digital pulses are applied to or digital pulses are output through a pin adjacent to a pin for which A/D conversion is in progress, the A/D converted value may not be as expected due to coupling noise. Accordingly, do not apply pulses to or output pulses from a pin adjacent to a pin for which A/D conversion is in progress.



a) Insert an inductor for the analog power input.
b) Wire the analog and digital supplies to a single point near the 5V power supply and provide separate wiring patterns on the board.
c) Place a bypass capacitor (electrolytic or laminated ceramic) near the common power supply.
d) Wire the analog and digital grounds to a single point near the power supplies, and provide separate wiring patterns for each on the board.
e) Place bypass capacitors (electrolytic or laminated ceramic) near the respective power supply pins.
f) Place capacitor Ce near the analog input pins of the device.

**Figure 31.40 Example of Power Wiring**



**Note:** C1: 4.7uF to 10uF
C2: 0.01uF to 0.1uF
Ce: 5 to 10nF
Re: 0 to 1kΩ
The values above are for reference.
D1, D2: $V_F \leq 0.3$ V

**Figure 31.41 Example of Noise Protection for Analog Input Circuit**

Capacitor C1 is effective for low-frequency noise, and capacitors C2 and Ce are effective for high-frequency noise.

The voltage on an AnVREF pin is undefined immediately after switching from the stopped state to the start of conversion operations, and this may have the effect of reducing the accuracy of conversion. As a countermeasure for this situation, connect capacitors C1 and C2 to the AnVREF pins.

# Section 32 Key Return (KR)

This section contains a generic description of the Key Return (KR) function.

The first part in this section describes the RH850/F1K specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the KR.

## 32.1 Features of RH850/F1K KR

### 32.1.1 Number of Units and Channels

This microcontroller has the following number of KR units.

**Table 32.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | | |
| Name | KRn (n = 0) | | |

The KR unit has the Key Return function of the following number of channels.

**Table 32.2 KRn Unit Configurations and Channels**

| Unit Name (Channel Name) KRn | No. of Channels | RH850/F1K 100 pins (8 ch) | RH850/F1K 144 pins (8 ch) | RH850/F1K 176 pins (8 ch) |
|---|---|---|---|---|
| KR0 | 8 | √ | √ | √ |

**Table 32.3 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual KR units are identified by the index “n” (n = 0); for example, KRnKRM indicates the key return mode register. |
| m | Throughout this section, the individual KR channels are identified by the index “m” (m = 0 to 7); for example, KRnKRMm indicates the key input enable bit of KRnKRM (key return mode register). |

### 32.1.2 Register Base Address

KRn base addresses are listed in the following table.

KRn register addresses are given as offsets from the base addresses.

**Table 32.4 Register Base Address**

| Base Address Name | Base Address |
|---|---|
| <KR0_base> | FFF7 $8000_H$ |

### 32.1.3 Clock Supply

The KRn clock supply is shown in the following table.

**Table 32.5 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| KR0 | PCLK | CPUCLK4 | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CPUCLK4 | |

### 32.1.4 Interrupt Requests

KRn interrupt requests are listed in the following table:

**Table 32.6 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **KR0** | | | |
| INTKRn | Key interrupt | 90 | — |

### 32.1.5 Reset Sources

KRn reset sources are listed in the following table. KRn is initialized by these reset sources.

**Table 32.7 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| KR0 | All reset sources (ISORES) |

### 32.1.6 External Input/Output Signals

External input/output signals of KRn are listed below.

**Table 32.8 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **KR0** | | |
| KRnTPKR7 to KRnTPKR0 | Key input signal | KR0I7 to KR0I0 |

## 32.2 Overview

### 32.2.1 Functional Overview

The Key Return function has the following features:

A key interrupt request signal (INTKRn) can be generated by inputting a falling signal, that goes from high to low, to any of the eight key input pins (KRnTPKR7 to KRnTPKR0).

### 32.2.2 Block Diagram

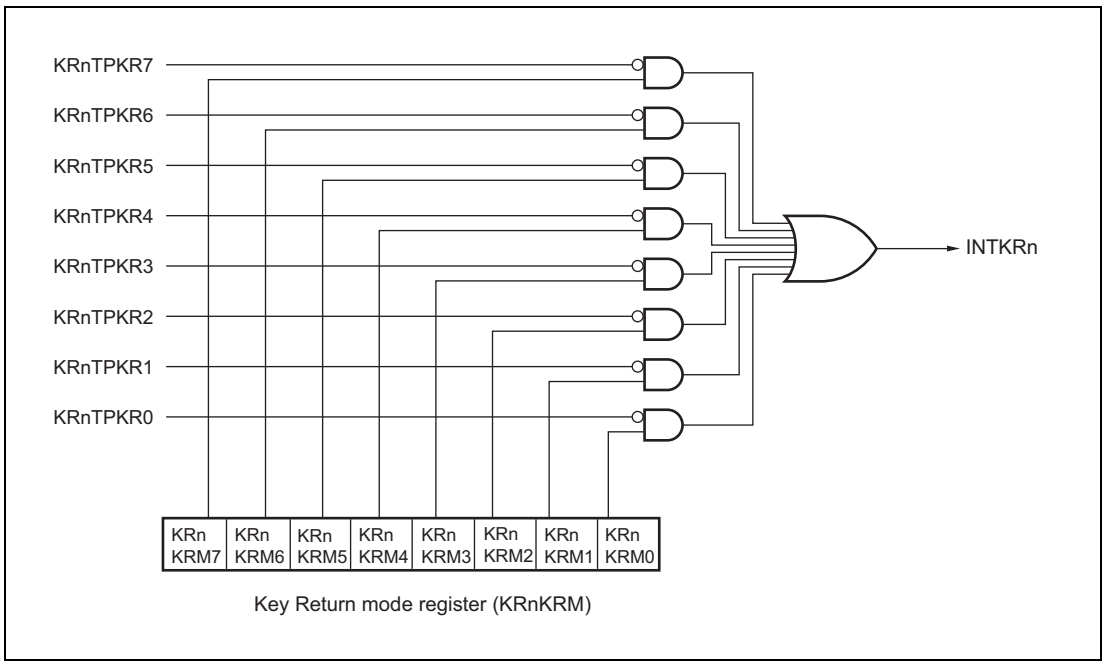


**Figure 32.1 Block Diagram of the Key Return Function**

# 32.3 Registers

## 32.3.1 List of Registers

KR registers are listed in the following table.

For details about <KRn_base>, see **Section 32.1.2, Register Base Address**.

**Table 32.9 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| KRn | Key return mode register | KRnKRM | <KRn_base> |

## 32.3.2 KRnKRM — Key Return Mode Register

This register enables/disables the key input signal detection.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** <KRn_base>

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | KRnKRM7 | KRnKRM6 | KRnKRM5 | KRnKRM4 | KRnKRM3 | KRnKRM2 | KRnKRM1 | KRnKRM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 32.10 KRnKRM - Key Return Mode Register Contents**

| Bit position | Bit name | Function |
|---|---|---|
| 7 to 0 | KRnKRMm | Enables/disables the key input signal detection.<br>0: Disabled<br>1: Enabled |

## 32.4 Operation

### 32.4.1 Interrupt Request INTKRn

The interrupt request INTKRn is generated when the level of the corresponding key input pin KRnTPKRm is changed from high to low while input to the key input pin KRnTPKRm is enabled (KRnKRM.KRnKRMm = 1).

**Figure 32.2** shows how the interrupt request is generated:

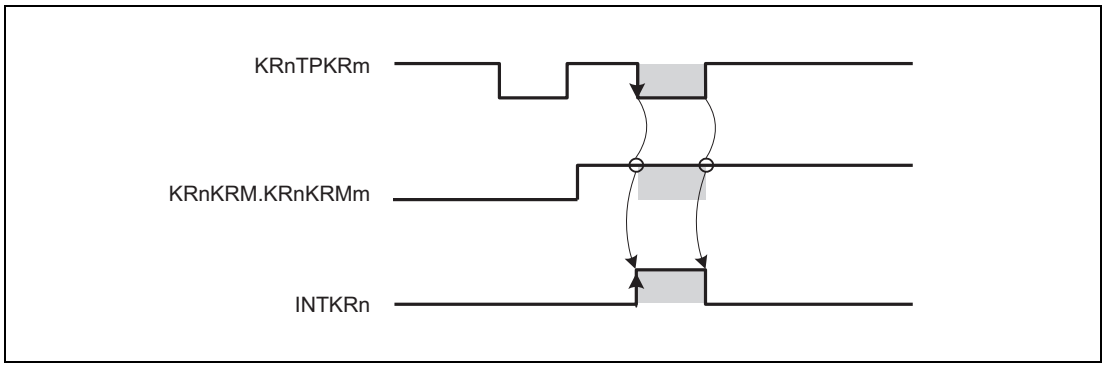

**Figure 32.2 Interrupt Request Generation**

**CAUTIONS**

1. **The change of a key input pin (KRnTPKRm) level from high to low does not trigger another INTKRn if any of the key return input pins are already low. The next INTKRn is only triggered by a key input pin level changing from high to low if all other key input pins are high.**
2. **If the key input value changes at the same time the setting of KRnKRM.KRnKRMm is changed, an unintended key interrupt request INTKRn might be generated. Therefore, mask (disable) INTKRn of the interrupt controller before changing KRnKRM.KRnKRMm from 0 to 1, or from 1 to 0.**

# Section 33 Functional Safety

This section provides an overview of the safety mechanisms included in the RH850/F1K Series.

This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.

For more information about the development process and safety mechanisms, please contact our sales office.

The following are the failure detection functions provided by this microcontroller.

## 33.1 Overview

### ECC

Detects failures of memories and data transfer paths and corrects some types of failures.

### Memory Protection

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

### Clock Monitor

Monitors the clock operation to detect abnormal operations.

For details, see **Section 13, Clock Monitor (CLMA)**.

### Data CRC

Generates CRC to detect data errors.

For details, see **Section 34, Data CRC (DCRA)**.

### Write-Protected Registers

The write-protected registers are protected from inadvertent write access due to erroneous program execution.

For details, see **Section 5, Write-Protected Registers**.

# 33.2 ECC

## 33.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

**Table 33.1 ECC Overview**

| Applicable Memory | | Applicable Data Width [bits] | Operation upon Error Detection | | | | | Failure Insertion |
|---|---|---|---|---|---|---|---|---|
| | | | Detection/ Correction | SYSERR | Interrupt Notice | Error Status | Address Capture | |
| Code flash | | 128 | SEC-DED | DED*2 | SEC-DED | Possible | Possible | Possible |
| Data flash | | 32 | SEC-DED | — | SEC-DED | Possible | Possible | Possible |
| Local RAM (CPU1/Self)<br>Retention RAM (CPU1/Self) | | 32 | SEC-DED | DED*2 | SEC-DED | Possible | Possible | Possible |
| Peripheral RAM*1 | CSIH | 32 | SEC-DED | — | SEC-DED | Possible | Possible | Possible |
| | RSCAN, CAN FD | 32 | SEC-DED | — | SEC-DED | Possible | Possible | Possible |

Note 1. For details of ECC for each peripheral IP, see the corresponding sections below.
- RS-CAN RAM: **Section 21.12, Detection and Correction of Errors in RS-CAN0 RAM** and **Section 21.23, Detection and Correction of Errors in RS-CAN RAM**
- CSIHnRAM: **Section 17.7, Detection and Correction of Errors in CSIHn RAM**

Note 2. For details, see **Section 33.2.2.2, Interrupt Requests** and **Section 33.2.4.2, Interrupt Requests**.

### Applicable Data Width

This is the data width to be ECC encoded.

To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).

(1) Reading data to be ECC-encoded including data to be rewritten

(2) Replacing data to be rewritten

(3) Writing back data generated in (2)

### Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected.

SED-DED: 1-bit errors and 2-bit errors can only be detected.

### SYSERR

SYSERR can be generated upon error detection.

### Interrupt Notice

An interrupt can be generated upon error detection.

### Error Status

The status of a detected error is retained.

### Address Capture

The address of a detected error is retained.

### Failure Insertion

Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

## 33.2.2 Code Flash ECC

### 33.2.2.1 Overview

RH850/F1K has two code flash ECC decoder circuits implemented, one inside the Processor Element (PE1) and one on the VCI (system interconnect).

**Figure 33.1** shows the location of two ECC decoders for the code flash.

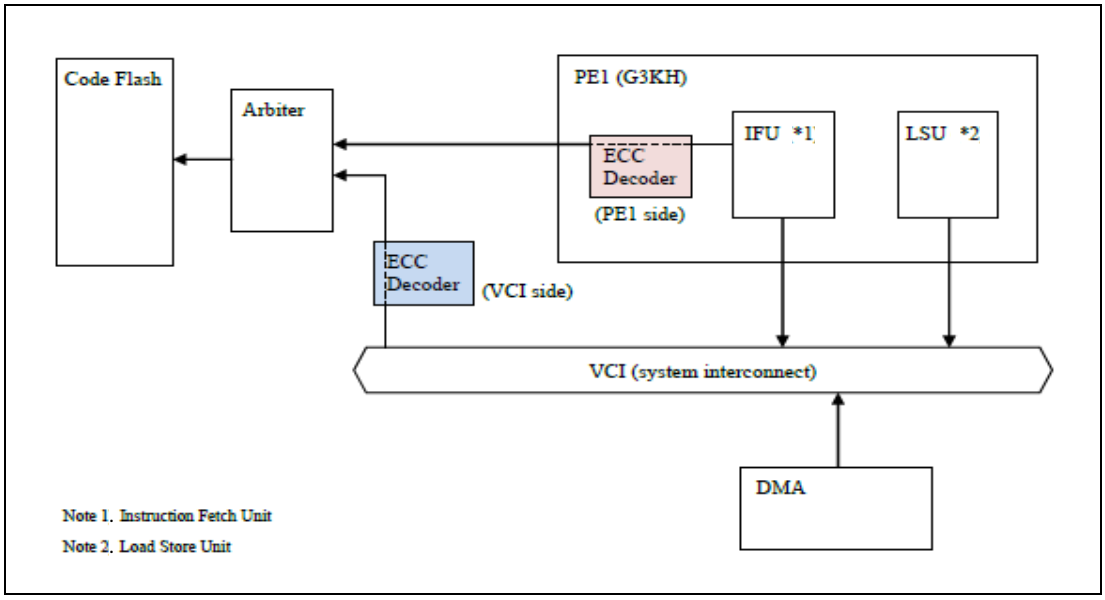

**Figure 33.1 Block Diagram of Code Flash ECC**

The code flash ECC is summarized in the table below.

| Item | Description |
|---|---|
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled.<br>When enabled, either of the following settings can be selected.<br>• 2-bit error detection and 1-bit error detection/correction.<br>• 2-bit error detection / 1-bit error detection.<br>When disabled, neither error detection nor correction is carried out.<br>In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected. |
| Error notification | A notification is sent when an ECC error occurs.<br>**ECC error:**<br>• Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit errors is selectable. For details of the SYSERR, see **Section 3, CPU System**.<br>• Enabling or disabling of error notification in the case of detection of a 1-bit ECC error is selectable.<br>In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error.<br>However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed. |
| Error status | The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored.<br>The ECC 1-bit error status is set only when no error status has been set.<br>The ECC 2-bit error status is set even when the ECC 1-bit error status is set.<br>A register for clearing the error status is provided. |

| Item | Description |
|---|---|
| Address capture | When no ECC error status has been set, the address at which the first ECC error occurred is captured.<br>In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured. |
| Self-diagnosis | ROM data and the ECC bit can be read directly.<br>Arbitrary data can be written to ROM data and the ECC bit. |
| Inhibiting instruction execution | Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching avoids the execution of incorrect instructions. |

#### 33.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.

**Table 33.2 Code Flash ECC Interrupt Requests (During CPU Fetching)**

| Unit Interrupt Signal | Description | Name | DMA Trigger Number |
|---|---|---|---|
| — | ECC 1-bit error interrupt of code flash | INTECCSCFLI0 | — |
| — | ECC 2-bit error interrupt of code flash | SYSERR | — |

**Table 33.3 Code Flash ECC Interrupt Requests (During CPU Data Access)**

| Unit Interrupt Signal | Description | Name | DMA Trigger Number |
|---|---|---|---|
| — | ECC 1-bit error interrupt of code flash | INTECCSCFLI0 | — |
| — | ECC 2-bit error interrupt of code flash | INTECCSCFLI0 or SYSERR | — |

**Table 33.4 Code Flash ECC Interrupt Requests (During Bus Master Access except CPU)**

| Unit Interrupt Signal | Description | Name | DMA Trigger Number |
|---|---|---|---|
| — | ECC 1-bit error interrupt of code flash | INTECCSCFLI0 | — |
| — | ECC 2-bit error interrupt of code flash | INTECCSCFLI0 | — |

### 33.2.2.3 List of Registers

Table 33.5 List of Registers

| Module Name | Register Name | Symbol*1 | Address |
|---|---|---|---|
| CFECC_VCI | Code flash ECC control register (VCI) | CFECCCTL_VCI | FFC6 2200$_H$ |
| | Code flash error information control register (VCI) | CFERRINT_VCI | FFC6 2204$_H$ |
| | Code flash status clear register (VCI) | CFSTCLR_VCI | FFC6 2208$_H$ |
| | Code flash error count overflow status register (VCI) | CFOVFSTR_VCI | FFC6 220C$_H$ |
| | Code flash 1st error status register (VCI) | CF1STERSTR_VCI | FFC6 2210$_H$ |
| | Code flash 1st error address register (VCI) | CF1STEADR0_VCI | FFC6 2250$_H$ |
| CFECC_CPU1 | Code flash ECC control register (PE1) | CFECCCTL_PE1 | FFC6 2400$_H$ |
| | Code flash error information control register (PE1) | CFERRINT_PE1 | FFC6 2404$_H$ |
| | Code flash status clear register (PE1) | CFSTCLR_PE1 | FFC6 2408$_H$ |
| | Code flash error count overflow status register (PE1) | CFOVFSTR_PE1 | FFC6 240C$_H$ |
| | Code flash 1st error status register (PE1) | CF1STERSTR_PE1 | FFC6 2410$_H$ |
| | Code flash 1st error address register (PE1) | CF1STEADR0_PE1 | FFC6 2450$_H$ |
| CFECC_VCI | Code flash sub-test control register (VCI) | CFSTSTCTL_VCI | FFC6 2350$_H$ |
| CFECC_CPU1 | Code flash sub-test control register (PE1) | CFSTSTCTL_PE1 | FFC6 2550$_H$ |

Note 1. The registers suffixed with symbols "_VCI" and "_PE1" are provided to ECC controllers corresponding to each access port: registers with "_VCI" are provided to the ECC controller for access from the system interconnect 1 to the code flash and registers with "_PE1" are provided to the ECC controller for access from the CPU1.

### 33.2.2.4 Details of Registers

#### (1) CFECCCTL_VCI/PE1 — Code Flash ECC Control Register

CFECCCTL_VCI/PE1 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFECCCTL_VCI/PE1, PROT1 and PROT0 need to be $01_B$.

**Access:** CFECCCTL_VCI and CFECCCTL_PE1 can be read or written in 32-bit units.
CFECCCTL_VCIL and CFECCCTL_PE1L can be read or written in 16-bit units.

**Address:** CFECCCTL_VCI: FFC6 $2200_H$
CFECCCTL_VCIL: FFC6 $2200_H$
CFECCCTL_PE1: FFC6 $2400_H$
CFECCCTL_PE1L: FFC6 $2400_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 33.6 CFECCCTL_VCI/PE1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFECCCTL. |
| 14 | PROT0 | |
| 13 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | 1-Bit Error Correction Disable<br>Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).<br>0: Enables correction of a 1-bit error upon detection.<br>1: Disables correction of a 1-bit error upon detection. |
| 0 | ECCDIS | ECC Disable<br>Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).<br>0: Enables ECC error detection and correction.<br>1: Disables ECC error detection and correction. |

### (2) CFERRINT_VCI/PE1 — Code Flash Error Information Control Register

CFERRINT_VCI/PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** CFERRINT_VCI and CFERRINT_PE1 can be read or written in 32-bit units.
CFERRINT_VCIL and CFERRINT_PE1L can be read or written in 16-bit units.
CFERRINT_VCILL and CFERRINT_PE1LL can be read or written in 8-bit units.

**Address:** CFERRINT_VCI: FFC6 2204$_H$
CFERRINT_VCIL: FFC6 2204$_H$
CFERRINT_VCILL: FFC6 2204$_H$
CFERRINT_PE1: FFC6 2404$_H$
CFERRINT_PE1L: FFC6 2404$_H$
CFERRINT_PE1LL: FFC6 2404$_H$

**Value after reset:** 0000 0003$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.7 CFERRINT_VCI/PE1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE*1 | ECC 2-Bit Error Notification Enable<br>Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled.<br>0: Disables notification of the ECC 2-bit error.<br>1: Enables notification of the ECC 2-bit error. |
| 0 | SEDIE | ECC 1-Bit Error Notification Enable<br>Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled.<br>0: Disables notification of the ECC 1-bit error.<br>1: Enables notification of the ECC 1-bit error. |

Note 1. This bit is not supported in CFERRINT_PE1. When writing to this bit in CFERRINT_PE1, always write 1.

Note 2. Regarding the interrupt request, see the **33.2.2.2, Interrupt Requests**.

### (3) CFSTCLR_VCI/PE1 — Code Flash Status Clear Register

CFSTCLR_VCI/PE1 clears the error flags in the error status register (CF1STERSTR_VCI/PE1), the overflow flag in the error overflow status register (CFOVFSTR_VCI/PE1), and the error address register (CF1STEADR0_VCI/PE1).

**Access:** CFSTCLR_VCI and CFSTCLR_PE1 are write-only registers that can be written in 32-bit units.
CFSTCLR_VCIL and CFSTCLR_PE1L are write-only registers that can be written in 16-bit units.
CFSTCLR_VCILL and CFSTCLR_PE1LL are write-only registers that can be written in 8-bit units.

**Address:** CFSTCLR_VCI: FFC6 2208$_H$
CFSTCLR_VCIL: FFC6 2208$_H$
CFSTCLR_VCILL: FFC6 2208$_H$
CFSTCLR_PE1: FFC6 2408$_H$
CFSTCLR_PE1L: FFC6 2408$_H$
CFSTCLR_PE1LL: FFC6 2408$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | STCLR0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W |

**Table 33.8 CFSTCLR_VCI/_PE1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | STCLR0 | Error Status Clear<br>0: No effect (Setting 0 does not affect the DEDF0 and SEDF0 flags in CF1STERSTR; ERROVF0 flag in CFOVFSTR; and CF1STEADR0.)<br>1: Writing 1 to this bit clears the DEDF0 and SEDF0 flags in CF1STERSTR; ERROVF0 flag in CFOVFSTR; and CF1STEADR0. |

### (4) CFOVFSTR_VCI/PE1 — Code Flash Error Count Overflow Status Register

CFOVFSTR_VCI/PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

**Access:** CFOVFSTR_VCI and CFOVFSTR_PE1 are read-only registers that can be read in 32-bit units.
CFOVFSTR_VCIL and CFOVFSTR_PE1L are read-only registers that can be read in 16-bit units.
CFOVFSTR_VCILL and CFOVFSTR_PE1LL are read-only registers that can be read in 8-bit units.

**Address:** CFOVFSTR_VCI: FFC6 220C$_H$
CFOVFSTR_VCIL: FFC6 220C$_H$
CFOVFSTR_VCILL: FFC6 220C$_H$
CFOVFSTR_PE1: FFC6 240C$_H$
CFOVFSTR_PE1L: FFC6 240C$_H$
CFOVFSTR_PE1LL: FFC6 240C$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ERROVF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.9 CFOVFSTR_VCI/PE1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | ERROVF0 | Error Overflow Flag<br>ERROVF0 shows whether a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register has occurred, except when both of the error address and source of the second error are the same as those of the first error.<br>0: Did not occur.<br>1: Occurred.<br><br>Clearing condition: Set the STCLR0 bit in CFSTCLR to 1. |

### (5) CF1STERSTR_VCI/PE1 — Code Flash 1st Error Status Register

CF1STERSTR_VCI/PE1 monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

**Access:** CF1STERSTR_VCI and CF1STERSTR_PE1 are read-only registers that can be read in 32-bit units.
CF1STERSTR_VCIL and CF1STERSTR_PE1L are read-only registers that can be read in 16-bit units.
CF1STERSTR_VCILL and CF1STERSTR_PE1LL are read-only registers that can be read in 8-bit units.

**Address:** CF1STERSTR_VCI: FFC6 2210$_H$
CF1STERSTR_VCIL: FFC6 2210$_H$
CF1STERSTR_VCILL: FFC6 2210$_H$
CF1STERSTR_PE1: FFC6 2410$_H$
CF1STERSTR_PE1L: FFC6 2410$_H$
CF1STERSTR_PE1LL: FFC6 2410$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DEDF0 | SEDF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.10 CF1STERSTR_VCI/PE1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | DEDF0 | ECC 2-Bit Error Monitor Flag<br>0: ECC 2-bit error is not detected.<br>1: ECC 2-bit error is detected.<br>Clearing condition: Set the STCLR0 bit in CFSTCLR to 1.<br>Setting condition: ECC 2-bit error is detected when DEDF0 is 0. |
| 0 | SEDF0 | ECC 1-Bit Error Monitor Flag<br>0: ECC 1-bit error is not detected.<br>1: ECC 1-bit error is detected when DEDF0 flag is 0.<br>Clearing condition:<br>Set the STCLR0 bit in CFSTCLR to 1.<br>Setting condition:<br>ECC 1-bit error is detected when DEDF0, SEDF0 are 0. |

### (6) CF1STEADR0_VCI/PE1 — Code Flash 1st Error Address Register

CF1STEADR0_VCI/PE1 holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STERSTR register is cleared by an internal reset, external reset, or by setting the STCLR bit in the CFSTCLR register to 1.

**Access:** CF1STEADR0_VCI and CF1STEADR0_PE1 are read-only registers that can be read in 32-bit units.
CF1STEADR0_VCIL, CF1STEADR0_VCIH, CF1STEADR0_PE1L and CF1STEADR0_PE1H are read-only registers that can be read in 16-bit units.
CF1STEADR0_VCILL, CF1STEADR0_VCILH, CF1STEADR0_VCIHL, CF1STEADR0_VCIHH, CF1STEADR0_PE1LL, CF1STEADR0_PE1LH, CF1STEADR0_PE1HL and CF1STEADR0_PE1HH are read-only registers that can be read in 8-bit units.

**Address:** CF1STEADR0_VCI: FFC6 2250$_H$
CF1STEADR0_VCIL: FFC6 2250$_H$
CF1STEADR0_VCIH: FFC6 2252$_H$
CF1STEADR0_VCILL: FFC6 2250$_H$
CF1STEADR0_VCILH: FFC6 2251$_H$
CF1STEADR0_VCIHL: FFC6 2252$_H$
CF1STEADR0_VCIHH: FFC6 2253$_H$
CF1STEADR0_PE1: FFC6 2450$_H$
CF1STEADR0_PE1L: FFC6 2450$_H$
CF1STEADR0_PE1H: FFC6 2452$_H$
CF1STEADR0_PE1LL: FFC6 2450$_H$
CF1STEADR0_PE1LH: FFC6 2451$_H$
CF1STEADR0_PE1HL: FFC6 2452$_H$
CF1STEADR0_PE1HH: FFC6 2453$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.11 CF1STEADR0_VCI/PE1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 25 | Reserved | When read, the value after reset is returned. |
| 24 to 4 | EADR[24:4] | 1st Error Address<br>Monitors the address of the first error.<br>The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated.<br>Clearing condition:<br>Set the STCLR0 bit in CFSTCLR to 1. |
| 3 to 0 | Reserved | When read, the value after reset is returned. |

### (7) CFSTSTCTL_VCI/PE1 — Code Flash Sub-Test Control Register

CFSTSTCTL_VCI/PE1 is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly.

When writing to CFSTSTCTL_VCI/PE1, PROT1 and PROT0 need to be $01_B$.

**Access:** CFSTSTCTL_VCI and CFSTSTCTL_PE1 can be read or written in 32-bit units.
CFSTSTCTL_VCIL and CFSTSTCTL_PE1L can be read or written in 16-bit units.

**Address:** CFSTSTCTL_VCI: FFC6 $2350_H$
CFSTSTCTL_VCIL: FFC6 $2350_H$
CFSTSTCTL_PE1: FFC6 $2550_H$
CFSTSTCTL_PE1L: FFC6 $2550_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PROT1 | PROT0 | — | — | — | — | — | — | — | — | — | — | — | — | — | ECCTST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 33.12 CFSTSTCTL_VCI/PE1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCTST bit.<br>The value written is not retained. These bits are always read as 0.<br>Set (PROT1, PROT0) = (0, 1) when writing to CFSTSTCTL. |
| 14 | PROT0 | |
| 13 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ECCTST | ECC Test<br>After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). |

Correctly reading instructions from the code flash access port is not possible while ECC test mode is selected (ECCTST = 1). While the access port for the CPU is set to test mode (including during changes to the value of the ECCTST bit), the CPU must run a program from the local RAM or retention RAM and must not fetch instructions from the code flash memory.

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see **Section 3, CPU System**.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of reading code flash are as follows:

**Table 33.13 Results of Reading Code Flash**

| Bit Number | Meaning | Bit Position | Description |
|---|---|---|---|
| bit[31:10] | all-0 | 31 to 10 | These bits are always 0. |
| bit[9] | Reserved | 9 | Unknown |
| bit[8:0] | ECC bits | 8 to 0 | ECC bits |

## 33.2.3 Data Flash ECC

### 33.2.3.1 Overview

The data flash ECC is summarized in the table below.

| Item | Description |
|---|---|
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled.<br>When enabled, either of the following settings can be selected.<br>• 2-bit error detection / 1-bit error detection and correction.<br>• 2-bit error detection / 1-bit error detection.<br>When disabled, neither error detection nor correction is carried out.<br>In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected. |
| Error notification | A notification is sent when an ECC error occurs.<br>• It is notified to the interrupt controller. Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable.<br>• Enabling or disabling of error notification in the case of detection of ECC 2-bit errors is selectable.<br>In the initial state, error notification is enabled upon detection of an ECC 2-bit error and error notification is disabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the Interrupt Controller, an interrupt processing is not executed. |
| Error status | The detection of ECC 2-bit errors and ECC 1-bit errors is can be monitored.<br>The function is set only while no error status is set.<br>A register for clearing the error status is provided. |
| Address capture | When no ECC error status has been set, the address at which the first ECC error occurred is captured. ECC error address is captured when both SEDF and DEDF of DFERSTR are 0. |
| Self-diagnosis | ROM data and the ECC bit can be read directly.<br>Arbitrary data can be written to ROM data and the ECC bit. |

### 33.2.3.2 Interrupt Requests

The interrupt requests for data flash ECC are shown below.

**Table 33.14 Data Flash ECC Interrupt Requests (During Read Access)**

| Unit Interrupt Signal | Description | Name | DMA Trigger Number |
|---|---|---|---|
| — | ECC 1-bit error interrupt of data flash | INTECCDEEP0 | — |
| — | ECC 2-bit error interrupt of data flash | INTECCDEEP0 | — |

#### 33.2.3.3 List of Registers

Table 33.15 List of Registers

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| DFECC | Data flash ECC control register | DFECCCTL | FFC6 2A00$_H$ |
| | Data flash error status register | DFERSTR | FFC6 2A04$_H$ |
| | Data flash error status clear register | DFERSTC | FFC6 2A08$_H$ |
| | Data flash error overflow status register | DFOVFSTR | FFC6 2A0C$_H$ |
| | Data flash error overflow status clear register | DFOVFSTC | FFC6 2A10$_H$ |
| | Data flash error notification control register | DFERRINT | FFC6 2A14$_H$ |
| | Data flash 1st error address register | DFEADR | FFC6 2A18$_H$ |
| | Data flash test control register | DFTSTCTL | FFC6 2A1C$_H$ |

### 33.2.3.4 Details of Registers

#### (1) DFECCCTL — Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCCTL, PROT1 and PROT0 need to be $01_B$.

**Access:** DFECCCTL can be read or written in 16-bit units.

**Address:** DFECCCTL: FFC6 $2A00_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PROT1 | PROT0 | — | — | — | — | — | — | — | — | — | — | — | — | SEDDIS | ECCDIS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 33.16 DFECCCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | PROT1 | Enables or disables modification of the ECCDIS and SEDDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCCTL. |
| 14 | PROT0 | |
| 13 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SEDDIS | 1-Bit Error Correction Disable<br>Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).<br>0: Enables correction of a 1-bit error upon detection.<br>1: Disables correction of a 1-bit error upon detection. |
| 0 | ECCDIS | ECC Disable<br>Enables or disables ECC error detection and correction.<br>Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).<br>In the initial state, ECC error detection and correction are enabled.<br>0: Enables ECC error detection and correction.<br>1: Disables ECC error detection and correction. |

### (2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.

The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

**Access:** DFERSTR is a read-only register that can be read in 8-bit units.

**Address:** DFERSTR: FFC6 2A04$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | DEDF | SEDF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 33.17 DFERSTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | DEDF | ECC 2-Bit Error Monitor Flag<br>0: An ECC 2-bit error is not detected.<br>1: An ECC 2-bit error is detected.<br><br>Clearing condition:<br>Set the ERRCLR bit in DFERSTC to 1.<br>Setting condition:<br>ECC 2-bit error is detected when both SEDF and DEDF are 0. |
| 0 | SEDF | ECC 1-Bit Error Monitor Flag<br>0: An ECC 1-bit error is not detected.<br>1: An ECC 1-bit error is detected.<br><br>Clearing condition:<br>Set the ERRCLR bit in DFERSTC to 1.<br>Setting condition:<br>ECC 1-bit error is detected when both SEDF and DEDF are 0. |

### (3) DFERSTC — Data Flash Error Status Clear Register

DFERSTC clears the error flags in the data flash error status register.

**Access:** DFERSTC is a write-only register that can be written in 8-bit units.

**Address:** DFERSTC: FFC6 2A08$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | ERRCLR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 33.18 DFERSTC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | ERRCLR | SEDF/DEDF Flag Clear<br>0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in DFERSTR.)<br>1: The SEDF/DEDF flag in DFERSTR is cleared. |

### (4) DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of data flash error overflow.

**Access:** DFOVFSTR is a read-only register that can be read in 8-bit units.

**Address:** DFOVFSTR: FFC6 2A0C$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | ERROVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 33.19 DFOVFSTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | ERROVF | Error Overflow Flag<br>ERROVF is set if an ECC error occurs while the error address register is full.<br>0: Did not occur.<br>1: Occurred.<br>Clearing condition:<br>Set the ERROVFCLR bit in data flash error overflow status clear register. |

### (5) DFOVFSTC — Data Flash Error Overflow Status Clear Register

DFOVFSTC clears the data flash error overflow flag.

**Access:** DFOVFSTC is a write-only register that can be written in 8-bit units.

**Address:** DFOVFSTC: FFC6 2A10$_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | ERROVFCLR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

**Table 33.20 DFOVFSTC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | ERROVFCLR | Error Overflow Flag Clear<br>0: No effect (Setting the ERROVFCLR bit to 0 does not affect the ERROVF flag in DFOVFSTR.)<br>1: The ERROVF flag in DFOVFSTR is cleared. |

### (6) DFERRINT — Data Flash Error Notification Control Register

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** DFERRINT can be read or written in 8-bit units.

**Address:** DFERRINT: FFC6 2A14$_H$

**Value after reset:** $02_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | DEDIE | SEDIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 33.21 DFERRINT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE | ECC 2-Bit Error Notification Control<br>Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled.<br>0: Disables notification of the ECC 2-bit error.<br>1: Enables notification of the ECC 2-bit error. |
| 0 | SEDIE | ECC 1-Bit Error Notification Control<br>Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled.<br>0: Disables notification of the ECC 1-bit error.<br>1: Enables notification of the ECC 1-bit error. |

### (7) DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0.

**Access:** DFEADR is a read-only register that can be read in 32-bit units.

**Address:** DFEADR: FFC6 2A18$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | DFEADR[20:16] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DFEADR[15:2] | | | | | | | | | | | | | | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.22 DFEADR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 21 | Reserved | When read, the value after reset is returned. |
| 20 to 2 | DFEADR[20:2] | ECC Error Address<br>DFEADR is read-only field to monitor the address at which an ECC error has occurred.<br>This register holds an internal address.<br>Convert it to the actual address by adding the data flash base address FF20 0000$_H$. |
| 1 to 0 | Reserved | When read, the value after reset is returned. |

### (8) DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for the ECC test.

After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read.

When writing to DFTSTCTL, PROT1 and PROT0 need to be $01_B$.

**Access:** DFTSTCTL can be read or written in 16-bit units.

**Address:** FFC6 2A1C$_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PROT1 | PROT0 | — | — | — | — | — | — | — | — | — | — | — | — | — | ECCTST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 33.23 DFTSTCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | PROT1 | Enables or disables modification of the ECCTST bit.<br>The value written is not retained. These bits are always read as 0.<br>Set (PROT1, PROT0) = (0, 1) when writing to DFTSTCTL. |
| 14 | PROT0 | |
| 13 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ECCTST | ECC Test<br>Sets ECC test mode.<br>Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). |

## 33.2.4 Local RAM (Including the Retention RAM) ECC

### 33.2.4.1 Overview

**CAUTION**

**The retention RAM is a part of the local RAM. The ECC for the retention RAM is shared with the local RAM. Therefore, use for the retention RAM the same register as that for the local RAM.**

Local RAM ECC of CPU1 is summarized in the table below.

| Item | Description |
|---|---|
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled.<br>When enabled, either of the following settings can be selected.<br>• 2-bit error detection and 1-bit error detection/correction.<br>• 2-bit error detection and 1-bit error detection.<br>When disabled, neither error detection nor correction is carried out.<br>In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected. |
| Error notification | A notification is sent when an ECC error occurs.<br>**ECC error:**<br>• Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit errors is selectable. For details of the SYSERR, see **Section 3, CPU System**.<br>• Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable.<br>In the initial state, notification of the 2-bit error is enabled and notification of the 1-bit error is enabled. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed. |
| Error status | The detection of ECC 2-bit errors and ECC 1-bit errors is can be monitored.<br>The function is set only while no error status is set.<br>A register for clearing the error status is provided. |
| Address capture | When no error status has been set, the address at which the first error occurred is captured.<br>In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured. |
| Self-diagnosis | Arbitrary data can be written to RAM data and the ECC bit.<br>RAM data and the ECC bit can be read directly. |
| Others | Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions. |

**CAUTION**

**When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.**

**Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.**

#### 33.2.4.2 Interrupt Requests

Local RAM ECC interrupt requests are listed below.

**Table 33.24 Local RAM ECC Interrupt Requests (During CPU Access)**

| Unit Interrupt Signal | Description | Name | DMA Trigger Number |
|---|---|---|---|
| — | ECC 1-bit error interrupt of RAM | INTECCRAM | — |
| — | ECC 2-bit error interrupt of RAM | INTECCRAM or SYSERR | — |

**Table 33.25 Local RAM ECC Interrupt Requests (During Read Access except CPU Access)**

| Unit Interrupt Signal | Description | Name | DMA Trigger Number |
|---|---|---|---|
| — | ECC 1-bit error interrupt of RAM | INTECCRAM | — |
| — | ECC 2-bit error interrupt of RAM | INTECCRAM | — |

### 33.2.4.3 List of Registers

Table 33.26 List of Registers

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| LRTST | Local RAM test control register (PE1) | LRTSTCTL_PE1 | FFC6 $5004_H$ |
| | Local RAM test data read buffer 0 (PE1) | LRTDATBF0_PE1 | FFC6 $5008_H$ |
| LRECC | Local RAM ECC control register (PE1) | LRECCCTL_PE1 | FFC6 $5400_H$ |
| | Local RAM error information control register (PE1) | LRERRINT_PE1 | FFC6 $5404_H$ |
| | Local RAM status clear register (PE1) | LRSTCLR_PE1 | FFC6 $5408_H$ |
| | Local RAM error count overflow status register (PE1) | LROVFSTR_PE1 | FFC6 $540C_H$ |
| | Local RAM 1st error status register (PE1) | LR1STERSTR_PE1 | FFC6 $5410_H$ |
| | Local RAM 1st error address register 0 (PE1) | LR1STEADR0_PE1 | FFC6 $5450_H$ |

### 33.2.4.4 Details of Registers

#### (1) LRTSTCTL_PE1 — Local RAM Test Control Register

LRTSTCTL is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits.

When writing to LRTSTCTL, PROT1 and PROT0 need to be $01_B$.

**Access:** LRTSTCTL_PE1 register can be read or written in 32-bit units.
LRTSTCTL_PE1L register can be read or written in 16-bit units.

**Address:** LRTSTCTL_PE1: FFC6 $5004_H$
LRTSTCTL_PE1L: FFC6 $5004_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PROT1 | PROT0 | — | — | — | — | — | — | — | — | — | — | — | — | ECCTST | DATSEL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 33.27 LRTSTCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCTST and DATSEL bits.<br>The value written is not retained. These bits are always read as 0.<br>Set (PROT1, PROT0) = (0, 1) when writing to LRTSTCTL. |
| 14 | PROT0 | |
| 13 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | ECC Test<br>After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). |
| 0 | DATSEL | Data Select<br>This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).<br>0: RAM data is selected.<br>1: The ECC bits are selected. |

**CAUTION**

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

### (2) LRTDATBF0_PE1 — Local RAM Test Data Read Buffer 0

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

**Access:** LRTDATBF0_PE1 register is a read only register that can be read in 32-bit units.

**Address:** FFC6 $5008_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | LRDATABF[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.28 LRTDATBF0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | LRDATABF [6:0] | These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register.<br>When reading from the local RAM, the ECC bits for the local RAM are stored in LRTDATABF[6:0]. |

### (3) LRECCCTL_PE1 — Local RAM ECC Control Register

LRECCCTL enables or disables ECC error detection and correction and 1-bit error correction.

When writing to LRECCCTL, PROT1 and PROT0 need to be $01_B$.

**Access:** LRECCCTL_PE1 register can be read or written in 32-bit units.
LRECCCTL_PE1L register can be read or written in 16-bit units.

**Address:** LRECCCTL_PE1: FFC6 $5400_H$
LRECCCTL_PE1L: FFC6 $5400_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PROT1 | PROT0 | — | — | — | — | — | — | — | — | — | — | — | — | SECDIS | ECCDIS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 33.29 LRECCCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRECCCTL. |
| 14 | PROT0 | |
| 13 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | 1-Bit Error Correction Disable<br>Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).<br>0: Enables correction of a 1-bit error upon detection.<br>1: Disables correction of a 1-bit error upon detection. |
| 0 | ECCDIS | ECC Disable<br>Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).<br>0: Enables ECC error detection and correction.<br>1: Disables ECC error detection and correction. |

### (4) LRERRINT_PE1 — Local RAM Error Information Control

LRERRINT enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** LRERRINT_PE1 register can be read or written in 32-bit units.
LRERRINT_PE1L register can be read or written in 16-bit units.
LRERRINT_PE1LL register can be read or written in 8-bit units.

**Address:** LRERRINT_PE1: FFC6 5404$_H$
LRERRINT_PE1L: FFC6 5404$_H$
LRERRINT_PE1LL: FFC6 5404$_H$

**Value after reset:** 0000 0003$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE | ECC 2-Bit Error Notification Enable<br>Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled.<br>0: Disables notification of the ECC 2-bit error.<br>1: Enables notification of the ECC 2-bit error. |
| 0 | SEDIE | ECC 1-Bit Error Notification Enable<br>Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled.<br>0: Disables notification of the ECC 1-bit error.<br>1: Enables notification of the ECC 1-bit error. |

### (5) LRSTCLR_PE1 — Local RAM Status Clear Register

LRSTCLR clears the error flags in the error status register (LR1STERSTR), the overflow flag in the error overflow status register (LROVFSTR), and the error address register (LR1STEADR0). LRSTCLR is a write-only register and is always read as 0.

**Access:** LRSTCLR_PE1 register is a write only register that can be written in 32-bit units.
LRSTCLR_PE1L register is a write only register that can be written in 16-bit units.
LRSTCLR_PE1LL register is a write only register that can be written in 8-bit units.

**Address:** LRSTCLR_PE1: FFC6 5408$_H$
LRSTCLR_PE1L: FFC6 5408$_H$
LRSTCLR_PE1LL: FFC6 5408$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 33.31 LRSTCLR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | STCLR0 | Error Status Flag Clear<br>Writing 1 to this bit clears the DEDF0 and SEDF0 flags in LR1STERSTR; ERROVF0 flag in LROVFSTR; and LR1STEADR0. |

### (6) LROVFSTR_PE1 — Local RAM Error Count Overflow Status Register

LROVFSTR monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, an external reset, or setting the STCLR0 bit to 1 in LRSTCLR.

**Access:** LROVFSTR_PE1 register is a read only register that can be read in 32-bit units.
LROVFSTR_PE1L register is a read only register that can be read in 16-bit units.
LROVFSTR_PE1LL register is a read only register that can be read in 8-bit units.

**Address:** LROVFSTR_PE1: FFC6 540C$_H$
LROVFSTR_PE1L: FFC6 540C$_H$
LROVFSTR_PE1LL: FFC6 540C$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ERROVF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.32 LROVFSTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | ERROVF0 | Error Overflow Flag<br>ERROVF0 is set if a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error. |

### (7) LR1STERSTR_PE1 — Local RAM 1st Error Status Register

LR1STERSTR monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0.

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR is cleared by an internal reset, an external reset, or setting 1 to the STCLR0 bit in LRSTCLR.

**Access:** LR1STERSTR_PE1 register is a read only register that can be read in 32-bit units.
LR1STERSTR_PE1L register is a read only register that can be read in 16-bit units.
LR1STERSTR_PE1LL register is a read only register that can be read in 8-bit units.

**Address:** LR1STERSTR_PE1: FFC6 5410$_H$
LR1STERSTR_PE1L: FFC6 5410$_H$
LR1STERSTR_PE1LL: FFC6 5410$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.33 LR1STERSTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | DEDF0 | ECC 2-Bit Error Monitor Flag<br>0: ECC 2-bit error is not detected.<br>1: ECC 2-bit error is detected.<br><br>Clearing condition:<br>Set the STCLR0 bit in LRSTCLR to 1.<br>Setting condition:<br>ECC 2-bit error is detected with DEDF0 being 0. |
| 0 | SEDF0 | ECC 1-Bit Error Monitor Flag<br>0: ECC 1-bit error is not detected.<br>1: ECC 1-bit error is detected.<br><br>Clearing condition:<br>Set the STCLR0 bit in LRSTCLR to 1.<br>Setting condition:<br>ECC 1-bit error is detected with both SEDF0 and DEDF0 being 0. |

### (8) LR1STEADR0_PE1 — Local RAM 1st Error Address Register 0

LR1STEADR0 holds the address at which an error has occurred.

The error address is set if an error occurs while error flags are 0 in LR1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address of the associated memory to transform the internal address to the real address. LR1STEADR0 is cleared by an internal reset, an external reset, or setting the STCLR0 bit to 1 in LRSTCLR.

**Access:** LR1STEADR0_PE1 register is a read only register that can be read in 32-bit units.
LR1STEADR0_PE1L and LR1STEADR0_PE1H registers are read only registers that can be read in 16-bit units.
LR1STEADR0_PE1LL, LR1STEADR0_PE1LH, and LR1STEADR0_PE1HL registers are read only registers that can be read in 8-bit units.

**Address:** LR1STEADR0_PE1: FFC6 5450$_H$
LR1STEADR0_PE1L: FFC6 5450$_H$,
LR1STEADR0_PE1H: FFC6 5452$_H$
LR1STEADR0_PE1LL: FFC6 5450$_H$,
LR1STEADR0_PE1LH: FFC6 5451$_H$,
LR1STEADR0_PE1HL: FFC6 5452$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 33.34 LR1STEADR0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 19 | Reserved | When read, the value after reset is returned. |
| 18 to 2 | EADR[18:2] | 1st Error Address<br>Monitors the address of the first error.<br>The error address is held if an error occurs while all the error flags are 0 in LR1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated. |
| 1 to 0 | Reserved | When read, the value after reset is returned. |

## 33.2.5 Peripheral RAM ECC

CSIH and RS-CAN have the ECC function for RAM. For details of these ECC function, see **Section 17.7, Detection and Correction of Errors in CSIHn RAM**, **Section 21.12, Detection and Correction of Errors in RS-CAN0 RAM** and **Section 21.23, Detection and Correction of Errors in RS-CAN RAM**.

# 33.3 Memory Protection

## 33.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU
  The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see the *RH850 Family User's Manual: Software*.
- Slave Guard
  A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.
  - PEG
    The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see **Section 3, CPU System**.
  - PBG
    The control registers in the peripheral circuits are protected against illegal accesses. For details, see **Section 33.3.2, PBG**.
  - PBGC
    The CPU system has a dedicated PBG function which is called a PBG for CPU system. For details, see **Section 33.3.3, PBG for CPU System**.

#### 33.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

**Table 33.35 Identifiers for Slave Guard**

| Identifier | Function |
|---|---|
| UM | When the CPU makes an access, this indicates the operating mode of the CPU.<br>0: Supervisor mode<br>1: User mode<br>When the DMAC makes an access, the value of this identifier is the value in the channel master setting register.<br>When another master makes an access, the value of this identifier is always 0. |
| SPID | When the CPU makes an access, this indicates the system protection identifier SPID that is assigned to the CPU.<br>When the DMAC makes an access, the value of this identifier is the value in the channel master setting register.<br>When another master makes an access, the value of this identifier is always $00_B$. |
| PEID | This indicates the access source bus master.<br>$000_B$: Reserved<br>$001_B$: CPU1<br>$010_B$: Reserved<br>$011_B$: Reserved<br>$100_B$: Reserved<br>$101_B$: Reserved<br>$110_B$: Reserved<br>$111_B$: Reserved<br>When the DMAC makes an access, the value of this identifier is the value in the channel master setting register. |

### 33.3.2 PBG

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers.

**Table 33.36 PBG Groups and Channels and Target Modules (1/4)**

| PBG Group | Group No. | PBG Channel Number | Protection Target Module | Target Register |
|---|---|---|---|---|
| PBG10 | 00 | 0 | FENMI | WDTNMIF<br>WDTNMIFC |

| | | 4 | Software reset | SWRESA |
| | | 5 | Flash memory (Self Programming) | —*2 |
| | | 6 | Flash memory (Control) | —*2 |
| | | 7 | Flash memory (Option Bytes) | OPBT0<br>PRDNAME1-3 |
| | | 8 | Write-Protect command registers | PROTCMD0<br>PROTS0 |

Note 1. For details, see **Section 5, Write-Protected Registers**, **Section 9, Reset Controller**, **Section 10, Power Supply Circuit**, **Section 11, Supply Voltage Monitor**, **Section 12, Clock Controller**, **Section 13, Clock Monitor (CLMA)**, **Section 14, Stand-By Controller (STBC)**, and **Section 15, Low-Power Sampler (LPS)**.

Note 2. Regarding the PBG registers for the flash memory, see the *RH850/F1K Flash Memory User's Manual:Hardware Interface*.

Note 3. Regarding the PBG register addresses, see the **Table 33.37, List of PBG Protection Registers**.

Note 4. Regarding the RSCAN and ECCCAN guard group, see the **Section 21, CAN Interface (RS-CAN)**.

### 33.3.2.1 List of Registers

The following table lists the registers provided for each PBG group. And PBG group is equal to module name.

**Table 33.37 List of PBG Protection Registers (1/4)**

| PBG Group | Group No. | Register Symbol | Register Name | R/W | Value after Reset | Address | Access Size | Power Domain |
|---|---|---|---|---|---|---|---|---|
| PBG10 | 00 | FSGD00PROT0 | PBG00 protection register 0 | R/W | 066F FFF7$_H$ | FFC4 0000$_H$ | 8/16/32 | ISO |
| | | FSGD00PROT1 | PBG00 protection register 1 | R/W | 066F FFF7$_H$ | FFC4 0004$_H$ | 8/16/32 | |
| | | FSGD00PROT2 | PBG00 protection register 2 | R/W | 066F FFF7$_H$ | FFC4 0008$_H$ | 8/16/32 | |
| | | FSGD00PROT3 | PBG00 protection register 3 | R/W | 066F FFF7$_H$ | FFC4 000C$_H$ | 8/16/32 | |
| | | FSGD00PROT4 | PBG00 protection register 4 | R/W | 066F FFF7$_H$ | FFC4 0010$_H$ | 8/16/32 | |
| | | FSGD00PROT5 | PBG00 protection register 5 | R/W | 066F FFF7$_H$ | FFC4 0014$_H$ | 8/16/32 | |
| | | FSGD00PROT6 | PBG00 protection register 6 | R/W | 066F FFF7$_H$ | FFC4 0018$_H$ | 8/16/32 | |
| | | FSGD00PROT7 | PBG00 protection register 7 | R/W | 066F FFF7$_H$ | FFC4 001C$_H$ | 8/16/32 | |
| | | FSGD00PROT8 | PBG00 protection register 8 | R/W | 066F FFF7$_H$ | FFC4 0020$_H$ | 8/16/32 | |
| | | FSGD00PROT9 | PBG00 protection register 9 | R/W | 066F FFF7$_H$ | FFC4 0024$_H$ | 8/16/32 | |
| | | FSGD00PROT10 | PBG00 protection register 10 | R/W | 066F FFF7$_H$ | FFC4 0028$_H$ | 8/16/32 | |
| | | FSGD00PROT11 | PBG00 protection register 11 | R/W | 066F FFF7$_H$ | FFC4 002C$_H$ | 8/16/32 | |
| | | FSGD00PROT12 | PBG00 protection register 12 | R/W | 066F FFF7$_H$ | FFC4 0030$_H$ | 8/16/32 | |
| | | FSGD00PROT13 | PBG00 protection register 13 | R/W | 066F FFF7$_H$ | FFC4 0034$_H$ | 8/16/32 | |
| PBG11 | 01 | FSGD01PROT0 | PBG01 protection register 0 | R/W | 066F FFF7$_H$ | FFC4 0100$_H$ | 8/16/32 | ISO |
| | | FSGD01PROT1 | PBG01 protection register 1 | R/W | 066F FFF7$_H$ | FFC4 0104$_H$ | 8/16/32 | |
| | | FSGD01PROT2 | PBG01 protection register 2 | R/W | 066F FFF7$_H$ | FFC4 0108$_H$ | 8/16/32 | |
| | | FSGD01PROT3 | PBG01 protection register 3 | R/W | 066F FFF7$_H$ | FFC4 010C$_H$ | 8/16/32 | |
| | | FSGD01PROT4 | PBG01 protection register 4 | R/W | 066F FFF7$_H$ | FFC4 0110$_H$ | 8/16/32 | |
| | | FSGD01PROT5 | PBG01 protection register 5 | R/W | 066F FFF7$_H$ | FFC4 0114$_H$ | 8/16/32 | |
| | | FSGD01PROT6 | PBG01 protection register 6 | R/W | 066F FFF7$_H$ | FFC4 0118$_H$ | 8/16/32 | |
| | | FSGD01PROT7 | PBG01 protection register 7 | R/W | 066F FFF7$_H$ | FFC4 011C$_H$ | 8/16/32 | |
| | | FSGD01PROT8 | PBG01 protection register 8 | R/W | 066F FFF7$_H$ | FFC4 0120$_H$ | 8/16/32 | |
| | | FSGD01PROT9 | PBG01 protection register 9 | R/W | 066F FFF7$_H$ | FFC4 0124$_H$ | 8/16/32 | |
| | | FSGD01PROT10 | PBG01 protection register 10 | R/W | 066F FFF7$_H$ | FFC4 0128$_H$ | 8/16/32 | |
| | | — | Reserved | — | — | FFC4 012C$_H$ | — | |
| | | FSGD01PROT12 | PBG01 protection register 12 | R/W | 066F FFF7$_H$ | FFC4 0130$_H$ | 8/16/32 | |
| | | FSGD01PROT13 | PBG01 protection register 13 | R/W | 066F FFF7$_H$ | FFC4 0134$_H$ | 8/16/32 | |
| | | FSGD01PROT14 | PBG01 protection register 14 | R/W | 066F FFF7$_H$ | FFC4 0138$_H$ | 8/16/32 | |

Table 33.37 List of PBG Protection Registers (2/4)

| PBG Group | Group No. | Register Symbol | Register Name | R/W | Value after Reset | Address | Access Size | Power Domain |
|---|---|---|---|---|---|---|---|---|
| PBG12 | 07 | FSGD07PROT0 | PBG07 protection register 0 | R/W | 066F FFF7$_H$ | FFC4 0400$_H$ | 8/16/32 | ISO |
| | | FSGD07PROT1 | PBG07 protection register 1 | R/W | 066F FFF7$_H$ | FFC4 0404$_H$ | 8/16/32 | |
| | | FSGD07PROT2 | PBG07 protection register 2 | R/W | 066F FFF7$_H$ | FFC4 0408$_H$ | 8/16/32 | |
| | | FSGD07PROT3 | PBG07 protection register 3 | R/W | 066F FFF7$_H$ | FFC4 040C$_H$ | 8/16/32 | |
| | | FSGD07PROT4 | PBG07 protection register 4 | R/W | 066F FFF7$_H$ | FFC4 0410$_H$ | 8/16/32 | |
| | | FSGD07PROT5 | PBG07 protection register 5 | R/W | 066F FFF7$_H$ | FFC4 0414$_H$ | 8/16/32 | |
| | | FSGD07PROT6 | PBG07 protection register 6 | R/W | 066F FFF7$_H$ | FFC4 0418$_H$ | 8/16/32 | |
| | | FSGD07PROT7 | PBG07 protection register 7 | R/W | 066F FFF7$_H$ | FFC4 041C$_H$ | 8/16/32 | |
| | | FSGD07PROT8 | PBG07 protection register 8 | R/W | 066F FFF7$_H$ | FFC4 0420$_H$ | 8/16/32 | |
| | | FSGD07PROT9 | PBG07 protection register 9 | R/W | 066F FFF7$_H$ | FFC4 0424$_H$ | 8/16/32 | |
| | | FSGD07PROT10 | PBG07 protection register 10 | R/W | 066F FFF7$_H$ | FFC4 0428$_H$ | 8/16/32 | |
| | | FSGD07PROT11 | PBG07 protection register 11 | R/W | 066F FFF7$_H$ | FFC4 042C$_H$ | 8/16/32 | |
| PBG12 | 07 | FSGD07PROT12 | PBG07 protection register 12 | R/W | 066F FFF7$_H$ | FFC4 0430$_H$ | 8/16/32 | ISO |
| PBG13 | 08 | FSGD08PROT0 | PBG08 protection register 0 | R/W | 066F FFF7$_H$ | FFC4 0500$_H$ | 8/16/32 | ISO |
| | | FSGD08PROT1 | PBG08 protection register 1 | R/W | 066F FFF7$_H$ | FFC4 0504$_H$ | 8/16/32 | |
| | | FSGD08PROT2 | PBG08 protection register 2 | R/W | 066F FFF7$_H$ | FFC4 0508$_H$ | 8/16/32 | |
| | | FSGD08PROT3 | PBG08 protection register 3 | R/W | 066F FFF7$_H$ | FFC4 050C$_H$ | 8/16/32 | |
| | | FSGD08PROT4 | PBG08 protection register 4 | R/W | 066F FFF7$_H$ | FFC4 0510$_H$ | 8/16/32 | |
| | | FSGD08PROT5 | PBG08 protection register 5 | R/W | 066F FFF7$_H$ | FFC4 0514$_H$ | 8/16/32 | |
| PBG20 | 02 | FSGD02PROT0 | PBG02 protection register 0 | R/W | 066F FFF7$_H$ | FFDD D000$_H$ | 8/16/32 | ISO |
| | | FSGD02PROT1 | PBG02 protection register 1 | R/W | 066F FFF7$_H$ | FFDD D004$_H$ | 8/16/32 | |
| | | FSGD02PROT2 | PBG02 protection register 2 | R/W | 066F FFF7$_H$ | FFDD D008$_H$ | 8/16/32 | |
| | | FSGD02PROT3 | PBG02 protection register 3 | R/W | 066F FFF7$_H$ | FFDD D00C$_H$ | 8/16/32 | |
| | | FSGD02PROT4 | PBG02 protection register 4 | R/W | 066F FFF7$_H$ | FFDD D010$_H$ | 8/16/32 | |
| | | FSGD02PROT5 | PBG02 protection register 5 | R/W | 066F FFF7$_H$ | FFDD D014$_H$ | 8/16/32 | |

| | | FSGD03PROT12 | PBG03 protection register 12 | R/W | 066F FFF7$_H$ | FFF9 4030$_H$ | 8/16/32 | |
| PBG31 | 04 | FSGD04PROT0 | PBG04 protection register 0 | R/W | 066F FFF7$_H$ | FFF9 4100$_H$ | 8/16/32 | ISO |
| | | FSGD04PROT1 | PBG04 protection register 1 | R/W | 0607 FE77$_H$ | FFF9 4104$_H$ | 8/16/32 | |
| | | — | Reserved | — | — | FFF9 4108$_H$ | — | |
| PBG31 | 04 | — | Reserved | — | — | FFF9 410C$_H$ | — | ISO |
| | | FSGD04PROT4 | PBG04 protection register 4 | R/W | 066F FFF7$_H$ | FFF9 4110$_H$ | 8/16/32 | |
| | | FSGD04PROT5 | PBG04 protection register 5 | R/W | 066F FFF7$_H$ | FFF9 4114$_H$ | 8/16/32 | |
| | | FSGD04PROT6 | PBG04 protection register 6 | R/W | 066F FFF7$_H$ | FFF9 4118$_H$ | 8/16/32 | |
| | | FSGD04PROT7 | PBG04 protection register 7 | R/W | 066F FFF7$_H$ | FFF9 411C$_H$ | 8/16/32 | |
| | | — | Reserved | — | — | FFF9 4120$_H$ | — | |
| | | FSGD04PROT9 | PBG04 protection register 9 | R/W | 066F FFF7$_H$ | FFF9 4124$_H$ | 8/16/32 | |
| | | FSGD04PROT10 | PBG04 protection register 10 | R/W | 066F FFF7$_H$ | FFF9 4128$_H$ | 8/16/32 | |
| | | FSGD04PROT11 | PBG04 protection register 11 | R/W | 066F FFF7$_H$ | FFF9 412C$_H$ | 8/16/32 | |
| PBG32 | 05 | FSGD05PROT0 | PBG05 protection register 0 | R/W | 066F FFF7$_H$ | FFF9 4200$_H$ | 8/16/32 | ISO |
| | | FSGD05PROT1 | PBG05 protection register 1 | R/W | 066F FFF7$_H$ | FFF9 4204$_H$ | 8/16/32 | |
| | | FSGD05PROT2 | PBG05 protection register 2 | R/W | 066F FFF7$_H$ | FFF9 4208$_H$ | 8/16/32 | |
| | | FSGD05PROT3 | PBG05 protection register 3 | R/W | 066F FFF7$_H$ | FFF9 420C$_H$ | 8/16/32 | |
| | | FSGD05PROT4 | PBG05 protection register 4 | R/W | 066F FFF7$_H$ | FFF9 4210$_H$ | 8/16/32 | |
| | | FSGD05PROT5 | PBG05 protection register 5 | R/W | 066F FFF7$_H$ | FFF9 4214$_H$ | 8/16/32 | |
| | | FSGD05PROT6 | PBG05 protection register 6 | R/W | 066F FFF7$_H$ | FFF9 4218$_H$ | 8/16/32 | |
| | | FSGD05PROT7 | PBG05 protection register 7 | R/W | 066F FFF7$_H$ | FFF9 421C$_H$ | 8/16/32 | |
| | | FSGD05PROT8 | PBG05 protection register 8 | R/W | 066F FFF7$_H$ | FFF9 4220$_H$ | 8/16/32 | |
| | | FSGD05PROT9 | PBG05 protection register 9 | R/W | 066F FFF7$_H$ | FFF9 4224$_H$ | 8/16/32 | |
| | | FSGD05PROT10 | PBG05 protection register 10 | R/W | 066F FFF7$_H$ | FFF9 4228$_H$ | 8/16/32 | |
| | | FSGD05PROT11 | PBG05 protection register 11 | R/W | 066F FFF7$_H$ | FFF9 422C$_H$ | 8/16/32 | |

Table 33.37 List of PBG Protection Registers (4/4)

| PBG Group | Group No. | Register Symbol | Register Name | R/W | Value after Reset | Address | Access Size | Power Domain |
|---|---|---|---|---|---|---|---|---|
| PBG50 | 06 | FSGD06PROT0 | PBG06 protection register 0 | R/W | 066F FFF7$_H$ | FFF9 0000$_H$ | 8/16/32 | ISO |
| | | FSGD06PROT1 | PBG06 protection register 1 | R/W | 0647 FF77$_H$ | FFF9 0004$_H$ | 8/16/32 | |
| | | — | Reserved | — | — | FFF9 0008$_H$ | — | |
| | | — | Reserved | — | — | FFF9 000C$_H$ | — | |
| | | FSGD06PROT4 | PBG06 protection register 4 | R/W | 066F FFF7$_H$ | FFF9 0010$_H$ | 8/16/32 | |
| | | FSGD06PROT5 | PBG06 protection register 5 | R/W | 066F FFF7$_H$ | FFF9 0014$_H$ | 8/16/32 | |
| | | — | Reserved | — | — | FFF9 0018$_H$ | — | |
| | | FSGD06PROT7 | PBG06 protection register 7 | R/W | 066F FFF7$_H$ | FFF9 001C$_H$ | 8/16/32 | |
| | | FSGD06PROT8 | PBG06 protection register 8 | R/W | 066F FFF7$_H$ | FFF9 0020$_H$ | 8/16/32 | |

The following table lists the registers provided for each PBG group.

**Table 33.38 List of PBG Error Registers**

| Module Name | Register Symbol | Register Name | R/W | Value after Reset | Address | Access Size |
|---|---|---|---|---|---|---|
| PBGxx | ERRSLVxxCTL | PBGxx error control register | W | 0000 $0000_H$ | <base_addr0> + $0_H$ | 8/16/32 |
| | ERRSLVxxSTAT | PBGxx error status register | R | 0000 $0000_H$ | <base_addr0> + $4_H$ | 8/16/32 |
| | ERRSLVxxADDR | PBGxx error address register | R | 0000 $0000_H$ | <base_addr0> + $8_H$ | 32 |
| | ERRSLVxxTYPE | PBGxx error type register | R | 0000 $0000_H$ | <base_addr0> + $C_H$ | 16/32 |

In the above table, “xx” in the register names and symbols represents the PBG group numbers. The table below shows the base address values <base_addr0>, which correspond to each of the PBG group numbers.

**Table 33.39 PBG Group Numbers and Error Base Addresses**

| PBG Group | PBG Group Number | <base_addr0> |
|---|---|---|
| PBG10 | 00 | FFC4 $0040_H$ |
| PBG11 | 01 | FFC4 $0140_H$ |
| PBG12 | 07 | FFC4 $0440_H$ |
| PBG13 | 08 | FFC4 $0540_H$ |
| PBG20 | 02 | FFDD $D040_H$ |
| PBG21 | 09 | FFDD $D140_H$ |
| PBG30 | 03 | FFF9 $4040_H$ |
| PBG31 | 04 | FFF9 $4140_H$ |
| PBG32 | 05 | FFF9 $4240_H$ |
| PBG50 | 06 | FFF9 $0040_H$ |

### 33.3.2.2 Details of Registers

#### (1) FSGDxxPROTn — PBGxx Protection Register n

FSGDxxPROTn specifies the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. "n" in the register names and symbols represents the PBG channel number.

**Access:** FSGDxxPROTn register can be read or written in 32-bit units.
FSGDxxPROTnL and FSGDxxPROTnH registers can be read or written in 16-bit units.
FSGDxxPROTnLL, FSGDxxPROTnLH, FSGDxxPROTnHL, and FSGDxxPROTnHH registers can be read or written in 8-bit units.

**Address:** See **Table 33.37, List of PBG Protection Registers**

**Value after reset:** See **Table 33.37, List of PBG Protection Registers**

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Note 1. It varies depending on each register. See **Section 33.3.2.1, List of Registers**.

**Table 33.40 FSGDxxPROTn Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | PROTLOCK | Register Lock<br>0: Enables FSGDxxPROTn rewrite.<br>1: Disables FSGDxxPROTn rewrite.<br>When PROTLOCK is set to 1, the value is held until reset is asserted. |
| 30 to 26 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | PROTUM | User Mode Access<br>0: Enables access in supervisor mode.<br>1: Enables access in user mode and supervisor mode. |
| 24 to 17 | PROTPEID[7:0] | PEID Access*1<br>The PROTPEID field is a bit list, in which one bit corresponds to one PEID value. Setting multiple bits enables multiple ID values simultaneously. For example, setting the PROTPEID field to 0000 $0110_B$ enables access with PEID = 1 and PEID = 2.<br>0: Disables access with PEIDn.<br>1: Enables access with PEIDn. |
| 16 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 to 5 | PROTSPID[3:0] | SPID Access*2<br>The PROTSPID field is a bit list, in which one bit corresponds to one SPID value. Setting multiple bits enables multiple SPID values simultaneously. For example, setting the PROTSPID field to $0110_B$ enables access with SPID = 1 and SPID = 2.<br>0: Disables access with SPIDn.<br>1: Enables access with SPIDn. |
| 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**Table 33.40 FSGDxxPROTn Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 | PROTRDPDEF | Default Read Protection<br>0: Enables read access from any master.<br>1: Only enables read access from the master having passed the filter. |
| 2 | PROTWRPDEF | Default Write Protection<br>0: Enables write access from any master.<br>1: Only enables write access from the master having passed the filter. |
| 1 | PROTRD | Read Permission<br>0: Disables reading by a bus master subject to access filtering.<br>1: Enables reading by a bus master subject to access filtering. |
| 0 | PROTWR | Write Permission<br>0: Disables writing by a bus master subject to access filtering.<br>1: Enables writing by a bus master subject to access filtering. |

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

### (2) ERRSLVxxCTL — PBGxx Error Control Register

ERRSLVxxCTL clears the status in error status register PBGxx.

**Access:** ERRSLVxxCTL register is a write only register that can be written in 32-bit units.
ERRSLVxxCTLL register is a write only register that can be written in 16-bit units.
ERRSLVxxCTLLL register is a write only register that can be written in 8-bit units.

**Address:** ERRSLVxxCTL: <base_addr0> + $0_H$
ERRSLVxxCTLL: <base_addr0> + $0_H$
ERRSLVxxCTLLL: <base_addr0> + $0_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLRO | CLRE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

**Table 33.41 ERRSLVxxCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the overflow flag.<br>0: Does not clear the overflow flag.<br>1: Clears the overflow flag. |
| 0 | CLRE | Clears the error flag.<br>0: Does not clear the error flag.<br>1: Clears the error flag. |

| CLRO | CLRE | Function |
|---|---|---|
| 0 | 0 | Clears neither of the bits. |
| 0 | 1 | Setting prohibited |
| 1 | 0 | Clears the OVF bit. |
| 1 | 1 | Clears the OVF and ERR bits. |

### (3) ERRSLVxxSTAT — PBGxx Error Status Register

ERRSLVxxSTAT holds the status of the illegal access rejected with the PBGxx.

**Access:** ERRSLVxxSTAT register is a read only register that can be read in 32-bit units.
ERRSLVxxSTATL register is a read only register that can be read in 16-bit units.
ERRSLVxxSTATLL register is a read only register that can be read in 8-bit units.

**Address:** ERRSLVxxSTAT: <base_addr0> + $4_H$
ERRSLVxxSTATL: <base_addr0> + $4_H$
ERRSLVxxSTATLL: <base_addr0> + $4_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | OVF | ERR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.42 ERRSLVxxSTAT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OVF | Error Entry Overflow Flag<br>0: No overflow<br>1: An overflow occurred.<br>If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBG error entry stages is 1.<br>Note that this overflow is not notified to INTGUARD. The error information of the guard violation when an overflow occurs are not captured. |
| 0 | ERR | Error Status Flag<br>0: No PBG protection violation<br>1: A PBG protection violation occurred. |

### (4) ERRSLVxxADDR — PBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

**Access:** ERRSLVxxADDR register is a read only register that can be read in 32-bit units.

**Address:** <base_addr0> + $8_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ADDR[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ADDR[15:2] | | | | | | | | | | | | | | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.43 ERRSLVxxADDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | ADDR[31:2] | Address in which the PBG protection violation is generated. |
| 1, 0 | Reserved | When read, the value after reset is returned. |

### (5) ERRSLVxxTYPE — PBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx.

**Access:** ERRSLVxxTYPE register is a read only register that can be read in 32-bit units.
ERRSLVxxTYPEL register is a read only register that can be read in 16-bit units.

**Address:** ERRSLVxxTYPE: <base_addr0> + $C_H$
ERRSLVxxTYPEL: <base_addr0> + $C_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PEID[2:0] | | | — | — | — | SPID[1:0] | | — | UM | — | — | — | — | — | WRITE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.44 ERRSLVxxTYPE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 13 | PEID[2:0] | PEID of the access source from which the PBG protection violation is generated. |
| 12 to 10 | Reserved | When read, the value after reset is returned. |
| 9, 8 | SPID[1:0] | SPID of the access source from which the PBG protection violation is generated. |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 | UM | UM of the access source from which the PBG protection violation is generated. |
| 5 | Reserved | When read, the value after reset is returned. |
| 4 to 1 | Reserved | These bits are read as an undefined value. |
| 0 | WRITE | This bit is set to 1 when the access that has generated the PBG protection violation is a write access. |

### 33.3.3 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.

**Table 33.45 Target Registers of PBG for CPU Subsystem**

| PBGC Group | Group No. | Channel Number | Protection Target Module | Target Register |
|---|---|---|---|---|
| PBGC0 | C0<br>(PBC group 0 for CPU system) | 0 | INTC2 | ICxxx (xxx=32 to 357)<br>IMRm (m=1 to 11)<br>(described in **Section 7, Exception/ Interrupts**) |
| | | 1 | DMA | All registers inside DMA controller<br>(described in **Section 8, DMA Controller**) |
| PBGC1 | C1<br>(PBC group 1 for CPU system) | 0 | Flash memory<br>(Programing function) | BFASELR*1 |
| | | 1 | Code flash ECC control register (VCI) | CFECCCTL_VCI<br>CFERRINT_VCI<br>CFSTCLR_VCI<br>CFOVFSTR_VCI<br>CF1STERSTR_VCI<br>CF1STEADR0_VCI<br>CFSTSTCTL_VCI |
| | | 2 | Code flash ECC control register (PE1) | CFECCCTL_PE1<br>CFERRINT_PE1<br>CFSTCLR_PE1<br>CFOVFSTR_PE1<br>CF1STERSTR_PE1<br>CF1STEADR0_PE1<br>CFSTSTCTL_PE1 |
| | | 3 | Local RAM ECC control register (PE1) | LRTSTCTL_PE1<br>LRTDATBF0_PE1<br>LRECCCTL_PE1<br>LRERRINT_PE1<br>LRSTCLR_PE1<br>LROVFSTR_PE1<br>LR1STERSTR_PE1<br>LR1STEADR0_PE1 |
| | | 4 | On-Chip Debug module | EPC<br>(described in **Section 36, On-Chip Debug Unit (OCD)**) |
| | | 5 | Buffer controller | FBUFCCTL<br>(described in **Section 3, CPU System**) |

Note 1. Regarding the PBGC registers for the flash memory, see the *RH850/F1K Flash Memory User's Manual:Hardware Interface*.

### 33.3.3.1 List of Registers

The following table lists the registers provided for each PBGC group. And PBG group is equal to module name.

**Table 33.46 List of PBGC Protection Registers**

| PBG Group | Group No. | Register Symbol | Register Name | R/W | Value after Reset | Address | Access Size | Power Domain |
|---|---|---|---|---|---|---|---|---|
| PBGC0 | C0 | FSGDC0PROT0 | PBGC0 protection register 0 | R/W | 07FF FFFF$_H$ | FFC4 C000$_H$ | 8/16/32 | ISO |
| | | FSGDC0PROT1 | PBGC0 protection register 1 | R/W | 07FF FFFF$_H$ | FFC4 C004$_H$ | 8/16/32 | |
| PBGC1 | C1 | FSGDC1PROT0 | PBGC1 protection register 0 | R/W | 07FF FFFF$_H$ | FFC4 C120$_H$ | 8/16/32 | ISO |
| | | FSGDC1PROT1 | PBGC1 protection register 1 | R/W | 07FF FFFF$_H$ | FFC4 C124$_H$ | 8/16/32 | |
| | | FSGDC1PROT2 | PBGC1 protection register 2 | R/W | 07FF FFFF$_H$ | FFC4 C128$_H$ | 8/16/32 | |
| | | FSGDC1PROT3 | PBGC1 protection register 3 | R/W | 07FF FFFF$_H$ | FFC4 C12C$_H$ | 8/16/32 | |
| | | FSGDC1PROT4 | PBGC1 protection register 4 | R/W | 07FF FFFF$_H$ | FFC4 C130$_H$ | 8/16/32 | |
| | | FSGDC1PROT5 | PBGC1 protection register 5 | R/W | 07FF FFFF$_H$ | FFC4 C134$_H$ | 8/16/32 | |

**Table 33.47 List of PBGC Error Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| PBGC0 | PBGC0 error control register | ERRSLVC0CTL | FFC4 C800$_H$ |
| | PBGC0 error status register | ERRSLVC0STAT | FFC4 C804$_H$ |
| | PBGC0 error address register | ERRSLVC0ADDR | FFC4 C808$_H$ |
| | PBGC0 error type register | ERRSLVC0TYPE | FFC4 C80C$_H$ |
| PBGC1 | PBGC1 error control register | ERRSLVC1CTL | FFC4 C900$_H$ |
| | PBGC1 error status register | ERRSLVC1STAT | FFC4 C904$_H$ |
| | PBGC1 error address register | ERRSLVC1ADDR | FFC4 C908$_H$ |
| | PBGC1 error type register | ERRSLVC1TYPE | FFC4 C90C$_H$ |

### 33.3.3.2 Details of Registers

#### (1) FSGDCxPROTn — PBGCx Protection Register n

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.

"n" in the register names and symbols represents the PBGC channel number.

**Access:** FSGDCxPROTn register can be read or written in 32-bit units.
FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units.
FSGDCxPROTnLL, FSGDCxPROTnLH, FSGDCxPROTnHL, and FSGDCxPROTnHH registers can be read or written in 8-bit units.

**Address:** See **Table 33.46, List of PBGC Protection Registers**

**Value after reset:** See **Table 33.46, List of PBGC Protection Registers**

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | PROTUM | PROTPEID[7:0] | | | | | | | | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | PROTSPID[3:0] | | | | — | PROTRDPDEF | PROTWRPDEF | PROTRD | PROTWR |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W |

**Table 33.48 FSGDCxPROTn Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 26 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | PROTUM | User Mode Access<br>0: Enables access in supervisor mode.<br>1: Enables access in user mode and supervisor mode. |
| 24 to 17 | PROTPEID[7:0] | PEID Access*1<br>The PROTPEID field is a bit list, in which one bit corresponds to one PEID value. Setting multiple bits enables multiple ID values simultaneously. For example, setting the PROTPEID field to 0000 $0110_B$ enables access with PEID = 1 and PEID = 2.<br>0: Disables access with PEIDn.<br>1: Enables access with PEIDn. |
| 16 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 to 5 | PROTSPID[3:0] | SPID Access*2<br>The PROTSPID field is a bit list, in which one bit corresponds to one SPID value. Setting multiple bits enables multiple SPID values simultaneously. For example, setting the PROTSPID field to $0110_B$ enables access with SPID = 1 and SPID = 2.<br>0: Disables access with SPIDn.<br>1: Enables access with SPIDn. |
| 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | PROTRDPDEF | Default Read Protection<br>0: Enables read access from any master.<br>1: Only enables read access from the master having passed the filter. |

**Table 33.48 FSGDCxPROTn Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 2 | PROTWRPDEF | Default Write Protection<br>0: Enables write access from any master.<br>1: Only enables write access from the master having passed the filter. |
| 1 | PROTRD | Read Permission<br>0: Disables reading by a bus master subject to access filtering.<br>1: Enables reading by a bus master subject to access filtering. |
| 0 | PROTWR | Write Permission<br>0: Disables writing by a bus master subject to access filtering.<br>1: Enables writing by a bus master subject to access filtering. |

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

### (2) ERRSLVCxCTL — PBGCx Error Control Register

ERRSLVCxCTL clears the status in error status register PBGCx.

**Access:** ERRSLVCxCTL register is a write only register that can be written in 32-bit units.
ERRSLVCxCTLL register is a write only register that can be written in 16-bit units.
ERRSLVCxCTLLL register is a write only register that can be written in 8-bit units.

**Address:** ERRSLVCxCTL: FFC4 C800H + ($100_H$ × x)
ERRSLVCxCTLL: FFC4 C800H + ($100_H$ × x)
ERRSLVCxCTLLL: FFC4 C800H + ($100_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLRO | CLRE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

**Table 33.49 ERRSLVCxCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When writing, write the value after reset. |
| 1 | CLRO | Clears the overflow flag.<br>0: Does not clear the overflow flag.<br>1: Clears the overflow flag. |
| 0 | CLRE | Clears the error flag.<br>0: Does not clear the error flag.<br>1: Clears the error flag. |

| CLRO | CLRE | Function |
|---|---|---|
| 0 | 0 | Clears neither of the bits. |
| 0 | 1 | Setting prohibited |
| 1 | 0 | Clears the OVF bit. |
| 1 | 1 | Clears the OVF and ERR bits. |

### (3) ERRSLVCxSTAT — PBGCx Error Status Register

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

**Access:** ERRSLVCxSTAT register is a read only register that can be read in 32-bit units.
ERRSLVCxSTATL register is a read only register that can be read in 16-bit units.
ERRSLVCxSTATLL register is a read only register that can be read in 8-bit units.

**Address:** ERRSLVCxSTAT: FFC4 C804H + ($100_H$ × x)
ERRSLVCxSTATL: FFC4 C804H + ($100_H$ × x)
ERRSLVCxSTATLL: FFC4 C804H + ($100_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OVF | Error Entry Overflow Flag<br>0: No overflow<br>1: An overflow occurred.<br>If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBGC error entry stages is 1.<br>Note that this overflow is not notified to INTGUARD. The error information of the guard violation when an overflow occurs are not captured. |
| 0 | ERR | Error Status Flag<br>0: No PBG protection violation<br>1: A PBG protection violation occurred. |

### (4) ERRSLVCxADDR — PBGCx Error Address Register

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

**Access:** ERRSLVCxADDR register is a read only register that can be read in 32-bit units.

**Address:** FFC4 C808H + ($100_H$ × x)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 33.51 ERRSLVCxADDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | ADDR[31:2] | Address in which the PBG protection violation is generated. |
| 1, 0 | Reserved | When read, the value after reset is returned. |

### (5) ERRSLVCxTYPE — PBGCx Error Type Register

ERRSLVCxTYPE holds the type of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

**Access:** ERRSLVCxTYPE register is a read only register that can be read in 32-bit units.
ERRSLVCxTYPEL register is a read only register that can be read in 16-bit units.

**Address:** ERRSLVCxTYPE: FFC4 C80CH + ($100_H$ × x)
ERRSLVCxTYPEL: FFC4 C80CH + ($100_H$ × x)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 33.52 ERRSLVCxTYPE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 13 | PEID[2:0] | PEID of the access source from which the PBG protection violation is generated. |
| 12 to 10 | Reserved | When read, the value after reset is returned. |
| 9, 8 | SPID[1:0] | SPID of the access source from which the PBG protection violation is generated. |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 | UM | UM of the access source from which the PBG protection violation is generated. |
| 5 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | WRITE | This bit is set to 1 when an access that has generated the PBG protection violation is the write. |

# Section 34 Data CRC (DCRA)

This section contains a generic description of the data CRC function A (DCRA).

The first part in this section describes the RH850/F1K specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the DCRA.

## 34.1 Features of RH850/F1K DCRA

### 34.1.1 Number of Units

This microcontroller has the following number of DCRA units.

**Table 34.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 4 | | |
| Name | DCRAn (n = 0 to 3) | | |

**Table 34.2 Index**

| Index | Description |
|---|---|
| n | Throughout this section, the individual data CRC function A units are identified by the index “n” (n = 0 to 3); for example, DCRAnCTL indicates the DCRAn control register. |

### 34.1.2 Register Base Address

DCRAn base addresses are listed in the following table.

DCRAn register addresses are given as offsets from the base addresses.

**Table 34.3 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <DCRA0_base> | FFF7 $0000_H$ |
| <DCRA1_base> | FFF7 $1000_H$ |
| <DCRA2_base> | FFF7 $2000_H$ |
| <DCRA3_base> | FFF7 $3000_H$ |

### 34.1.3 Clock Supply

The DCRAn clock supply is shown in the following table.

**Table 34.4 Clock Supply**

| Unit Name | Unit Clock Name | Clock Supply Name | Description |
|---|---|---|---|
| DCRAn | PCLK | CPUCLK4 | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CPUCLK4 | |

### 34.1.4 Reset Sources

DCRAn reset sources are listed in the following table. DCRAn is initialized by these reset sources.

**Table 34.5 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| DCRAn | All reset sources (ISORES) |

## 34.2 Overview

### 34.2.1 Functional Overview

The data CRC function A can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- 32-bit Ethernet CRC
  $(X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^{8}+X^{7}+X^{5}+X^{4}+X^{2}+X^{1}+1)$
- 16-bit CCITT CRC
  $(X^{16}+X^{12}+X^{5}+1)$
- CRC of an arbitrary data block length can be generated.
- After initialization of the CRC data register, every write access to the CRC input register generates a new CRC according to the selected polynomial, and the result is stored in the CRC data register.

### 34.2.2 Block Diagram

The following picture shows the block diagram of the data CRC function A.

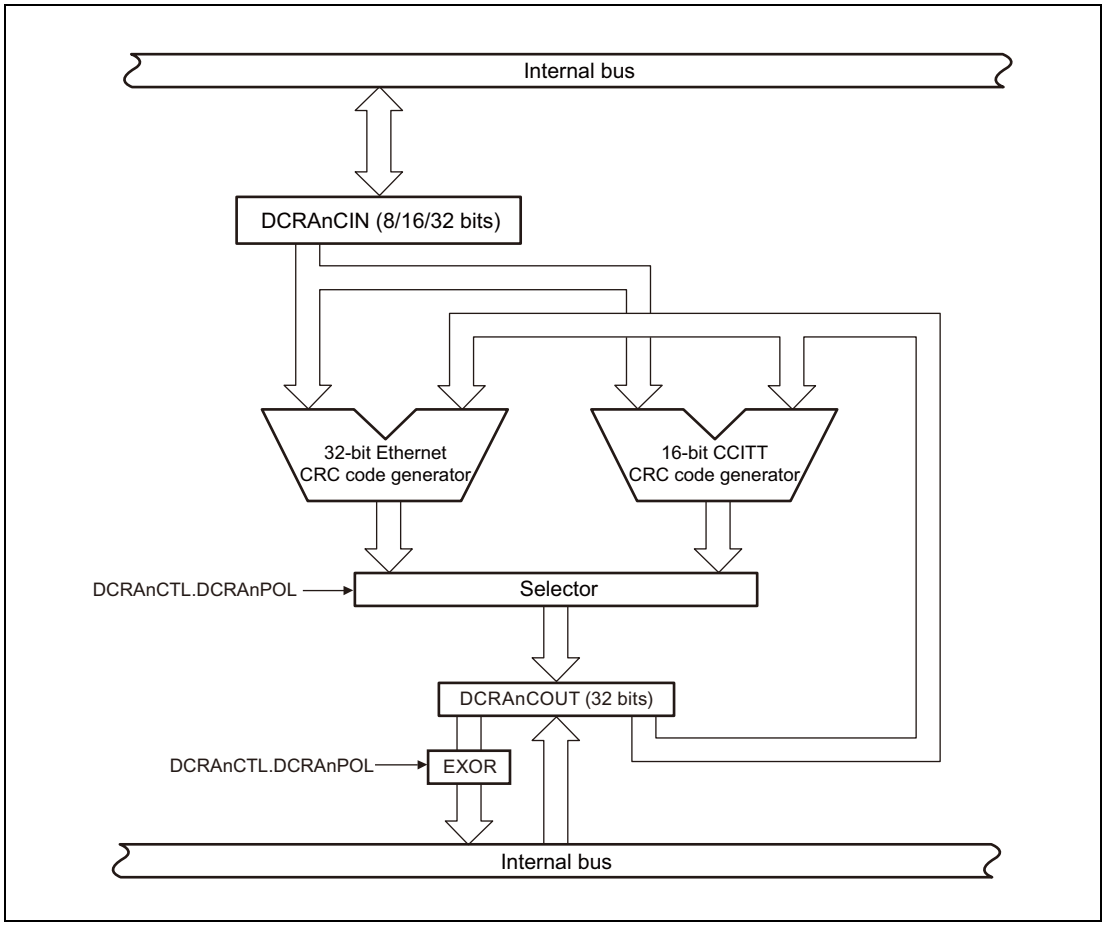

**Figure 34.1 Block Diagram of Data CRC Function A**

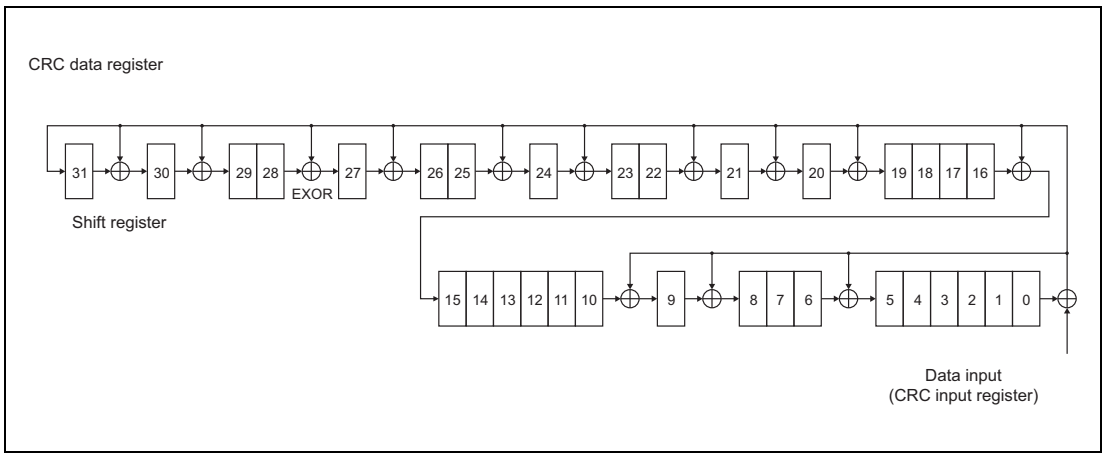
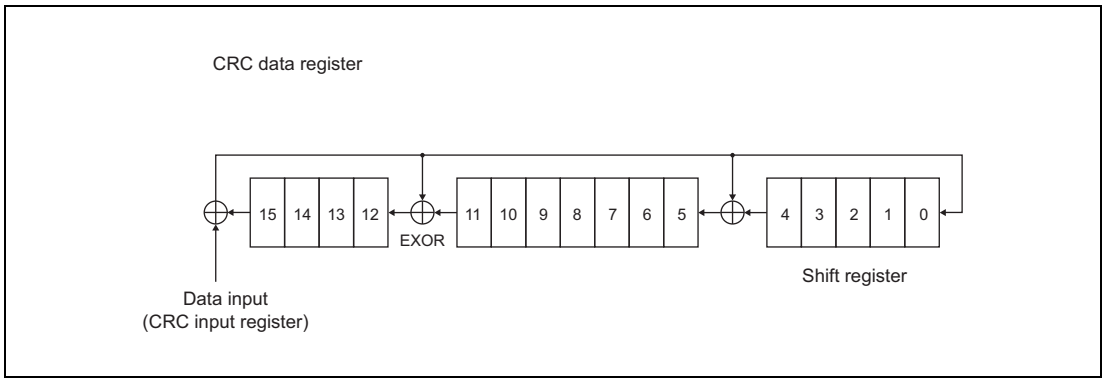
### 34.2.3 Operational Circuit

- 32-bit Ethernet



- 16-bit CCITT



## 34.3 Registers

### 34.3.1 List of Registers

DCRA registers are listed in the following table.

For details about <DCRAn_base>, see **Section 34.1.2, Register Base Address**.

**Table 34.6 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| DCRAn | CRC input register | DCRAnCIN | <DCRAn_base> + $00_H$ |
| | CRC data register | DCRAnCOUT | <DCRAn_base> + $04_H$ |
| | CRC control register | DCRAnCTL | <DCRAn_base> + $20_H$ |

### 34.3.2 DCRAnCIN — CRC Input Register

This register holds the input data for CRC calculation. The effective bit width used for CRC calculation must be set by DCRAnCTL.DCRAnISZ[1:0].

When data is written to this register, the CRC code is generated.

The CRC calculation is immediately started after the DCRAnCIN register is written. The DCRAnCOUT register must be initialized with the initial starting value, before the first data of the data block is written to DCRAnCIN register.

**Access:** This register can be read or written in 32-bit units.

**Address:** <DCRAn_base>

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DCRAnCIN[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DCRAnCIN[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 34.7 DCRAnCIN Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | DCRAnCIN [31:0] | Input Data for CRC Calculation<br>The valid bits are:<br>• For 32 bit effective bit width: DCRAnCIN[31:0]<br>• For 16 bit effective bit width: DCRAnCIN[15:0]<br>• For 8 bit effective bit width: DCRAnCIN[7:0] |

### 34.3.3 DCRAnCOUT — CRC Data Register

This register stores the result of the CRC code generated by the 32-bit Ethernet polynomial or the 16-bit CCITT polynomial.

**Access:** This register can be read or written in 32-bit units.

**Address:** <DCRAn_base> + $4_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DCRAnCOUT[31:16] | | | | | | | | | | | | | | | |
| Value after reset *1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DCRAnCOUT[15:0] | | | | | | | | | | | | | | | |
| Value after reset *1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The read value after reset is 0000 $0000_H$ since the 32-bit Ethernet CRC polynomial is selected as the CRC generating function after reset.

**Table 34.8 DCRAnCOUT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | DCRAnCOUT [31:0] | Result of the CRC Code Generation<br>When the 16-bit CCITT polynomial is enabled, the bits 15 to 0 show the CRC result. The bits 31 to 16 are undefined.<br>The read value of this register is a value obtained by performing EXOR calculation for the following value:<br>• For 32-bit Ethernet polynomial: FFFF $FFFF_H$<br>• For 16-bit CCITT polynomial: $0000_H$<br>For example, when DCRAnCOUT = 5555 $5555_H$ for the 32-bit Ethernet polynomial, AAAA $AAAA_H$ is read. |

**CAUTION**

This register must initialized by setting the initial start value before the first data of the data block is written to DCRAnCIN register.

### 34.3.4 DCRAnCTL — CRC Control Register

This register controls the CRC generation process.

**Access:** This register can be read or written in 8-bit units.

**Address:** <DCRAn_base> + $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | DCRAnISZ[1:0] | | DCRAnPOL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

**Table 34.9 DCRAnCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2, 1 | DCRAnISZ[1:0] | Specify the CRC input bit width.<br>00: 32 bits (DCRAnCIN[31:0])<br>01: 16 bits (DCRAnCIN[15:0])<br>10: 8 bits (DCRAnCIN[7:0])<br>11: Setting prohibited |
| 0 | DCRAnPOL | Specifies the CRC generation method.<br>0: 32-bit Ethernet CRC polynomial generation.<br>The byte order of the DCRAnCIN register is LSB (least significant bit) first. This means that, if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = $10_B$), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 0 (LSB) is the start bit of the input data.<br>1: 16-bit CCITT CRC polynomial generation.<br>The byte order of the DCRAnCIN register is MSB (most significant bit) first. This means that, if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = $10_B$), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 7 (MSB) is the start bit of the input data. |

**CAUTION**

- If the CRC generation method (DCRAnCTL.DCRAnPOL) is changed, the DCRAnCOUT register must be initialized by setting the initial start value.
- The CRC input bit width (DCRAnCTL.DCRAnISZ[1:0]) must be set according to the data block bit width. Changing the CRC input bit width is not allowed during processing of a data block (a data block consists of N bytes, half-words or one word). After the final CRC result is read from DCRAnCOUT register, the bit width can be changed. In that case, the DCRAnCOUT register must be initialized with the initial start value.

## 34.4 Operation

The data CRC function A generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is forwarded to the data CRC function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet or 16-bit CCITT. The initial starting value must be set at the DCRAnCOUT register before the first write access to the CRC input register (DCRAnCIN) is performed.

The flowchart below shows the CRC generating procedure.

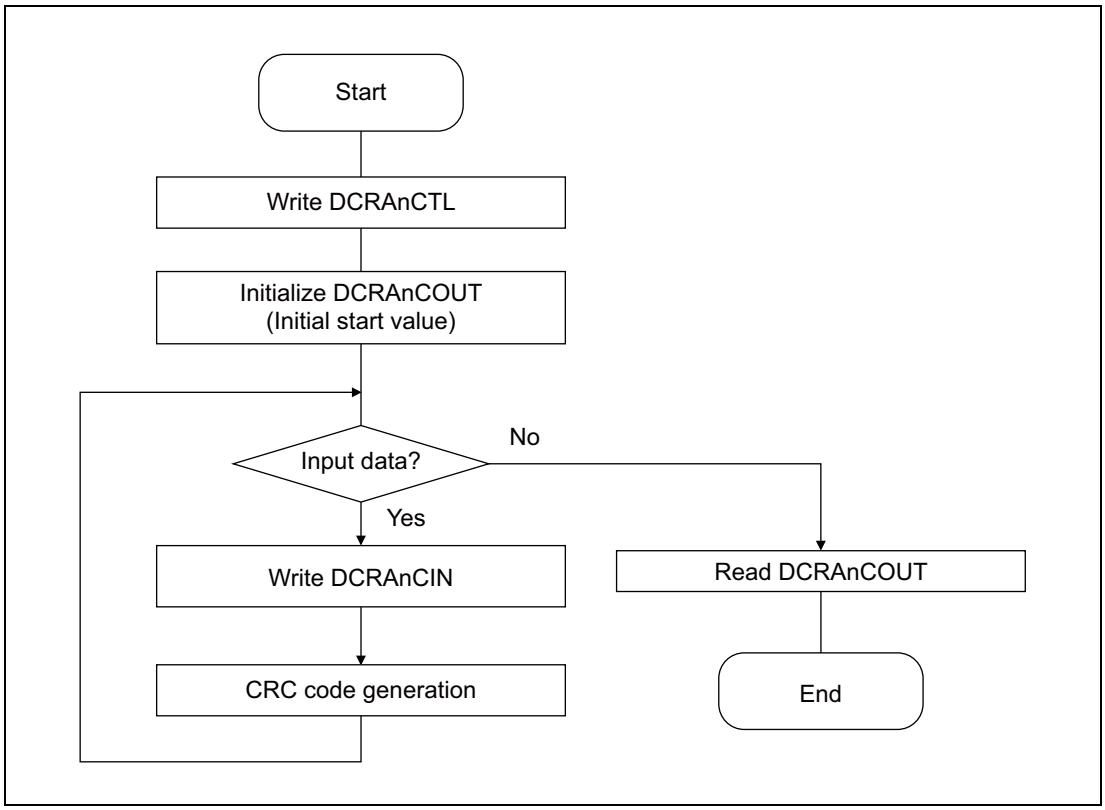


**Figure 34.2 Flowchart of Data CRC Function A**

**NOTES**

1. Before writing the first data to DCRAnCIN, the CRC output register DCRAnCOUT must be initialized with the initial start value.
2. DCRAnCOUT must be re-initialized by setting the initial start value when the polynomial is changed by changing DCRAnCTL.DCRAnPOL.
3. Setting example of the initial start values of the respective polynomials
   The following is the example of setting values.

**Table 34.10 Setting Example of Initial Start Values (When Read at a Reset)**

| | Initial Start Value | EXOR Value | DCRAnCOUT Read Value |
|---|---|---|---|
| 16-bit CCITT | XXXX $FFFF_H$ | XXXX $0000_H$ | XXXX $FFFF_H$ |
| 32-bit Ethernet | $FFFF\ FFFF_H$ | $FFFF\ FFFF_H$ | $0000\ 0000_H$ |

**Note:** X: undefined

# Section 35 Security Function

Please refer to separate volumes about security function which consist of 3 volumes as shown below.

1. Basic Security
2. Secure Watchdog Timer
3. ICUSE

# Section 36 On-Chip Debug Unit (OCD)

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

The debug functions incorporated in this microcontroller conform to IEEE-ISTO 5001™-2003 Class 3*1, a Nexus debug interface standard.

**Note 1.** This function is supported only by products with an $\overline{\text{EVTO}}$ pin.

**CAUTION**

**The debug functions described in this section are supported by the microcontroller but whether they are usable depends on the debugger. For details on debugging, see the user's manual of the debugger.**

## 36.1 Overview of RH850/F1K OCD

### 36.1.1 Functional Overview

The on-chip debug functions described below are supported by the microcontroller.

#### (1) Debug interface

This microcontroller supports the following as debug interfaces: Nexus Interface, Low Pin Debug Interface (1-pin) - hereinafter called “LPD (1-pin)”, and Low Pin Debug Interface (4-pin) - hereinafter called “LPD (4-pin)”.

On-chip debug can be performed using these debug interfaces.

**NOTE**

When LPD (1-pin) is used, LPD is operating by the clock of MainOSC.

#### (2) Debug monitoring function

Debug-dedicated monitor program space is mounted and is used during debugging.

The basic debug functions below can be used by running a monitoring program.

- Downloading the user-created program
- Reading and writing the memory and registers
- Running the user-created program starting at any address

#### (3) On-chip break

A maximum of 12 breakpoints can be specified at any execution address. Of the 12 breakpoints, a maximum of four breakpoints can be specified for any access (access address, access data).

#### (4) Software break

Software break points can be specified at any execution address.

#### (5) Peripheral break

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for instance upon a breakpoint hit.

#### (6) Forced break

Execution of the user-created program can be interrupted forcibly.

#### (7) Forced reset

This device (microcontroller) can be forcibly reset.

#### (8) Real time RAM monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.

#### (9) Dynamic memory modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.

#### (10) Timer function

Using a 32-bit counter, the time for running the user-created program can be measured based on the clock for debug.

For the measurement accuracy, see the user's manual of the debugger.

#### (11) Mask function

Masking the following factors is possible.

- All reset sources except for a POC reset and a wakeup reset

#### (12) Hot plug-in function

Debugging can be started in normal operating mode without external reset input.

**NOTE**

When the hot plug-in function is used in power save mode, the INTDCUTDI interrupt is required to return from power save mode as the wake-up process. About the INTDCUTDI interrupt, see Table 7.4, EI Level Maskable Interrupt Sources (Channel No. 21).

#### (13) Security function

To prevent the contents of the flash memory from being read by an unauthorized person, a 128-bit ID code can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code written to the microcontroller, the flash memory cannot be accessed.

For details on how to set the ID code, see the user's manual of the debugger.

#### (14) Trace function

Execution history, data changes, etc. of the user-created program can be obtained.

**NOTE**

The trace function is only available in devices with 2-MB memory.

### 36.1.2 External Input/Output Pins

Table 36.1 External Input/Output Pins

| Pin | Special Function | PKG No | | |
|---|---|---|---|---|
| | | 100 pins | 144 pins | 176 pins |
| JP0_0 | DCUTDI/LPDI/LPDIO | √ | √ | √ |
| JP0_1 | DCUTDO/LPDO | √ | √ | √ |
| JP0_2 | DCUTCK/LPDCLK | √ | √ | √ |
| JP0_3 | DCUTMS | √ | √ | √ |
| JP0_4 | $\overline{\text{DCUTRST}}$ | √ | √ | √ |
| JP0_5 | $\overline{\text{DCURDY}}$/LPDCLKOUT | √ | √ | √ |
| JP0_6 | $\overline{\text{EVTO}}$ | | √ | √ |

## 36.2 Peripheral Break Control

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for instance upon a breakpoint hit.

During peripheral break, the peripheral modules operate as follows.

### a. Modules that stop unconditionally regardless of the EPC.SVSTOP setting

Table 36.2 Modules that Stop Unconditionally Regardless of the EPC.SVSTOP Setting

| Module |
|---|
| Window watchdog timer (WDTA) |

### b. Modules that continue to operate by the setting of emulation registers even when EPC.SVSTOP = 1

Table 36.3 Modules that Continue to Operate by the Setting of Emulation Registers even when EPC.SVSTOP = 1

| Module | Emulation Register | n |
|---|---|---|
| OS timer (OSTM) | OSTMnEMU.OSTMnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0 to 4 |
| Timer array unit D (TAUD) | TAUDnEMU.TAUDnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0 |
| Timer Array Unit B (TAUB) | TAUBnEMU.TAUBnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0, 1 |
| Timer array unit J (TAUJ) | TAUJnEMU.TAUJnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0, 1 |
| Real-Time Clock (RTCA) | RTCAnEMU.RTCAnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0 |
| Clocked serial interface G (CSIG) | CSIGnEMU.CSIGnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0, 1 |
| Clocked serial interface H (CSIH) | CSIHnEMU.CSIHnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0 to 3 |
| Timer Motor Control Function (TAPA) | TAPAnEMU.TAPAnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0 |
| Encoder Timer (ENCA) | ENCAnEMU.ENCAnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0 |
| PWM Output/Diagnostic (PWM-Diag) | PWBAnEMU.PWBAnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0 |
| | PWSAnEMU.PWSAnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0 |
| A/D converter (ADCA) | ADCAnEMU.ADCAnSVSDIS<br>0: Stops during break<br>1: Continues during break | 0, 1 |

**CAUTION**

**For details on the registers, see the register description of the corresponding section.**

### c. Modules that stop when EPC.SVSTOP = 1

Table 36.4 Modules that Stop when EPC.SVSTOP = 1

| Module |
|---|
| LIN/UART interface (RLIN3) |
| Low-Power Sampler (LPS) |

## 36.3 Hot Plug-in in Each Mode

### 36.3.1 RUN Mode

When Hot Plug-in has occurred in RUN mode, it is necessary to maintain the current state.

### 36.3.2 STOP/DeepSTOP Mode

When Hot Plug-in has occurred in STOP/DeepSTOP mode, it is necessary to transfer in RUN mode.

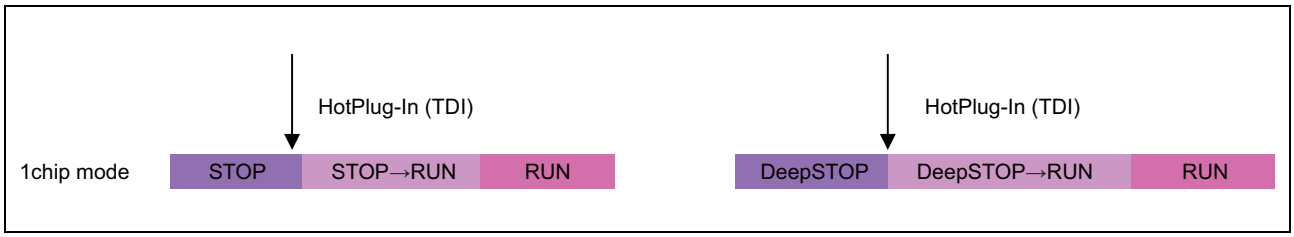

Figure 36.1 Hot Plug-in in STOP/DeepSTOP mode

### 36.3.3 Cyclic RUN Mode

When Hot Plug-in has occurred in Cyclic RUN mode, it is necessary to transfer in DeepSTOP mode and wakeup to RUN mode.

All regulators in ISO are made operating state in OCD mode.

Then, on the occurrence of interrupt of “DCUTDI Low level Detection interrupt (INTDCUTDI)”, it is necessary for a transfer order to be executed to DeepSTOP mode by user (software) if on-chip debugging is performed.

The sequence of the time when to enter to OCD mode in Cyclic RUN mode is mentioned below.

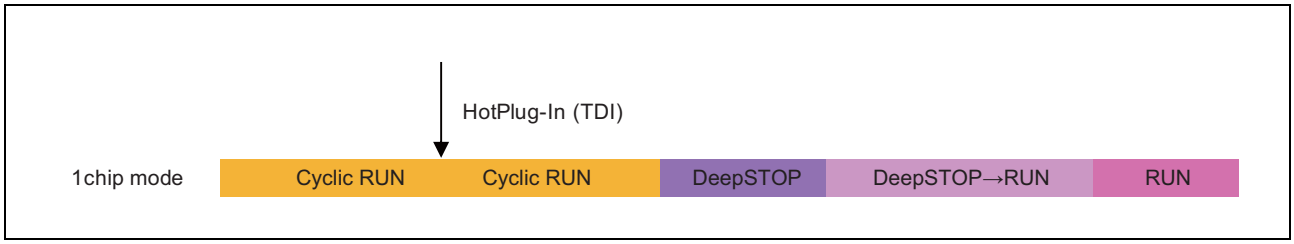

Figure 36.2 Hot Plug-in in Cyclic RUN mode

### 36.3.4 Cyclic STOP Mode

When Hot Plug-in has occurred in Cyclic STOP mode, it is necessary to transfer in Cyclic RUN mode.

Then, on the occurrence of wakeup factor of DCUTDI, it is necessary for a transfer to be executed as the same case of Cyclic RUN mode.

The sequence of the time when to enter to OCD mode in Cyclic STOP mode is mentioned below.

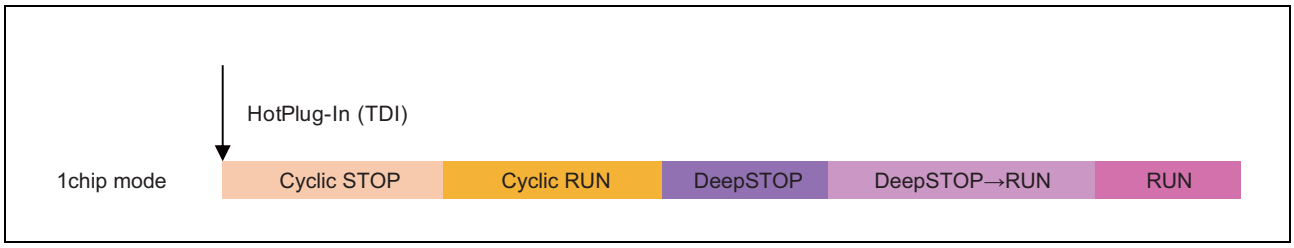

**Figure 36.3 Hot Plug-in in Cyclic STOP mode**

# 36.4 Registers

## 36.4.1 EPC — Emulation Peripheral Control Register

This register stops operation of peripheral functions (timer, serial interface, and A/D converter) in debug mode (SVSTOP).

**Access:** Accessing from the user program is prohibited.

**Address:** —

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | SVSTOP | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | — | — | — | — | — | — | — | — |

**Table 36.5 EPC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | — |
| 6 | SVSTOP | Stops operation of peripheral functions (timer, serial interface, and A/D converter) during debugging.<br>0: Does not stop operation<br>1: Stops operation |
| 5 to 0 | Reserved | — |

**NOTE**

EPC is set by the debugger. Setting by the user program is prohibited. As for the setting of the debugger, see the user's manual of the debugger.

## 36.5 Cautions on Using On-Chip Debugging

### 36.5.1 Treatment of Devices Used for Debugging

Do not install a device that was used for debugging on a mass-produced product, because the flash memory was rewritten during system debugging and thus the write/erase endurance of the flash memory cannot be guaranteed.

### 36.5.2 Reset Assertion When a Debugger is Connected

If a program in which a reset is asserted at the start of program execution is executed when a debugger is being used, the microcontroller is reset before preparation for communications between the OCD emulator and microcontroller is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. To ensure that the debugger operates properly when debugging a program in which a reset is asserted at the start of program execution, insert a wait between the start of program and reset assertion.

### 36.5.3 Restrictions When HS IntOSC is Used as the Main Clock Source Instead of MainOSC

Need to change the debug interface configuration (OPJTAG) to LPD (4-pin) in advance if E1 Emulator is used for debug.

LPD (1-pin) mode can’t be used.

### 36.5.4 Restrictions When the Writing of OCD_MD and RESET are Occur at the Same Time, or Restrictions When the Writing of MTR (DBG_CTRLP) and RESET are Occur at the Same Time

When the writing of OCD_MD and RESET are occur at the same time, or the writing of MTR (DBG_CTRLP) and RESET are occur at the same time, it is a possibility of terminal hazard.

If the debugger was disconnected, please reconnect the debugger.

### 36.5.5 Transition to DeepSTOP Mode When a Debugger is Connected

When a debugger is in use, when a program to transition to DeepSTOP mode is executed immediately following the start of the program, the microcomputer stops power supply to the Isolated area before preparation for communications between the OCD emulator and microcomputer is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. A wait must be inserted during the period from release from the reset state and transition to DeepSTOP mode by the emulator for correct operation of the debugger when debugging a program to transition to DeepSTOP mode immediately after the program starts.

# Section 37 Flash Memory

This section describes the flash memory mounted on RH850/F1K.

The first part in this section describes the characteristics of the mounted flash memory and the characteristics specific to RH850/F1K, such as the memory map, flash memory programming, and ECC.

## 37.1 Features

- Includes code flash memory and data flash memory
  The code flash memory can store program codes and data and has the user area and the extended user area.
  The data flash memory is used for storing data.
- Method of flash memory programming
  Flash memory programming via a serial interface and programming of flash memory by a user program (self-programming) are supported.
- Support for BGO (Back Ground Operation)
  The BGO function allows programs to be executed in the code flash memory while the data flash memory is being programmed/erased.
- Flash memory data security
  - Support for security functions to protect against illicit tampering with or reading out of data in the flash memory
  - Support for protection functions to protect against erroneous overwriting of the flash memory
- Option byte function
  Sets the operation after releasing reset for ports, WDTA, CVM, and CAN FD CRC(Supported only for PREMIUM), and RESETOUT.
- Support for the error detection/correction function (ECC) in the code flash memory and data flash memory
  Built-in ECC function can detect 2-bit errors and detect/correct 1-bit errors.
- Interrupts can be acknowledged in self-programming mode.

For code flash sizes and data flash sizes of each product, see the following sections.

- **Section 4.1, Address Space**

## 37.2 Structure of Memory

### 37.2.1 Mapping of Code Flash Memory

**Figure 37.1** illustrates the mapping of the code flash memory for the 2 MB, 1.5 MB, 1 MB, and 768 KB devices. The user area of the code flash memory of the RH850/F1K is divided into 8 and 32 KB blocks, which serve as the units of erasure. A single 32 KB block is also incorporated as the extended user area. The user area and extended user area are available as areas for storing the user program.

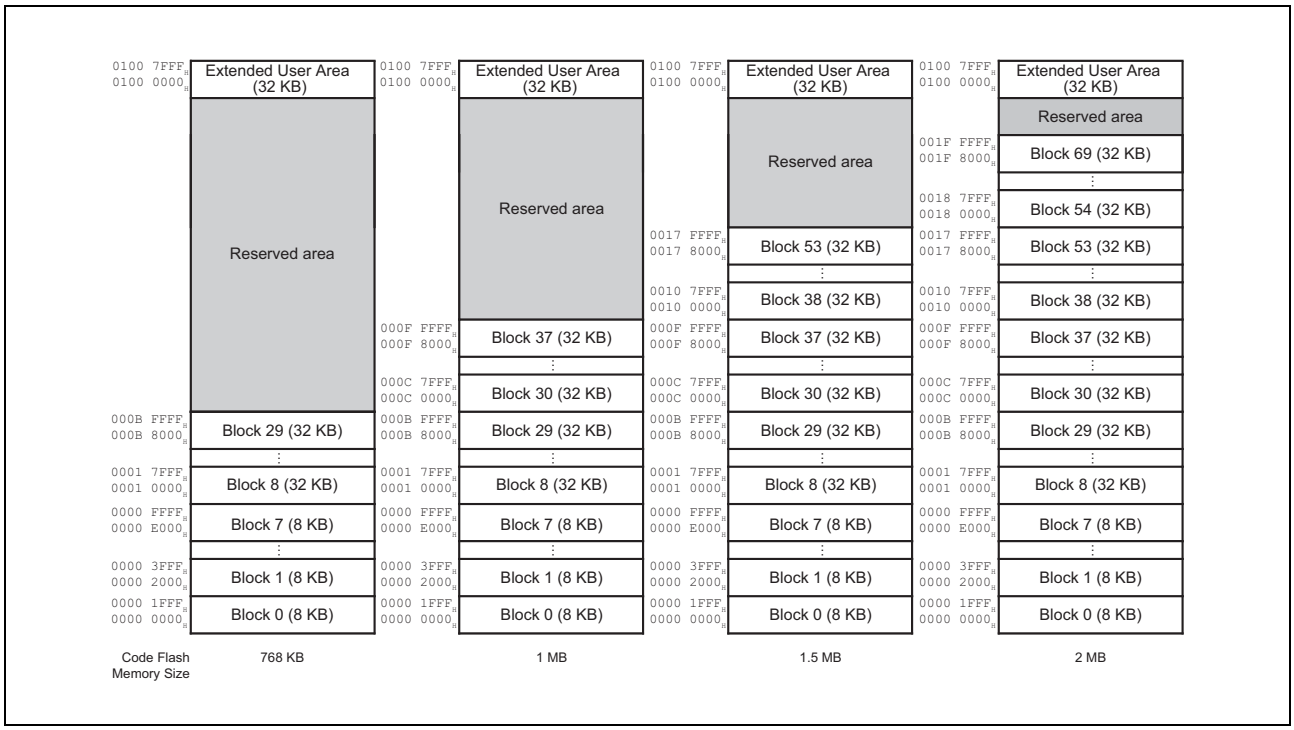

**Figure 37.1 Mapping of the Code Flash Memory**

### 37.2.2 Mapping of Data Flash Memory

The data area of the data flash memory in the RH850/F1K is divided into 64-byte blocks, with each being a unit for erasure. **Figure 37.2** shows the mapping of the data flash memory.

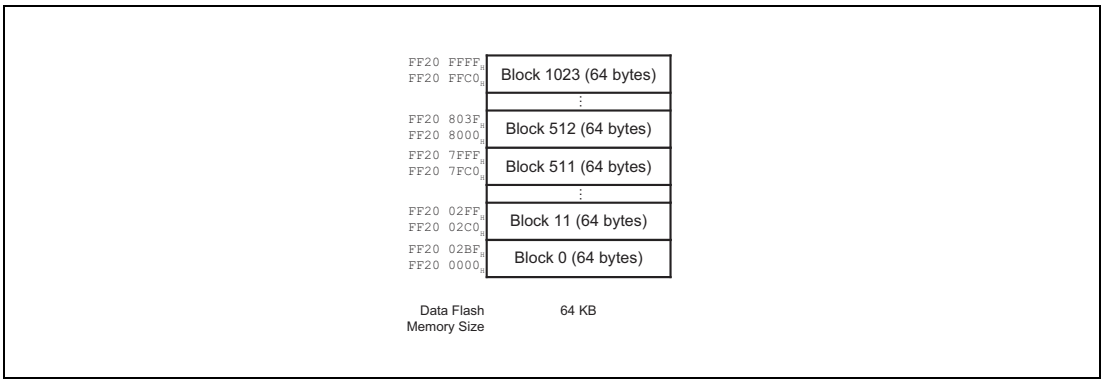

**Figure 37.2 Mapping of the Data Flash Memory**

## 37.3 Operating Modes Associated with Flash Memory

**Figure 37.3** is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, see **Section 6, Operating Mode**.

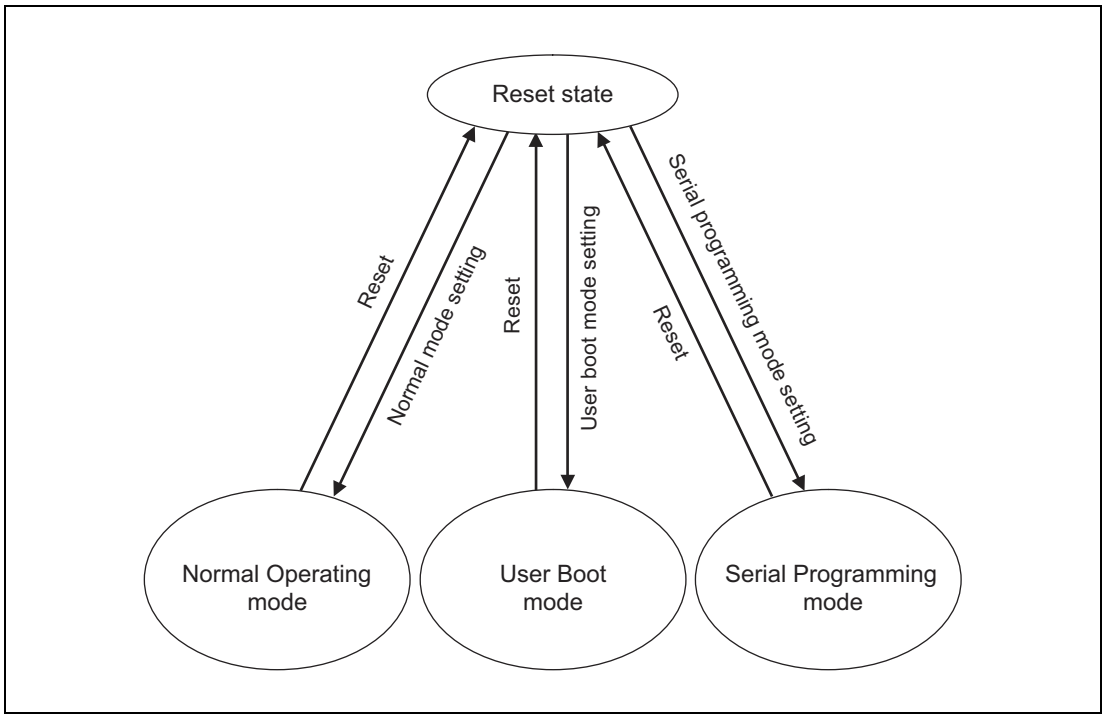

**Figure 37.3 Mode Transition Associated with Flash Memory**

**Table 37.1** shows the flash memory area which is programmable and erasable in each mode and the boot program after reset release.

**Table 37.1 Programmable and Erasable Area in Each Mode and the Boot Program after Reset Release**

| Item | Normal Operating Mode | User Boot Mode | Serial Programming Mode |
|---|---|---|---|
| Programmable and erasable area | • User area<br>• Extended user area<br>• Data area | • User area<br>• Data area | • User area<br>• Extended user area<br>• Data area |
| Boot program after reset release | Program in user area or extended user area (Changeable by using the variable reset vector) | Program in extended user area. (Reset vector is 0100 $0000_H$) | Firmware program for serial programming |

## 37.4 Functions

### 37.4.1 Functional Overview

The flash memory of the RH850/F1K can be updated via a serial interface by a dedicated flash memory programmer (serial programming), before being mounted on the target system or on a flash adapter system.

Furthermore, security functions to prohibit updating of the user program written in the flash memory are incorporated, and this can prevent tampering by third parties.

Programming by the user program (self-programming) is suited for applications where the target system program may require updating after deployed to the end user. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as external communications, etc., and this allows programming under various conditions. **Table 37.2** gives an overview of the methods of programming and the corresponding operating modes.

**Table 37.2 Methods of Programming**

| Method of Programming | Description | Operating Mode |
|---|---|---|
| Serial programming | A dedicated flash memory programmer allows on-board programming of the flash memory after the device is mounted on the target system. | Serial programming mode |
| | A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system. | |
| Self-programming | The user program that is written to code flash memory in advance by serial programming also allows updating the flash memory.<br>The background operation capability makes it possible to fetch instructions or otherwise read data in code flash memory while the data flash memory is self-programming.<br>For this reason, it is possible to update the data flash memory by executing a program written to the code flash memory.<br>Instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being updated by self-programming. In such cases, a program for updating must be transferred to the local RAM in advance and executed. | Normal operating mode<br>User boot mode |

Renesas provides a library for self-programming. For details on this library, see the user's manuals for the code flash library and data flash library of this device.

**Table 37.3** lists the functions of the flash memory. Dedicated flash memory programmer commands enable serial programming, while reading of the flash memory by a library function or the user program enables self-programming.

Table 37.3 Basic Functions at a Glance

| Function | Description | Level of Support (√: Supported, △: Conditionally Supported, —: Not Supported) | |
|---|---|---|---|
| | | Serial programming | Self-programming |
| Blank checking | This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure. | √ | △<br>(Only data flash is supported) |
| Block erasure | This is for erasing the contents of a specified block of memory. | √ | √ |
| Programming | This is for writing to a specified address. | √ | √ |
| Verification and checksum | Data that are read out from flash memory are compared with data transferred from the flash memory programmer. | √ | —<br>(Reading of data by the user program is possible) |
| Reading | Data that have been written to the flash memory are read out. | √ | √ |
| Setting for OTP (one-time programming) | A specified block of code flash memory is set for OTP (OTP can only be set, that is, it is not possible to release a block's OTP setting). | √ | √ |
| Setting an ID | An ID setting is made for use in controlling the connection of a dedicated flash memory programmer for serial programming, controlling of the on-chip debugger, and programming of the code flash memory by self-programming. | √ | √ |
| Security settings | Security settings are for use in serial programming. | √ | △<br>(Only when setting is prohibited after being permitted) |
| Protection settings | Settings for block protection of code flash memory and variable reset vector are provided. | △<br>(Setting of the reset vector values for variable reset vector function is not supported.) | √ |
| Setting of option bytes | Option bytes are set to change them from the initial values for the RH850/F1K. | √ | √ |
| Clearing the configuration | ID setting, security settings, protection settings, and option byte settings are initialized. | √ | — |

For details on serial programming, see the user’s manual of the flash programmer.

For details on self-programming, see the user’s manuals for the code flash library and data flash library of this device.

The flash memory supports various security functions.

The OTP setting and authentication of the ID code are security functions for use with serial programming and self-programming.

In serial programming, authentication of the ID code, prohibiting connection of a dedicated flash memory programmer, and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

The security functions supported by the flash memory are listed in **Table 37.4**.

For details on security function, see the *RH850/F1K Basic Security User's Manual:Hardware*.

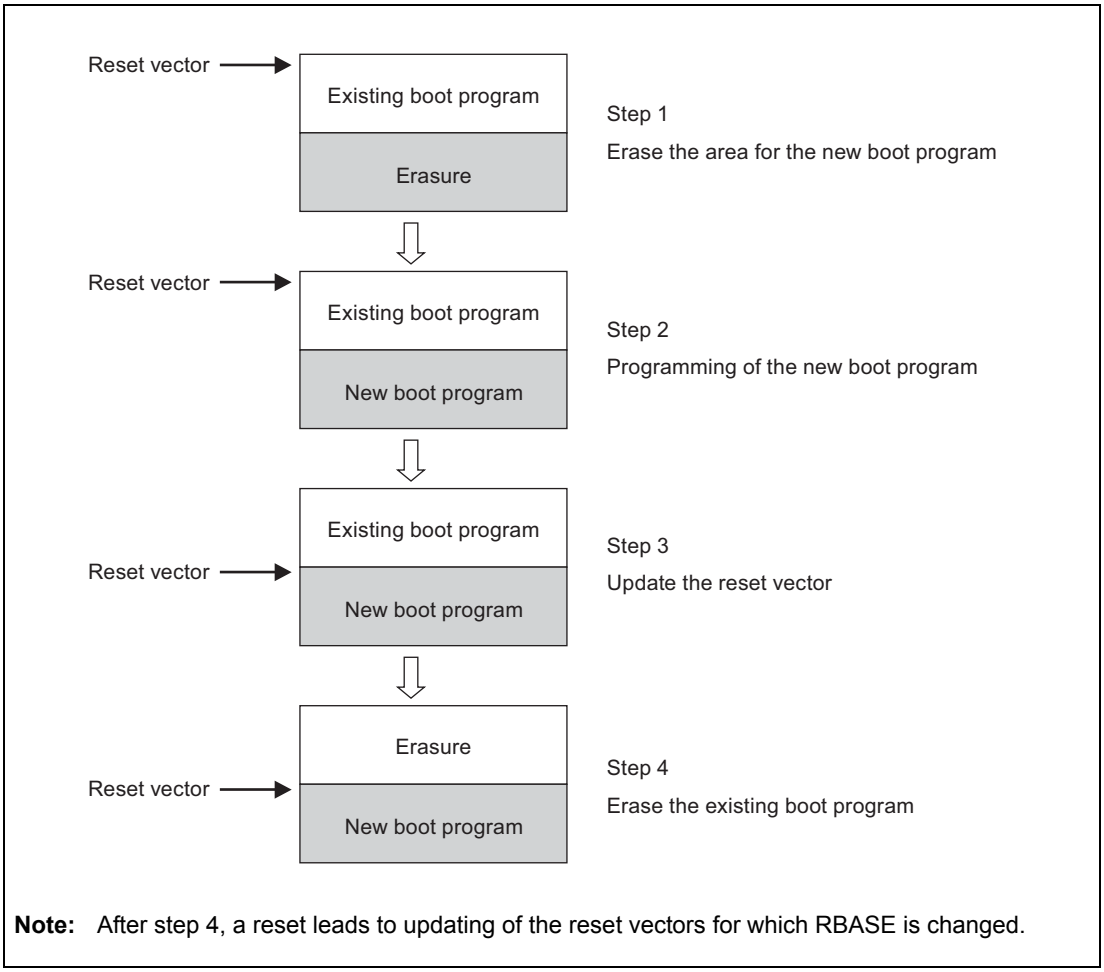
**Table 37.4 Summary of Security Functions**

| Function | Description |
|---|---|
| OTP | OTP can be individually set for each block of the user area and the extended user area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self-programming is prohibited. Once set, the OTP setting cannot be released. Furthermore, since execution of the configuration clearing command is prohibited for any area for which OTP has been set, changing a security setting from “prohibited” to “permitted” is not possible. |
| ID authentication | The result of ID authentication can be used to control the connection of a dedicated flash memory programmer for serial programming. The result of ID authentication can also be used to control enabling of self-programming. |
| Prohibition of connection of a dedicated flash memory programmer | The connection of a dedicated flash memory programmer for serial programming is prohibited. Since execution of the configuration clearing command is also prohibited when the connection of a dedicated flash memory programmer is prohibited, changing a security setting from “prohibited” to “permitted” is not possible. |
| Prohibition of block erasure commands | Block erasure commands at the time of serial programming are prohibited. Since execution of the configuration clearing command is also prohibited when block erasure commands are prohibited, changing a security setting from “prohibited” to “permitted” is not possible. |
| Prohibition of programming commands | Block erasure commands and programming commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted. |
| Prohibition of read commands | Read commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted. |

The flash memory supports various protection functions. The protection functions supported by the flash memory are listed in **Table 37.5**.

**Table 37.5 Summary of Protection Functions**

| Function | Description |
|---|---|
| Block protection | Lock bit settings can be individually made to enable or disable programming and erasure of each block of the user area and the extended user area of code flash memory. Programming and erasure by self-programming of an area for which the lock bit is set and the lock bit function is enabled are prohibited.<br>Programming or erasure can proceed again when the lock bit function is disabled after having been enabled. When a block of code flash memory is erased, the lock bit for that block is also erased. |
| Hardware protection | The level on the FLMD0 pin can be set to prohibit programming and erasure of the code flash memory.<br>- FLMD0 = 0: Programming prohibited<br>- FLMD0 = 1: Programming permitted |
| Variable reset vector | The protection settings include control of the reset vector. As shown in **Figure 37.4**, after programming of a new boot program while leaving the existing boot program in place, changing the reset vector is a safe way to change to the area holding the new boot program.<br>The areas that can be specified by using the reset vector are the user area and extended user area. |



**Note:** After step 4, a reset leads to updating of the reset vectors for which RBASE is changed.

**Figure 37.4 Utilizing the Variable Reset Vector Function to Update the Boot Program**

## 37.5 Serial Programming

A dedicated flash memory programmer can be used to handle flash memory in serial programming mode.

#### Serial programming

The microcontroller is mounted on the system board at the time of serial programming. Providing a connector to the board enables handling of the microcontroller by the flash memory programmer to proceed.

### 37.5.1 Environments for Programming

The recommended environments for handling the flash memory of the microcontroller with data are described below.

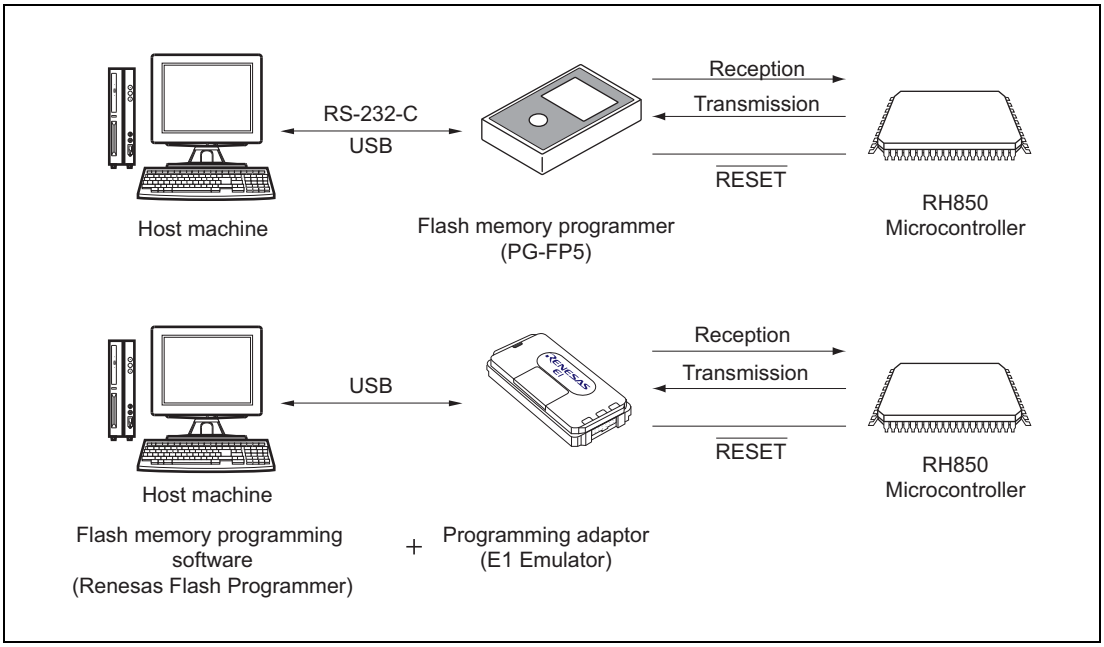


**Figure 37.5 Environments for Handling Programs of the Flash Memory**

By using the PG-FP5 flash memory programmer or the combination of the Renesas Flash Programmer (software for writing to flash memory) running on the host machine and the E1 emulator as an programming adaptor, the user is easily able to erase, program, and verify the contents of the on-chip memory of flash-memory-equipped microcontrollers from Renesas Electronics.

The PG-FP5 flash memory programmer handles programming from a host machine or programming in stand-alone mode while the Renesas Flash Programmer only handles programming from a host machine.

**NOTE**

For details on the PG-FP5, see the *PG-FP5 Flash Memory Programmer User's Manual*. For details on the Renesas Flash Programmer of flash programming software, see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

## 37.6 Communication Modes

### 37.6.1 Asynchronous Flash Programming Interface - 1-Wire UART

The single-wire asynchronous serial programming interface, 1-wire UART is connected to the flash memory programmer with the following port.

- FPDR (JP0_0): Receive data input/transmit data output

### 37.6.2 Asynchronous Flash Programming Interface - 2-Wire UART

The double-wire asynchronous serial programming interface, 2-wire UART is connected to the flash memory programmer with the following ports.

- FPDR (JP0_0): Receive data input
- FPDT (JP0_1): Transmit data output

### 37.6.3 Synchronous Flash Programming Interface CSI

The synchronous serial programming interface CSI is connected to the flash memory programmer with the following ports.

- FPDR (JP0_0): Receive data input
- FPDT (JP0_1): Transmit data output
- FPCK (JP0_2): Serial clock input

The flash memory programmer outputs the serial data clock SCK, and the microcontroller operates as a slave.

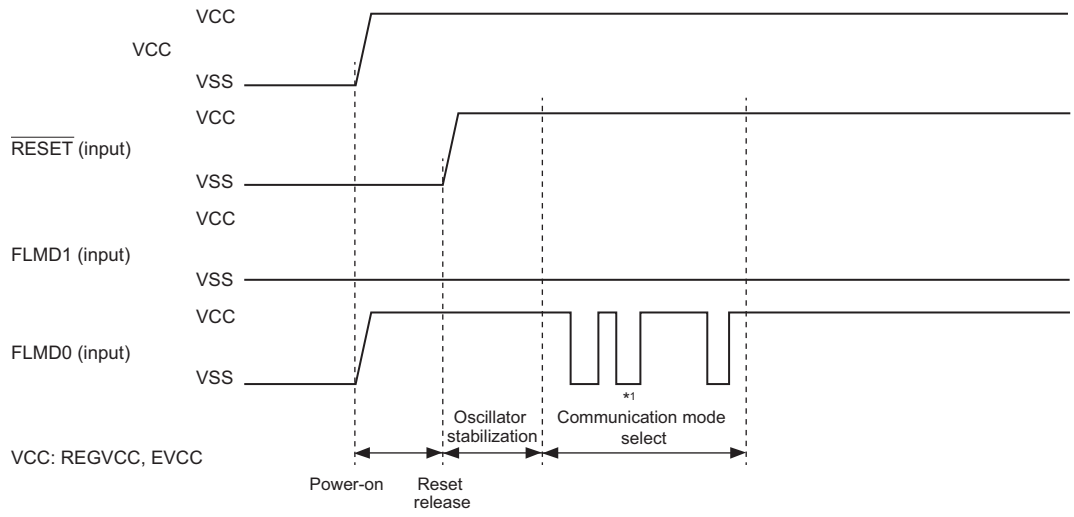
**NOTE**

For details on Renesas Flash Programmer, see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

### 37.6.4 Selection of Communication Method

In RH850/F1K, communication method can be selected by pulse input to the FLMD0 pin (up to 7 pulses) after transition to the flash memory programming mode. The FLMD0 pulse is generated by a dedicated flash memory programmer.

**Figure 37.6** shows the relation between the number of pulses and communication method.



Note 1. The number of clock cycles to be inserted depends on the communication method as in the following table.

| FLMD0 Pulse | Communication Method |
|---|---|
| 0 | 2-wire UART |
| 7 | 1-wire UART |
| 3 | CSI |
| Other than above | Setting prohibited |

**Figure 37.6 Selection of Communication Method**

# 37.7 Self-Programming

## 37.7.1 Outline

The RH850/F1K supports programming of the flash memory by the user program itself. Renesas Electronics provides a code flash library and a data flash library for use with user programs. These libraries can be used for writing to the code flash memory and to the data flash memory.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to local RAM in advance of the programming operation, and executed from the given destination to perform the programming.

The programming program can be copied to the local RAM in advance and executed to program the code flash memory.

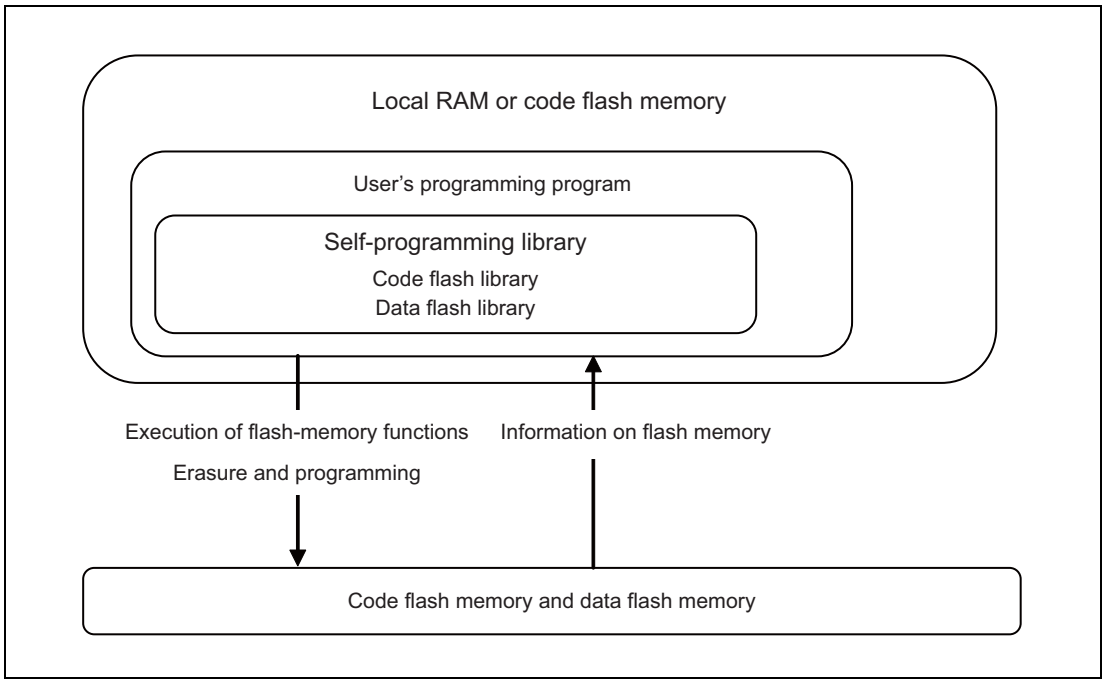


**Figure 37.7 Schematic View of Self-Programming**

For details on the self-programming of flash memory, see the user's manuals for the code flash and data flash libraries for this device.

### 37.7.2 Background Operation

Background operations can be used when the combination of the flash memory for writing and the flash memory for reading is any of those listed below.

**Table 37.6 Conditions under which Background Operation is Usable**

| Range for Writing | Range for Reading |
|---|---|
| Data flash memory | Code flash memory |

### 37.7.3 Enabling Self-Programming

The self-programming function can be activated in normal operating mode and user boot mode.

Erasure and programming of the code flash memory by the self-programming function is enabled by making the FLMD0 pin high level.

This prevents unnecessary overwriting of the program if the device operates incorrectly.

The FLMD0 pin is made high level by using one of the following methods.

- The FLMD0 pin is externally pulled up.
- The FLMD0 pin is pulled up by the FLMDCNT register.

The outline of the FLMDCNT register is described in **Section 37.7.3.1, FLMDCNT Register**.

#### 37.7.3.1 FLMDCNT Register

This register specifies the internal pull-up or pull-down of the FLMD0 pin.

The correct write sequence using the FLMDPCMD register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFA0 0000$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FLMDPUP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 37.7 FLMDCNT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | FLMDPUP | FLMD0 Pin Software Control<br>0: Pull-down selected<br>1: Pull-up selected |

## 37.8 Reading Flash Memory

### 37.8.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in normal mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception.

### 37.8.2 Reading Data Flash Memory

Configure the number of read cycles in the EEPRDCYCL register prior to reading data from data flash memory in normal mode. Once this register is properly configured, data can be read by simply accessing addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programmed again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

### 37.8.2.1 EEPRDCYCL — Data Flash Wait Cycle Control Register

This register is used to specify the number of wait cycles to be inserted when reading the data in the data flash.

Set the number of wait cycles to be inserted in the clock cycle when reading the data flash according to the operating clock frequency of the CPU ($f_{CPUCLK}$).

**Access:** This register can be read or written in 8-bit units.

**Address:** FFC5 $9810_H$

**Value after reset:** $0F_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | WAIT[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 37.8 EEPRDCYCL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | WAIT[3:0] | Number of Wait Cycles |

| WAIT [3:0] | Number of Wait Cycles | CPU Operation Frequency | | |
|---|---|---|---|---|
| | | $f_{CPUCLK}$ ≤ 40 MHz | 40 MHz < $f_{CPUCLK}$ ≤ 80 MHz | 80 MHz < $f_{CPUCLK}$ ≤ 120 MHz |
| 0000 | 1 | √ | Setting prohibited | Setting prohibited |
| 0001 | 2 | √ | √ | Setting prohibited |
| 0010 | 3 | √ | √ | √ |
| 0011 | 4 | √ | √ | √ |
| 0100 | 5 | √ | √ | √ |
| 0101 | 6 | √ | √ | √ |
| 0110 | 7 | √ | √ | √ |
| 0111 | 8 | √ | √ | √ |
| 1000 | 9 | √ | √ | √ |
| Other than above | 10 | √ | √ | √ |

**NOTES**

1. The read access time to the data flash is calculated by the number of wait cycles.

   Read access time to the data flash = {17 + (Number of wait cycles) × 4)} / CPU operating frequency

   However, the time may be changed depending on the combination of instructions before and after the execution.
2. √ indicates the number of wait cycles that can be set.

### 37.8.2.2 PRDNAMEn — Product Name Storage Register (n = 1 to 3)

This register stores the product name. The product part name is stored in 16-byte ASCII code, and PRDNAME1, PRDNAME2, and PRDNAME3 correspond to the fourth to first bytes, eighth to fifth bytes, and twelfth to ninth bytes of the product part name respectively.

**Access:** These registers are read-only registers that can be read in 32-bit units.

**Address:** PRDNAME1: FFCD 00D0$_H$
PRDNAME2: FFCD 00D4$_H$
PRDNAME3: FFCD 00D8$_H$

**Value after reset:** See **Table 37.10** to **Table 37.12**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PRDNAMEn[31:24]*1 | | | | | | | | PRDNAMEn[23:16]*1 | | | | | | | |
| Value after reset | | | | | | | | | | | | | | | | |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PRDNAMEn[15:8]*1 | | | | | | | | PRDNAMEn[7:0]*1 | | | | | | | |
| Value after reset | | | | | | | | | | | | | | | | |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. n = 1 to 3.

**Table 37.9 PRDNAMEn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | — | Product name fourth byte (PRDNAME1), eighth byte (PRDNAME2) twelfth byte (PRDNAME3) |
| 23 to 16 | — | Product name third byte (PRDNAME1), seventh byte (PRDNAME2) eleventh byte (PRDNAME3) |
| 15 to 8 | — | Product name second byte (PRDNAME1), sixth byte (PRDNAME2) tenth byte (PRDNAME3) |
| 7 to 0 | — | Product name first byte (PRDNAME1), fifth byte (PRDNAME2) ninth byte (PRDNAME3) |

**Table 37.10** to **Table 37.12** list registers related to product information.

### 37.8.2.3 CHIPIDnXX — Chip ID Register (n = 1,2, XX = LL,LH,HL,HH)

The RH850/F1K provides the option of a unique chip ID of the device.

**Access:** These registers are read-only registers that can be read in 32-bit units.

**Address:** CHIPID1LL: FFCD 00E0$_H$
CHIPID1LH: FFCD 00E4$_H$
CHIPID1HL: FFCD 00E8$_H$
CHIPID1HH: FFCD 00EC$_H$
CHIPID2LL: FFCD 00F0$_H$
CHIPID2LH: FFCD 00F4$_H$
CHIPID2HL: FFCD 00F8$_H$
CHIPID2HH: FFCD 00FC$_H$

**Value after reset:** Unique value

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CHIPIDnXX[31:24]*1 | | | | | | | | CHIPIDnXX[23:16]*1 | | | | | | | |
| Value after reset | | | | | | | | | | | | | | | | |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. n = 1, 2 XX = LL, LH, HL, HH

## 37.9 Option Bytes

The option bytes of the flash memory are an expansion area and hold data specified by the user for a variety of purposes. Initial settings for peripheral modules and so on as specified by the option bytes become effective on release from the reset state.

### 37.9.1 Option Byte Setting

Be sure to set the option byte area that corresponds to the optional functions listed below, before writing a program to the flash memory.

The optional functions specified by the option bytes are as follows.

- Function of port group JP0
- Activation code method of WDTA1
- Start mode of WDTA1
- Enabling or disabling WDTA1
- Activation code method of WDTA0
- Start mode of WDTA0
- Enabling or disabling WDTA0
- Initial value of the overflow interval time for WDTA1 and WDTA0
- Protocol of CAN FD CRC (Supported only for PREMIUM)
- Enabling or disabling of $\overline{\text{RESETOUT}}$
- Enabling the high voltage monitor
- Enabling the low voltage monitor

### 37.9.2 OPBT0 — Option Byte 0

The settings and bit positions of the option bytes are listed below.

For details on how to set an option byte, see the user's manual of the flash programmer for serial programming as well as the code flash library for self-programming.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | OPJTAG[1:0] | | — | — | WDT 1_3 | — | WDT 1_1 | WDT 1_0 | WDT 0_3 | — | WDT 0_1 | WDT 0_0 | WDT_2 | WDT_1 | WDT_0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | CANFD CRC | RESET OUTEN | — | — | — | CVM_H D_EN | CVM_L D_EN | — | — | — | — |

**Table 37.13 Option Byte 0 Settings (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When writing, write “1”. |
| 30, 29 | OPJTAG[1:0] | These bits control the function of port group JP0.<br>00: JP0 is used for general purpose/alternative function port.<br>01: JP0 is used for LPD 4-pin mode.<br>10: JP0 is used for LPD 1-pin mode.<br>11: JP0 is used for Nexus I/F. |
| 28, 27 | Reserved | When writing, write “1”. |
| 26 | WDT1_3 | Specifies the activation code method of WDTA1.<br>0: Fixed activation code<br>1: Variable activation code |
| 25 | Reserved | When writing, write “1”. |
| 24 | WDT1_1 | Specifies the start mode of WDTA1.<br>0: Software trigger start mode<br>1: Default start mode |
| 23 | WDT1_0 | Enables or disables WDTA1.<br>0: WDTA1 is disabled<br>1: WDTA1 is enabled |
| 22 | WDT0_3 | Specifies the activation code method of WDTA0.<br>0: Fixed activation code<br>1: Variable activation code |
| 21 | Reserved | When writing, write “1”. |
| 20 | WDT0_1 | Specifies the start mode of WDTA0.<br>0: Software trigger start mode<br>1: Default start mode |
| 19 | WDT0_0 | Enables or disables WDTA0.<br>0: WDTA0 is disabled<br>1: WDTA0 is enabled |
| 18 to 16 | WDT_[2:0] | Control of the overflow interval time for WDTA0 and WDTA1<br>These bits specify the reset value of WDTAnMD.WDTAnOVF[2:0]. |
| 15 to 11 | Reserved | When writing, write “1”. |
| 10 | CANFDCRC*1 | CAN FD CRC protocol<br>0: Original protocol<br>1: New protocol |
| 9 | RESETOUTEN | $\overline{\text{RESETOUT}}$ control<br>0: $\overline{\text{RESETOUT}}$ disable<br>1: $\overline{\text{RESETOUT}}$ enable |
| 8 to 6 | Reserved | When writing, write “1”. |

**Table 37.13 Option Byte 0 Settings (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 5 | CVM_HD_EN | High Voltage Monitor Enable<br>0: Disable high voltage detection<br>1: Enable high voltage detection |
| 4 | CVM_LD_EN | Low Voltage Monitor Enable<br>0: Disable low voltage detection<br>1: Enable low voltage detection |
| 3 to 0 | Reserved | When writing, write “1”. |

Note 1. This bit is supported only for PREMIUM.

### 37.9.3 OPBT1 — Option Byte 1

The settings and bit positions of the option bytes are listed below.

For details on how to set an option byte, see the user's manual of the flash programmer for serial programming as well as the code flash library for self-programming.

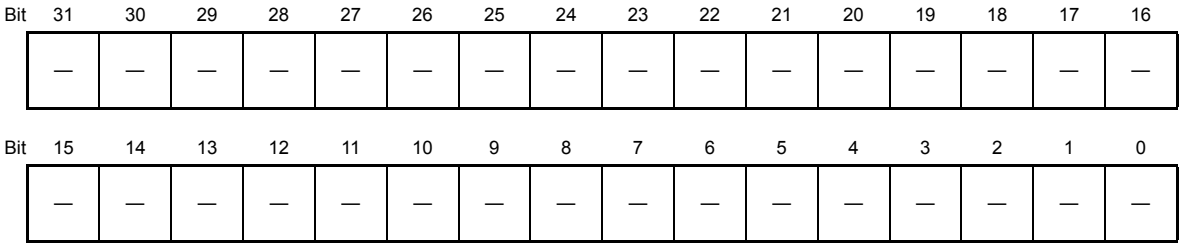

**Table 37.14 Option Byte 1 Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 10 | Reserved | When writing, write “1”. |
| 9 | Reserved | When writing, write “0”. |
| 8 to 0 | Reserved | When writing, write “1”. |

## 37.10 Usage Notes

### (1) Reading areas where programming or erasure was interrupted

When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid the reading out of undefined data, which might cause a malfunction, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.

### (2) Reading the code flash memory that has been erased but not yet been programmed again

Note that reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.

### (3) Prohibition of additional writing

Writing to a given area two or more times is not possible. When overwriting data in an area of flash memory after writing to the area has been completed, erase the area first.

### (4) Resets during programming and erasure

In the case of an external reset during programming and erasure, wait for at least the minimum value of $\overline{\text{RESET}}$ input low level width once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.

### (5) Allocation of vectors for interrupts and other exceptions during programming and erasure

Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.

### (6) Abnormal termination of programming and erasure

Even if programming/erasure ends abnormally due to the assertion of a reset by the $\overline{\text{RESET}}$ pin, the programming/erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming/erasure ends abnormally, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to ensure that the corresponding area is completely erased before using.

If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled (locked). In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state (the area is not locked).

### (7) Items prohibited during programming and erasure

Do not perform the following operations during programming and erasure.

- Set the operating voltage from the power supply outside the allowed range.
- Change the frequency of the peripheral clock.

### (8) Erasure of all flash memory before clearing the configuration

Erase the user area of code flash and all of the data area of data flash before clearing the configuration.

### (9) Restriction on serial programming when HS IntOSC is used

- 1-wire/2-wire UART mode cannot be used.
- The E1 emulator cannot be used.

# Section 38 RAM

This section describes the local RAM mounted on RH850/F1K.

## 38.1 Features

- RH850/F1K includes the following RAMs:
  - Local RAM
    The local RAM is accessible at high speed. Values in the local RAM are not retained in DeepSTOP mode.
  - Retention RAM
    The retention RAM is a part of the local RAM and is also accessible at high speed. Values in the retention RAM are retained in DeepSTOP mode.
    In addition except for the write access, even if the power-supply voltage (REGVCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage ($V_{VLVI}$).

Access time for each RAM is shown in the table below.

**Table 38.1 RAM Access Time**

| Type of Access | RAM | 1st Access (CPUCLK) | Continuous Access (CPUCLK) |
|---|---|---|---|
| Instruction fetch | Local RAM | 5 | 5 |
| | Retention RAM | 5 | 5 |
| Read access | Local RAM | 1 | 1 |
| | Retention RAM | 1 | 1 |
| Write access | Local RAM | 1 | 1 |
| | Retention RAM | 1 | 1 |

**NOTE**

There is possibility that number of access clock of above table is changed depending on the combination before and after instructions.

When RAM access is misaligned, these number is increased.

- Error detection/correction function (ECC) in the local RAM and retention RAM
  The ECC function is included, which can detect 2-bit errors and detect/correct 1-bit errors. For details, see **Section 33, Functional Safety**.

## 38.2 Memory Configuration

**Figure 38.1** shows the memory map of the local RAM and the retention RAM.

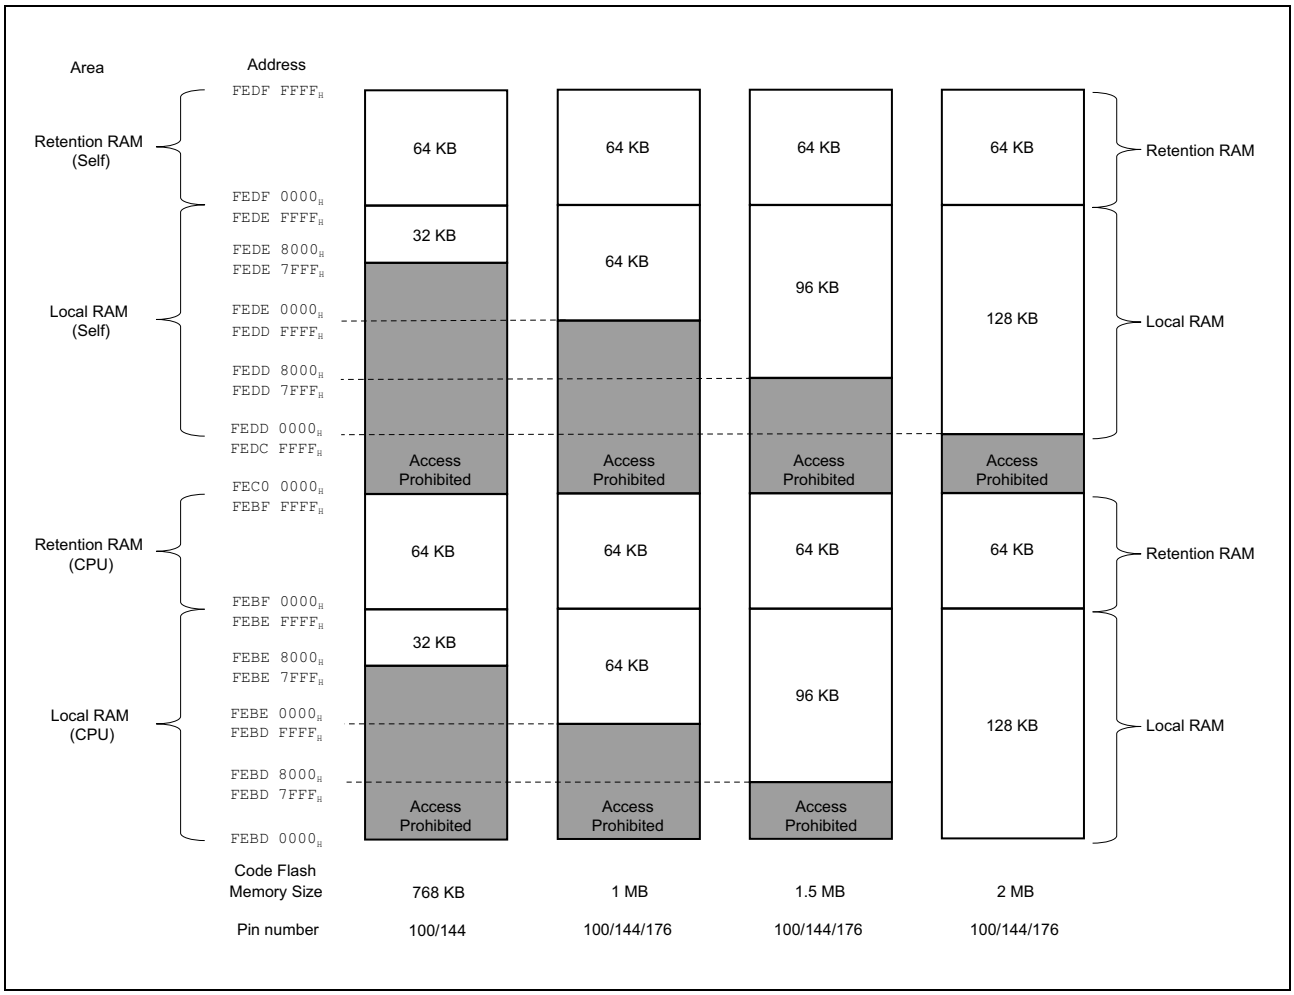

**Figure 38.1 Memory Map of the Local RAM and the Retention RAM**

## 38.3 Usage Notes

Before accessing the local or retention RAM with ECC error detection and correction enabled, initialize the RAM by setting the access size to the largest bit length.

Accessing the RAM before initializing it may lead to the detection of ECC errors. ECC errors may be detected if initialization is not handled in the maximum unit of access, for example, when 32-bit word RAM is accessed in 8- or 16-bit units.

# Section 39 Boundary Scan

This section contains a generic description of boundary scan.

The RH850/F1K has a JTAG interface and provides a boundary scan function.

## 39.1 Overview

Boundary scan is a test method defined in the IEEE standard 1149.1 that is used to test the connection between the devices mounted on the printed-circuit board. The boundary scan of the RH850/F1K conforms to IEEE Std 1149.1-2001.

## 39.2 Features

- Five control signals (DCUTCK, DCUTDI, DCUTDO, DCUTMS, and $\overline{\text{DCUTRST}}$)
- TAP controller
- Instruction register
- Bypass register
- Boundary scan register

The JTAG interface has four instructions.

- BYPASS
  Test mode conforming to the IEEE 1149.1
- EXTEST
  Test mode conforming to the IEEE 1149.1
- SAMPLE/PRELOAD
  Test mode conforming to the IEEE 1149.1
- IDCODE
  Test mode conforming to the IEEE 1149.1

**Figure 39.1** shows a block diagram of the JTAG interface.

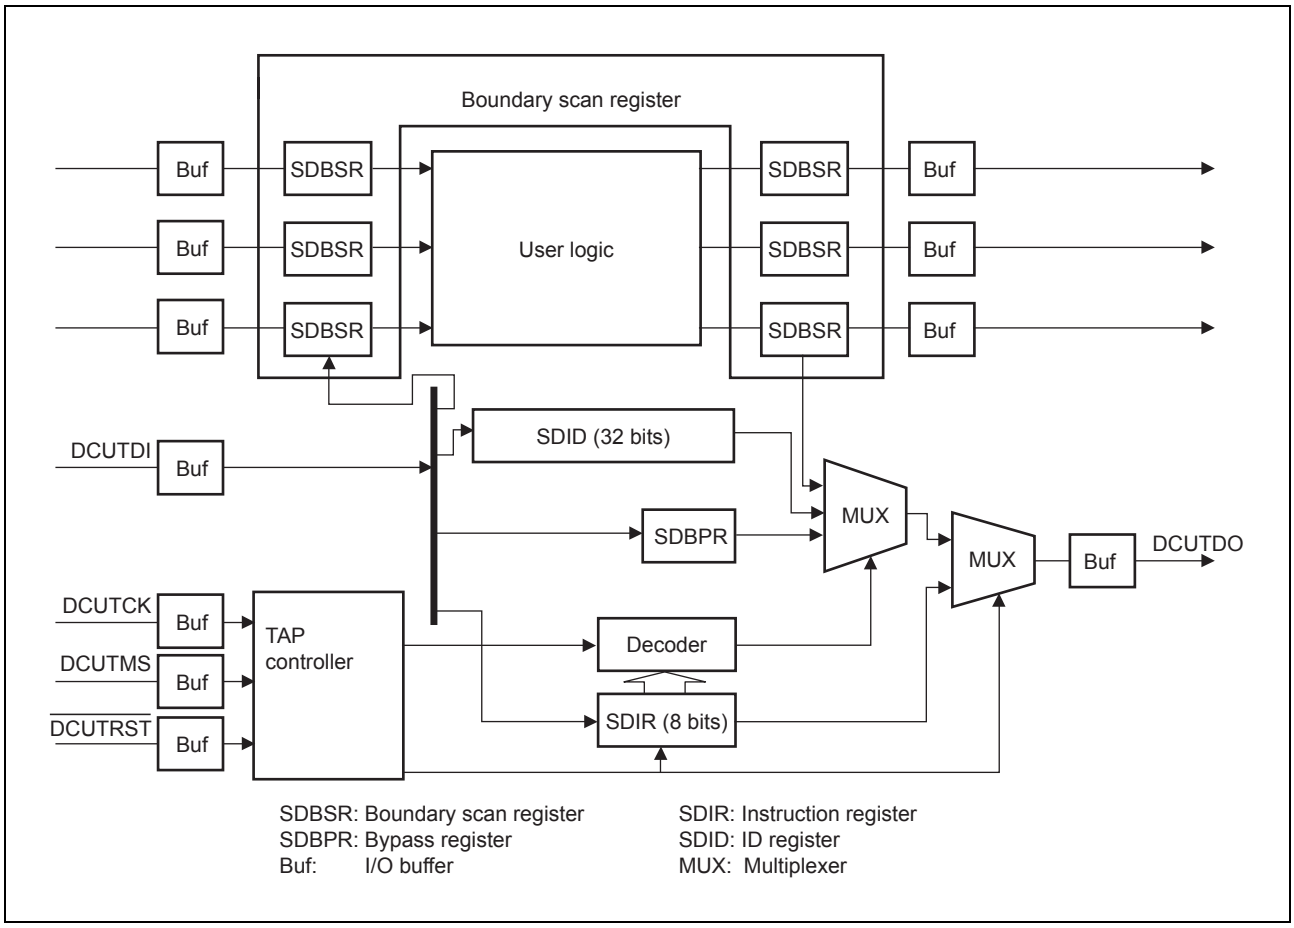

**Figure 39.1 Block Diagram of JTAG Interface**

## 39.3 External Input/Output Pins

There are five JTAG control signals: DCUTCK, DCUTDI, DCUTMS, DCUTDO, and $\overline{\text{DCUTRST}}$.

**Table 39.1** shows the pin configuration.

**Table 39.1 Pin Configuration**

| Pin Name | Description |
|---|---|
| DCUTCK | Serial data input/output clock pin<br>Data is input to DCUTDI and is output from DCUTDO in synchronization with this clock signal. |
| DCUTMS | Mode select input pin<br>Changing the level of this signal in synchronization with DCUTCK changes the state of the TAP controller. For the protocol, see **Figure 39.2, TAP Controller State Transition Diagram**. |
| $\overline{\text{DCUTRST}}$ | Reset input pin<br>A low-level input of this signal resets the JTAG interface. This signal is accepted asynchronously with DCUTCK. |
| DCUTDI | Serial data input pin<br>Data is input in synchronization with DCUTCK and sent to the JTAG interface. |
| DCUTDO | Serial data output pin<br>Data to be read from the JTAG interface is output in synchronization with DCUTCK. |

## 39.4 Register Descriptions

The JTAG interface has the following registers. None of the registers can be accessed by the CPU.

- SDIR: Instruction register
- SDID: ID register
- SDBPR: Bypass register
- SDBSR: Boundary scan register

**Table 39.2 Register Configuration**

| Register Name | Symbol | Access Size | Value After Reset*1 |
|---|---|---|---|
| Instruction register | SDIR | 8 | $55_H$ |
| ID register | SDID | 32 | See **Table 39.5, ID Register Codes** |
| Bypass register | SDBPR | 1 | Undefined |
| Boundary scan register | SDBSR | — | Undefined |

Note 1. Registers are initialized when $\overline{\text{DCUTRST}}$ pin is 0 or when TAP is in the Test-Logic-Reset state.

Instructions can be serially transferred from the serial data input pin (DCUTDI) and input to the instruction register (SDIR). The bypass register (SDBPR) is a 1-bit register, to which DCUTDI and DCUTDO are connected in BYPASS mode. The boundary scan register (SDBSR) is connected to DCUTDI and DCUTDO in SAMPLE/PRELOAD mode and EXTEST mode. The ID register (SDID) is a 32-bit register, from which the fixed code is output via DCUTDO in IDCODE mode.

**Table 39.3** shows the serial transfer types possible with the JTAG interface registers.

**Table 39.3 Serial Transfer Types**

| Register | Serial Input | Serial Output |
|---|---|---|
| SDIR | Possible | Impossible*1 |
| SDBPR | Possible | Possible |
| SDBSR | Possible | Possible |
| SDID | Impossible | Possible |

Note 1. A fixed value is read out.

### 39.4.1 Instruction Register (SDIR)

The instruction register (SDIR) is an 8-bit register that holds a boundary scan instruction. SDIR is initialized by a low-level input of $\overline{\text{DCUTRST}}$ or in the TAP Test-Logic-Reset state. Operation is not guaranteed if a reserved instruction is set in this register.

**Table 39.4 Boundary Scan Instructions**

| Instruction Code | | | | | | | | Description |
|---|---|---|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | JTAG EXTEST |
| 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | JTAG SAMPLE/PRELOAD |
| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | JTAG IDCODE (initial value) |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | JTAG BYPASS |
| Other than above | | | | | | | | Reserved |

### 39.4.2 ID Register (SDID)

The ID register (SDID) is a 32-bit register with a device specific ID.

SDID can be read from the JTAG interface when the IDCODE instruction is set, but cannot be accessed from the CPU.

For the read values, see **Table 39.2, Register Configuration** and **Table 39.5, ID Register Codes**.

**Table 39.5 ID Register Codes**

| PKG | ID Register Codes | | | |
|---|---|---|---|---|
| | 31 to 28 | 27 to 12 | 11 to 1 | 0 |
| 176 pins | 0001 | 1000 0011 0000 1000 | 0100 0100 011 | 1 |
| 144 pins | 0001 | 1000 0011 0001 0010 | 0100 0100 011 | 1 |
| 100 pins | 0001 | 1000 0011 0001 0011 | 0100 0100 011 | 1 |

### 39.4.3 Bypass Register (SDBPR)

The bypass register (SDBPR) is a 1-bit register. When SDIR is set to BYPASS mode, SDBPR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBPR is not initialized by a power-on reset or by a low-level input of $\overline{\text{DCUTRST}}$.

### 39.4.4 Boundary Scan Register (SDBSR)

The boundary scan register (SDBSR) is a shift register for controlling the external I/O pins. When SDIR is set to SAMPLE/PRELOAD or EXTEST mode, SDBSR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBSR is not initialized by a power-on reset or a low-level input of $\overline{\text{DCUTRST}}$.

## 39.5 Operation

### 39.5.1 TAP Controller

**Table 39.2** shows the state transition of the TAP controller. The transition condition is the DCUTMS value at the rising edge of DCUTCK.

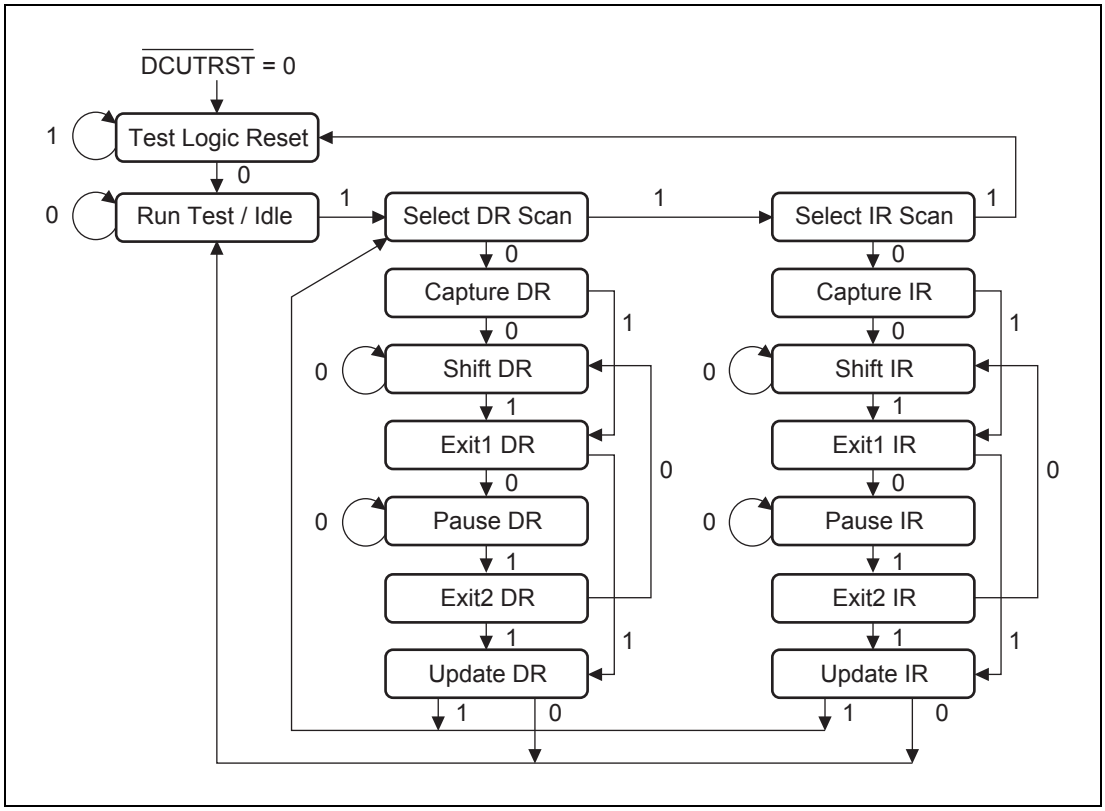

**Figure 39.2 TAP Controller State Transition Diagram**

**NOTE**

The DCUTDI value is sampled at the rising edge of DCUTCK and is shifted at the falling edge. DCUTDO is in the high-impedance state in the states other than Shift-DR and Shift-IR. A low-level input of $\overline{\text{DCUTRST}}$ causes transition to Test-Logic-Reset state asynchronously with DCUTCK.

## 39.5.2 Supported Instructions

### 39.5.2.1 BYPASS

The BYPASS instruction is a required standard instruction to operate the bypass register. This instruction shortens the shift path to achieve high-speed serial data transfer of other devices on the printed-circuit board. During execution of this instruction, the test circuit has no effect on the system circuit.

### 39.5.2.2 SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input the value to the boundary scan register from the internal circuits of this device; to output the value from the scan path; and to load data onto the scan path. During execution of this instruction, the level of the input pin of this device is sent to the internal circuits as is, and the value of the internal circuits is output to the outside via the output pin as is. Executing this instruction has no effect on the system circuit of this device.

The SAMPLE operation allows taking in the snapshots of the value to be transferred to the internal circuits from the input pin or the value to be transferred to the output pin from the internal circuits to the boundary scan register and allows reading the snapshots from the scan path. Snapshots can be taken in without preventing the normal operation of this device.

The PRELOAD operation allows setting the initial value to the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. If the EXTEST instruction is executed without PRELOAD operation, an undefined value is output from the output pin until the first scan sequence is completed (transfer to the output latch) because the parallel output latch value is always output to the output pin by the EXTEST instruction.

### 39.5.2.3 EXTEST

The EXTEST instruction is used to test the external circuits when this device is mounted on the printed-circuit board. When this instruction is executed, the output pin is used to output the test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed-circuit board; whereas the input pin is used to take in the test result from the printed-circuit board to the boundary scan register. When the EXTEST instruction is executed N times for testing, the test data for the Nth execution is scanned in at the (N - 1)th scan-out.

If the data is loaded onto the boundary scan register of the output pin in the Capture-DR state of this instruction, it is not used for testing the external circuits (replaced through shift operation).

### 39.5.2.4 IDCODE

The IDCODE instruction sets the JTAG interface pins to IDCODE mode, which is defined by the JTAG standard. When the JTAG interface is initialized (by a low-level input of $\overline{\text{DCUTRST}}$ or placing TAP in the Test-Logic-Reset state), IDCODE mode is set.

### 39.5.3 Pins Subject to Boundary Scan

All pins, excluding pins such as external clock input pins or power supply pins, are subject to boundary scan.

The pins which are not subjected to boundary scan are listed in **Table 39.6**.

**Table 39.6 Pins not Subject to Boundary Scan**

| Type | Pins |
|---|---|
| JTAG interface | DCUTCK, DCUTDI, DCUTDO, DCUTMS, $\overline{\text{DCUTRST}}$ |
| Power supply pins | REGVCC, AWOVCL, AWOVSS, ISOVCL, ISOVSS<br>EVCC, EVSS |
| Power supply pins (A/D converter) | A0VREF, A1VREF*1, A0VSS, A1VSS*1 |
| Clock | X1, X2, XT1*1, IP0_0/XT2*1 |
| Mode setting | P10_8/FLMD1, P10_1/MODE0, P10_2/MODE1 |

Note 1. Only available for 176 pin and 144 pin devices.

The following signals are only sampled in boundary scan mode.

**Table 39.7 Pins Subject to Boundary Scan (Sampling Only)**

| Function | Pin Name |
|---|---|
| Reset | $\overline{\text{RESET}}$ |
| Mode setting | FLMD0 |

The following pins are shared by the analog buffer. Accordingly, boundary scan only applies to general I/O pins.

**Table 39.8 Pins Subject to Boundary Scan (Only General I/O Pins)**

| Function | Pin Name |
|---|---|
| ADCA0 input | P8_0-12, P9_0-6, AP0_0-15 |
| ADCA1 input | P18_0-7, AP1_0-15 |

**NOTE**

In boundary scan mode, the level of the following pins must be fixed:
P10_1 = Low, P10_2 = High, and P10_8 = High

## 39.6 Usage Notes

1. Once an instruction is set, it is not modified until another instruction is issued. To issue the same instruction twice in a row, insert an instruction that has no effect on chip operation (such as BYPASS) between the instructions.
2. To start the system in boundary scan mode, de-assert $\overline{\text{DCUTRST}}$ while $\overline{\text{RESET}}$ is high. Also be sure to set DCUTMS to high before de-asserting $\overline{\text{DCUTRST}}$ and ensure that DCUTMS remains high for 600 ns + five DCUTCK clock cycles after de-asserting $\overline{\text{DCUTRST}}$.
3. For the maximum clock frequency that can be input to DCUTCK, see the Electrical Characteristics section in the Data Sheet document.
4. If serial transfer is performed exceeding the number of bits of the register connected between DCUTDI and DCUTDO, the data that is input from DCUTDI is output from DCUTDO as is.
5. If the serial transfer sequence is corrupted, be sure to assert $\overline{\text{DCUTRST}}$. In this case, transfer starts again from the beginning regardless of the point of transfer corruption.
6. Data is output via DCUTDO at the falling edge of DCUTCK.
7. To facilitate debugging, route $\overline{\text{DCUTRST}}$ on the board in such a way that patterns can be easily cut.

# Section 40 Electrical Characteristics

## 40.1 Overview

The electrical spec of this device is guaranteed by the following operational condition. But, this condition is different depends on each characteristics, so refer to each chapter for more detail.

### 40.1.1 Pin Groups

#### 40.1.1.1 176 pin

| Symbol | Pin Group Supplied by | Related Pins/Ports |
|---|---|---|
| PgR | REGVCC, AWOVSS | X1, X2, XT1, XT2/IP0_0 |
| PgE | EVCC, EVSS | Related ports: JP0, P0, P1, P2, P8, P9, P10, P11, P12, P18, P20<br>Related pins: $\overline{\text{RESET}}$, FLMD0 |
| PgA0 | A0VREF, A0VSS | Related port: AP0 |
| PgA1 | A1VREF, A1VSS | Related port: AP1 |

#### 40.1.1.2 144 pin

| Symbol | Pin Group Supplied by | Related Pins/Ports |
|---|---|---|
| PgR | REGVCC, AWOVSS | X1, X2, XT1, XT2/IP0_0 |
| PgE | EVCC, EVSS | Related ports: JP0, P0, P1, P8, P9, P10, P11, P12, P18, P20<br>Related pins: $\overline{\text{RESET}}$, FLMD0 |
| PgA0 | A0VREF, A0VSS | Related port: AP0 |
| PgA1 | A1VREF, A1VSS | Related port: AP1 |

#### 40.1.1.3 100 pin

| Symbol | Pin Group Supplied by | Related Pins/Ports |
|---|---|---|
| PgR | REGVCC, AWOVSS | X1, X2 |
| PgE | EVCC, EVSS | Related ports: JP0, P0, P8, P9, P10, P11<br>Related pins: $\overline{\text{RESET}}$, FLMD0 |
| PgA0 | A0VREF, A0VSS | Related port: AP0 |

### 40.1.2 General Measurement Conditions

#### 40.1.2.1 Common Conditions

- Power supply
  - REGVCC = EVCC = VPOC*1 to 5.5 V
  - A0VREF = 3.0 V to 5.5 V
  - A1VREF = 3.0 V to 5.5 V
  - AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V

- Capacitance of the internal regulator
  - CAWOVCL: 0.1 µF ± 30%
  - CISOVCL: 0.1 µF ± 30%
- Operating temperature
  - Tj = –40 to +130°C @R7F7015xx3AFP*
    @R7F7016yy3AFP*
  - Tj = –40 to +150°C @R7F7015xx4AFP*
    @R7F7016yy4AFP*

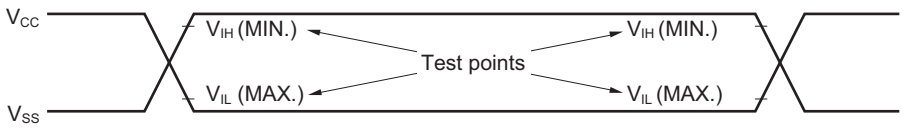
  xx = 42, 43, 46, 47, 57, 60, 61, 62, 63, 66, 67, 77, 80, 81, 82, 83, 86, 87, 97
  yy = 02, 03, 10, 11, 12, 13, 20, 21, 22, 23

  Regarding operation temperature of each product, see **Section 1.3, RH850/F1K Product Lineup**.
- Load conditions
  - CL = 30 pF

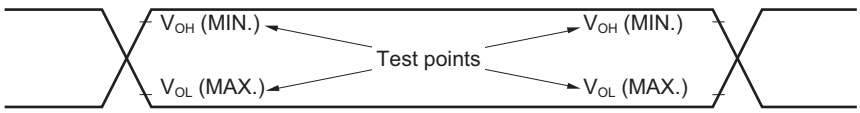
**Note 1.** "VPOC" means POC (power on clear) detection voltage. For more detail, see **Section 40.8.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

### 40.1.2.2 AC Characteristic Measurement Condition

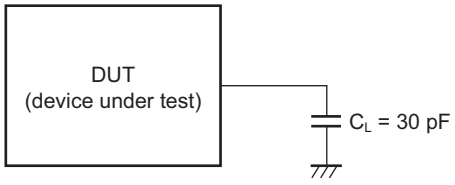
#### (1) AC test input measurement points



#### (2) AC test output measurement points



#### (3) Load conditions



**CAUTION**

**If the load capacitance exceeds 30pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30pF.**

## 40.2 Absolute Maximum Ratings

**CAUTIONS**

1. **Do not directly connect outputs (or input/outputs) to each other, power supply and ground.**
2. **Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.**
3. **When designing an external circuit ensure that the connections don't conflict with the port state of this device.**

### 40.2.1 Supply Voltages

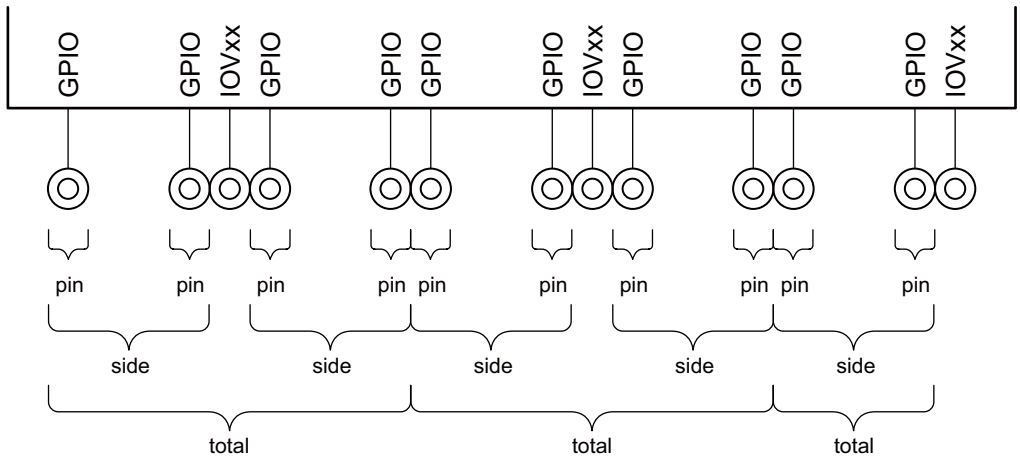
| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| System supply voltage | REGVCC | | –0.5 | | 6.5 | V |
| | AWOVSS | | –0.5 | | 0.5 | V |
| | ISOVSS | | –0.5 | | 0.5 | V |
| Port supply voltage | EVCC | | –0.5 | | 6.5 | V |
| | EVSS | | –0.5 | | 0.5 | V |
| A/D-converter supply voltage | A0VREF | | –0.5 | | 6.5 | V |
| | A1VREF | | –0.5 | | 6.5 | V |
| | A0VSS | | –0.5 | | 0.5 | V |
| | A1VSS | | –0.5 | | 0.5 | V |

### 40.2.2 Port Voltages

| Item | Pin Group*1 | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| Input voltage | PgR | VI | | –0.5 | | REGVCC + 0.5 (Do not exceed 6.5 V) | V |
| | PgE | | | –0.5 | | EVCC + 0.5 (Do not exceed 6.5 V) | V |
| | PgA0 | | | –0.5 | | A0VREF + 0.5 (Do not exceed 6.5 V) | V |
| | PgA1 | | | –0.5 | | A1VREF + 0.5 (Do not exceed 6.5 V) | V |

Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.

### 40.2.3 Port Current



**Definition of the condition:**

- **Per pin:** Output current of one GPIO
- **Per side:** Total output current of all GPIO pins on one side of one IOVxx
- **Total:** Total output current of both sides of one IOVxx

**Note:**

- **GPIO:** General-purpose I/O pin (JP0, P0, P1, P2, P8, P9, P10, P11, P12, P18, P20, AP0, AP1)
- **IOVxx:** Power supply pin for I/O pins (EVCC/EVSS, A0VREF/A0VSS, A1VREF/A1VSS)

### 40.2.3.1 176 pin

| Item | Symbol | Pin Group | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| High-level output current | IOH | PgE | Per pin | | | –10 | mA |
| | | | Per side1 (Total of P9_0 to P9_6, P20_0 to P20_5) | | | –48 | mA |
| | | | Per side2 (Total of P10_6 to P10_9, P18_0 to P18_7) | | | –48 | mA |
| | | | Per side3 (Total of P10_10 to P10_14, P11_1 to P11_7, P11_15, P12_0 to P12_2) | | | –48 | mA |
| | | | Per side4 (Total of P10_0 to P10_5) | | | –48 | mA |
| | | | Per side5 (Total of P0_0 to P0_3, P10_15, P11_0, P11_8 to P11_14, P12_3 to P12_5) | | | –48 | mA |
| | | | Per side6 (Total of JP0_3 to JP0_5, P0_4 to P0_6, P0_11 to P0_14, P1_0 to P1_3, P1_12, P1_13, P2_6, P8_2, P8_10 to P8_12) | | | –48 | mA |
| | | | Per side7 (Total of JP0_0 to JP0_2, P1_8 to P1_11, P2_0, P2_1) | | | –48 | mA |
| | | | Per side8 (Total of JP0_6, P0_7 to P0_10, P1_4 to P1_7, P1_14, P1_15, P2_2 to P2_5, P8_0, P8_1, P8_3 to P8_9) | | | –48 | mA |
| | | | Total (EVCC: side1 to side4.) | | | –60 | mA |
| | | | Total (EVCC: side4 to side8.) | | | –60 | mA |
| | | PgA0 | Per pin | | | –10 | mA |
| | | | Total (A0VREF) | | | –48 | mA |
| | | PgA1 | Per pin | | | –10 | mA |
| | | | Total (A1VREF) | | | –48 | mA |
| Low-level output current | IOL | PgE | Per pin | | | 10 | mA |
| | | | Per side1 (Total of P9_0 to P9_6, P20_0 to P20_5) | | | 48 | mA |
| | | | Per side2 (Total of P18_0 to P18_7) | | | 48 | mA |
| | | | Per side3 (Total of P10_6 to P10_14, P11_1, P11_2) | | | 48 | mA |
| | | | Per side4 (Total of P11_3 to P11_7, P11_15, P12_0 to P12_2) | | | 48 | mA |
| | | | Per side5 (Total of P10_0 to P10_5) | | | 48 | mA |
| | | | Per side6 (Total of P10_15, P11_0, P11_8 to P11_14, P12_3 to p12_5) | | | 48 | mA |
| | | | Per side7 (Total of P0_0 to P0_6, P0_11 to P0_14, P1_0 to P1_3, P1_12, P1_13, P2_6) | | | 48 | mA |
| | | | Per side8 (Total of JP0_0 to JP0_5, P1_8 to P1_11, P2_0, P2_1, P8_2, P8_10 to P8_12) | | | 48 | mA |
| | | | Per side9 (Total of JP0_6, P0_7 to P0_10, P2_2, P2_3) | | | 48 | mA |
| | | | Per side10 (Total of P1_4 to P1_7, P1_14, P1_15, P2_4, P2_5, P8_0, P8_1, P8_3 to P8_9) | | | 48 | mA |
| | | | Total (EVCC: side1 to side5.) | | | 60 | mA |
| | | | Total (EVCC: side5 to side10.) | | | 60 | mA |
| | | PgA0 | Per pin | | | 10 | mA |
| | | | Total (A0VSS) | | | 48 | mA |
| | | PgA1 | Per pin | | | 10 | mA |
| | | | Total (A1VSS) | | | 48 | mA |

### 40.2.3.2 144 pin

| Item | Symbol | Pin Group | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| High-level output current | IOH | PgE | Per pin | | | –10 | mA |
| | | | Per side1 (Total of P9_0 to P9_6, P20_4, P20_5) | | | –48 | mA |
| | | | Per side2 (Total of P10_6 to P10_9, P18_0 to P18_3) | | | –48 | mA |
| | | | Per side3 (Total of P10_10 to P10_14, P11_1 to P11_7, P11_15, P12_0 to P12_2) | | | –48 | mA |
| | | | Per side4 (Total of P0_0 to P0_3, P10_0 to P10_5, P10_15, P11_0, P11_8 to P11_14) | | | –48 | mA |
| | | | Per side5 (Total of JP0_3 to JP0_5, P0_4 to P0_6, P0_11 to P0_14, P1_0 to P1_3, P8_2, P8_10 to P8_12) | | | –48 | mA |
| | | | Per side6 (Total of JP0_0 to JP0_2, P1_8 to P1_11) | | | –48 | mA |
| | | | Per side7 (Total of JP0_6, P0_7 to P0_10, P1_4 to P1_7, P8_0, P8_1, P8_3 to P8_9) | | | –48 | mA |
| | | | Total (EVCC: side1 to side4.) | | | –60 | mA |
| | | | Total (EVCC: side4 to side7.) | | | –60 | mA |
| | | PgA0 | Per pin | | | –10 | mA |
| | | | Total (A0VREF) | | | –48 | mA |
| | | PgA1 | Per pin | | | –10 | mA |
| | | | Total (A1VREF) | | | –48 | mA |
| Low-level output current | IOL | PgE | Per pin | | | 10 | mA |
| | | | Per side1 (Total of P9_0 to P9_6, P20_4, P20_5) | | | 48 | mA |
| | | | Per side2 (Total of P18_0 to P18_3) | | | 40 | mA |
| | | | Per side3 (Total of P10_6 to P10_14, P11_1, P11_2) | | | 48 | mA |
| | | | Per side4 (Total of P11_3 to P11_7, P11_15, P12_0 to P12_2) | | | 48 | mA |
| | | | Per side5 (Total of P0_0 to P0_6, P0_11 to P0_14, P1_0 to P1_3, P10_0 to P10_5, P10_15, P11_0, P11_8 to P11_14) | | | 48 | mA |
| | | | Per side6 (Total of JP0_0 to JP0_5, P1_8 to P1_11, P8_2, P8_10 to P8_12) | | | 48 | mA |
| | | | Per side7 (Total of JP0_6, P0_7 to P0_10) | | | 48 | mA |
| | | | Per side8 (Total of P1_4 to P1_7, P8_0, P8_1, P8_3 to P8_9) | | | 48 | mA |
| | | | Total (EVCC: side1 to side5.) | | | 60 | mA |
| | | | Total (EVCC: side5 to side8.) | | | 60 | mA |
| | | PgA0 | Per pin | | | 10 | mA |
| | | | Total (A0VSS) | | | 48 | mA |
| | | PgA1 | Per pin | | | 10 | mA |
| | | | Total (A1VSS) | | | 48 | mA |

#### 40.2.3.3 100 pin

| Item | Symbol | Pin Group | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| High-level output current | IOH | PgE | Per pin | | | –10 | mA |
| | | | Per side (Total of P9_0 to P9_6) | | | –48 | mA |
| | | | Per side (Total of P0_0 to P0_3, P10_3 to P10_5, P10_15, P11_0) | | | –48 | mA |
| | | | Per side (Total of JP0_3 to JP0_5, P0_4 to P0_6, P0_11 to P0_14, P8_2, P8_10 to P8_12) | | | –48 | mA |
| | | | Per side (Total of JP0_0 to JP0_2) | | | –30 | mA |
| | | | Per side (Total of P0_7 to P0_10, P8_0, P8_1, P8_3 to P8_9) | | | –48 | mA |
| | | | Per side (Total of P10_6 to P10_9) | | | –40 | mA |
| | | | Per side(Total of P10_10 to P10_14, P11_1 to P11_7) | | | –48 | mA |
| | | | Per side (Total of P10_0 to P10_2) | | | –30 | mA |
| | | | Total (EVCC) | | | –60 | mA |
| | | PgA0 | Per pin | | | –10 | mA |
| | | | Total (A0VREF) | | | –48 | mA |
| Low-level output current | IOL | PgE | Per pin | | | 10 | mA |
| | | | Per side (Total of P9_0 to P9_6) | | | 48 | mA |
| | | | Per side (Total of P0_0 to P0_6, P0_11 to P0_14, P10_3 to P10_5, P10_15, P11_0) | | | 48 | mA |
| | | | Per side (Total of JP0_0 to JP0_5, P8_2, P8_10 to P8_12) | | | 48 | mA |
| | | | Per side (Total of P0_7 to P0_10) | | | 40 | mA |
| | | | Per side (Total of P8_0, P8_1, P8_3 to P8_9) | | | 48 | mA |
| | | | Per side(Total of P10_6 to P10_14, P11_1, P11_2) | | | 48 | mA |
| | | | Per side (Total of P11_3 to P11_7) | | | 48 | mA |
| | | | Per side (Total of P10_0 to P10_2) | | | 30 | mA |
| | | | Total (EVCC) | | | 60 | mA |
| | | PgA0 | Per pin | | | 10 | mA |
| | | | Total (A0VSS) | | | 48 | mA |

### 40.2.4 Temperature Condition

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Storage temperature | Tstg | | –55 | | 170 | °C |
| Junction temperature | Tj | R7F7015xx3AFP*<br>R7F7016yy3AFP* | –40 | | 130 | °C |
| | | R7F7015xx4AFP*<br>R7F7016yy4AFP* | –40 | | 150 | °C |

xx = 42, 43, 46, 47, 57, 60, 61, 62, 63, 66, 67, 77, 80, 81, 82, 83, 86, 87, 97
yy = 02, 03, 10, 11, 12, 13, 20, 21, 22, 23

Regarding operation temperature of each product, see **Section 1.3, RH850/F1K Product Lineup**.

## 40.3 Capacitance

**Condition:** REGVCC = EVCC = A0VREF = A1VREF = AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V, Ta = 25°C

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Input capacitance | CI*1 | f = 1 MHz<br>0 V for non measurement pins | | | 10 | pF |
| Input/output capacitance | CIO*2 | | | | 10 | pF |

Note 1. CI: Capacitance between the input pin and ground

Note 2. CIO: Capacitance between the input/output pin and ground

## 40.4 Operational Condition

### ECO

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| CPU clock frequency | $f_{CPUCLK}$ | | | | 80 | MHz |
| | $f_{CPUCLK2}$ | for OSTMn | | | 40 | MHz |
| Peripheral clock (clock domain) frequency*1 | $f_{CKSCLK_AWDTA}$ | for WDTA0 | | | 240*2 | kHz |
| | $f_{CKSCLK_ATAUJ}$ | for TAUJ0 | | | 40 | MHz |
| | $f_{CKSCLK_ARTCA}$ | for RTCA0 | | | 4 | MHz |
| | $f_{CKSCLK_AADCA}$ | for ADCA0 | | | 40 | MHz |
| | $f_{CKSCLK_AFOUT}$ | for FOUT | | | 24 | MHz |
| | $f_{CKSCLK_IPERI1}$ | for TAUD0 | | | 80 | MHz |
| | | for TAUJ1 | | | | |
| | | for ENCA0 | | | | |
| | | for TAPA0 | | | | |
| | | for PIC0 | | | | |
| | $f_{CKSCLK_IPERI2}$ | for TAUBn | | | 40 | MHz |
| | | for RS-CANn (clkc) | | | | |
| | | for PWBAn | | | | |
| | | for PWGAn | | | | |
| | | for PWSAn | | | | |
| | $f_{CKSCLK_ILIN}$ | for RLIN2m | | | 40 | MHz |
| | | for RLIN3n | | | | |
| | $f_{CKSCLK_IADCA}$ | for ADCA1 | | | 40 | MHz |
| | $f_{CKSCLK_ICANOSC}$ | for RS-CANn (clk_xincan) | | | 24 | MHz |
| | $f_{CKSCLK_ICSI}$ | for CSIGn | | | 80 | MHz |
| | | for CSIHn | | | | |
| | $f_{LS\ IntOSC}$ | for WDTA1 | | | 240*2 | kHz |
| | $f_{CKSCLK_IIIC}$ | for RIICn | | | 40 | MHz |
| | $f_{EMCLK}$ | for LPSn | | | 8 | MHz |
| Power supply | REGVCC | REGVCC = EVCC | VPOC*3 | | 5.5 | V |
| | EVCC | | | | | |
| | A0VREF | | 3.0 | | 5.5 | V |
| | A1VREF | | | | | |
| Normal operation voltage | AWOVCL | | 1.1 | 1.25 | 1.35 | V |
| | ISOVCL | | | | | |
| Limited operation voltage*4 | AWOVCL | | 1.35 | | 1.43 | V |
| | ISOVCL | | | | | |

Note 1. For clock specification of peripherals, see **Section 12, Clock Controller**.

Note 2. This frequency depends on the internal oscillator (LS IntOSC).

Note 3. “VPOC” means POC (power on clear) detection voltage (TYP. 2.85 V). For detail, see **Section 40.8.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.
In addition, the guaranteed operation in DC characteristic.
And AC characteristic is guaranteed when more than 3.0 V.
When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V

### ADVANCED, PREMIUM

| | | $f_{EX}$=20MHz | 20 | | | ns |
| | | $f_{EX}$=24MHz | 16 | | | ns |
| X1 clock Input period jitter | | | –0.3 | | 0.3 | ns |
| SubOSC frequency | $f_{SOSC}$ | Crystal | 30 | 32.768 | 38 | kHz |
| SubOSC current consumption | $I_{SOSC}$ | After stabilization | | 1.5*3 | 4*3 | µA |
| SubOSC DC operating point | $V_{SOSCDCOP}$ | | | 0.65*3 | | V |
| SubOSC oscillation stabilization time | $t_{SSTB}$ | | | *2 | | s |

Note 1. Oscillator stabilization time is time until being set (“1”) in MOSCS.MOSCCLKACT bit after MOSCE.MOSCENTRG bit is written “1”, and depends on the setting value of MOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

Note 2. Oscillator stabilization time is time until being set (“1”) in SOSCS.SOSCCLKACT bit after SOSCE.SOSCENTRG bit is written “1”, and depends on the setting value of SOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

Note 3. This is reference value.

Note 4. The following three crystal/ceramic resonator frequencies are supported: 16 MHz, 20 MHz and 24 MHz.

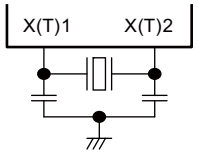
Note 5. X2 should be open and its parasitic capacitance should be less than 5pF.

**CAUTION**

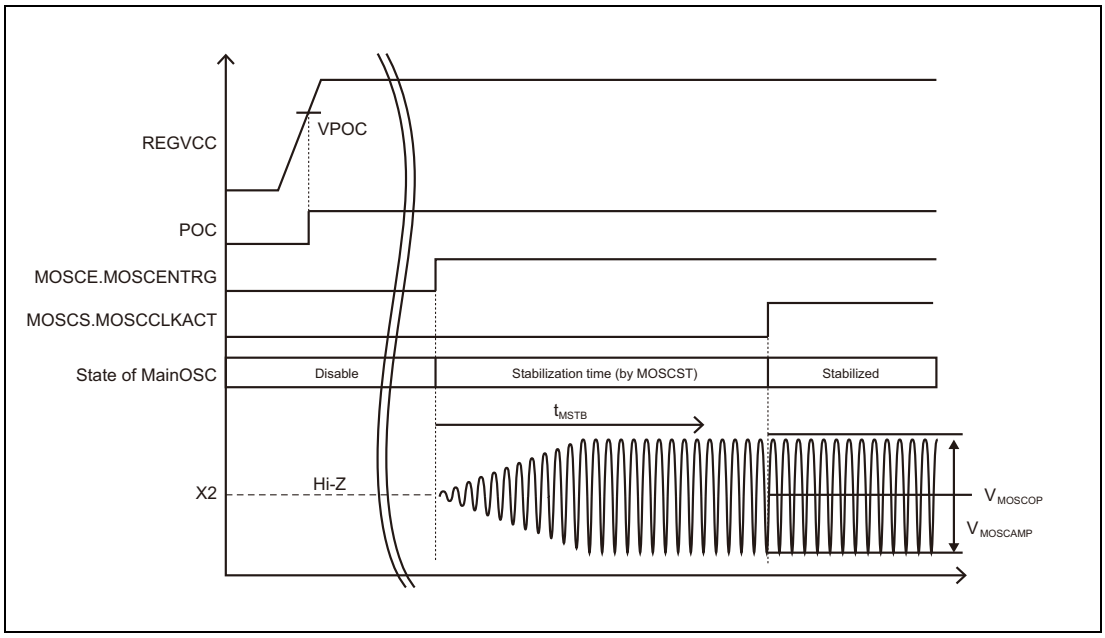
The oscillation stabilization time differs according the matching with the external resonator circuit. It is recommended to determine the oscillation stabilization time by an oscillator matching test.

**NOTE**

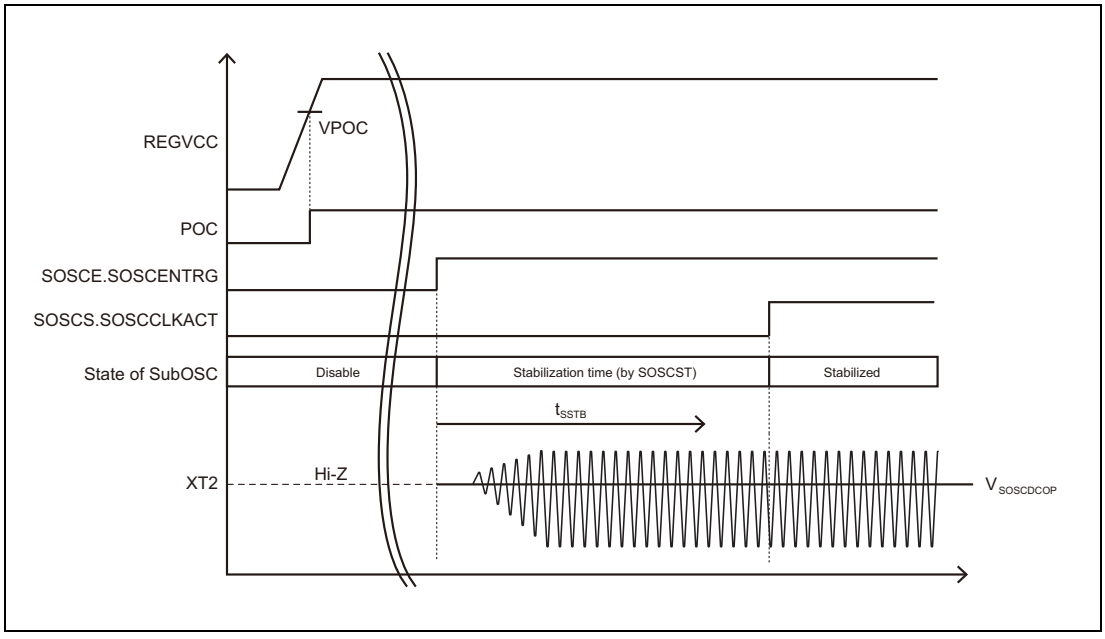
Recommended oscillator circuit is shown below.



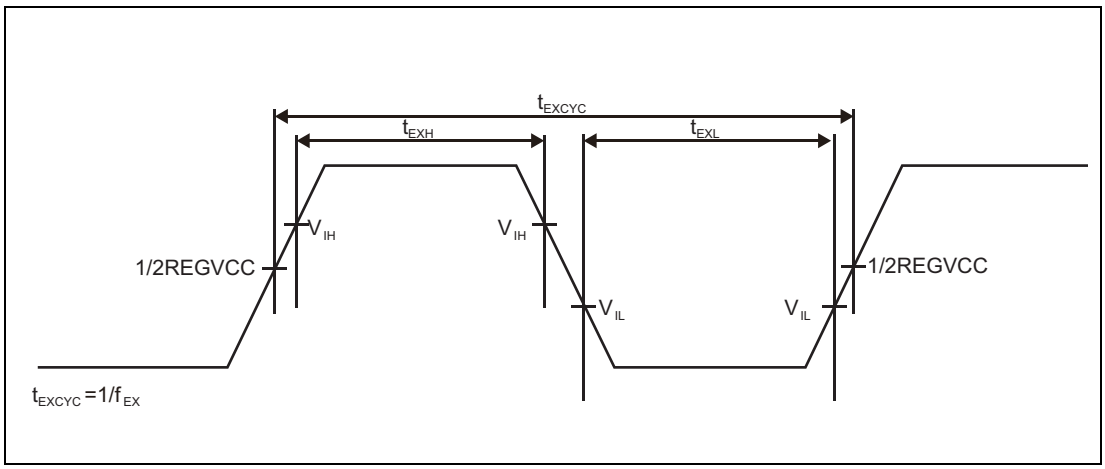
MainOSC



SubOSC



External clock



## 40.6 Internal Oscillator Characteristics

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| LS IntOSC frequency | $f_{RL}$ | | 220.8 | 240 | 259.2 | kHz |
| HS IntOSC frequency | $f_{RH}$ | | 7.6 | 8 | 8.4 | MHz |
| | | After user trimming @ trimming temp | 7.92 | 8 | 8.08 | MHz |
| HS IntOSC current consumption | $I_{RH}$ | After stabilization | | | 170*1 | µA |
| HS IntOSC oscillation stabilization time | $t_{RHSTB}$ | | | | 54.4 | µs |

Note 1. This is reference value.

## 40.7 PLL Characteristics

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Input frequency | $f_{PLLICLK}$ | MainOSC | 16 | 20 | 24 | MHz |
| | | HS IntOSC After user trimming @ trimming temp*3 | 7.92 | 8.0 | 8.08 | MHz |
| Output frequency (PLL for CPU) | $f_{CPLL}$ | ECO | 63.3 | | 80 | MHz |
| | | ADVANCED, PREMIUM | 63.3 | | 120 | MHz |
| Output frequency (PLL for Peripheral) | $f_{PPLL}$ | | 63.3 | | 80 | MHz |
| Output period jitter*1 | $t_{CPJ}$ | | –100 | | 100 | ps |
| Long term jitter*1 | $t_{LTJ}$ | term = 1 µs | –500 | | 500 | ps |
| | | term = 10 µs | –1 | | 1 | ns |
| | | term = 20 µs | –2 | | 2 | ns |
| Lock time*2 | $t_{LCKP}$ | | 104 | 112.3 | 122.1 | µs |

Note 1. This is reference value.

Note 2. Lock time is time until being set (“1”) in PLLS.PLLCLKACT bit after PLLE.PLLENTRG bit is written “1”.

Note 3. HS IntOSC supports $F_{CPLL}$ = 80 MHz only. Please use it after an evaluation in customers enough.

# 40.8 Power Management Characteristics

## 40.8.1 Regulator Characteristics

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
Tj = –40 to (depend on the product) °C, CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Input voltage | REGVCC | | VPOC*1 | | 5.5 | V |
| Output voltage | AWOVCL | AWOVCL pin | 1.15 | 1.25 | 1.35 | V |
| | ISOVCL | ISOVCL pin | 1.15 | 1.25 | 1.35 | V |
| Capacitance | CAWOVCL | AWOVCL pin | 0.07 | 0.10 | 0.13 | µF |
| | CISOVCL | ISOVCL pin | 0.07 | 0.10 | 0.13 | µF |
| Equivalent series resistance for load capacitance | RVRAWO | for CAWOVCL | | | 40*2 | mΩ |
| | RVRISO | for CISOVCL | | | 40*2 | mΩ |
| Inrush current during power-on | | | | | 120 | mA |

Note 1. “VPOC” means POC (power on clear) detection voltage (typ. 2.85V). For detail, see **Section 40.8.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

Note 2. This is reference value.

## 40.8.2 Voltage Detector (POC, LVI, VLVI, CVM) Characteristics

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | | | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|---|
| Detection voltage (REGVCC) | VPOC | POC | | | 2.7 | 2.85 | 3.0 | V |
| | VLVI0 | LVI | Rise | | 3.87 | 4.0 | 4.13 | V |
| | | | Fall | | 3.9 | 4.0 | 4.1 | V |

| | VVLVI | VLVI | | | 1.8 | 1.9 | 2.0 | V |
| Detection voltage (ISOVCL) | VCVMH | CVM | High voltage**Caution** | | 1.35 | 1.39 | 1.43 | V |
| | VCVML*8 | | Low voltage**Caution** | | 1.10 | 1.15 | 1.20 | V |
| Response time | $t_{D_POC1}$*6 | POC | At power-on (Rise) | *1 | | | 2 | ms |
| | | | | *2 | | | 6.3 | ms |
| | | | After power-on (Rise) | *3 | | | 2 | ms |
| | | | | *4 | | | 5 | ms |
| | $t_{D_POC2}$*7 | | After power-on (Fall) | *5 | | | 5 | µs |
| | $t_{D_LVI}$ | LVI | | | | | 2 | ms |
| | $t_{D_VLVI}$ | VLVI | | *3 | | | 2 | ms |
| | | | | *4 | | | 5 | ms |
| | $t_{D_CVM}$ | CVM | | | 0.2 | | 10 | µs |
| Setup time | $t_{S_LVI}$ | LVI | LVICNT0,1 bits are set to 1 (except $00_B$), then LVI is ready to operate | | | | 80 | µs |
| REGVCC minimum width | $t_{W_POC}$ | POC | | | 0.2 | | | ms |
| | $t_{W_LVI}$ | LVI | | | 0.2 | | | ms |
| | $t_{W_VLVI}$ | VLVI | | | 0.2 | | | ms |

Note 1. Voltage slope ($t_{VS}$) : 0.02 V/ms ≤ $t_{VS}$ ≤ 0.5 V/ms
Note 2. Voltage slope ($t_{VS}$) : 0.5 V/ms < $t_{VS}$ ≤ 500 V/ms
Note 3. Voltage slope ($t_{VS}$) : 0.02 V/ms ≤ $t_{VS}$ ≤ 20 V/ms
Note 4. Voltage slope ($t_{VS}$) : 20 V/ms < $t_{VS}$ ≤ 500 V/ms
Note 5. Voltage slope ($t_{VS}$) : 0.02 V/ms ≤ $t_{VS}$ ≤ 500 V/ms
Note 6. $t_{D_POC1}$ is the time from detection voltage to release of reset signal.
Note 7. $t_{D_POC2}$ is the time from detection voltage to occurrence of reset signal.
Note 8. The CVM monitors the internal voltage regulator output to ensure that ISOVCL is upper than specified minimum level.

**Caution:** A detection of the voltage ISOVCL outside the specified level of VCVMH and VCVML is not ensured by CVM.

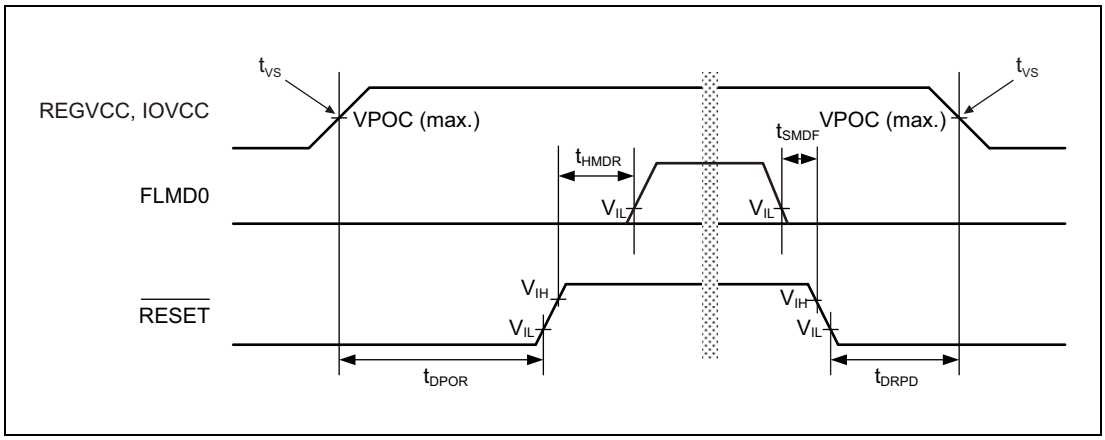
| $\overline{\text{RESET}}$ ↓ to REGVCC ↓ and IOVCC*1 ↓ delay time | $t_{DRPD}$ | | 0 | | | ms |



Note 1. IOVCC means EVCC, A0VREF and A1VREF.

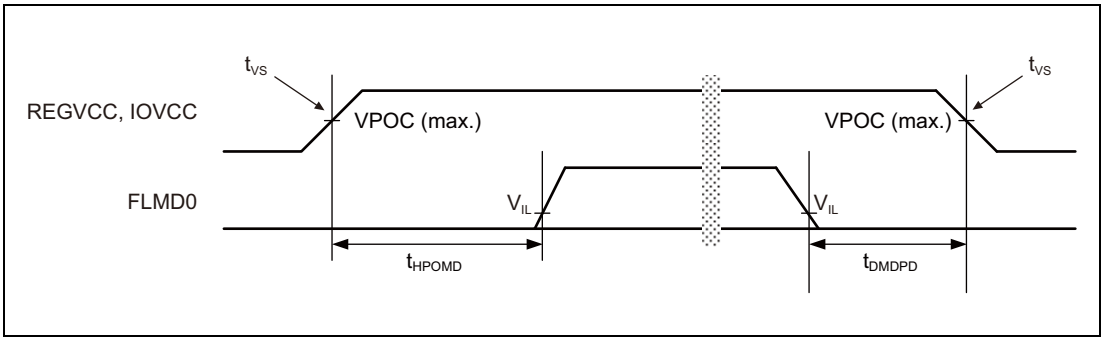
**Table 40.5 In case the $\overline{\text{RESET}}$ pin is not used and fixed to high level by pull-up*1**

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Voltage slope (REGVCC and IOVCC*2) | $t_{VS}$ | | 0.02 (= 50 ms/V) | | 500 (= 2 µs/V) | V/ms |
| REGVCC ↑ and IOVCC*2 ↑ to FLMD0 hold time | $t_{HPOMD}$ | Voltage slope ($t_{VS}$) : 0.02 V/ms ≤ $t_{VS}$ ≤ 0.5 V/ms | 2 | | | ms |
| | | Voltage slope ($t_{VS}$) : 0.5 V/ms < $t_{VS}$ ≤ 500 V/ms | 6.3 | | | ms |
| FLMD0 ↓ to REGVCC ↓ and IOVCC*2 ↓ delay time | $t_{DMDPD}$ | | 1 | | | µs |

Note 1. This operating condition is available only in normal operation mode (include self-programming mode). When the device is used in except normal operation mode, please use the $\overline{\text{RESET}}$ pin.

Note 2. IOVCC means EVCC, A0VREF and A1VREF.



### 40.8.4 CPU Reset Release Timing

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

**Table 40.6 In case the $\overline{\text{RESET}}$ pin is not used**

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| REGVCC ↑ to CPU reset release*1 | $t_{DPCRR}$ | Voltage slope ($t_{VS}$) : 0.02 V/ms ≤ $t_{VS}$ ≤ 0.5 V/ms | | | 2.58 | ms |
| | | Voltage slope ($t_{VS}$) : 0.5 V/ms < $t_{VS}$ ≤ 500 V/ms | | | 8.3 | ms |

Note 1. This is reference value.

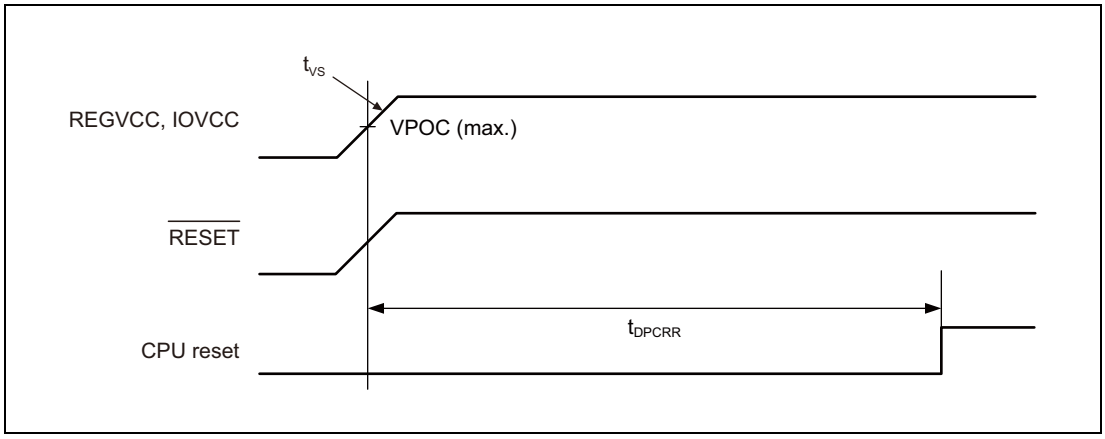


**Table 40.7 In case the $\overline{\text{RESET}}$ pin is used**

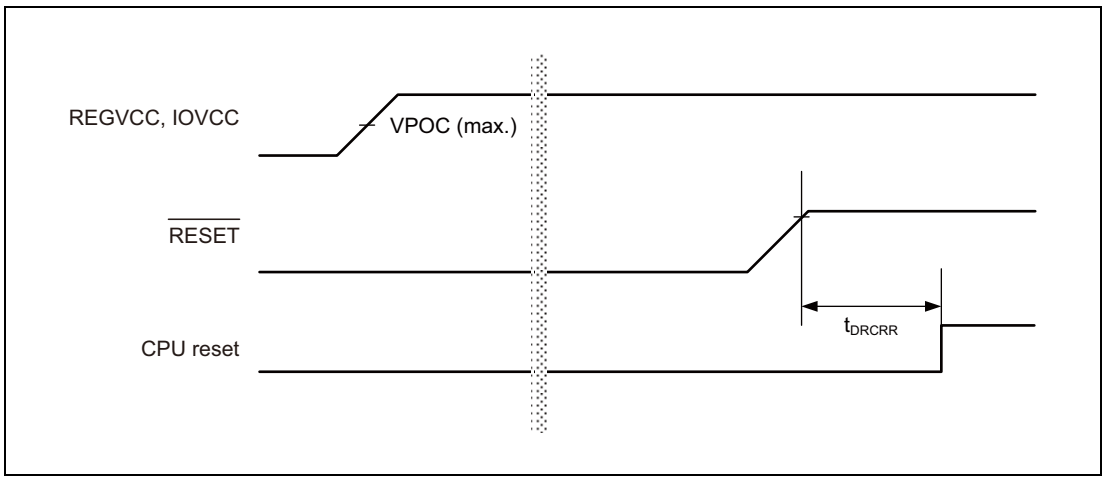
| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| $\overline{\text{RESET}}$ ↑ to CPU reset release*1 | $t_{DRCRR}$ | | | | 16*2 | µs |

Note 1. This is reference value.

Note 2. At least $t_{DPCRR}$ time is necessary reaching from VPOC (max) even if power up sequence is kept shown on **Section 40.8.3, Power Up/Down Timing**.



## 40.9 Pin Characteristics

**Condition:** Some of the conditions mentioned in this chapter can be selected by software and described in the hardware user's manual.

Note 1. Pull-down resistor for ADC diagnostic purpose. Control via ADC self-diagnostic register.

Note 2. Supports Cload: 100pF

Note 3. Supports Cload: 50pF

Note 4. Pull-down resistors for ADC diagnostic and internal pull-down purposes. For ADC diagnostic, control via ADC self-diagnostic register. For internal pull-down, control via PD register.

Note 5. TTL is selected for Boundary scan mode or Nexus in normal operating mode.

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| | | Slow mode | CL = 30 pF | | | 10 | MHz |
| | | | CL = 50 pF | | | 6 | MHz |
| | | | CL = 100 pF | | | 3 | MHz |

Note 1. “IOVCC” means the pins are assigned to the power supply (EVCC, A0VREF and A1VREF).

Note 2. Not select the analog input function of ADCn.

Note 3. When the internal pull-up resistor of FLMD0 pin is applied by FLMDCNT register, please connect 86 kΩ or more as external pull-down resistor.

Note 4. The number of pin indicates simultaneous ON.

Note 5. Measurement point: 0.1 × IOVCC to 0.9 × IOVCC

Note 6. Measurement point: 0.2 × IOVCC to 0.8 × IOVCC

## 40.9.1 Output Current

### 40.9.1.1 176 pin

| Item | Symbol | Pin Group | Condition | MIN. | TYP. | MAX. | Unit |

| | | | Total (EVSS) | | | 60 | mA |
| | | PgA0 | Total (A0VSS) | | | 16 | mA |

**Note:** For detail of the definition of “side” and “total”, see **Section 40.2.3, Port Current**.

## 40.10 Power Supply Currents

**Condition:** REGVCC, EVCC, A0VREF and A1VREF total current. But the I/O buffer is stopped.

### ECO

| Item | Symbol | Condition | | | | MIN. | TYP.*1 | MAX. | Unit |
|---|---|---|---|---|---|---|---|---|---|
| | | CPU | PLL | Tj | Peripheral*2 | | | | |
| RUN mode current | IDDR | Run (80 MHz) | Run | –40 to 150°C | Run(#1) | | 26 | 74 | mA |
| | | | | 25°C | Stop(#1) | | 20 | | mA |
| RUN mode current (During data/code flash programming) | IDDR3 | Run (80 MHz) | Run | –40 to 150°C | Run(#2) | | 37 | 89 | mA |
| HALT mode current | IDDH | Run (80 MHz) | Run | –40 to 150°C | Run(#3) | | 23 | 72 | mA |

### ADVANCED, PREMIUM

| Item | Symbol | Condition | | | | MIN. | TYP.*1 | MAX. | Unit |
|---|---|---|---|---|---|---|---|---|---|
| | | CPU | PLL | Tj | Peripheral*2 | | | | |
| RUN mode current | IDDR | Run (120 MHz) | Run | –40 to 150°C | Run(#1) | | 32 | 81 | mA |
| | | | | 25°C | Stop(#1) | | 26 | | mA |
| RUN mode current (During data/code flash programming) | IDDR3 | Run (120 MHz) | Run | –40 to 150°C | Run(#2) | | 43 | 96 | mA |
| HALT mode current | IDDH | Run (120 MHz) | Run | –40 to 150°C | Run(#3) | | 29 | 77 | mA |

| Item | Symbol | Condition | | | | MIN. | TYP.*1 | MAX. | Unit |
|---|---|---|---|---|---|---|---|---|---|
| | | CPU | PLL | Tj | Peripheral*2 | | | | |
| STOP mode current | IDDS | Stop | Stop | –40 to 90°C | Stop(#2) | | 0.7 | 12 | mA |
| | | | | 110°C | Stop(#2) | | | 17 | mA |
| | | | | 135°C | Stop(#2) | | | 31 | mA |
| DeepSTOP mode current | IDDDS | Power off | Power off | –40 to 85°C | Stop(#3) | | 50 | 470 | µA |
| | | | | 105°C | Stop(#3) | | | 830 | µA |
| | | | | 125°C | Stop(#3) | | | 1370 | µA |
| Cyclic RUN mode current | IDDCR | Run (HS IntOSC) | Stop | –40 to 90°C | Run(#4) | | 3.6 | 21 | mA |
| | | | | 115°C | Run(#4) | | | 28 | mA |
| | | | | 135°C | Run(#4) | | | 40 | mA |
| Cyclic STOP mode current | IDDCS | Stop | Stop | –40 to 90°C | Run(#5) | | 1.1 | 13 | mA |
| | | | | 110°C | Run(#5) | | | 18 | mA |
| | | | | 135°C | Run(#5) | | | 32 | mA |

Note 1. The condition of “TYP.” shows the specification with the following conditions. Also, the value is just for reference only.
- Tj = 25°C
- REGVCC = EVCC = A0VREF = A1VREF = 5.0 V
- AWOVSS = EVSS = A0VSS = A1VSS = 0 V

Note 2. Operating condition of each peripheral function is shown in the table of next page.

**Caution:** It must be ensured that the junction temperature in the Ta range remains below Tj≤150°C and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

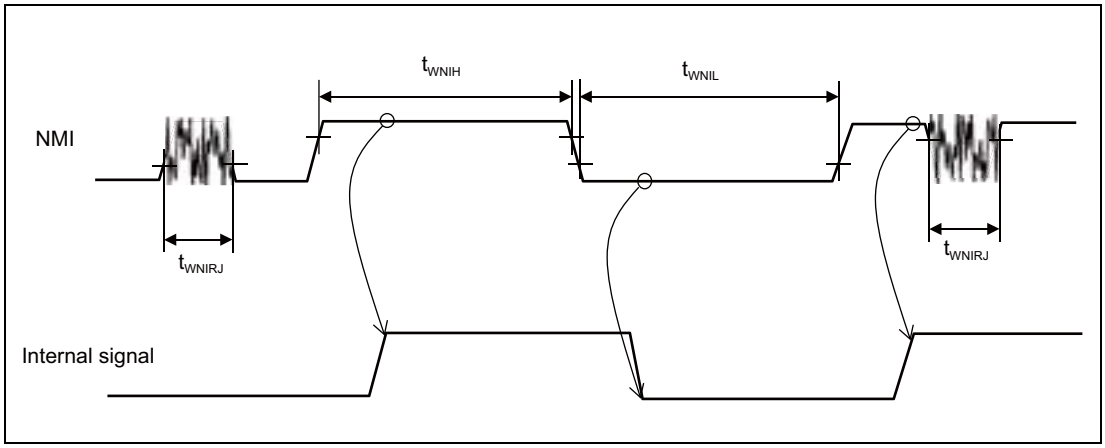
## 40.11 Interrupt Timing

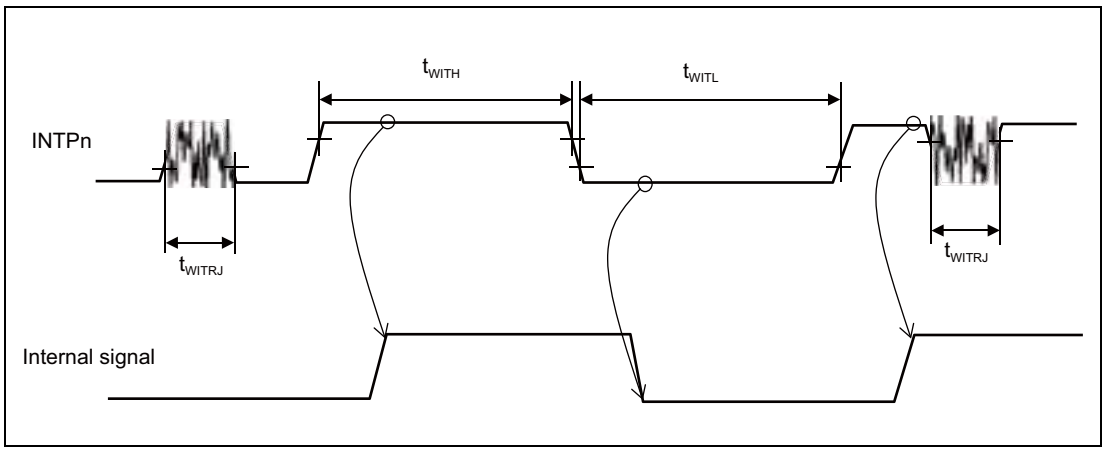
**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| NMI input high/low level width*1 | $t_{WNIH}$/ $t_{WNIL}$ | Edge detection mode | 600 | | | ns |
| | | Level detection mode (EMCLK is operated by HS IntOSC) | 756 | | | ns |
| | | Level detection mode (EMCLK is operated by LS IntOSC) | 5.13 | | | µs |
| NMI pulse rejection*2 | $t_{WNIRJ}$ | | 100 | | | ns |
| INTPn input high/low level width*1 | $t_{WITH}$/ $t_{WITL}$ | Edge detection mode | 600 | | | ns |
| | | Level detection mode (EMCLK is operated by HS IntOSC) | 756 | | | ns |
| | | Level detection mode (EMCLK is operated by LS IntOSC) | 5.13 | | | µs |
| INTPn pulse rejection*2 | $t_{WITRJ}$ | | 100 | | | ns |

Note 1. NMI and INTPn input width is needed to ensure that the internal interrupt signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.





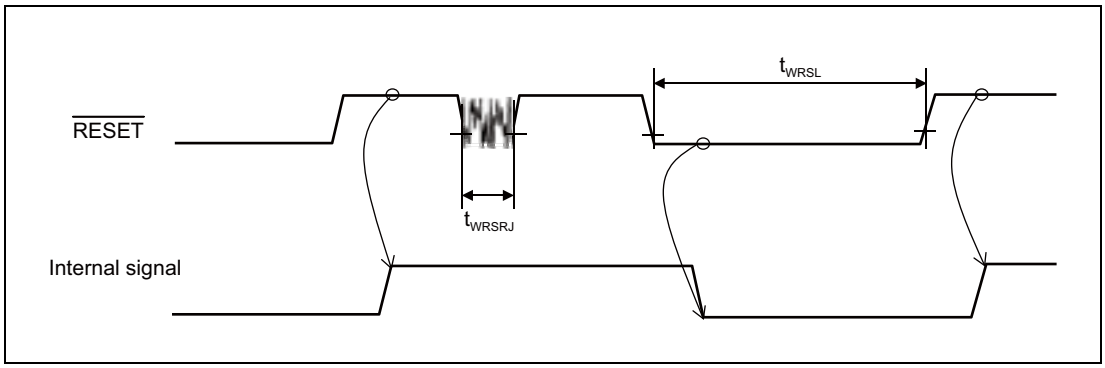
## 40.12 $\overline{\text{RESET}}$ Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| $\overline{\text{RESET}}$ input low level width*1 | $t_{WRSL}$ | Except power on | 600 | | | ns |
| $\overline{\text{RESET}}$ pulse rejection*2 | $t_{WRSRJ}$ | | 100 | | | ns |

Note 1. $\overline{\text{RESET}}$ input width is needed to ensure that the internal reset signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

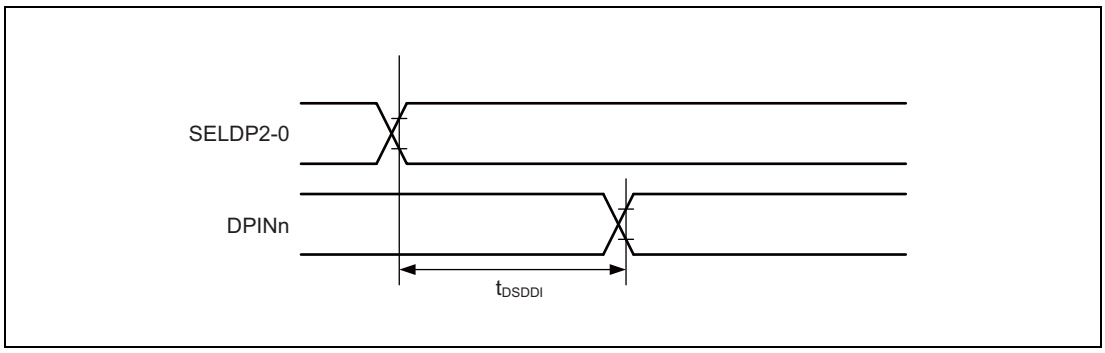


## 40.13 Low Power Sampler (DPIN input) Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| DPINn input delay time (vs SELDP2-0) | $t_{DSDDI}$ | | | | 150 | ns |

n = 7 to 0



## 40.14 CSCXFOUT Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF +/–30%, CISOVCL: 0.1µF +/–30%, Ta = –40 to (depend on the product) °C,
CL = 30 pF

<Output driver strength>

CSCXFOUT: Slow or fast mode (refer to the condition in the following table)

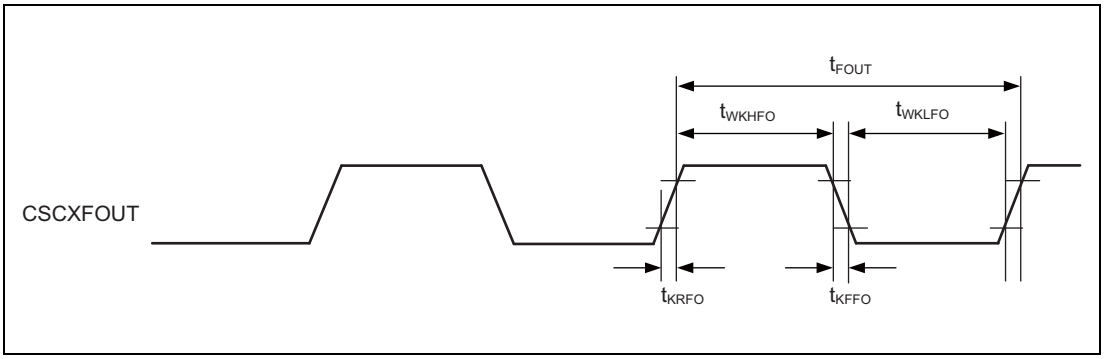
| Item | Symbol | Condition | | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| CSCXFOUT output cycle | $t_{FOUT}$ | Slow mode | | 100 (max. 10 MHz) | | | ns |
| | | Fast mode (Except JP0_3 pin)*1 | | 41.6 (max. 24 MHz) | | | ns |
| CSCXFOUT high level width | $t_{WKHFO}$ | Slow mode | N: 1*2 or even value*3 | $t_{FOUT}$ / 2 – 37 | | | ns |
| | | | N: Odd value (N ≥ 5)*3, *4 | $t_{FOUT}$ × (N+1) / 2N – 37 | | | ns |
| | | Fast mode (Except JP0_3 pin)*1 | N: 1*2 or even value*3 | $t_{FOUT}$ / 2 – 10 | | | ns |
| | | | N: Odd value (N ≥ 3)*3 | $t_{FOUT}$ × (N+1) / 2N – 10 | | | ns |
| CSCXFOUT low level width | $t_{WKLFO}$ | Slow mode | N: 1*2 or even value*3 | $t_{FOUT}$ / 2 – 37 | | | ns |
| | | | N: Odd value (N ≥ 5)*3, *4 | $t_{FOUT}$ × (N–1) / 2N – 37 | | | ns |
| | | Fast mode (Except JP0_3 pin)*1 | N: 1*2 or even value*3 | $t_{FOUT}$ / 2 – 10 | | | ns |
| | | | N: Odd value (N ≥ 3)*3 | $t_{FOUT}$ × (N–1) / 2N – 10 | | | ns |
| CSCXFOUT rise/ fall time | $t_{KRFO}$/ $t_{KFFO}$ | Slow mode | | | | 37 | ns |
| | | Fast mode (Except JP0_3 pin)*1 | | | | 10 | ns |

Note 1. JP0_3 does not support fast mode.

Note 2. When MainOSC, HS IntOSC, LS IntOSC or SubOSC is selected as source clock with the condition of N=1, the characteristics of output signal depends on the selected source clock. It is recommended to use output signal after evaluation on an actual environment.

Note 3. “N” is the value of “Clock divisor N” defined by FOUTDIV register.

Note 4. The selection of N = 3 is prohibited when slow mode is used.



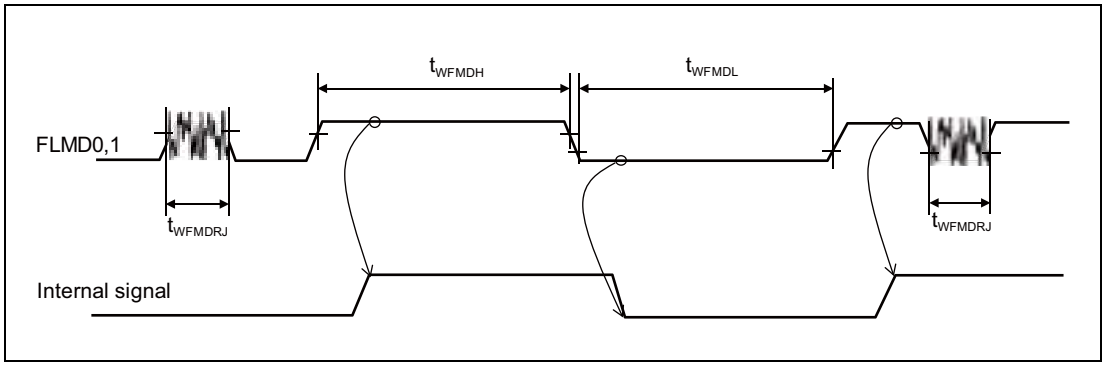
## 40.15 Mode Timing

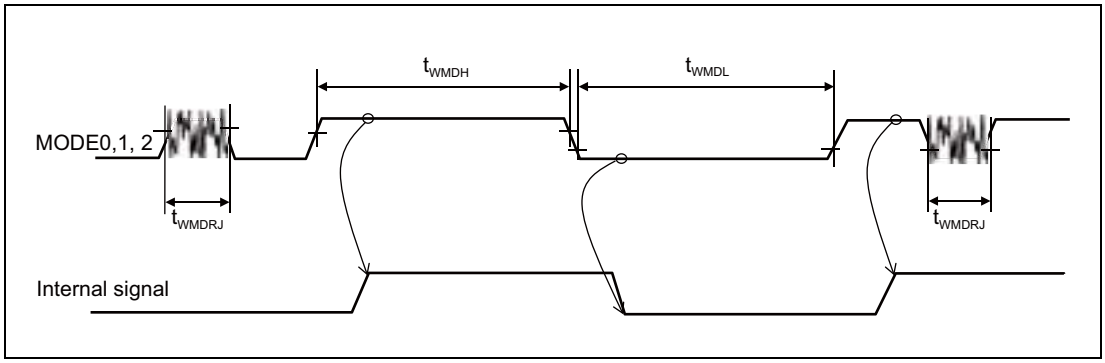
**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| FLMD0,1 input high/low level width*1 | $t_{WFMDH}$/ $t_{WFMDL}$ | | 600 | | | ns |
| FLMD0, 1 pulse rejection*2 | $t_{WFMDRJ}$ | | 100 | | | ns |
| MODE0, 1, 2 input high/low level width*1 | $t_{WMDH}$/ $t_{WMDL}$ | | 600 | | | ns |
| MODE0, 1, 2 pulse rejection*2 | $t_{WMDRJ}$ | | 100 | | | ns |

Note 1. FLMD0,1 and MODE0,1, 2 input width is needed to ensure that the internal mode signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.





## 40.16 Timer Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| TAUD0Iy input high/low level width (y = 0 to 15) | $t_{WTDIH}$/ $t_{WTDIL}$ | | n × Tsamp + 20[*1, *2] | | | ns |
| TAUD0Oy output cycle (y = 0 to 15) | $t_{TDCYK}$ | Slow mode | | | 10 | MHz |
| TAUBxIy input high/low level width (x = 0, 1, y = 0 to 15) | $t_{WTBIH}$/ $t_{WTBIL}$ | | n × Tsamp + 20[*1, *2] | | | ns |
| TAUBxOy output cycle (x = 0, 1, y = 0 to 15) | $t_{TBCYK}$ | Slow mode | | | 10 | MHz |
| TAUJxIy input high/low level width[*3] (x = 0, 1, y = 0 to 3) | $t_{WTJIH}$/ $t_{WTJIL}$ | | 600 | | | ns |
| TAUJxIy pulse rejection[*4] | $t_{WTIJRJ}$ | | 100 | | | ns |
| TAUJxOy output cycle (x = 0, 1, y = 0 to 3) | $t_{TJCYK}$ | Slow mode | | | 10 | MHz |
| RTCA0OUT output cycle | $t_{RTCYK}$ | | | 1 | | Hz |
| TAPA0ESO input high/low level width[*3] | $t_{WESIH}$/ $t_{WESIL}$ | | 600 | | | ns |
| TAPA0ESO pulse rejection[*4] | $t_{WESIRJ}$ | | 100 | | | ns |
| TAPA0Uy/Vy/Wy output cycle (y = P, N) | $t_{TPCYK}$ | Slow mode | | | 10 | MHz |
| ENCA0TINy input high/low level width (y = 0, 1) | $t_{WENTIH}$/ $t_{WENTIL}$ | | n × Tsamp + 20[*1] | | | ns |
| ENCA0Ey input high/low level width (y = 0,1,C) | $t_{WENyIH}$/ $t_{WENyIL}$ | | n × Tsamp + 20[*1] | | | ns |
| PWGAyO output cycle (y = 0 to 71) | $t_{PWGCYK}$ | Slow mode | | | 10 | MHz |

Note 1. n: Sampling number of the digital noise filter for each input.
Tsamp: Sampling time of the digital noise filter for each input.

Note 2. Input more than 1 count clock width of each timer counter channel.

Note 3. TAUJxIy and TAPA0ESO input width is needed to ensure that the internal timer input signal is activated.

Note 4. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

## 40.17 RLIN2/RLIN3 timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| RLIN3 transfer rate | | LIN specification | 1 | | 20 | kbps |
| | | LIN extended baud rate | 1 | | 115.2*1 | kbps |
| | | UART function | | | 1.5 | Mbps |
| RLIN2 transfer rate | | LIN specification | 1 | | 20 | kbps |

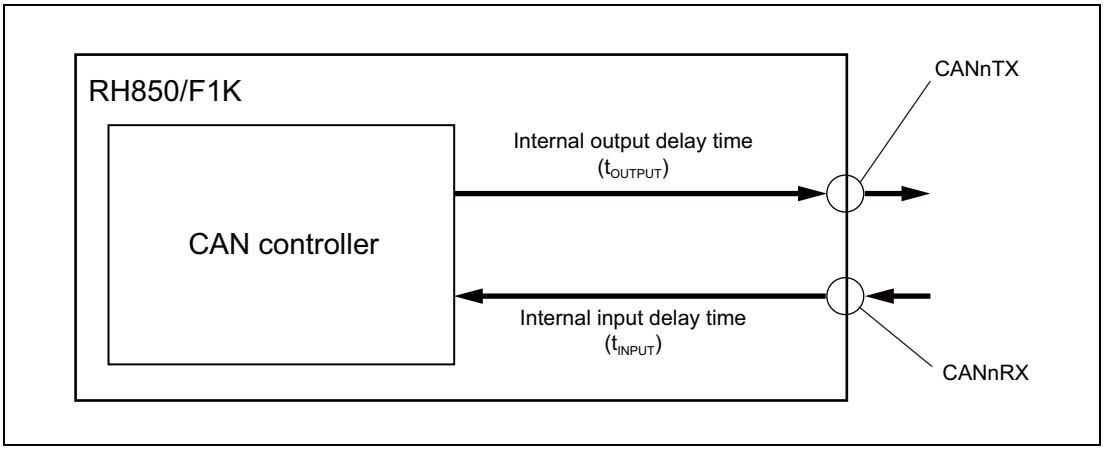
Note 1. The LIN extended baud rate is not part of the LIN standard specification.

## 40.18 RS-CAN Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Transfer rate | | ECO, ADVANCED | | | 1 | Mbps |
| | | PREMIUM<br>Data rate | | | 5<br>(@ TQ = 8) | Mbps |
| Internal delay time*1 | $t_{NODE}$ | | | | 100 | ns |

Note 1. $t_{NODE}$ = Internal input delay time ($t_{INPUT}$) + Internal output delay time ($t_{OUTPUT}$)



# 40.19 CSI Timing

## 40.19.1 CSIG Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF +/–30%, CISOVCL: 0.1µF +/–30%, Ta = –40 to (depend on the product) °C,
CL = 30 pF

**Table 40.8 CSIG Timing (Master Mode)**

<Output driver strength>

CSIGnSO, CSIGnSC (output): Fast mode

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Macro operation clock cycle time | $t_{KCYGn}$ | | 12.5 (max. 80 MHz) | | | ns |
| CSIGnSC cycle time | $t_{KCYMGn}$ | | 100 | | | ns |
| CSIGnSC high level width | $t_{KWHMGn}$ | | 0.5 × $t_{KCYMGn}$ – 10 | | | ns |
| CSIGnSC low level width | $t_{KWLMGn}$ | | 0.5 × $t_{KCYMGn}$ – 10 | | | ns |

| | $t_{SSCSBHn1}$ | CSIHnCFGx.CSIHnDAP = 1 | (CSSETUP + 0.5) × $t_{KCYMHn}$ – 23 | | | ns |
| CSIHnCSS0-7 hold time (vs. CSIHnSC) | $t_{HSCSBHn0}$ | CSIHnCTL1.CSIHnSIT = 0 | CSSHOLD × $t_{KCYMHn}$ – 5 | | | ns |
| | $t_{HSCSBHn1}$ | CSIHnCTL1.CSIHnSIT = 1 | (CSSHOLD + 0.5) × $t_{KCYMHn}$ – 5 | | | ns |

n = 0 to 3

**NOTE**

CSIDLE: Setting value of CSIHnCFGx.CSIHnIDx[2:0]

CSSETUP: Setting value of CSIHnCFGx.CSIHnSPx[3:0]

CSSHOLD: Setting value of CSIHnCFGx.CSIHnHDx[3:0]

x: Depends on number of the chip select signals.

**CAUTION**

When the serial clock level is changed during the communication (CSIHnCFGx.CSIHnCKPx) and the IDLE has a setting of 0.5 transmission clock cycles, an inactive width time $t_{WSCSBHn}$ of "0.5 × $t_{KCYMHn}$" is added.

### Table 40.11 CSIH Timing (Slave Mode)

<Output driver strength>
CSIHnSO, CSIHnSC (output): Fast mode
CSIHnRYO: Slow mode

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Macro Operation clock cycle time | $t_{KCYHn}$ | | 12.5 (max. 80 MHz) | | | ns |
| CSIHnSC cycle time | $t_{KCYSHn}$ | | 200 | | | ns |
| CSIHnSC high level width | $t_{KWHSHn}$ | | $0.5 \times t_{KCYSHn} - 10$ | | | ns |
| CSIHnSC low level width | $t_{KWLSHn}$ | | $0.5 \times t_{KCYSHn} - 10$ | | | ns |
| CSIHnSI setup time (vs. CSIHnSC) | $t_{SSISHn}$ | | 20 | | | ns |
| CSIHnSI hold time (vs. CSIHnSC) | $t_{HSISHn}$ | | $t_{KCYHn} + 5$ | | | ns |
| CSIHnSO output delay (vs. CSIHnSC) | $t_{DSOSHn}$ | | | | 30 | ns |
| CSIHnRYO output delay | $t_{SRYOHn}$ | | | | 38 | ns |
| $\overline{\text{CSIHnSSI}}$ setup time (vs. CSIHnSC) | $t_{SSSISHn}$ | | $0.5 \times t_{KCYSHn} - 5$ | | | ns |
| $\overline{\text{CSIHnSSI}}$ hold time (vs. CSIHnSC) | $t_{HSSISHn}$ | | $t_{KCYHn} + 5$ | | | ns |

n = 0 to 3

## 40.20 RIIC Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C

**Table 40.12 RIIC Timing (Normal Mode)**

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| RIIC0SCL clock period | $f_{CLK}$ | | | | 100 | kHz |
| Bus free time (between stop/start condition) | $t_{BUF}$ | | 4.7 | | | µs |
| Hold time*1 | $t_{HD}$: STA | | 4.0 | | | µs |
| RIIC0SCL clock low-level width | $t_{LOW}$ | | 4.7 | | | µs |
| RIIC0SCL clock high-level time | $t_{HIGH}$ | | 4.0 | | | µs |
| Setup time for start/restart condition | $t_{SU}$: STA | | 4.7 | | | µs |
| Data hold time | $t_{HD}$: DAT | CBUS compatible master | 5.0 | | | µs |
| | | $I^2C$ mode | 0*2 | | | µs |
| Data setup time | $t_{SU}$: DAT | | 250 | | | ns |
| Stop condition setup time | $t_{SU}$: STO | | 4.0 | | | µs |
| Capacitance load of each bus line | Cb | | | | 400 | pF |

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIIC0SDA signal (at VIH min. of RIIC0SCL signal). In order to occupy the undefined area at the falling edge of RIIC0SCL.

**Note:** If the system does not extend the RIIC0SCL signal low hold time ($t_{Low}$), only the maximum data hold time ($t_{HD}$: DAT) needs to be satisfied.

**Table 40.13 RIIC Timing (Fast Mode)**

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| RIIC0SCL clock period | $f_{CLK}$ | | | | 400 | kHz |
| Bus free time (between stop/start condition) | $t_{BUF}$ | | 1.3 | | | µs |
| Hold time*1 | $t_{HD}$: STA | | 0.6 | | | µs |
| RIIC0SCL clock low-level width | $t_{LOW}$ | | 1.3 | | | µs |
| RIIC0SCL clock high-level time | $t_{HIGH}$ | | 0.6 | | | µs |
| Setup time for start/restart condition | $t_{SU}$: STA | | 0.6 | | | µs |
| Data hold time | $t_{HD}$: DAT | $I^2C$ mode | 0*2 | | | µs |
| Data setup time | $t_{SU}$: DAT | | 100*3 | | | ns |
| Stop condition setup time | $t_{SU}$: STO | | 0.6 | | | µs |
| Pulse width with spike suppressed by input filter | $t_{SP}$ | | 0 | | 50 | ns |
| Capacitance load of each bus line | Cb | | | | 400 | pF |

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIIC0SDA signal (at VIH min. of RIIC0SCL signal). In order to occupy the undefined area at the falling edge of RIIC0SCL.

Note 3. The fast mode $I^2C$ bus can be used in normal mode $I^2C$ bus system. In this case, set the fast mode $I^2C$ bus so that it meets the following conditions.
- If the system does not extend the RIIC0SCL signal's low state hold time: $t_{SU}$: DAT ≥ 250 ns
- If the system extends the RIIC0SCL signal's low state hold time:
Transmit the following data bit to the RIIC0SDA line prior to releasing the RIIC0SCL line (1250 ns: Normal mode $I^2C$ bus specification).

**Note:** If the system does not extend the RIIC0SCL signal low hold time ($t_{Low}$), only the maximum data hold time ($t_{HD}$: DAT) needs to be satisfied.

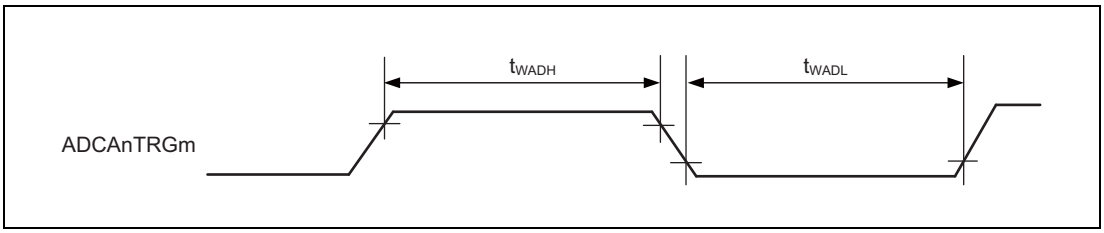
## 40.21 ADTRG Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| ADCAnTRGm input high/ low level width | $t_{WADH}$/ $t_{WADL}$ | | k × Tsamp + 20*1 | | | ns |

Note 1. k: Sampling number of the digital noise filter for each input.
Tsamp: Sampling time of the digital noise filter for each input.

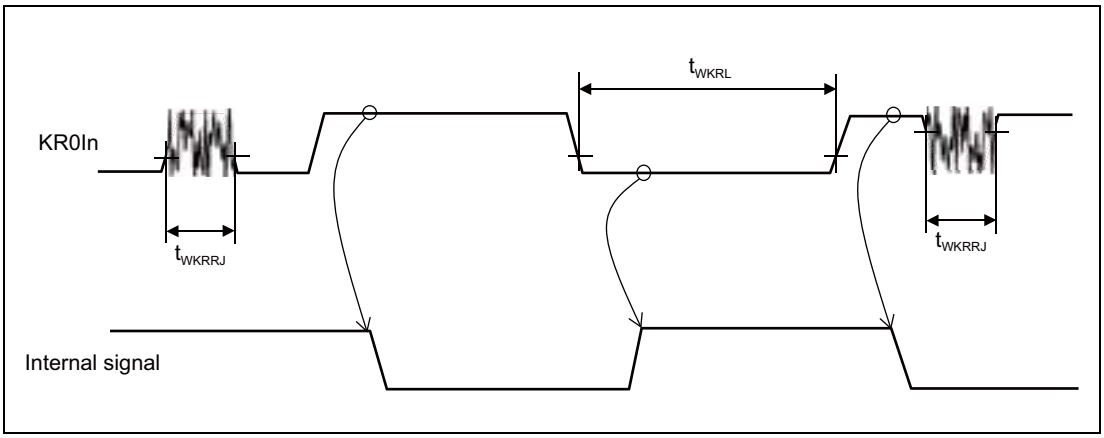


## 40.22 Key Return Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| KR0In input low level width*1 | $t_{WKRL}$ | | 600 | | | ns |
| KR0In pulse rejection*2 | $t_{WKRRJ}$ | | 100 | | | ns |

Note 1. KR0In input width is needed to ensure that the internal key input signal is activated.
Note 2. Pulses shorter than this minimum is ignored. This is reference value.
Noise such as the figure can be filtered.



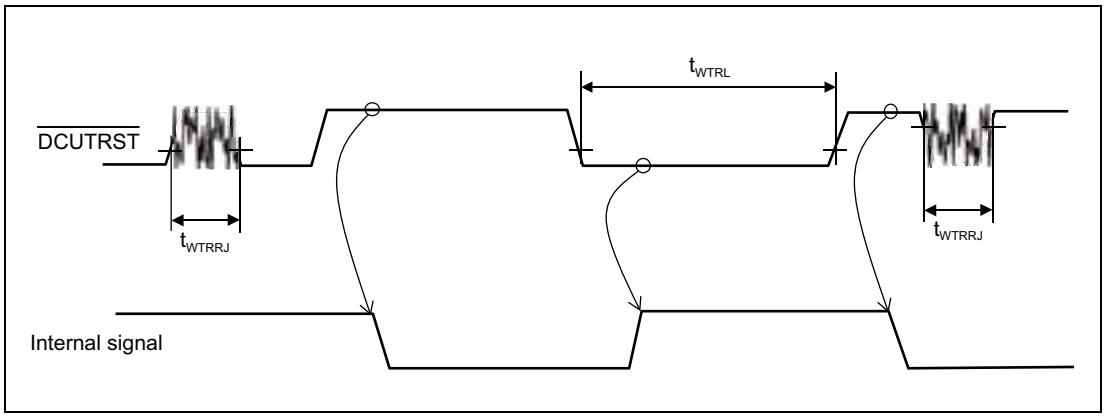
## 40.23 $\overline{\text{DCUTRST}}$ Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| $\overline{\text{DCUTRST}}$ input low level width*1 | $t_{WTRL}$ | | 600 | | | ns |
| $\overline{\text{DCUTRST}}$ pulse rejection*2 | $t_{WTRRJ}$ | | 100 | | | ns |

Note 1. $\overline{\text{DCUTRST}}$ input width is needed to ensure that the internal DCU reset input signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value.
Noise such as the figure can be filtered.



# 40.24 Debug Interface Characteristics

## 40.24.1 Nexus Interface Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

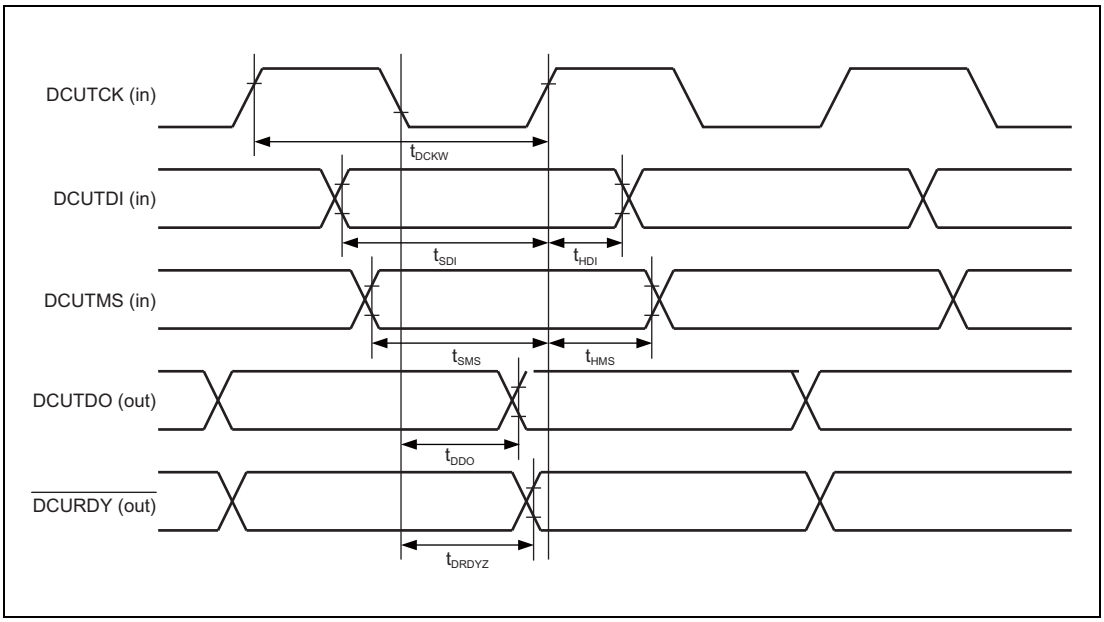
<Input buffer>

DCUTDI, DCUTCK, DCUTMS, $\overline{\text{DCUTRST}}$: TTL

<Output driver strength>

DCUTDO, $\overline{\text{DCURDY}}$: Fast mode

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| DCUTCK cycle width | $t_{DCKW}$ | | 50 | | | ns |
| DCUTDI setup time (vs DCUTCK ↑) | $t_{SDI}$ | | 12 | | | ns |
| DCUTDI hold time (vs DCUTCK ↑) | $t_{HDI}$ | | 3 | | | ns |
| DCUTMS setup time (vs DCUTCK ↑) | $t_{SMS}$ | | 12 | | | ns |
| DCUTMS hold time (vs DCUTCK ↑) | $t_{HMS}$ | | 3 | | | ns |
| DCUTDO delay time (↓ DCUTCK) | $t_{DDO}$ | | 0 | | 20 | ns |
| $\overline{\text{DCURDY}}$ delay time (↓ DCUTCK) | $t_{RDYZ}$ | | 0 | | 20 | ns |



## 40.24.2 LPD (4 pin) Interface Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 100 pF

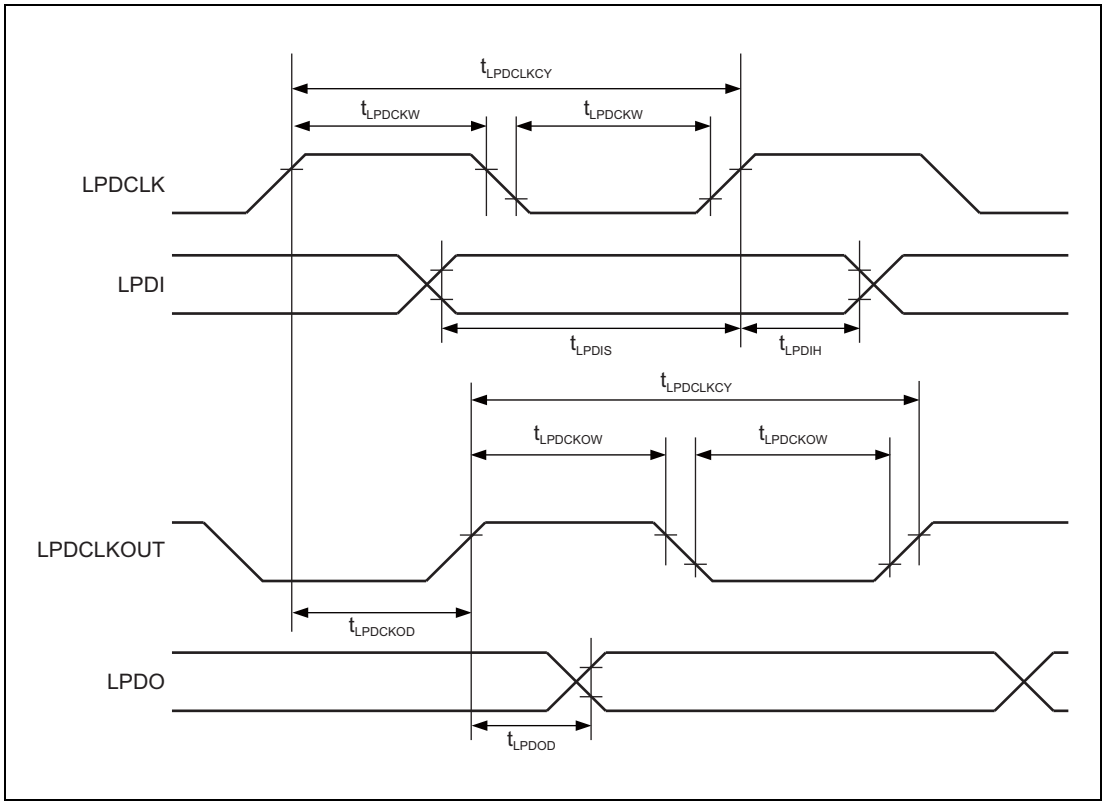
<Input buffer>

LPDCLK, LPDI: TTL

<Output driver strength>

LPDCLKOUT, LPDO: Fast mode

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| LPDCLK cycle time/ LPDCLKOUT cycle time | $t_{LPDCLKCY}$ | | 83.3 (max.12MHz) | | | ns |
| LPDCLK High-level width/ LPDCLK Low-level width | $t_{LPDCKW}$ | | 0.5 × $t_{LPDCLKCY}$ – 10 | | | ns |
| LPDCLKOUT High-level width/ LPDCLKOUT low-level width | $t_{LPDCKOW}$ | | $t_{LPDCKW}$ – 10 | | | ns |
| LPDI setup time (LPDCLK ↑) | $t_{LPDIS}$ | | 41 | | | ns |
| LPDI hold time (LPDCLK ↑) | $t_{LPDIH}$ | | 3 | | | ns |
| LPDCLK to LPDCLKOUT delay time | $t_{LPDCKOD}$ | | | | 44 | ns |
| LPDO delay time (LPDCLKOUT ↑) | $t_{LPDOD}$ | | 0 | | 15 | ns |



### 40.24.3 LPD (1 pin) Interface Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 50 pF

<Input buffer>

LPDIO: TTL

<Output driver strength>

LPDIO: Fast mode

<External pull-up resistor>

LPDIO: 4.7 kΩ to 10 kΩ

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| LPD (1 pin) Baud rate | | | | | 2.0 | Mbps |

# 40.25 Flash Programming Characteristics

## 40.25.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

**Table 40.14 Basic characteristics**

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Operation frequency | $f_{PCLK}$*3 | ECO | 4*4 | | 20 | MHz |
| | | ADVANCED, PREMIUM | 4*4 | | 30 | MHz |
| Number of rewrites*1 | CWRT | Data retention of 20 years*2 | 1000 | | | times |

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 1000), the device can be erased “n” times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3. $f_{PCLK}$ = 1/4 $f_{CPUCLK}$: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

**Table 40.15 Programming characteristic (1/2)**

| Item | Symbol | Condition | Block size | MIN. | TYP. | MAX. | Unit |

| | | | 2 MB | | 10.8 | 33.6 | s |

Note 1. Only the processing time of the hardware. The overhead required by the software is not included.

## 40.25.2 Data Flash

The data flash memory is shipped in the erased state. If the data flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

**Table 40.16 Basic characteristics**

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Operation frequency | $f_{PCLK}$*3 | ECO | 4*4 | | 20 | MHz |
| | | ADVANCED, PREMIUM | 4*4 | | 30 | MHz |
| Number of rewrites*1 | CWRT | Data retention 20 years*2 | 125 k | | | times |
| | | Data retention 3 years*2 | 250 k | | | times |

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 125000), the device can be erased “n” times for each block. For example, when a block of 64 bytes is erased after 4 bytes of writing have been performed for different addresses 168 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the data flash memory.

Note 3. $f_{PCLK}$ = 1/4 $f_{CPUCLK}$: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

**Table 40.17 Programming characteristics**

| Item | Symbol | Condition | Block size | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| Programming time | | $f_{PCLK}$ ≥ 20 MHz | 4 B | | 0.16*1 | 1.7*1 | ms |
| | | $f_{PCLK}$ ≥ 20 MHz | 32 KB | | 1.4 | 6.8 | s |
| | | $f_{PCLK}$ ≥ 20 MHz | 64 KB | | 2.79 | 13.44 | s |

| | | $f_{PCLK}$ ≥ 20 MHz | 32 KB | | 0.9 | 5.2 | s |
| | | $f_{PCLK}$ ≥ 20 MHz | 64 KB | | 1.74 | 10.24 | s |
| Blank check time | | $f_{PCLK}$ ≥ 20 MHz | 4 B | | | 30*1 | µs |
| | | | 64 B | | | 100*1 | µs |
| | | | 32 KB | | | 35.2 | ms |
| | | | 64 KB | | | 70.4 | ms |

Note 1. Only the processing time of the hardware. The overhead required by the software is not included.

## 40.25.3 Serial Programming Interface

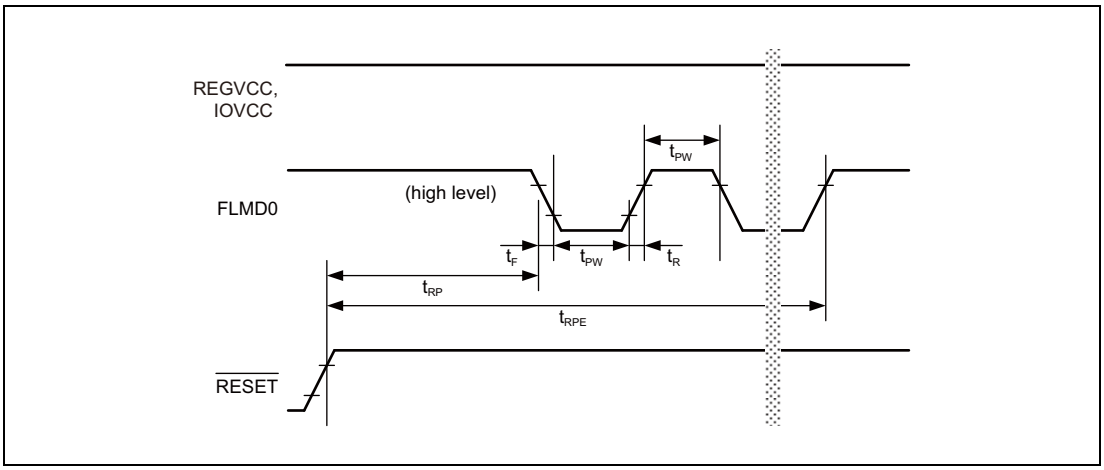
### 40.25.3.1 Serial Programmer Setup Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| FLMD0 pulse input start time | $t_{RP}$ | | 1.5 | | | ms |
| FLMD0 pulse input end time | $t_{RPE}$ | | | | 101.5 | ms |
| FLMD0 low/high level width | $t_{PW}$ | | 1.6 | | | µs |
| FLMD0 rise time | $t_R$ | | | | 20 | ns |
| FLMD0 fall time | $t_F$ | | | | 20 | ns |

**NOTE**

IOVCC: EVCC = A0VREF = A1VREF



### 40.25.3.2 Flash Programming Interface

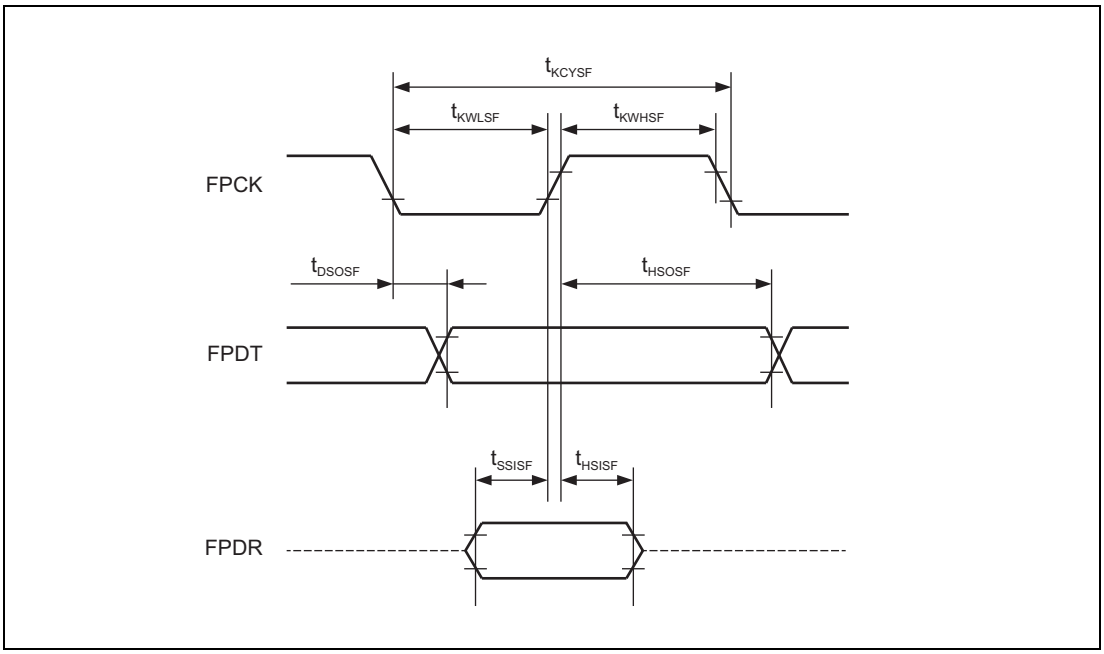
**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|
| Flash Programming transfer rate | | 1-wired UART mode | | | 1 | Mbps |
| | | 2-wired UART mode (ECO) | | | 1 | Mbps |
| | | 2-wired UART mode (PREMIUM, ADVANCED) | | | 1.5 | Mbps |
| FPCK cycle time | $t_{KCYSF}$ | 3-wired clock sync mode | 200*1 | | | ns |
| FPCK high level width | $t_{KWHSF}$ | 3-wired clock sync mode | $t_{KCYSF}$ / 2 – 15 | | | ns |
| FPCK low level width | $t_{KWLSF}$ | 3-wired clock sync mode | $t_{KCYSF}$ / 2 – 15 | | | ns |
| FPDR setup time (vs. FPCK) | $t_{SSISF}$ | 3-wired clock sync mode | $t_{Pcyc}$ × 2 | | | ns |
| FPDR hold time (vs. FPCK) | $t_{HSISF}$ | 3-wired clock sync mode | $t_{Pcyc}$ × 2 | | | ns |
| FPDT output delay (vs. FPCK) | $t_{DSOSF}$ | 3-wired clock sync mode Not continuous transfer (data: 1st bit) | | | 0 | ns |
| | | 3-wired clock sync mode Not continuous transfer (data: except 1st bit) | | | $–t_{KWHSF}$ + 3 × $t_{Pcyc}$ + 36 | ns |
| FPDT hold time (vs. FPCK) | $t_{HSOSF}$ | 3-wired clock sync mode | $t_{Pcyc}$ × 2 | | | ns |

Note 1. Input an external clock that is more than 6 clocks of PCLK.

**NOTE**

$t_{Pcyc}$ is period of PCLK.



## 40.26 A/D Converter Characteristics

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

| | | | AnVREF = 3.0 V to 4.5 V | ADCAnIm | | | ±1.0 | LSB |
| | | | | ADCAnImS | | | ±2.0 | LSB |

Note 1. This does not include quantization error.

Note 2. 3.0 + 1.3 × (the number of used T&H)

Note 3. Include the oscillation accuracy of HS IntOSC.

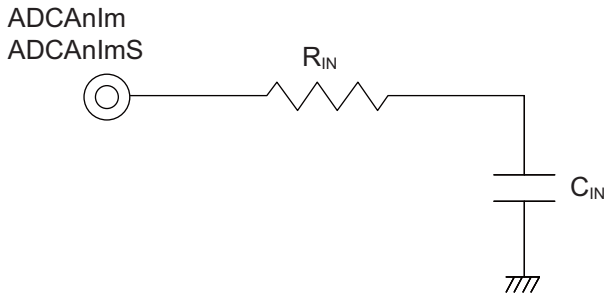
Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as “sampling time + successive approximation time”.
Conversion precision include the influence of the injection current.

**Note:** Conversion accuracy when ADCA0ImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.

**CAUTION**

When an external digital pulse is applied to AP0, AP1, P8, P9 and P18 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse.
The same behavior may apply when the digital buffer is used as output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

### 40.26.1 Equivalent Circuit of the Analog Input Block



| Terminals | Condition | $R_{IN}$ (kΩ) | $C_{IN}$ (pF) |
|---|---|---|---|
| ADCA0I0 to 15 | When T&H is used | 14.0 | 1.8 |
| | When T&H is not used | 3.9 | 2.1 |
| ADCA0I0S to 3S, 5S to 16S | | 5.0 | 8.6 |
| ADCA0I4S, 17S to 19S | — | 5.4 | 8.6 |
| ADCA1I0 to 15 | — | 3.6 | 1.8 |
| ADCA1I0S to 7S | — | 4.7 | 4.5 |

**CAUTION**

This specification is not tested during outgoing inspection. Therefore $R_{IN}$ and $C_{IN}$ are reference values only and not guaranteed. In addition these values are specified as maximum values.

## 40.27 Injection Currents

Table 40.18 Definition of Pin Group (176 pin)

| Symbol | Power Supply for Pin Group | Pin |
|---|---|---|
| PgR | REGVCC, AWOVSS | IP0_0 |
| PgE | EVCC, EVSS | JP0, P0, P1, P2, P10, P11, P12, P20 |
| PgE’ | EVCC, EVSS | P8, P9, P18 |
| PgA0 | A0VREF, A0VSS | AP0 |
| PgA1 | A1VREF, A1VSS | AP1 |

Table 40.19 Definition of Pin Group (144 pin)

| Symbol | Power Supply for Pin Group | Pin |
|---|---|---|
| PgR | REGVCC, AWOVSS | IP0_0 |
| PgE | EVCC, EVSS | JP0, P0, P1, P10, P11, P12, P20 |
| PgE’ | EVCC, EVSS | P8, P9, P18 |
| PgA0 | A0VREF, A0VSS | AP0 |
| PgA1 | A1VREF, A1VSS | AP1 |

Table 40.20 Definition of Pin Group (100 pin)

| Symbol | Power Supply for Pin Group | Pin |
|---|---|---|
| PgE | EVCC, EVSS | JP0, P0, P10, P11 |
| PgE’ | EVCC, EVSS | P8, P9 |
| PgA0 | A0VREF, A0VSS | AP0 |

## 40.27.1 Absolute Maximum Ratings

### 40.27.1.1 176 pin and 144 pin

| Item | Symbol | Condition | | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| Positive overload current VIN > VCC | $I_{INJPM}$ | PgE | Per pin | | | 10 | mA |
| | | | Total | | | 120 | mA |
| | | PgE’ | Per pin | | | 10 | mA |
| | | | Total | | | 120 | mA |
| | | PgA0 | Per pin | | | 10 | mA |
| | | | Total | | | 60 | mA |
| | | PgA1 | Per pin | | | 10 | mA |
| | | | Total | | | 60 | mA |
| | | PgR | Per pin | | | 10 | mA |
| Negative overload current VIN < VSS | $I_{INJNM}$ | PgE | Per pin | | | –10 | mA |
| | | | Total | | | –120 | mA |
| | | PgE’ | Per pin | | | –10 | mA |
| | | | Total | | | –120 | mA |
| | | PgA0 | Per pin | | | –10 | mA |
| | | | Total | | | –60 | mA |
| | | PgA1 | Per pin | | | –10 | mA |
| | | | Total | | | –60 | mA |
| | | PgR | Per pin | | | –10 | mA |

**CAUTIONS**

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of injected current for PgA0 and PgA1, TESH0SN cannot be kept. Its deviating value will increase sharply with increasing absolute value of injection current.

### 40.27.1.2 100 pin

| Item | Symbol | Condition | | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| Positive overload current VIN > VCC | $I_{INJPM}$ | PgE | Per pin | | | 10 | mA |
| | | | Total | | | 60 | mA |
| | | PgE’ | Per pin | | | 10 | mA |
| | | | Total | | | 60 | mA |
| | | PgA0 | Per pin | | | 10 | mA |
| | | | Total | | | 60 | mA |
| Negative overload current VIN < VSS | $I_{INJNM}$ | PgE | Per pin | | | –10 | mA |
| | | | Total | | | –60 | mA |
| | | PgE’ | Per pin | | | –10 | mA |
| | | | Total | | | –60 | mA |
| | | PgA0 | Per pin | | | –10 | mA |
| | | | Total | | | –60 | mA |

**CAUTIONS**

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of injected current for PgA0, TESH0SN cannot be kept. Its deviating value will increase sharply with increasing absolute value of injection current.

## 40.27.2 DC Characteristics for Overload Current

### 40.27.2.1 176 pin and 144 pin

| Item | Symbol | Condition | | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| Positive overload current<br>VIN > VCC | $I_{INJP}$ | PgE | Per pin | | | 2 | mA |
| | | | Total | | | 100 | mA |
| | | PgE’ | Per pin | | | 3 | mA |
| | | | Total | | | 40 | mA |
| | | PgA0 | Per pin | | | 3 | mA |
| | | | Total | | | 20 | mA |
| | | PgA1 | Per pin | | | 3 | mA |
| | | | Total | | | 20 | mA |
| | | PgR | Per pin | | | 2 | mA |
| Negative overload current<br>VIN < VSS | $I_{INJN}$ | PgE | Per pin | | | –2 | mA |
| | | | Total | | | –100 | mA |
| | | PgE’ | Per pin | | | –3 | mA |
| | | | Total | | | –40 | mA |
| | | PgA0 | Per pin | | | –3 | mA |
| | | | Total | | | –20 | mA |
| | | PgA1 | Per pin | | | –3 | mA |
| | | | Total | | | –20 | mA |
| | | PgR | Per pin | | | –2 | mA |

**NOTE**

These specifications are not tested on sorting and are specified based on the device characterization.

### 40.27.2.2 100 pin

| Item | Symbol | Condition | | MIN. | TYP. | MAX. | Unit |
|---|---|---|---|---|---|---|---|
| Positive overload current<br>VIN > VCC | $I_{INJP}$ | PgE | Per pin | | | 2 | mA |
| | | | Total | | | 50 | mA |
| | | PgE’ | Per pin | | | 3 | mA |
| | | | Total | | | 20 | mA |
| | | PgA0 | Per pin | | | 3 | mA |
| | | | Total | | | 20 | mA |
| Negative overload current<br>VIN < VSS | $I_{INJN}$ | PgE | Per pin | | | –2 | mA |
| | | | Total | | | –50 | mA |
| | | PgE’ | Per pin | | | –3 | mA |
| | | | Total | | | –20 | mA |
| | | PgA0 | Per pin | | | –3 | mA |
| | | | Total | | | –20 | mA |

**NOTE**

These specifications are not tested on sorting and are specified based on the device characterization.

# 40.28 Thermal Characteristics

## 40.28.1 Parameters

| Package | Item | Symbol | Estimate | Unit | Note |
|---|---|---|---|---|---|
| 176 pin LQFP | Thermal Resistance | Θja | 35.5 | °C/W | Conforming to JESD51-7 (4 layers) |
| | Thermal Characterization Parameter | ψjb | 27.6 | | |
| 144 pin LQFP | Thermal Resistance | Θja | 35.5 | °C/W | Conforming to JESD51-7 (4 layers) |
| | Thermal Characterization Parameter | ψjb | 26.9 | | |
| 100 pin LQFP | Thermal Resistance | Θja | 38.3 | °C/W | Conforming to JESD51-7 (4 layers) |
| | Thermal Characterization Parameter | ψjb | 28.1 | | |

**Note:** The thermal resistance and characterization parameters depend on the usage environment.

## 40.28.2 Board

Conforming to JESD51-7 (4 layers)

| | Board Size (mm) | | |
|---|---|---|---|
| | X | Y | Area ($mm^2$) |
| Board | 76.2 | 114.3 | 8709.66 |
| Remaining copper rates | Thickness of conductors | | |
| 50-95-95-50% | 70-35-35-70µm | | |
