Rev.1.10 Nov, 2016

# Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
3. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics product.
5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.

   “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; and safety equipment etc.

   Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (nuclear reactor control systems, military equipment etc.). You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application for which it is not intended. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.
6. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You should not use Renesas Electronics products or technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. When exporting the Renesas Electronics products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the contents and conditions set forth in this document, Renesas Electronics assumes no responsibility for any losses incurred by you or third parties as a result of unauthorized use of Renesas Electronics products.
11. This document may not be reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

# Notes for CMOS devices

**(1) Voltage application waveform at input pin:**

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (MAX) and VIH (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and VIH (MIN).

**(2) Handling of unused input pins:**

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

**(3) Precaution against ESD:**

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

**(4) Status before initialization:**

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

**(5) Power ON/OFF sequence:**

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

**(6) Input of signal during power off state:**

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

# How to Use This Manual

**Readers** This manual is intended for users who wish to understand the functions of the RH850/F1K and design application systems using the following RH850/F1K microcontrollers:

**Purpose** This manual is intended to give users an understanding of the hardware functions of the RH850/F1K shown in the *Organization* below.

**Organization** This manual is divided into two parts: Hardware (this manual) and Architecture (RH850G3KH User's Manual: Software).

| Hardware | Software |
|---|---|
| Pin functions | Overview |
| CPU function | Processor Model |
| On-chip peripheral functions | Register Reference |
| Flash memory programming | Exceptions and Interrupts |
| | Memory Management |
| | Instruction Reference |
| | Reset |
| | Appendix |

**How to read this manual** It is assumed that the readers of this manual have general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

To understand the overall functions of the RH850/F1K.

→ Read this manual according to the Contents.

To understand the details of an instruction function

→ See RH850G3KH User's Manual: Software (R01US0165E) available separately.

**Conventions**

Data significance: Higher digits on the left and lower digits on the right

Active low representation: xxx (overscore over pin or signal name)

Memory map address: Higher addresses on the top and lower addresses on the bottom

Note: Footnote for item marked with Note in the text

Caution: Information requiring particular attention

Remark: Supplementary information

Numeric representation: Binary ... xxxx or $xxxx_B$

Decimal ... xxxx

Hexadecimal ... $xxxx_H$

Prefix indicating power of 2 (address space, memory capacity):

K (kilo): $2^{10} = 1,024$

M (mega): $2^{20} = 1,024^2$

G (giga): $2^{30} = 1,024^3$

# Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.

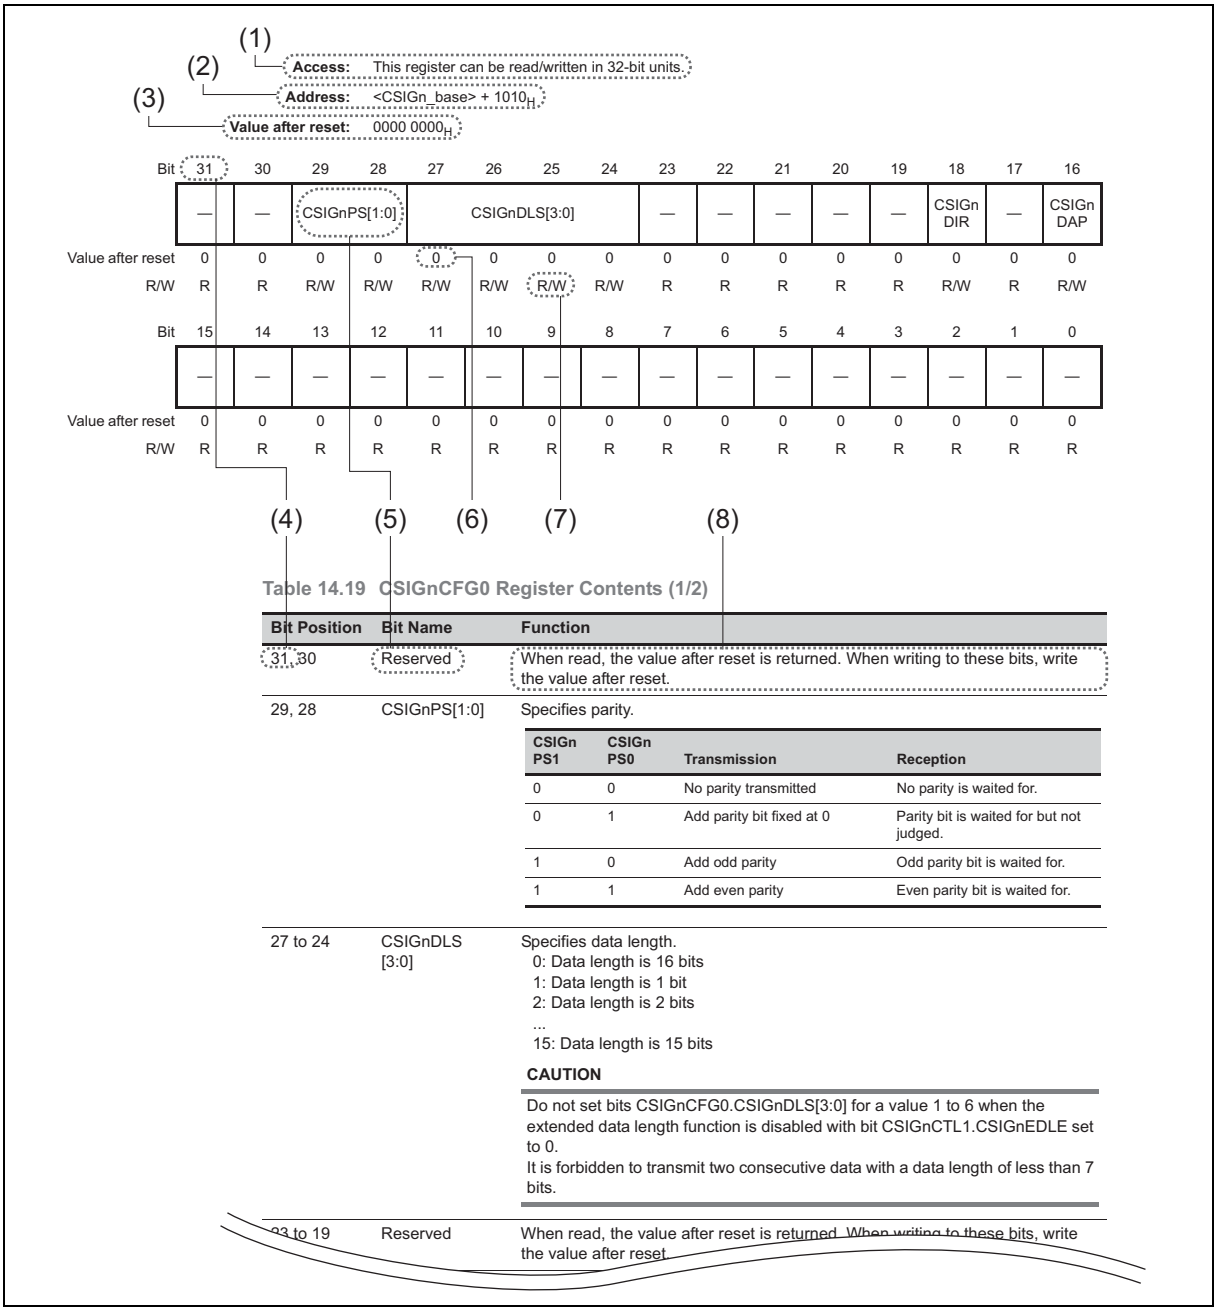

**Table 14.19 CSIGnCFG0 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 29, 28 | CSIGnPS[1:0] | Specifies parity. |

| CSIGn PS1 | CSIGn PS0 | Transmission | Reception |
|---|---|---|---|
| 0 | 0 | No parity transmitted | No parity is waited for. |
| 0 | 1 | Add parity bit fixed at 0 | Parity bit is waited for but not judged. |
| 1 | 0 | Add odd parity | Odd parity bit is waited for. |
| 1 | 1 | Add even parity | Even parity bit is waited for. |

| | | |
|---|---|---|
| 27 to 24 | CSIGnDLS [3:0] | Specifies data length.<br>0: Data length is 16 bits<br>1: Data length is 1 bit<br>2: Data length is 2 bits<br>...<br>15: Data length is 15 bits<br>**CAUTION**<br>Do not set bits CSIGnCFG0.CSIGnDLS[3:0] for a value 1 to 6 when the extended data length function is disabled with bit CSIGnCTL1.CSIGnEDLE set to 0.<br>It is forbidden to transmit two consecutive data with a data length of less than 7 bits. |
| 23 to 19 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |

(1) Access

The register can be accessed in the bit unit indicated here.

(2) Address

This is the register address.
For base address, see description of base address in each section.

(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from A to F or as X where they are undefined.

(4) Bit position

This is the bit number.
The bits are numbered from 31 to 0 for 32-bit registers, 15 to 0 for 16-bit registers, and 7 to 0 for 8-bit registers.

(5) Bit name

Bit name or field name is indicated.
When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGnDLS[3:0] above.
Indicate reserved bits by using a dash (—).

(6) Value after a reset (in binary notation)

This is the bit values after a reset.

| | | |
|---|---|---|
| 0 | : | The value after a reset is 0. |
| 1 | : | The value after a reset is 1. |
| — | : | The value after a reset is undefined. |

(7) R/W

This is the bit attribute of all bits of the register.

| | | |
|---|---|---|
| R/W | : | The bit or field is readable and writable. |
| R | : | The bit or field is readable.<br>Note that all reserved bits are indicated as R. When written, the value specified in the bit chart or the value after a reset should be written. |
| W | : | This bit or field is writable. When read, the value is undefined. If a value is indicated in the bit chart, the value is returned. |

(8) Function

This is function of the bit.

All trademarks and registered trademarks are the property of their respective owners.

# Table of Contents

Section 1 Overview ..... 71

1.1 RH850/F1K Product Features ..... 71
1.2 RH850/F1K Functions ..... 72
1.3 RH850/F1K Product Lineup ..... 74
1.4 RH850/F1K Product Block Diagrams ..... 76

Section 2 Pin Function ..... 79

2.1 Pin Connection Diagram ..... 79
2.2 Pin Description ..... 94
2.3 Pin Functions During and After Reset ..... 98
2.4 Port state in Standby Mode ..... 99
2.5 Recommended Connection of Unused Pins ..... 99
2.6 RH850/F1K Port Features ..... 101
2.6.1 Port Group ..... 101
2.6.2 Port Group Index n ..... 101
2.6.3 Register Base Address ..... 101
2.6.4 Clock Supply ..... 101
2.7 Port Functions ..... 102
2.7.1 Functional Overview ..... 102
2.7.2 Terms ..... 103
2.7.2.1 JTAG Ports ..... 103
2.7.3 Overview of Pin Functions ..... 104
2.7.4 Pin Data Input/Output ..... 106
2.7.4.1 Output Data ..... 106
2.7.4.2 Input Data ..... 106
2.7.4.3 Writing to the Pn Register ..... 107
2.8 Schematic View of Port Control ..... 108
2.9 Port Group Configuration Registers ..... 109
2.9.1 Overview ..... 109
2.9.2 Pin Function Configuration ..... 112
2.9.2.1 PMCn / JPMC0 — Port Mode Control Register ..... 112
2.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register ..... 113
2.9.2.3 PIPCn — Port IP Control Register ..... 114
2.9.2.4 PMn / APMn / JPM0 — Port Mode Register ..... 115
2.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register ..... 116
2.9.2.6 PIBCn / APIBCn / JPIBC0 / IPIBC0 — Port Input Buffer Control Register ..... 118
2.9.2.7 PFCn / JPFC0 — Port Function Control Register ..... 119
2.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register ..... 120
2.9.2.9 PFCAEn — Port Function Control Additional Expansion Register ..... 121
2.9.3 Pin Data Input/Output ..... 123
2.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register ..... 123
2.9.3.2 PPRn / APPRn / JPPR0 / IPPR0 — Port Pin Read Register ..... 124
2.9.3.3 Pn / APn / JP0 — Port Register ..... 125
2.9.3.4 PNOTn / APNOTn / JPNOT0 — Port NOT Register ..... 126
2.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register ..... 127

2.9.4 Configuration of Electrical Characteristics ..... 128
2.9.4.1 PUn / JPU0 — Pull-Up Option Register ..... 128
2.9.4.2 PDn / JPD0 — Pull-Down Option Register ..... 129
2.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register ..... 130
2.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register ..... 131
2.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register ..... 132
2.9.4.6 JPISA0 — Port Input Buffer Selection Advanced Register ..... 133
2.9.5 Port Register Protection ..... 133
2.9.6 Flowchart Examples for Port Settings ..... 134
2.9.6.1 Batch Setting ..... 134
2.9.6.2 Individual Settings ..... 135
2.10 Port (General I/O) Function Overview ..... 138
2.10.1 JTAG Port 0 (JP0) ..... 139
2.10.1.1 Alternative Function ..... 139
2.10.1.2 Control Registers ..... 140
2.10.2 Port 0 (P0) ..... 142
2.10.2.1 Alternative Function ..... 142
2.10.2.2 Control Registers ..... 143
2.10.3 Port 1 (P1) ..... 144
2.10.3.1 Alternative Function ..... 144
2.10.3.2 Control Registers ..... 145
2.10.4 Port 2 (P2) ..... 147
2.10.4.1 Alternative Function ..... 147
2.10.4.2 Control Registers ..... 148
2.10.5 Port 8 (P8) ..... 149
2.10.5.1 Alternative Function ..... 149
2.10.5.2 Control Registers ..... 150
2.10.6 Port 9 (P9) ..... 151
2.10.6.1 Alternative Function ..... 151
2.10.6.2 Control Registers ..... 152
2.10.7 Port 10 (P10) ..... 153
2.10.7.1 Alternative Function ..... 153
2.10.7.2 Control Registers ..... 154
2.10.8 Port 11 (P11) ..... 155
2.10.8.1 Alternative Function ..... 155
2.10.8.2 Control Registers ..... 156
2.10.9 Port 12 (P12) ..... 158
2.10.9.1 Alternative Function ..... 158
2.10.9.2 Control Registers ..... 159
2.10.10 Port 18 (P18) ..... 161
2.10.10.1 Alternative Function ..... 161
2.10.10.2 Control Registers ..... 162
2.10.11 Port 20 (P20) ..... 164
2.10.11.1 Alternative Function ..... 164
2.10.11.2 Control Registers ..... 165
2.10.12 Analog Port 0 (AP0) ..... 167
2.10.12.1 Alternative Function ..... 167
2.10.12.2 Control Registers ..... 168

2.10.13 Analog Port 1 (AP1) ..... 169
2.10.13.1 Alternative Function ..... 169
2.10.13.2 Control Registers ..... 170
2.10.14 Input Port 0 (IP0) ..... 171
2.10.14.1 Alternative Function ..... 171
2.10.14.2 Control Registers ..... 172
2.11 Port (Special I/O) Function Overview ..... 173
2.11.1 Special I/O after Reset ..... 173
2.11.1.1 P8_6: $\overline{\text{RESETOUT}}$ ..... 173
2.11.1.2 JP0_0 to JP0_6: Debug Interface ..... 175
2.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer ..... 175
2.11.1.4 Mode Pins ..... 175
2.11.1.5 IP0_0: XT2 ..... 175
2.11.2 A/D Input Alternative I/O ..... 176
2.11.3 Special I/O Control ..... 178
2.11.3.1 Direct I/O Control (PIPC) ..... 178
2.11.3.2 Input Buffer Control (PISn/JPIS0, JPISA0) ..... 179
2.11.3.3 Output Buffer Control (PDSC) ..... 183
2.12 Noise Filter & Edge/Level Detector ..... 186
2.12.1 Port Filter Assignment ..... 186
2.12.1.1 Input Pins that Incorporate Analog Filter Type A ..... 186
2.12.1.2 Input Pins that Incorporate Analog Filter Type B ..... 187
2.12.1.3 Input Pins that Incorporate Analog Filter Type C ..... 187
2.12.1.4 Input Pins that Incorporate Digital Filter Type D ..... 188
2.12.1.5 Input Pins that Incorporate Digital Filter Type E ..... 190
2.12.2 Clock Supply for Port Filters ..... 194
2.13 Description of Port Noise Filter & Edge/Level Detection ..... 195
2.13.1 Overview ..... 195
2.13.1.1 Analog Filter Types ..... 195
2.13.1.2 Digital Filter Types ..... 195
2.13.2 Analog Filters ..... 196
2.13.2.1 Analog Filter Characteristic ..... 196
2.13.2.2 Analog Filter Control Registers ..... 196
2.13.2.3 Analog Filter in Standby Mode ..... 196
2.13.3 Digital Filters ..... 199
2.13.3.1 Digital Filter Characteristic ..... 199
2.13.3.2 Digital Filter Groups ..... 200
2.13.3.3 Digital Filters in Standby Mode ..... 200
2.13.3.4 Digital Filter Control Registers ..... 201
2.13.4 Filter Control Registers ..... 202
2.13.4.1 FCLA0CTLm_<name> — Filter Control Register ..... 203
2.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register ..... 204
2.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register ..... 205
2.13.4.4 DNFA<name>ENH – Digital Noise Elimination Enable H Register ..... 206
2.13.4.5 DNFA<name>ENL – Digital Noise Elimination Enable L Register ..... 207

Section 3 CPU System ..... 208
3.1 Overview ..... 208
3.1.1 Block Configuration ..... 208
3.2 CPU ..... 210
3.2.1 Core Functions ..... 210
3.2.1.1 Features ..... 210
3.2.1.2 Register Set ..... 211
3.2.1.3 Instruction ..... 246
3.2.2 Buffers for Code Flash ..... 247
3.2.2.1 Features ..... 247
3.2.2.2 Function of Buffers ..... 247
3.2.2.3 Registers for Buffer Control ..... 248
3.2.3 Reliability Functions ..... 249
3.2.3.1 PE Guard Function (PEG) ..... 249
3.2.3.2 System Error Generator Function (SEG) ..... 255
3.3 Notes ..... 260
3.3.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution 260
3.3.2 Ensure Coherency after Rewriting the Code Flash ..... 261
3.3.3 Access to Registers by Using Bit-Manipulation Instructions ..... 261
3.3.4 Caution of Prefetching ..... 261

Section 4 Address Space ..... 262
4.1 Address Space ..... 262
4.2 Address Space Viewed from Each Bus Master ..... 265
4.2.1 Space in which Instructions can be Fetched ..... 265
4.2.2 Data Space Accessible by CPU ..... 265
4.2.3 Data Space Accessible by DMA ..... 265
4.3 Peripheral I/O Address Map ..... 266

Section 5 Write-Protected Registers ..... 271
5.1 Overview ..... 271
5.1.1 Functional Overview ..... 271
5.1.2 Writing Procedure to Write-Protected Registers ..... 271
5.1.3 Interrupt during Write Protection Unlock ..... 272
5.1.4 Emulation Break during Write Protection Unlock Sequence ..... 273
5.1.5 Write-Protection Target Registers ..... 273
5.2 Registers ..... 276
5.2.1 List of Registers ..... 276
5.2.2 Details of Control Protection Cluster Registers ..... 278
5.2.2.1 PROTCMDn — Protection Command Register ..... 278
5.2.2.2 PROTSn — Protection Status Register ..... 279
5.2.3 Details of Clock Monitor Protection Cluster Registers ..... 280
5.2.3.1 CLMAnPCMD — CLMAn Protection Command Register ..... 280
5.2.3.2 CLMAnPS — CLMAn Protection Status Register ..... 281
5.2.3.3 PROTCMDCLMA — Clock Monitor Test Protection Command Register ..... 282

5.2.3.4 PROTSCLMA — Clock Monitor Test Protection Status Register ... 283
5.2.4 Details of Core Voltage Monitor Protection Cluster Registers ... 284
5.2.4.1 PROTCMDCVM — Core Voltage Monitor Protection Command Register ... 284
5.2.4.2 PROTSCVM — Core Voltage Monitor Protection Status Register ... 285
5.2.5 Details of Port Protection Cluster Registers ... 286
5.2.5.1 PPCMDn — Port Protection Command Register ... 286
5.2.5.2 PPROTSn — Port Protection Status Register ... 287
5.2.6 Details of Self-Programming Protection Cluster Registers ... 288
5.2.6.1 FLMDPCMD — FLMD Protection Command Register ... 288
5.2.6.2 FLMDPS — FLMD Protection Error Status Register ... 289

Section 6 Operating Mode ... 290

Section 7 Exception/Interrupts ... 291

7.1 Features ... 291
7.2 Interrupt Sources ... 293
7.2.1 Interrupt Sources ... 293
7.2.1.1 FE Level Non-Maskable Interrupts ... 293
7.2.1.2 FE Level Maskable Interrupts ... 294
7.2.1.3 EI Level Maskable Interrupts ... 295
7.2.2 List of Registers ... 307
7.2.3 FE Level Non-Maskable Interrupt Sources ... 308
7.2.3.1 WDTNMIF — FENMI Factor Register ... 308
7.2.3.2 WDTNMIFC — WDTNMI Factor Clear Register ... 309
7.2.4 FE Level Maskable Interrupt Sources ... 310
7.2.4.1 FEINTF — FEINT Factor Register ... 310
7.2.4.2 FEINTFMSK — FEINT Factor Mask Register ... 312
7.2.4.3 FEINTFC — FEINT Factor Clear Register ... 314
7.3 Edge/Level Detection ... 316
7.4 Interrupt Controller Control Registers ... 317
7.4.1 List of Registers ... 317
7.4.2 ICxxx — EI Level Interrupt Control Registers ... 318
7.4.3 IMRm — EI Level Interrupt Mask Registers (m = 0 to 11) ... 320
7.4.4 FNC — FE Level NMI Status Register ... 321
7.4.5 FIC — FE Level Maskable Interrupt Status Register ... 322
7.5 EI Level Maskable Interrupt Select Registers ... 323
7.5.1 List of Registers ... 323
7.5.2 SELB_INTC1 — INTC1 Interrupt Select Register ... 324
7.5.3 SELB_INTC2 — INTC2 Interrupt Select Register ... 326
7.6 Interrupt Function System Registers ... 327
7.6.1 FPIPR — FPI Exception Interrupt Priority ... 327
7.6.2 ISPR — Priority of Interrupt being Serviced ... 327
7.6.3 PMR — Interrupt Priority Masking ... 327
7.6.4 ICSR — Interrupt Control Status ... 327
7.6.5 INTCFG — Interrupt Function Setting ... 327
7.7 Operation when Acknowledging an Interrupt ... 328

7.7.1 Exception Source Codes for Different Types of SYSERR Exceptions ..... 330
7.8 Return from Interrupts ..... 331
7.9 Interrupt Operation ..... 332
7.9.1 Interrupt Mask Function of EI Level Maskable Interrupt (EIINT) ..... 332
7.9.2 Interrupt Priority Level Judgment ..... 332
7.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled ..... 333
7.9.2.2 Masking through Priority Mask Register (PMR) ..... 333
7.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected ..... 333
7.9.2.4 Interrupt Suspended by CPU ..... 333
7.9.3 Interrupt Request Acknowledgement Conditions and the Priority ..... 336
7.9.4 Exception Priority of Interrupts and the Priority Mask ..... 336
7.9.5 Interrupt Priority Mask ..... 336
7.9.6 Priority Mask Function ..... 337
7.9.7 Exception Management ..... 337
7.10 Exception Handler Address ..... 338
7.10.1 Direct Vector Method ..... 339
7.10.2 Table Reference Method ..... 341

Section 8 DMA Controller ..... 343

8.1 Features of RH850/F1K DMA Controller ..... 343
8.1.1 Number of Channels ..... 343
8.1.2 Register Base Address ..... 343
8.1.3 Interrupt Requests ..... 344
8.1.4 DMA Trigger Factors ..... 345
8.2 Overview ..... 349
8.2.1 Overview ..... 349
8.2.2 Term Definition ..... 350
8.3 DMA Function ..... 351
8.3.1 Basic Operation of DMA Transfer ..... 351
8.3.1.1 Transfer Mode ..... 351
8.3.1.2 Executing a DMA Cycle ..... 351
8.3.1.3 Updating Transfer Information ..... 351
8.3.1.4 Last Transfer and Address Reload Transfer ..... 352
8.3.1.5 Transfer Completion Interrupt Output ..... 352
8.3.1.6 Continuous Transfer ..... 353
8.3.2 Channel Priority Order ..... 355
8.3.2.1 DMAC Channel Arbitration ..... 355
8.3.2.2 Interface Arbitration ..... 356
8.3.3 Reload Function ..... 357
8.3.3.1 Overview of the Reload Function ..... 357
8.3.3.2 Operation of Reload Function 1 ..... 357
8.3.3.3 Reload Function 2 ..... 358
8.3.3.4 Timing of Setting DMAC Reload Registers ..... 360
8.3.4 Chain Function ..... 361
8.3.4.1 Overview ..... 361
8.3.4.2 Setting Up the Chain Function ..... 362

8.3.4.3 Caution for Using the Chain Function ... 362
8.3.5 DMAC Operation ... 363
8.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests ... 363
8.3.5.2 Generating and Accepting a Software DMA Transfer Request ... 363
8.3.5.3 Executing DMA Transfer ... 363
8.4 Suspension, Resume, Transfer Abort, and Clearing of a DMA Transfer Request ... 364
8.4.1 DMA Suspension and Resume by Software Control ... 364
8.4.2 Suspension, Resume, and Transfer Abort of a DMAC Channel ... 364
8.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR ... 365
8.4.4 List of Suspend, Resume, and Transfer Abort Functions ... 366
8.5 Error Control ... 367
8.5.1 Type of Error ... 367
8.5.2 DMA Transfer Error ... 367
8.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs ... 367
8.6 Reliability Functions ... 368
8.6.1 Overview ... 368
8.6.2 Register Access Protection Function ... 368
8.6.2.1 Identifying the Accessing Master ... 368
8.6.2.2 Master Access ... 368
8.6.2.3 Channel Assignment ... 368
8.6.2.4 Illegal Access ... 369
8.6.3 Master Information Inherit Function ... 370
8.6.4 Other Reliability Functions ... 370
8.6.4.1 Restriction on the Next Channel in the Chain ... 370
8.7 Setting Up DMA Transfer ... 371
8.7.1 Overview of Setting Up DMA ... 371
8.7.2 Setting Up the Overall DMA Operation ... 372
8.7.3 Setting Up the DMA Channel Setting ... 372
8.7.3.1 Setting Up the DMAC Channel Setting ... 372
8.8 Global Registers ... 374
8.8.1 List of Global Register Address ... 374
8.8.2 Details of Global Registers ... 375
8.8.2.1 DMACTL — DMA Control Register ... 375
8.8.2.2 DMACER — DMAC Error Register ... 376
8.8.2.3 DM0CMV — DMAC0 Register Access Protection Violation Register ... 377
8.8.2.4 DM1CMV — DMAC1 Register Access Protection Violation Register ... 378
8.8.2.5 CMVC — Register Access Protection Violation Clear Register ... 379
8.8.2.6 DMniCM — DMAC Channel Master Setting (ni = 00 to 07 and 10 to 17) ... 380
8.9 DMAC Channel Registers ... 381
8.9.1 DMAC Channel Register Addresses ... 381
8.9.2 Details of DMAC Channel Registers ... 382
8.9.2.1 DSAm — DMAC Source Address Register ... 382
8.9.2.2 DDAm — DMAC Destination Address Register ... 383
8.9.2.3 DTCm — DMAC Transfer Count Register ... 384
8.9.2.4 DTCTm — DMAC Transfer Control Register ... 385
8.9.2.5 DRSAm — DMAC Reload Source Address Register ... 388

8.9.2.6 DRDAm — DMAC Reload Destination Address Register ... 389
8.9.2.7 DRTCm — DMAC Reload Transfer Count Register ... 390
8.9.2.8 DCENm — DMAC Channel Operation Enable Setting Register ... 391
8.9.2.9 DCSTm — DMAC Transfer Status Register ... 392
8.9.2.10 DCSTSm — DMAC Transfer Status Set Register ... 394
8.9.2.11 DCSTCm — DMAC Transfer Status Clear Register ... 395
8.9.2.12 DTFRm — DTFR Setting Register ... 396
8.9.2.13 DTFRRQm — DTFR Transfer Request Status Register ... 397
8.9.2.14 DTFRRQCm — DTFR Transfer Request Clear Register ... 398

Section 9 Reset Controller ... 399

9.1 Overview ... 399
9.1.1 Reset Sources ... 399
9.1.2 Reset Controller Redundancy ... 400
9.1.3 Reset Output ($\overline{\text{RESETOUT}}$) ... 401
9.1.4 Reset Flag ... 401
9.1.5 Clock Supply ... 401
9.2 Configuration ... 402
9.2.1 Block Diagram ... 402
9.3 Registers ... 405
9.3.1 Reset Controller Registers Overview ... 405
9.3.2 Details of Reset Flag Registers ... 406
9.3.2.1 RESF — Reset Factor Register ... 406
9.3.2.2 RESFC — Reset Factor Clear Register ... 408
9.3.2.3 RESFR — Redundant Reset Factor Register ... 409
9.3.2.4 RESFCR — Redundant Reset Factor Clear Register ... 411
9.3.3 Details of Software Reset Control Registers ... 412
9.3.3.1 SWRESA — Software Reset Register ... 412
9.3.4 Details of Cyclic RUN Mode Reset Vector Address Register ... 413
9.3.4.1 CYCRBASE — Cyclic RUN mode RBASE Register ... 413
9.4 Functional Description ... 414
9.4.1 Reset Flags ... 414
9.4.2 Power-On-Clear (POC) Reset ... 414
9.4.3 Low-Voltage Indicator (LVI) Reset ... 417
9.4.4 Core Voltage Monitor (CVM) Reset ... 418
9.4.5 External Reset ($\overline{\text{RESET}}$) ... 419
9.4.6 Watchdog Timer (WDTA) Reset ... 420
9.4.7 Software Reset ... 420
9.4.8 Clock Monitor (CLMA) Reset ... 421
9.4.9 Debugger Reset ... 421
9.4.10 Reset Vector Address of CPU ... 421

Section 10 Power Supply Circuit ... 422

10.1 Function ... 422
10.1.1 Power Supply Pins ... 423
10.1.2 Block Diagram of Power Domains ... 424

10.1.3 Power Domains Arrangement ... 426

Section 11 Supply Voltage Monitor ... 427

11.1 Overview ... 427
11.1.1 Functional Overview ... 427
11.1.2 Power-On Clear (POC) ... 428
11.1.3 Low Voltage Indicator Circuit (LVI) ... 428
11.1.3.1 LVI Reference Voltage ... 428
11.1.3.2 LVI Reset (LVIRES) ... 428
11.1.3.3 LVI Interrupt (INTLVIL/INTLVIH) ... 429
11.1.3.4 LVI Setting Procedure ... 430
11.1.3.5 Clock Supply to the LVI ... 430
11.1.4 Core Voltage Monitor (CVM) ... 431
11.1.4.1 CVM Reset ($\overline{\text{CVMRES}}$) ... 431
11.1.4.2 CVM Setting ... 431
11.1.4.3 Diagnostic (DIAG) Mode ... 431
11.1.4.4 Clock Supply to the CVM ... 432
11.1.5 RAM Retention Voltage Indicator (Very-Low-Voltage Detection Circuit, VLVI) ... 433
11.1.5.1 Clock Supply to the VLVI ... 433
11.1.5.2 Retention RAM Content Retention ... 433
11.1.6 Block Diagram ... 434
11.2 Registers ... 435
11.2.1 List of Registers ... 435
11.2.2 Low-Voltage Indicator Reset Control Registers ... 436
11.2.2.1 LVICNT — LVI Control Register ... 436
11.2.3 Core Voltage Monitor Control Registers ... 437
11.2.3.1 CVMF — CVM Factor Register ... 437
11.2.3.2 CVMDE — CVM Detection Enable Register ... 438
11.2.3.3 CVMDIAG — CVM Diagnostic Mode Setting Register ... 439
11.2.4 Very-Low-Voltage Detection Control Registers ... 440
11.2.4.1 VLVF — Very-Low-Voltage Detection Register ... 440
11.2.4.2 VLVFC — Very-Low-Voltage Detection Clear Register ... 441

Section 12 Clock Controller ... 442

12.1 Features of Clock Controller of RH850/F1K ... 442
12.2 Configuration of Clock Controller ... 444
12.2.1 Clock Generation Circuits ... 446
12.2.2 Clock Selection ... 447
12.2.3 Clock Domains ... 448
12.2.4 Resetting Clock Oscillators ... 448
12.3 Clock Oscillators ... 449
12.3.1 Main Oscillator (MainOSC) ... 449
12.3.2 Sub Oscillator (SubOSC) ... 451
12.3.3 High Speed Internal Oscillator (HS IntOSC) ... 452
12.3.4 Low Speed Internal Oscillator (LS IntOSC) ... 454
12.3.5 PLL ... 455

12.3.5.1 PLL Parameters ... 457
12.4 Registers ... 458
12.4.1 List of Registers ... 458
12.4.2 Clock Oscillator Registers ... 460
12.4.2.1 MOSCE — MainOSC Enable Register ... 460
12.4.2.2 MOSCS — MainOSC Status Register ... 462
12.4.2.3 MOSCC — MainOSC Control Register ... 463
12.4.2.4 MOSCST — MainOSC Stabilization Time Register ... 464
12.4.2.5 MOSCSTPM — MainOSC Stop Mask Register ... 465
12.4.2.6 MOSCM — MainOSC Mode Control Register ... 466
12.4.2.7 SOSCE — SubOSC Enable Register ... 467
12.4.2.8 SOSCS — SubOSC Status Register ... 468
12.4.2.9 SOSCST — SubOSC Stabilization Time Register ... 469
12.4.2.10 ROSCE — HS IntOSC Enable Register ... 470
12.4.2.11 ROSCS — HS IntOSC Status Register ... 471
12.4.2.12 ROSCSTPM — HS IntOSC Stop Mask Register ... 472
12.4.2.13 PLLE — PLL Enable Register ... 473
12.4.2.14 PLLS — PLL Status Register ... 474
12.4.2.15 PLLC — PLL Control Register ... 475
12.4.2.16 PLL Input Clock Selection ... 479
12.4.2.17 PPLLCLK Source Clock Selection ... 481
12.4.2.18 ROSCUT — HS IntOSC User Trimming Register ... 483
12.4.3 Clock Selector Control Register ... 484
12.4.3.1 WDTA0 Clock Domain C_AWO_WDTA ... 484
12.4.3.2 TAUJ Clock Domain C_AWO_TAUJ ... 487
12.4.3.3 RTCA Clock Domain C_AWO_RTCA ... 492
12.4.3.4 ADCA0 Clock Domain C_AWO_ADCA ... 497
12.4.3.5 FOUT Clock Domain C_AWO_FOUT ... 502
12.4.3.6 CPU Clock Domain C_ISO_CPUCLK ... 505
12.4.3.7 Peripheral Clock Domains C_ISO_PERI1 and C_ISO_PERI2 ... 509
12.4.3.8 RLIN Clock Domains C_ISO_LIN ... 513
12.4.3.9 ADCA1 Clock Domain C_ISO_ADCA ... 518
12.4.3.10 RS-CAN Clock Domains C_ISO_CAN and C_ISO_CANOSC ... 522
12.4.3.11 CSI Clock Domain C_ISO_CSI ... 528
12.4.3.12 IIC Clock Domain C_ISO_IIC ... 530
12.5 Clock Domain Setting Method ... 532
12.5.1 Clock Domain Setting ... 532
12.5.1.1 Overview of Clock Selector Register ... 532
12.5.1.2 Setting Procedure for Clock Domain ... 533
12.5.2 Stopping the Clock in Stand-by Mode ... 533
12.5.3 Clock Domain Settings ... 534
12.6 Frequency Output Function (FOUT) ... 536
12.6.1 Functional Overview ... 536
12.6.2 Clock Supply ... 536
12.6.3 Registers ... 537
12.6.3.1 List of Registers ... 537
12.6.3.2 FOUTDIV — Clock Division Ratio Register ... 538
12.6.3.3 FOUTSTAT — Clock Divider Status Register ... 539

Section 13 Clock Monitor (CLMA) ..... 540
13.1 Features of RH850/F1K CLMA ..... 540
13.1.1 Number of Channels ..... 540
13.1.2 Register Base Addresses ..... 540
13.1.3 Clock Supply to CLMA ..... 540
13.1.4 Reset Sources ..... 541
13.1.5 Internal Input/Output Signals ..... 541
13.2 Overview ..... 542
13.2.1 Functional Overview ..... 542
13.3 Enabling CLMA ..... 543
13.4 Functions ..... 544
13.4.1 Detection of Abnormal Clock Frequencies ..... 544
13.4.2 Notification of Abnormal Clock Frequency ..... 546
13.5 Registers ..... 547
13.5.1 List of Registers ..... 547
13.5.2 CLMAnCTL0 — CLMAn Control Register 0 ..... 548
13.5.3 CLMAnCMPH — CLMAn Compare Register H ..... 549
13.5.4 CLMAnCMPL — CLMAn Compare Register L ..... 549
13.5.5 CLMATEST — CLMA Test Register ..... 550
13.5.6 CLMATESTS — CLMA Test Status Register ..... 551
13.5.7 CLMAnEMU0 — CLMAn Emulation Register 0 ..... 552
13.6 Usage Notes for CLMAn ..... 553
Section 14 Stand-By Controller (STBC) ..... 554
14.1 Functions ..... 554
14.1.1 Types of Stand-By Mode ..... 554
14.1.2 Wake-Up Control ..... 555
14.1.2.1 Wake-Up Factors for Stand-By Modes ..... 555
14.1.2.2 Setting of Wake-Up Factors ..... 557
14.1.3 On-Chip Debug Wake-Up ..... 560
14.1.4 I/O Buffer Control ..... 561
14.1.4.1 I/O Buffer Hold State ..... 561
14.1.4.2 I/O Buffers during STOP Mode ..... 561
14.1.4.3 I/O Buffers during DeepSTOP Mode ..... 561
14.1.5 Transition to Stand-By Mode ..... 562
14.1.6 Clock Supply ..... 562
14.2 Registers ..... 563
14.2.1 List of Registers ..... 563
14.2.2 Details of Stand-By Controller Control Registers ..... 564
14.2.2.1 STBC0PSC — Power Save Control Register ..... 564
14.2.2.2 STBC0STPT — Power Stop Trigger Register ..... 565
14.2.2.3 WUF0/WUF20/WUF_ISO0 — Wake-Up Factor Registers ..... 566
14.2.2.4 WUFMSK0/WUFMSK20/WUFMSK_ISO0 — Wake-Up Factor Mask Registers ..... 567
14.2.2.5 WUFC0/WUFC20/WUFC_ISO0 — Wake-Up Factor Clear Registers ..... 568
14.2.2.6 IOHOLD — I/O Buffer Hold Control Register ..... 569

14.3 Mode Transition ..... 570
14.3.1 STOP Mode ..... 570
14.3.2 DeepSTOP Mode ..... 572
14.3.3 Cyclic RUN Mode ..... 575
14.3.4 Cyclic STOP Mode ..... 577
14.4 Writing to the Stand-By Controller Related Registers ..... 578
14.5 Clock Oscillator Behavior During Stand-By Mode Transition ..... 578
14.6 Cautions when Using Stand-By Modes ..... 584
14.6.1 Cautions Concerning Transitioning to DeepSTOP Mode When Using a Debugger ..... 584

Section 15 Low-Power Sampler (LPS) ..... 585

15.1 Features of RH850/F1K LPS ..... 585
15.1.1 Number of Units ..... 585
15.1.2 Register Base Address ..... 586
15.1.3 Clock Supply ..... 586
15.1.4 Interrupt Request ..... 586
15.1.5 Reset Sources ..... 587
15.1.6 External Input/Output Signals ..... 587
15.1.7 Internal Input/Output Signals ..... 587
15.2 Overview ..... 588
15.2.1 Functional Overview ..... 588
15.3 Registers ..... 589
15.3.1 List of Registers ..... 589
15.3.2 SCTLR — LPS Control Register ..... 590
15.3.3 EVFR — Event Flag Register ..... 592
15.3.4 DPSELR0 — DPIN Select Register 0 ..... 593
15.3.5 DPSELRM — DPIN Select Register M ..... 594
15.3.6 DPSELRH — DPIN Select Register H ..... 595
15.3.7 DPDSR0 — DPIN Data Set Register 0 ..... 596
15.3.8 DPDSRM — DPIN Data Set Register M ..... 597
15.3.9 DPDSRH — DPIN Data Set Register H ..... 598
15.3.10 DPDIMR0 — DPIN Data Input Monitor Register 0 ..... 599
15.3.11 DPDIMR1 — DPIN Data Input Monitor Register 1 ..... 599
15.3.12 DPDIMR2 — DPIN Data Input Monitor Register 2 ..... 600
15.3.13 DPDIMR3 — DPIN Data Input Monitor Register 3 ..... 600
15.3.14 DPDIMR4 — DPIN Data Input Monitor Register 4 ..... 601
15.3.15 DPDIMR5 — DPIN Data Input Monitor Register 5 ..... 601
15.3.16 DPDIMR6 — DPIN Data Input Monitor Register 6 ..... 602
15.3.17 DPDIMR7 — DPIN Data Input Monitor Register 7 ..... 602
15.3.18 CNTVAL — Count Value Register ..... 603
15.3.19 SOSTR — LPS Operation Status Register ..... 604
15.4 Digital Input Mode ..... 605
15.4.1 Digital Port Error Interrupt ..... 611
15.5 Analog Input Mode ..... 611

15.5.1 Analog Port Error Interrupt ... 616

Section 16 Clocked Serial Interface G (CSIG) ... 617

16.1 Features of RH850/F1K CSIG ... 617
16.1.1 Number of Units ... 617
16.1.2 Register Base Address ... 617
16.1.3 Clock Supply ... 617
16.1.4 Interrupt Request ... 618
16.1.5 Reset Sources ... 618
16.1.6 External Input/Output Signals ... 619
16.1.7 Data Consistency Check ... 619
16.2 Overview ... 620
16.2.1 Functional Overview ... 620
16.2.2 Functional Overview Description ... 620
16.2.3 Block Diagram ... 621
16.3 Registers ... 622
16.3.1 List of Registers ... 622
16.3.2 CSIGnCTL0 — CSIGn Control Register 0 ... 623
16.3.3 CSIGnCTL1 — CSIGn Control Register 1 ... 624
16.3.4 CSIGnCTL2 — CSIGn Control Register 2 ... 626
16.3.5 CSIGnSTR0 — CSIGn Status Register 0 ... 627
16.3.6 CSIGnSTCR0 — CSIGn Status Clear Register 0 ... 629
16.3.7 CSIGnBCTL0 — CSIGn Rx-Only Mode Control Register 0 ... 630
16.3.8 CSIGnCFG0 — CSIGn Configuration Register 0 ... 631
16.3.9 CSIGnTX0W — CSIGn Transmission Register 0 for Word Access ... 633
16.3.10 CSIGnTX0H — CSIGn Transmission Register 0 for Half Word Access ... 634
16.3.11 CSIGnRX0 — CSIGn Reception Register 0 ... 634
16.3.12 CSIGnEMU — CSIGn Emulation Register ... 635
16.3.13 List of Cautions ... 636
16.4 Interrupt Sources ... 637
16.4.1 Interrupt Delay ... 637
16.4.2 INTCSIGTIC (Communication Status Interrupt) ... 638
16.4.3 INTCSIGTIR (Reception Status Interrupt) ... 639
16.4.4 INTCSIGTIRE (Communication Error Interrupt) ... 639
16.5 Operation ... 640
16.5.1 Master/Slave Mode ... 640
16.5.1.1 Master Mode ... 640
16.5.1.2 Slave Mode ... 641
16.5.2 Master/Slave Connections ... 642
16.5.2.1 One Master and One Slave ... 642
16.5.2.2 One Master and Multiple Slaves ... 643
16.5.3 Transmission Clock Selection ... 644
16.5.4 Data Transfer Modes ... 645
16.5.4.1 Transmit-Only Mode ... 645
16.5.4.2 Receive-Only Mode ... 645

16.5.4.3 Transmit/Receive Mode ... 645
16.5.5 Data Length Selection ... 646
16.5.5.1 Data Length Selection without Extended Length ... 646
16.5.5.2 Data Length Selection with Extended Data Length ... 646
16.5.6 Serial Data Direction Selection Function ... 648
16.5.7 Communication in Slave Mode ... 649
16.5.8 Handshake Function ... 650
16.5.8.1 Slave Mode ... 650
16.5.8.2 Master Mode ... 651
16.5.9 Loop-Back Mode ... 652
16.5.10 Error Detection ... 653
16.5.10.1 Data Consistency Check ... 653
16.5.10.2 Parity Check ... 654
16.5.10.3 Overrun Error ... 654
16.6 Operating Procedures ... 656
16.6.1 Master Mode Transmission/Reception by DMA ... 656

Section 17 Clocked Serial Interface H (CSIH) ... 658
17.1 Features of RH850/F1K CSIH ... 658
17.1.1 Number of Units ... 658
17.1.2 Register Base Address ... 659
17.1.3 Clock Supply ... 659
17.1.4 Interrupt Requests ... 660
17.1.5 Reset Sources ... 660
17.1.6 External Input/Output Signals ... 661
17.1.7 Data Consistency Check ... 662
17.2 Overview ... 663
17.2.1 Functional Overview ... 663
17.2.2 Functional Overview Description ... 664
17.2.3 Block Diagram ... 665
17.3 Registers ... 666
17.3.1 List of Registers ... 666
17.3.2 CSIHnCTL0 — CSIHn Control Register 0 ... 667
17.3.3 CSIHnCTL1 — CSIHn Control Register 1 ... 668
17.3.4 CSIHnCTL2 — CSIHn Control Register 2 ... 670
17.3.5 CSIHnSTR0 — CSIHn Status Register 0 ... 672
17.3.6 CSIHnSTCR0 — CSIHn Status Clear Register 0 ... 676
17.3.7 CSIHnMCTL0 — CSIHn Memory Control Register 0 ... 677
17.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1 ... 678
17.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2 ... 679
17.3.10 CSIHnMRWP0 — CSIHn Memory Read/Write Pointer Register 0 ... 681
17.3.11 CSIHnCFGx — CSIHn Configuration Register x ... 683
17.3.12 CSIHnTX0W — CSIHn Transmit Data Register 0 for Word Access ... 688
17.3.13 CSIHnTX0H — CSIHn Transmit Data Register 0 for Half Word Access ... 690
17.3.14 CSIHnRX0W — CSIHn Receive Data Register 0 for Word Access ... 691
17.3.15 CSIHnRX0H — CSIHn Receive Data Register 0 for Half Word Access ... 692

17.3.16 CSIHnEMU — CSIHn Emulation Register ..... 692
17.3.17 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3) ..... 693
17.3.18 List of Cautions ..... 694
17.4 Interrupt Sources ..... 697
17.4.1 Overview ..... 697
17.4.2 Interrupt Delay ..... 698
17.4.3 INTCSIHTIC (Communication Status Interrupt) ..... 699
17.4.3.1 INTCSIHTIC in Direct Access Mode ..... 700
17.4.3.2 INTCSIHTIC in FIFO Mode ..... 701
17.4.3.3 INTCSIHTIC in Job Mode ..... 702
17.4.4 INTCSIHTIR (Reception Status Interrupt) ..... 703
17.4.4.1 INTCSIHTIR in Direct Access Mode ..... 703
17.4.4.2 INTCSIHTIR in Dual Buffer Mode ..... 704
17.4.5 INTCSIHTIRE (Communication Error Interrupt) ..... 705
17.4.6 INTCSIHTIJC (Job Completion Interrupt) ..... 706
17.5 Operation ..... 707
17.5.1 Operating Modes (Master/Slave) ..... 707
17.5.1.1 Master Mode ..... 707
17.5.1.2 Slave Mode ..... 708
17.5.2 Master/Slave Connections ..... 709
17.5.2.1 One Master and One Slave ..... 709
17.5.2.2 One Master and Multiple Slaves ..... 710
17.5.3 Chip Selection (CS) Features ..... 711
17.5.3.1 Configuration Registers ..... 711
17.5.3.2 CS Example ..... 713
17.5.3.3 Job Concept ..... 713
17.5.4 Details of Chip Select Timing ..... 714
17.5.4.1 Changing the Clock Phase ..... 714
17.5.4.2 Changing the Data Phase ..... 716
17.5.5 Transmission Clock Selection ..... 717
17.5.6 CSIH Buffer Memory ..... 719
17.5.6.1 FIFO Mode ..... 719
17.5.6.2 Dual Buffer Mode ..... 720
17.5.6.3 Transmit-Only Buffer Mode ..... 720
17.5.6.4 Direct Access Mode ..... 720
17.5.7 Data Transfer Modes ..... 721
17.5.7.1 Transmit-Only Mode ..... 721
17.5.7.2 Receive-Only Mode ..... 721
17.5.7.3 Transmit/Receive Mode ..... 721
17.5.7.4 Summary ..... 721
17.5.8 Data Length Selection ..... 722
17.5.8.1 Data Length from 2 to 16 Bits ..... 722
17.5.8.2 Data Length Greater than 16 Bits ..... 723
17.5.9 Serial Data Direction Selection ..... 725
17.5.10 Slave Select (SS) Function ..... 726
17.5.10.1 Communication Timing Using SS Function ..... 726
17.5.10.2 CSIHTSSO Operation ..... 727
17.5.11 Handshake Function ..... 728

17.5.11.1 Slave Mode ... 728
17.5.11.2 Master Mode ... 731
17.5.12 Error Detection ... 732
17.5.12.1 Data Consistency Check ... 732
17.5.12.2 Parity Check ... 734
17.5.12.3 Time-Out Error ... 735
17.5.12.4 Overflow Error ... 736
17.5.12.5 Overrun Error ... 738
17.5.13 Loop-Back Mode ... 741
17.5.14 CPU-Controlled High Priority Communication Function ... 742
17.5.15 Enforced Chip Select Idle Setting ... 745
17.6 Operating Procedures ... 746
17.6.1 Procedures in Direct Access Mode ... 746
17.6.1.1 Transmission/Reception in Master Mode when Job Mode is Disabled ... 746
17.6.1.2 Transmission/Reception in Master Mode when Job Mode is Enabled ... 748
17.6.2 Procedures in Transmit-Only Buffer Mode ... 750
17.6.2.1 Transmission/Reception in Master Mode when Job Mode is Disabled ... 750
17.6.2.2 Transmission/Reception in Master Mode when Job Mode is Enabled ... 752
17.6.3 Procedures in Dual Buffer Mode ... 754
17.6.3.1 Transmission/Reception in Master Mode when Job Mode is Disabled ... 754
17.6.3.2 Transmission/Reception in Master Mode when Job Mode is Enabled ... 756
17.6.3.3 Transmit/Receive in Slave Mode when Job Mode is Disabled ... 758
17.6.4 Procedures in FIFO Mode ... 760
17.6.4.1 Transmission/Reception in Master Mode when Job Mode is Disabled ... 760
17.6.4.2 Transmit/Receive Mode when Job Mode is Enabled in Master Mode ... 762
17.7 Detection and Correction of Errors in CSIHn RAM ... 764
17.7.1 ECC for the CSIHn RAM ... 764
17.7.2 Interrupt Request ... 764
17.7.3 Register Base Address ... 765
17.7.4 List of Registers ... 765
17.7.5 ECCCSIHnCTL — CSIHn ECC Control Register ... 766
17.7.6 ECCCSIHnTMC — CSIHn ECC Test Mode Control Register ... 768
17.7.7 ECCCSIHnTED — CSIHn ECC Encode/Decode Input/Output Replacement Test Register ... 770
17.7.8 ECCCSIHnTRC — CSIHn ECC Redundant Bit Data Control Test Register ... 771
17.7.9 ECCCSIHnAD0 — CSIHn ECC Error Address Register 0 ... 772
17.7.10 ECCCSIHnSYND — CSIHn ECC Decode Syndrome Data Register ... 773
17.7.11 ECCCSIHnHORD — CSIHn ECC 7-Bit Redundant Bit Data Hold Test Register ... 774
17.7.12 ECCCSIHnECRD — CSIHn ECC Encode Test Register ... 774
17.7.13 ECCCSIHnERDB — CSIHn ECC Redundant Bit Input/Output Replacement Register ... 775
17.7.14 SELB_READTEST — ECCREAD Test Select Register ... 776

Section 18 LIN Master Interface (RLIN2) ... 777

18.1 Features of RH850/F1K RLIN2 ... 777
18.1.1 Number of Units and Channels ... 777
18.1.2 Register Base Addresses ... 778
18.1.3 Clock Supply ... 778

18.1.4 Interrupt Request ... 778
18.1.5 Reset Sources ... 779
18.1.6 External Input/Output Signals ... 779

18.2.1 Functional Overview ... 780
18.2.2 Block Diagram ... 781
18.3 Registers ... 782
18.3.1 List of Registers ... 782
18.3.2 Global Registers ... 783
18.3.2.1 RLN24nGLWBR — LIN Wake-Up Baud Rate Select Register ... 783
18.3.2.2 RLN24nGLBRP0 — LIN Baud Rate Prescaler 0 Register ... 784
18.3.2.3 RLN24nGLBRP1 — LIN Baud Rate Prescaler 1 Register ... 785
18.3.2.4 RLN24nGLSTC — LIN Self-Test Control Register ... 786
18.3.3 Channel Registers ... 787
18.3.3.1 RLN24nmLiMD — LIN Mode Register ... 787
18.3.3.2 RLN24nmLiBFC — LIN Break Field Configuration Register ... 788
18.3.3.3 RLN24nmLiSC — LIN Space Configuration Register ... 789
18.3.3.4 RLN24nmLiWUP — LIN Wake-Up Configuration Register ... 790
18.3.3.5 RLN24nmLiIE — LIN Interrupt Enable Register ... 791
18.3.3.6 RLN24nmLiEDE — LIN Error Detection Enable Register ... 792
18.3.3.7 RLN24nmLiCUC — LIN Control Register ... 794
18.3.3.8 RLN24nmLiTRC — LIN Transmission Control Register ... 795
18.3.3.9 RLN24nmLiMST — LIN Mode Status Register ... 796
18.3.3.10 RLN24nmLiST — LIN Status Register ... 797
18.3.3.11 RLN24nmLiEST — LIN Error Status Register ... 799
18.3.3.12 RLN24nmLiDFC — LIN Data Field Configuration Register ... 801
18.3.3.13 RLN24nmLiIDB — LIN ID Buffer Register ... 803
18.3.3.14 RLN24nmLiCBR — LIN Checksum Buffer Register ... 804
18.3.3.15 RLN24nmLiDBRb — LIN Data Buffer b Register ... 805
18.4 Interrupt Sources ... 807
18.5 Modes ... 808
18.6 LIN Reset Mode ... 810
18.7 LIN Operation Mode ... 811
18.8 LIN Wake-Up Mode ... 811
18.9 Header Transmission/Response Transmission/Response Reception ... 812
18.9.1 Header Transmission ... 812
18.9.2 Response Transmission ... 813
18.9.3 Response Reception ... 814
18.10 Data Transmission/Reception ... 815
18.10.1 Data Transmission ... 815
18.10.2 Data Reception ... 816
18.11 Transmission/Reception Data Buffering ... 817
18.11.1 Transmission of LIN Frames ... 817
18.11.2 Reception of LIN Frames ... 818
18.12 Wake-Up Transmission/Reception ... 819

18.12.1 Wake-Up Transmission ..... 819
18.12.2 Wake-Up Reception ..... 820
18.12.3 Wake-Up Collision ..... 820
18.13 Status ..... 821
18.14 Error Status ..... 822
18.14.1 Types of Error Statuses ..... 822
18.14.2 Target Time Domain for Error Detection ..... 823
18.15 LIN Self-Test Mode ..... 824
18.15.1 Transition to LIN Self-Test Mode ..... 825
18.15.2 Transmission in LIN Self-Test Mode ..... 826
18.15.3 Reception in LIN Self-Test Mode ..... 827
18.15.4 Exiting LIN Self-Test Mode ..... 828
18.16 Baud Rate Generator ..... 829

Section 19 LIN/UART Interface (RLIN3) ..... 830
19.1 Features of RH850/F1K RLIN3 ..... 830
19.1.1 Number of Units and Channels ..... 830
19.1.2 Register Base Address ..... 831
19.1.3 Clock Supply ..... 831
19.1.4 Interrupt Request ..... 832
19.1.5 Reset Sources ..... 832
19.1.6 External Input/output Signals ..... 833
19.2 Overview ..... 834
19.2.1 Functional Overview ..... 834
19.2.2 Block Diagram ..... 838
19.2.3 Terms used in block diagram ..... 838
19.3 Registers ..... 839
19.3.1 List of Registers ..... 839
19.3.2 LIN Master Related Registers ..... 841
19.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register ..... 841
19.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register ..... 842
19.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register ..... 843
19.3.2.4 RLN3nLSTC — LIN Self-Test Control Register ..... 844
19.3.2.5 RLN3nLMD — LIN Mode Register ..... 845
19.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register ..... 847
19.3.2.7 RLN3nLSC — LIN Space Configuration Register ..... 848
19.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register ..... 849
19.3.2.9 RLN3nLIE — LIN Interrupt Enable Register ..... 850
19.3.2.10 RLN3nLEDE —LIN Error Detection Enable Register ..... 852
19.3.2.11 RLN3nLCUC — LIN Control Register ..... 854
19.3.2.12 RLN3nLTRC — LIN Transmission Control Register ..... 855
19.3.2.13 RLN3nLMST — LIN Mode Status Register ..... 856
19.3.2.14 RLN3nLST — LIN Status Register ..... 857
19.3.2.15 RLN3nLEST — LIN Error Status Register ..... 859
19.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register ..... 861
19.3.2.17 RLN3nLIDB — LIN ID Buffer Register ..... 863

19.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register ... 864
19.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8) ... 865
19.3.3 LIN Slave Related Registers ... 867
19.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register ... 867
19.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register ... 868
19.3.3.3 RLN3nLSTC — LIN Self-Test Control Register ... 869
19.3.3.4 RLN3nLMD — LIN Mode Register ... 870
19.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register ... 871
19.3.3.6 RLN3nLSC — LIN Space Configuration Register ... 872
19.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register ... 873
19.3.3.8 RLN3nLIE — LIN Interrupt Enable Register ... 874
19.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register ... 876
19.3.3.10 RLN3nLCUC — LIN Control Register ... 878
19.3.3.11 RLN3nLTRC — LIN Transmission Control Register ... 879
19.3.3.12 RLN3nLMST — LIN Mode Status Register ... 880
19.3.3.13 RLN3nLST — LIN Status Register ... 881
19.3.3.14 RLN3nLEST — LIN Error Status Register ... 883
19.3.3.15 RLN3nLDFC — LIN Data Field Configuration Register ... 885
19.3.3.16 RLN3nLIDB — LIN ID Buffer Register ... 887
19.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register ... 888
19.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8) ... 889
19.3.4 UART Related Registers ... 890
19.3.4.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register ... 890
19.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register ... 891
19.3.4.3 RLN3nLMD — UART Mode Register ... 892
19.3.4.4 RLN3nLBFC — UART Configuration Register ... 893
19.3.4.5 RLN3nLSC — UART Space Configuration Register ... 895
19.3.4.6 RLN3nLEDE —UART Error Detection Enable Register ... 896
19.3.4.7 RLN3nLCUC — UART Control Register ... 897
19.3.4.8 RLN3nLTRC — UART Transmission Control Register ... 898
19.3.4.9 RLN3nLMST — UART Mode Status Register ... 899
19.3.4.10 RLN3nLST — UART Status Register ... 900
19.3.4.11 RLN3nLEST — UART Error Status Register ... 902
19.3.4.12 RLN3nLDFC — UART Data Field Configuration Register ... 904
19.3.4.13 RLN3nLIDB — UART ID Buffer Register ... 905
19.3.4.14 RLN3nLUDB0 — UART Data Buffer 0 Register ... 905
19.3.4.15 RLN3nLDBRb — UART Data Buffer b Register (b = 1 to 8) ... 906
19.3.4.16 RLN3nLUOER — UART Operation Enable Register ... 907
19.3.4.17 RLN3nLUOR1 — UART Option Register 1 ... 908
19.3.4.18 RLN3nLUTDR — UART Transmission Data Register ... 910
19.3.4.19 RLN3nLURDR — UART Reception Data Register ... 911
19.3.4.20 RLN3nLUWTDR — UART Wait Transmission Data Register ... 912
19.4 Interrupt Sources ... 913
19.5 Modes ... 914
19.6 LIN Reset Mode ... 916
19.7 LIN Mode ... 917
19.7.1 LIN Master Mode ... 920
19.7.1.1 Header Transmission ... 920

19.7.1.2 Response Transmission ... 921
19.7.1.3 Response Reception ... 922
19.7.2 LIN Slave Mode ... 923
19.7.2.1 Header Reception ... 923
19.7.2.2 Response Transmission ... 926
19.7.2.3 Response Reception ... 927
19.7.2.4 No-response Request ... 928
19.7.3 Data Transmission/Reception ... 929
19.7.3.1 Data Transmission ... 929
19.7.3.2 Data Reception ... 930
19.7.4 Transmission/Reception Data Buffering ... 931
19.7.4.1 Transmission of LIN Frames ... 931
19.7.4.2 Reception of LIN Frames ... 932
19.7.4.3 Multi-Byte Response Transmission/Reception Function ... 933
19.7.5 Wake-up Transmission/Reception ... 934
19.7.5.1 Wake-up Transmission ... 934
19.7.5.2 Wake-up Reception ... 935
19.7.5.3 Wakeup Collision ... 935
19.7.6 Statuses ... 936
19.7.7 Error Statuses ... 938
19.7.7.1 LIN Master Mode ... 938
19.7.7.2 LIN Slave Mode ... 940
19.8 UART Mode ... 942
19.8.1 Transmission ... 942
19.8.1.1 Continuous Transmission ... 944
19.8.1.2 UART Buffer Transmission ... 945
19.8.1.3 Data Transmission ... 947
19.8.1.4 Transmission Start Wait Function ... 948
19.8.2 Reception ... 949
19.8.2.1 Data Reception ... 950
19.8.3 Expansion Bits ... 951
19.8.3.1 Expansion Bit Transmission ... 951
19.8.3.2 Expansion Bit Reception ... 951
19.8.3.3 Expansion Bit Reception (with Expansion Bit Comparison) ... 952
19.8.3.4 Expansion Bit Reception (with Data Comparison) ... 953
19.8.4 Statuses ... 954
19.8.5 Error Statuses ... 955
19.9 LIN Self-Test Mode ... 956
19.9.1 Transition to LIN Self-Test Mode ... 958
19.9.2 Transmission in LIN Master Self-Test Mode ... 959
19.9.3 Reception in LIN Master Self-Test Mode ... 960
19.9.4 Transmission in LIN Slave Self-Test Mode ... 961
19.9.5 Reception in LIN Slave Self-Test Mode ... 963
19.9.6 Exiting LIN Self-Test Mode ... 964
19.10 Baud Rate Generator ... 965
19.10.1 LIN Master Mode ... 965
19.10.2 LIN Slave Mode ... 966

19.10.3 UART Mode ... 967
19.11 Noise Filter ... 968

Section 20 I2C Bus Interface (RIIC) ... 970
20.1 Features of RH850/F1K RIIC ... 970
20.1.1 Number of Units and Channels ... 970
20.1.2 Register Base Address ... 970
20.1.3 Clock Supply ... 970
20.1.4 Interrupt Requests ... 971
20.1.5 Reset Sources ... 971
20.1.6 External Input/Output Signals ... 971
20.2 Overview ... 972
20.2.1 Functional Overview ... 972

20.3 Registers ... 976
20.3.1 List of Registers ... 976
20.3.2 RIICnCR1 — I2C Bus Control Register 1 ... 977
20.3.3 RIICnCR2 — I2C Bus Control Register 2 ... 980
20.3.4 RIICnMR1 — I2C Bus Mode Register 1 ... 984
20.3.5 RIICnMR2 — I2C Bus Mode Register 2 ... 986
20.3.6 RIICnMR3 — I2C Bus Mode Register 3 ... 988
20.3.7 RIICnFER — I2C Bus Function Enable Register ... 991
20.3.8 RIICnSER — I2C Bus Status Enable Register ... 993
20.3.9 RIICnIER — I2C Bus Interrupt Enable Register ... 995
20.3.10 RIICnSR1 — I2C Bus Status Register 1 ... 997
20.3.11 RIICnSR2 — I2C Bus Status Register 2 ... 1000
20.3.12 RIICnSARy — I2C Slave Address Register y (y = 0 to 2) ... 1005
20.3.13 RIICnBRL — I2C Bus Bit Rate Low-Level Register ... 1007
20.3.14 RIICnBRH — I2C Bus Bit Rate High-Level Register ... 1008
20.3.15 RIICnDRT — I2C Bus Transmit Data Register ... 1011
20.3.16 RIICnDRR — I2C Bus Receive Data Register ... 1012
20.3.17 RIICnDRS — I2C Bus Shift Register ... 1013
20.4 Interrupt Sources ... 1014
20.5 Operation ... 1015
20.5.1 Communication Data Format ... 1015
20.5.2 Initial Settings ... 1016
20.5.3 Master Transmit Operation ... 1017
20.5.4 Master Receive Operation ... 1021
20.5.5 Slave Transmit Operation ... 1027
20.5.6 Slave Receive Operation ... 1030
20.6 SCL Synchronization Circuit ... 1033
20.7 Facility for Delaying SDA Output ... 1034
20.8 Digital Noise-Filter Circuits ... 1035
20.9 Address Match Detection ... 1036

20.9.1 Slave-Address Match Detection ..... 1036
20.9.2 Detection of the General Call Address ..... 1038
20.9.3 Device-ID Address Detection ..... 1039
20.10 Automatic Low-Hold Function for SCL ..... 1041
20.10.1 Function to Prevent Wrong Transmission of Transmit Data ..... 1041
20.10.2 NACK Reception Transfer Suspension Function ..... 1042
20.10.3 Function to Prevent Failure to Receive Data ..... 1043
20.11 Arbitration-Lost Detection Functions ..... 1045
20.11.1 Master Arbitration-Lost Detection (MALE Bit) ..... 1045
20.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit) ..... 1047
20.11.3 Slave Arbitration-Lost Detection (SALE Bit) ..... 1048
20.12 Start Condition/Restart Condition/Stop Condition Issuing Function ..... 1049
20.12.1 Issuing a Start Condition ..... 1049
20.12.2 Issuing a Restart Condition ..... 1049
20.12.3 Issuing a Stop Condition ..... 1051
20.13 Bus Hanging ..... 1052
20.13.1 Timeout Function ..... 1052
20.13.2 Extra SCL Clock Cycle Output Function ..... 1054
20.13.3 RIIC Reset and Internal Reset ..... 1055
20.14 Reset Function of RIIC ..... 1056

Section 21 CAN Interface (RS-CAN) ..... 1058
21.1 Features of RH850/F1K RS-CANFD ..... 1058
21.1.1 Number of Units and Channels ..... 1058
21.2 RS-CANFD ..... 1059
21.2.1 Register Base Address ..... 1060
21.2.2 Clock Supply ..... 1060
21.2.3 Interrupt Requests ..... 1061
21.2.4 Reset Factors ..... 1063
21.2.5 External Input/Output Signals ..... 1063
21.3 Overview ..... 1064
21.3.1 Functional Overview ..... 1064
21.3.2 Interface Modes ..... 1066
21.3.3 Block Diagram ..... 1067
21.4 Registers (Classical CAN Mode) ..... 1068
21.4.1 List of Registers ..... 1068
21.4.2 Details of Channel-Related Registers ..... 1072
21.4.2.1 RSCANnCmCFG — Channel Configuration Register (m = 0 to 5) ..... 1072
21.4.2.2 RSCANnCmCTR — Channel Control Register (m = 0 to 5) ..... 1074
21.4.2.3 RSCANnCmSTS — Channel Status Register (m = 0 to 5) ..... 1079
21.4.2.4 RSCANnCmERFL — Channel Error Flag Register (m = 0 to 5) ..... 1082
21.4.3 Details of Global-Related Registers ..... 1086
21.4.3.1 RSCANnGCFG — Global Configuration Register ..... 1086
21.4.3.2 RSCANnGCTR — Global Control Register ..... 1089
21.4.3.3 RSCANnGSTS — Global Status Register ..... 1091

21.4.3.4 RSCANnGERFL — Global Error Flag Register ... 1093
21.4.3.5 RSCANnGTSC — Global Timestamp Counter Register ... 1095
21.4.3.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0 ... 1096
21.4.3.7 RSCANnGTINTSTS1 — Global TX Interrupt Status Register 1 ... 1099
21.4.3.8 RSCANnGFDCFG — Global FD Configuration Register ... 1101
21.4.4 Details of Receive Rule-related Registers ... 1102
21.4.4.1 RSCANnGAFLECTR — Receive Rule Entry Control Register ... 1102
21.4.4.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0 ... 1103
21.4.4.3 RSCANnGAFLCFG1 — Receive Rule Configuration Register 1 ... 1105
21.4.4.4 RSCANnGAFLIDj — Receive Rule ID Register (j = 0 to 15) ... 1106
21.4.4.5 RSCANnGAFLMj — Receive Rule Mask Register (j = 0 to 15) ... 1108
21.4.4.6 RSCANnGAFLP0j — Receive Rule Pointer 0 Register (j = 0 to 15) ... 1109
21.4.4.7 RSCANnGAFLP1j — Receive Rule Pointer 1 Register (j = 0 to 15) ... 1111
21.4.5 Details of Receive Buffer-Related Registers ... 1112
21.4.5.1 RSCANnRMNB — Receive Buffer Number Register ... 1112
21.4.5.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0 to 2) ... 1113
21.4.5.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 95) ... 1114
21.4.5.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 95) ... 1115
21.4.5.5 RSCANnRMDF0q — Receive Buffer Data Field 0 Register (q = 0 to 95) ... 1116
21.4.5.6 RSCANnRMDF1q — Receive Buffer Data Field 1 Register (q = 0 to 95) ... 1117
21.4.6 Details of Receive FIFO Buffer-Related Registers ... 1118
21.4.6.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) ... 1118
21.4.6.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ... 1120
21.4.6.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) ... 1122
21.4.6.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7) ... 1123
21.4.6.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7) 1124
21.4.6.6 RSCANnRFDF0x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7) ... 1125
21.4.6.7 RSCANnRFDF1x — Receive FIFO Buffer Access Data Field 1 Register (x = 0 to 7) ... 1126
21.4.7 Details of Transmit/Receive FIFO Buffer-Related Registers ... 1127
21.4.7.1 RSCANnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 17) ... 1127
21.4.7.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 17) ... 1131
21.4.7.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 17) ... 1134
21.4.7.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 17) ... 1136
21.4.7.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 17) ... 1138
21.4.7.6 RSCANnCFDF0k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 17) ... 1140
21.4.7.7 RSCANnCFDF1k — Transmit/receive FIFO Buffer Access Data Field 1 Register (k = 0 to 17) ... 1141
21.4.8 Details of FIFO Status-Related Registers ... 1142
21.4.8.1 RSCANnFESTS — FIFO Empty Status Register ... 1142
21.4.8.2 RSCANnFFSTS — FIFO Full Status Register ... 1144
21.4.8.3 RSCANnFMSTS — FIFO Message Lost Status Register ... 1146

21.4.8.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register ..... 1148
21.4.8.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register ..... 1149
21.4.8.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register ..... 1151
21.4.9 Details of Transmit Buffer-Related Registers ..... 1153
21.4.9.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 95) ..... 1153
21.4.9.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 95) ..... 1155
21.4.9.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 95) ..... 1157
21.4.9.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 95) ..... 1159
21.4.9.5 RSCANnTMDF0p — Transmit Buffer Data Field 0 Register (p = 0 to 95) ..... 1161
21.4.9.6 RSCANnTMDF1p — Transmit Buffer Data Field 1 Register (p = 0 to 95) ..... 1162
21.4.9.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0 to 2) ..... 1163
21.4.10 Details of Transmit Buffer Status-Related Registers ..... 1165
21.4.10.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0 to 2) ..... 1165
21.4.10.2 RSCANnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0 to 2) ..... 1167
21.4.10.3 RSCANnTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0 to 2) ..... 1169
21.4.10.4 RSCANnTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0 to 2) ..... 1171
21.4.11 Details of Transmit Queue-Related Registers ..... 1173
21.4.11.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 5) ..... 1173
21.4.11.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0 to 5) ..... 1175
21.4.11.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 5) ..... 1177
21.4.12 Details of Transmit history-related Registers ..... 1178
21.4.12.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0 to 5) ..... 1178
21.4.12.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0 to 5) ..... 1180
21.4.12.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 5) 1182
21.4.12.4 RSCANnTHLACCm — Transmit History Access Register (m = 0 to 5) ..... 1183
21.4.13 Details of Test-Related Registers ..... 1185
21.4.13.1 RSCANnGTSTCFG — Global Test Configuration Register ..... 1185
21.4.13.2 RSCANnGTSTCTR — Global Test Control Register ..... 1187
21.4.13.3 RSCANnGLOCKK — Global Lock Key Register ..... 1188
21.4.13.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63) ..... 1189
21.5 Registers (CAN FD Mode) ..... 1190
21.5.1 List of Registers ..... 1190
21.5.2 Details of Interface Mode-Related Registers ..... 1195
21.5.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register ..... 1195
21.5.3 Details of Channel-Related Registers ..... 1196
21.5.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0 to 5) ..... 1196
21.5.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0 to 5) ..... 1198
21.5.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0 to 5) ..... 1203
21.5.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0 to 5) ..... 1206

21.5.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration register (m = 0 to 5) ... 1210
21.5.3.6 RSCFDnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 to 5) ... 1213
21.5.3.7 RSCFDnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 5) ... 1217
21.5.3.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 5) ... 1218
21.5.3.9 RSCFDnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 to 5) ... 1220
21.5.4 Details of Global-Related Registers ... 1222
21.5.4.1 RSCFDnCFDGCFG — Global Configuration Register ... 1222
21.5.4.2 RSCFDnCFDGCTR — Global Control Register ... 1226
21.5.4.3 RSCFDnCFDGSTS — Global Status Register ... 1228
21.5.4.4 RSCFDnCFDGERFL — Global Error Flag Register ... 1230
21.5.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register ... 1232
21.5.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0 ... 1233
21.5.4.7 RSCFDnCFDGTINTSTS1 — Global TX Interrupt Status Register 1 ... 1236
21.5.4.8 RSCFDnCFDGFDCFG — Global FD Configuration Register ... 1238
21.5.5 Details of Receive Rule-related Registers ... 1239
21.5.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register ... 1239
21.5.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0 ... 1240
21.5.5.3 RSCFDnCFDGAFLCFG1 — Receive Rule Configuration Register 1 ... 1242
21.5.5.4 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15) ... 1243
21.5.5.5 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15) ... 1245
21.5.5.6 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15) ... 1246
21.5.5.7 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15) ... 1248
21.5.6 Details of Receive Buffer-related Registers ... 1249
21.5.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register ... 1249
21.5.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0 to 2) ... 1250
21.5.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 95) ... 1251
21.5.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 95) ... 1252
21.5.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 95) ... 1254
21.5.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 95) ... 1255
21.5.7 Details of Receive FIFO Buffer-related Registers ... 1256
21.5.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) ... 1256
21.5.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ... 1258
21.5.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) ... 1260
21.5.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7) ... 1261
21.5.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7) ... 1262
21.5.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7) ... 1264
21.5.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7) ... 1265
21.5.8 Transmit/Receive FIFO Buffer Related Registers ... 1266
21.5.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 17) ... 1266
21.5.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 17) ... 1270

21.5.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 17) ... 1274
21.5.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 17) ... 1276
21.5.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 17) ... 1278
21.5.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CAN FD Configuration/ Status Register (k = 0 to 17) ... 1280
21.5.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 17) ... 1282
21.5.9 Details of FIFO Status-related Registers ... 1283
21.5.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register ... 1283
21.5.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register ... 1285
21.5.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register ... 1287
21.5.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register ... 1289
21.5.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register ... 1290
21.5.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register ... 1292
21.5.10 Details of FIFO DMA-Related Registers ... 1294
21.5.10.1 RSCFDnCFDCDTCT — DMA Enable Register ... 1294
21.5.10.2 RSCFDnCFDCDTSTS — DMA Status Register ... 1296
21.5.11 Details of Transmit Buffer-related Registers ... 1298
21.5.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 95) ... 1298
21.5.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 95) ... 1300
21.5.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 95) ... 1302
21.5.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 95) ... 1304
21.5.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 95) ... 1306
21.5.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 95) ... 1308
21.5.11.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0 to 2) ... 1309
21.5.12 Details of Transmit Buffer Status-related Registers ... 1311
21.5.12.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0 to 2) ... 1311
21.5.12.2 RSCFDnCFDTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0 to 2) ... 1313
21.5.12.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0 to 2) ... 1315
21.5.12.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0 to 2) ... 1317
21.5.13 Details of Transmit Queue-related Registers ... 1319
21.5.13.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 5) ... 1319
21.5.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 5) ... 1321
21.5.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 5) ... 1323
21.5.14 Details of Transmit History-related Registers ... 1324
21.5.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 5) ... 1324
21.5.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0 to 5) ... 1326

21.5.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 5) ... 1328
21.5.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0 to 5) ... 1329
21.5.15 Details of Test-related Registers ... 1331
21.5.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register ... 1331
21.5.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register ... 1333
21.5.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register ... 1334
21.5.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63) ... 1335

24.12.7.6 Specific Timing Diagrams: Overflow Behavior ..... 1732
24.12.8 TAUBTTINm Input Position Detection Function ..... 1736
24.12.8.1 Overview ..... 1736
24.12.8.2 Equations ..... 1736
24.12.8.3 Block Diagram and General Timing Diagram ..... 1737
24.12.8.4 Register Settings ..... 1738
24.12.8.5 Operating Procedure for TAUBTTINm Input Position Detection Function ..... 1739
24.12.8.6 Specific Timing Diagrams ..... 1740
24.12.9 TAUBTTINm Input Period Count Detection Function ..... 1741
24.12.9.1 Overview ..... 1741
24.12.9.2 Equations ..... 1741

24.12.9.3 Block Diagram and General Timing Diagram ... 1742
24.12.9.4 Register Settings ... 1743
24.12.9.5 Operating Procedure for TAUBTTINm Input Period Count Detection Function ... 1744
24.12.9.6 Specific Timing Diagrams ... 1745
24.12.10 TAUBTTINm Input Pulse Interval Judgment Function ... 1746
24.12.10.1 Overview ... 1746
24.12.10.2 Block Diagram and General Timing Diagram ... 1747
24.12.10.3 Register Settings ... 1747
24.12.10.4 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function ... 1749
24.12.11 TAUBTTINm Input Signal Width Judgment Function ... 1750
24.12.11.1 Overview ... 1750
24.12.11.2 Block Diagram and General Timing Diagram ... 1751
24.12.11.3 Register Settings ... 1752
24.12.11.4 Operating Procedure for TAUBTTINm Input Signal Width Judgment Function ... 1753
24.12.12 Overflow Interrupt Output Function (during TAUBTTINm Width Measurement) ... 1754
24.12.12.1 Overview ... 1754
24.12.12.2 Block Diagram and General Timing Diagram ... 1755
24.12.12.3 Register Settings ... 1756
24.12.12.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement) ... 1758
24.12.13 Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection) ... 1759
24.12.13.1 Overview ... 1759
24.12.13.2 Block Diagram and General Timing Diagram ... 1760
24.12.13.3 Register Settings ... 1761
24.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection) ... 1763
24.13 Independent Channel Simultaneous Rewrite Functions ... 1764
24.13.1 Simultaneous Rewrite Trigger Generation Function Type 1 ... 1764
24.13.1.1 Overview ... 1764
24.13.1.2 Equations ... 1765
24.13.1.3 Block Diagram and General Timing Diagram ... 1766
24.13.1.4 Register Settings for The Upper Channel ... 1768
24.13.1.5 Register Settings for the Lower Channel(s) ... 1769
24.13.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1 ... 1770
24.14 Synchronous Channel Operation Functions ... 1771
24.14.1 PWM Output Function ... 1771
24.14.1.1 Overview ... 1771
24.14.1.2 Equations ... 1772
24.14.1.3 Block Diagram and General Timing Diagram ... 1772
24.14.1.4 Register Settings for the Master Channel ... 1774
24.14.1.5 Register Settings for the Slave Channel(s) ... 1776
24.14.1.6 Operating Procedure for PWM Output Function ... 1778
24.14.1.7 Specific Timing Diagrams ... 1779
24.14.2 One-Shot Pulse Output Function ... 1783
24.14.2.1 Overview ... 1783
24.14.2.2 Equations ... 1784
24.14.2.3 Block Diagram and General Timing Diagram ... 1785

24.14.2.4 Register Settings for the Master Channel ..... 1787
24.14.2.5 Register Settings for the Slave Channel ..... 1789
24.14.2.6 Operating Procedure for One-Shot Pulse Output Function ..... 1791
24.14.2.7 Specific Timing Diagrams ..... 1792
24.14.3 Delay Pulse Output Function ..... 1798
24.14.3.1 Overview ..... 1798
24.14.3.2 Equations ..... 1799
24.14.3.3 Block Diagram and General Timing Diagram ..... 1801
24.14.3.4 Register Settings for the Master Channel ..... 1803
24.14.3.5 Register Settings for Slave Channel 1 ..... 1805
24.14.3.6 Register Settings For Slave Channel 2 ..... 1807
24.14.3.7 Register Settings for Slave Channel 3 ..... 1809
24.14.3.8 Operating Procedure for Delay Pulse Output Function ..... 1810
24.14.3.9 Specific Timing Diagrams ..... 1812
24.14.4 AD Conversion Trigger Output Function Type 1 ..... 1814
24.14.4.1 Overview ..... 1814
24.14.4.2 Block Diagram and General Timing Diagram ..... 1814
24.14.5 Triangle PWM Output Function ..... 1816
24.14.5.1 Overview ..... 1816
24.14.5.2 Equations ..... 1817
24.14.5.3 Block Diagram and General Timing Diagram ..... 1818
24.14.5.4 Register Settings for the Master Channel ..... 1820
24.14.5.5 Register Settings for the Slave Channel(s) ..... 1822
24.14.5.6 Operating Procedure for Triangle PWM Output Function ..... 1824
24.14.5.7 Specific Timing Diagrams ..... 1825
24.14.6 Triangle PWM Output Function with Dead Time ..... 1827
24.14.6.1 Overview ..... 1827
24.14.6.2 Equations ..... 1829
24.14.6.3 Block Diagram and General Timing Diagram ..... 1830
24.14.6.4 Register Settings for the Master Channel ..... 1832
24.14.6.5 Register Settings for Slave Channel 2 ..... 1834
24.14.6.6 Register Settings for Slave Channel 3 ..... 1836
24.14.6.7 Operating Procedure for Triangle PWM Output Function with Dead Time ..... 1838
24.14.6.8 Specific Timing Diagrams ..... 1839
24.14.7 A/D Conversion Trigger Output Function Type 2 ..... 1850
24.14.7.1 Overview ..... 1850
24.14.7.2 Block Diagram and General Timing Diagram ..... 1850

Section 25 Timer Array Unit D (TAUD) ..... 1852

25.1 Features of RH850/F1K TAUD ..... 1852
25.1.1 Number of Units and Channels ..... 1852
25.1.2 Register Base Address ..... 1852
25.1.3 Clock Supply ..... 1853
25.1.4 Interrupt Requests ..... 1853
25.1.5 Reset Sources ..... 1853
25.1.6 External Input/Output Signals ..... 1854
25.1.7 Internal Input/Output Signals ..... 1855
25.1.8 TAUD0 Input Selection ..... 1855

25.1.8.1 List of Registers ... 1857
25.1.8.2 SELB_TAUD0I — TAUDTTINm Input Signal Selection Register ... 1857
25.2 Overview ... 1858
25.2.1 Functional Overview ... 1858
25.2.2 Terms ... 1859
25.2.3 Functional List of Timer Operations ... 1860
25.2.4 TAUD I/O and Interrupt Request Signals ... 1861
25.2.5 Block Diagram ... 1862
25.2.6 Description of Blocks ... 1863
25.3 Registers ... 1864
25.3.1 List of Registers ... 1864
25.3.2 Details of TAUDn Prescaler Registers ... 1865
25.3.2.1 TAUDnTPS — TAUDn Prescaler Clock Select Register ... 1865
25.3.2.2 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register ... 1868
25.3.3 Details of TAUDn Control Registers ... 1869
25.3.3.1 TAUDnCDRm — TAUDn Channel Data Register ... 1869
25.3.3.2 TAUDnCNTm — TAUDn Channel Counter Register ... 1870
25.3.3.3 TAUDnCMORm — TAUDn Channel Mode OS Register ... 1871
25.3.3.4 TAUDnCMURm — TAUDn Channel Mode User Register ... 1874
25.3.3.5 TAUDnCSRm — TAUDn Channel Status Register ... 1875
25.3.3.6 TAUDnCSCm — TAUDn Channel Status Clear Register ... 1876
25.3.3.7 TAUDnTS — TAUDn Channel Start Trigger Register ... 1876
25.3.3.8 TAUDnTE — TAUDn Channel Enable Status Register ... 1877
25.3.3.9 TAUDnTT — TAUDn Channel Stop Trigger Register ... 1877
25.3.4 Details of TAUDn Simultaneous Rewrite Registers ... 1878
25.3.4.1 TAUDnRDE — TAUDn Channel Reload Data Enable Register ... 1878
25.3.4.2 TAUDnRDS — TAUDn Channel Reload Data Control Channel Select Register 1878
25.3.4.3 TAUDnRDM — TAUDn Channel Reload Data Mode Register ... 1879
25.3.4.4 TAUDnRDC — TAUDn Channel Reload Data Control Register ... 1879
25.3.4.5 TAUDnRDT — TAUDn Channel Reload Data Trigger Register ... 1880
25.3.4.6 TAUDnRSF — TAUDn Channel Reload Status Register ... 1880
25.3.5 Details of TAUDn Output Registers ... 1881
25.3.5.1 TAUDnTOE — TAUDn Channel Output Enable Register ... 1881
25.3.5.2 TAUDnTO — TAUDn Channel Output Register ... 1881
25.3.5.3 TAUDnTOM — TAUDn Channel Output Mode Register ... 1882
25.3.5.4 TAUDnTOC — TAUDn Channel Output Configuration Register ... 1882
25.3.5.5 TAUDnTOL — TAUDn Channel Output Active Level Register ... 1883
25.3.6 Details of TAUDn Dead Time Output Registers ... 1884
25.3.6.1 TAUDnTDE — TAUDn Channel Dead Time Output Enable Register ... 1884
25.3.6.2 TAUDnTDM — TAUDn Channel Dead Time Output Mode Register ... 1884
25.3.6.3 TAUDnTDL — TAUDn Channel Dead Time Output Level Register ... 1885
25.3.7 Details of TAUDn Real-time/Modulation Output Registers ... 1886
25.3.7.1 TAUDnTRE — TAUDn Channel Real-time Output Enable Register ... 1886
25.3.7.2 TAUDnTRC — TAUDn Channel Real-time Output Control Register ... 1886
25.3.7.3 TAUDnTRO — TAUDn Channel Real-time Output Register ... 1887
25.3.7.4 TAUDnTME — TAUDn Channel Modulation Output Enable Register ... 1887
25.3.8 TAUDn Emulation Register ... 1888
25.3.8.1 TAUDnEMU — TAUDn Emulation Register ... 1888

25.4 Operating Procedure ..... 1889
25.5 Concepts of Synchronous Channel Operation ..... 1890
25.5.1 Rules of Synchronous Channel Operation ..... 1890
25.5.2 Simultaneous Start and Stop of Synchronous Channel Counters ..... 1892
25.5.2.1 Simultaneous Start and Stop within the Same Unit ..... 1892
25.5.2.2 Simultaneous Start between the Units ..... 1892
25.6 Simultaneous Rewrite ..... 1893
25.6.1 Overview of Operations ..... 1893
25.6.2 How to Control Simultaneous Rewrite ..... 1895
25.6.2.1 Initial Settings ..... 1896
25.6.2.2 Start Counter and Count Operation ..... 1896
25.6.2.3 Simultaneous Rewrite ..... 1896
25.6.3 Other General Rules of Simultaneous Rewrite ..... 1897
25.6.4 Types of Simultaneous Rewrite ..... 1898
25.6.4.1 Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A) ..... 1898
25.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel (Method B) ..... 1900
25.6.4.3 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1) ..... 1901
25.6.4.4 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2) ..... 1903
25.7 Channel Output Modes ..... 1905
25.7.1 General Procedures for Specifying a Channel Output Mode ..... 1907
25.7.2 Channel Output Modes Controlled Independently by TAUDn Signals ..... 1908
25.7.2.1 Independent Channel Output Mode 1 ..... 1908
25.7.2.2 Independent Channel Output Mode 1 with Real-Time Output ..... 1908
25.7.2.3 Independent Channel Output Mode 2 ..... 1909
25.7.3 Channel Output Modes Controlled Synchronously by TAUDn Signals ..... 1910
25.7.3.1 Synchronous Channel Output Mode 1 ..... 1910
25.7.3.2 Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output ..... 1910
25.7.3.3 Synchronous Channel Output Mode 2 ..... 1910
25.7.3.4 Synchronous Channel Output Mode 2 with Dead Time Output ..... 1911
25.7.3.5 Synchronous Channel Output Mode 2 with One-Phase PWM Output ..... 1912
25.7.3.6 Synchronous Channel Output Mode 2 with Complementary Modulation Output 1913
25.7.3.7 Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output ..... 1913
25.8 Start Timing in Each Operating Modes ..... 1914
25.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode ..... 1914
25.8.2 Event Count Mode ..... 1915
25.8.3 Other Operating Modes ..... 1915
25.9 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts ..... 1916
25.10 Interrupt Generation upon Overflow ..... 1917
25.10.1 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function ..... 1918

25.10.2 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width) ..... 1919
25.10.3 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function ..... 1920
25.10.4 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count) ..... 1921
25.11 TAUDTTINm Edge Detection ..... 1922
25.12 Independent Channel Operation Functions ..... 1923
25.12.1 Interval Timer Function ..... 1923
25.12.1.1 Overview ..... 1923
25.12.1.2 Equations ..... 1923
25.12.1.3 Block Diagram and General Timing Diagram ..... 1924
25.12.1.4 Register Settings ..... 1925
25.12.1.5 Operating Procedure for Interval Timer Function ..... 1927
25.12.1.6 Specific Timing Diagrams ..... 1928
25.12.2 TAUDTTINm Input Interval Timer Function ..... 1932
25.12.2.1 Overview ..... 1932
25.12.2.2 Equations ..... 1932
25.12.2.3 Block Diagram and General Timing Diagram ..... 1933
25.12.2.4 Register Settings ..... 1934
25.12.2.5 Operating Procedure for TAUDTTINm Input Interval Timer Function ..... 1936
25.12.2.6 Specific Timing Diagrams ..... 1937
25.12.3 Clock Divide Function ..... 1938
25.12.3.1 Overview ..... 1938
25.12.3.2 Equations ..... 1939
25.12.3.3 Block Diagram and General Timing Diagram ..... 1939
25.12.3.4 Register Settings ..... 1940
25.12.3.5 Operating Procedure for Clock Divide Function ..... 1942
25.12.3.6 Specific Timing Diagrams ..... 1943
25.12.4 External Event Count Function ..... 1945
25.12.4.1 Overview ..... 1945
25.12.4.2 Equations ..... 1945
25.12.4.3 Block Diagram and General Timing Diagram ..... 1946
25.12.4.4 Register Settings ..... 1947
25.12.4.5 Operating Procedure for External Event Count Function ..... 1948
25.12.4.6 Specific Timing Diagrams ..... 1949
25.12.5 Delay Count Function ..... 1951
25.12.5.1 Overview ..... 1951
25.12.5.2 Equations ..... 1951
25.12.5.3 Block Diagram and General Timing Diagram ..... 1952
25.12.5.4 Register Settings ..... 1953
25.12.5.5 Operating Procedure for Delay Count Function ..... 1954
25.12.6 One-Pulse Output Function ..... 1955
25.12.6.1 Overview ..... 1955
25.12.6.2 Equations ..... 1955
25.12.6.3 Block Diagram and General Timing Diagram ..... 1956
25.12.6.4 Register Settings ..... 1957
25.12.6.5 Operating Procedure for One-Pulse Output Function ..... 1959

25.12.7 TAUDTTINm Input Pulse Interval Measurement Function ..... 1960
25.12.7.1 Overview ..... 1960
25.12.7.2 Equations ..... 1961
25.12.7.3 Block Diagram and General Timing Diagram ..... 1962
25.12.7.4 Register Settings ..... 1963
25.12.7.5 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function ..... 1964
25.12.7.6 Specific Timing Diagrams: Overflow Operation ..... 1965
25.12.8 TAUDTTINm Input Signal Width Measurement Function ..... 1968
25.12.8.1 Overview ..... 1968
25.12.8.2 Equations ..... 1969
25.12.8.3 Block Diagram and General Timing Diagram ..... 1969
25.12.8.4 Register Settings ..... 1971
25.12.8.5 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function ..... 1972
25.12.8.6 Specific Timing Diagrams: Overflow Operation ..... 1973
25.12.9 TAUDTTINm Input Position Detection Function ..... 1977
25.12.9.1 Overview ..... 1977
25.12.9.2 Equations ..... 1977
25.12.9.3 Block Diagram and General Timing Diagram ..... 1978
25.12.9.4 Register Settings ..... 1979
25.12.9.5 Operating Procedure for TAUDTTINm Input Position Detection Function ..... 1980
25.12.9.6 Specific Timing Diagrams ..... 1981
25.12.10 TAUDTTINm Input Period Count Detection Function ..... 1982
25.12.10.1 Overview ..... 1982
25.12.10.2 Equations ..... 1982
25.12.10.3 Block Diagram and General Timing Diagram ..... 1983
25.12.10.4 Register Settings ..... 1984
25.12.10.5 Operating Procedure for TAUDTTINm Input Period Count Detection Function ..... 1985
25.12.10.6 Specific Timing Diagrams ..... 1986
25.12.11 TAUDTTINm Input Pulse Interval Judgment Function ..... 1987
25.12.11.1 Overview ..... 1987
25.12.11.2 Block Diagram and General Timing Diagram ..... 1988
25.12.11.3 Register Settings ..... 1989
25.12.11.4 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function ..... 1990
25.12.12 TAUDTTINm Input Signal Width Judgment Function ..... 1991
25.12.12.1 Overview ..... 1991
25.12.12.2 Block Diagram and General Timing Diagram ..... 1992
25.12.12.3 Register Settings ..... 1993
25.12.12.4 Operating Procedure for TAUDTTINm Input Signal Width Judgment Function ..... 1994
25.12.13 Overflow Interrupt Output Function (during TAUDTTINm Width Measurement) ..... 1995
25.12.13.1 Overview ..... 1995
25.12.13.2 Block Diagram and General Timing Diagram ..... 1996
25.12.13.3 Register Settings ..... 1997
25.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement) ..... 1998
25.12.14 Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection) ..... 1999
25.12.14.1 Overview ..... 1999
25.12.14.2 Block Diagram and General Timing Diagram ..... 2000

25.12.14.3 Register Settings ..... 2001
25.12.14.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection) ..... 2002
25.12.15 One-Phase PWM Output Function ..... 2003
25.12.15.1 Overview ..... 2003
25.12.15.2 Block Diagram and General Timing Diagram ..... 2004
25.12.15.3 Register Settings for Lower Channels ..... 2006
25.12.15.4 Register Settings for Upper Channels ..... 2008
25.12.15.5 Operating Procedure for One-phase PWM Output Function ..... 2009
25.13 Independent Channel Real-Time Functions ..... 2010
25.13.1 Real-Time Output Function Type 1 ..... 2010
25.13.1.1 Overview ..... 2010
25.13.1.2 Equations ..... 2011
25.13.1.3 Block Diagram and General Timing Diagram ..... 2011
25.13.1.4 Register Settings for Upper Channels ..... 2013
25.13.1.5 Register Settings for Lower Channels ..... 2015
25.13.1.6 Operating Procedure for Real-Time Output Function Type 1 ..... 2016
25.13.1.7 Specific Timing Diagrams ..... 2017
25.13.2 Real-Time Output Function Type 2 ..... 2018
25.13.2.1 Overview ..... 2018
25.13.2.2 Block Diagram and General Timing Diagram ..... 2019
25.13.2.3 Register Settings for Upper Channels ..... 2021
25.13.2.4 Register Settings for Lower Channels ..... 2023
25.13.2.5 Operating Procedure for Real-Time Output Function Type 2 ..... 2024
25.13.2.6 Specific Timing Diagrams ..... 2025
25.14 Independent Channel Simultaneous Rewrite Functions ..... 2026
25.14.1 Simultaneous Rewrite Trigger Generation Function Type 1 ..... 2026
25.14.1.1 Overview ..... 2026
25.14.1.2 Equations ..... 2027
25.14.1.3 Block Diagram and General Timing Diagram ..... 2028
25.14.1.4 Register Settings for Upper Channels ..... 2030
25.14.1.5 Register Settings for Lower Channels ..... 2031
25.14.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1 ..... 2032
25.14.2 Simultaneous Rewrite Trigger Generation Function Type 2 ..... 2033
25.14.2.1 Overview ..... 2033
25.14.2.2 Block Diagram and General Timing Diagram ..... 2034
25.14.2.3 Register Settings for Upper Channels ..... 2036
25.14.2.4 Register Settings for Lower Channels ..... 2038
25.14.2.5 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 2 ..... 2039
25.15 Synchronous Channel Operation Functions ..... 2041
25.15.1 PWM Output Function ..... 2041
25.15.1.1 Overview ..... 2041
25.15.1.2 Equations ..... 2042
25.15.1.3 Block Diagram and General Timing Diagram ..... 2042
25.15.1.4 Register Settings for the Master Channel ..... 2044
25.15.1.5 Register Settings for Slave Channels ..... 2046
25.15.1.6 Operating Procedure for PWM Output Function ..... 2048

25.15.1.7 Specific Timing Diagrams ..... 2049
25.15.2 One-Shot Pulse Output Function ..... 2052
25.15.2.1 Overview ..... 2052
25.15.2.2 Equations ..... 2053
25.15.2.3 Block Diagram and General Timing Diagram ..... 2053
25.15.2.4 Register Settings for the Master Channel ..... 2055
25.15.2.5 Register Settings for Slave Channels ..... 2057
25.15.2.6 Operating Procedure for One-Shot Pulse Output Function ..... 2059
25.15.2.7 Specific Timing Diagrams ..... 2060
25.15.3 Trigger Start PWM Output Function ..... 2064
25.15.3.1 Overview ..... 2064
25.15.3.2 Equations ..... 2065
25.15.3.3 Block Diagram and General Timing Diagram ..... 2065
25.15.3.4 Register Settings for the Master Channel ..... 2067
25.15.3.5 Register Settings for Slave Channels ..... 2069
25.15.3.6 Operating Procedure for Trigger Start PWM Output Function ..... 2071
25.15.3.7 Specific Timing Diagrams ..... 2072
25.15.4 Delay Pulse Output Function ..... 2075
25.15.4.1 Overview ..... 2075
25.15.4.2 Equations ..... 2076
25.15.4.3 Block Diagram and General Timing Diagram ..... 2077
25.15.4.4 Register Settings for the Master Channel ..... 2079
25.15.4.5 Register Settings for Slave Channel 1 ..... 2081
25.15.4.6 Register Settings for Slave Channel 2 ..... 2083
25.15.4.7 Register Settings for Slave Channel 3 ..... 2085
25.15.4.8 Operating Procedure for Delay Pulse Output Function ..... 2087
25.15.4.9 Specific Timing Diagrams ..... 2089
25.15.5 Offset Trigger Output Function ..... 2091
25.15.5.1 Overview ..... 2091
25.15.5.2 Equations ..... 2092
25.15.5.3 Block Diagram and General Timing Diagram ..... 2092
25.15.5.4 Register Settings for the Master Channel ..... 2094
25.15.5.5 Register Settings for Slave Channels ..... 2096
25.15.5.6 Operating Procedure for Offset Trigger Output Function ..... 2098
25.15.5.7 Specific Timing Diagrams ..... 2099
25.15.6 A/D Conversion Trigger Output Function Type 1 ..... 2101
25.15.6.1 Overview ..... 2101
25.15.6.2 Block Diagram and General Timing Diagram ..... 2101
25.15.7 Triangle PWM Output Function ..... 2103
25.15.7.1 Overview ..... 2103
25.15.7.2 Equations ..... 2104
25.15.7.3 Block Diagram and General Timing Diagram ..... 2105
25.15.7.4 Register Settings for the Master Channel ..... 2107
25.15.7.5 Register Settings for Slave Channels ..... 2109
25.15.7.6 Operating Procedure for Triangle PWM Output Function ..... 2111
25.15.7.7 Specific Timing Diagrams ..... 2112
25.15.8 Triangle PWM Output Function with Dead Time ..... 2114
25.15.8.1 Overview ..... 2114
25.15.8.2 Equations ..... 2116

25.15.8.3 Block Diagram and General Timing Diagram ..... 2117
25.15.8.4 Register Settings for the Master Channel ..... 2119
25.15.8.5 Register Settings for Slave Channel 2 ..... 2121
25.15.8.6 Register Settings for Slave Channel 3 ..... 2123
25.15.8.7 Operating Procedure for Triangle PWM Output Function with Dead Time ..... 2125
25.15.8.8 Specific Timing Diagrams ..... 2126
25.15.9 A/D Conversion Trigger Output Function Type 2 ..... 2128
25.15.9.1 Overview ..... 2128
25.15.9.2 Block Diagram and General Timing Diagram ..... 2128
25.15.10 Interrupt Request Signals Culling Function ..... 2130
25.15.10.1 Overview ..... 2130
25.15.10.2 Equations ..... 2131
25.15.10.3 Block Diagram and General Timing Diagram ..... 2131
25.15.10.4 Register Settings for the Master Channel ..... 2133
25.15.10.5 Register Settings for the Slave Channel ..... 2135
25.15.10.6 Operating Procedure for Interrupt Request Signals Culling Function ..... 2136
25.15.10.7 Specific Timing Diagrams ..... 2137
25.16 Synchronous Non-Complementary and Complementary Modulation Output Functions ..... 2138
25.16.1 Non-Complementary Modulation Output Function Type 1 ..... 2138
25.16.1.1 Overview ..... 2138
25.16.1.2 Equations ..... 2140
25.16.1.3 Block Diagram and General Timing Diagram ..... 2141
25.16.1.4 Register Settings for the Master Channel ..... 2143
25.16.1.5 Register Settings for Slave Channel 1 ..... 2145
25.16.1.6 Register Settings for Slave Channels 2 to 7 ..... 2147
25.16.1.7 Operating Procedure for Non-Complementary Modulation Output Function Type 1 ..... 2149
25.16.1.8 Specific Timing Diagrams ..... 2151
25.16.2 Non-Complementary Modulation Output Function Type 2 ..... 2152
25.16.2.1 Overview ..... 2152
25.16.2.2 Equations ..... 2154
25.16.2.3 Block Diagram and General Timing Diagram ..... 2155
25.16.2.4 Register Settings for the Master Channel ..... 2157
25.16.2.5 Register Settings for Slave Channel 1 ..... 2159
25.16.2.6 Register settings for slave channels 2 to 7 ..... 2161
25.16.2.7 Operating Procedure for Non-Complementary Modulation Output Function Type 2 ..... 2163
25.16.2.8 Specific Timing Diagrams ..... 2165
25.16.3 Complementary Modulation Output Function ..... 2166
25.16.3.1 Overview ..... 2166
25.16.3.2 Equations ..... 2169
25.16.3.3 Block Diagram and General Timing Diagram ..... 2170
25.16.3.4 Register Settings for the Master Channel ..... 2172
25.16.3.5 Register Settings for Slave Channel 1 ..... 2174
25.16.3.6 Register settings for slave channels 2, 4, and 6 ..... 2176
25.16.3.7 Register settings for slave channels 3, 5, and 7 ..... 2178
25.16.3.8 Operating Procedure for Complementary Modulation Output Function ..... 2180
25.16.3.9 Specific Timing Diagrams ..... 2182

Section 26 Timer Array Unit J (TAUJ) ..... 2184
26.1 Features of RH850/F1K TAUJ ..... 2184
26.1.1 Number of Units ..... 2184
26.1.2 Register Base Address ..... 2184
26.1.3 Clock Supply ..... 2185
26.1.4 Interrupt Requests ..... 2185
26.1.5 Reset Sources ..... 2185
26.1.6 External Input/Output Signals ..... 2186
26.1.7 Internal Input/Output Signals ..... 2186
26.1.8 TAUJ0 Input Selection ..... 2186
26.1.8.1 List of Registers ..... 2188
26.1.8.2 SELB_TAUJ0I — TAUJTTINm Input Signal Selection Register ..... 2188
26.2 Overview ..... 2189
26.2.1 Functional Overview ..... 2189
26.2.2 Terms ..... 2190
26.2.3 Functional List of Timer Operations ..... 2191
26.2.4 TAUJ I/O and Interrupt Request Signals ..... 2191
26.2.5 Block Diagram ..... 2192
26.2.6 Description of Block Diagram ..... 2193
26.3 Registers ..... 2194
26.3.1 List of Registers ..... 2194
26.3.2 Details of TAUJn Prescaler Registers ..... 2195
26.3.2.1 TAUJnTPS — TAUJn Prescaler Clock Select Register ..... 2195
26.3.2.2 TAUJnBRS — TAUJn Prescaler Baud Rate Setting Register ..... 2198
26.3.3 Details of TAUJn Control Registers ..... 2199
26.3.3.1 TAUJnCDRm — TAUJn Channel Data Register ..... 2199
26.3.3.2 TAUJnCNTm — TAUJn Channel Counter Register ..... 2200
26.3.3.3 TAUJnCMORm — TAUJn Channel Mode OS Register ..... 2202
26.3.3.4 TAUJnCMURm — TAUJn Channel Mode User Register ..... 2205
26.3.3.5 TAUJnCSRm — TAUJn Channel Status Register ..... 2206
26.3.3.6 TAUJnCSCm — TAUJn Channel Status Clear Trigger Register ..... 2206
26.3.3.7 TAUJnTS — TAUJn Channel Start Trigger Register ..... 2207
26.3.3.8 TAUJnTE — TAUJn Channel Enable Status Register ..... 2207
26.3.3.9 TAUJnTT — TAUJn Channel Stop Trigger Register ..... 2208
26.3.4 Details of TAUJn Simultaneous Rewrite Register ..... 2209
26.3.4.1 TAUJnRDE — TAUJn Channel Reload Data Enable Register ..... 2209
26.3.4.2 TAUJnRDM — TAUJn Channel Reload Data Mode Register ..... 2209
26.3.4.3 TAUJnRDT — TAUJn Channel Reload Data Trigger Register ..... 2210
26.3.4.4 TAUJnRSF — TAUJn Channel Reload Status Register ..... 2210
26.3.5 Details of TAUJn Output Registers ..... 2211
26.3.5.1 TAUJnTOE — TAUJn Channel Output Enable Register ..... 2211
26.3.5.2 TAUJnTO — TAUJn Channel Output Register ..... 2211
26.3.5.3 TAUJnTOM — TAUJn Channel Output Mode Register ..... 2212
26.3.5.4 TAUJnTOC — TAUJn Channel Output Configuration Register ..... 2213
26.3.5.5 TAUJnTOL — TAUJn Channel Output Active Level Register ..... 2214
26.3.6 TAUJn Emulation Register ..... 2215
26.3.6.1 TAUJnEMU — TAUJn Emulation Register ..... 2215

26.4 Operating Procedure ..... 2216
26.5 Concepts of Synchronous Channel Operation Function ..... 2217
26.5.1 Rules of Synchronous Channel Operation Function ..... 2217
26.5.2 Simultaneous Start and Stop of Synchronous Channel Counters ..... 2219
26.5.2.1 Simultaneous Start and Stop within a TAUJ Unit ..... 2219
26.5.2.2 Simultaneous Start between TAUJ Units ..... 2219
26.6 Simultaneous Rewrite ..... 2220
26.6.1 How to Control Simultaneous Rewrite ..... 2220
26.6.1.1 Initial Settings ..... 2221
26.6.1.2 Start Counter and Count Operation ..... 2221
26.6.1.3 Simultaneous Rewrite ..... 2221
26.6.2 Other General Rules for Simultaneous Rewrite ..... 2221
26.6.3 Simultaneous Rewrite Procedure ..... 2222
26.7 Channel Output Modes ..... 2224
26.7.1 General Procedures for Specifying a Channel Output Mode ..... 2226
26.7.2 Channel Output Modes Controlled Independently by TAUJn Signals ..... 2227
26.7.2.1 Independent Channel Output Mode 1 ..... 2227
26.7.3 Channel Output Modes Controlled Synchronously by TAUJn Signals ..... 2227
26.7.3.1 Synchronous Channel Output Mode 1 ..... 2227
26.8 Start Timing in Each Operating Modes ..... 2228
26.8.1 Interval Timer Mode, Capture Mode, and Count Capture Mode ..... 2228
26.8.2 Other Operating Modes ..... 2229
26.9 TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts ..... 2230
26.10 Interrupt Generation upon Overflow ..... 2231
26.10.1 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function ..... 2232
26.11 TAUJTTINm Edge Detection ..... 2233
26.12 Independent Channel Operation Functions ..... 2234
26.12.1 Interval Timer Function ..... 2234
26.12.1.1 Overview ..... 2234
26.12.1.2 Equations ..... 2234
26.12.1.3 Block Diagram and General Timing Diagram ..... 2235
26.12.1.4 Register Settings ..... 2236
26.12.1.5 Operating Procedure for Interval Timer Function ..... 2238
26.12.1.6 Specific Timing Diagrams ..... 2239
26.12.2 TAUJTTINm Input Interval Timer Function ..... 2241
26.12.2.1 Overview ..... 2241
26.12.2.2 Equations ..... 2241
26.12.2.3 Block Diagram and General Timing Diagram ..... 2242
26.12.2.4 Register Settings ..... 2243
26.12.2.5 Operating Procedure for TAUJTTINm Input Interval Timer Function ..... 2245
26.12.2.6 Specific Timing Diagrams ..... 2246
26.12.3 TAUJTTINm Input Pulse Interval Measurement Function ..... 2247
26.12.3.1 Overview ..... 2247
26.12.3.2 Equations ..... 2248
26.12.3.3 Block Diagram and General Timing Diagram ..... 2248

26.12.3.4 Register Settings ..... 2250
26.12.3.5 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function ..... 2251
26.12.3.6 Specific Timing Diagrams: Overflow Behavior ..... 2252
26.12.4 TAUJTTINm Input Signal Width Measurement Function ..... 2256
26.12.4.1 Overview ..... 2256
26.12.4.2 Equations ..... 2257
26.12.4.3 Block Diagram and General Timing Diagram ..... 2257
26.12.4.4 Register Settings ..... 2258
26.12.4.5 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function ..... 2259
26.12.4.6 Specific Timing Diagrams: Overflow Behavior ..... 2260
26.12.5 TAUJTTINm Input Position Detection Function ..... 2264
26.12.5.1 Overview ..... 2264
26.12.5.2 Equations ..... 2264
26.12.5.3 Block Diagram and General Timing Diagram ..... 2265
26.12.5.4 Register Settings ..... 2266
26.12.5.5 Operating Procedure for TAUJTTINm Input Position Detection Function ..... 2267
26.12.5.6 Specific Timing Diagrams ..... 2268
26.12.6 TAUJTTINm Input Period Count Detection Function ..... 2269
26.12.6.1 Overview ..... 2269
26.12.6.2 Equations ..... 2269
26.12.6.3 Block Diagram and General Timing Diagram ..... 2270
26.12.6.4 Register Settings ..... 2271
26.12.6.5 Operating Procedure for TAUJTTINm Input Period Count Detection Function ..... 2272
26.12.6.6 Specific Timing Diagrams ..... 2273
26.12.7 Overflow Interrupt Output Function (during TAUJTTINm Width Measurement) ..... 2274
26.12.7.1 Overview ..... 2274
26.12.7.2 Block Diagram and General Timing Diagram ..... 2275
26.12.7.3 Register Settings ..... 2276
26.12.7.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement) ..... 2277
26.12.8 Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection) ..... 2278
26.12.8.1 Overview ..... 2278
26.12.8.2 Block Diagram and General Timing Diagram ..... 2279
26.12.8.3 Register Settings ..... 2280
26.12.8.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection) ..... 2281
26.13 Synchronous Channel Operation Functions ..... 2282
26.13.1 PWM Output Function ..... 2282
26.13.1.1 Overview ..... 2282
26.13.1.2 Equations ..... 2284
26.13.1.3 Block Diagram and General Timing Diagram ..... 2284
26.13.1.4 Register Settings for the Master Channel ..... 2286
26.13.1.5 Register Settings for the Slave Channel(s) ..... 2288
26.13.1.6 Operating Procedure for PWM Output Function ..... 2290
26.13.1.7 Specific Timing Diagrams ..... 2291

Section 27 Real-Time Clock (RTCA) ..... 2294
27.1 Features of RH850/F1K RTCA ..... 2294
27.1.1 Number of Units and Channels ..... 2294
27.1.2 Register Base Address ..... 2294
27.1.3 Clock Supply ..... 2294
27.1.4 Interrupt Requests ..... 2295
27.1.5 Reset Sources ..... 2295
27.1.6 External Input/Output Signals ..... 2295
27.2 Overview ..... 2296
27.2.1 Functional Overview ..... 2296
27.2.2 Block Diagram ..... 2296
27.2.3 Description of Blocks ..... 2297
27.3 Registers ..... 2298
27.3.1 List of Registers ..... 2298
27.3.2 Details of RTCA Control Registers ..... 2299
27.3.2.1 RTCAnCTL0 — RTCA Control Register 0 ..... 2299
27.3.2.2 RTCAnCTL1 — RTCA Control Register 1 ..... 2300
27.3.2.3 RTCAnCTL2 — RTCA Control Register 2 ..... 2301
27.3.3 Details of RTCA Sub-Counter Registers ..... 2303
27.3.3.1 RTCAnSUBC — RTCA Sub-Count Register ..... 2303
27.3.3.2 RTCAnSRBU — RTCA Sub-Count Register Read Buffer ..... 2304
27.3.3.3 RTCAnSUBU — RTCA Clock Error Correction Register ..... 2305
27.3.3.4 RTCAnSCMP — RTCA Sub-Counter Compare Register ..... 2306
27.3.4 Details of RTCA Clock Counter and Buffer Registers ..... 2307
27.3.4.1 RTCAnSECC — RTCA Seconds Count Register ..... 2307
27.3.4.2 RTCAnSEC — RTCA Seconds Count Buffer Register ..... 2308
27.3.4.3 RTCAnMINC — RTCA Minutes Count Register ..... 2309
27.3.4.4 RTCAnMIN — RTCA Minutes Count Buffer Register ..... 2310
27.3.4.5 RTCAnHOURC — RTCA Hours Count Register ..... 2311
27.3.4.6 RTCAnHOUR — RTCA Hours Count Buffer Register ..... 2313
27.3.4.7 RTCAnWEEKC — RTCA Day of the Week Count Register ..... 2314
27.3.4.8 RTCAnWEEK — RTCA Day of the Week Count Buffer Register ..... 2315
27.3.4.9 RTCAnDAYC — RTCA Day of the Month Count Register ..... 2316
27.3.4.10 RTCAnDAY — RTCA Day of the Month Count Buffer Register ..... 2317
27.3.4.11 RTCAnMONC — RTCA Month Count Register ..... 2318
27.3.4.12 RTCAnMONTH — RTCA Month Count Buffer Register ..... 2319
27.3.4.13 RTCAnYEARC — RTCA Year Count Register ..... 2320
27.3.4.14 RTCAnYEAR — RTCA Year Count Buffer Register ..... 2321
27.3.5 Details of RTCA Special Counter and Buffer Registers ..... 2322
27.3.5.1 RTCAnTIMEC — RTCA Time Count Register ..... 2322
27.3.5.2 RTCAnTIME — RTCA Time Count Buffer Register ..... 2323
27.3.5.3 RTCAnCALC — RTCA Calendar Count Register ..... 2324
27.3.5.4 RTCAnCAL — RTCA Calendar Count Buffer Register ..... 2325
27.3.6 Details of RTCA Alarm Setting Registers ..... 2326
27.3.6.1 RTCAnALM — RTCA Alarm Minute Setting Register ..... 2326
27.3.6.2 RTCAnALH — RTCA Alarm Hour Setting Register ..... 2327
27.3.6.3 RTCAnALW — RTCA Alarm Day of the Week Setting Register ..... 2328

27.3.7 RTCA Emulation Register ... 2329
27.3.7.1 RTCAnEMU — RTCA Emulation Register ... 2329
27.4 Operation ... 2330
27.4.1 Clock Counter Format ... 2331
27.4.2 Fixed Interval Interrupt Function ... 2331
27.4.3 Alarm Interrupt Function ... 2331
27.4.4 Clock Error Correction ... 2332
27.4.4.1 Setting the Correction Value and the Operator ... 2334
27.4.4.2 Impact of the Repetition Interval ... 2334
27.4.4.3 Sample Settings ... 2335
27.5 Procedures for Setup, Writing and Reading ... 2337
27.5.1 Initial Setting of the RTCA ... 2337
27.5.1.1 RTCA Stop Procedure ... 2337
27.5.1.2 RTCA Initialization Procedure ... 2338
27.5.2 Updating Clock Counters ... 2339
27.5.3 Reading Clock Counters ... 2340
27.5.3.1 Procedure for Reading Count Buffer Registers ... 2340
27.5.3.2 Procedure for Reading Counter Registers Directly ... 2342
27.5.4 Reading RTCAnSRBU ... 2343
27.5.5 Writing to RTCAnSUBU ... 2344
27.5.6 Writing to RTCAnSCMP ... 2345
27.6 Timing Diagrams ... 2346
27.6.1 Timing of Counter Start ... 2346
27.6.2 Timing of Clock Counter Update while Counter Is Enabled ... 2347
27.6.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled ... 2348

Section 28 Encoder Timer (ENCA) ... 2349

28.1 Features of RH850/F1K ENCA ... 2349
28.1.1 Number of Units and Channels ... 2349
28.1.2 Register Base Address ... 2349
28.1.3 Clock Supply ... 2350
28.1.4 Interrupt Requests ... 2350
28.1.5 Reset Sources ... 2350
28.1.6 External Input/Output Signals ... 2350
28.1.7 Internal Input/Output Signals ... 2351
28.2 Overview ... 2352
28.2.1 Functional Overview ... 2352
28.2.2 Block Diagram ... 2353
28.3 Registers ... 2354
28.3.1 List of Registers ... 2354
28.3.2 ENCAnCTL — ENCAn Control Register ... 2355
28.3.3 ENCAnIOC0 — ENCAn I/O Control Register 0 ... 2357
28.3.4 ENCAnIOC1 — ENCAn I/O Control Register 1 ... 2358
28.3.5 ENCAnFLG — ENCAn Status Flag Register ... 2360
28.3.6 ENCAnFGC — ENCAn Status Flag Clear Register ... 2361

28.3.7 ENCAnCCR0 — ENCAn Capture/Compare Register 0 ..... 2362
28.3.8 ENCAnCCR1 — ENCAn Capture/Compare Register 1 ..... 2363
28.3.9 ENCAnCNT — ENCAn Counter Register ..... 2364
28.3.10 ENCAnTE — ENCAn Timer Enable Status Register ..... 2365
28.3.11 ENCAnTS — ENCAn Timer Start Trigger Register ..... 2366
28.3.12 ENCAnTT — ENCAn Timer Stop Trigger Register ..... 2367
28.3.13 ENCAnEMU — ENCAn Emulation Register ..... 2368
28.4 Operation ..... 2369
28.4.1 Timer Counter Operation ..... 2369
28.4.2 Up/Down Control of Timer Counter ..... 2371
28.4.2.1 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $00_B$ ..... 2371
28.4.2.2 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $01_B$ ..... 2372
28.4.2.3 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $10_B$ ..... 2373
28.4.2.4 When ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = $11_B$ ..... 2374
28.4.3 Timer Counter Clear Control by Encoder Input ..... 2375
28.4.3.1 Clearing Method when ENCAnSCE = 0 ..... 2375
28.4.3.2 Clearing Method when ENCAnSCE = 1 ..... 2375
28.4.4 Functions of ENCAnCCR0 ..... 2376
28.4.4.1 Compare Function ..... 2376
28.4.4.2 Capture Function ..... 2376
28.4.5 Functions of ENCAnCCR1 ..... 2377
28.4.5.1 Compare Function ..... 2377
28.4.5.2 Capture Function ..... 2378
28.4.5.3 Timer Counter Clearing upon Compare Register Match ..... 2379
28.4.6 Startup/Stop of Timer Counter ..... 2379
28.4.6.1 Startup of Timer ..... 2379
28.4.6.2 Stop of Timer ..... 2379
28.5 ENCAn Setting Sequences ..... 2380
28.5.1 ENCAn Setting Procedure ..... 2380
28.5.1.1 Initial Setting Procedure for the Counter ..... 2380
28.5.1.2 Initial Setting Procedure for Counter Clear ..... 2381
28.5.1.3 Setting Procedure for ENCAnCCR0 Register ..... 2381
28.5.1.4 Setting Procedure for ENCAnCCR1 Register ..... 2381
28.6 Timing Chart ..... 2382
28.6.1 Overflow Occurrence and Overflow Flag Clear Operation ..... 2382
28.6.2 Underflow Occurrence and Underflow Flag Clear Operation ..... 2383
28.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin) ..... 2384
28.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin) ..... 2385
28.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin) ..... 2386
28.6.6 Overflow Operation Immediately after Startup ..... 2387
28.6.7 Underflow Operation Immediately after Startup ..... 2388
28.6.8 Using the ENCAnLDE Function Immediately after Startup ..... 2389
28.6.9 ENCAnLDE Function (Loading Count Value) ..... 2390
28.6.10 Conflict between ENCAnLDE Function (Loading Counter Value) and Rewrite of ENCAnCCR0 Register ..... 2392

28.6.11 Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin) ..... 2393
28.6.12 Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input ..... 2395
28.6.13 Capture Operation between Count Clocks (ENCAnCCR1) ..... 2396
28.6.14 Capture Operation between Count Clocks (ENCAnCCR0) ..... 2397
28.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0 ..... 2398
28.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1 ..... 2399
28.6.17 Encoder Operation when Compare Match Clear Control is Disabled ..... 2400
28.6.18 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE = 1 ..... 2401
28.6.18.1 Accompanying capture operation ..... 2401
28.6.18.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = $11_B$) ..... 2402
28.6.18.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = $11_B$) ..... 2403
28.6.18.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = $11_B$) ..... 2403
28.6.18.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = $11_B$) ..... 2404
28.6.19 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0 ..... 2405

Section 29 Motor Control ..... 2406

29.1 Features of RH850/F1K Motor Control ..... 2406
29.1.1 Number of Units and Channels ..... 2406
29.1.2 Register Base Address ..... 2407
29.1.3 Clock Supply ..... 2407
29.1.4 Interrupt Request ..... 2407
29.1.5 Reset Sources ..... 2407
29.1.6 External Input/Output Signal ..... 2408
29.1.7 Internal Output Signal ..... 2409
29.2 Overview ..... 2410
29.2.1 Functional Overview ..... 2410
29.2.2 Basic Structure of Motor Control ..... 2411
29.2.3 Block Diagram ..... 2412
29.2.4 Definition of Terms ..... 2413
29.3 Registers ..... 2414
29.3.1 List of Registers ..... 2414
29.3.2 TAPAnCTL0 — TAPA Control Register 0 ..... 2415
29.3.3 TAPAnCTL1 — TAPA Control Register 1 ..... 2416
29.3.4 TAPAnFLG — TAPA Flag Register ..... 2417
29.3.5 TAPAnACWE — TAPA Asynchronous Hi-Z Control Write Enable Register ..... 2418

29.3.6 TAPAnACTS — TAPA Asynchronous Hi-Z Control Start Trigger Register ..... 2418
29.3.7 TAPAnACTT — TAPA Asynchronous Hi-Z Control Stop Trigger Register ..... 2419
29.3.8 TAPAnOPHS — TAPA Hi-Z Start Trigger Register ..... 2419
29.3.9 TAPAnOPHT — TAPA Hi-Z Stop Trigger Register ..... 2420
29.3.10 TAPAnEMU — TAPA Emulation Register ..... 2420
29.4 Asynchronous Hi-Z Control Function ..... 2421
29.4.1 Overview ..... 2421
29.4.2 System Configuration Example ..... 2421
29.4.3 Basic Operation ..... 2423
29.4.4 Asynchronous Hi-Z Control Using Software Trigger ..... 2425
29.4.5 Operating Procedure ..... 2426
29.4.6 TAPA0 Hi-Z Control Input Selection ..... 2427
29.4.7 Registers ..... 2428
29.4.7.1 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0) ..... 2428
29.5 INT Signal Output Selection Function ..... 2429
29.5.1 Configuration of the INT Signal Output Selection Function ..... 2429
29.5.2 Block Diagram ..... 2430
29.5.3 Registers ..... 2431
29.5.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0) ..... 2431
29.6 A/D Converter Conversion Trigger Selection Function ..... 2432
29.6.1 Configuration of A/D Converter Conversion Trigger Selection Function ..... 2432
29.6.2 Block Diagram ..... 2433
29.6.3 Waveforms of A/D Converter Conversion Trigger Output Control Operation in Triangle PWM Mode ..... 2434
29.6.4 Operating Procedure for A/D Converter Conversion Trigger Selection Function ..... 2436
29.7 ADCA Trigger Selection Function ..... 2437
29.7.1 Functional Overview ..... 2437
29.7.2 Configuration ..... 2437
29.7.3 Registers ..... 2438
29.7.3.1 PIC0ADTEN4nj — A/D Conversion Trigger Output Control Register 4nj (n = 0, j = 0 to 2) ..... 2438
29.7.4 Example of Operation ..... 2439
29.7.5 Setup Flow ..... 2439
29.8 Simultaneous Start Trigger Function ..... 2440
29.8.1 Functional Overview ..... 2440
29.8.2 Configuration ..... 2440
29.8.3 Registers ..... 2441
29.8.3.1 PIC0SSER0 — Simultaneous Start Control Register 0 ..... 2441
29.8.3.2 PIC0SSER2 — Simultaneous Start Control Register 2 ..... 2441
29.8.3.3 PIC0SST — Simultaneous Start Trigger Control Register ..... 2442
29.8.4 Example of Operation ..... 2443
29.8.5 Setup Flow ..... 2444
29.9 Trigger & Pulse Width Measuring Function ..... 2445
29.9.1 Functional Overview ..... 2445
29.9.2 Configuration ..... 2445
29.9.3 Registers ..... 2447

29.9.3.1 PIC0REG31 — Timer I/O Control Register 31 ... 2447
29.9.4 Example of Operation ... 2449
29.9.5 Setup Flow ... 2451
29.9.6 Setting Examples for Operation Functions ... 2454
29.10 A/D Trigger Encoder Capture Function ... 2457
29.10.1 Functional Overview ... 2457
29.10.2 Configuration ... 2457
29.10.3 Registers ... 2458
29.10.3.1 PIC0REG30 — Timer I/O Control Register 30 ... 2458
29.10.4 Example of Operation ... 2459
29.10.5 Setup Flow ... 2460
29.10.6 Setting Examples for Operation Functions ... 2461
29.11 Three-Phase PWM Output with Dead Time ... 2462
29.11.1 Functional Overview ... 2462
29.11.2 Configuration ... 2462
29.11.3 Registers ... 2465
29.11.3.1 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0) ... 2465
29.11.3.2 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0) ... 2466
29.11.4 Operation Example ... 2467
29.11.4.1 Pwm Output ... 2467
29.11.4.2 One-Phase PWM Output ... 2467
29.11.4.3 SR Flip-Flop Circuit ... 2468
29.11.5 Setup Flow ... 2476
29.11.6 Setting Examples for Operation Functions ... 2478
29.11.6.1 TAUDn Settings (Active High Example) ... 2478
29.11.6.2 PIC Settings ... 2483
29.12 High-accuracy Triangle PWM Output with Dead Time ... 2484
29.12.1 Functional Overview ... 2484
29.12.2 Configuration ... 2485
29.12.3 Registers ... 2487
29.12.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0) ... 2487
29.12.3.2 PIC0REG2n1 — Timer I/O Control Register 2n1 (n = 0) ... 2488
29.12.3.3 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0) ... 2490
29.12.3.4 PIC0REG2n3 — Timer I/O Control Register 2n3 (n = 0) ... 2491
29.12.3.5 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0) ... 2493
29.12.4 Operation Example ... 2494
29.12.4.1 Triangle PWM Output with Dead Time ... 2494
29.12.4.2 One-shot Pulse Output ... 2494
29.12.4.3 U phase Combination Circuit (PFN001) ... 2495
29.12.4.4 Logical Operation Circuit (FN0i) (i = 0 or 1) ... 2497
29.12.5 Setup Flow ... 2507
29.12.6 Setting Examples for Operation Functions ... 2509
29.12.6.1 TAUDn settings (active high example) ... 2509
29.12.6.2 PIC Settings (Active High Example) ... 2515
29.13 Delay Pulse Output with Dead Time ... 2516
29.13.1 Functional Overview ... 2516
29.13.2 Configuration ... 2516

29.13.2.1 TAUDn configuration ..... 2517
29.13.3 Registers ..... 2519
29.13.3.1 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0) ..... 2519
29.13.3.2 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0) ..... 2520
29.13.4 Operation Example ..... 2521
29.13.4.1 Delay pulse output function ..... 2521
29.13.4.2 One-phase PWM output ..... 2521
29.13.5 Setup Flow ..... 2527
29.13.6 Setting Examples for Operation Functions ..... 2530
29.13.6.1 TAUDn Settings ..... 2530
29.13.6.2 Peripheral Interconnections Settings ..... 2535

Section 30 PWM Output/Diagnostic (PWM-Diag) ..... 2536

30.1 Features of RH850/F1K PWM-Diag ..... 2536
30.1.1 Number of Units and Channels ..... 2536
30.1.2 Register Base Address ..... 2537
30.1.3 Clock Supply ..... 2537
30.1.4 Interrupt Requests ..... 2538
30.1.5 Reset Sources ..... 2540
30.1.6 External Input/Output Signals ..... 2540
30.1.7 Internal Signals ..... 2540
30.1.8 Functional Overview ..... 2541
30.1.9 Block Diagram ..... 2543
30.2 Registers ..... 2544
30.2.1 List of Registers ..... 2544
30.2.1.1 PWBAnBRSm Register ..... 2545
30.2.1.2 PWBAnTE Register ..... 2546
30.2.1.3 PWBAnTS Register ..... 2547
30.2.1.4 PWBAnTT Register ..... 2548
30.2.1.5 PWBAnEMU Register ..... 2549
30.2.1.6 PWGAnCTL — PWGA Control Register ..... 2550
30.2.1.7 PWGAnCNT — PWM Cycle Count Register ..... 2550
30.2.1.8 PWGAnCSDR — PWM Output Set Condition Register ..... 2551
30.2.1.9 PWGAnCRDR — PWM Output Reset Condition Register ..... 2551
30.2.1.10 PWGAnCTDR — PWGA_TRGOUTn Generation Condition Register ..... 2552
30.2.1.11 PWGAnCSBR — PWGAnCSDR Buffer Register ..... 2552
30.2.1.12 PWGAnCRBR — PWGAnCRDR Buffer Register ..... 2553
30.2.1.13 PWGAnCTBR — PWGAnCTDR Buffer Register ..... 2553
30.2.1.14 PWGAnRSF — Buffer Register Reload Status Register ..... 2554
30.2.1.15 PWGAnRDT — Buffer Register Reload Trigger Register ..... 2554
30.2.1.16 SLPWGAk — PWGA Synchronous Trigger Register (k = 0 to 2) ..... 2555
30.2.1.17 PWSAnCTL Register ..... 2556
30.2.1.18 PWSAnSTR Register ..... 2556
30.2.1.19 PWSAnSTC Register ..... 2557
30.2.1.20 PWSAnQUEj (j = 0 to 7) Register ..... 2557
30.2.1.21 PWSAnPVCRx_y (x = 00, 02, 04 ... 70, y = 01, 03, 05 ... 71) Register ..... 2558
30.2.1.22 PWSAnEMU — Emulation Control Register ..... 2559
30.3 Operating Procedure ..... 2560

30.4 Operation Waveform of PWM-Diag ..... 2562
30.4.1 PWM Waveform Output by PWGA and Operation Waveform for A/D Conversion Trigger Output ..... 2562
30.4.1.1 Basic Operation Waveform of PWGA ..... 2562
30.4.1.2 Operation Waveform when Simultaneous Rewrite for PWGA is Executed ..... 2563
30.4.1.3 Operation Waveform when Stopping and Restarting PWGA Operation ..... 2564
30.4.1.4 Waveforms of PWGA Operation with Specific Settings ..... 2566
30.4.2 Operation Waveform when A/D Conversion Trigger Occurs in PWSA ..... 2567
30.5 PWM-Diag Related Function in A/D Converter (ADCA) ..... 2568
30.5.1 ADCA Registers when the PWM-Diag Function is Used ..... 2568

Section 31 A/D Converter (ADCA) ..... 2569

31.1 Features of RH850/F1K ADCA ..... 2569
31.1.1 Number of Units and Channels ..... 2569
31.1.2 Register Base Address ..... 2570
31.1.3 Clock Supply ..... 2571
31.1.4 Interrupt Requests ..... 2571
31.1.5 Reset Sources ..... 2571
31.1.6 External Input/Output Signals ..... 2572
31.2 Overview ..... 2575
31.2.1 Functional Overview ..... 2575
31.2.2 Block Diagram ..... 2577
31.3 Registers ..... 2582
31.3.1 List of Registers ..... 2582
31.3.2 ADCA Specific Registers ..... 2584
31.3.2.1 ADCAnVCRj — Virtual Channel Register j ..... 2584
31.3.2.2 ADCAnPWDVCR — PWM-Diag Virtual Channel Register ..... 2586
31.3.2.3 ADCAnDRj — Data Register j ..... 2587
31.3.2.4 ADCAnDIRj — Data Supplementary Information Register j ..... 2589
31.3.2.5 ADCAnPWDTSNDR — PWM-Diag Data Register ..... 2590
31.3.2.6 ADCAnPWDDIR — PWM-Diag Data Supplementary Information Register ..... 2591
31.3.2.7 ADCAnADHALTR — A/D Force Halt Register ..... 2592
31.3.2.8 ADCAnADCR — A/D Control Register ..... 2593
31.3.2.9 ADCAnMPXCURR — MPX Current Register ..... 2595
31.3.2.10 ADCAnTHSMPSTCR — T&H Sampling Start Control Register ..... 2596
31.3.2.11 ADCAnTHCR — T&H Control Register ..... 2597
31.3.2.12 ADCAnTHAHLDSTCR — T&H Group A Hold Start Control Register ..... 2598
31.3.2.13 ADCAnTHBHLDSTCR — T&H Group B Hold Start Control Register ..... 2599
31.3.2.14 ADCAnTHACR — T&H Group A Control Register ..... 2600
31.3.2.15 ADCAnTHBCR — T&H Group B Control Register ..... 2601
31.3.2.16 ADCAnTHER — T&H Enable Register ..... 2603
31.3.2.17 ADCAnTHGSR — T&H Group Select Register ..... 2604
31.3.2.18 ADCAnSMPCR — Sampling Control Register ..... 2606
31.3.2.19 ADCAnSFTCR — Safety Control Register ..... 2607
31.3.2.20 ADCAnULLMTBR0 to 2 — Upper Limit/Lower Limit Table Registers 0 to 2 ..... 2608
31.3.2.21 ADCAnECR — Error Clear Register ..... 2609
31.3.2.22 ADCAnULER — Upper Limit/Lower Limit Error Register ..... 2610

31.3.2.23 ADCAnOWER — Overwrite Error Register ... 2612
31.3.3 Scan Group (SG) Specific Registers ... 2613
31.3.3.1 ADCAnSGSTCRx — Scan Group x Start Control Register ... 2613
31.3.3.2 ADCAnSGCRx — Scan Group x Control Register ... 2614
31.3.3.3 ADCAnPWDSGCR — PWM-Diag Scan Group Control Register ... 2615
31.3.3.4 ADCAnSGVCSPx — Scan Group x Start Virtual Channel Pointer ... 2616
31.3.3.5 ADCAnSGVCEPx — Scan Group x End Virtual Channel Pointer ... 2617
31.3.3.6 ADCAnSGMCYCRx — Scan Group x Multicycle Register ... 2618
31.3.3.7 ADCAnPWDSGSEFCR — PWM-Diag Scan End Flag Clear Register ... 2619
31.3.3.8 ADCAnSGSEFCRx — Scan Group x Scan End Flag Clear Register ... 2620
31.3.3.9 ADCAnSGSTR — Scan Group Status Register ... 2621
31.3.4 Hardware Trigger Specific Register ... 2623
31.3.4.1 ADCAnSGTSELx — Scan Group x Start Trigger Control Register x ... 2623
31.3.5 Self-Diagnosis Specific Registers ... 2625
31.3.5.1 ADCAnDGCTL0 — Self-Diagnosis Control Register 0 ... 2625
31.3.5.2 ADCAnDGCTL1 — Self-Diagnosis Control Register 1 ... 2626
31.3.5.3 ADCAnPDCTL1 — Pull Down Control Register 1 ... 2627
31.3.5.4 ADCAnPDCTL2 — Pull Down Control Register 2 ... 2628
31.3.6 Emulation Specific Register ... 2629
31.3.6.1 ADCAnEMU — Emulation Control Register ... 2629
31.4 Operation ... 2630
31.4.1 Initial Setting ... 2630
31.4.2 Trigger Input ... 2631
31.4.3 Ending A/D Conversion ... 2632
31.4.4 Example of Scan Group Operation ... 2633
31.4.5 Channel Repeat Mode ... 2635
31.4.6 Example of Simultaneous Track and Hold Operation ... 2637
31.4.7 A/D Conversion with External Analog Multiplexer ... 2639
31.4.7.1 A/D Conversion with PWM-Diag Enabled ... 2641
31.4.8 Example of Synchronous Suspend and Resume Operation ... 2643
31.4.9 Example of Asynchronous Suspend and Resume Operation ... 2644
31.4.10 Error Detecting Functions ... 2645
31.4.10.1 Upper-Limit/Lower-Limit Error Detecting Function ... 2645
31.4.10.2 Overwrite Error Detecting Function ... 2645
31.4.10.3 SVSTOP Operation ... 2645
31.4.11 Activating Scan Group by a Hardware Trigger ... 2649
31.4.11.1 Stopping Scan Group by ADHALT ... 2649
31.4.12 Scan End Interrupt Request ... 2650
31.4.13 A/D Error Interrupt Request ... 2651
31.5 Self-Diagnostic Function ... 2652
31.5.1 Diagnosis of A/D Conversion Circuit ... 2653
31.5.1.1 Diagnostic procedure ... 2653
31.5.2 Diagnosis of Channel Multiplexer ... 2654
31.5.2.1 Diagnostic procedure ... 2655
31.5.3 Diagnosis of Open Pins ... 2656
31.5.3.1 Diagnostic procedure ... 2657
31.5.4 Diagnosis of T&H Circuit ... 2658

31.5.4.1 Diagnostic Procedure (in case of T&H circuit ch0 diagnosis) ... 2658
31.5.4.2 Diagnosis Mechanism ... 2660
31.6 Definition of A/D Conversion Accuracy ... 2661
31.7 Usage Notes ... 2662
31.7.1 Range of Channel Input Voltage ... 2662
31.7.2 Notes on Application Design ... 2662

Section 32 Key Return (KR) ... 2667

32.1 Features of RH850/F1K KR ... 2667
32.1.1 Number of Units and Channels ... 2667
32.1.2 Register Base Address ... 2667
32.1.3 Clock Supply ... 2668
32.1.4 Interrupt Requests ... 2668
32.1.5 Reset Sources ... 2668
32.1.6 External Input/Output Signals ... 2668
32.2 Overview ... 2669
32.2.1 Functional Overview ... 2669
32.2.2 Block Diagram ... 2669
32.3 Registers ... 2670
32.3.1 List of Registers ... 2670
32.3.2 KRnKRM — Key Return Mode Register ... 2670
32.4 Operation ... 2671
32.4.1 Interrupt Request INTKRn ... 2671

Section 33 Functional Safety ... 2672

33.1 Overview ... 2672
33.2 ECC ... 2673
33.2.1 Overview ... 2673
33.2.2 Code Flash ECC ... 2675
33.2.2.1 Overview ... 2675
33.2.2.2 Interrupt Requests ... 2676
33.2.2.3 List of Registers ... 2677
33.2.2.4 Details of Registers ... 2678
33.2.3 Data Flash ECC ... 2686
33.2.3.1 Overview ... 2686
33.2.3.2 Interrupt Requests ... 2686
33.2.3.3 List of Registers ... 2687
33.2.3.4 Details of Registers ... 2688
33.2.4 Local RAM (Including the Retention RAM) ECC ... 2694
33.2.4.1 Overview ... 2694
33.2.4.2 Interrupt Requests ... 2695
33.2.4.3 List of Registers ... 2696
33.2.4.4 Details of Registers ... 2697
33.2.5 Peripheral RAM ECC ... 2704
33.3 Memory Protection ... 2705

33.3.1 Overview ... 2705
33.3.1.1 Identifiers for Slave Guard ... 2706
33.3.2 PBG ... 2707
33.3.2.1 List of Registers ... 2711
33.3.2.2 Details of Registers ... 2716
33.3.3 PBG for CPU System ... 2722
33.3.3.1 List of Registers ... 2723
33.3.3.2 Details of Registers ... 2724

Section 34 Data CRC (DCRA) ... 2730

34.1 Features of RH850/F1K DCRA ... 2730
34.1.1 Number of Units ... 2730
34.1.2 Register Base Address ... 2730
34.1.3 Clock Supply ... 2731
34.1.4 Reset Sources ... 2731
34.2 Overview ... 2732
34.2.1 Functional Overview ... 2732
34.2.2 Block Diagram ... 2732
34.2.3 Operational Circuit ... 2733
34.3 Registers ... 2734
34.3.1 List of Registers ... 2734
34.3.2 DCRAnCIN — CRC Input Register ... 2735
34.3.3 DCRAnCOUT — CRC Data Register ... 2736
34.3.4 DCRAnCTL — CRC Control Register ... 2737
34.4 Operation ... 2738

Section 35 Security Function ... 2739

Section 36 On-Chip Debug Unit (OCD) ... 2740

36.1 Overview of RH850/F1K OCD ... 2740
36.1.1 Functional Overview ... 2740
36.1.2 External Input/Output Pins ... 2742
36.2 Peripheral Break Control ... 2743
36.3 Hot Plug-in in Each Mode ... 2745
36.3.1 RUN Mode ... 2745
36.3.2 STOP/DeepSTOP Mode ... 2745
36.3.3 Cyclic RUN Mode ... 2745
36.3.4 Cyclic STOP Mode ... 2746
36.4 Registers ... 2747
36.4.1 EPC — Emulation Peripheral Control Register ... 2747
36.5 Cautions on Using On-Chip Debugging ... 2748
36.5.1 Treatment of Devices Used for Debugging ... 2748
36.5.2 Reset Assertion When a Debugger is Connected ... 2748
36.5.3 Restrictions When HS IntOSC is Used as the Main Clock Source Instead of MainOSC ... 2748

36.5.4 Restrictions When the Writing of OCD_MD and RESET are Occur at the Same Time, or Restrictions When the Writing of MTR (DBG_CTRLP) and RESET are Occur at the Same Time ..... 2748

# Section 1 Overview

## 1.1 RH850/F1K Product Features

The features of the RH850/F1K are described below.

The RH850/F1K is a 32-bit single-chip microcontroller with a G3KH CPU core. The key features of the F1K are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode in which the power supply to the most circuits of the microcontroller can be turned off.

### Applications

The RH850/F1K is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

## 1.2 RH850/F1K Functions

Table 1.1 Overview of Product (1/2)

| Product name | | | RH850/F1K | | |
|---|---|---|---|---|---|
| | | | 100 pin | 144 pin | 176 pin |
| Memory | | | See **Table 1.2, Product Lineup**. | | |
| External memory interface (MEMC) | | | Not provided | | |
| CPU | CPU System | | G3KH | | |
| | CPU frequency | | 120 MHz max. (ADVANCED/ PREMIUM) | 80 MHz max. (ECO)<br>120 MHz max. (ADVANCED/PREMIUM) | |
| | FPU | | Single-precision | | |
| | Memory Protection Unit (MPU) | | Provided | | |
| DMA | | | 16 channels | | |
| Operating clock | Main Oscillator (MainOSC) | | 16/20/24 MHz | | |
| | Low Speed Internal Oscillator (LS IntOSC) | | 240 kHz (typ.) | | |
| | High Speed Internal Oscillator (HS IntOSC) | | 8 MHz (typ.) | | |
| | PLL | | Provided | | |
| | Sub Oscillator (SubOSC) | | Not provided | 32.768 kHz | |
| I/O port | | | 81 | 120 | 150 |
| A/D converter | ADC0 | Physical input channels | Total 36 ch (12 bit resolution: 16 ch + 10 bit resolution: 20 ch) | Total 36 ch (12 bit resolution: 16 ch + 10 bit resolution: 20 ch) | Total 36 ch (12 bit resolution: 16 ch + 10 bit resolution: 20 ch) |
| | | External multiplexer support for channel number extension | Provided | | |
| | | Channels with T&H | 6 | | |
| | ADC1 | Physical input channels | Not provided | Total 12 ch (12 bit resolution: 8 ch + 10 bit resolution: 4 ch) | Total 24 ch (12 bit resolution: 16 ch + 10 bit resolution: 8 ch) |
| | | External multiplexer support for channel number extension | Not provided | | |
| | | Channels with T&H | Not provided | | |
| Timer | Timer Array Unit D (TAUD) | | 1 unit (16 bit resolution timers × 16 channels /unit) | | |
| | Timer Array Unit B (TAUB) | | 1 unit (16 bit resolution timers × 16 channels /unit) | | 2 units (16 bit resolution timers × 16 channels /unit) |
| | Timer Array Unit J (TAUJ) | | 2 units (32 bit resolution timers × 4 channels /unit) | | |
| | Operating System Timer (OSTM) | | 5 units | | |
| | Real-Time Counter (RTCA) | | Not provided | 1 unit | |
| | Encoder Timer (ENCA) | | 1 unit | | |
| | Window Watchdog Timer A (WDTA) | | 2 units | | |

**Table 1.1 Overview of Product (2/2)**

| Product name | | RH850/F1K | | |
|---|---|---|---|---|
| | | 100 pin | 144 pin | 176 pin |
| Serial interfaces | Clocked Serial Interface G (CSIG) | 1 channel | 2 channels | |
| | Clocked Serial Interface H (CSIH) | 4 channels | | |
| | CAN Interface | ADVANCED | ECO/ADVANCED | |
| | | RSCAN<br>6 channels<br>(Total 480 message buffers) | RSCAN<br>6 channels<br>(Total 480 message buffers) | RSCAN<br>7 channels<br>(Total 560 message buffers) |
| | | PREMIUM | | |
| | | RS-CANFD<br>6 channels<br>(Total 480 message buffers) | RS-CANFD<br>6 channels<br>(Total 480 message buffers) | RS-CANFD<br>6 channels<br>+<br>RSCAN<br>1 channel<br>(Total 560 message buffers) |
| | LIN/UART Interface (RLIN3) | 4 channels | 6 channels | |
| | LIN Master Interface (RLIN2) | 3 channels | 6 channels | 10 channels |
| | $I^2C$ Interface (RIIC) | 1 channel | | |
| External Interrupts | Maskable | 13 | 16 | |
| | Non-maskable (NMI) | 1 | | |
| Other functions | Clock Monitors (CLMA) | For PLL, HS IntOSC, MainOSC | | |
| | Data CRC (DCRA) | 4 channels | | |
| | Low-Voltage Indicator (LVI) | Provided | | |
| | Power-On-Clear (POC) | Provided | | |
| | Core Voltage Monitors (CVM) | Provided | | |
| | Error Correction Coding (ECC) | For Code flash, Data flash, Local RAM, Retention RAM, CSIH, RS-CAN | | |
| | Low Power Sampling (LPS) | Provided | | |
| | PWM diagnosis (PWM_DIAG) | 48 channels | 64 channels | 72 channels |
| | Motor Control | 1 unit | | |
| | Key Return (KR) | 8 channels | | |
| | CLOCK OUTPUT (FOUT) | Provided | | |
| | RESET OUTPUT (RESETOUT) | Provided | | |
| | ICUSE (Intelligent Cryptographic Unit E) | Provided | | |
| | SWDT (Secure WDT) | Provided | | |
| | On-Chip debug (OCD) | Provided | | |
| | Boundary Scan | Provided | | |
| Voltage supply | Internal supply | VPOC to 5.5 V | | |
| | Input/output buffer supplies | VPOC to 5.5 V | | |
| | A/D Converter supplies | 3.0 to 5.5 V | | |
| Package | | 100 pin LQFP | 144 pin LQFP | 176pin LQFP |

## 1.3 RH850/F1K Product Lineup

**CAUTION**

- **When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.**
  **(e.g.) When RS-CAN channel 0 is used:**
  **CAN0TX P0_0 P10_1**
  **CAN0RX P0_1 P10_0**
  **Use one of the following pin combinations:**
  - **P0_0 and P0_1, or**
  - **P10_0 and P10_1.**
- **The combinations of P0_0 and P10_0, and P0_1 and P10_1 are not allowed.**

## 2.3 Pin Functions During and After Reset

**Table 2.5 Pin Functions During and After Reset**

| Pins | During Reset | After Reset |
|---|---|---|
| JP0_0 | High impedance | JP0_0 : Input<br>Serial programming mode: FPDR, FPDT (1 wire UART)<br>FPDR (2 wire UART)<br>Nexus I/F : DCUTDI input<br>LPD (4pin) : LPDI input<br>LPD (1pin) : LPDIO input/output |
| JP0_1 | High impedance | JP0_1 : Input<br>Serial programming mode: FPDT<br>Nexus I/F : DCUTDO output<br>LPD (4pin) : LPDO output<br>LPD (1pin) : High impedance |
| JP0_2 | High impedance | JP0_2 : Input<br>Serial programming mode: FPCK<br>Nexus I/F : DCUTCK input<br>LPD (4pin) : LPDCLK input<br>LPD (1pin) : High impedance |
| JP0_3 | High impedance | JP0_3 : Input<br>Serial programming mode: High impedance<br>Nexus I/F : DCUTMS input<br>LPD (4pin) : High impedance<br>LPD (1pin) : High impedance |
| JP0_4 | Input*3 | JP0_4 : Input<br>Serial programming mode: High impedance<br>Nexus I/F : $\overline{\text{DCUTRST}}$ input*1<br>LPD (4pin) : High impedance<br>LPD (1pin) : High impedance |
| JP0_5 | High impedance | JP0_5 : Input<br>Serial programming mode: High impedance<br>Nexus I/F : $\overline{\text{DCURDY}}$ output<br>LPD (4pin) : LPDCLKOUT output<br>LPD (1pin) : High impedance |
| JP0_6 | High impedance | JP0_6 : Input<br>Serial programming mode: High impedance<br>Nexus I/F : $\overline{\text{EVTO}}$ output<br>LPD (4pin) : High impedance<br>LPD (1pin) : High impedance |
| P8_6 | Output*2, *4 | Output (OPBT0.RESETOUTEN = 1)*2<br>High impedance (OPBT0.RESETOUTEN = 0)*2, *4 |
| P0 to P2, P8 to P12, P18 and P20 (except P8_6, P10_1, P10_2, P10_6 and P10_8) | High impedance | High impedance |
| P10_1 | High impedance | High impedance (FLMD0 = 0)<br>High impedance (FLMD0 = 1, FLMD1 = 0)<br>MODE0 input (FLMD0 = 1, FLMD1 = 1) |
| P10_2 | High impedance | High impedance (FLMD0 = 0)<br>High impedance (FLMD0 = 1, FLMD1 = 0)<br>MODE1 input (FLMD0 = 1, FLMD1 = 1) |
| P10_6 | High impedance | High impedance (FLMD0 = 0)<br>High impedance (FLMD0 = 1, FLMD1 = 0)<br>High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 0)<br>High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 1)<br>High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0)<br>MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1) |
| P10_8 | High impedance | High impedance (FLMD0 = 0)<br>FLMD1 input (FLMD0 = 1) |
| FLMD0 | Input | Input |
| $\overline{\text{RESET}}$ | Input | Input |
| AP0, AP1 | High impedance | High impedance |

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low.

Note 2. $\overline{\text{RESETOUT}}$ is output. For details, see **Section 2.11, Port (Special I/O) Function Overview**.

Note 3. When the power is turned on or when a reset is deasserted, the JP0_4 pin should be driven Low.

Note 4. If OPBT0.RESETOUTEN = 0, P8_6 pin status has a possibility to become unstable (less than 15 µs) at the transition moment to reset status by internal reset factors.

## 2.4 Port state in Standby Mode

For the port state in standby mode, see **Section 14.1.4, I/O Buffer Control**.

## 2.5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.

**Table 2.6 Recommended Connection of Unused Pins**

| Pin | Recommended Connection of Unused Pins |
|---|---|
| A0VREF, A1VREF*1 | Connected to EVCC |
| A0VSS, A1VSS*1 | Connected to EVSS |
| $\overline{\text{RESET}}$ | Connected to EVCC via a resistor |
| XT1 | Connected to REGVCC or AWOVSS via a resistor*3 (bit 0 of IPIBC0 = 1)<br>Connected to AWOVSS (bit 0 of IPIBC0 = 0) |
| X1 | Connected to AWOVSS via a resistor |
| X2 | Open |
| FLMD0 | Must be used |
| IP0_0 | Connected to REGVCC or AWOVSS via a resistor*3 (bit 0 of IPIBC0 = 1)<br>Open (bit 0 of IPIBC0 = 0) |
| JP0 (excluding JP0_4)<br>P0<br>P1<br>P2<br>P8 (excluding P8_6)<br>P9<br>P20 | Input: Open (when the PIBCn_m and PMCn_m bits are 0)<br>Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1)<br>Output: Open |
| P8_6 | Input: Open (when the PIBCn_m and PMCn_m bits are 0)<br>Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1)<br>Output: Open |
| JP0_4 | Connected to EVSS via a resistor*2 |
| P10 (excluding P10_1, P10_2, P10_6, P10_8)<br>P11<br>P12<br>P18 | Input: Open (when the PIBCn_m and PMCn_m bits are 0)<br>Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1)<br>Output: Open |
| P10_1, P10_2, P10_6, P10_8 | Input: Open (when the PIBCn_m and PMCn_m bits are 0)<br>Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1)<br>Output: Open |
| AP0 | Input: Open (when the PIBCn_m bit is 0)<br>Connected to A0VREF or A0VSS via a resistor (when the PIBCn_m bit is 1)<br>Output: Open |
| AP1 | Input: Open (when the PIBCn_m bit is 0)<br>Connected to A1VREF or A1VSS via a resistor (when the PIBCn_m bit is 1)<br>Output: Open |
| Nexus/LPD I/F (JP0) | DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor<br>DCUTDO/LPDO (JP0_1): Open<br>DCUTCK/LPDCLK (JP0_2): Open<br>DCUTMS (JP0_3): Connected to EVCC via a resistor<br>$\overline{\text{DCUTRST}}$ (JP0_4): Connected to EVSS via a resistor*2<br>$\overline{\text{DCURDY}}$/LPDCLKOUT (JP0_5):Open<br>$\overline{\text{EVTO}}$ (JP0_6): Open*1 |

Note 1. Only in 176 and 144 pin devices.

Note 2. For details, see the specifications of the development tool.

Note 3. XT1 = IP0_0 (XT2) = REGVCC or AWOVSS should be set.
XT1 is connected to IP0_0 (XT2) through an internal resistor. Therefore, it is necessary to maintain equal voltage level in order not to make a current path.

# 2.6 RH850/F1K Port Features

## 2.6.1 Port Group

The RH850/F1K provides the following port groups, indicated by the numbers in the table below.

**Table 2.7 Port Groups in RH850/F1K**

| No. of Pins | Port Group | RH850/F1K |
|---|---|---|
| 100 pins | Number | 7 |
| | Name | P0, P8 to P11, JP0, AP0 |
| 144 pins | Number | 13 |
| | Name | P0, P1, P8 to P12, P18, P20, JP0, AP0, AP1, IP0 |
| 176 pins | Number | 14 |
| | Name | P0 to P2, P8 to P12, P18, P20, JP0, AP0, AP1, IP0 |

## 2.6.2 Port Group Index n

Throughout this section, the port groups are identified by using the index “n” (n = 0 to 2, 8 to 12, 18, and 20). For example, the port mode control register of the Pn pin is PMCn.

## 2.6.3 Register Base Address

Port and JTAG port base addresses are listed in the following table.

Port and JTAG port register addresses are given as offsets from the base addresses.

**Table 2.8 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <PORTn_base> | FFC1 $0000_H$ |
| <JPORT0_base> | FFC2 $0000_H$ |

## 2.6.4 Clock Supply

The clock supply to ports is shown in the following table.

**Table 2.9 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name |
|---|---|---|
| Port | Register access clock | CPUCLK4 |
| | | CPUCLK2 |

# 2.7 Port Functions

This product has various pins for input/output ports. The ports are organized in port groups.

The RH850/F1K also has several control registers to enable pins to be used as other than general purpose input/output pins.

For a description of the terms pin, port, and port group, see **Section 2.7.2, Terms**.

## 2.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16.
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.
  **Table 2.38**, **Table 2.40**, **Table 2.42**, **Table 2.44**, **Table 2.46**, **Table 2.48**, **Table 2.50**, **Table 2.52**, **Table 2.54**, **Table 2.56**, **Table 2.58**, **Table 2.60**, **Table 2.62**, **Table 2.64** and **Section 2.9.2, Pin Function Configuration**.

**CAUTION**

**Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.**

**[Example]**

**INTP0 is assigned to the following pins on this device. However, the INTP0 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.**

- **JP0_0 (1st input alternative function)**
- **P0_1 (2nd, 3rd input alternative function)**
- **P10_0 (2nd input alternative function)**

**In the above case, when the 1st input alternative function (INTP0) of JP0_0 is selected, using the 2nd input alternative function (CAN0RX/INTP0) of P0_1 only for the CAN signal is also prohibited.**

## 2.7.2 Terms

The following terms are used in this section:

**Pin**

Denotes the physical pin. Every pin is denoted by a unique pin number.

A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

**Port group**

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

**Port mode and ports**

A pin in port mode works as a general purpose input/output pin. It is then called “port”.

The corresponding name is Pn_m. For example, P0_7 denotes port 7 of port group 0. It is referenced as “port P0_7”.

**Alternative mode**

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0_0 and INTP0. The different names indicate the function of the pin at that time.

### 2.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging. These are special port groups provided because the microcontroller cannot be used for the user's application while on-chip debugging is being executed. When a debugger is not connected and the microcontroller is operating normally, these port groups can be used in the same way as the other port groups.

JTAG port group registers and bit names are prefixed by a “J”. For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

**NOTE**

In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

### 2.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMCn.PMCn_m bit = 0)

  A pin in port mode operates as a general purpose input/output pin. The I/O mode is selected by setting the PMn.PMn_m bit.

- Software I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 0)

  In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn_m bit.

- Direct I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 1)

  In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.

**Table 2.10 Pin Function Configuration (Overview)**

| Mode | Bit | | | I/O |
|---|---|---|---|---|
| | PMCn_m | PMn_m | PIPCn_m | |
| Port mode | 0 | 0 | X | O |
| | | 1*1 | | I |
| Software I/O control alternative mode | 1 | 0 | 0 | O |
| | | 1 | 0 | I |
| Direct I/O control alternative mode | | X | 1 | Controlled by the alternative function |

Note 1. The input buffer must be enabled (PIBCn_m bit = 1).

- Software I/O control alternative mode (PIPCn.PIPCn_m bit = 0)
  - Output (PMn_m bit = 0): Alternative output mode 1 to Alternative output mode 7
  - Input (PMn_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPCn.PIPCn_m bit = 1)
  - The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

**Table 2.11 Alternative Mode Selection Overview (PMCn.PMCn_m Bit = 1)**

| Mode | Register | | | | | I/O |
|---|---|---|---|---|---|---|
| | PIPC*1 | PM*1 | PFCAE | PFCE | PFC | |
| Alternative output mode 1 (ALT-OUT1) | 0 | 0 | 0 | 0 | 0 | O |
| Alternative input mode 1 (ALT-IN1) | | 1 | | | | I |
| Alternative output mode 2 (ALT-OUT2) | | 0 | 0 | 0 | 1 | O |
| Alternative input mode 2 (ALT-IN2) | | 1 | | | | I |
| Alternative output mode 3 (ALT-OUT3) | | 0 | 0 | 1 | 0 | O |
| Alternative input mode 3 (ALT-IN3) | | 1 | | | | I |
| Alternative output mode 4 (ALT-OUT4) | | 0 | 0 | 1 | 1 | O |
| Alternative input mode 4 (ALT-IN4) | | 1 | | | | I |
| Alternative output mode 5 (ALT-OUT5) | | 0 | 1 | 0 | 0 | O |
| Alternative input mode 5 (ALT-IN5) | | 1 | | | | I |
| Alternative output mode 6 (ALT-OUT6) | | 0 | 1 | 0 | 1 | O |
| Alternative input mode 6 (ALT-IN6) | | 1 | | | | I |
| Alternative output mode 7 (ALT-OUT7) | | 0 | 1 | 1 | 0 | O |
| Alternative input mode 7 (ALT-IN7) | | 1 | | | | I |
| Other than the above | Setting prohibited | | | | | |

Note 1. If PIPCn.PIPCn_m bit = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

If a pin is in alternative mode (PMCn.PMCn_m bit = 1), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

## 2.7.4 Pin Data Input/Output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

### 2.7.4.1 Output Data

In the port mode (PMCn.PMCn_m bit = 0), the value of the Pn.Pn_m bit is output from the Pn_m pin.

### 2.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pn_m bit, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits.

The different PPRn read modes are shown in the table below.

**Table 2.12 PPRn_m Read Values**

| PMC n_m | PM n_m | PIBC n_m | PIPC n_m | PODC n_m | Mode | PPRn_m Read Value |
|---|---|---|---|---|---|---|
| 0 | 1 | 0 | X | X | Port input, input buffer disabled | Pn.Pn_m bit |
| | | 1 | | X | Port input, input buffer enabled | Pn_m pin |
| | 0 | X | | 0 | Port push-pull output | Pn.Pn_m bit*1 |
| | | | | 1 | Port open-drain output | |
| 1 | 1 | X | 0 | X | Software I/O control alternative input | Pn_m pin |
| | 0 | | | 0 | Software I/O control alternative push-pull output | Output signal from the alternative function*1 |
| | | | | 1 | Software I/O control alternative open-drain output | |
| | X | | 1 | 0 | Direct I/O control alternative input or push-pull output | I/O port in alternative mode:<br>• Input: Pn_m pin<br>• Output: Output signal from the alternative function*1 |
| | | | | 1 | Direct I/O control alternative input or open-drain output | |

Note 1. When PBDCn_m = 1, the level of the Pn_m pin is returned by the PPRn_m bit.

The control registers in the above table have the following effects:

- PMCn.PMCn_m bit
  This bit selects port mode (PMCn_m = 0) or alternative mode (PMCn_m = 1).
- PMn.PMn_m bit
  This bit selects input (PMn_m = 1) or output (PMn_m = 0) when the port mode (PMCn_m = 0) and software I/O control alternative mode (PMCn_m = 1, PIPCn_m = 0) have been selected.
- PIBCn.PIBCn_m bit
  This bit disables (PIBCn_m = 0) or enables (PIBCn_m = 1) the input buffer in input port mode (PMCn_m = 0 and PMn_m = 1). If the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit; otherwise the Pn_m pin level is returned.
  If alternative mode (PMCn_m = 1), this bit must always set to 0.
- PIPCn.PIPCn_m bit
  This bit selects software I/O control alternative mode or direct I/O control alternative mode.

- PODCn.PODCn_m bit
  This bit selects push-pull output (PODCn_m = 0) or open-drain output (PODCn_m = 1).
- PBDCn.PBDCn_m bit
  In output mode, when this bit is set to 1, the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

**CAUTION**

**When using Pn_m as an alternative output function (PMCn.PMCn_m bit = 1, PMn.PMn_m bit = 0), the level of the Pn_m pin can be read at the PPRn.PPRn_m bit by enabling bidirectional mode (PBDCn.PBDCn_m bit = 1).**

**Note, however, that the level of the Pn_m pin will be input to the alternative input function that the Pn_m pin is being used as.**

### 2.7.4.3 Writing to the Pn Register

The data to be output via port Pn_m in port mode (PMCn.PMCn_m bit = 0) is held in port register Pn.

Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.
  In this case, new data can be written directly to the Pn register.
- By performing an indirect bitwise operation (a “set”, “reset”, or “not” operation) on the Pn register.
  An indirect bitwise operation (“set”, “reset”, or “not”) can be performed on the Pn register by using the following two registers:
  - Port Set/Reset register PSRn
    If the PSRn.PSRn (m + 16) bit = 1, the value of the Pn.Pn_m bit is determined by the value of the PSRn.PSRn_m bit.
    In other words, the Pn_m bit can be set or reset without writing directly to the Pn register.
  - Port NOT register PNOTn
    By setting PNOTn.PNOTn_m bit to 1, the Pn.Pn_m bit can be inverted without writing directly to the Pn register.

An indirect bitwise operation on the Pn register (“set”, “reset”, or “not”) has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

## 2.8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

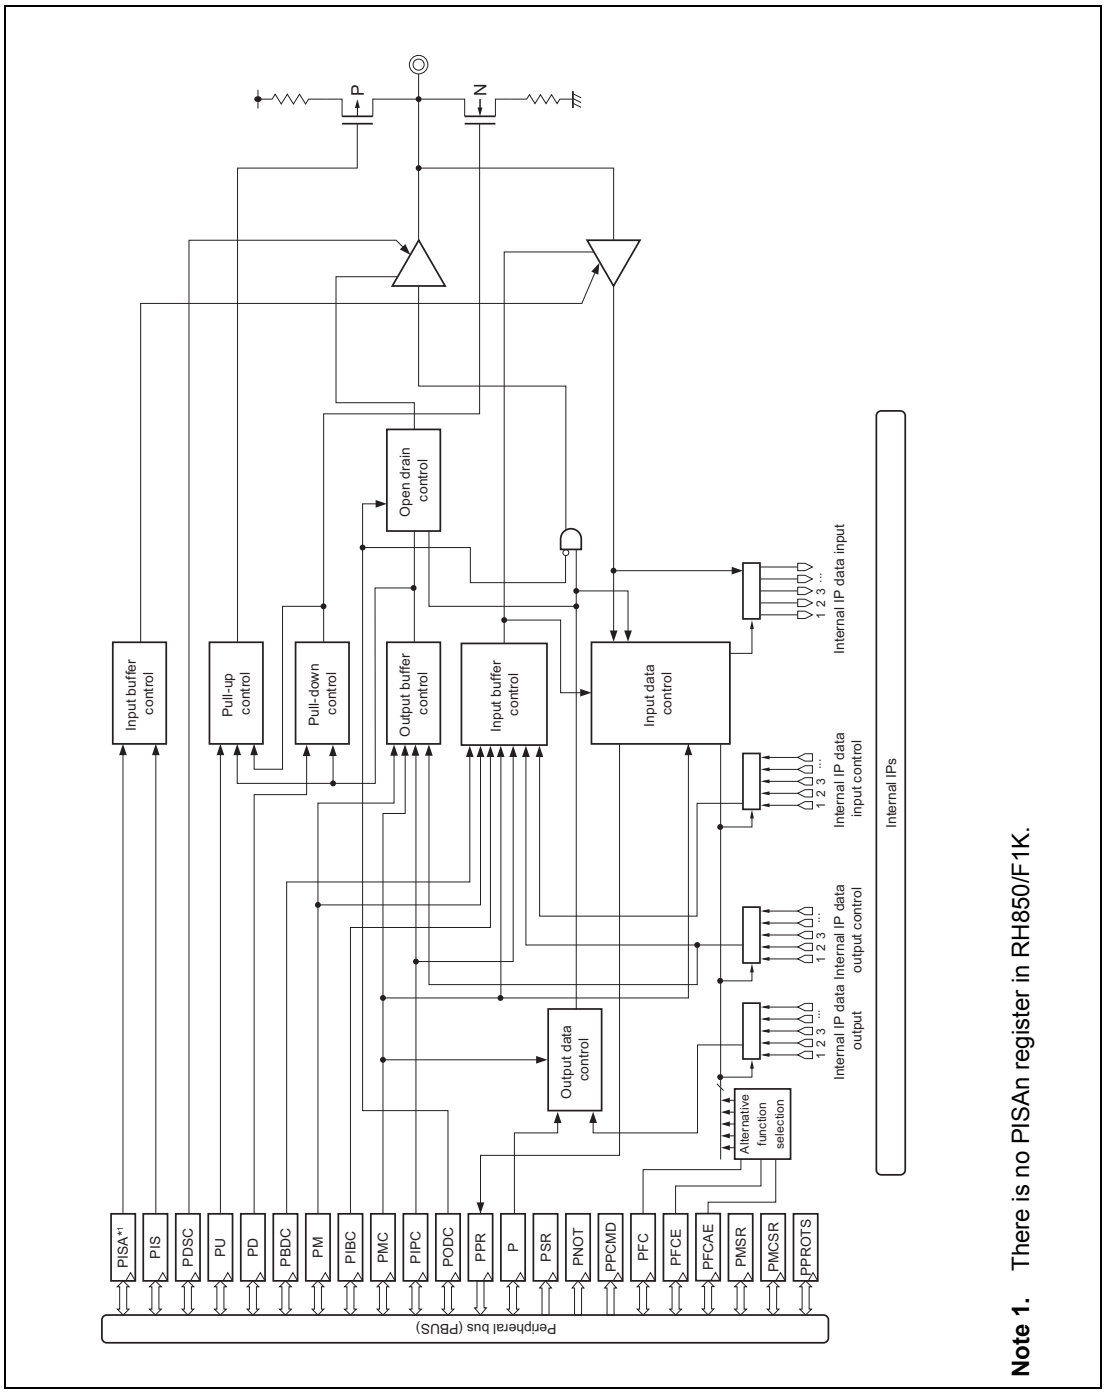

**Figure 2.4 Schematic View of Port Control**

**CAUTION**

**Use documented alternative functions only.**

## 2.9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

- **Section 2.9.2, Pin Function Configuration**
- **Section 2.9.3, Pin Data Input/Output**
- **Section 2.9.4, Configuration of Electrical Characteristics**

### 2.9.1 Overview

The following registers are used for setting the individual pins of the port groups.

For details on <PORTn_base> and <JPORT0_base>, see **Section 2.6.3, Register Base Address**.

**Table 2.13 Port Group Configuration Registers (1/2)**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| **Pin function configuration** | | | |
| PORT | Port mode control register | PMCn | <PORTn_base> + $0400_H$ + n × 4 |
| JTAG | | JPMC0 | <JPORT0_base> + $0040_H$ |
| PORT | Port mode control set/reset register | PMCSRn | <PORTn_base> + $0900_H$ + n × 4 |
| JTAG | | JPMCSR0 | <JPORT0_base> + $0090_H$ |
| PORT | Port IP control register | PIPCn | <PORTn_base> + $4200_H$ + n × 4 |
| PORT | Port mode register | PMn | <PORTn_base> + $0300_H$ + n × 4 |
| | | APMn | <PORTn_base> + $03C8_H$ + n × 4 |
| JTAG | | JPM0 | <JPORT0_base> + $0030_H$ |
| PORT | Port mode set/reset register | PMSRn | <PORTn_base> + $0800_H$ + n × 4 |
| | | APMSRn | <PORTn_base> + $08C8_H$ + n × 4 |
| JTAG | | JPMSR0 | <JPORT0_base> + $0080_H$ |
| PORT | Port input buffer control register | PIBCn | <PORTn_base> + $4000_H$ + n × 4 |
| | | APIBCn | <PORTn_base> + $40C8_H$ + n × 4 |
| JTAG | | JPIBC0 | <JPORT0_base> + $0400_H$ |
| PORT | | IPIBC0 | <PORTn_base> + $40F0_H$ |
| PORT | Port function control register | PFCn | <PORTn_base> + $0500_H$ + n × 4 |
| JTAG | | JPFC0 | <JPORT0_base> + $0050_H$ |
| PORT | Port function control expansion register | PFCEn | <PORTn_base> + $0600_H$ + n × 4 |
| JTAG | | JPFCE0 | <JPORT0_base> + $0060_H$ |
| PORT | Port function control additional expansion register | PFCAEn | <PORTn_base> + $0A00_H$ + n × 4 |
| **Pin data input/output** | | | |
| PORT | Port bidirection control register | PBDCn | <PORTn_base> + $4100_H$ + n × 4 |
| | | APBDCn | <PORTn_base> + $41C8_H$ + n × 4 |
| JTAG | | JPBDC0 | <JPORT0_base> + $0410_H$ |
| PORT | Port pin read register | PPRn | <PORTn_base> + $0200_H$ + n × 4 |
| | | APPRn | <PORTn_base> + $02C8_H$ + n × 4 |
| JTAG | | JPPR0 | <JPORT0_base> + $0020_H$ |
| PORT | | IPPR0 | <PORTn_base> + $02F0_H$ |

Table 2.13 Port Group Configuration Registers (2/2)

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| PORT | Port register | Pn | <PORTn_base> + $0000_H$ + n × 4 |
| | | APn | <PORTn_base> + $00C8_H$ + n × 4 |
| JTAG | | JP0 | <JPORT0_base> + $0000_H$ |
| PORT | Port NOT register | PNOTn | <PORTn_base> + $0700_H$ + n × 4 |
| | | APNOTn | <PORTn_base> + $07C8_H$ + n × 4 |
| JTAG | | JPNOT0 | <JPORT0_base> + $0070_H$ |
| PORT | Port set/reset register | PSRn | <PORTn_base> + $0100_H$ + n × 4 |
| | | APSRn | <PORTn_base> + $01C8_H$ + n × 4 |
| JTAG | | JPSR0 | <JPORT0_base> + $0010_H$ |
| **Configuration of electrical characteristics** | | | |
| PORT | Pull-up option register | PUn | <PORTn_base> + $4300_H$ + n × 4 |
| JTAG | | JPU0 | <JPORT0_base> + $0430_H$ |
| PORT | Pull-down option register | PDn | <PORTn_base> + $4400_H$ + n × 4 |
| JTAG | | JPD0 | <JPORT0_base> + $0440_H$ |
| PORT | Port drive strength control register | PDSCn | <PORTn_base> + $4600_H$ + n × 4 |
| JTAG | | JPDSC0 | <JPORT0_base> + $0460_H$ |
| PORT | Port open drain control register | PODCn | <PORTn_base> + $4500_H$ + n × 4 |
| JTAG | | JPODC0 | <JPORT0_base> + $0450_H$ |
| PORT | Port input buffer selection register | PISn | <PORTn_base> + $4700_H$ + n × 4 |
| JTAG | | JPIS0 | <JPORT0_base> + $0470_H$ |
| JTAG | Port input buffer selection advanced register | JPISA0 | <JPORT0_base> + $04A0_H$ |
| **Port protection** | | | |
| PORT | Port protection command register | PPCMDn | <PORTn_base> + $4C00_H$ + n × 4 |
| JTAG | | JPPCMD0 | <JPORT0_base> + $04C0_H$ |
| PORT | Port protection status register | PPROTSn | <PORTn_base> + $4B00_H$ + n × 4 |
| JTAG | | JPPROTS0 | <JPORT0_base> + $04B0_H$ |

### Index n

In **Table 2.13, Port Group Configuration Registers**, the index "n" in register symbols denotes the actual indices of the individual port groups. For example, PMCn generically indicates a port mode control register for port group n (Pn). The values for n differ according to the number of pins on the device in the way shown in **Table 2.14**.

Table 2.14 Number of Pins on the Device, Name of Port Groups, and Values for "n" in Register Symbols

| Number of Pins on the Device | Port Groups | Values for "n" |
|---|---|---|
| 100 pins | P0, P8, P9, P10, P11 | 0, 8, 9, 10, 11 |
| | AP0 | 0 |
| 144 pins | P0, P1, P8, P9, P10, P11, P12, P18, P20 | 0, 1, 8, 9, 10, 11, 12, 18, 20 |
| | AP0, AP1 | 0, 1 |
| 176 pins | P0, P1, P2, P8, P9, P10, P11, P12, P18, P20 | 0, 1, 2, 8, 9, 10, 11, 12, 18, 20 |
| | AP0, AP1 | 0, 1 |

### JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.

All descriptions (except for those of the PFCAEn register and PIPCn register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

### Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

## 2.9.2 Pin Function Configuration

### 2.9.2.1 PMCn / JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

**Access:** PMCn: This register can be read or written in 16-bit units.
JPMC0: This register can be read or written in 8-bit units.

**Address:** PMCn: <PORTn_base> + $0400_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPMC0: <JPORT0_base> + $0040_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PMCn_15 | PMCn_14 | PMCn_13 | PMCn_12 | PMCn_11 | PMCn_10 | PMCn_9 | PMCn_8 | PMCn_7 | PMCn_6 | PMCn_5 | PMCn_4 | PMCn_3 | PMCn_2 | PMCn_1 | PMCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

**Table 2.15 PMCn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PMCn_[15:0] | Specifies the operation mode of the corresponding pin.<br>0: Port mode<br>1: Alternative mode |

**CAUTIONS**

1. I/O is not controlled by only setting alternative mode (PMCn.PMCn_m bit = 1). If the alternative function requires direct I/O control, also set the PIPCn.PIPCn_m bit to 1.
2. If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLm_<name>, DNFA<name>CTL and the DNFA<name>EN register. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**, and **Section 2.13, Description of Port Noise Filter & Edge/Level Detection**.

**NOTE**

The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].

### 2.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

**Access:** PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as $0000_H$. Reading bits 15 to 0 returns the value of register PMCn.
JPMCSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as $000000_H$. Reading bits 7 to 0 returns the value of register JPMC0.

**Address:** PMCSRn: <PORTn_base> + $0900_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPMCSR0: <JPORT0_base> + $0090_H$*1

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PMCSRn_31 | PMCSRn_30 | PMCSRn_29 | PMCSRn_28 | PMCSRn_27 | PMCSRn_26 | PMCSRn_25 | PMCSRn_24 | PMCSRn_23 | PMCSRn_22 | PMCSRn_21 | PMCSRn_20 | PMCSRn_19 | PMCSRn_18 | PMCSRn_17 | PMCSRn_16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PMCSRn_15 | PMCSRn_14 | PMCSRn_13 | PMCSRn_12 | PMCSRn_11 | PMCSRn_10 | PMCSRn_9 | PMCSRn_8 | PMCSRn_7 | PMCSRn_6 | PMCSRn_5 | PMCSRn_4 | PMCSRn_3 | PMCSRn_2 | PMCSRn_1 | PMCSRn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

**Table 2.16 PMCSRn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | PMCSRn_ [31:16] | Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m.<br>0: PMCn_m is not affected by PMCSRn_m.<br>1: PMCn_m is PMCSRn_m.<br>Example:<br>If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15. |
| 15 to 0 | PMCSRn_ [15:0] | Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1.<br>0: PMCn_m is 0.<br>1: PMCn_m is 1. |

**NOTE**

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].

### 2.9.2.3 PIPCn — Port IP Control Register

This register specifies whether the I/O direction of the Pn_m pin is controlled by the port mode register PMn.PMn_m or by an alternative function.

If the Pn_m pin is operated in alternative mode (PMCn.PMCn_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn_m setting.

Regarding the alternative functions for which the PIPC register must be set, see **Section 2.11, Port (Special I/O) Function Overview**

**Access:** This register can be read or written in 16-bit units.

**Address:** PIPCn: <PORTn_base> + $4200_H$ + n × 4 (n = 0, 10, 11) *1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PIPCn_15 | PIPCn_14 | PIPCn_13 | PIPCn_12 | PIPCn_11 | PIPCn_10 | PIPCn_9 | PIPCn_8 | PIPCn_7 | PIPCn_6 | PIPCn_5 | PIPCn_4 | PIPCn_3 | PIPCn_2 | PIPCn_1 | PIPCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.41, Control Registers (P0)**, **Table 2.51, Control Registers (P10)**, and **Table 2.53, Control Registers (P11)**.

**Table 2.17 PIPCn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PIPCn_[15:0] | Specifies the I/O mode.<br>0: I/O mode is selected by PMn.PMn_m (software I/O control).<br>1: I/O mode is selected by the peripheral function (direct I/O control). |

### 2.9.2.4 PMn / APMn / JPM0 — Port Mode Register

This register specifies whether the individual pins of the port group n are in input mode or in output mode.

**Access:** PMn, APMn: These registers can be read or written in 16-bit units.
JPM0: This register can be read or written in 8-bit units.

**Address:** PMn: <PORTn_base> + $0300_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APMn: <PORTn_base> + $03C8_H$ + n × 4 (n = 0, 1)
JPM0: <JPORT0_base> + $0030_H$*1

**Value after reset:** $FFFF_H$*2

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PMn_15 | PMn_14 | PMn_13 | PMn_12 | PMn_11 | PMn_10 | PMn_9 | PMn_8 | PMn_7 | PMn_6 | PMn_5 | PMn_4 | PMn_3 | PMn_2 | PMn_1 | PMn_0 |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1*3 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

Note 2. The PM8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8 register is $FFBF_H$.
When the OPBT0.RESETOUTEN = 0, the PM8 register is $FFFF_H$.

Note 3. The PM8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PM8_6 bit is 1.

**Table 2.18 PMn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PMn_[15:0] | Specifies input/output mode of the corresponding pin.<br>0: Output mode (output enabled)<br>1: Input mode (output disabled) |

**NOTES**

1. To use a port in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
2. By default, PMn.PMn_m specifies the I/O direction in port mode (PMCn.PMCn_m = 0) and alternative mode (PMCn.PMCn_m=1), since PIPCn.PIPCn_m = 0 (I/O mode is controlled by PMn.PMn_m) after reset.
3. The control bits of the analog port register (APMn) are APMn_[15:0].
4. The control bits of the JTAG port mode register (JPM0) are JPM0_[7:0].

### 2.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

**Access:** PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as $0000_H$.
Reading bits 15 to 0 returns the value of registers PMn and APMn.
JPMSR0: This registers can be read or written in 32-bit units. Bits 31 to 8 are always read as $000000_H$.
Reading bits 7 to 0 returns the value of register JPM0.

**Address:** PMSRn: <PORTn_base> + $0800_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APMSRn: <PORTn_base> + $08C8_H$ + n × 4 (n = 0, 1)
JPMSR0: <JPORT0_base> + $0080_H$*1

**Value after reset:** 0000 $FFFF_H$*2

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PMSRn_31 | PMSRn_30 | PMSRn_29 | PMSRn_28 | PMSRn_27 | PMSRn_26 | PMSRn_25 | PMSRn_24 | PMSRn_23 | PMSRn_22 | PMSRn_21 | PMSRn_20 | PMSRn_19 | PMSRn_18 | PMSRn_17 | PMSRn_16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PMSRn_15 | PMSRn_14 | PMSRn_13 | PMSRn_12 | PMSRn_11 | PMSRn_10 | PMSRn_9 | PMSRn_8 | PMSRn_7 | PMSRn_6 | PMSRn_5 | PMSRn_4 | PMSRn_3 | PMSRn_2 | PMSRn_1 | PMSRn_0 |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1*3 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

Note 2. The PMSR8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8 register is 0000 $FFBF_H$.
When the OPBT0.RESETOUTEN = 0, the PMSR8 register is 0000 $FFFF_H$.

Note 3. The PMSR8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PMSR8_6 bit is 1.

**Table 2.19 PMSRn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | PMSRn_[31:16] | Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to PMn_m.<br>0: PMn_m is not affected by PMSRn_m.<br>1: PMn_m is PMSRn_m.<br>Example:<br>If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15. |
| 15 to 0 | PMSRn_[15:0] | Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1.<br>0: PMn_m is 0.<br>1: PMn_m is 1. |

**NOTES**

1. The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0_[31:0].
2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn_[31:0].

### 2.9.2.6 PIBCn / APIBCn / JPIBC0 / IPIBC0 — Port Input Buffer Control Register

In input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), this register enables the port pin's input buffer.

**Access:** PIBCn, APIBCn, IPIBC0: These registers can be read or written in 16-bit units.
JPIBC0: This register can be read or written in 8-bit units.

**Address:** PIBCn: <PORTn_base> + $4000_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APIBCn: <PORTn_base> + $40C8_H$+ n × 4 (n = 0, 1)
JPIBC0: <JPORT0_base> + $0400_H$
IPIBC0: <PORTn_base> + $40F0_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PIBCn_15 | PIBCn_14 | PIBCn_13 | PIBCn_12 | PIBCn_11 | PIBCn_10 | PIBCn_9 | PIBCn_8 | PIBCn_7 | PIBCn_6 | PIBCn_5 | PIBCn_4 | PIBCn_3 | PIBCn_2 | PIBCn_1 | PIBCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, **Table 2.63, Control Registers (AP1)**, and **Table 2.65, Control Registers (IP0)**.

**Table 2.20 PIBCn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PIBCn_[15:0] | Enables/disables the input buffer.<br>0: Input buffer disabled<br>1: Input buffer enabled |

**NOTES**

1. When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
2. The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0_[7:0].

**CAUTION**

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn_m = 1).

### 2.9.2.7 PFCn / JPFC0 — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

**Access:** PFCn: This register can be read or written in 16-bit units.
JPFC0: This register can be read or written in 8-bit units.

**Address:** PFCn: <PORTn_base> + $0500_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPFC0: <JPORT0_base> + $0050_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PFCn_15 | PFCn_14 | PFCn_13 | PFCn_12 | PFCn_11 | PFCn_10 | PFCn_9 | PFCn_8 | PFCn_7 | PFCn_6 | PFCn_5 | PFCn_4 | PFCn_3 | PFCn_2 | PFCn_1 | PFCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**..

**Table 2.21 PFCn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PFCn_[15:0] | Specifies the alternative function of the pin.<br>For details, see **Table 2.24, Setting Alternative Functions**. |

**NOTE**

The control bits of the JTAG port function control register (JPFC0) are JPFC0_[7:0].

### 2.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

**Access:** PFCEn: This register can be read or written in 16-bit units.
JPFCE0: This register can be read or written in 8-bit units.

**Address:** PFCEn: <PORTn_base> + $0600_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 20)
JPFCE0: <JPORT0_base> + $0060_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PFCEn_15 | PFCEn_14 | PFCEn_13 | PFCEn_12 | PFCEn_11 | PFCEn_10 | PFCEn_9 | PFCEn_8 | PFCEn_7 | PFCEn_6 | PFCEn_5 | PFCEn_4 | PFCEn_3 | PFCEn_2 | PFCEn_1 | PFCEn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**:**Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**,**Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, and **Table 2.59, Control Registers (P20)**.

**Table 2.22 PFCEn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PFCEn_[15:0] | Specifies the alternative function of the pin.<br>For details, see **Table 2.24, Setting Alternative Functions**. |

**NOTE**

The control bits of the JTAG port function control register (JPFCE0) are JPFCE0_[7:0].

### 2.9.2.9 PFCAEn — Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

**Access:** This register can be read or written in 16-bit units.

**Address:** PFCAEn: <PORTn_base> + $0A00_H$ + n × 4 (n = 0, 1, 2, 10, 11, 12, 20)*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PFCAEn_15 | PFCAEn_14 | PFCAEn_13 | PFCAEn_12 | PFCAEn_11 | PFCAEn_10 | PFCAEn_9 | PFCAEn_8 | PFCAEn_7 | PFCAEn_6 | PFCAEn_5 | PFCAEn_4 | PFCAEn_3 | PFCAEn_2 | PFCAEn_1 | PFCAEn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, and **Table 2.59, Control Registers (P20)**.

**Table 2.23 PFCAEn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PFCAEn_[15:0] | Specifies the alternative function of the pin.<br>For details, see **Table 2.24, Setting Alternative Functions**. |

**Table 2.24 Setting Alternative Functions**

| PFCAEn_m | PFCEn_m | PFCn_m | PMn_m | Function |
|---|---|---|---|---|
| 0 | 0 | 0 | 1 | Alternative input mode 1 |
| | | | 0 | Alternative output mode 1 |
| | | 1 | 1 | Alternative input mode 2 |
| | | | 0 | Alternative output mode 2 |
| | 1 | 0 | 1 | Alternative input mode 3 |
| | | | 0 | Alternative output mode 3 |
| | | 1 | 1 | Alternative input mode 4 |
| | | | 0 | Alternative output mode 4 |
| 1 | 0 | 0 | 1 | Alternative input mode 5 |
| | | | 0 | Alternative output mode 5 |
| | | 1 | 1 | Alternative input mode 6 |
| | | | 0 | Alternative output mode 6 |
| | 1 | 0 | 1 | Alternative input mode 7 |
| | | | 0 | Alternative output mode 7 |
| | | 1 | X | Setting prohibited |

**CAUTION**

- After selecting the alternative function by the PFCn_m, PFCEn_m, or PFCAEn_m bit, set the PMCn_m bit to “1”.
- With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited.
  For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as a pin function other than b.

**NOTE**

For more details on the assignment of each function, see **Sections 2.10.1** to **2.10.14**.

## 2.9.3 Pin Data Input/Output

### 2.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

**Access:** PBDCn, APBDCn: These registers can be read or written in 16-bit units.
JPBDC0: This register can be read or written in 8-bit units.

**Address:** PBDCn: <PORTn_base> + $4100_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APBDCn: <PORTn_base> + $41C8_H$ + n × 4 (n = 0, 1)
JPBDC0: <JPORT0_base> + $0410_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PBDCn_15 | PBDCn_14 | PBDCn_13 | PBDCn_12 | PBDCn_11 | PBDCn_10 | PBDCn_9 | PBDCn_8 | PBDCn_7 | PBDCn_6 | PBDCn_5 | PBDCn_4 | PBDCn_3 | PBDCn_2 | PBDCn_1 | PBDCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

**Table 2.25 PBDCn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PBDCn[15:0] | Enables/disables bidirectional mode of the corresponding pin.<br>0: Bidirectional mode disabled<br>1: Bidirectional mode enabled |

**CAUTION**

When the Pn_m port is used for the alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m = 0), the level of the Pn_m pin can be read from PPRn.PPRn_m by enabling the bidirectional mode (PBDCn.PBDCn_m = 1).

However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

**NOTE**

The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0_[7:0].

### 2.9.3.2 PPRn / APPRn / JPPR0 / IPPR0 — Port Pin Read Register

This register reflects the actual level of the Pn_m pin, whether it is the value of the Pn.Pn_m bit or the level of an alternative output function.

**Access:** PPRn, APPRn, IPPR0: These registers are read-only registers that can be read in 16-bit units.
JPPR0: This register is a read-only register that can be read in 8-bit units.

**Address:** PPRn: <PORTn_base> + $0200_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APPRn: <PORTn_base> + $02C8_H$ + n × 4 (n = 0, 1)
JPPR0: <JPORT0_base> + $0020_H$
IPPR0: <PORTn_base> + $02F0_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PPRn_15 | PPRn_14 | PPRn_13 | PPRn_12 | PPRn_11 | PPRn_10 | PPRn_9 | PPRn_8 | PPRn_7 | PPRn_6 | PPRn_5 | PPRn_4 | PPRn_3 | PPRn_2 | PPRn_1 | PPRn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, **Table 2.63, Control Registers (AP1)**, and **Table 2.65, Control Registers (IP0)**.

**Table 2.26 PPRn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PPRn_[15:0] | The Pn_m Pin, Pn.Pn_m value or alternative function output. |

**NOTES**

1. For the read values of the PPRn register, see **Section 2.7.4, Pin Data Input/Output**.
2. The control bits of the JTAG port pin read register (JPPR0) are JPPR0_[7:0].

### 2.9.3.3 Pn / APn / JP0 — Port Register

This register holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 0).

**Access:** Pn, APn: These registers can be read or written in 16-bit units.
JP0: This register can be read or written in 8-bit units.

**Address:** Pn: <PORTn_base> + $0000_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APn: <PORTn_base> + $00C8_H$ + n × 4 (n = 0, 1)
JP0: <JPORT0_base> + $0000_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Pn_15 | Pn_14 | Pn_13 | Pn_12 | Pn_11 | Pn_10 | Pn_9 | Pn_8 | Pn_7 | Pn_6 | Pn_5 | Pn_4 | Pn_3 | Pn_2 | Pn_1 | Pn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

**Table 2.27 Pn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | Pn_[15:0] | Sets the output level of the Pn_m pin (m = 0 to 15).<br>0: Outputs low level<br>1: Outputs high level |

**NOTE**

The control bits of the JTAG port register (JP0) are JP0_[7:0].

### 2.9.3.4 PNOTn / APNOTn / JPNOT0 — Port NOT Register

This register allows the Pn_m bit of the port register Pn to be inverted without directly writing to Pn.

**Access:** PNOTn, APNOTn: These registers are write-only registers that can be written in 16-bit units. When read, $0000_H$ is returned.
JPNOT0: This register is a write-only register that can be written in 8-bit units. When read, $00_H$ is returned.

**Address:** PNOTn: <PORTn_base> + $0700_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APNOTn: <PORTn_base> + $07C8_H$ + n × 4 (n = 0, 1)
JPNOT0: <JPORT0_base> + $0070_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

**Table 2.28 PNOTn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PNOTn_[15:0] | Specifies if Pn.Pn_m is inverted.<br>0: Pn.Pn_m is not inverted (Pn_m → Pn_m)<br>1: Pn.Pn_m is inverted ($\overline{Pn_m}$ → Pn_m) |

**NOTE**

The control bits of the JTAG port NOT register are JPNOT0_[7:0].

### 2.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn_m is set by the corresponding bit in the lower 16 bits of PSRn.

**Access:** PSRn, APSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as $0000_H$. Reading bits 15 to 0 returns the value of registers Pn and APn.
JPSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as $000000_H$. Reading bits 7 to 0 returns the value of register JP0.

**Address:** PSRn: <PORTn_base> + $0100_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APSRn: <PORTn_base> + $01C8_H$ + n × 4 (n = 0, 1)
JPSR0: <JPORT0_base> + $0010_H$*1

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PSRn_31 | PSRn_30 | PSRn_29 | PSRn_28 | PSRn_27 | PSRn_26 | PSRn_25 | PSRn_24 | PSRn_23 | PSRn_22 | PSRn_21 | PSRn_20 | PSRn_19 | PSRn_18 | PSRn_17 | PSRn_16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PSRn_15 | PSRn_14 | PSRn_13 | PSRn_12 | PSRn_11 | PSRn_10 | PSRn_9 | PSRn_8 | PSRn_7 | PSRn_6 | PSRn_5 | PSRn_4 | PSRn_3 | PSRn_2 | PSRn_1 | PSRn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

**Table 2.29 PSRn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | PSRn_[31:16] | Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to Pn_m.<br>0: Pn_m is not affected by PSRn_m.<br>1: Pn_m is PSRn_m<br>Example:<br>If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15. |
| 15 to 0 | PSRn_[15:0] | Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1.<br>0: Pn_m = 0<br>1: Pn_m = 1 |

**NOTE**

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0_[31:0].

## 2.9.4 Configuration of Electrical Characteristics

### 2.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

**Access:** PUn: This register can be read or written in 16-bit units.
JPU0: This register can be read or written in 8-bit units.

**Address:** PUn: <PORTn_base> + $4300_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11,12, 18, 20)
JPU0: <JPORT0_base> + $0430_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PUn_15 | PUn_14 | PUn_13 | PUn_12 | PUn_11 | PUn_10 | PUn_9 | PUn_8 | PUn_7 | PUn_6 | PUn_5 | PUn_4 | PUn_3 | PUn_2 | PUn_1 | PUn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

**Table 2.30 PUn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PUn_[15:0] | Specifies whether an internal pull-up resistor is connected to the corresponding pin.<br>0: No internal pull-up resistor connected<br>1: An internal pull-up resistor connected |

**NOTES**

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].

### 2.9.4.2 PDn / JPD0 — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

**Access:** PDn: This register can be read or written in 16-bit units.
JPD0: This register can be read or written in 8-bit units.

**Address:** PDn: <PORTn_base> + $4400_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPD0: <JPORT0_base> + $0440_H$*1

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PDn_15 | PDn_14 | PDn_13 | PDn_12 | PDn_11 | PDn_10 | PDn_9 | PDn_8 | PDn_7 | PDn_6 | PDn_5 | PDn_4 | PDn_3 | PDn_2 | PDn_1 | PDn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

**Table 2.31 PDn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PDn_[15:0] | Specifies whether to connect an internal pull-down resistor to the corresponding pin:<br>0: No internal pull-down resistor connected<br>1: An internal pull-down resistor connected |

**NOTES**

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPD0) are JPD0_[7:0].

### 2.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**. Regarding the alternative functions for which the PDSC register needs to be set, see **Section 2.11.3.3, Output Buffer Control (PDSC)**.

**Access:** PDSCn, JPDSC0: These registers can be read or written in 32-bit units.

**Address:** PDSCn: <PORTn_base> + $4600_H$ + n × 4 (n = 0, 1, 2, 10, 11, 12, 18, 20)
JPDSC0: <JPORT0_base> + $0460_H$*1

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PDSCn_15 | PDSCn_14 | PDSCn_13 | PDSCn_12 | PDSCn_11 | PDSCn_10 | PDSCn_9 | PDSCn_8 | PDSCn_7 | PDSCn_6 | PDSCn_5 | PDSCn_4 | PDSCn_3 | PDSCn_2 | PDSCn_1 | PDSCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

**Table 2.32 PDSCn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 to 0 | PDSCn_[15:0] | Specifies the port drive strength of the output buffer of the port pin.<br>0: Lower drive strength (when the frequency output from the pin is 10 MHz or below)<br>1: High drive strength (when the frequency output from the pin is 40 MHz or less). |

**NOTE**

The control bits of the JTAG port drive strength control register (JPDSC0) are JPDSC0_[31:0].

### 2.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** PODCn, JPODC0: These registers can be read or written in 32-bit units.

**Address:** PODCn: <PORTn_base> + $4500_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPODC0: <JPORT0_base> + $0450_H$*1

**Value after reset:** 0000 $0000_H$*2

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PODCn_15 | PODCn_14 | PODCn_13 | PODCn_12 | PODCn_11 | PODCn_10 | PODCn_9 | PODCn_8 | PODCn_7 | PODCn_6 | PODCn_5 | PODCn_4 | PODCn_3 | PODCn_2 | PODCn_1 | PODCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0*3 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

Note 2. The PODC8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8 register is 0000 $0040_H$.
When the OPBT0.RESETOUTEN = 0, the PODC8 register is 0000 $0000_H$.

Note 3. The PODC8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8_6 bit is 1.
When the OPBT0.RESETOUTEN = 0, the PODC8_6 bit is 0.

**Table 2.33 PODCn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 to 0 | PODCn_[15:0] | Specifies the output buffer function.<br>0: Push-pull<br>1: Open-drain |

**NOTE**

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0_[31:0].

### 2.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

**Access:** PISn: This register can be read or written in 16-bit units.
JPIS0: This register can be read or written in 8-bit units.

**Address:** PISn: <PORTn_base> + $4700_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPIS0: <JPORT0_base> + $0470_H$*1

**Value after reset:** $FFFF_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PISn_15 | PISn_14 | PISn_13 | PISn_12 | PISn_11 | PISn_10 | PISn_9 | PISn_8 | PISn_7 | PISn_6 | PISn_5 | PISn_4 | PISn_3 | PISn_2 | PISn_1 | PISn_0 |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

**Table 2.34 PISn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | PISn_[15:0] | Specifies the input buffer Characteristics:<br>0: Type 1 (SHMT1)<br>1: Type 2 (SHMT4) |

**NOTE**

1. Details of the definition of type 1 and type 2 are given in **Section 2.11.3.2, Input Buffer Control (PISn/JPIS0, JPISA0)**. For details, also see the **Section 40, Electrical Characteristics** for input buffer characteristics.
2. The control bits of the JTAG port input buffer selection register (JPIS0) are JPIS0_[7:0].

### 2.9.4.6 JPISA0 — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

**Access:** This register can be read or written in 8-bit units.

**Address:** JPISA0: <JPORT0_base> + $04A0_H$*1

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | JPISA0_3 | JPISA0_2 | - | JPISA0_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**.

**Table 2.35 JPISA0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4, 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3, 2, 0 | JPISA0_[3, 2, 0] | Specifies the input buffer characteristics:<br>0: Type 2 (SHMT4)<br>1: Type 5 (TTL) |

**Table 2.36 JTAG Port Input Selection Advanced Register Contents**

| JPISA0 | JPIS0 | Function |
|---|---|---|
| 0 | 0 | Type 1 input buffer is selected (SHMT1) |
| | 1 | Type 2 input buffer is selected (SHMT4) |
| 1 | X | Type 5 input buffer is selected (TTL) |

**NOTE**

Details of the definition of type 2 and type 5 are given in **Section 2.11.3.2, Input Buffer Control (PISn/JPIS0, JPISA0)**. For details, also see the **Section 40, Electrical Characteristics** for input buffer characteristics.

## 2.9.5 Port Register Protection

RH850/F1K has Port Protection Command Registers (PPCMDn) and Port Protection Status Registers (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see **Section 5, Write-Protected Registers**.

## 2.9.6 Flowchart Examples for Port Settings

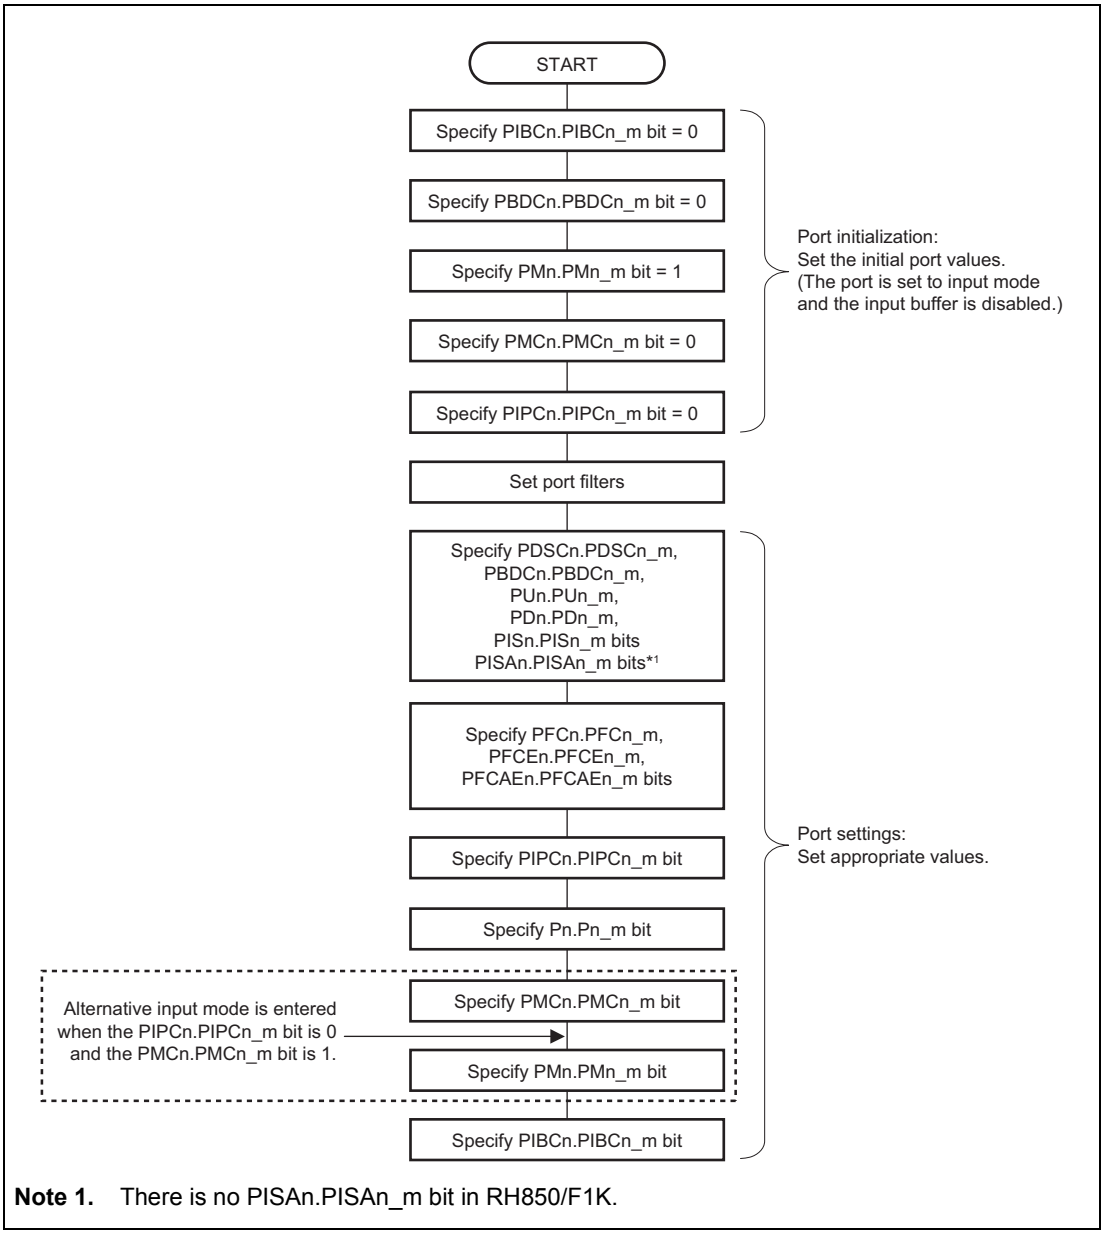
Examples of the port settings are shown in the flowchart below.

**CAUTION**

**If the port is set to the PIPCn.PIPCn_m bit = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCn.PMCn_m bit is set to 1 and when the PMn.PMn_m bit is set to 0. If an interrupt-related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.**

### 2.9.6.1 Batch Setting

An example of specifying batch port group settings is shown in the flowchart below.

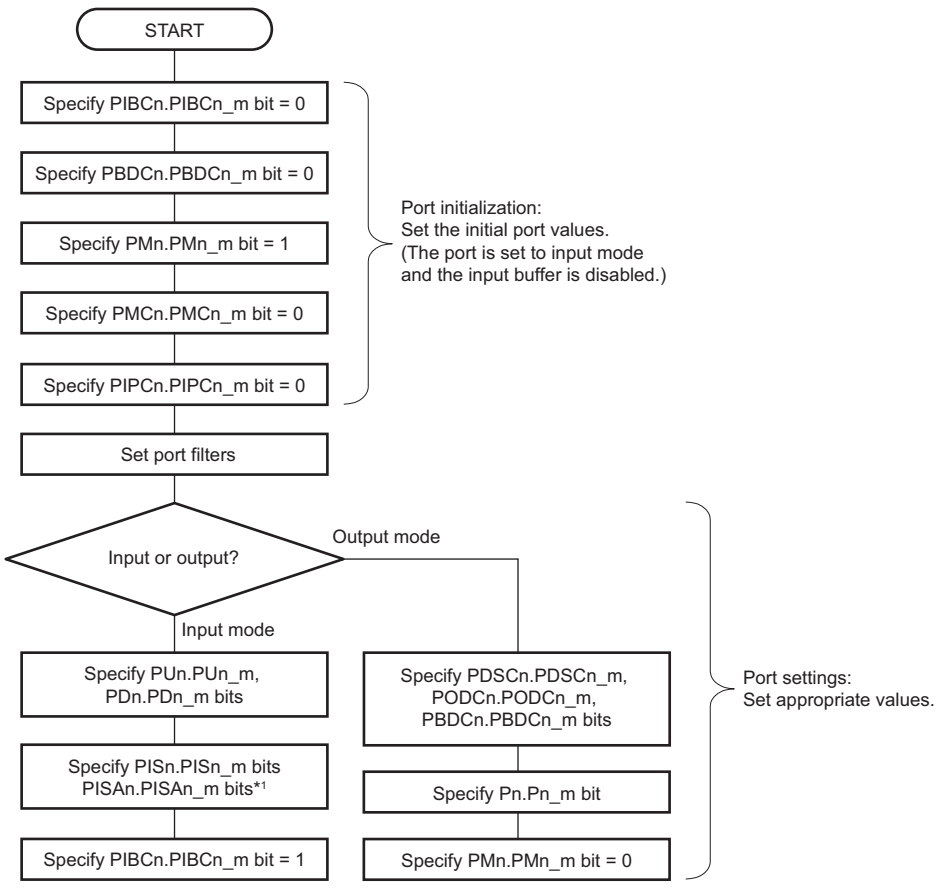


**Note 1.** There is no PISAn.PISAn_m bit in RH850/F1K.

**Figure 2.5 Example of Port Settings (When Specified in Batch)**

### 2.9.6.2 Individual Settings

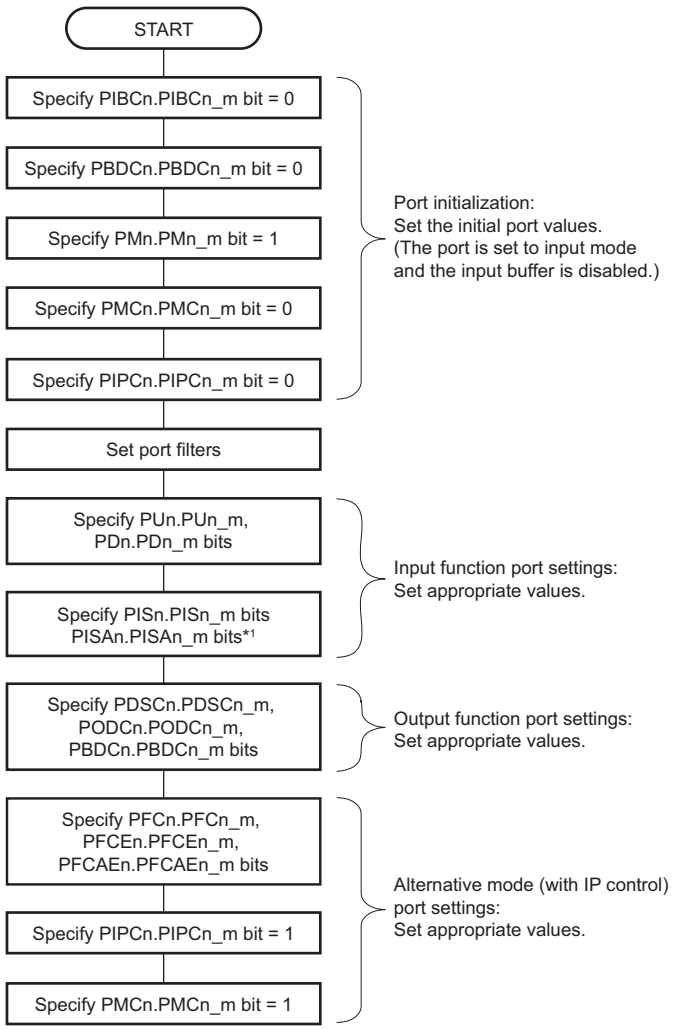
An example of specifying individual port settings is shown in the flowchart below.



**Note 1.** There is no PISAn.PISAn_m bit in RH850/F1K.

**Figure 2.6 Example of Port Settings (in Port Mode)**

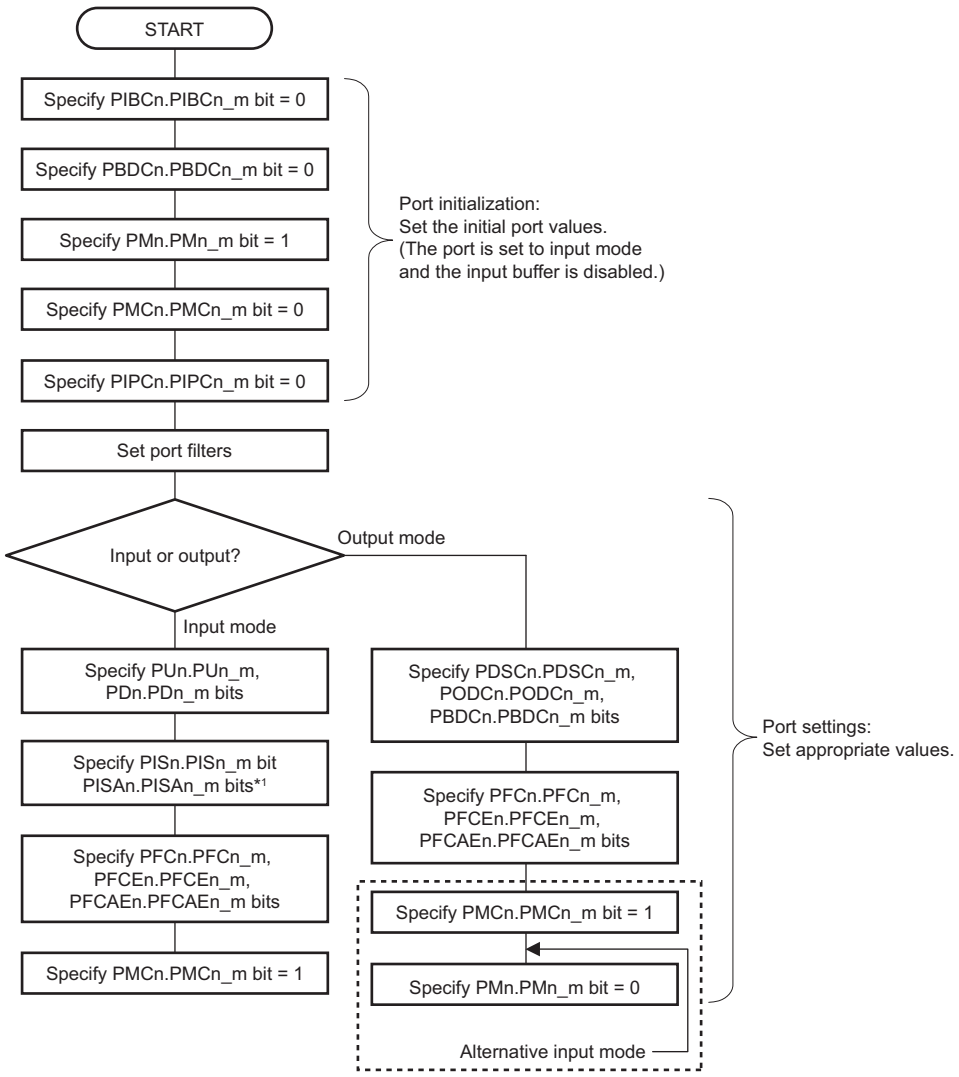
(a) With IP control



**Note 1.** There is no PISAn.PISAn_m bit in RH850/F1K.

**Figure 2.7 Example of Port Settings (in Alternative Mode) (1/2)**

(b) Without IP control



**Note 1.** There is no PISAn.PISAn_m bit in RH850/F1K.

**Figure 2.8 Example of Port Settings (in Alternative Mode) (2/2)**

## 2.10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCn register setting. When PMCn.PMCn_m = 1, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

**Table 2.37 Port Function**

| Port | Pin Name | Size | Direction | Power Domain | Special Alternative Function | Device | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | | 100 pins | 144 pins | 176 pins |
| JTAG Port 0 | JP0_0 - 5 | 6 bits | In/Out | AWO | JTAG, LPD | √ | — | — |
| | JP0_0 - 6 | 7 bits | | | | — | √ | √ |
| Port 0 | P0_0 - 14 | 15 bits | In/Out | AWO | | √ | √ | √ |
| Port 1 | P1_0 - 11 | 12 bits | In/Out | AWO | | — | √ | — |
| | P1_0 - 15 | 16 bits | | | | — | — | √ |
| Port 2 | P2_0 - 6 | 7 bits | In/Out | AWO | | — | — | √ |
| Port 8 | P8_0 - 12 | 13 bits | In/Out | AWO | ADCA0 (10-bit resolution)<br>RESETOUT | √ | √ | √ |
| Port 9 | P9_0 - 6 | 7 bits | In/Out | ISO | ADCA0 (10-bit resolution) | √ | √ | √ |
| Port 10 | P10_0 - 15 | 16 bits | In/Out | ISO | | √ | √ | √ |
| Port 11 | P11_0 - 7 | 8 bits | In/Out | ISO | | √ | — | — |
| | P11_0 - 15 | 16 bits | | | | — | √ | √ |
| Port 12 | P12_0 - 2 | 3 bits | In/Out | ISO | | — | √ | — |
| | P12_0 - 5 | 6 bits | | | | — | — | √ |
| Port 18 | P18_0 - 3 | 4 bits | In/Out | ISO | ADCA1 (10-bit resolution) | — | √ | — |
| | P18_0 - 7 | 8 bits | | | ADCA1 (10-bit resolution) | — | — | √ |
| Port 20 | P20_4 - 5 | 2 bits | In/Out | ISO | | — | √ | — |
| | P20_0 - 5 | 6 bits | | | | — | — | √ |
| Analog Port 0 | AP0_0 - 15 | 16 bits | In/Out | AWO | ADCA0 (12/10-bit resolution) | √ | √ | √ |
| Analog Port 1 | AP1_0 - 7 | 8 bits | In/Out | ISO | ADCA1 (12/10-bit resolution) | — | √ | — |
| | AP1_0 - 15 | 16 bits | | | ADCA1 (12/10-bit resolution) | — | — | √ |
| Input Port 0 | IP0_0 | 1 bit | In | AWO | SOSC (XT2 pin) | — | √ | √ |

## 2.10.1 JTAG Port 0 (JP0)

### 2.10.1.1 Alternative Function

The following alternative functions are available when JTAG port 0 is configured as a general-purpose I/O port by setting OPJTAG[1:0] on the corresponding option byte to $00_B$.

**Table 2.38 JTAG Port 0 (JP0)**

| Port Mode (JPMC0_m = 0) | Alternative Mode (JPMC0_m = 1) | | | | | | | | | | Special Function | PKG No. | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1st Alternative | | 2nd Alternative | | 3rd Alternative | | 4th Alternative | | 5th Alternative | | | | | |
| | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | | 100 pins | 144 pins | 176 pins |
| JP0_0*1 | INTP0 | | | | FPDR | FPDT | | | | | DCUTDI/LPDI/ LPDIO | 28 | 39 | 47 |
| JP0_1 | INTP1 | | TAUJ0I0 | TAUJ0O0 | | FPDT | | | | | DCUTDO/LPDO | 27 | 38 | 46 |
| JP0_2 | INTP2 | | TAUJ0I1 | TAUJ0O1 | FPCK | | | | | | DCUTCK/ LPDCLK | 26 | 37 | 45 |
| JP0_3 | INTP3 | CSCXFOUT | TAUJ0I2 | TAUJ0O2 | | | | | | | DCUTMS | 25 | 36 | 44 |
| JP0_4 | | | | | | | | | | | $\overline{\text{DCUTRST}}$ | 24 | 35 | 43 |
| JP0_5 | NMI | RTCA0OUT*2 | TAUJ0I3 | TAUJ0O3 | | | | | | | $\overline{\text{DCURDY}}$/ LPDCLKOUT | 23 | 34 | 42 |
| JP0_6 | | | | | | | | | | | $\overline{\text{EVTO}}$ | — | 54 | 66 |

Note 1. In LPD (1-pin) mode, the JP0_0 output buffer state is Open-drain.

Note 2. Non-existent in 100 pins PKG.

**CAUTION**

The behavior and performance are not guaranteed when alternative functions are not assigned to the register.

### 2.10.1.2 Control Registers

Table 2.39 Control Registers (JP0) (1/2)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| JP0 | JTAG port register 0 | 8 | 5-0 | R/W | $0000_H$ | $00_H$ | √ | — | — |
| | | | 6-0 | | | | — | √ | √ |
| JPSR0 | JTAG port set/reset register 0 | 32 | 21-16, 5-0 | R/W | $0010_H$ | $0000\ 0000_H$ | √ | — | — |
| | | | 22-16, 6-0 | | | | — | √ | √ |
| JPPR0 | JTAG port pin read register 0 | 8 | 5-0 | R | $0020_H$ | $00_H$ | √ | — | — |
| | | | 6-0 | | | | — | √ | √ |
| JPM0 | JTAG port mode register 0 | 8 | 5-0 | R/W | $0030_H$ | $FF_H$ | √ | — | — |
| | | | 6-0 | | | | — | √ | √ |
| JPMC0 | JTAG port mode control register 0 | 8 | 5, 3-0 | R/W | $0040_H$ | $00_H$ | √ | √ | √ |
| JPFC0 | JTAG port function control register 0 | 8 | 5, 3-1 | R/W | $0050_H$ | $00_H$ | √ | √ | √ |
| JPFCE0 | JTAG port function control expansion register 0 | 8 | 2-0 | R/W | $0060_H$ | $00_H$ | √ | √ | √ |
| JPNOT0 | JTAG port NOT register 0 | 8 | 5-0 | W | $0070_H$ | $00_H$ | √ | — | — |
| | | | 6-0 | | | | — | √ | √ |
| JPMSR0 | JTAG port mode set/reset register 0 | 32 | 21-16, 5-0 | R/W | $0080_H$ | $0000\ FFFF_H$ | √ | — | — |
| | | | 22-16, 6-0 | | | | — | √ | √ |
| JPMCSR0 | JTAG port mode control set/reset register 0 | 32 | 21, 19-16, 5, 3-0 | R/W | $0090_H$ | $0000\ 0000_H$ | √ | √ | √ |
| JPIBC0 | JTAG port input buffer control register 0 | 8 | 5-0 | R/W | $0400_H$ | $00_H$ | √ | — | — |
| | | | 6-0 | | | | — | √ | √ |
| JPBDC0 | JTAG port bidirection control register 0 | 8 | 5-0 | R/W | $0410_H$ | $00_H$ | √ | — | — |
| | | | 6-0 | | | | — | √ | √ |
| JPU0 | Pull-up option register 0 | 8 | 5-0 | R/W | $0430_H$ | $00_H$ | √ | — | — |
| | | | 6-0 | | | | — | √ | √ |
| JPD0 | Pull-down option register 0 | 8 | 5-0 | R/W | $0440_H$ | $00_H$ | √ | — | — |
| | | | 6-0 | | | | — | √ | √ |
| JPODC0 | JTAG port open drain control register 0 | 32 | 5-0 | R/W | $0450_H$ | $0000\ 0000_H$ | √ | — | — |
| | | | 6-0 | | | | — | √ | √ |
| JPDSC0 | JTAG port drive strength control register 0 | 32 | 5, 3-1 | R/W | $0460_H$ | $0000\ 0000_H$ | √ | — | — |
| | | | 6, 5, 3-1 | | | | — | √ | √ |
| JPIS0 | JTAG port input buffer selection register 0 | 8 | 5, 3-0 | R/W | $0470_H$ | $FF_H$ | √ | — | — |
| | | | 6, 5, 3-0 | | | | — | √ | √ |

Table 2.39 Control Registers (JP0) (2/2)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| JPISA0 | JTAG port input buffer selection advanced register 0 | 8 | 3, 2, 0 | R/W | $04A0_H$ | $00_H$ | √ | √ | √ |
| JPPROTS0 | JTAG port protection status register 0 | 32 | 0 | R | $04B0_H$ | $0000\ 0000_H$ | √ | √ | √ |
| JPPCMD0 | JTAG port protection command register 0 | 32 | 7-0 | W | $04C0_H$ | $xxxx\ xx00_H$ | √ | √ | √ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

## 2.10.2 Port 0 (P0)

### 2.10.2.1 Alternative Function

Table 2.40 Port 0 (P0)

| Port Mode (PMC0_m = 0) | Alternative Mode (PMC0_m =1) | | | | | | | | | | | | | | Special Function | PKG No. | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1st Alternative | | 2nd Alternative | | 3rd Alternative | | 4th Alternative | | 5th Alternative | | 6th Alternative | | 7th Alternative | | | 100 pins | 144 pins | 176 pins |
| | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | | | | |
| P0_0 | TAUD0I2 | TAUD0O2 | RLIN20RX | CAN0TX | | PWGA10O | $\overline{\text{CSIH0SSI}}$ | DPO | | | | | | | | 6 | 13 | 18 |

| | | | 15-0 | | | | — | — | √ |
| PODC1 | Port open drain control register 1 | 32 | 11-0 | R/W | $4504_H$ | $0000\ 0000_H$ | — | √ | — |
| | | | 15-0 | | | | — | — | √ |
| PDSC1 | Port drive strength control register 1 | 32 | 11-0 | R/W | $4604_H$ | $0000\ 0000_H$ | — | √ | — |
| | | | 15-0 | | | | — | — | √ |

Table 2.43 Control Registers (P1) (2/2)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| PIS1 | Port input buffer selection register 1 | 16 | 11-0 | R/W | $4704_H$ | $FFFF_H$ | — | √ | — |
| | | | 15-0 | | | | — | — | √ |
| PPROTS1 | Port protection status register 1 | 32 | 0 | R | $4B04_H$ | $0000\ 0000_H$ | — | √ | √ |
| PPCMD1 | Port protection command register 1 | 32 | 7-0 | W | $4C04_H$ | $xxxx\ xx00_H$ | — | √ | √ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

## 2.10.4 Port 2 (P2)

### 2.10.4.1 Alternative Function

Table 2.44 Port 2 (P2)

| Port Mode (PMC2_m =0) | Alternative Mode (PMC2_m =1) | | | | | | | | | | | | | | Special Function | PKG No. | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1st Alternative | | 2nd Alternative | | 3rd Alternative | | 4th Alternative | | 5th Alternative | | 6th Alternative | | 7th Alternative | | | 100 pins | 144 pins | 176 pins |
| | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | | | | |
| P2_0 | RLIN27RX | | INTP6/CAN6RX | | | | | | | | | | CAN6RX | | | — | — | 49 |
| P2_1 | | RLIN27TX | | CAN6TX | | | | | | | | | | | | — | — | 48 |
| P2_2 | RLIN28RX | | | | | | | | | | | | | | | — | — | 65 |
| P2_3 | | RLIN28TX | | | | | | | | | | | | | | — | — | 64 |
| P2_4 | RLIN29RX | | | ADCA0SEL0 | | | | | | | | | | | | — | — | 76 |
| P2_5 | | RLIN29TX | | ADCA0SEL1 | | | | | | | | | | | | — | — | 77 |
| P2_6 | | ADCA0SEL2 | | | | | | | | | | | | | | — | — | 36 |

**CAUTION**

The behavior and performance are not guaranteed when alternative functions are not assigned to the register.

### 2.10.4.2 Control Registers

Table 2.45 Control Registers (P2)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| P2 | Port register 2 | 16 | 6-0 | R/W | $0008_H$ | $0000_H$ | — | — | √ |
| PSR2 | Port set/reset register 2 | 32 | 22-16, 6-0 | R/W | $0108_H$ | 0000 $0000_H$ | — | — | √ |
| PPR2 | Port pin read register 2 | 16 | 6-0 | R | $0208_H$ | $0000_H$ | — | — | √ |
| PM2 | Port mode register 2 | 16 | 6-0 | R/W | $0308_H$ | $FFFF_H$ | — | — | √ |
| PMC2 | Port mode control register 2 | 16 | 6-0 | R/W | $0408_H$ | $0000_H$ | — | — | √ |
| PFC2 | Port function control register 2 | 16 | 5, 4, 1, 0 | R/W | $0508_H$ | $0000_H$ | — | — | √ |
| PFCE2 | Port function control expansion register 2 | 16 | 0 | R/W | $0608_H$ | $0000_H$ | — | — | √ |
| PNOT2 | Port NOT register 2 | 16 | 6-0 | W | $0708_H$ | $0000_H$ | — | — | √ |
| PMSR2 | Port mode set/reset register 2 | 32 | 22-16, 6-0 | R/W | $0808_H$ | 0000 $FFFF_H$ | — | — | √ |
| PMCSR2 | Port mode control set/reset register 2 | 32 | 22-16, 6-0 | R/W | $0908_H$ | 0000 $0000_H$ | — | — | √ |
| PFCAE2 | Port function control additional expansion register 2 | 16 | 0 | R/W | $0A08_H$ | $0000_H$ | — | — | √ |
| PIBC2 | Port input buffer control register 2 | 16 | 6-0 | R/W | $4008_H$ | $0000_H$ | — | — | √ |
| PBDC2 | Port bidirection control register 2 | 16 | 6-0 | R/W | $4108_H$ | $0000_H$ | — | — | √ |
| PU2 | Pull-up option register 2 | 16 | 6-0 | R/W | $4308_H$ | $0000_H$ | — | — | √ |
| PD2 | Pull-down option register 2 | 16 | 6-0 | R/W | $4408_H$ | $0000_H$ | — | — | √ |
| PODC2 | Port open drain control register 2 | 32 | 6-0 | R/W | $4508_H$ | 0000 $0000_H$ | — | — | √ |
| PDSC2 | Port drive strength control register 2 | 32 | 6-0 | R/W | $4608_H$ | 0000 $0000_H$ | — | — | √ |
| PIS2 | Port input buffer selection register 2 | 16 | 6-0 | R/W | $4708_H$ | $FFFF_H$ | — | — | √ |
| PPROTS2 | Port protection status register 2 | 32 | 0 | R | $4B08_H$ | 0000 $0000_H$ | — | — | √ |
| PPCMD2 | Port protection command register 2 | 32 | 7-0 | W | $4C08_H$ | xxxx $xx00_H$ | — | — | √ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

## 2.10.5 Port 8 (P8)

### 2.10.5.1 Alternative Function

Table 2.46 Port 8 (P8)

| Port Mode (PMC8_m = 0) | Alternative Mode (PMC8_m = 1) | | | | | | | | | | ADC | Special Function | PKG No. | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1st Alternative | | 2nd Alternative | | 3rd Alternative | | 4th Alternative | | 5th Alternative | | | | 100 pins | 144 pins | 176 pins |
| | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | | | | | |
| P8_0 | TAUJ0I0 | TAUJ0O0 | DPIN2 | PWGA14O | INTP4 | CSIH0CSS0 | | | | | ADCA0I0S | | 42 | 64 | 80 |
| P8_1 | TAPA0ESO | TAUJ0O1 | DPIN0 | PWGA15O | INTP5 | CSIH1CSS3 | | | | | ADCA0I1S | | 43 | 65 | 81 |
| P8_2 | TAUJ0I0 | TAUJ0O0 | DPIN2 | CSIH0CSS0 | INTP6 | PWGA22O | | | | | ADCA0I4S | | 19 | 30 | 38 |
| P8_3 | TAUJ0I1 | TAUJ0O1 | DPIN3 | CSIH0CSS1 | INTP7 | PWGA23O | | | | | ADCA0I5S | | 44 | 66 | 82 |
| P8_4 | TAUJ0I2 | TAUJ0O2 | DPIN4 | CSIH0CSS2 | INTP8 | PWGA36O | | | | | ADCA0I6S | | 45 | 67 | 83 |
| P8_5 | TAUJ0I3 | TAUJ0O3 | NMI | CSIH0CSS3 | INTP9*1 | PWGA37O | | | | | ADCA0I7S | | 46 | 68 | 84 |
| P8_6 | NMI | CSIH0CSS4 | | PWGA38O | | RTCA0OUT*1 | | | | | ADCA0I8S | $\overline{\text{RESETOUT}}$ | 47 | 69 | 85 |
| P8_7 | | CSIH3CSS0 | | PWGA39O | | ADCA0SEL0 | | RTCA0OUT | | | ADCA0I14S | | 48 | 70 | 86 |
| P8_8 | | CSIH3CSS1 | | PWGA40O | | ADCA0SEL1 | | | | | ADCA0I15S | | 49 | 71 | 87 |
| P8_9 | | CSIH3CSS2 | | PWGA41O | | ADCA0SEL2 | | | | | ADCA0I16S | | 50 | 72 | 88 |
| P8_10 | | CSIH3CSS3 | DPIN14 | PWGA42O | | | | | | | ADCA0I17S | | 20 | 31 | 39 |
| P8_11 | TAUJ1I2 | TAUJ1O2 | DPIN15 | PWGA43O | | CSIH1CSS4 | | | | | ADCA0I18S | | 21 | 32 | 40 |
| P8_12 | TAUJ1I3 | TAUJ1O3 | DPIN16 | PWGA44O | | CSIH1CSS5 | | | | | ADCA0I19S | | 22 | 33 | 41 |

Note 1. Non-existent in 100 pins PKG.

**CAUTIONS**

1. The behavior and performance are not guaranteed when alternative functions are not assigned to the register.
2. Use ADC functions with their initial settings.
3. When the $\overline{\text{RESETOUT}}$ function is selected for the P8_6 pin, the P8_6 pin outputs a low-level as the $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is released. For details, see **Section 2.11.1.1, P8_6: RESETOUT**.

### 2.10.5.2 Control Registers

Table 2.47 Control Registers (P8)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| P8 | Port register 8 | 16 | 12-0 | R/W | $0020_H$ | $0000_H$ | √ | √ | √ |
| PSR8 | Port set/reset register 8 | 32 | 28-16, 12-0 | R/W | $0120_H$ | $0000\ 0000_H$ | √ | √ | √ |
| PPR8 | Port pin read register 8 | 16 | 12-0 | R | $0220_H$ | $0000_H$ | √ | √ | √ |
| PM8 | Port mode register 8 | 16 | 12-0 | R/W | $0320_H$ | $FFBF_H$ | √ | √ | √ |
| PMC8 | Port mode control register 8 | 16 | 12-0 | R/W | $0420_H$ | $0000_H$ | √ | √ | √ |
| PFC8 | Port function control register 8 | 16 | 12-0 | R/W | $0520_H$ | $0000_H$ | √ | √ | √ |
| PFCE8 | Port function control expansion register 8 | 16 | 12, 11, 9-7, 5-0 | R/W | $0620_H$ | $0000_H$ | √ | — | — |
| | | | 12, 11, 9-0 | | | | — | √ | √ |
| PNOT8 | Port NOT register 8 | 16 | 12-0 | W | $0720_H$ | $0000_H$ | √ | √ | √ |
| PMSR8 | Port mode set/reset register 8 | 32 | 28-16, 12-0 | R/W | $0820_H$ | $0000\ FFBF_H$ | √ | √ | √ |
| PMCSR8 | Port mode control set/reset register 8 | 32 | 28-16, 12-0 | R/W | $0920_H$ | $0000\ 0000_H$ | √ | √ | √ |
| PIBC8 | Port input buffer control register 8 | 16 | 12-0 | R/W | $4020_H$ | $0000_H$ | √ | √ | √ |
| PBDC8 | Port bidirection control register 8 | 16 | 12-0 | R/W | $4120_H$ | $0000_H$ | √ | √ | √ |
| PU8 | Pull-up option register 8 | 16 | 12-0 | R/W | $4320_H$ | $0000_H$ | √ | √ | √ |
| PD8 | Pull-down option register 8 | 16 | 12-0 | R/W | $4420_H$ | $0000_H$ | √ | √ | √ |
| PODC8 | Port open drain control register 8 | 32 | 12-0 | R/W | $4520_H$ | $0000\ 0040_H$ | √ | √ | √ |
| PIS8 | Port input buffer selection register 8 | 32 | 12-0 | R/W | $4720_H$ | $FFFF_H$ | √ | √ | √ |
| PPROTS8 | Port protection status register 8 | 32 | 0 | R | $4B20_H$ | $0000\ 0000_H$ | √ | √ | √ |
| PPCMD8 | Port protection command register 8 | 32 | 7-0 | W | $4C20_H$ | $xxxx\ xx00_H$ | √ | √ | √ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

**CAUTION**

**P8_6 drives a low level after any kind of reset release, until it is later configured differently by register settings.**

**To avoid a data collision, the outside circuit connected to this pin must not drive a high level.**

## 2.10.6 Port 9 (P9)

### 2.10.6.1 Alternative Function

Table 2.48 Port 9 (P9)

| Port Mode (PMC9_m = 0) | Alternative Mode (PMC9_m = 1) | | | | | | | | | | ADC | PKG No. | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1st Alternative | | 2nd Alternative | | 3rd Alternative | | 4th Alternative | | 5th Alternative | | | | | |
| | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | | 100 pins | 144 pins | 176 pins |
| P9_0 | NMI | PWGA8O | TAUD0I0 | TAUD0O0 | ADCA0TRG0 | CSIH2CSS0 | KR0I4 | | | | ADCA0I2S | 69 | 92 | 108 |
| P9_1 | INTP11 | PWGA9O | TAUD0I2 | TAUD0O2 | KR0I5 | CSIH2CSS1 | | | | | ADCA0I3S | 70 | 93 | 109 |
| P9_2 | KR0I6 | PWGA20O | TAPA0ESO | CSIH2CSS2 | | | | | | | ADCA0I9S | 71 | 94 | 110 |
| P9_3 | KR0I7 | PWGA21O | | CSIH2CSS3 | TAUJ1I1 | TAUJ1O1 | | | | | ADCA0I10S | 72 | 95 | 111 |
| P9_4 | | CSIH0CSS5 | | PWGA33O | TAUJ1I0 | TAUJ1O0 | | | | | ADCA0I11S | 73 | 96 | 112 |
| P9_5 | | CSIH0CSS6 | | PWGA34O | TAUJ1I1 | TAUJ1O1 | | | | | ADCA0I12S | 74 | 97 | 113 |
| P9_6 | | CSIH0CSS7 | | PWGA35O | | | | | | | ADCA0I13S | 75 | 98 | 114 |

**CAUTIONS**

1. The behavior and performance are not guaranteed when alternative functions are not assigned to the register.
2. Use ADC functions with their initial settings.

### 2.10.6.2 Control Registers

Table 2.49 Control Registers (P9)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| P9 | Port register 9 | 16 | 6-0 | R/W | $0024_H$ | $0000_H$ | √ | √ | √ |
| PSR9 | Port set/reset register 9 | 32 | 22-16, 6-0 | R/W | $0124_H$ | $0000\ 0000_H$ | √ | √ | √ |
| PPR9 | Port pin read register 9 | 16 | 6-0 | R | $0224_H$ | $0000_H$ | √ | √ | √ |
| PM9 | Port mode register 9 | 16 | 6-0 | R/W | $0324_H$ | $FFFF_H$ | √ | √ | √ |
| PMC9 | Port mode control register 9 | 16 | 6-0 | R/W | $0424_H$ | $0000_H$ | √ | √ | √ |
| PFC9 | Port function control register 9 | 16 | 6-0 | R/W | $0524_H$ | $0000_H$ | √ | √ | √ |
| PFCE9 | Port function control expansion register 9 | 16 | 5-3, 1, 0 | R/W | $0624_H$ | $0000_H$ | √ | √ | √ |
| PNOT9 | Port NOT register 9 | 16 | 6-0 | W | $0724_H$ | $0000_H$ | √ | √ | √ |

| | | | 7-0 | | | | — | — | √ |

Table 2.57 Control Registers (P18) (2/2)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| PIS18 | Port input buffer selection register 18 | 16 | 3-0 | R/W | $4748_H$ | $FFFF_H$ | — | √ | — |
| | | | 7-0 | | | | — | — | √ |
| PPROTS18 | Port protection status register 18 | 32 | 0 | R | $4B48_H$ | $0000\ 0000_H$ | — | √ | √ |
| PPCMD18 | Port protection command register 18 | 32 | 7-0 | W | $4C48_H$ | $xxxx\ xx00_H$ | — | √ | √ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

## 2.10.11 Port 20 (P20)

### 2.10.11.1 Alternative Function

Table 2.58 Port 20 (P20)

| Port Mode (PMC20_m =0) | Alternative Mode (PMC20_m = 1) | | | | | | | | | | | | | | Special Function | PKG No. | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1st Alternative | | 2nd Alternative | | 3rd Alternative | | 4th Alternative | | 5th Alternative | | 6th Alternative | | 7th Alternative | | | | | |
| | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | | 100 pins | 144 pins | 176 pins |
| P20_0 | RLIN26RX | | | PWGA64O | INTP6 /CAN6RX | | | | | | | | CAN6RX | | | — | — | 118 |
| P20_1 | | RLIN26TX | | PWGA65O | | CAN6TX | | | | | | | | | | — | — | 117 |
| P20_2 | CAN4RX/ INTP4 | | | PWGA66O | RLIN29RX | | | | | | | | CAN4RX | | | — | — | 116 |
| P20_3 | | CAN4TX | | PWGA67O | | RLIN29TX | | | | | | | | | | — | — | 115 |
| P20_4 | RLIN23RX | | | PWGA59O | | | | | | | | | | | | — | 100 | 120 |
| P20_5 | | RLIN23TX | | PWGA60O | | | | | | | | | | | | — | 99 | 119 |

**CAUTION**

The behavior and performance are not guaranteed when alternative functions are not assigned to the register.

### 2.10.11.2 Control Registers

Table 2.59 Control Registers (P20) (1/2)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| P20 | Port register 20 | 16 | 5, 4 | R/W | $0050_H$ | $0000_H$ | — | √ | — |
| | | | 5-0 | | | | — | — | √ |

| AP0_11 | | | | | | | | | | | ADCA0I11 | 57 | 79 | 95 |
| AP0_12 | | | | | | | | | | | ADCA0I12 | 56 | 78 | 94 |
| AP0_13 | | | | | | | | | | | ADCA0I13 | 55 | 77 | 93 |
| AP0_14 | | | | | | | | | | | ADCA0I14 | 54 | 76 | 92 |
| AP0_15 | | | | | | | | | | | ADCA0I15 | 53 | 75 | 91 |

**CAUTION**

Use ADC functions with their initial settings.

### 2.10.12.2 Control Registers

Table 2.61 Control Registers (AP0)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| AP0 | Analog port register 0 | 16 | 15-0 | R/W | $00C8_H$ | $0000_H$ | √ | √ | √ |
| APSR0 | Analog port set/reset register 0 | 32 | 31-16, 15-0 | R/W | $01C8_H$ | $0000\ 0000_H$ | √ | √ | √ |
| APPR0 | Analog port pin read register 0 | 16 | 15-0 | R | $02C8_H$ | $0000_H$ | √ | √ | √ |
| APM0 | Analog port mode register 0 | 16 | 15-0 | R/W | $03C8_H$ | $FFFF_H$ | √ | √ | √ |
| APNOT0 | Analog port NOT register 0 | 16 | 15-0 | W | $07C8_H$ | $0000_H$ | √ | √ | √ |
| APMSR0 | Analog port mode set/reset register 0 | 32 | 31-16, 15-0 | R/W | $08C8_H$ | $0000\ FFFF_H$ | √ | √ | √ |
| APIBC0 | Analog port input buffer control register 0 | 16 | 15-0 | R/W | $40C8_H$ | $0000_H$ | √ | √ | √ |
| APBDC0 | Analog port bidirection control register 0 | 16 | 15-0 | R/W | $41C8_H$ | $0000_H$ | √ | √ | √ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

## 2.10.13 Analog Port 1 (AP1)

### 2.10.13.1 Alternative Function

Table 2.62 Analog Port 1 (AP1)

| Port Mode | Alternative Mode | | | | | | | | | | ADC | PKG No. | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1st Alternative | | 2nd Alternative | | 3rd Alternative | | 4th Alternative | | 5th Alternative | | | 100 pins | 144 pins | 176 pins |
| | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | | | | |
| AP1_0 | | | | | | | | | | | ADCA1I0 | — | 109 | 133 |
| AP1_1 | | | | | | | | | | | ADCA1I1 | — | 108 | 132 |
| AP1_2 | | | | | | | | | | | ADCA1I2 | — | 107 | 131 |
| AP1_3 | | | | | | | | | | | ADCA1I3 | — | 106 | 130 |
| AP1_4 | | | | | | | | | | | ADCA1I4 | — | 105 | 129 |
| AP1_5 | | | | | | | | | | | ADCA1I5 | — | 104 | 128 |
| AP1_6 | | | | | | | | | | | ADCA1I6 | — | 103 | 127 |
| AP1_7 | | | | | | | | | | | ADCA1I7 | — | 102 | 126 |
| AP1_8 | | | | | | | | | | | ADCA1I8 | — | — | 125 |
| AP1_9 | | | | | | | | | | | ADCA1I9 | — | — | 124 |
| AP1_10 | | | | | | | | | | | ADCA1I10 | — | — | 123 |
| AP1_11 | | | | | | | | | | | ADCA1I11 | — | — | 122 |
| AP1_12 | | | | | | | | | | | ADCA1I12 | — | — | 137 |
| AP1_13 | | | | | | | | | | | ADCA1I13 | — | — | 136 |
| AP1_14 | | | | | | | | | | | ADCA1I14 | — | — | 135 |
| AP1_15 | | | | | | | | | | | ADCA1I15 | — | — | 134 |

**CAUTION**

Use ADC functions with their initial settings.

### 2.10.13.2 Control Registers

Table 2.63 Control Registers (AP1)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| AP1 | Analog port register 1 | 16 | 7-0 | R/W | $00CC_H$ | $0000_H$ | — | √ | — |
| | | | 15-0 | | | | — | — | √ |
| APSR1 | Analog port set/reset register 1 | 32 | 23-16, 7-0 | R/W | $01CC_H$ | $0000\ 0000_H$ | — | √ | — |
| | | | 31-16, 15-0 | | | | — | — | √ |
| APPR1 | Analog port pin read register 1 | 16 | 7-0 | R | $02CC_H$ | $0000_H$ | — | √ | — |
| | | | 15-0 | | | | — | — | √ |
| APM1 | Analog port mode register 1 | 16 | 7-0 | R/W | $03CC_H$ | $FFFF_H$ | — | √ | — |
| | | | 15-0 | | | | — | — | √ |
| APNOT1 | Analog port NOT register 1 | 16 | 7-0 | W | $07CC_H$ | $0000_H$ | — | √ | — |
| | | | 15-0 | | | | — | — | √ |
| APMSR1 | Analog port mode Set/reset register 1 | 32 | 23-16, 7-0 | R/W | $08CC_H$ | $0000\ FFFF_H$ | — | √ | — |
| | | | 31-16, 15-0 | | | | — | — | √ |
| APIBC1 | Analog port input buffer control register 1 | 16 | 7-0 | R/W | $40CC_H$ | $0000_H$ | — | √ | — |
| | | | 15-0 | | | | — | — | √ |
| APBDC1 | Analog port bidirection control register 1 | 16 | 7-0 | R/W | $41CC_H$ | $0000_H$ | — | √ | — |
| | | | 15-0 | | | | — | — | √ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

## 2.10.14 Input Port 0 (IP0)

### 2.10.14.1 Alternative Function

Table 2.64 Input Port 0 (IP0)

| Port Mode | Alternative Mode | | | | | | | | | | Special Function | PKG No. | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1st Alternative | | 2nd Alternative | | 3rd Alternative | | 4th Alternative | | 5th Alternative | | | 100 pins | 144 pins | 176 pins |
| | Input | Output | Input | Output | Input | Output | Input | Output | Input | Output | | | | |
| IP0_0 | | | | | | | | | | | XT2 | — | 47 | 57 |

### 2.10.14.2 Control Registers

Table 2.65 Control Registers (IP0)

| Register | Function | Register Size | Effective Bit | | Offset Address | Value after Reset | Device | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | Position | R/W*1 | | | 100 pins | 144 pins | 176 pins |
| IPPR0 | Input port pin read register 0 | 16 | 0 | R | $02F0_H$ | $0000_H$ | — | √ | √ |
| IPIBC0 | Port input buffer control register 0 | 16 | 0 | R/W | $40F0_H$ | $0000_H$ | — | √ | √ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

**CAUTION**

When the IP0_0/XT2 pin is used as an input port, set the IPIBC0_0 bit to 1 while stopping the SOSC operation. For details on the settings for SOSC operations, see **Section 12.4.2.7, SOSCE — SubOSC Enable Register**. When the IP0_0/XT2 pin is used for the SubOSC (SOSC) not as an input port, set the IPIBC0_0 bit to 0.

# 2.11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

## 2.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

### 2.11.1.1 P8_6: $\overline{\text{RESETOUT}}$

The P8_6 pin ($\overline{\text{RESETOUT}}$ signal) changes PM8.PM8_6 and PODC8.PODC8_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.

(Case 1) : OPBT0.RESETOUTEN = 1

- P8.P8_6 = 0 : Outputs low level
- PM8.PM8_6 = 0 : Output mode
- PODC8.PODC8_6 = 1 : Open-drain

(Case 2) : OPBT0.RESETOUTEN = 0

- P8.P8_6 = 0 : Outputs low level
- PM8.PM8_6 = 1 : Input mode
- PODC8.PODC8_6 = 0 : Push-pull

For detail of OPBT0.RESETOUTEN register, see **Section 37.9.2, OPBT0 — Option Byte 0**, also see **Section 9.4.2, Power-On-Clear (POC) Reset**.

When the P8_6 pin setting is updated with another value, the pin operates by new setting.

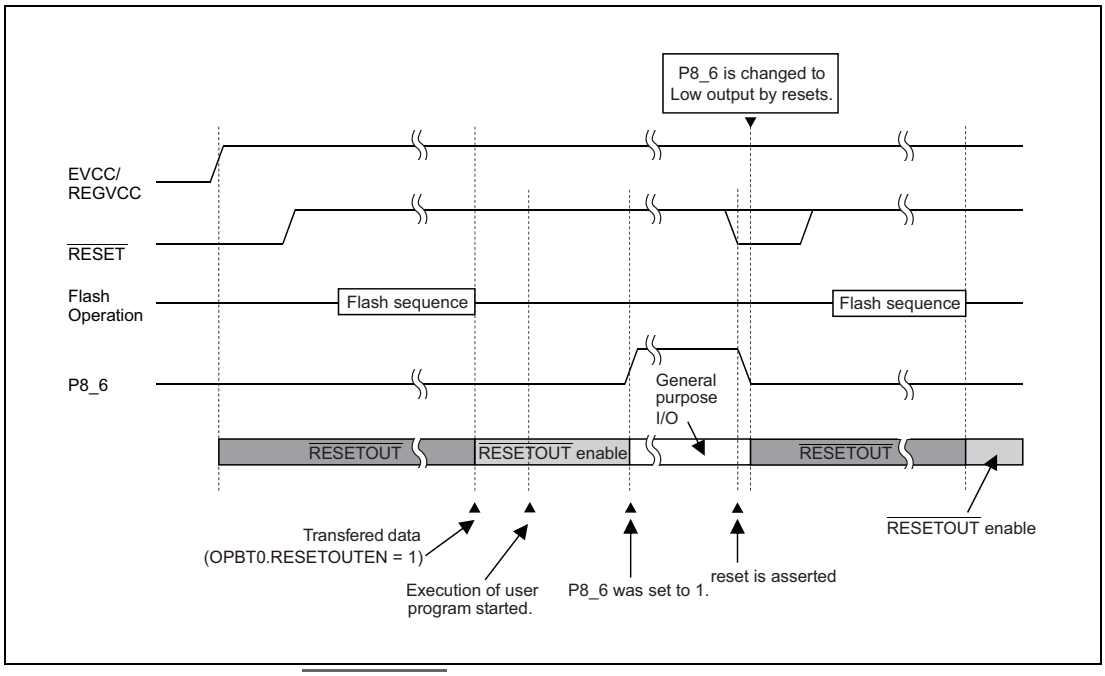

**Figure 2.9 P8_6 Pin ($\overline{\text{RESETOUT}}$ Signal) Operation While a Reset is asserted and released : (Case 1) OPBT0.RESETOUTEN setting is 1**

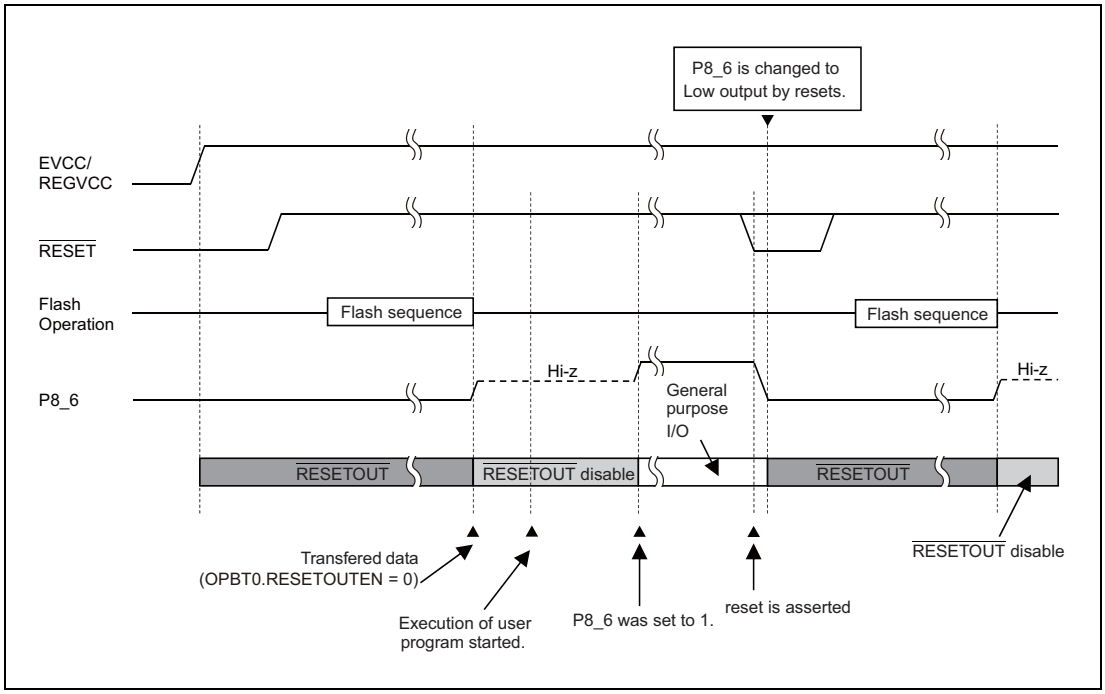

**Figure 2.10 P8_6 Pin ($\overline{\text{RESETOUT}}$ Signal) Operation While a Reset is asserted and released : (Case 2) OPBT0.RESETOUTEN setting is 0**

### 2.11.1.2 JP0_0 to JP0_6: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

**Table 2.66 Debug Intterface**

| OPJTAG1 | OPJTAG0 | Mode | JP0_0 | JP0_1 | JP0_2 | JP0_3 | JP0_4 | JP0_5 | JP0_6 |
|---|---|---|---|---|---|---|---|---|---|
| 1 | 1 | Nexus I/F | DCUTDI input | DCUTDO output | DCUTCK input | DCUTMS input | $\overline{\text{DCUTRST}}$ input | $\overline{\text{DCURDY}}$ output | $\overline{\text{EVTO}}$*1 output |
| 0 | 1 | LPD (4-pin) | LPDI input | LPDO output | LPDCLK input | Port/ alternative function | Port/ alternative function | LPDCLK OUT output | Port/ alternative function |
| 1 | 0 | LPD (1-pin) | LPDIO input/ output | Port/ alternative function | Port/ alternative function | Port/ alternative function | Port/ alternative function | Port/ alternative function | Port/ alternative function |

Note 1. Only available for 176 pin and 144 pin devices.

Consequently, the port and alternative functions on these pins cannot be used while the debugger is connected. (The pins with port/alternative function can be used.)

**NOTE**

For the OPJTAG[1:0] settings, see **Section 37.9.2, OPBT0 — Option Byte 0**.

### 2.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer

These pins are used for connecting a flash programmer. See *Flash Programmer's Manual* for details.

### 2.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10_8: FLMD1 pin can select serial programming mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_2: MODE1 and the P10_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_6: MODE2, the P10_2: MODE1 and the P10_1: MODE0 pins can select user boot mode.

For details on the mode selection, see **Section 6, Operating Mode**.

### 2.11.1.5 IP0_0: XT2

This pin is the SubOSC (SOSC) input pin. When the IPIBC0_0 bit = 1, the IP0_0/XT2 pin is used as an input port. If you make this setting, stop SOSC operation at the same time.

## 2.11.2 A/D Input Alternative I/O

The following ports are permanently connected to A/D input functions. (However, an analog input to the A/D is controlled by the A/D module.)

**Table 2.67 A/D Input Alternative Pins (1/2)**

| Port | A/D Input | Device | | |
|---|---|---|---|---|
| | | 100 pins | 144 pins | 176 pins |
| P8_0 | ADCA0I0S | √ | √ | √ |
| P8_1 | ADCA0I1S | √ | √ | √ |
| P8_2 | ADCA0I4S | √ | √ | √ |
| P8_3 | ADCA0I5S | √ | √ | √ |
| P8_4 | ADCA0I6S | √ | √ | √ |
| P8_5 | ADCA0I7S | √ | √ | √ |
| P8_6 | ADCA0I8S | √ | √ | √ |
| P8_7 | ADCA0I14S | √ | √ | √ |
| P8_8 | ADCA0I15S | √ | √ | √ |
| P8_9 | ADCA0I16S | √ | √ | √ |
| P8_10 | ADCA0I17S | √ | √ | √ |

## 2.11.3 Special I/O Control

### 2.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.

The following table lists all alternative functions where PIPCn.PIPCn_m must be set to 1.

For details, see **Section 2.9.2.3, PIPCn — Port IP Control Register**.

**Table 2.68 Alternative Modes that Require Setting PIPCn.PIPCn_m = 1**

| Function | Alternative functions Name | Port Name | Power Supply Area | Control | Reference Section |
|---|---|---|---|---|---|
| TAPA | TAPA0UP | P10_0 | ISO | U phase Hi-Z control | **Section 29** |
| | TAPA0UN | P10_1 | ISO | | |
| | TAPA0VP | P10_2 | ISO | V phase Hi-Z control | |

### 2.11.3.2 Input Buffer Control (PISn/JPIS0, JPISA0)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type 1/2 or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in **Table 2.70**.

**Table 2.69 Port Input Buffer Characteristics Selection (1/3)**

| Port Name | Input Buffer Selection | | Device | | |
|---|---|---|---|---|---|
| | Type 1 (PISn_m = 0) | Type 2 (PISn_m = 1) | 100 pins | 144 pins | 176 pins |
| P0_0 | SHMT1 | SHMT4 | √ | √ | √ |

Table 2.70 JTAG port Input Buffer Characteristics Selection

| Port Name | Input Buffer Selection | | | Devices | | |
|---|---|---|---|---|---|---|
| | Type 1 (JPIS0_m=0 & JPISA0_m=0) | Type 2 (JPIS0_m=1 & JPISA0_m=0) | Type 5 (JPISA0_m = 1) | 100 pins | 144 pins | 176 pins |
| JP0_0 | SHMT1 | SHMT4 | TTL*1, *2, *3, *4 | √ | √ | √ |
| JP0_1 | SHMT1 | SHMT4 | — | √ | √ | √ |
| JP0_2 | SHMT1 | SHMT4 | TTL*1, *2, *3 | √ | √ | √ |
| JP0_3 | SHMT1 | SHMT4 | TTL*1, *2 | √ | √ | √ |
| JP0_4 | — | SHMT4 | —*1, *2 | √ | √ | √ |
| JP0_5 | SHMT1 | SHMT4 | — | √ | √ | √ |
| JP0_6 | SHMT1 | SHMT4 | — | — | √ | √ |

Note 1. TTL is selected for Boundary scan mode without JPISA0 register setting.
Note 2. TTL is selected for Nexus in normal operating mode without JPISA0 register setting.
Note 3. TTL is selected for LPD (4-pin) in normal operating mode without JPISA0 register setting.
Note 4. TTL is selected for LPD (1-pin) in normal operating mode without JPISA0 register setting.

**NOTES**

1. For the SHMT1, SHMT4, and TTL pin characteristics, see the **Section 40, Electrical Characteristics**.
2. For the input buffer after reset, type 2 (SHMT4) is selected.

### 2.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

**Table 2.71 Output Buffer Characteristics Selection (1/3)**

| Port Name | Output Drive Strength Selection | | Device | | |
|---|---|---|---|---|---|
| | Slow Mode (PDSCn_m = 0) | Fast Mode (PDSCn_m = 1) | 100 pins | 144 pins | 176 pins |
| JP0_1 | 10 MHz | 40 MHz*2 | √ | √ | √ |
| JP0_2 | 10 MHz | 40 MHz | √ | √ | √ |
| JP0_3 | 10 MHz | 40 MHz | √ | √ | √ |
| JP0_5 | 10 MHz | 40 MHz | √ | √ | √ |
| JP0_6 | 10 MHz | 40 MHz | — | √ | √ |
| P0_0 | 10 MHz | 40 MHz | √ | √ | √ |
| P0_1 | 10 MHz | 40 MHz | √ | √ | √ |
| P0_2 | 10 MHz | 40 MHz*1 | √ | √ | √ |
| P0_3 | 10 MHz | 40 MHz*1 | √ | √ | √ |
| P0_4 | 10 MHz | 40 MHz | √ | √ | √ |
| P0_5 | 10 MHz | 40 MHz*2 | √ | √ | √ |
| P0_6 | 10 MHz | 40 MHz*2 | √ | √ | √ |
| P0_7 | 10 MHz | 40 MHz | √ | √ | √ |
| P0_8 | 10 MHz | 40 MHz | √ | √ | √ |
| P0_9 | 10 MHz | 40 MHz | √ | √ | √ |

| P20_4 | 10 MHz | 40 MHz | — | √ | √ |
| P20_5 | 10 MHz | 40 MHz | — | √ | √ |

Note 1. Supports Cload: 100pF

Note 2. Supports Cload: 50pF (Set fast mode if the load capacitance of CSIH is 50 pF.)

## 2.12 Noise Filter & Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1K supports both analog and digital filters.

It also supports the function for edge and level detection after the signals have passed through a filter.

The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter & edge/level detection control registers and control bits, and register addresses.

For details on the digital/analog filter function and noise filter & edge/level detection control registers, see **Section 2.13, Description of Port Noise Filter & Edge/Level Detection**.

**NOTE**

In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

### 2.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

#### 2.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

- Filter control register FCLA0CTLm_<name> (m = 0 to 7)
  A dedicated FCLA0CTLm_<name> register is provided for each pin in a port that incorporates an analog filter.

**Table 2.72 Input Pins that Incorporate Analog Filter Type A**

| Module Name | Input Pin | FCLA0CTL Register Configuration | | Device | | |
|---|---|---|---|---|---|---|
| | | Register | Address | 100 pins | 144 pins | 176 pins |
| FCLA0 | NMI | FCLA0CTL0_NMI | FFC3 4000$_H$ | √ | √ | √ |
| | INTP0 | FCLA0CTL0_INTPL | FFC3 4020$_H$ | √ | √ | √ |
| | INTP1 | FCLA0CTL1_INTPL | FFC3 4024$_H$ | √ | √ | √ |
| | INTP2 | FCLA0CTL2_INTPL | FFC3 4028$_H$ | √ | √ | √ |
| | INTP3 | FCLA0CTL3_INTPL | FFC3 402C$_H$ | √ | √ | √ |
| | INTP4 | FCLA0CTL4_INTPL | FFC3 4030$_H$ | √ | √ | √ |
| | INTP5 | FCLA0CTL5_INTPL | FFC3 4034$_H$ | √ | √ | √ |
| | INTP6 | FCLA0CTL6_INTPL | FFC3 4038$_H$ | √ | √ | √ |

| | INTP15 | FCLA0CTL7_INTPH | FFC3 405C$_H$ | — | √ | √ |

### 2.12.1.2 Input Pins that Incorporate Analog Filter Type B

The input pins of analog filter type B incorporate an analog filter. Edge/level detection is controlled by the registers for individual peripheral functions.

**Table 2.73 Input Pins that Incorporate Analog Filter Type B**

| Input Pin | Edge/Level Detection | Device | | |
|---|---|---|---|---|
| | | 100 pins | 144 pins | 176 pins |
| TAUJ0I0 | Edge detection*1 | √ | √ | √ |
| TAUJ0I1 | Edge detection*1 | √ | √ | √ |
| TAUJ0I2 | Edge detection*1 | √ | √ | √ |
| TAUJ0I3 | Edge detection*1 | √ | √ | √ |
| TAUJ1I0 | Edge detection*1 | √ | √ | √ |
| TAUJ1I1 | Edge detection*1 | √ | √ | √ |
| TAUJ1I2 | Edge detection*1 | √ | √ | √ |
| TAUJ1I3 | Edge detection*1 | √ | √ | √ |
| TAPA0ESO | Edge detection*2 | √ | √ | √ |
| KR0I0 | Low level detection | √ | √ | √ |
| KR0I1 | Low level detection | √ | √ | √ |
| KR0I2 | Low level detection | √ | √ | √ |
| KR0I3 | Low level detection | √ | √ | √ |
| KR0I4 | Low level detection | √ | √ | √ |
| KR0I5 | Low level detection | √ | √ | √ |
| KR0I6 | Low level detection | √ | √ | √ |
| KR0I7 | Low level detection | √ | √ | √ |

Note 1. For details on edge detection for TAUJ, see **Section 26.3.3.4, TAUJnCMURm — TAUJn Channel Mode User Register**.

Note 2. For details on edge detection for TAPA, see **Section 29.3.2, TAPAnCTL0 — TAPA Control Register 0**.

### 2.12.1.3 Input Pins that Incorporate Analog Filter Type C

The input pins of analog filter type C only incorporate an analog filter function.

**Table 2.74 Input Pins that Incorporate Analog Filter Type C**

| Input Pin |
|---|
| FLMD0 |
| FLMD1 |
| MODE0 |
| MODE1 |
| MODE2 |
| $\overline{\text{RESET}}$ |
| $\overline{\text{DCUTRST}}$ |

#### 2.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm_<name> (m = 0 to 2)
  Each port with a digital filter has a special FCLA0CTLm_<name> register.
- Digital noise elimination control register DNFA<name>CTL
  Each DNFA<name>CTL control register controls digital filter processing for three input signals per group.
- Digital noise elimination enable register DNFA<name>EN
  The setting of the DNFA<name>ENL[2:0] bits in DNFA<name>EN enables or disables digital noise elimination for three input signals per group.

Table 2.75 Input Pins that Incorporate Digital Filter Type D

| Input Pin | Device | | | Digital Noise Elimination Control Register | | Digital Noise Elimination Enable Register | | | Filter Control Register | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 100 pin | 144 pin | 176 pin | Control Register | Address | Control Register | Control Bit | Address | Control Register | Address |
| ADCA0TRG0 | √ | √ | √ | DNFAADCTL0CTL | FFC3 00A0$_H$ | DNFAADCTL0EN (DNFAADCTL0ENL) | DNFAADCTL0ENL0 | FFC3 00A4$_H$ (FFC3 00AC$_H$) | FCLA0CTL0 _ADC0 | FFC3 4060$_H$ |
| ADCA0TRG1 | √ | √ | √ | | | | DNFAADCTL0ENL1 | | FCLA0CTL1 _ADC0 | FFC3 4064$_H$ |
| ADCA0TRG2 | √ | √ | √ | | | | DNFAADCTL0ENL2 | | FCLA0CTL2 _ADC0 | FFC3 4068$_H$ |
| ADCA1TRG0 | — | √ | √ | DNFAADCTL1CTL | FFC3 00C0$_H$ | DNFAADCTL1EN (DNFAADCTL1ENL) | DNFAADCTL1ENL0 | FFC3 00C4$_H$ (FFC3 00CC$_H$) | FCLA0CTL0 _ADC1 | FFC3 4080$_H$ |
| ADCA1TRG1 | — | √ | √ | | | | DNFAADCTL1ENL1 | | FCLA0CTL1 _ADC1 | FFC3 4084$_H$ |
| ADCA1TRG2 | — | √ | √ | | | | DNFAADCTL1ENL2 | | FCLA0CTL2 _ADC1 | FFC3 4088$_H$ |

#### 2.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<name>CTL
  Each DNFA<name>CTL control register controls digital filter processing for up to 16 input signals per group.
- Digital noise elimination enable register DNFA<name>EN
  The setting of the DNFA<name>ENL[7:0] and DNFA<name>ENH[7:0] bits in DNFA<name>EN enables or disables digital noise elimination for up to 16 input signals per group.

Table 2.76 Input Pins that Incorporate Digital Filter Type E (1/3)

| Input Pin | Devises | | | Digital Noise Elimination Control Register | | Digital Noise Elimination Enable Register | | | Edge Detection |
|---|---|---|---|---|---|---|---|---|---|
| | 100 pin | 144 pin | 176 pin | Control Register | Address | Control Register | Control Bit | Address | Register Name |

Note 1. For the setting for TAUD edge detection, see **Section 25.3.3.4, TAUDnCMURm — TAUDn Channel Mode User Register**.

Note 2. For the setting for TAUB edge detection, see **Section 24.3.3.4, TAUBnCMURm — TAUBn Channel Mode User Register**

Note 3. For the setting for ENCA edge detection, see **Section 28.3.3, ENCAnIOC0 — ENCAn I/O Control Register 0**.

## 2.12.2 Clock Supply for Port Filters

The following table shows the clock supply for each filter type in each port domain.

**Table 2.77 Clock Supply for Port Filters**

| Peripheral Function | Port Domain*1 | Filter Type | Filter Clock | Setting Register | |
|---|---|---|---|---|---|
| | | | | Source Clock Selection | Clock Selection |
| ADCA0 | Always-On area | Digital filter type D | DNFATCKI | CKSC_AADCAS_CTL | CKSC_AADCAD_CTL |
| ADCA1 | Isolated area | Digital filter type D | DNFATCKI | CKSC_IADCAS_CTL | CKSC_IADCAD_CTL |
| TAUD0 | Isolated area | Digital filter type E | DNFATCKI | CKSC_IPERI1S_CTL | — |
| TAUB0 | Isolated area | Digital filter type E | DNFATCKI | CKSC_IPERI2S_CTL | — |
| TAUB1 | Isolated area | Digital filter type E | DNFATCKI | CKSC_IPERI2S_CTL | — |
| ENCA0 | Isolated area | Digital filter type E | DNFATCKI | CKSC_IPERI1S_CTL | — |

Note 1. Power Domain

**NOTE**

For the Setting Register, see **Section 12.4.3, Clock Selector Control Register**.

# 2.13 Description of Port Noise Filter & Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.

**NOTE**

In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

## 2.13.1 Overview

### 2.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.
  Used for external interrupt signals.
- Type B: An analog filter
  Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.
- Type C: An analog filter only
  Used for the external $\overline{\text{RESET}}$ input and mode signals.

### 2.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection.
  Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function.
  Used for the timer input signals and encoder input signals.

## 2.13.2 Analog Filters

### 2.13.2.1 Analog Filter Characteristic

See the **Section 40, Electrical Characteristics** for the input conditions for signals input to pins that incorporate an analog filter.

### 2.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm_<name> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in **Table 2.72, Input Pins that Incorporate Analog Filter Type A**, in **Section 2.12.1, Port Filter Assignment**.

### 2.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

#### (1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

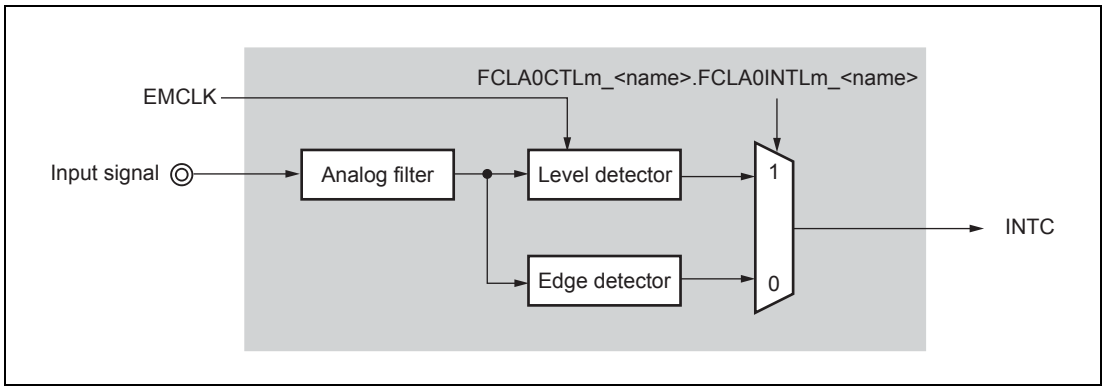

**Figure 2.11 Block Diagram of Analog Filter Type A**

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLA0CTLm_<name>.FCLA0INTLm_<name>.

- FCLA0INTLm_<name> bit = 0: Edge detection

  Whether a rising or falling edge is detected can be specified by setting the FCLA0CTLm_<name>.FCLA0INTRm_<name> and FCLA0CTLm_<name>.FCLA0INTFm_<name> bits.

- FCLA0INTLm_<name> bit = 1: Level detection

  The detection of a high level or low level can be specified by setting FCLA0CTLm_<name>.FCLA0INTRm_<name> bit.

The table below summarizes the detection conditions of the analog filter.

**Table 2.78 Analog Filter Event Detection Conditions**

| FCLA0INTLm_<name> | FCLA0INTFm_<name> | FCLA0INTRm_<name> | Edge Detection | Level Detection |
|---|---|---|---|---|
| 0 | 0 | 0 | No edge detected | Disabled |
| | 0 | 1 | Rising edge | |
| | 1 | 0 | Falling edge | |
| | 1 | 1 | Rising and falling edges | |
| 1 | X | 0 | Disabled | Low level |
| | X | 1 | | High level |

#### Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

### (2) Analog filter type B

A block diagram of analog filter type B is shown below.

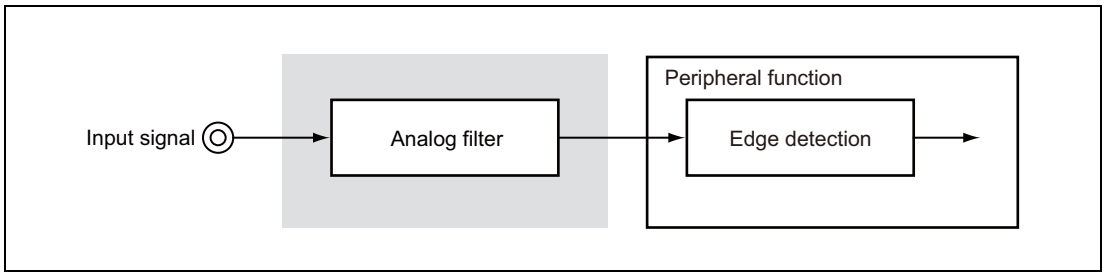

**Figure 2.12 Block Diagram of Analog Filter Type B**

#### Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

### (3) Analog filter type C

A block diagram of analog filter type C is shown below.

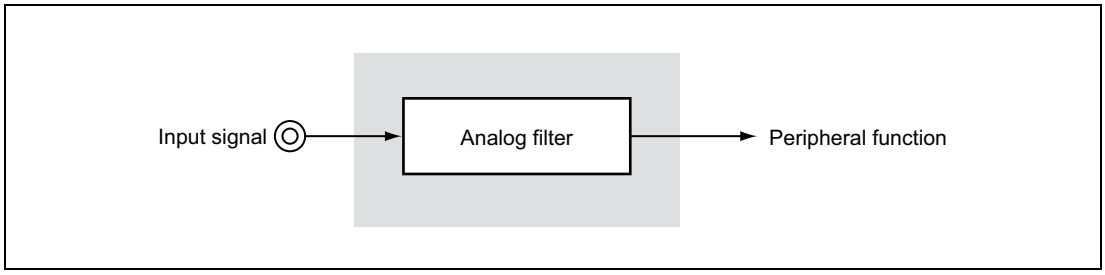

**Figure 2.13 Block Diagram of Analog Filter Type C**

The generated signals are always input signals that have passed through an analog filter.

#### Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2.13.3 Digital Filters

### 2.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.

The input signal is sampled with the sampling frequency fs.

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFA<name>CTL.DNFA<name>PRS[2:0] select the sampling frequency based on
  $fs = f_{DNFATCKI} / 2^{DNFA<name>PRS[2:0]}$
  where $f_{DNFATCKI}$ is the frequency of the DNFATCKI clock.
- DNFA<name>CTL.DNFA<name>NFSTS[1:0] determines the number of same level samples, "s", (2 to 5):

  s = DNFA<name>NFSTS[1:0] + 2

External signal pulses shorter than the following are suppressed at all times.

s ×1/fs

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

(s + 1) × 1/fs

External signal pulses in the following range may be suppressed or judged as valid.

s × 1/fs to (s + 1) × 1/fs

The filter operation is illustrated in the figure below with DNFA<name>NFSTS[1:0] = $01_B$, i.e. s = 3 same level samples.

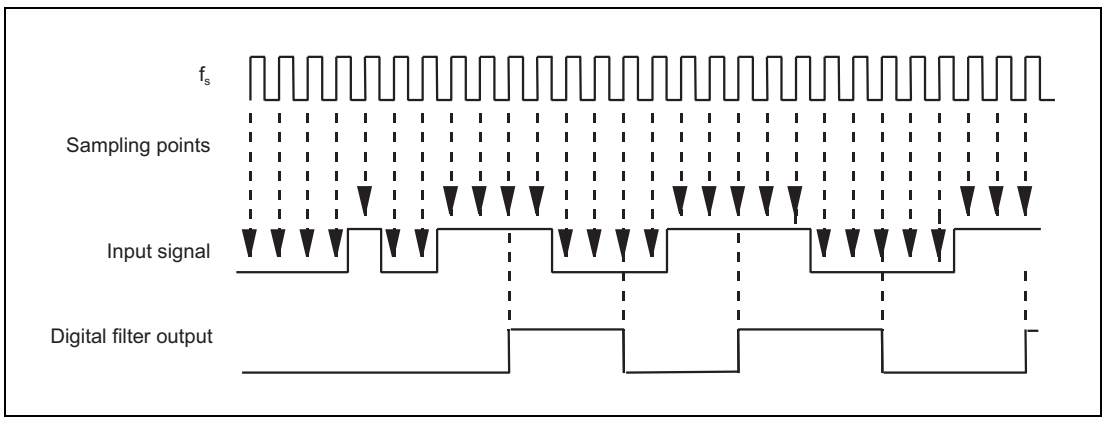

**Figure 2.14 Digital Filter Function**

### 2.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFA<name>CTL.DNFA<name>PRS[2:0] and DNFA<name>NFSTS[1:0] apply to the signals.

However, the digital filter for each signal can be enabled or disabled separately by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

**CAUTIONS**

1. **When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) for the port pin to switch to the alternative function.**
   **s = DNFA<name>NFSTS[1:0] + 2**
   **$s \times 1/f_S + 2 \times 1/f_{DNFATCKI}$**
2. **When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.**
   **$s \times 1/f_S + 3 \times 1/f_{DNFATCKI}$**

### 2.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.
Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

### 2.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA<name>CTL and digital noise elimination enable register DNFA<name>EN are used to set all the filters in the same group (<name> = peripheral function group).

The DNFA<name>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <name>.

The DNFA<name>EN register enables/disables each filter by setting the corresponding bit in DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTL0_ADCn registers are ordered in groups of 3 registers with the same index n. The register index n is in 0 or 1.

The assignment of the input signals to the control registers and their addresses are given in **Table 2.75, Input Pins that Incorporate Digital Filter Type D** and **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

**CAUTION**

**Do not change any control register settings while the corresponding digital filter is enabled by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1. Otherwise an unintended filter output may be generated.**

#### (1) Digital filter type D

A block diagram of digital filter type D is shown below.

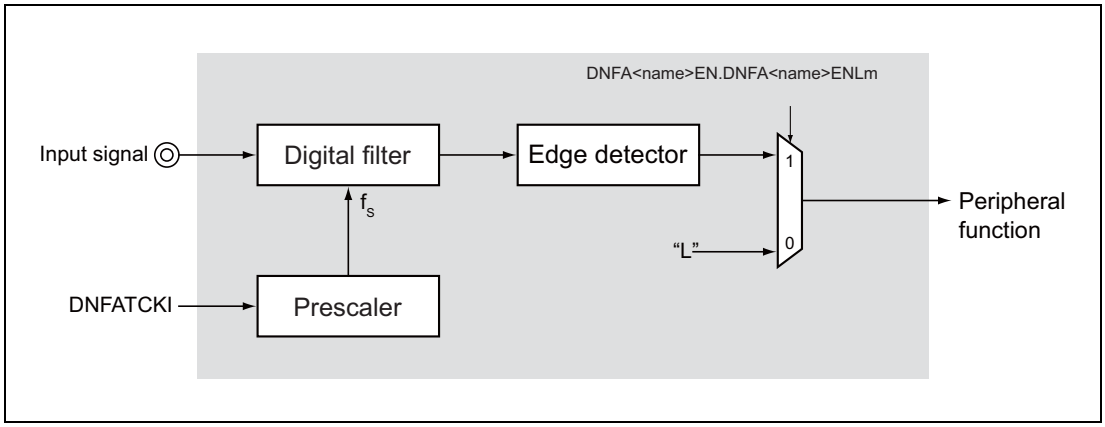

**Figure 2.15 Block Diagram of Digital Filter Type D**

The generated signal depends on the register setting, as shown in the following table.

**Table 2.79 Output Options for Digital Filter Type D**

| DNFA<name>EN.DNFA<name>ENLm | Signals Output to Peripheral Functions |
|---|---|
| 0 | Fixed to low level |
| 1 | Input signal passed through filter |

### (2) Digital filter type E

A block diagram of digital filter type E is shown below.

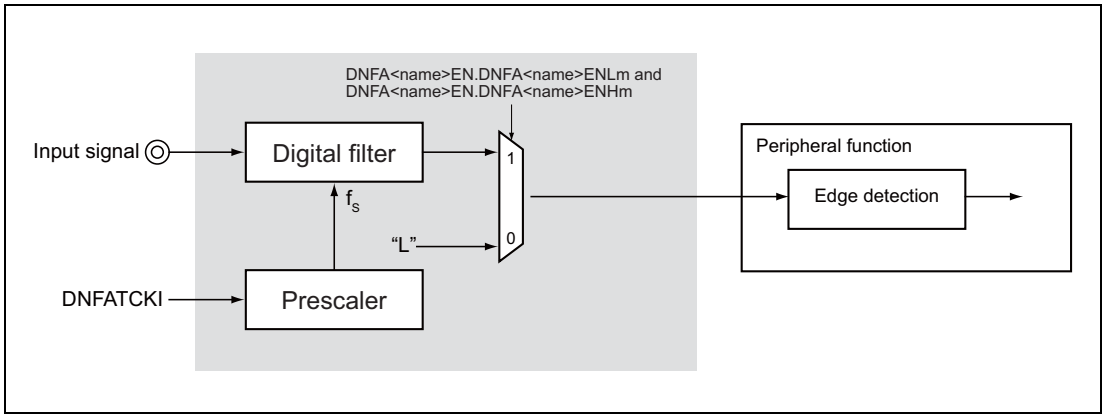

**Figure 2.16 Block Diagram of Digital Filter Type E**

The generated signal depends on the register setting, as shown in the following table.

**Table 2.80 Output Options for Digital Filter Type E**

| DNFA<name>EN.DNFA<name>ENLm and DNFA<name>EN.DNFA<name>ENHm | Signals Output to Peripheral Functions |
|---|---|
| 0 | Fixed to low level |
| 1 | Input signal passed through filter |

## 2.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:

**Table 2.81 List of Filter Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| FCLA0 | Filter control register m | FCLA0CTLm_<name> | The addresses are shown in the tables in **Section 2.12.1, Port Filter Assignment**. |
| DNF | Digital noise elimination control register | DNFA<name>CTL | |
| | Digital noise elimination enable register | DNFA<name>EN | |
| | Digital noise elimination enable H register | DNFA<name>ENH | |
| | Digital noise elimination enable L register | DNFA<name>ENL | |

### 2.13.4.1 FCLA0CTLm_<name> — Filter Control Register

This register controls the analog and digital filter operation.

**Access:** This register can be read or written in 8-bit units.

**Address:** The allocation of input signals to FCLA0CTLm_<name> registers and the address of each register are shown in the tables in **Section 2.12.1, Port Filter Assignment**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | FCLA0INTLm_<name> | FCLA0INTFm_<name> | FCLA0INTRm_<name> |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

**Table 2.82 FCLA0CTLm_<name> Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 | FCLA0INTLm_<name> | Detection Mode Selection<br>0: Edge detection<br>1: Level detection<br>**Note:** This bit is only valid for analog filter type A. |
| 1 | FCLA0INTFm_<name> | • In level detection mode (FCLA0INTLm_<name> = 1): This bit has no effect.<br>• In edge detection mode (FCLA0INTLm_<name> = 0): Falling edge detection control<br>0: Falling edge detection disabled<br>1: Falling edge detection enabled<br>**Note:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode. |
| 0 | FCLA0INTRm_<name> | • In level detection mode (FCLA0INTLm_<name> = 1): Detected level selection<br>0: Low level detection<br>1: High level detection<br>• In edge detection mode (FCLA0INTLm_<name> = 0): Rising edge detection control<br>0: Rising edge detection disabled<br>1: Rising edge detection enabled<br>**Note:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode. |

**CAUTION**

Digital filter type D: Always set bit 2 to "0".

### 2.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.

**NOTE**

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 8-bit units.

**Address:** For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see **Table 2.75, Input Pins that Incorporate Digital Filter Type D** and **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

### 2.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.

**NOTE**

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 16-bit units.
The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

**Address:** For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see **Table 2.75, Input Pins that Incorporate Digital Filter Type D** and **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

### 2.13.4.4 DNFA<name>ENH – Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>ENH register.

**NOTE**

This register is only valid for digital filter type E.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DNFA <name> ENH7 | DNFA <name> ENH6 | DNFA <name> ENH5 | DNFA <name> ENH4 | DNFA <name> ENH3 | DNFA <name> ENH2 | DNFA <name> ENH1 | DNFA <name> ENH0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

For details of the respective bit functions, see **Section 2.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register**.

### 2.13.4.5 DNFA<name>ENL – Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>ENL register.

**NOTE**

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see **Table 2.75, Input Pins that Incorporate Digital Filter Type D** and **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DNFA <name> ENL7 | DNFA <name> ENL6 | DNFA <name> ENL5 | DNFA <name> ENL4 | DNFA <name> ENL3 | DNFA <name> ENL2 | DNFA <name> ENL1 | DNFA <name> ENL0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

For details of the respective bit functions, see **Section 2.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register**.

# Section 3 CPU System

## 3.1 Overview

### 3.1.1 Block Configuration

**Figure 3.1** shows the block configuration diagram of RH850/F1K.

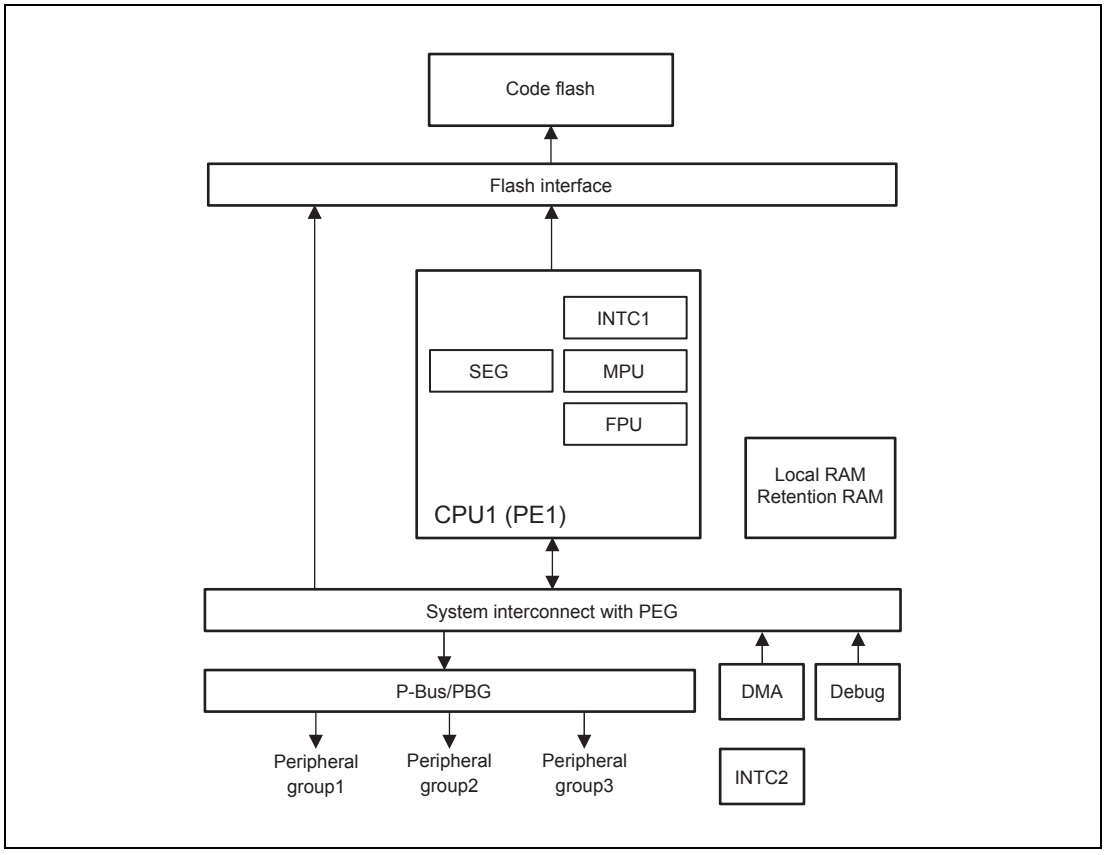

**Figure 3.1 Block Configuration Diagram of the RH850/F1K**

#### CPU1 (PE1)

The RH850 G3KH Core is used as the main CPU.

#### Local RAM

This is a high-speed accessible RAM

#### Retention RAM

The retention RAM is used to retain values in DeepSTOP mode. Since the continuous local RAM area is assigned for the retention RAM, the retention RAM can also serve as a local RAM for sharing data with the DMA.

#### Code flash

The code flash memory is included for program storage. It is connected with CPU1 via the flash interface.

### Data flash

The data flash memory can be rewritten by the CPU1. It has a greater write endurance than the code flash memory.

### P-Bus

The P-Bus connects the peripheral IPs. The P-Bus is divided into three peripheral groups, 1 to 3.

### INTC1, INTC2

There are two interrupt controllers, INTC1 and INTC2.

### DMA

The DMA transfer module (DMAC) is included.

### Slave guard

The slave guard is a function to prevent unauthorized access from the specific bus master, and consists of the following guard structures:

(1) PE guard (PEG)

The PE guard is a function to prevent unauthorized access to the resources (local RAM and retention RAM) in the PE from an external master. After reset is released, access from other than the own PE is prohibited.

(2) System error generation (SEG)

The registers control how to response SYSERR.

(3) Peripheral guard (PBG)

The peripheral guard is a function to prevent unauthorized access to peripherals. The control registers in the peripheral circuits are protected against illegal accesses.

For details, see **Section 33, Functional Safety**.

# 3.2 CPU

## 3.2.1 Core Functions

### 3.2.1.1 Features

**Table 3.1** lists features of the RH850 G3KH core.

**Table 3.1 Features of the RH850 G3KH Core**

| Item | Feature |
|---|---|
| CPU | • Advanced 32-bit architecture for embedded control<br>• 32-bit internal data bus<br>• Thirty-two 32-bit general-purpose registers<br>• RISC-type instruction set<br>– Long-/short-format load/store instructions<br>– Three-operand instructions<br>– Instruction set based on C language<br>• CPU operating modes<br>– User mode and supervisor mode<br>• Address space: 4-Gbyte linear address space for both data and instructions |
| Coprocessor | • Floating-point operation coprocessor (FPU)<br>– Supports single precision (32 bits)<br>– Supports data types and exceptions conforming to IEEE754.<br>– Rounding mode: Neighborhood, 0 direction, +∞ direction, and –∞ direction<br>– Handling of denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754 |
| Exception/ Interrupt | • 16 interrupt priority levels settable for each channel<br>• Vector selection method selectable according to performance request or memory usage<br>– Direct branching exception vectors<br>– Indirect branching exception vectors referring to the address table<br>• Supports the high-speed save/return processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt |
| Memory management | • Memory protection function (MPU): 16 areas settable |
| Cache | • No cache memory is equipped. |

### 3.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

#### (1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).

**Table 3.2 Program Registers**

| Program Register | Name | Function | Description |
|---|---|---|---|
| General-purpose registers | r0 | Zero register | Always retains “0” |
| | r1 | Assembler reserved register | Used as working register for generating addresses |
| | r2 | Register for address and data variables (used when the real-time OS used does not use this register) | |
| | r3 | Stack pointer (SP) | Used for generating a stack frame when a function is called |
| | r4 | Global pointer (GP) | Used for accessing a global variable in the data area |
| | r5 | Text pointer (TP) | Used as a register that indicates the start of the text area (area where program code is placed) |
| | r6 to r29 | Register for address and data variables | |
| | r30 | Element pointer (EP) | Used as a base pointer for generating addresses when accessing memory |
| | r31 | Link pointer (LP) | Used when the compiler calls a function |
| Program counter | PC | Retains instruction addresses during execution of programs | |

**NOTE**

For further descriptions of r1, r3 to r5, and r31 used by the assembler and/or C compiler, see the specification of each software development environment.

### (a) General-purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables. Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, r30

   These registers are implicitly used by instructions.

   r0 is a register that always retains "0". It is used for operations that use 0 and addressing with base address being 0.

   r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.

   r30 is used as a base pointer when the SLD or SST instruction accesses memory.

2. r1, r4, r5, r31

   These registers are implicitly used by the assembler and C compiler.

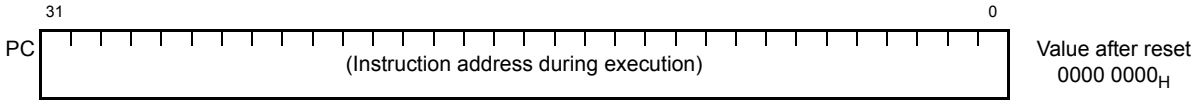
   When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

3. r2

   This register might be used by a real-time OS in some cases. If the real-time OS that is being used does not use r2, r2 can be used as a register for address variables or data variables.

### (b) PC – Program Counter

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0, and branching to an odd number address is disabled.



**Note:** The value after reset differs depending on the setting value of the reset vector. For details, see **(q) RBASE — Reset Vector Base Address Register**.

### (2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and a selection ID.

Table 3.3 Basic System Registers

| Register No. (regID, selID) | Symbol | Function | Access Permission |
|---|---|---|---|
| SR0, 0 | EIPC | Status save registers when acknowledging EI level exception | SV |
| SR1, 0 | EIPSW | Status save registers when acknowledging EI level exception | SV |
| SR2, 0 | FEPC | Status save registers when acknowledging FE level exception | SV |
| SR3, 0 | FEPSW | Status save registers when acknowledging FE level exception | SV |
| SR5, 0 | PSW | Program status word | *1 |
| SR6, 0 | FPSR | (Refer to FPU function registers.) | CU and SV |
| SR7, 0 | FPEPC | (Refer to FPU function registers.) | CU and SV |
| SR8, 0 | FPST | (Refer to FPU function registers.) | CU |
| SR9, 0 | FPCC | (Refer to FPU function registers.) | CU |
| SR10, 0 | FPCFG | (Refer to FPU function registers.) | CU |
| SR11, 0 | FPEC | (Refer to FPU function registers.) | CU and SV |
| SR13, 0 | EIIC | EI level exception cause | SV |
| SR14, 0 | FEIC | FE level exception cause | SV |
| SR16, 0 | CTPC | CALLT execution status save register | UM |
| SR17, 0 | CTPSW | CALLT execution status save register | UM |
| SR20, 0 | CTBP | CALLT base pointer | UM |
| SR28, 0 | EIWR | EI level exception working register | SV |
| SR29, 0 | FEWR | FE level exception working register | SV |
| SR0, 1 | MCFG0 | Machine configuration | SV |
| SR2, 1 | RBASE | Reset vector base address | SV |
| SR3, 1 | EBASE | Exception handler vector address | SV |
| SR4, 1 | INTBP | Base address of the interrupt handler address table | SV |
| SR5, 1 | MCTL | CPU control | SV |
| SR6, 1 | PID | Processor ID | SV |
| SR11, 1 | SCCFG | SYSCALL operation setting | SV |
| SR12, 1 | SCBP | SYSCALL base pointer | SV |
| SR0, 2 | HTCFG0 | Thread configuration | SV |
| SR6, 2 | MEA | Memory error address | SV |
| SR7, 2 | ASID | Address space ID | SV |
| SR8, 2 | MEI | Memory error information | SV |

Note 1. The access permission differs depending on the bit.

(a) EIPC — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see "*Types of Exceptions*" in *Software Manual*).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address cannot be specified.

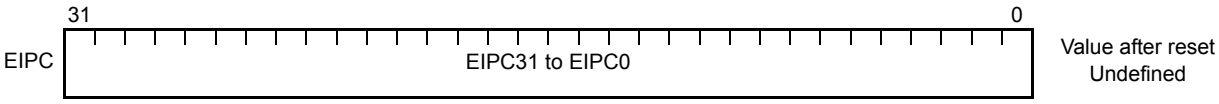


**Table 3.4 EIPC Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 1 | EIPC31 to EIPC1 | These bits indicate the PC saved when an EI level exception is acknowledged. | R/W | Undefined |
| 0 | EIPC0 | This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0. | R/W | Undefined |

(b) EIPSW — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

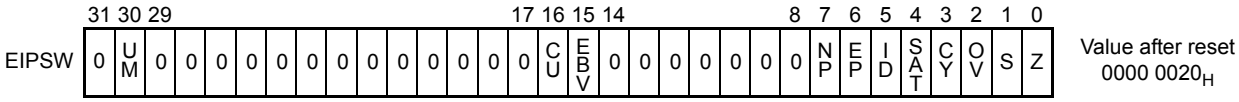

**Table 3.5 EIPSW Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 30 | UM | This bit stores the PSW.UM bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 29 to 17 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 16 | CU | This bit stores the PSW.CU field setting when an EI level exception is acknowledged. | R/W | 0 |
| 15 | EBV | This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 14 to 8 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit stores the PSW.NP bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 6 | EP | This bit stores the PSW.EP bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 5 | ID | This bit stores the PSW.ID bit setting when an EI level exception is acknowledged. | R/W | 1 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 0 | Z | This bit stores the PSW.Z bit setting when an EI level exception is acknowledged. | R/W | 0 |

(c) FEPC — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see *"Types of Exceptions"* in *Software Manual*).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address cannot be specified.

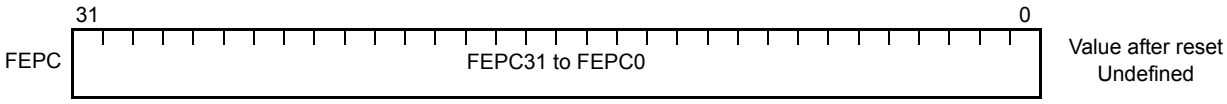

**Table 3.6 FEPC Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 1 | FEPC31 to FEPC1 | These bits indicate the PC saved when an FE level exception is acknowledged. | R/W | Undefined |
| 0 | FEPC0 | This bit indicates the PC saved when an FE level exception is acknowledged.<br>Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0. | R/W | Undefined |

(d) FEPSW — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

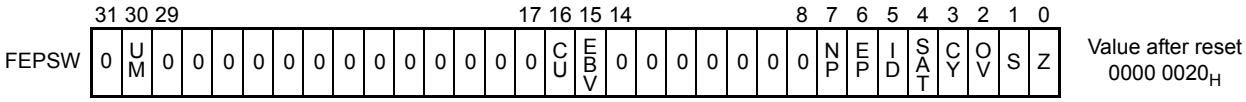

**Table 3.7 FEPSW Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 30 | UM | This bit stores the PSW.UM bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 29 to 17 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 16 | CU | This bit stores the PSW.CU field setting when an FE level exception is acknowledged. | R/W | 0 |
| 15 | EBV | This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 14 to 8 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit stores the PSW.NP bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 6 | EP | This bit stores the PSW.EP bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 5 | ID | This bit stores the PSW.ID bit setting when an FE level exception is acknowledged. | R/W | 1 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 0 | Z | This bit stores the PSW.Z bit setting when an FE level exception is acknowledged. | R/W | 0 |

(e) PSW — Program Status Word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by conditional instructions (Bcond, CMOV, etc.)).

**CAUTIONS**

1. **When the LDSR instruction is used to change the contents of each bit in this register, the changed contents become valid immediately after completion of the LDSR instruction execution.**
2. **The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See Table 3.8, Access Permission for PSW Register for the access permission for each bit.**

**Table 3.8 Access Permission for PSW Register**

| Bit | | Access Permission When Reading | Access Permission When Writing |
|---|---|---|---|
| 30 | UM | UM | SV*1 |
| 16 | CU | UM | SV*1 |
| 15 | EBV | UM | SV*1 |
| 7 | NP | UM | SV*1 |
| 6 | EP | UM | SV*1 |
| 5 | ID | UM | SV*1 |
| 4 | SAT | UM | UM |
| 3 | CY | UM | UM |
| 2 | OV | UM | UM |
| 1 | S | UM | UM |
| 0 | Z | UM | UM |

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

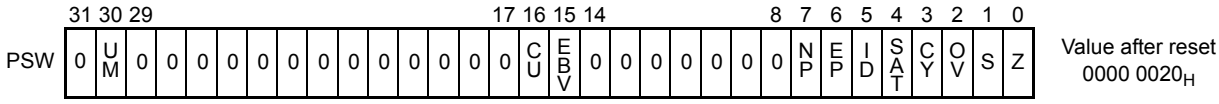

**Table 3.9 PSW Register Contents (1/2)**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 30 | UM | This bit indicates that the CPU is in user mode (in UM mode).<br>0: Supervisor mode<br>1: User mode | R/W | 0 |
| 29 to 17 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 16 | CU | This bit indicates the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor unusable exception occurs if an instruction for the coprocessor is executed or a coprocessor resource (system register) is accessed.<br>CU bit 16: FPU | R/W | 0 |

Table 3.9 PSW Register Contents (2/2)

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 15 | EBV | This bit indicates the reset vector and exception vector operation. See the description on RBASE ((q) RBASE — Reset Vector Base Address Register) and EBASE ((r) EBASE — Exception Handler Vector Address Register) in this section. | R/W | 0 |
| 14 to 8 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see **Table 7.1, List of Exception Sources**.<br>0: The acknowledgement of FE level exception is enabled.<br>1: The acknowledgement of FE level exception is disabled. | R/W | 0 |
| 6 | EP | This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1.<br>0: An exception other than an interrupt is not being serviced.<br>1: An exception other than an interrupt is being serviced. | R/W | 0 |
| 5 | ID | This bit disables the acknowledgement of EI level exception. When an EI level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level exception. As for the exceptions which the ID bit disables the acknowledgment, see **Table 7.1, List of Exception Sources**. This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction.<br>0: EI level exception is not being processed or the section is not a critical section (after execution of EI instruction).<br>1: EI level exception is being processed or the section is a critical section (after execution of DI instruction). | R/W | 1 |
| 4 | SAT*1 | This bit indicates that the operation result is saturated because the operation result of a saturated operation instruction has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1, but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed.<br>0: Not saturated<br>1: Saturated | R/W | 0 |
| 3 | CY | This bit indicates whether a carry or borrow has occurred in the operation result.<br>0: Carry and borrow have not occurred.<br>1: Carry or borrow has occurred. | R/W | 0 |
| 2 | OV*1 | This bit indicates whether or not an overflow has occurred during an operation.<br>0: Overflow has not occurred.<br>1: Overflow has occurred. | R/W | 0 |
| 1 | S*1 | This bit indicates whether or not the result of an operation is negative.<br>0: Result of operation is positive or 0.<br>1: Result of operation is negative. | R/W | 0 |
| 0 | Z | This bit indicates whether or not the result of an operation is 0.<br>0: Result of operation is not 0.<br>1: Result of operation is 0. | R/W | 0 |

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. The SAT flag is set to 1 only when the OV flag is set to 1 in a saturated operation.

| Operation Result Status | Flag Status | | | Operation Result after Saturation Processing |
|---|---|---|---|---|
| | SAT | OV | S | |
| Exceeded positive maximum value | 1 | 1 | 0 | 7FFF FFFF$_H$ |
| Exceeded negative maximum value | 1 | 1 | 1 | 8000 0000$_H$ |
| Positive (maximum value not exceeded) | Value prior to operation is retained. | 0 | 0 | Operation result itself |
| Negative (maximum value not exceeded) | | | 1 | |

### (f) EIIC — EI Level Exception Source Register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

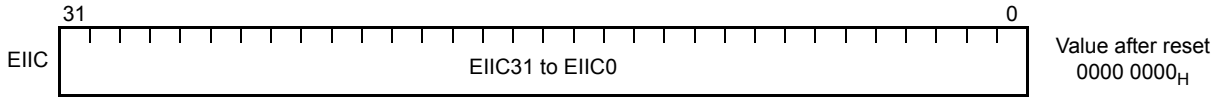

**Table 3.10 EIIC Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 0 | EIIC31 to EIIC0 | These bits store the exception source code when an EI level exception is acknowledged.<br>The EIIC15 to EIIC0 field stores the lower 16 bits of the exception source code.<br>The EIIC31 to EIIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0. | R/W | 0 |

### (g) FEIC — FE Level Exception Source Register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

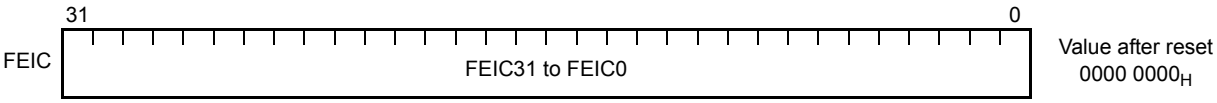

**Table 3.11 FEIC Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 0 | FEIC31 to FEIC0 | These bits store the exception source code when an FE level exception is acknowledged.<br>The FEIC15 to FEIC0 field stores the lower 16 bits of the exception source code.<br>The FEIC31 to FEIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0. | R/W | 0 |

### (h) CTPC — Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address cannot be specified.

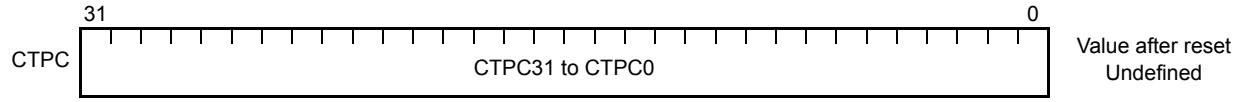

**Table 3.12 CTPC Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 1 | CTPC31 to CTPC1 | These bits indicate the PC of the instruction after the CALLT instruction. | R/W | Undefined |
| 0 | CTPC0 | This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0. | R/W | Undefined |

### (i) CTPSW — Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

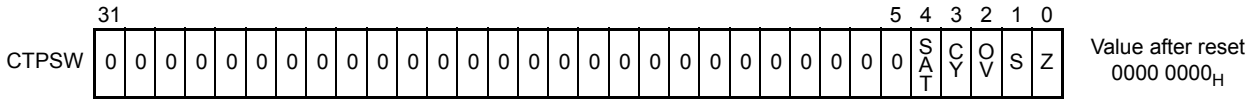

**Table 3.13 CTPSW Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 5 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when the CALLT instruction is executed. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when the CALLT instruction is executed. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when the CALLT instruction is executed. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when the CALLT instruction is executed. | R/W | 0 |
| 0 | Z | This bit stores the PSW.Z bit setting when the CALLT instruction is executed. | R/W | 0 |

### (j) CTBP — CALLT Base Pointer Register

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.

Be sure to set the CTBP register to a halfword address.

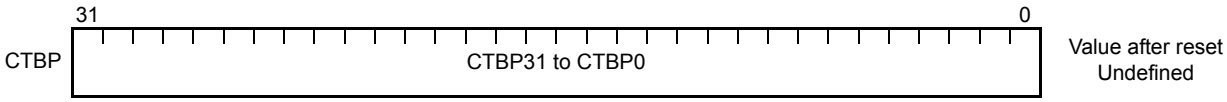

**Table 3.14 CTBP Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 1 | CTBP31 to CTBP1 | These bits indicate the base pointer address of the CALLT instruction. These bits indicate the start address of the table used by the CALLT instruction. | R/W | Undefined |
| 0 | CTBP0 | This bit indicates the base pointer address of the CALLT instruction. This bit indicates the start address of the table used by the CALLT instruction. Always set this bit to 0. | R | 0 |

### (k) ASID — Address Space ID Register

This register indicates the address space ID. This is used to identify the address space provided by the memory management function.

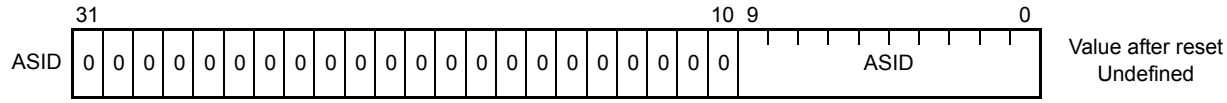

**Table 3.15 ASID Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 10 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 9 to 0 | ASID | These bits indicate the address space ID. | R/W | Undefined |

### (l) EIWR — EI Level Exception Working Register

The EIWR register is used as a working register when an EI level exception has occurred.

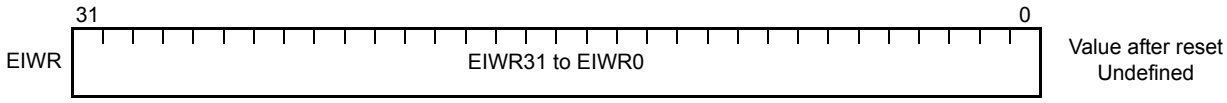

**Table 3.16 EIWR Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 0 | EIWR31 to EIWR0 | These bits constitute a working register that can be used for any purpose during the servicing of an EI level exception. This register can be used to temporarily save the values of general-purpose registers, etc. | R/W | Undefined |

(m) FEWR — FE Level Exception Working Register

The FEWR register is used as a working register when an FE level exception has occurred.

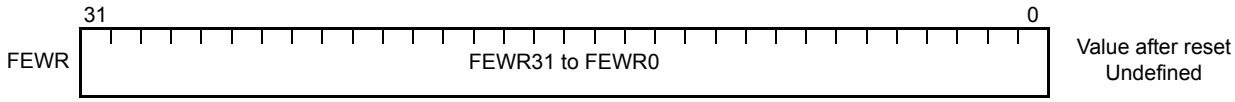

**Table 3.17 FEWR Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 0 | FEWR31 to FEWR0 | These bits constitute a working register that can be used for any purpose during the servicing of an FE level exception. This register can be used to temporarily save the values of general-purpose registers, etc. | R/W | Undefined |

(n) HTCFG0 — Thread Configuration Register

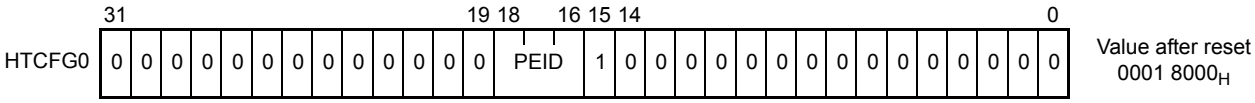

**Table 3.18 HTCFG0 Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 19 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 18 to 16 | PEID | These bits indicate the processor element number. | R | $001_B$ |
| 15 | — | (Reserved for future expansion. Be sure to set to 1.) | R | 1 |
| 14 to 0 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |

(o) MEA — Memory Error Address Register

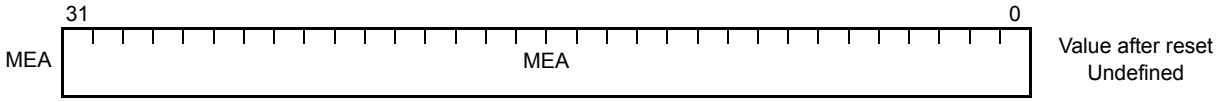

**Table 3.19 MEA Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 0 | MEA | These bits store the violation address when an MAE (misaligned) or MPU occurs. | R/W | Undefined |

(p) MEI — Memory Error Information Register

This register is used to store information about the instruction that caused a misaligned (MAE) or memory protection (MDP) exception when such an exception occurred. This information is used during emulation.

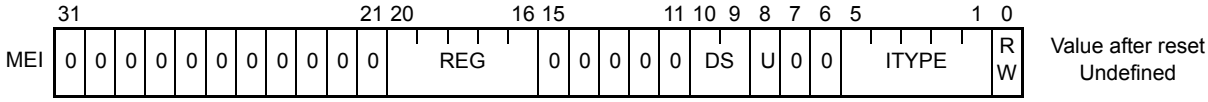

**Table 3.20 MEI Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 21 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 20 to 16 | REG | These bits indicate the number of the source or destination register accessed by the instruction that caused the exception. For details, see **Table 3.21**. | R/W | Undefined |
| 15 to 11 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 10, 9 | DS | These bits indicate the data type of the instruction that caused the exception.*1<br>0: Byte (8 bits)<br>1: Halfword (16 bits)<br>2: Word (32 bits)<br>3: Double-word (64 bits)<br>For details, see **Table 3.21**. | R/W | Undefined |
| 8 | U | This bit indicates the sign extension method of the instruction that caused the exception.<br>0: Signed<br>1: Unsigned<br>For details, see **Table 3.21**. | R/W | Undefined |
| 7, 6 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 to 1 | ITYPE | These bits indicate the instruction that caused the exception. For details, see **Table 3.21**. | R/W | Undefined |
| 0 | RW | This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory).<br>0: Read (Load-memory)<br>1: Write (Store-memory)<br>For details, see **Table 3.21**. | R/W | Undefined |

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

**Table 3.21 Instructions Causing Exceptions and Values of MEI Register (1/2)**

| Instruction | REG | DS | U | RW | ITYPE |
|---|---|---|---|---|---|
| SLD.B | dst | 0 (byte) | 0 (signed) | 0 (read) | $00000_B$ |
| SLD.BU | dst | 0 (byte) | 1 (unsigned) | 0 (read) | $00000_B$ |
| SLD.H | dst | 1 (halfword) | 0 (signed) | 0 (read) | $00000_B$ |
| SLD.HU | dst | 1 (halfword) | 1 (unsigned) | 0 (read) | $00000_B$ |
| SLD.W | dst | 2 (word) | 0 (signed) | 0 (read) | $00000_B$ |
| SST.B | src | 0 (byte) | 0 (signed) | 1 (write) | $00000_B$ |
| SST.H | src | 1 (halfword) | 0 (signed) | 1 (write) | $00000_B$ |
| SST.W | src | 2 (word) | 0 (signed) | 1 (write) | $00000_B$ |
| LD.B (disp16) | dst | 0 (byte) | 0 (signed) | 0 (read) | $00001_B$ |
| LD.BU (disp16) | dst | 0 (byte) | 1 (unsigned) | 0 (read) | $00001_B$ |
| LD.H (disp16) | dst | 1 (halfword) | 0 (signed) | 0 (read) | $00001_B$ |

Table 3.21 Instructions Causing Exceptions and Values of MEI Register (2/2)

| Instruction | REG | DS | U | RW | ITYPE |
|---|---|---|---|---|---|
| LD.HU (disp16) | dst | 1 (halfword) | 1 (unsigned) | 0 (read) | $00001_B$ |
| LD.W (disp16) | dst | 2 (word) | 0 (signed) | 0 (read) | $00001_B$ |
| ST.B (disp16) | src | 0 (byte) | 0 (signed) | 1 (write) | $00001_B$ |
| ST.H (disp16) | src | 1 (halfword) | 0 (signed) | 1 (write) | $00001_B$ |
| ST.W (disp16) | src | 2 (word) | 0 (signed) | 1 (write) | $00001_B$ |
| LD.B (disp23) | dst | 0 (byte) | 0 (signed) | 0 (read) | $00010_B$ |
| LD.BU (disp23) | dst | 0 (byte) | 1 (unsigned) | 0 (read) | $00010_B$ |
| LD.H (disp23) | dst | 1 (halfword) | 0 (signed) | 0 (read) | $00010_B$ |
| LD.HU (disp23) | dst | 1 (halfword) | 1 (unsigned) | 0 (read) | $00010_B$ |
| LD.W (disp23) | dst | 2 (word) | 0 (signed) | 0 (read) | $00010_B$ |
| ST.B (disp23) | src | 0 (byte) | 0 (signed) | 1 (write) | $00010_B$ |
| ST.H (disp23) | src | 1 (halfword) | 0 (signed) | 1 (write) | $00010_B$ |

| LD.DW (disp23) | dst | 3 (double-word) | 0 (signed) | 0 (read) | $00010_B$ |
| ST.DW (disp23) | src | 3 (double-word) | 0 (signed) | 1 (write) | $00010_B$ |
| LDL.W | dst | 2 (word) | 0 (signed) | 0 (read) | $00111_B$ |
| STC.W | src | 2 (word) | 0 (signed) | 1 (write) | $00111_B$ |
| CAXI | dst | 2 (word) | 0 (signed) | 0 (read)/1 (write) | $01000_B$ |
| SET1 | — | 0 (byte) | 0 (signed) | 0 (read)/1 (write) | $01001_B$ |
| CLR1 | — | 0 (byte) | 0 (signed) | 0 (read)/1 (write) | $01001_B$ |
| NOT1 | — | 0 (byte) | 0 (signed) | 0 (read)/1 (write) | $01001_B$ |
| TST1 | — | 0 (byte) | 0 (signed) | 0 (read) | $01001_B$ |
| PREPARE | — | 2 (word) | 0 (signed) | 1 (write) | $01100_B$ |
| DISPOSE | — | 2 (word) | 0 (signed) | 0 (read) | $01100_B$ |
| PUSHSP | — | 2 (word) | 0 (signed) | 1 (write) | $01101_B$ |
| POPSP | — | 2 (word) | 0 (signed) | 0 (read) | $01101_B$ |
| SWITCH | — | 1 (halfword) | 0 (signed) | 0 (read) | $10000_B$ |
| CALLT | — | 1 (halfword) | 1 (unsigned) | 0 (read) | $10001_B$ |
| SYSCALL | — | 2 (word) | 0 (signed) | 0 (read) | $10010_B$ |
| CACHE | — | — | — | — | — |
| Interrupt (table reference)*1 | — | 2 (word) | 0 (signed) | 0 (read) | $10101_B$ |

Note 1. When reading the interrupt vector by using the table reference method.

**NOTE**

dst: destination register number, src: source register number

### (q) RBASE — Reset Vector Base Address Register

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

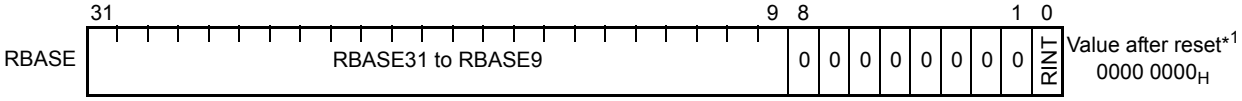

**Table 3.22 RBASE Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 9 | RBASE31 to RBASE9 | These bits indicate the reset vector when there is a reset. When PSW.EBV = 0, this address is also used as the exception vector.<br>For RBASE8 to RBASE0, 0 is used implicitly. | R | 0000 0000 0000 0000 0000 000B*1 |
| 8 to 1 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | RINT | When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See **Section 7.10.1, Direct Vector Method**. This bit is valid when PSW.EBV = 0. | R | 0 |

Note 1. The value depends on the reset vector. The values set at shipment are shown in the table. When the reset vector is modified, the address will be changed.

### (r) EBASE — Exception Handler Vector Address Register

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

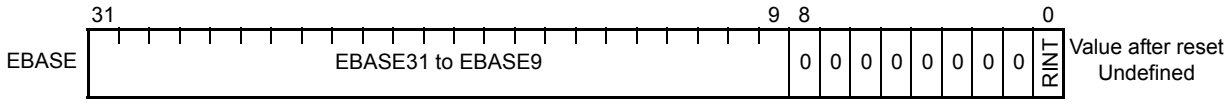

**Table 3.23 EBASE Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 9 | EBASE31 to EBASE9 | The exception handler routine address is changed to the address resulting from adding the offset address of each exception to the base address specified for this register.<br>For EBASE8 to EBASE0, 0 is used implicitly. | R/W | Undefined |
| 8 to 1 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | RINT | When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See **Section 7.10.1, Direct Vector Method**. | R/W | Undefined |

### (s) INTBP — Base Address Register of the Interrupt Handler Address Table

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

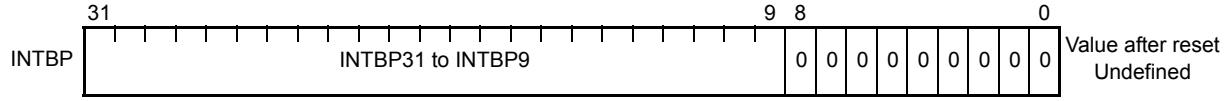

**Table 3.24 INTBP Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 9 | INTBP31 to INTBP9 | These bits indicate the base pointer address for an interrupt when the table reference method is used.<br>The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified by the table reference method (EIINT0 to EIINT511) is acknowledged.<br>For INTBP8 to INTBP0, 0 is used implicitly. | R/W | Undefined |
| 8 to 0 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |

### (t) PID — Processor ID Register

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

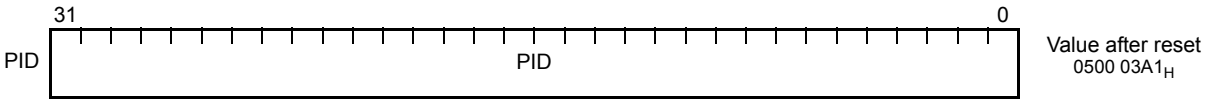

**Table 3.25 PID Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 24 | PID | Architecture Identifier<br>This identifier indicates the architecture of the processor. | R | $05_H$ |
| 23 to 8 | | Function Identifier<br>This identifier indicates the functions of the processor.<br>These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented).<br>Bits 23 to 11: Reserved<br>Bit 10: Double-precision floating-point operation function<br>Bit 9: Single-precision floating-point operation function<br>Bit 8: Memory protection function (MPU) | R | $0003_H$ |
| 7 to 0 | | Version Identifier<br>This identifier indicates the version of the processor. | R | $A1_H$ |

(u) SCCFG — SYSCALL Operation Setting Register

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

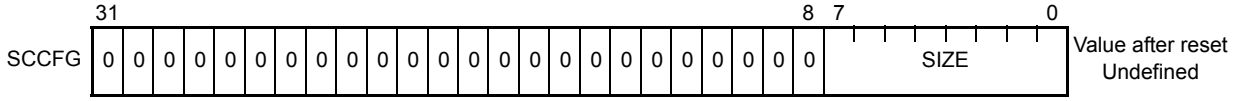

Table 3.26 SCCFG Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 8 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 to 0 | SIZE | These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255.<br>By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used.<br>If vectors exceeding the maximum number of entries are specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry. | R/W | Undefined |

(v) SCBP — SYSCALL Base Pointer Register

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

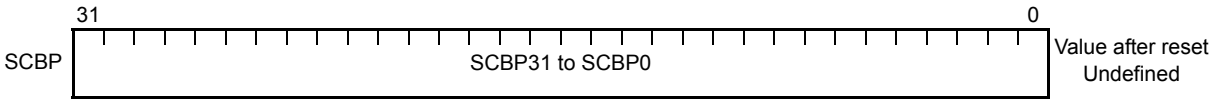

Table 3.27 SCBP Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 2 | SCBP31 to SCBP2 | These bits indicate the base pointer address of the SYSCALL instruction.<br>These bits indicate the start address of the table used by the SYSCALL instruction. | R/W | Undefined |
| 1, 0 | SCBP1, SCBP0 | These bits indicate the base pointer address of the SYSCALL instruction.<br>These bits indicate the start address of the table used by the SYSCALL instruction.<br>Always set these bits to 0. | R | 0 |

(w) MCFG0 — Machine Configuration Register

This register indicates the CPU configuration.

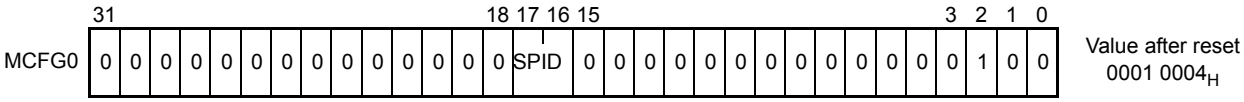

**Table 3.28 MCFG0 Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 18 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 17, 16 | SPID | These bits indicate the system protection number. | R/W | $01_B$ |
| 15 to 3 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 2 | — | (Reserved for future expansion. Be sure to set to 1.) | R | 1 |
| 1, 0 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |

(x) MCTL — Machine Control Register

This register is used to control the CPU.

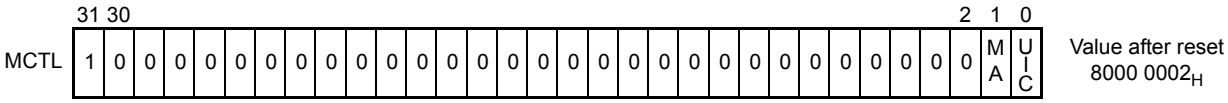

**Table 3.29 MCTL Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 | — | (Reserved for future expansion. Be sure to set to 1.) | R | 1 |
| 30 to 2 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | MA | This bit is used to control the misaligned access.<br>0: In the event of a misaligned access, an exception is always generated.*1<br>1: The correct operation is controlled by hardware.*2 | R/W | 1 |
| 0 | UIC | This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction in user mode becomes possible. | R/W | 0 |

Note 1. Excluding LD.DW, and ST.DW for word boundary allocation.

Note 2. Exception still occurs in case of LD.DW or ST.DW for misaligned access except word boundary allocation.

### (3) Interrupt Function Registers

Table 3.30 Interrupt Function System Registers

| Register No. (regID, selID) | Symbol | Function | Access Permission |
|---|---|---|---|
| SR7, 1 | FPIPR | FPI exception interrupt priority setting | SV |
| SR10, 2 | ISPR | Priority of interrupt being serviced | SV |
| SR11, 2 | PMR | Interrupt priority masking | SV |
| SR12, 2 | ICSR | Interrupt control status | SV |
| SR13, 2 | INTCFG | Interrupt function setting | SV |

#### (a) FPIPR — FPI Exception Interrupt Priority Setting Register

This register is used to set the interrupt priority of FPI exception.

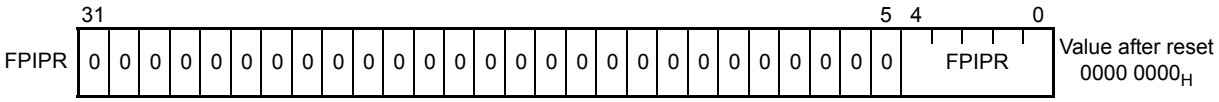

Table 3.31 FPIPR Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 5 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 to 0 | FPIPR | These bits are used to specify the interrupt priority of floating-point operation exceptions (imprecise) (FPI). Specify values from 0 to 16.<br>Specifying 17 or greater is prohibited.<br>FPI exceptions are handled using the specified interrupt priority. If an FPI exception occurs at the same time as an interrupt that has the same priority, the FPI exception is prioritized.<br>**NOTE**<br>A set value of more than 16 is treated as 16. | R/W | 0 |

(b) ISPR — Priority of Interrupt being Serviced Register

This register retains the priority of the EIINTn interrupt being serviced by the CPU. This priority value is then used to perform priority ceiling processing when multiple interrupts occur.

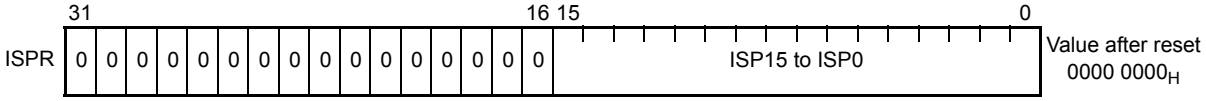

**Table 3.32 ISPR Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 16 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 15 to 0 | ISP15 to ISP0 | These bits indicate the acknowledgment status of an EIINTn interrupt with a priority that corresponds to the relevant bit position.<br>0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged.<br>1: An interrupt request for an interrupt whose priority corresponds to the relevant bit position is being serviced by the CPU core.<br><br>The bit positions correspond to the following priority levels.<br><br>**Bit / Priority**<br>0 — Priority 0 (highest)<br>1 — Priority 1<br>...<br>14 — Priority 14<br>15 — Priority 15 (lowest)<br><br>When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISP0 bits that are set to 1 (0 is the highest priority) is cleared to 0.*1<br>While a bit in this register is set to 1, same or lower priority interrupts (EIINTn) and FPI exceptions*2 are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged.<br>When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit. | R*3 | 0 |

Note 1. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) to the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.

Note 2. Since FPI exceptions have the same level of priority as EIINTn interrupts, they are affected by interrupts in the same way as the ISPR. The priority of FPI exceptions is set by the FPIPR register.

Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

### (c) PMR — Interrupt Priority Masking Register

This register is used to mask the specified interrupt priority.

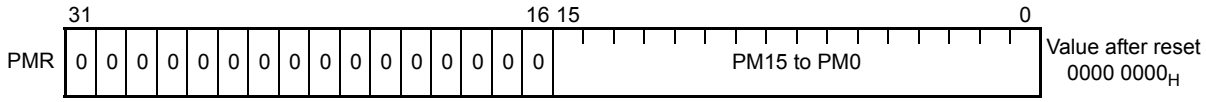

**Table 3.33 PMR Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 16 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 15 to 0 | PM15 to PM0 | These bits mask an interrupt request with a priority level that corresponds to the relevant bit position.<br>0: Servicing of an interrupt with a priority that corresponds to the relevant bit position is enabled.<br>1: Servicing of an interrupt with a priority that corresponds to the relevant bit position is disabled.<br><br>The bit positions correspond to the following priority levels:<br><br>**Bit** / **Priority**<br>0 / Priority 0 (highest)<br>1 / Priority 1<br>... <br>14 / Priority 14<br>15 / Priority 15 and priority 16 (lowest)<br><br>While a bit in this register is set to 1, interrupts (EIINTn) and FPI exceptions*1 with the priority corresponding to that bit are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*2. | R/W | 0 |

Note 1. Since FPI exceptions are specified as the same level of priority as that of interrupts (EIINTn), it is affected by the PMR like interrupts. The priority of FPI exceptions is set by the FPIPR register.

Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, $FF00_H$ can be set, but $F0F0_H$ or $00FF_H$ cannot.

### (d) ICSR — Interrupt Control Status Register

This register indicates the interrupt control status in the CPU.

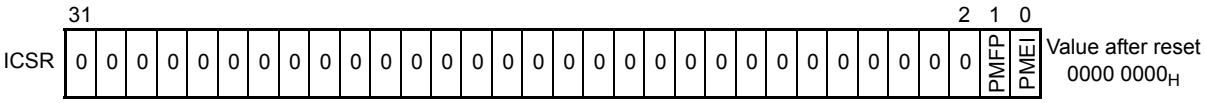

**Table 3.34 ICSR Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 2 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | PMFP | This bit indicates that an FPI exception with the priority level masked by the PMR register exists. | R | 0 |
| 0 | PMEI | This bit indicates that an interrupt (EIINTn) with the priority level masked by the PMR register exists. | R | 0 |

(e) INTCFG — Interrupt Function Setting Register

This register is used to specify settings related to the CPU's internal interrupt function.

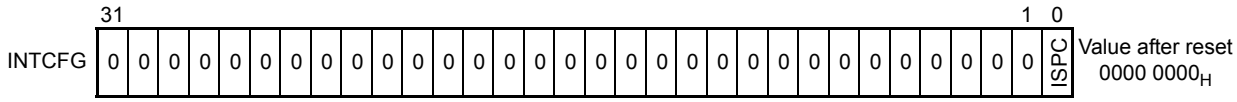

**Table 3.35 INTCFG Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 1 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | ISPC | This bit specifies how the ISPR register is updated.<br>0: The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored.<br>1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed.<br><br>If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (EIINTn) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, updating by the program (via execution of an LDSR instruction) is ignored.<br>If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (EIINTn) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program.<br>In normal cases, the ISPC bit should be cleared to 0. When performing software-based control of interrupt priorities, however, set this bit (1) and perform priority control by using the PMR register. | R/W | 0 |

### (4) FPU Function Registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations. The RH850/F1K supports single-precision floating-point instruction and thirty-two 32-bit registers can be specified.

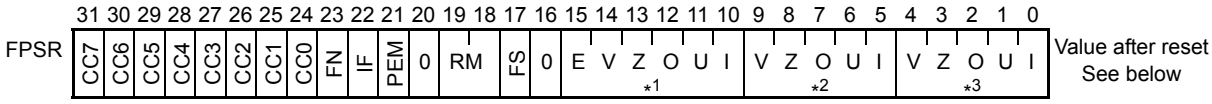
These registers correspond to general-purpose registers r0 to r31. The FPU can use the following system registers to control floating-point operation.

**Table 3.36 FPU System Registers**

| Register No. (regID, selID) | Symbol | Function | Access Permission |
|---|---|---|---|
| SR6, 0 | FPSR | Floating-point operation setting/status | CU and SV |
| SR7, 0 | FPEPC | Floating-point operation exception program counter | CU and SV |
| SR8, 0 | FPST | Floating-point status | CU |
| SR9, 0 | FPCC | Floating-point operation comparison result | CU |
| SR10, 0 | FPCFG | Floating-point function setting | CU |
| SR11, 0 | FPEC | Floating-point operation exception control | CU and SV |

#### (a) FPSR — Floating-point Operation Setting/Status Register

This register indicates the execution status of floating-point operations and any exceptions that occur.



Note 1. Cause bits (XC)
Note 2. Enable bits(XE)
Note 3. Preservation bits (XP)

**Table 3.37 FPSR Register Contents (1/2)**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 24 | CC[7:0] | These are the CC (condition) bits. They store the results of floating-point comparison instructions. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction.<br>0: Comparison result is false<br>1: Comparison result is true | R/W | Undefined |
| 23 | FN | This bit enables flush-to-nearest mode. When the FN bit is set to 1, if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number. | R/W | 0 |
| 22 | IF | This bit accumulates and indicates information about the flushing of input operands. | R/W | 0 |
| 21 | PEM | This bit specifies whether to handle an exception as a precise exception. If the PEM bit is 1, exceptions that are caused by the execution of a floating-point operation instruction are handled as precise exceptions. | R/W | 0 |
| 20 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |

Table 3.37 FPSR Register Contents (2/2)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th><th>R/W</th><th>Value after Reset</th></tr>
<tr><td>19, 18</td><td>RM</td><td>These are the rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions.
<table>
<tr><th colspan="2">RM bits</th><th rowspan="2">Mnemonic</th><th rowspan="2">Description</th></tr>
<tr><th>19</th><th>18</th></tr>
<tr><td>0</td><td>0</td><td>RN</td><td>Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.</td></tr>
<tr><td>0</td><td>1</td><td>RZ</td><td>Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.</td></tr>
<tr><td>1</td><td>0</td><td>RP</td><td>Rounds the result toward +∞. The result is nearest to a value greater than the accurate result with infinite accuracy.</td></tr>
<tr><td>1</td><td>1</td><td>RM</td><td>Rounds the result toward –∞. The result is nearest to a value less than the accurate result with infinite accuracy.</td></tr>
</table></td><td>R/W</td><td>00</td></tr>
<tr><td>17</td><td>FS</td><td>This bit enables values that cannot be normalized (subnormal numbers) to be flushed. If the FS bit is set, input operands and operation results that are subnormal numbers are flushed without causing an unimplemented operation exception (E). An input operand that is a subnormal number is flushed to 0 with the same sign.<br>Operation results that are subnormal numbers either become 0 or the minimum normalized number, depending on the rounding mode.
<table>
<tr><th rowspan="2">Operation Result that is a Subnormal Number</th><th colspan="4">Rounding Mode and Value after Flushing</th></tr>
<tr><th>RN*1</th><th>RZ</th><th>RP</th><th>RM</th></tr>
<tr><td>Positive</td><td>+0</td><td>+0</td><td>$+2^{Emin}$</td><td>+0</td></tr>
<tr><td>Negative</td><td>–0</td><td>–0</td><td>–0</td><td>$-2^{Emin}$</td></tr>
</table>
Note 1. If the rounding mode is RN and the FPSR.FN bit is set to 1, flushing will occur in the direction of higher accuracy.</td><td>R/W</td><td>1</td></tr>
<tr><td>16</td><td>—</td><td>(Reserved for future expansion. Be sure to set to 0.)</td><td>R</td><td>0</td></tr>
<tr><td>15 to 10</td><td>XC (E, V, Z, O, U, I)</td><td>These are the cause bits.</td><td>R/W</td><td>Undefined</td></tr>
<tr><td>9 to 5</td><td>XE (V, Z, O, U, I)</td><td>These are the enable bits.</td><td>R/W</td><td>0</td></tr>
<tr><td>4 to 0</td><td>XP (V, Z, O, U, I)</td><td>These are the preservation bits.</td><td>R/W</td><td>Undefined</td></tr>
</table>

(b) FPEPC — Floating-point Exception Program Counter Register

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.

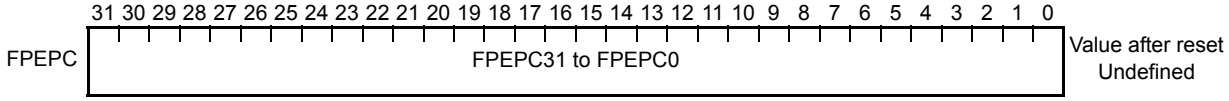


**Table 3.38 FPEPC Register Contents**

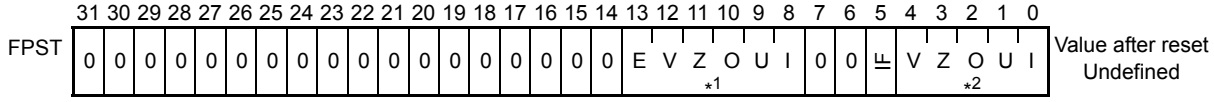
| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 1 | FPEPC31 to FPEPC1 | These bits store the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs. | R/W | Undefined |
| 0 | FPEPC0 | This bit stores the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs.<br>Always set this bit to 0. | R | 0 |

(c) FPST — Floating-point Operation Status Register

This register reflects the contents of the FPSR register bits related to the operation status.



Note 1. Cause bits (XC)

Note 2. Preservation bits (XP)

**Table 3.39 FPST Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 14 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 13 to 8 | XC (E, V, Z, O, U, I) | These are cause bits. Values written to these bits are reflected in FPSR.XC bits. | R/W | Undefined |
| 7, 6 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 | IF | This bit accumulates and indicates information about the flushing of input operands. | R/W | 0 |
| 4 to 0 | XP (V, Z, O, U, I) | These are preservation bits. Values written to these bits are reflected in FPSR.XP bits. | R/W | Undefined |

### (d) FPCC — Floating-point Operation Comparison Result Register

This register reflects the contents of the FPSR.CC[7:0] bits.

| | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FPCC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | CC7 | CC6 | CC5 | CC4 | CC3 | CC2 | CC1 | CC0 | Value after reset Undefined |

**Table 3.40 FPCC Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 8 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 to 0 | CC[7:0] | These are CC (condition) bits. They store the result of a floating-point comparison instruction. The CC[7:0] bits are not affected by any instructions except the comparison instruction and LDSR instruction. Values written to these bits are reflected in the CC[7:0] bits of FPSR.<br>0: Comparison result is false<br>1: Comparison result is true | R/W | Undefined |

### (e) FPCFG — Floating-point Operation Configuration Register

This register reflects the contents of the FPSR register bits related to the operation settings.

| | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FPCFG | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | RM | | 0 | 0 | 0 | V | Z | O *1 | U | I | Value after reset 0000 0000$_H$ |

Note 1. Enable bits (XE)

**Table 3.41 FPCFG Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 10 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 9, 8 | RM | These are rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions.<br>Values written to these bits are reflected in RM bits of FPSR. | R/W | 0 |

| RM bits | | | |
|---|---|---|---|
| 9 | 8 | Mnemonic | Description |
| 0 | 0 | RN | Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0. |
| 0 | 1 | RZ | Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy. |
| 1 | 0 | RP | Rounds the result toward + ∞. The result is nearest to a value greater than the accurate result with infinite accuracy. |
| 1 | 1 | RM | Rounds the result toward – ∞. The result is nearest to a value less than the accurate result with infinite accuracy. |

| | | | | |
|---|---|---|---|---|
| 7 to 5 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 to 0 | XE (V, Z, O, U, I) | These are the enable bits. | R/W | 0 |

(f) FPEC — Floating-point Exception Control Register

This register controls the floating-point operation exception.

| | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FPEC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | FPIVD | Value after reset 0000 0000$_H$ |

Table 3.42 FPEC Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 1 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | FPIVD*1 | This bit indicates the status of reporting the FPI exception.<br>If this bit is set to 1, the FPI exception is reported to the CPU but is not acknowledged. It is automatically cleared to 0 when the CPU acknowledges the FPI exception.<br>While this bit is set to 1, all the floating-point instructions are invalidated.<br>Report of the FPI exception can be canceled by clearing (0) this bit by the LDSR instruction while it is set to 1. When report of the FPI exception is canceled, the CPU does not acknowledge the FPI exception.<br>0: FPI exception is not reported.<br>1: FPI exception is reported. | R/W | 0 |

Note 1. The FPIVD bit can only be cleared to 0 by the write operation of the LDSR instruction. It cannot be set to 1.

### (5) MPU Function Registers

Table 3.43 MPU Function System Registers (1/2)

| Register No. (regID, selID) | Symbol | Function | Access Permission |
|---|---|---|---|
| SR0, 5 | MPM | Memory protection operation mode setting | SV |
| SR1, 5 | MPRC | MPU region control | SV |
| SR4, 5 | MPBRGN | MPU base region number | SV |
| SR5, 5 | MPTRGN | MPU end region number | SV |
| SR8, 5 | MCA | Memory protection setting check address | SV |
| SR9, 5 | MCS | Memory protection setting check size | SV |
| SR10, 5 | MCC | Memory protection setting check command | SV |
| SR11, 5 | MCR | Memory protection setting check result | SV |
| SR0, 6 | MPLA0 | Protection area lower limit address | SV |
| SR1, 6 | MPUA0 | Protection area upper limit address | SV |
| SR2, 6 | MPAT0 | Protection area attribute | SV |
| SR4, 6 | MPLA1 | Protection area lower limit address | SV |
| SR5, 6 | MPUA1 | Protection area upper limit address | SV |
| SR6, 6 | MPAT1 | Protection area attribute | SV |
| SR8, 6 | MPLA2 | Protection area lower limit address | SV |
| SR9, 6 | MPUA2 | Protection area upper limit address | SV |
| SR10, 6 | MPAT2 | Protection area attribute | SV |
| SR12, 6 | MPLA3 | Protection area lower limit address | SV |
| SR13, 6 | MPUA3 | Protection area upper limit address | SV |
| SR14, 6 | MPAT3 | Protection area attribute | SV |
| SR16, 6 | MPLA4 | Protection area lower limit address | SV |
| SR17, 6 | MPUA4 | Protection area upper limit address | SV |

Table 3.43 MPU Function System Registers (2/2)

| Register No. (regID, selID) | Symbol | Function | Access Permission |
|---|---|---|---|
| SR18, 6 | MPAT4 | Protection area attribute | SV |
| SR20, 6 | MPLA5 | Protection area lower limit address | SV |
| SR21, 6 | MPUA5 | Protection area upper limit address | SV |
| SR22, 6 | MPAT5 | Protection area attribute | SV |
| SR24, 6 | MPLA6 | Protection area lower limit address | SV |
| SR25, 6 | MPUA6 | Protection area upper limit address | SV |
| SR26, 6 | MPAT6 | Protection area attribute | SV |
| SR28, 6 | MPLA7 | Protection area lower limit address | SV |
| SR29, 6 | MPUA7 | Protection area upper limit address | SV |
| SR30, 6 | MPAT7 | Protection area attribute | SV |
| SR0, 7 | MPLA8 | Protection area lower limit address | SV |
| SR1, 7 | MPUA8 | Protection area upper limit address | SV |
| SR2, 7 | MPAT8 | Protection area attribute | SV |
| SR4, 7 | MPLA9 | Protection area lower limit address | SV |
| SR5, 7 | MPUA9 | Protection area upper limit address | SV |
| SR6, 7 | MPAT9 | Protection area attribute | SV |
| SR8, 7 | MPLA10 | Protection area lower limit address | SV |
| SR9, 7 | MPUA10 | Protection area upper limit address | SV |
| SR10, 7 | MPAT10 | Protection area attribute | SV |
| SR12, 7 | MPLA11 | Protection area lower limit address | SV |
| SR13, 7 | MPUA11 | Protection area upper limit address | SV |
| SR14, 7 | MPAT11 | Protection area attribute | SV |
| SR16, 7 | MPLA12 | Protection area lower limit address | SV |
| SR17, 7 | MPUA12 | Protection area upper limit address | SV |
| SR18, 7 | MPAT12 | Protection area attribute | SV |
| SR20, 7 | MPLA13 | Protection area lower limit address | SV |
| SR21, 7 | MPUA13 | Protection area upper limit address | SV |
| SR22, 7 | MPAT13 | Protection area attribute | SV |
| SR24, 7 | MPLA14 | Protection area lower limit address | SV |
| SR25, 7 | MPUA14 | Protection area upper limit address | SV |
| SR26, 7 | MPAT14 | Protection area attribute | SV |
| SR28, 7 | MPLA15 | Protection area lower limit address | SV |
| SR29, 7 | MPUA15 | Protection area upper limit address | SV |
| SR30, 7 | MPAT15 | Protection area attribute | SV |

### (a) MPM — Memory Protection Operation Mode Register

The memory protection mode register is used to define the basic operating state of the memory protection function. The settings for this register are normally specified once on startup and are not changed during program execution.

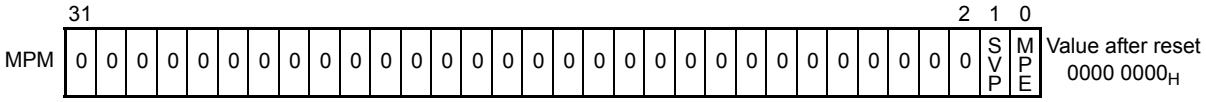


**Table 3.44 MPM Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 2 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | SVP | In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*1<br>0: As usual, implicitly enable all access in SV mode.<br>1: Restrict access according to the SX, SW, and SR bits even in SV mode.*2 | R/W | 0 |
| 0 | MPE | This bit is used to specify whether to enable or disable the MPU function.<br>0: Disable<br>1: Enable | R/W | 0 |

Note 1. If the SVP bit is set to 1, access will be restricted in accordance with the setting for each protection area, even in SV mode. Therefore, specify the protection area beforehand so that the access from the program which set the SVP bit is not restricted.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

### (b) MPRC — MPU Region Control Register

Bits used to perform special memory protection function operations are located in this register.

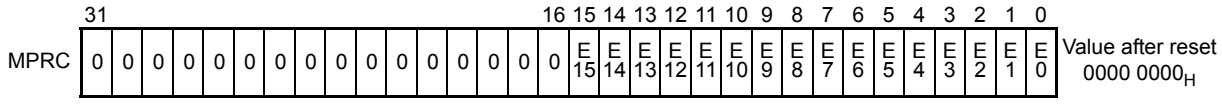

**Table 3.45 MPRC Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 16 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 15 to 0 | E15 to E0 | These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0). | R/W | 0 |

(c) MPBRGN — MPU Base Region Register

This register indicates the minimum usable MPU area number.

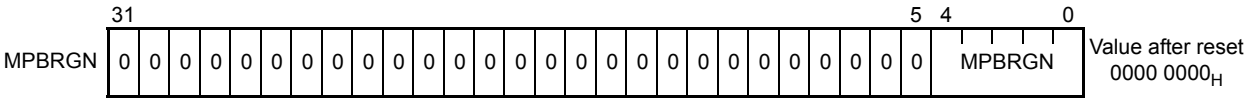

**Table 3.46 MPBRGN Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 5 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 to 0 | MPBRGN | These bits indicate the smallest number of an MPU area.<br>These bits always indicate 0. | R | 0 |

(d) MPTRGN — MPU End Region Register

This register indicates the maximum usable MPU area number + 1.

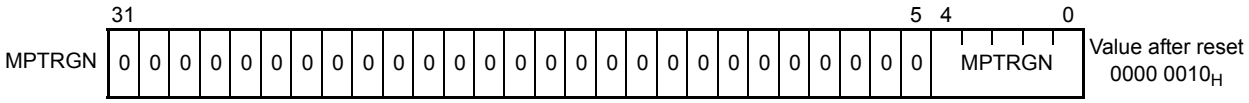

**Table 3.47 MPTRGN Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 5 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 to 0 | MPTRGN | These bits indicate the largest number of an MPU area + 1.<br>These bits indicate the maximum number of MPU areas incorporated into the hardware. | R | 10000B |

(e) MCA — Memory Protection Setting Check Address Register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

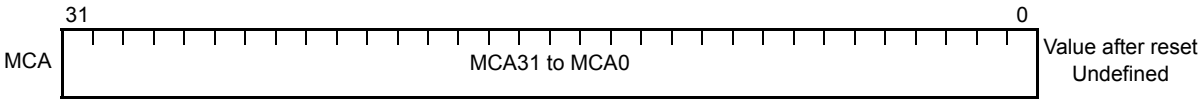

**Table 3.48 MCA Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 0 | MCA31 to MCA0 | These bits are used to specify the start address of the memory area that is subject to a memory protection setting check in bytes. | R/W | Undefined |

### (f) MCS — Memory Protection Setting Check Size Register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

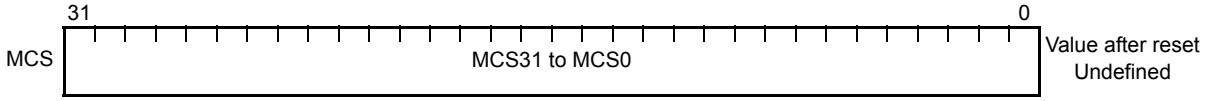

**Table 3.49 MCS Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 0 | MCS31 to MCS0 | These bits are used to specify the size of the memory area that is subject to a memory protection setting check and the size of the target area in bytes.<br>Because the specified size is assumed to represent an unsigned integer, it is not possible to check an area in the direction in which the address value decreases relative to the MCA register value.<br>Do not specify 0000 $0000_H$ for the MCS register. | R/W | Undefined |

### (g) MCC — Memory Protection Setting Check Command Register

This register is used to specify the base address of the area where memory protection settings are checked.

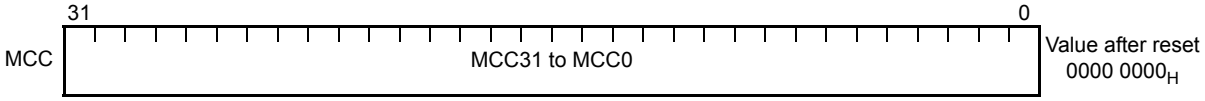

**Table 3.50 MCC Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 0 | MCC31 to MCC0 | When any value is written to the MCC register, a memory protection setting check starts. By setting up the MCA/MCS register and then writing to the MCC register, results are stored in MCR.<br>Because the check is started by any written value, a check can be started by using r0 as the source register without using any unnecessary registers.<br>Note that, for the check, the results are applied according to each area setting regardless of the state of the PSW.UM bit.<br>When the MCC register is read, value 0000 $0000_H$ is always returned. | R/W | 0 |

(h) MCR — Memory Protection Setting Check Result Register

This register is used to store the results of a memory protection setting check.

Be sure to clear bits 31 to 9, 7 and 6.

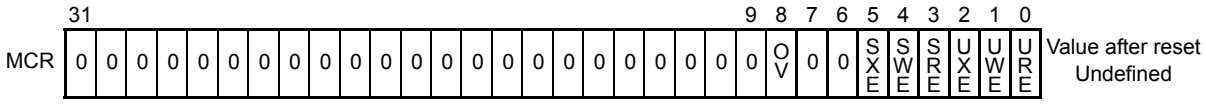

**Table 3.51 MCR Register Contents**

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 9 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 8 | OV | If the specified area includes 0000 0000$_H$ or 7FFF FFFF$_H$, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 7, 6 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 | SXE | If the specified area is contained within one of the protection areas and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 4 | SWE | If the specified area is contained within one of the protection areas and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 3 | SRE | If the specified area is contained within one of the protection areas and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 2 | UXE | If the specified area is contained within one of the protection areas and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 1 | UWE | If the specified area is contained within one of the protection areas and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 0 | URE | If the specified area is contained within one of the protection areas and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |

(i) MPLAn — Protection Area Lower Limit Address Register

These registers indicate the lower limit address of area n (where n = 0 to 15).

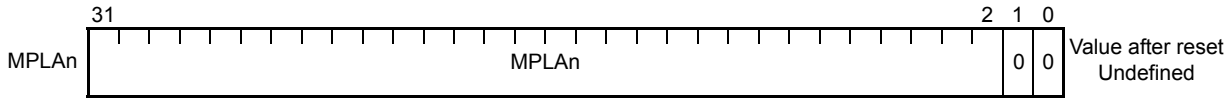

Table 3.52 MPLAn Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 2 | MPLA31 to MPLA2 | These bits indicate the lower limit address of area n.<br>For MPLA1 and MPLA0, 0 is used implicitly. | R/W | Undefined |
| 1, 0 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |

(j) MPUAn — Protection Area Upper Limit Address Register

These registers indicate the upper limit address of area n (where n = 0 to 15).

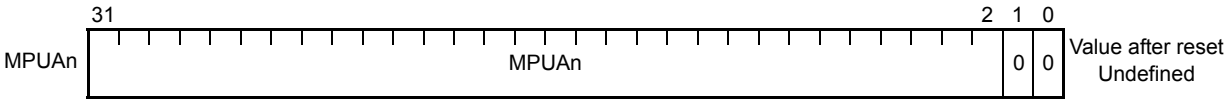

Table 3.53 MPUAn Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 2 | MPUA31 to MPUA2 | These bits indicate the upper limit address of area n.<br>For MPUAn.MPUA1 and MPUA0, 1 is used implicitly. | R/W | Undefined |
| 1, 0 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |

(k) MPATn — Protection Area Attribute Register

These registers indicate the attributes of area n (where n = 0 to 15).

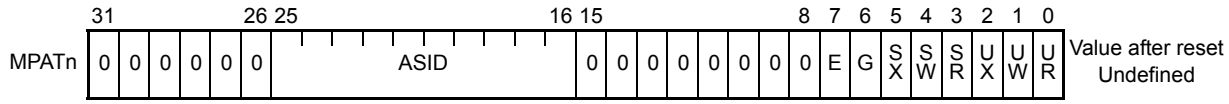

Table 3.54 MPATn Register Contents (1/2)

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 26 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 25 to 16 | ASID | These bits indicate the ASID value to be used as the area match condition. | R/W | Undefined |
| 15 to 8 | — | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | E | This bit indicates whether area n is enabled or disabled.<br>0: Area n is disabled.<br>1: Area n is enabled. | R/W | 0 |
| 6 | G | 0: Areas match only if ASIDs are equal.<br>1: Areas match even if ASIDs are not equal.<br>If this bit is 0, MPATn.ASID = ASID.ASID is used as the area match condition.<br>If this bit is 1, areas may match even if the values of MPATn.ASID and ASID.ASID are not equal. | R/W | Undefined |

Table 3.54 MPATn Register Contents (2/2)

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 5 | SX | This bit indicates the execution privilege for the supervisor mode.*1<br>0: Execution is disabled.<br>1: Execution is enabled. | R/W | Undefined |
| 4 | SW | This bit indicates whether writing is enabled in the supervisor mode.*1<br>0: Writing is disabled.<br>1: Writing is enabled. | R/W | Undefined |
| 3 | SR | This bit indicates whether writing is enabled in the supervisor mode.*1<br>0: Reading is disabled.<br>1: Reading is enabled. | R/W | Undefined |
| 2 | UX | This bit indicates the execution privilege for the user mode.<br>0: Execution is disabled.<br>1: Execution is enabled. | R/W | Undefined |
| 1 | UW | This bit indicates whether writing is enabled in the user mode.<br>0: Writing is disabled.<br>1: Writing is enabled. | R/W | Undefined |
| 0 | UR | This bit indicates whether writing is enabled in the user mode.<br>0: Reading is disabled.<br>1: Reading is enabled. | R/W | Undefined |

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

### (6) Cache Operation Function Registers

The RH850/F1K does not include a cache operation function, so all the following registers return a value of 0 when read, and writing to these registers is ignored.

**Table 3.55 Cache Operation Function Registers**

| Register No. (regID, selID) | Symbol | Function | Access Permission |
|---|---|---|---|
| SR12, 4 | BWERRL | Not implemented. A value of 0 is returned when read and writing is ignored. | SV |
| SR13, 4 | BWERRH | | SV |
| SR14, 4 | BRERRL | | SV |
| SR15, 4 | BRERRH | | SV |
| SR16, 4 | ICTAGL | | SV |
| SR17, 4 | ICTAGH | | SV |
| SR18, 4 | ICDATL | | SV |
| SR19, 4 | ICDATH | | SV |
| SR20, 4 | DCTAGL | | SV |
| SR21, 4 | DCTAGH | | SV |
| SR22, 4 | DCDATL | | SV |
| SR23, 4 | DCDATH | | SV |
| SR24, 4 | ICCTRL | | SV |
| SR25, 4 | DCCTRL | | SV |

## 3.2.1.3 Instruction

See *"Instruction" in Software Manual*.

A snooze instruction halts operation of the CPU core for 32 clocks.

## 3.2.2 Buffers for Code Flash

### 3.2.2.1 Features

CPU accesses Code flash by two paths; instruction fetch access is direct to Flash interface, and data access is via System interconnect to Code Flash. Both paths equip buffers, which can be cleared by software. See also **Figure 33.1 "Block Diagram of Code Flash ECC"** for ECC decoders in these paths.

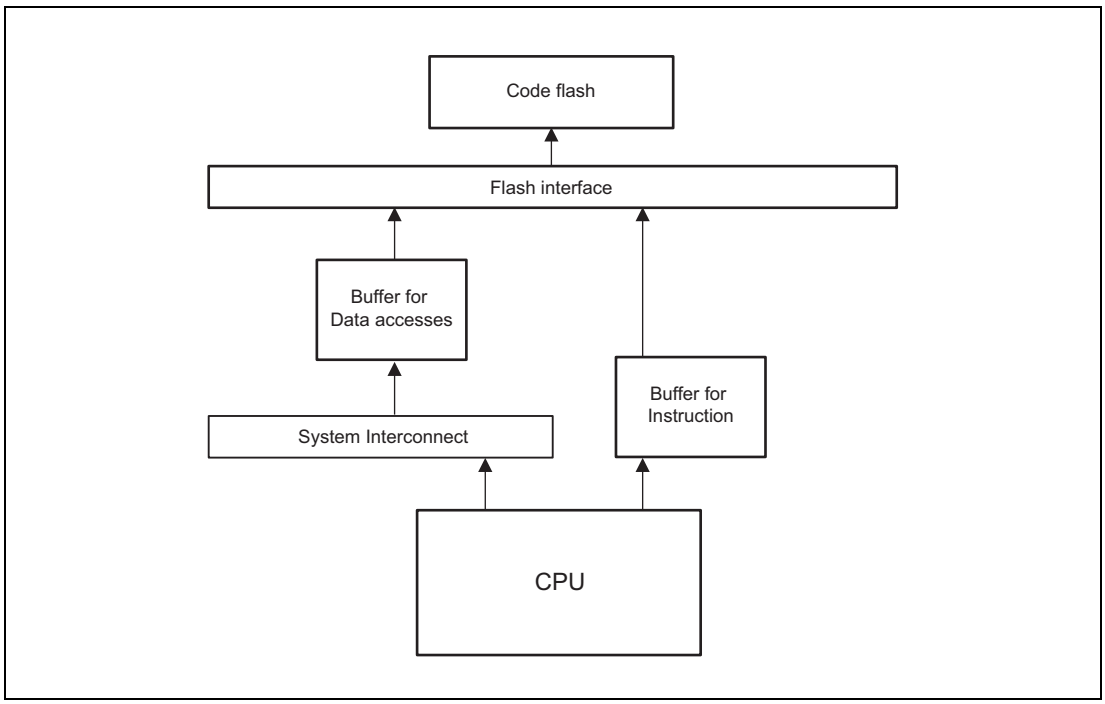

**Figure 3.2 Buffers for Code Flash**

### 3.2.2.2 Function of Buffers

One-line buffer with 128 bits is mounted for instruction fetches to code flash. The data is read out from the buffer after the next access to the same address, so the code flash is not accessed again within 128 bits location.

One-line buffer with 128 bits is mounted as a data buffer. This buffer is not only used by the CPU but also used by DMA via system interconnect. The data is read out from the buffer if the next access is within the same 128 bits boundary.

One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these two buffers.

### 3.2.2.3 Registers for Buffer Control

#### (1) List of Buffer Control Registers

Table 3.56 Buffer Control Register (Base Address: FFC5 $B000_H$)

| Module Name | Address Offset | Size (Byte) | Register Name | Abbreviation | Right | R/W | Operable Bit | | | | Value after Reset |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | 1 | 8 | 16 | 32 | |
| FBUF_CTRL | $+000_H$ | 4 | Flash Buffer Clear Control Register | FBUFCCTL | — | R/W | — | √ | √ | √ | 0000 $0000_H$ |

#### (2) Register Sets

| | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FBUFCCTL | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | FBUFCLR |

Value after reset
0000 $0000_H$

Table 3.57 FBUFCCTL Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
|---|---|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. | R | 0 |
| 0 | FBUFCLR | Buffer clear bits. To clear buffers, write 1 to this bit and then write 0.<br>0: Buffers are valid<br>1: Buffers are invalid (cleared) | R/W | 0 |

Please do following procedures when you want to clear the buffers.

Step 1: Write 0 to FBUFCCTL.FBUFCLR

Step 2: Write 1 to FBUFCCTL.FBUFCLR

Step 3: Write 0 to FBUFCCTL.FBUFCLR

Step 4: Read the FBUFCCTL register (dummy read)

Step 5: Execute the SYNCP instruction

Step 6: Execute the SYNCI instruction

If you do not do Step 3 after Step 2, the buffers are kept invalid during FBUFCCTL.FBUFCLR = 1.

## 3.2.3 Reliability Functions

### 3.2.3.1 PE Guard Function (PEG)

#### (1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the CPU (PE) from an external master. This function protects access to the local RAM and the retention RAM in the PE. In the initial state after a reset, access by masters other than own PE is disabled. Setting the registers listed in **(3) List of PEG Protection Setting Registers** enables access by masters other than own PE.

(1) Detecting PE guard violation
If an external master makes an unauthorized access to the resource area in a PE for which PE guard is set, the access is detected as a PE guard violation.

(2) Blocking unauthorized access
When a PE guard violation is detected, unauthorized access to the internal resources of the PE are blocked to prevent unauthorized modification of the contents of PE resources.

(3) Notifying occurrence of violation
An error response to an unauthorized access is sent to the request source of external master. When DMA Controller makes an unauthorized access, meanwhile, a DMA transfer error is detected. A PE guard violation is notified as INTGUARD interrupt request which is a source of FEINT.

#### (2) Protection Made by SPID

- Setting PEG Protection
  - Up to four areas can be set depending on the Local RAM address and the retention RAM address of the own PE.
  - The area range is specified by the base address and the mask bit (4 kbytes to 4 Gbytes).
  - “Read enable” and “write enable” can be set for each area.
  - “Enable” or “disable” can be selected based on the system protection identifier (SPID) for each area.
- Procedure for permitting access by using the system protection identifier (SPID)

1. Is the area subject to access is the local RAM area or the retention RAM area? If so, go to step 2.
2. Is the area subject to access is within the range of valid areas 0, 1, 2, or 3? If so, go to step 3. Otherwise, return an error response.
3. Are all the conditions below for the relevant area satisfied? If so, permit access.
   - The system protection identifier (SPID) is enabled.
   - Required operations (read/write) are enabled.

   Otherwise, return an error response.

### (3) List of PEG Protection Setting Registers

Specify the necessary settings in the registers below to protect PE resources from unauthorized access by an external master.

- Whether to permit access to the local RAM and the retention RAM in the PE can be specified.

**Table 3.58 PEG registers (Base Address : FFFE E600$_H$)**

| Module Name | Address Offset | Size (Byte) | Register Name | Abbreviation | Right | R/W | Operable Bit | | | | Value after Reset |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | 1 | 8 | 16 | 32 | |
| PEG | +00C$_H$ | 4 | PEG SPID control register | PEGSP | — | R/W | — | √ | √ | √ | 0000 0000$_H$ |
| | +080$_H$ | 4 | PEG area 0 mask setting register | PEGG0MK | — | R/W | — | √ | √ | √ | 0000 0000$_H$ |
| | +084$_H$ | 4 | PEG area 0 base setting register | PEGG0BA | — | R/W | — | √ | √ | √ | 0000 0000$_H$ |
| | +090$_H$ | 4 | PEG area 1 mask setting register | PEGG1MK | — | R/W | — | √ | √ | √ | 0000 0000$_H$ |
| | +094$_H$ | 4 | PEG area 1 base setting register | PEGG1BA | — | R/W | — | √ | √ | √ | 0000 0000$_H$ |

| | +0B0$_H$ | 4 | PEG area 3 mask setting register | PEGG3MK | — | R/W | — | √ | √ | √ | 0000 0000$_H$ |
| | +0B4$_H$ | 4 | PEG area 3 base setting register | PEGG3BA | — | R/W | — | √ | √ | √ | 0000 0000$_H$ |

### (4) Register Set

#### (a) PEGSP — PEG SPID Control Register

**Access:** PEGSP register can be read or written in 32-bit units.
PEGSPL register can be read or written in 16-bit units.
PEGSPLL register can be read or written in 8-bit units.

**Address:** PEGSP: FFFE E60C$_H$
PEGSPL: FFFE E60C$_H$
PEGSPLL: FFFE E60C$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SPEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 3.59 PEGSP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SPEN | Access permission to external master with specified SPID.<br>0: Not permit.<br>1: Permit. |

### (b) PEGGnMK — PEG Area n Mask Setting Register (n = 0 to 3)

The PEGGnMK register defines which bits of PEGGnBA.GnBASE are compared with the access address. If bit PEGGnMK.GnMASK[m] is cleared, bit PEGGnBA.GnBASE[m] is compared with bit m of the access address.

**Access:** PEGGnMK register can be read or written in 32-bit units.
PEGGnMKL, PEGGnMKH registers can be read or written in 16-bit units.
PEGGnMKLH, PEGGnMKHL, PEGGnMKHH registers can be read or written in 8-bit units.

**Address:** PEGGnMK: FFFE $E680_H$ + ($10_H$ × n)
PEGGnMKL: FFFE $E680_H$ + ($10_H$ × n),
PEGGnMKH: FFFE $E682_H$ + ($10_H$ × n)
PEGGnMKLH: FFFE $E681_H$ + ($10_H$ × n),
PEGGnMKHL: FFFE $E682_H$ + ($10_H$ × n),
PEGGnMKHH: FFFE $E683_H$ + ($10_H$ × n)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GnMASK | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GnMASK | | | | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 3.60 PEGGnMK Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 12 | GnMASK | 0: Target bits are compared when determining the PE guard area.<br>1: Target bits are not compared when determining the PE guard area. |
| 11 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**NOTE**

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

### (c) PEGGnBA — PEG Area n Base Setting Register (n = 0 to 3)

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n. Setting the GnEN bit to 1 validates the access enable conditions specified by this register and the PEGGnMK register.

**Access:** PEGGnBA register can be read or written in 32-bit units.
PEGGnBAL, PEGGnBAH registers can be read or written in 16-bit units.
PEGGnBALL, PEGGnBALH, PEGGnBAHL, PEGGnBAHH registers can be read or written in 8-bit units.

**Address:** PEGGnBA: FFFE E684$_H$ + (10$_H$ × n)
PEGGnBAL: FFFE E684$_H$ + (10$_H$ × n),
PEGGnBAH: FFFE E686$_H$ + (10$_H$ × n)
PEGGnBALL: FFFE E684$_H$ + (10$_H$ × n),
PEGGnBALH: FFFE E685$_H$ + (10$_H$ × n),
PEGGnBAHL: FFFE E686$_H$ + (10$_H$ × n),
PEGGnBAHH: FFFE E687$_H$ + (10$_H$ × n)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GnBASE | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GnBASE | | | | — | — | — | — | GnSP3 | GnSP2 | GnSP1 | GnSP0 | — | GnWR | GnRD | GnEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W |

**Table 3.61 PEGGnBA Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 12 | GnBASE | Base address that specifies the range of PE guard protection area n. |
| 11 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | GnSP3 | Access permission setting from SPID = 3 external master to PE guard protection area n.<br>0: Not permit.<br>1: Permit. |
| 6 | GnSP2 | Access permission setting from SPID = 2 external master to PE guard protection area n.<br>0: Not permit.<br>1: Permit. |
| 5 | GnSP1 | Access permission setting from SPID = 1 external master to PE guard protection area n.<br>0: Not permit.<br>1: Permit. |
| 4 | GnSP0 | Access permission setting from SPID = 0 external master to PE guard protection area n.<br>0: Not permit.<br>1: Permit. |
| 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | GnWR | Write access permission to PE guard protection area n.<br>0: Write access is disabled.<br>1: Write access is enabled. |
| 1 | GnRD | Read access permission to PE guard protection area n.<br>0: Read access is disabled.<br>1: Read access is enabled. |

Table 3.61 PEGGnBA Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | GnEN | Enables or Disables the setting for the access enable conditions to PE guard protection area n.<br>0: Settings for access enable conditions are disabled.<br>1: Settings for access enable conditions are enabled. |

**NOTE**

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

### 3.2.3.2 System Error Generator Function (SEG)

SEG (SysErrGen) controls interrupt notification and recording after a system error occurred by a data access.

Multiple error occurrence inputs are categorized according to error factor, and are processed sequentially from the highest-priority error factor, generating an FE-level asynchronous exception (SYSERR).

The bit position of the SEGFLAG register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits.

Error address information is recorded only once regardless of error frequency.

The error with the highest priority among the error factors is valid when errors occur simultaneously. Recorded error address information is not overwritten by subsequent errors.

#### (1) List of SEG Function Control Registers

Table 3.62 SEG Registers (Base Address: FFFE E980$_H$)

| Module Name | Address Offset | Size (Byte) | Register Name | Abbreviation | Right *1 | R/W | Operable Bit | | | | Value after Reset |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | 1 | 8 | 16 | 32 | |
| SEG | +00$_H$ | 2 | SEG Error control register | SEGCONT | SV | R/W | — | — | √ | — | 0000$_H$ |
| | +02$_H$ | 2 | SEG Error flag register | SEGFLAG | SV | R/W | — | — | √ | — | 0000$_H$ |
| | +08$_H$ | 4 | SEG Error address information register | SEGADDR | SV | R/W | — | — | — | √ | Undefined (retained) |

Note 1. Registers for which “SV” is described are writable with the SV right (UM = 0). Attempting to write, if these conditions do not hold, leads to a SYSERR exception with setting VCIF flag. No restriction is provided for read accesses.

### (2) Register Set

#### (a) SEGCONT — SEG Error Control Register

This register is used to enable (= 1) or disable (= 0) notification of SysErr request in response to error flags that store the error occurrence status for each factor.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | VCSE | APIE | — | — | TCME | — | VCIE | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R | R | R/W | R | R/W | R | R | R | R |

**Table 3.63 SEGCONT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | VCSE | This bit enables notification of an error response detected inside system interconnect. |
| 9 | APIE | This bit enables notification of an error response from peripherals. The error notification includes the following cases:<br>• Error response from peripherals in write access<br>• PBG error in write access |
| 8 to 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | TCME | This bit enables notification of an error during data access to its own local RAM and retention RAM.<br>The error notification includes the following cases:<br>• ECC uncorrectable error<br>• Detection of an access to RAM unimplemented area |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | VCIE | • This bit enables notification of an error response during access to P-Bus. The error notification includes the following cases:<br>– Error response from peripherals (excluding errors in write access)<br>– PBG error (excluding errors in write access)<br>• This bit enables notification of an error response during access to code flash. The error notification includes the following cases:<br>– ECC uncorrectable error<br>• This bit enables notification of an error response when accessing to a part of access prohibited areas in address map. |
| 3 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

(b) SEGFLAG — SEG Error Flag Register

This register indicates error flags that store error occurrence status of each factors. The flags are set to 1 by an error occurrence input. The flags are not automatically cleared to 0. Both setting and clearing of each flag are supported in writing to the register.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | VCSF | APIF | — | — | TCMF | — | VCIF | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R | R | R/W | R | R/W | R | R | R | R |

**Table 3.64 SEGFLAG Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | VCSF | Flag corresponding to bit 10 of the SEGCONT register |
| 9 | APIF | Flag corresponding to bit 9 of the SEGCONT register |
| 8 to 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | TCMF | Flag corresponding to bit 6 of the SEGCONT register |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | VCIF | Flag corresponding to bit 4 of the SEGCONT register |
| 3 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**NOTE**

An error may lead to setting of multiple error flags in SEG.

### (c) SEGADDR — Error Address Information Register

Address information (one record) which is notified with error occurence is stored in the register. The register is not updated while one or more bits in SEGFLAG register are set.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Address[31:16] | | | | | | | | | | | | | | | |
| Value after reset | × | × | × | × | × | × | × | × | × | × | × | × | × | × | × | × |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Address[15:0] | | | | | | | | | | | | | | | |
| Value after reset | × | × | × | × | × | × | × | × | × | × | × | × | × | × | × | × |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

×: Undefined (retained)

**Table 3.65 SEGADDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | Address | These bits store the error address information. |

Note 1. SEGADDR stores error address information in case of an error occurrence related to VCIF bit or TCMF bit in SEGFLAG register. SEGADDR register stores all 0 data in case of an error occurrence related to VCSF bit and APIF bit in SEGFLAG register.

Note 2. In case of an error occurrence related to TCMF bit in SEGFLAG register, bit[18:0] of the error address are stored in SEGADDR[18:0] and SEGADDR[31:19] are filled with 0.

### (3) SEG Function

#### (a) SEG Function: SYSERR request notification by error Flag

- Setting an error flag takes precedence over clearing the same flag.
  - A simultaneous clearing operation is ignored.
- Priority of error factors
  - The bit position of each flags in SEGFLAG register which error notification is enabled by SEGCONT register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
  - The bit position of error factors is reported as a “SysErr factor code.”
- Conditions for starting SysErr request notification
  - Even if a flag which error notification is disabled by SEGCONT register is set to 1, notification is not made.
  - Notification is made immediately after a flag which error notification is enabled by SEGCONT register is set to 1.
  - After clearing of a flag, notification is made if an other flag which error notification is enabled by SEGCONT register remains set.
- Finishing notification at a SysErr acknowledgement
  - Even after notification is finished, the flag is not cleared automatically.
  - Notification is not made until setting or clearing the flag again.
  - If an error flag that is prioritized higher than the error factor is set prior to an acknowledgement, the notification information may be replaced with a higher prioritized SysErr factor code.

#### (b) SEG Function: Recording Error Address Information

- When an error which error notification is enabled by SEGCONT register occurs, the error address is retained in the SEGADDR register.
  - No information is retained by setting or clearing an error flag in SEGFLAG register.
  - When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While a flag which error notification is enabled by SEGCONT register is set to 1, overwrite to the SEGADDR register is inhibited.
  - If error occurrence input continues, information of subsequent error factors is not retained.
  - To reset the inhibition of overwrite to the register, clear either SEGCONT or SEGFLAG register (or both of them).

#### (c) Supplementary Notes on SYSERR Exception

- Even when a SYSERR exception occurs, the value of the PSW.EBV bit is held, and the base address of the exception handler does not switch.

## 3.3 Notes

### 3.3.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see *APPENDIX A. Hazard Resolution Procedure for System Registers* in the *RH850G3KH User's Manual: Software.*

**When the updated results in the control registers are to be used by the subsequent instruction:**

Example 1: An interrupt is enabled by execution of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits. Proceed as follows in this case.

(1) Execute the store instruction to update a control register (ST.W, etc).

(2) Perform a dummy read of the above control register (LD.W, etc).

(3) Execute SYNCP.

(4) Execute the subsequent instruction (EI).

In case of RH850/F1K, SYNCM instruction has the same effects as above-mentioned (2) and (3).

Example 2: When you must wait until a control register (control register A) has been completely updated before accessing another control register (control register B), execute similar processing. For example, different peripheral functions are linked, or the interrupt mask for INTC is cleared after the peripheral function is set. Note that this processing is not required if the control registers A and B belong to the same peripheral group.

(1) Execute the store instruction to update the control register A (ST.W, etc).

(2) Perform a dummy read of the above control register (LD.W, etc).

(3) Execute SYNCP.

(4) Execute the store instruction to access the control register B (ST.W, LD.W, etc).

In case of RH850/F1K, SYNCM instruction has the same effects as above-mentioned (2) and (3).

The similar processing is also required when starting to access a memory or control register to be protected is started after a safety function (such as some kind of memory protection and ECC) has been completely set up.

**When the updated results of the control register or memory to be used in the instruction fetch of the subsequent instruction:**

(a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.

(1) Execute the store instruction to update a memory (ST.W, etc).

(2) Perform a dummy read of the above memory (LD.W, etc).

(3) Execute SYNCP.

(4) Execute SYNCI.

(5) Execute the subsequent instruction (branch instruction, etc).

(b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.

(1) Execute the store instruction to update a control register (ST.W, etc).

(2) Perform a dummy read of the control register (LD.W, etc).

(3) Execute SYNCP.

(4) Execute SYNCI.

(5) Execute the subsequent instruction (branch instruction, etc).

**When switching the code flash memory area:**

In this case, see *Section 10, Usage Notes, (7) Updating the BFASELR register* in the *RH850/F1K Flash Memory User's Manual: Hardware Interface*.

### 3.3.2 Ensure Coherency after Rewriting the Code Flash

The CPU1 is equipped with the buffer for the code flash area as described in **Section 3.2.2, Buffers for Code Flash**.

Therefore, clear the buffer to ensure coherency after rewriting the code flash by self-programming.

### 3.3.3 Access to Registers by Using Bit-Manipulation Instructions

Writing bit-manipulation instructions consists of read-modify-write processing in 8-bit units. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

### 3.3.4 Caution of Prefetching

There is a possibility that the reading of the memory occurs by pre-fetch from the area where instruction codes do not exist. Secure more than 40-byte initialized area after the area where instruction codes are stored.

# Section 4 Address Space

## 4.1 Address Space

**Table 4.1**, **Table 4.2**, **Table 4.3** and **Table 4.4** show the address space of the RH850/F1K.

**CAUTION**

**Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in Table 4.1, Table 4.2, Table 4.3 and Table 4.4. If such an address is accessed, operation is not guaranteed.**

**NOTE**

CPU1 area: Address area accessible from CPU and DMA

Self area: Address area accessible only from CPU to refer the CPU's self resource

**Table 4.1 Address Space (2-MB 100, 144, 176 Pin Product)**

| Address | Address Space Type | Size |
|---|---|---|
| 0000 $0000_H$ to 001F $FFFF_H$ | Code flash | 2 MB |
| 0020 $0000_H$ to 00FF $FFFF_H$ | Access prohibited area | |
| 0100 $0000_H$ to 0100 $7FFF_H$ | Code flash (extended user area) | 32 KB |
| 0100 $8000_H$ to FEBC $FFFF_H$ | Access prohibited area | |
| FEBD $0000_H$ to FEBE $FFFF_H$ | Local RAM (CPU1 area) | 128 KB |
| FEBF $0000_H$ to FEBF $FFFF_H$ | Retention RAM (CPU1 area) | 64 KB |
| FEC0 $0000_H$ to FEDC $FFFF_H$ | Access prohibited area | |
| FEDD $0000_H$ to FEDE $FFFF_H$ | Local RAM (self area) | 128 KB |
| FEDF $0000_H$ to FEDF $FFFF_H$ | Retention RAM (self area) | 64 KB |
| FEE0 $0000_H$ to FF1F $FFFF_H$ | Access prohibited area | |
| FF20 $0000_H$ to FF20 $FFFF_H$ | Data flash | 64 KB |
| FF21 $0000_H$ to FF9F $FFFF_H$ | Access prohibited area | |
| FFA0 $0000_H$ to FFFD $FFFF_H$ | On-chip peripheral I/O area | 6 MB - 128 KB |
| FFFE $0000_H$ to FFFE $DFFF_H$ | Access prohibited area | |
| FFFE $E000_H$ to FFFE $FFFF_H$ | On-chip peripheral I/O area (self area) | 8 KB |
| FFFF $0000_H$ to FFFF $4FFF_H$ | Access prohibited area | |
| FFFF $5000_H$ to FFFF $FFFF_H$ | On-chip peripheral I/O area | 44 KB |

Table 4.2 Address Space (1.5-MB 100, 144, 176 Pin Product)

| Address | Address Space Type | Size |
|---|---|---|
| 0000 0000$_H$ to 0017 FFFF$_H$ | Code flash | 1.5 MB |
| 0018 0000$_H$ to 00FF FFFF$_H$ | Access prohibited area | |
| 0100 0000$_H$ to 0100 7FFF$_H$ | Code flash (extended user area) | 32 KB |
| 0100 8000$_H$ to FEBD 7FFF$_H$ | Access prohibited area | |
| FEBD 8000$_H$ to FEBE FFFF$_H$ | Local RAM (CPU1 area) | 96 KB |
| FEBF 0000$_H$ to FEBF FFFF$_H$ | Retention RAM (CPU1 area) | 64 KB |
| FEC0 0000$_H$ to FEDD 7FFF$_H$ | Access prohibited area | |
| FEDD 8000$_H$ to FEDE FFFF$_H$ | Local RAM (self area) | 96 KB |
| FEDF 0000$_H$ to FEDF FFFF$_H$ | Retention RAM (self area) | 64 KB |
| FEE0 0000$_H$ to FF1F FFFF$_H$ | Access prohibited area | |
| FF20 0000$_H$ to FF20 FFFF$_H$ | Data flash | 64 KB |
| FF21 0000$_H$ to FF9F FFFF$_H$ | Access prohibited area | |
| FFA0 0000$_H$ to FFFD FFFF$_H$ | On-chip peripheral I/O area | 6 MB - 128 KB |
| FFFE 0000$_H$ to FFFE DFFF$_H$ | Access prohibited area | |
| FFFE E000$_H$ to FFFE FFFF$_H$ | On-chip peripheral I/O area (self area) | 8 KB |
| FFFF 0000$_H$ to FFFF 4FFF$_H$ | Access prohibited area | |
| FFFF 5000$_H$ to FFFF FFFF$_H$ | On-chip peripheral I/O area | 44 KB |

Table 4.3 Address Space (1-MB 100, 144, 176 Pin Product)

| Address | Address Space Type | Size |
|---|---|---|
| 0000 0000$_H$ to 000F FFFF$_H$ | Code flash | 1 MB |
| 0010 0000$_H$ to 00FF FFFF$_H$ | Access prohibited area | |
| 0100 0000$_H$ to 0100 7FFF$_H$ | Code flash (extended user area) | 32 KB |
| 0100 8000$_H$ to FEBD FFFF$_H$ | Access prohibited area | |
| FEBE 0000$_H$ to FEBE FFFF$_H$ | Local RAM (CPU1 area) | 64 KB |
| FEBF 0000$_H$ to FEBF FFFF$_H$ | Retention RAM (CPU1 area) | 64 KB |
| FEC0 0000$_H$ to FEDD FFFF$_H$ | Access prohibited area | |
| FEDE 0000$_H$ to FEDE FFFF$_H$ | Local RAM (self area) | 64 KB |
| FEDF 0000$_H$ to FEDF FFFF$_H$ | Retention RAM (self area) | 64 KB |
| FEE0 0000$_H$ to FF1F FFFF$_H$ | Access prohibited area | |
| FF20 0000$_H$ to FF20 FFFF$_H$ | Data flash | 64 KB |
| FF21 0000$_H$ to FF9F FFFF$_H$ | Access prohibited area | |
| FFA0 0000$_H$ to FFFD FFFF$_H$ | On-chip peripheral I/O area | 6 MB - 128 KB |
| FFFE 0000$_H$ to FFFE DFFF$_H$ | Access prohibited area | |
| FFFE E000$_H$ to FFFE FFFF$_H$ | On-chip peripheral I/O area (self area) | 8 KB |
| FFFF 0000$_H$ to FFFF 4FFF$_H$ | Access prohibited area | |
| FFFF 5000$_H$ to FFFF FFFF$_H$ | On-chip peripheral I/O area | 44 KB |

Table 4.4 Address Space (768-KB 100, 144 Pin Product)

| Address | Address Space Type | Size |
|---|---|---|
| 0000 $0000_H$ to 000B $FFFF_H$ | Code flash | 768 KB |
| 000C $0000_H$ to 00FF $FFFF_H$ | Access prohibited area | |
| 0100 $0000_H$ to 0100 $7FFF_H$ | Code flash (extended user area) | 32 KB |
| 0100 $8000_H$ to FEBE $7FFF_H$ | Access prohibited area | |
| FEBE $8000_H$ to FEBE $FFFF_H$ | Local RAM (CPU1 area) | 32 KB |
| FEBF $0000_H$ to FEBF $FFFF_H$ | Retention RAM (CPU1 area) | 64 KB |
| FEC0 $0000_H$ to FEDE $7FFF_H$ | Access prohibited area | |
| FEDE $8000_H$ to FEDE $FFFF_H$ | Local RAM (self area) | 32 KB |
| FEDF $0000_H$ to FEDF $FFFF_H$ | Retention RAM (self area) | 64 KB |
| FEE0 $0000_H$ to FF1F $FFFF_H$ | Access prohibited area | |
| FF20 $0000_H$ to FF20 $FFFF_H$ | Data flash | 64 KB |
| FF21 $0000_H$ to FF9F $FFFF_H$ | Access prohibited area | |
| FFA0 $0000_H$ to FFFD $FFFF_H$ | On-chip peripheral I/O area | 6 MB - 128 KB |
| FFFE $0000_H$ to FFFE $DFFF_H$ | Access prohibited area | |
| FFFE $E000_H$ to FFFE $FFFF_H$ | On-chip peripheral I/O area (self area) | 8 KB |
| FFFF $0000_H$ to FFFF $4FFF_H$ | Access prohibited area | |
| FFFF $5000_H$ to FFFF $FFFF_H$ | On-chip peripheral I/O area | 44 KB |

## 4.2 Address Space Viewed from Each Bus Master

**Table 4.5** shows address spaces viewed from each bus master.

### 4.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, Local RAM, and Retention RAM.

### 4.2.2 Data Space Accessible by CPU

See **Table 4.5** for the spaces accessible from the CPU.

### 4.2.3 Data Space Accessible by DMA

See **Table 4.5** for the spaces accessible from the DMA.

**Table 4.5 Address Space Viewed from Each Bus Master (2-MB Product)**

| Address | Access from CPU | Access from DMA |
|---|---|---|
| 0000 0000$_H$ to 001F FFFF$_H$ | Code flash | Code flash |
| 0020 0000$_H$ to 00FF FFFF$_H$ | Access prohibited area | Access prohibited area |
| 0100 0000$_H$ to 0100 7FFF$_H$ | Code flash (extended user area) | Code flash (extended user area) |
| 0100 8000$_H$ to FEBC FFFF$_H$ | Access prohibited area | Access prohibited area |
| FEBD 0000$_H$ to FEBE FFFF$_H$ | Local RAM (CPU1 area) | Local RAM (CPU1 area) |
| FEBF 0000$_H$ to FEBF FFFF$_H$ | Retention RAM (CPU1 area) | Retention RAM (CPU1 area) |
| FEC0 0000$_H$ to FEDC FFFF$_H$ | Access prohibited area | Access prohibited area |
| FEDD 0000$_H$ to FEDE FFFF$_H$ | Local RAM (self area) | Access prohibited area |
| FEDF 0000$_H$ to FEDF FFFF$_H$ | Retention RAM (self area) | Access prohibited area |
| FEE0 0000$_H$ to FF1F FFFF$_H$ | Access prohibited area | Access prohibited area |
| FF20 0000$_H$ to FF20 FFFF$_H$ | Data flash | Data flash |
| FF21 0000$_H$ to FF9F FFFF$_H$ | Access prohibited area | Access prohibited area |
| FFA0 0000$_H$ to FFFD FFFF$_H$ | On-chip peripheral I/O area | On-chip peripheral I/O area |
| FFFE 0000$_H$ to FFFE DFFF$_H$ | Access prohibited area | Access prohibited area |
| FFFE E000$_H$ to FFFE FFFF$_H$ | On-chip peripheral I/O area (self area) | Access prohibited area |
| FFFF 0000$_H$ to FFFF 4FFF$_H$ | Access prohibited area | Access prohibited area |
| FFFF 5000$_H$ to FFFF FFFF$_H$ | On-chip peripheral I/O area | On-chip peripheral I/O area |

**Note:** The following color coding is used in the map above.

| |
|---|
| Fetch and data access available |
| Data access available |
| Access prohibited |

## 4.3 Peripheral I/O Address Map

**Table 4.6** shows peripheral I/O address map.

Table 4.6 Peripheral I/O Address Map (1/5)

| Address | Peripheral Group | Peripheral I/O |
|---|---|---|
| FF00 0000$_H$ to FF1F FFFF$_H$ | — | Access prohibited area |
| FF20 0000$_H$ to FF20 FFFF$_H$ | 2 | Data flash |
| FF21 0000$_H$ to FF9F FFFF$_H$ | — | Access prohibited area |
| FFA0 0000$_H$ to FFA0 001F$_H$ | 1 | FLMD (FLMDCNT) |
| FFA0 0020$_H$ to FFA0 0FFF$_H$ | — | Access prohibited area |
| FFA0 1000$_H$ to FFA0 103F$_H$ | — | Access prohibited area |
| FFA0 1040$_H$ to FFA0 1FFF$_H$ | — | Access prohibited area |
| FFA0 2000$_H$ to FFA0 201F$_H$ | — | Access prohibited area |
| FFA0 2020$_H$ to FFA0 FFFF$_H$ | — | Access prohibited area |
| FFA1 0000$_H$ to FFA1 1FFF$_H$ | 1 | Flash controller |
| FFA1 2000$_H$ to FFA1 FFFF$_H$ | — | Access prohibited area |
| FFA2 0000$_H$ to FFA2 FFFF$_H$ | 1 | FACI command-issuing area |
| FFA3 0000$_H$ to FFBF FFFF$_H$ | — | Access prohibited area |
| FFC0 0000$_H$ to FFC0 000F$_H$ | 1 | FENMI |
| FFC0 0010$_H$ to FFC0 00FF$_H$ | — | Access prohibited area |
| FFC0 0100$_H$ to FFC0 010F$_H$ | 1 | FEINT |
| FFC0 0110$_H$ to FFC0 0FFF$_H$ | — | Access prohibited area |
| FFC0 1000$_H$ to FFC0 1007$_H$ | 1 | SELB_INTC |
| FFC0 1008$_H$ to FFC0 FFFF$_H$ | — | Access prohibited area |
| FFC1 0000$_H$ to FFC1 4CCF$_H$ | 1 | PORT |
| FFC1 4CD0$_H$ to FFC1 FFFF$_H$ | — | Access prohibited area |
| FFC2 0000$_H$ to FFC2 04CF$_H$ | 1 | PORT (JTAG) |
| FFC2 04D0$_H$ to FFC2 FFFF$_H$ | — | Access prohibited area |
| FFC3 0000$_H$ to FFC3 00CF$_H$ | 1 | PORT (DNF) |
| FFC3 00D0$_H$ to FFC3 3FFF$_H$ | — | Access prohibited area |
| FFC3 4000$_H$ to FFC3 409F$_H$ | 1 | FCLA0 |
| FFC3 40A0$_H$ to FFC3 FFFF$_H$ | — | Access prohibited area |
| FFC4 0000$_H$ to FFC4 004F$_H$ | 1 | P-Bus guard (PBG10) |
| FFC4 0050$_H$ to FFC4 00FF$_H$ | — | Access prohibited area |
| FFC4 0100$_H$ to FFC4 014F$_H$ | 1 | P-Bus guard (PBG11) |
| FFC4 0150$_H$ to FFC4 03FF$_H$ | — | Access prohibited area |
| FFC4 0400$_H$ to FFC4 044F$_H$ | 1 | P-Bus guard (PBG12) |
| FFC4 0450$_H$ to FFC4 04FF$_H$ | — | Access prohibited area |
| FFC4 0500$_H$ to FFC4 054F$_H$ | 1 | P-Bus guard (PBG13) |
| FFC4 0550$_H$ to FFC4 BFFF$_H$ | — | Access prohibited area |
| FFC4 C000$_H$ to FFC4 C00F$_H$ | 2 | P-Bus guard (PBGC0) |
| FFC4 C010$_H$ to FFC4 C0FF$_H$ | — | Access prohibited area |
| FFC4 C100$_H$ to FFC4 C13F$_H$ | 2 | P-Bus guard (PBGC1) |
| FFC4 C140$_H$ to FFC4 C7FF$_H$ | — | Access prohibited area |
| FFC4 C800$_H$ to FFC4 C80F$_H$ | 2 | ERRSLV (PBGC0) |
| FFC4 C810$_H$ to FFC4 C8FF$_H$ | — | Access prohibited area |

Table 4.6 Peripheral I/O Address Map (2/5)

| Address | Peripheral Group | Peripheral I/O |
|---|---|---|
| FFC4 C900$_H$ to FFC4 C90F$_H$ | 2 | ERRSLV (PBGC1) |
| FFC4 C910$_H$ to FFC5 97FF$_H$ | — | Access prohibited area |
| FFC5 9800$_H$ to FFC5 981F$_H$ | 2 | DCIB (EEPRDCYCL) |
| FFC5 9820$_H$ to FFC5 AFFF$_H$ | — | Access prohibited area |
| FFC5 B000$_H$ to FFC5 B00F$_H$ | 2 | FBUF CTRL |

# Section 5 Write-Protected Registers

This section contains a generic description of the write-protected registers.

The first part in this section describes the features specific to the write-protected registers, and the ensuing sections describe the various registers.

## 5.1 Overview

### 5.1.1 Functional Overview

The RH850/F1K products require a special procedure using write-protected registers to set important registers that affect the system, such as clock, reset, and port-related registers. The settings of protected registers are protected against illegal writing by programs by requiring a special procedure. For details about the protected registers, see **Section 5.1.5, Write-Protection Target Registers**. Write-protected registers are managed in units of protected registers called register protection clusters.

### 5.1.2 Writing Procedure to Write-Protected Registers

Write access to a write-protected register is enabled by using the following protection unlock sequence:

1. Write the fixed value 0000 $00A5_H$ to the protection command register.
2. Write the desired value to the protected register.
3. Write the bit-wise inversion of the desired value to the protected register.
4. Write the desired value to the protected register.
5. Verify that the desired value has been written to the protected register.
   Verify successful write of the desired value to the protected register by verifying that the error monitor bit in the protection status register is “0”.
   In case the write was not successful, indicated by the error monitor bit set to “1”, the entire sequence has to be restarted at step 1.

If another register (second register) is accessed between step 1 and step 4 of the above sequence for writing to a write-protected register (first register), the protection mechanism operates as follows:

- If the second register belongs to the same cluster, the write to the protected register fails (the error monitor bit is set to 1). The entire sequence has to be restarted at step 1.
- If the second register does not belong to the same cluster, the protection unlock sequence is not disrupted and the write to the first register completes successfully.

### 5.1.3 Interrupt during Write Protection Unlock

If an interrupt occurs during the protection unlock sequence, the protection mechanism operates as follows:

(1) If an interrupt request is accepted during the protection unlock sequence and write access to a register of the same cluster is performed

The protection unlock sequence is disrupted, so the write operation to the protected register cannot be completed upon returning from the interrupt service routine. **Figure 5.1** shows an execution example.

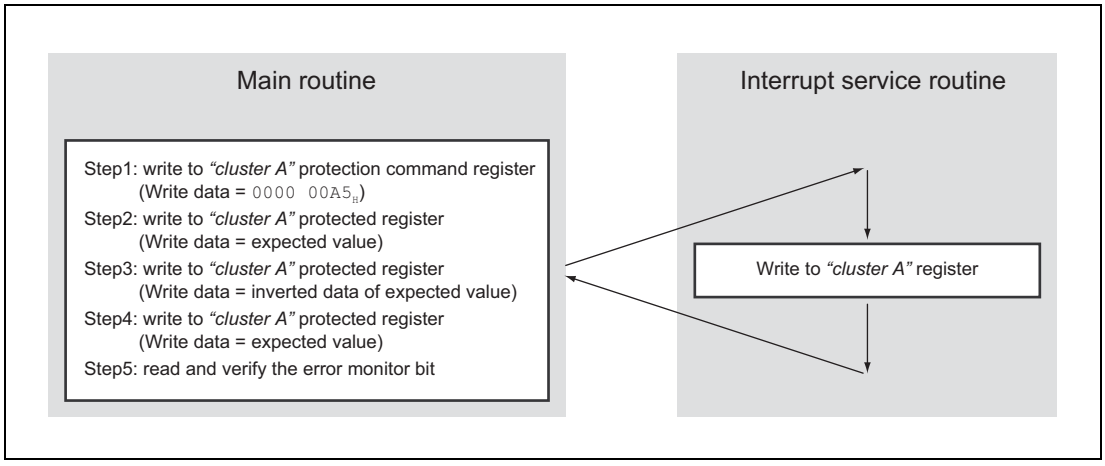

**Figure 5.1 Example of Interruption of Register Protection Unlock Sequence**

(2) If an interrupt request is accepted during the protection unlock sequence and write access to a register of a different cluster is performed

The protection unlock sequence is not disrupted, so the write operation to the protected register is completed upon returning from the interrupt service routine. **Figure 5.2** shows an execution example.

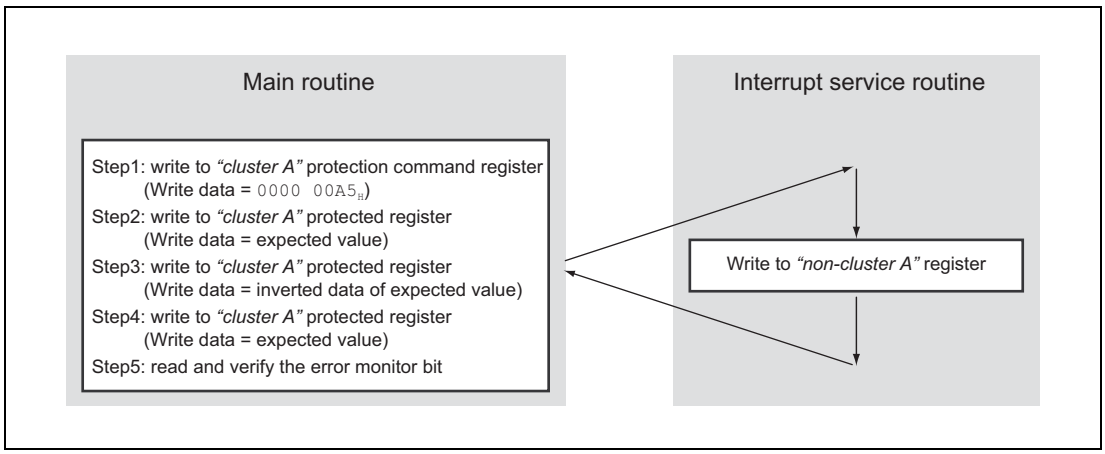

**Figure 5.2 Example of Successful Protection Unlock Sequence**

For more information on registers of RH850/F1K register protection clusters, see **Section 5.1.5, Write-Protection Target Registers**.

### 5.1.4 Emulation Break during Write Protection Unlock Sequence

If an emulation break occurs during the protection unlock sequence, e.g. because of a breakpoint hit, the register protection is suspended until normal operation is resumed.
Even if any register of the same cluster is accessed during the break, the protection unlock sequence is not disrupted and the error monitor bit is not set to 1.

### 5.1.5 Write-Protection Target Registers

The registers that are protected through the write-protection control registers are listed below.

**Table 5.1 Write-Protection Target Registers (1/2)**

| Protection Target | Protection Target Register | Protection Control Register | | Protection Cluster |
|---|---|---|---|---|
| | | Command Register | Status Register | |
| Clock controller | MOSCE | PROTCMD0 | PROTS0 | Control protection cluster 0 |
| | ROSCE | | | |
| | SOSCE | | | |
| | CKSC_AWDTAD_CTL | | | |
| | CKSC_ATAUJS_CTL | | | |
| | CKSC_ATAUJD_CTL | | | |
| | CKSC_ARTCAS_CTL | | | |
| | CKSC_ARTCAD_CTL | | | |
| | CKSC_AADCAS_CTL | | | |
| | CKSC_AADCAD_CTL | | | |
| | CKSC_AFOUTS_CTL | | | |
| | ROSCUT | | | |
| Stand-by function | STBC0PSC | | | |
| | STBC0STPT | | | |
| | IOHOLD | | | |
| Reset function | LVICNT | | | |
| | SWRESA | | | |
| | CYCRBASE | | | |
| Clock Controller | PLLE | PROTCMD1 | PROTS1 | Control protection cluster 1 |
| | CKSC_CPUCLKS_CTL | | | |
| | CKSC_CPUCLKD_CTL | | | |
| | CKSC_IPERI1S_CTL | | | |
| | CKSC_IPERI2S_CTL | | | |
| | CKSC_ILINS_CTL | | | |
| | CKSC_IADCAS_CTL | | | |
| | CKSC_IADCAD_CTL | | | |
| | CKSC_ILIND_CTL | | | |
| | CKSC_ICANS_CTL | | | |
| | CKSC_ICANOSCD_CTL | | | |
| | CKSC_ICSIS_CTL | | | |
| | CKSC_IIICS_CTL | | | |
| | CKSC_PPLLCLKS_CTL | | | |
| | CKSC_PLLIS_CTL | | | |

Table 5.1 Write-Protection Target Registers (2/2)

| Protection Target | Protection Target Register | Protection Control Register | | Protection Cluster |
|---|---|---|---|---|
| | | Command Register | Status Register | |
| Clock Monitors | CLMA0CTL0 | CLMA0PCMD | CLMA0PS | Clock Monitor control protection cluster 0 |
| | CLMA1CTL0 | CLMA1PCMD | CLMA1PS | Clock Monitor control protection cluster 1 |
| | CLMA2CTL0 | CLMA2PCMD | CLMA2PS | Clock Monitor control protection cluster 2 |
| | CLMATEST | PROTCMDCLMA | PROTSCLMA | Clock Monitor test protection cluster |
| Port*1 | JPODC0 | JPPCMD0 | JPPROTS0 | Port protection cluster 0 |
| | PODC0 | PPCMD0 | PPROTS0 | |
| | PODC1 | PPCMD1 | PPROTS1 | |
| | PODC2 | PPCMD2 | PPROTS2 | |
| | PODC8 | PPCMD8 | PPROTS8 | |
| | JPDSC0 | JPPCMD0 | JPPROTS0 | |
| | PDSC0 | PPCMD0 | PPROTS0 | |
| | PDSC1 | PPCMD1 | PPROTS1 | |
| | PDSC2 | PPCMD2 | PPROTS2 | |
| | PODC9 | PPCMD9 | PPROTS9 | Port protection cluster 1 |
| | PODC10 | PPCMD10 | PPROTS10 | |
| | PODC11 | PPCMD11 | PPROTS11 | |
| | PODC12 | PPCMD12 | PPROTS12 | |
| | PODC18 | PPCMD18 | PPROTS18 | |
| | PODC20 | PPCMD20 | PPROTS20 | |
| | PDSC10 | PPCMD10 | PPROTS10 | |
| | PDSC11 | PPCMD11 | PPROTS11 | |
| | PDSC12 | PPCMD12 | PPROTS12 | |
| | PDSC18 | PPCMD18 | PPROTS18 | |
| | PDSC20 | PPCMD20 | PPROTS20 | |
| Core Voltage Monitor | CVMF | PROTCMDCVM | PROTSCVM | Core Voltage Monitor protection cluster |
| | CVMDIAG | | | |
| Self-programming function | FLMDCNT | FLMDPCMD | FLMDPS | Self-programming protection cluster |

Note 1. Each port group has its own protection command register and status register. For details, see **(1) Port protection clusters** on the next page.

### (1) Port protection clusters

The following port control registers have a write protection function:

- Port open drain control registers (PODCn, JPODC0)
- Port drive strength control registers (PDSCn, JPDSC0)

The write protected port registers are divided into two port protection clusters as shown in the following table:

**Table 5.2 Port Protection Clusters**

| Port Protection Cluster | Port Group |
|---|---|
| 0 | JP0, P0, P1, P2, P8 |
| 1 | P9, P10, P11, P12, P18, P20 |

**NOTE**

Each port group n has its own port protection command register PPCMDn and port protection status register PPROTSn.

However, any port protection command registers of the same port protection cluster can be used in the protection unlock sequence. For instance, PPCMD1 can be used to unlock the protection of PODC2.

## 5.2 Registers

### 5.2.1 List of Registers

The following table lists the write-protection control registers.

**Table 5.3 List of Write-Protection Control Registers (1/2)**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| **Control protection clusters** | | | |
| WPROTR | Protection command register 0 | PROTCMD0 | FFF8 0000$_H$ |
| | Protection command register 1 | PROTCMD1 | FFF8 8000$_H$ |
| | Protection status register 0 | PROTS0 | FFF8 0004$_H$ |
| | Protection status register 1 | PROTS1 | FFF8 8004$_H$ |
| **Clock monitor control and test protection cluster** | | | |
| CLMAn | Protection command register 0 | CLMA0PCMD | FFF8 C010$_H$ |
| | Protection command register 1 | CLMA1PCMD | FFF8 D010$_H$ |
| | Protection command register 2 | CLMA2PCMD | FFF8 E010$_H$ |
| | Protection status register 0 | CLMA0PS | FFF8 C014$_H$ |
| | Protection status register 1 | CLMA1PS | FFF8 D014$_H$ |
| | Protection status register 2 | CLMA2PS | FFF8 E014$_H$ |
| CLMA | Protection command register | PROTCMDCLMA | FFF8 C200$_H$ |
| | Protection status register | PROTSCLMA | FFF8 C204$_H$ |
| **Port protection cluster 0** | | | |
| JTAG | Protection command registers | JPPCMD0 | FFC2 04C0$_H$ |
| PORT | | PPCMD0 | FFC1 4C00$_H$ |
| | | PPCMD1 | FFC1 4C04$_H$ |
| | | PPCMD2 | FFC1 4C08$_H$ |
| | | PPCMD8 | FFC1 4C20$_H$ |
| JTAG | Protection status registers | JPPROTS0 | FFC2 04B0$_H$ |
| PORT | | PPROTS0 | FFC1 4B00$_H$ |
| | | PPROTS1 | FFC1 4B04$_H$ |
| | | PPROTS2 | FFC1 4B08$_H$ |
| | | PPROTS8 | FFC1 4B20$_H$ |
| **Port protection cluster 1** | | | |
| PORT | Protection command registers | PPCMD9 | FFC1 4C24$_H$ |
| | | PPCMD10 | FFC1 4C28$_H$ |
| | | PPCMD11 | FFC1 4C2C$_H$ |
| | | PPCMD12 | FFC1 4C30$_H$ |
| | | PPCMD18 | FFC1 4C48$_H$ |
| | | PPCMD20 | FFC1 4C50$_H$ |

Table 5.3 List of Write-Protection Control Registers (2/2)

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| PORT | Protection status registers | PPROTS9 | FFC1 4B24$_H$ |
| | | PPROTS10 | FFC1 4B28$_H$ |
| | | PPROTS11 | FFC1 4B2C$_H$ |
| | | PPROTS12 | FFC1 4B30$_H$ |
| | | PPROTS18 | FFC1 4B48$_H$ |
| | | PPROTS20 | FFC1 4B50$_H$ |
| **Core Voltage Monitor protection cluster** | | | |
| SVM | Protection command register | PROTCMDCVM | FFF8 3200$_H$ |
| | Protection status register | PROTSCVM | FFF8 3204$_H$ |
| **Self-programming protection cluster** | | | |
| FLMD | Protection command register | FLMDPCMD | FFA0 0004$_H$ |
| | Protection error status register | FLMDPS | FFA0 0008$_H$ |

## 5.2.2 Details of Control Protection Cluster Registers

### 5.2.2.1 PROTCMDn — Protection Command Register

This register is used to initiate the write protection unlock sequence for write-protected registers.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** XXXX $XX00_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | PCMDn[7:0] | | | | | | | |
| Value after reset | — | — | — | — | — | — | — | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 5.4 PROTCMDn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing to these bits, write 0. |
| 7 to 0 | PCMDn[7:0] | Protection command register bits to enable writing to protected registers of control protection cluster |

### 5.2.2.2 PROTSn — Protection Status Register

This register indicates the status of the protection unlock sequence performed by PROTCMDn.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PROTSnERR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 5.5 PROTSn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | PROTSnERR | Write sequence protection error monitor<br>0: No protection error occurred<br>1: Protection error occurred |

## 5.2.3 Details of Clock Monitor Protection Cluster Registers

### 5.2.3.1 CLMAnPCMD — CLMAn Protection Command Register

This register is a protection command register for the CLMAnCTL0 register.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CLMAnREG[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W |

**Table 5.6 CLMAnPCMD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | CLMAnREG[7:0] | Protection command register bits to enable writing to the CLMAnCTL0 register |

### 5.2.3.2 CLMAnPS — CLMAn Protection Status Register

This register is used to verify whether the write-protected register (CLMAnCTL0) has been successfully written or not.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | CLMAnPRERR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 5.7 CLMAnPS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | CLMAnPRERR | Write protection sequence error monitor<br>0: No protection error occurred<br>1: Protection error occurred |

### 5.2.3.3 PROTCMDCLMA — Clock Monitor Test Protection Command Register

This register is a protection command register for the CLMATEST register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** XXXX XX00$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

### 5.2.3.4 PROTSCLMA — Clock Monitor Test Protection Status Register

This register is used to verify whether the write-protected register (CLMATEST) has been successfully written or not.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 5.2.4 Details of Core Voltage Monitor Protection Cluster Registers

### 5.2.4.1 PROTCMDCVM — Core Voltage Monitor Protection Command Register

This register is a protection command register for the CVMF and CVMDIAG registers.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** XXXX XX00$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 8 | Reserved | When writing to these bits, write 0. |
| 7 to 0 | CVMFREG[7:0] | Protection command register bits to enable writing to the CVMF and CVMDIAG registers |

### 5.2.4.2 PROTSCVM — Core Voltage Monitor Protection Status Register

This register is used to verify whether the write-protected register (CVMF, CVMDIAG) has been successfully written or not.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | CVMFPRERR | Write protection sequence error monitor<br>0: No protection error occurred<br>1: Protection error occurred |

## 5.2.5 Details of Port Protection Cluster Registers

### 5.2.5.1 PPCMDn — Port Protection Command Register

PPCMDn is a protection command register for port group n.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** XXXX XX00$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | PPCMDn[7:0] | | | | | | | |
| Value after reset | — | — | — | — | — | — | — | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**NOTE**

The protection command register for port group JP0 is JPPCMD0. Its bits are JPPCMD0[7:0].

**Table 5.12 PPCMDn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing to these bits, write 0. |
| 7 to 0 | PPCMDn[7:0] | Protection command register bits that enable writing to port protection cluster registers |

### 5.2.5.2 PPROTSn — Port Protection Status Register

PPROTSn is a protection status register for write-protected registers of port group n. It indicates the status of the protection sequence operated by PPCMDn.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PPROTSnPRERR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**NOTE**

The protection status register for port group JP0 is JPPROTS0. Its bit is JPPROTS0PRERR.

**Table 5.13 PPROTSn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | PPROTSn PRERR | Write protection sequence error monitor<br>0: No protection error occurred<br>1: Protection error occurred |

## 5.2.6 Details of Self-Programming Protection Cluster Registers

### 5.2.6.1 FLMDPCMD — FLMD Protection Command Register

FLMDPCMD is a protection command register for the FLMDCNT register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** XXXX XX00$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | — | — | — | — | — | — | — | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

**Table 5.14 FLMDPCMD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When writing to these bits, write 0. |
| 7 to 0 | FLMDPC[7:0] | Protection command register bits that enable writing to FLMDCNT register |

### 5.2.6.2 FLMDPS — FLMD Protection Error Status Register

This register is used to verify whether the write-protected register (FLMDCNT) has been successfully written or not.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See **Table 5.3, List of Write-Protection Control Registers**.

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FLMDPRERR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 5.15 FLMDPS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | FLMDPRERR | Write protection sequence error monitor<br>0: No protection error occurred<br>1: Protection error occurred |

# Section 6 Operating Mode

This section describes the operating mode and mode selection of the RH850/F1K.

The RH850/F1K has the operating mode shown below.

- Normal operating mode

  This mode is for execution of the user program. The on-chip debug functions also use this mode. If FLMD0 is pulled up high during operation in this mode, writing to the code flash memory through self-programming is enabled.

- Serial programming mode

  The dedicated flash memory programmer enables erasing/writing to flash memory.

- Boundary scan mode

  This mode allows boundary scan tests compliant with IEEE Standard 1149.1.

- User boot mode

  This mode is the same as normal operating mode except that the reset vector base address is fixed to "$01000000_H$", and transition to standby modes is not supported.

When an external reset or power-on-clear reset is generated, the state of the FLMD0, FLMD1, MODE0, MODE1, and MODE2 pins are used to determine the operating mode after reset is released. The operating mode is fixed by the release of these reset factors. **Table 6.1** lists the relationship between the pin settings and the operating mode.

**Table 6.1 Selection of Operating Mode**

| Pins | | | | | Operating Mode |
|---|---|---|---|---|---|
| FLMD0 | FLMD1 (P10_8) | MODE0 (P10_1) | MODE1 (P10_2) | MODE2 (P10_6) | |
| 0 | x | x | x | x | Normal operating mode |
| 1 | 0 | x | x | x | Serial programming mode |
| 1 | 1 | 0 | 1 | x | Boundary scan mode |
| 1 | 1 | 1 | 1 | 1 | User boot mode |
| Other than the above | | | | | Setting prohibited |

**CAUTION**

**To change operating mode, restart from power-on clear reset. (Remove the power supply once and apply it again.) In the case of only by the external reset, some functions are not initialized after the mode transitions. For details of functions not initialized by the external reset, see Section 9.1.1, Reset Sources.**

# Section 7 Exception/Interrupts

## 7.1 Features

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions.

The details on exceptions are described in the *RH850G3KH User's Manual: Software*.

**Table 7.1 List of Exception Sources**

| Name | Symbol | Source | Priority | Saved to |
|---|---|---|---|---|
| Reset | RESET | Reset input | High | — |
| FE level non-maskable interrupt[*1] | FENMI | FENMI input | | FE |
| System error exception | SYSERR | SYSERR input | | FE |
| FE level maskable interrupt[*1] | FEINT | FEINT input | | FE |
| Floating-point arithmetic exception (imprecise) | FPI | Execution of FPU instruction | | EI |
| EI level maskable interrupt[*1] | EIINT | Interrupt controller | | EI |
| Memory protection exception (execution right) | MIP | Memory protection violation | | FE |
| System error exception | SYSERR | Error input at instruction fetch | | FE |
| Reserved instruction exception | RIE | Execution of reserved instruction | | FE |
| Coprocessor unusable exception | UCPOP | Execution of coprocessor instruction/ access right violation | | FE |
| Privileged instruction exception | PIE | Execution of privileged instruction | | FE |
| Misaligned exception | MAE | Generation of misaligned access | | FE |
| Memory protection exception (access right) | MDP | Memory protection violation | | FE |
| Floating-point arithmetic exception (precise) | FPP | Execution of FPU instruction | | EI |
| System call | SYSCALL | Execution of SYSCALL instruction | | EI |
| FE level trap | FETRAP | Execution of FETRAP instruction | | FE |
| EI level trap 0 | TRAP0 | Execution of TRAP instruction | | EI |
| EI level trap 1 | TRAP1 | Execution of TRAP instruction | Low | EI |

Note 1. These interrupt exceptions are described in this section.

### (1) Interrupts

The following three exceptions in **Table 7.1** are called interrupts, and are described in this section.

- FE level non-maskable interrupt (FENMI)
  An FENMI interrupt is acknowledged even if another FE level interrupt - FEINT - has been generated.
  - An FENMI interrupt is acknowledged even if the CPU system register PSW.NP = 1.
  - Return from an FENMI interrupt is not possible and neither is recovery.
- FE level maskable interrupt (FEINT)
  - FEINT can be acknowledged if the CPU system register PSW.NP = 0. It is masked if PSW.NP = 1.
  - Return from an FEINT interrupt is possible and so is recovery.
- EI level maskable interrupt (EIINT)
  An EIINT interrupt can be acknowledged if an FE level interrupt - FENMI or FEINT - has not been generated.
  - EIINT can be acknowledged if the CPU system register PSW.NP = 0.
    It is masked if PSW.NP = 1, EIINT with a higher priority is being processed, or PSW.ID = 1.
  - Return from an EIINT interrupt is possible and so is recovery.
  - Interrupt masking can be specified for each interrupt channel.
  - 16 interrupt priority levels can be specified for each interrupt channel
  - In this section, the EIINT that corresponds to interrupt channel n is indicated by “INTn”, whereas the EIINT that corresponds to interrupt source xxx is indicated by “INTxxx”.

  For the PSW register, see **Table 3.9 PSW Register Contents** and the *RH850G3KH User's Manual: Software*.

**NOTE**

Return: Indicates whether or not the program can resume from where it was interrupted.

Recovery: Indicates whether or not the processor status (status of processor resources including general purpose registers and system registers) can be restored to the status they were in when the program was interrupted.

These interrupt sources are described in **Section 7.2, Interrupt Sources**.

### (2) Overview of interrupts

- Priority levels for interrupt
  16 priority levels of maskable interrupts by request can be set by interrupt control register.
- Detecting methods of external interrupts (TNMI/INTPm)
  A method of detecting external interrupts (TNMI and INTPm) can be selected from five types: rising edge, falling edge, both edges, low level, and high level.
- 2 types of interrupt handler address setting Direct branching method or table referencing method is selectable by register setting.

# 7.2 Interrupt Sources

## 7.2.1 Interrupt Sources

### 7.2.1.1 FE Level Non-Maskable Interrupts

#### (1) Priority

See **Table 7.1, List of Exception Sources**.

#### (2) Return PC

Return or recovery from an FE non-maskable interrupt is not possible.

#### (3) Status Register

See **Section 7.4.4, FNC — FE Level NMI Status Register**.

#### (4) Return Instruction

None

**Table 7.2 FE Level Non-Maskable Interrupt Requests**

| Interrupt | | | Interrupt Request | | Unit | Priority | Exception Source Code | Handler Address 00000... |
|---|---|---|---|---|---|---|---|---|
| | Control Register | | | | | | | |
| Symbol | Name | Address | Name | Source | | | | |
| FENMI | FNC | FFFE EA78$_H$ | TNMI | NMI pin | Port | *1 | 0E0$_H$ | 0E0$_H$ |
| | | | WDTA0NMI | WDTA0 FENMI interrupt | WDTA0 | | | |
| | | | WDTA1NMI | WDTA1 FENMI interrupt | WDTA1 | | | |

Note 1. See **Table 7.1, List of Exception Sources**.

The source of the FENMI interrupt can be evaluated by a dedicated flag register. See **Section 7.2.3, FE Level Non-Maskable Interrupt Sources** for details.

### 7.2.1.2 FE Level Maskable Interrupts

#### (1) Priority

See **Table 7.1, List of Exception Sources**.

#### (2) Return PC

The return PC returned from an interrupt handling routine by the FERET instruction is the PC from when the program was suspended (current PC).

#### (3) Status Register

See **Section 7.4.5, FIC — FE Level Maskable Interrupt Status Register**.

#### (4) Return Instruction

FERET

**Table 7.3 FE Level Maskable Interrupt Requests**

| Interrupt | | | Interrupt Request | | Unit | 100 pin | 144 pin | 176 pin | Priority | Exception Source Code | Handler Address 00000... |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | Control Register | | | | | | | | | | |
| Symbol | Name | Address | Name | Source | | | | | | | |
| FEINT | FIC | FFFE EA7A$_H$ | INTLVIL | LVI voltage detection (falling) | LVI | √ | √ | √ | *1 | 0F0$_H$ | 0F0$_H$ |
| | | | INTECCDEEP0 | Data flash ECC 1-bit error or 2-bit error interrupt | Data flash | √ | √ | √ | | | |
| | | | INTECCDCNRAM0 | RSCAN0 ECC 1-bit error or 2-bit error interrupt | RSCAN0 (ch0-5) | √ | √ | √ | | | |
| | | | INTECCDCNRAM1 | RSCAN1 ECC 1-bit error or 2-bit error interrupt | RSCAN1 (ch6) | — | — | √ | | | |
| | | | INTECCDCSIH0 | CSIH0 ECC 1-bit error or 2-bit error interrupt | CSIH0 | √ | √ | √ | | | |
| | | | INTECCDCSIH1 | CSIH1 ECC 1-bit error or 2-bit error interrupt | CSIH1 | √ | √ | √ | | | |
| | | | INTECCDCSIH2 | CSIH2 ECC 1-bit error or 2-bit error interrupt | CSIH2 | √ | √ | √ | | | |
| | | | INTECCDCSIH3 | CSIH3 ECC 1-bit error or 2-bit error interrupt | CSIH3 | √ | √ | √ | | | |
| | | | INTECCSCFLI0 | Code Flash ECC 1-bit error or 2-bit error interrupt | Code flash | √ | √ | √ | | | |
| | | | INTECCRAM | RAM ECC 1-bit error or 2-bit error interrupt | RAM | √ | √ | √ | | | |
| | | | INTOSTM0_FE*2 | OSTM0 interrupt | OSTM0 | √ | √ | √ | | | |
| | | | INTLVIH | LVI voltage detection (rising) | LVI | √ | √ | √ | | | |
| | | | INTGUARD | PE Guard (PEG) error or Peripheral Guard (PBG) error or PBG for CPU System error interrupt | CPU, PBG, PBGC | √ | √ | √ | | | |
| | | | INTOSTM1_FE | OSTM1 interrupt | OSTM1 | √ | √ | √ | | | |
| | | | INTOSTM2_FE | OSTM2 interrupt | OSTM2 | √ | √ | √ | | | |
| | | | INTOSTM3_FE | OSTM3 interrupt | OSTM3 | √ | √ | √ | | | |
| | | | INTOSTM4_FE | OSTM4 interrupt | OSTM4 | √ | √ | √ | | | |
| | | | INTDMAERR | DMA transfer error interrupt | DMAC | √ | √ | √ | | | |

Note 1. See **Table 7.1, List of Exception Sources**.

Note 2. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited.
When INTOSTM0 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM0

* Timing monitor (TSU)
This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

### 7.2.1.3 EI Level Maskable Interrupts

#### (1) Interrupt Naming Rules

The composition of the interrupt request signal names, their assigned interrupt control registers and the bits in these registers follow special rules.

In the following the name of the specific interrupt request is represented by **<*name*>**.

For details of the names used in **IC**<*name*>, see **Table 7.4**.

- Interrupt request name: **INT<*name*>**
  The prefix **"INT"** is appended to **<*name*>**.
- Interrupt request control register: **IC<*name*>**
  The prefix **"IC"** is appended to **<*name*>**.
  The 16-bit register **IC<*name*>** can also be accessed in byte units:
  - Low byte (bits [7:0]) of the **IC<*name*>** register: **IC<*name*>L**
    The suffix **"L"** is appended to the register name **IC<*name*>**.
  - High byte (bits [15:8]) of the **IC<*name*>** register: **IC<*name*>H**
    The suffix **"H"** is appended to the register name **IC<*name*>**.
- Interrupt control register bit names: **CT<*name*>**, **RF<*name*>**, **MK<*name*>**, **TB<*name*>**, **P3<*name*>**, **P2<*name*>**, **P1<*name*>**, **P0<*name*>**
  The bit prefix "**CT**", "**RF**", "**MK**", "**TB**", "**P3**", "**P2**", "**P1**", or "**P0**" is appended to the interrupt <*name*>.

**Example**

The interrupt request from channel 2 of TAUD0 channel (**<*name*>** = *TAUD0I2*) is named

**INT***TAUD0I2*

The related interrupt control registers are

**IC***TAUD0I2*, **IC***TAUD0I2L*, **IC***TAUD0I2H*

The bits in this register are

**CT***TAUD0I2*,**RF***TAUD0I2*, **MK***TAUD0I2*, **TB***TAUD0I2*, **P3***TAUD0I2*, **P2***TAUD0I2*, **P1***TAUD0I2*, **P0***TAUD0I2*

#### (2) Priority

See **Table 7.1, List of Exception Sources**.

#### (3) Return PC

The return PC returned from an interrupt handling routine by the EIRET instruction is the PC from when the program was suspended (current PC).

#### (4) Control Register

EI level maskable interrupt control register

See **Section 7.4.2, ICxxx — EI Level Interrupt Control Registers**.

### (5) Return Instruction

EIRET instruction

### (6) Configuration

EI-level maskable interrupts are controlled by the two controllers, INTC1 and INTC2. The interrupts are supported on a total of 358 channels with a cascade connection of INTC1 and INTC2.

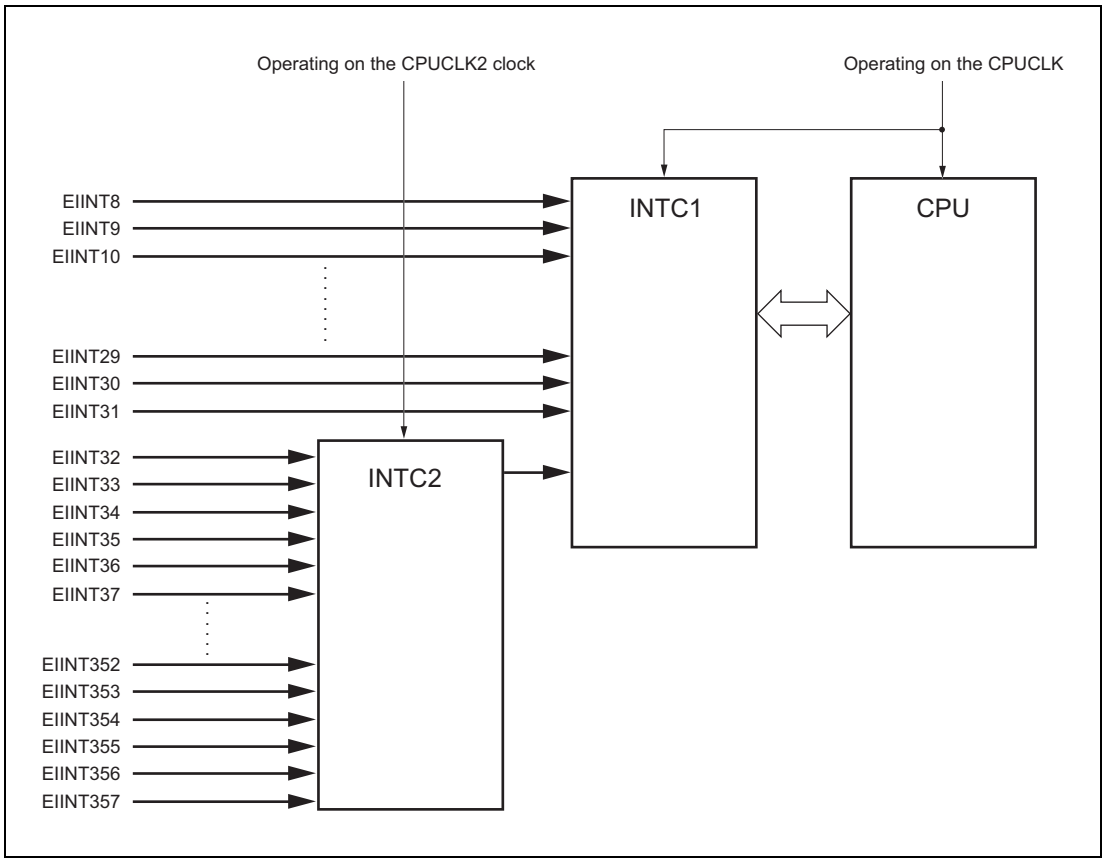

**Figure 7.1 Configuration Diagram of EI Level Maskable Interrupt**

**CAUTION**

**As CPUCLK2 is the operating clock for INTC2, the EIINT32 to EIINT357 interrupts, which are connected to INTC2, are delayed more than the interrupts directly connected to INTC1.**

**Table 7.4** lists EI level maskable interrupts.

Table 7.4 EI Level Maskable Interrupt Sources (1/9)

| Interrupt | | | Interrupt Request | | | | Exception Source Code | 100 pins | 144 pins | 176 pins | Handler Address (Offset)*8 | | |

| 355 | Reserved | FFFF B2C6$_H$ | | | | | 1163$_H$ | — | — | — | | | +58C$_H$ |
| 356 | ICDPE | FFFF B2C8$_H$ | INTDPE | LPS digital port error interrupt | LPS0 | Level | 1164$_H$ | √ | √ | √ | | | +590$_H$ |
| 357 | ICAPE | FFFF B2CA$_H$ | INTAPE | LPS analog port error interrupt | LPS0 | Level | 1165$_H$ | √ | √ | √ | | | +594$_H$ |

Note 1. Each interrupt is connected to INTC1 channel 8 to 31 and INTC2 channel 32 to 357.

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an EI level interrupt control register. For details, see **Section 7.4.2, ICxxx — EI Level Interrupt Control Registers**. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. Dummy-reading of the register and execution of the SYNCP instruction are required to reflect the result of the register update to the subsequent instruction.

Note 3. Irrespective of interrupt channels, an offset address is determined in the range from +100$_H$ to 1F0$_H$ according to the priority (0 to 15).

Note 4. Irrespective of the priority, offset addresses are uniformly +100$_H$.

Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.
Exception handler address read position = INTBP register + channel number × 4 bytes

Note 6. The same interrupt source is assigned to different interrupt channels. For details, see **Section 7.5.2, SELB_INTC1 — INTC1 Interrupt Select Register**.

Note 7. Two interrupt sources are assigned to the same interrupt channel. For details, see **Section 7.5.3, SELB_INTC2 — INTC2 Interrupt Select Register**.

Note 8. For details, see **Section 7.10, Exception Handler Address**.
Note 9. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTM0 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU.
Note 10. For details on the interrupt source, see the *RH850/F1K Flash Memory User's Manual: Hardware Interface*.

### 7.2.2 List of Registers

Interrupt sources registers are listed in the following table.

**Table 7.5 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| ECON_NMI | FENMI Factor Register | WDTNMIF | FFC0 $0000_H$ |
| | WDTNMI Factor Clear Register | WDTNMIFC | FFC0 $0008_H$ |
| ECON_FEINT | FEINT Factor Register | FEINTF | FFC0 $0100_H$ |
| | FEINT Factor Mask Register | FEINTFMSK | FFC0 $0104_H$ |
| | FEINT Factor Clear Register | FEINTFC | FFC0 $0108_H$ |

## 7.2.3 FE Level Non-Maskable Interrupt Sources

### 7.2.3.1 WDTNMIF — FENMI Factor Register

This register contains information about which source has generated the FE level non-maskable interrupt (FENMI). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFC0 0000$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 7.6 WDTNMIF Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | WDTA1NMIF | WDTA1NMI flag<br>0: No WDTA1NMI occurred<br>1: WDTA1NMI has occurred |
| 1 | WDTA0NMIF | WDTA0NMI flag<br>0: No WDTA0NMI occurred<br>1: WDTA0NMI has occurred |
| 0 | TNMIF | Input signal flag from the NMI pin<br>0: No TNMI occurred<br>1: TNMI has occurred |

### 7.2.3.2 WDTNMIFC — WDTNMI Factor Clear Register

This register clears the FE level non-maskable interrupt flags of the WDTNMIF register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFC0 0008$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W | W |

**Table 7.7 WDTNMIFC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When writing, write the value after reset. |
| 2 | WDTA1NMIFC | WDTA1NMIF flag clear<br>0: —<br>1: Clear |
| 1 | WDTA0NMIFC | WDTA0NMIF flag clear<br>0: —<br>1: Clear |
| 0 | TNMIFC | TNMIF flag clear<br>0: —<br>1: Clear |

## 7.2.4 FE Level Maskable Interrupt Sources

### 7.2.4.1 FEINTF — FEINT Factor Register

This register contains information about which source has generated the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFC0 0100$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 17 | GUARDFEIF | INTGUARD interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 16 | Reserved | When read, the value after reset is returned. |
| 15 | LVIHFEIF | INTLVIH interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 14 | OSTM0FEIF | INTOSTM0_FE interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |

Table 7.8 FEINTF Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 13 | ECCRAM FEIF | INTECCRAM interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 12 | ECCSCFLI0 FEIF | INTECCSCFLI0 interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 11 | Reserved | When read, the value after reset is returned. |
| 10 | ECCDCSIH3 FEIF | INTECCDCSIH3 interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 9 | ECCDCSIH2 FEIF | INTECCDCSIH2 interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 8 | ECCDCSIH1 FEIF | INTECCDCSIH1 interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 7 | ECCDCSIH0 FEIF | INTECCDCSIH0 interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 6 | ECCDCNRAM0 FEIF | INTECCDCNRAM0 interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 5 | Reserved | When read, the value after reset is returned. |
| 4 | ECCDEEP0 FEIF | INTECCDEEP0 interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |
| 3 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | LVILFEIF | INTLVIL interrupt occurrence<br>0: No interrupt occurred<br>1: Interrupt has occurred |

Note 1. For the supported products, see **Table 7.3, FE Level Maskable Interrupt Requests**.

### 7.2.4.2 FEINTFMSK — FEINT Factor Mask Register

This register masks the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFC0 0104$_H$

**Value after reset:** FFFF FFFF$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. For the supported products, see **Table 7.3, FE Level Maskable Interrupt Requests**.

### 7.2.4.3 FEINTFC — FEINT Factor Clear Register

This register clears the bits of the FEINT factor register (FEINTF).

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFC0 0108$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 3 to 1 | Reserved | When writing, write the value after reset. |
| 0 | LVILFEIFC | LVILFEIF flag clear<br>0: —<br>1: Clear |

Note 1. For the supported products, see **Table 7.3, FE Level Maskable Interrupt Requests**.

## 7.3 Edge/Level Detection

External interrupts (TNMI and INTPm) can be specified to be generated when a rising edge, falling edge, rising or falling edge, low level, or high level is detected at an external interrupt pin.

The following registers are used to specify the edge and level of each interrupt:

**Table 7.11 External Interrupt Edge/Level Detection Registers**

| Interrupt | Register |
|---|---|
| TNMI | FCLA0CTL0_NMI |
| INTP0 | FCLA0CTL0_INTPL |
| INTP1 | FCLA0CTL1_INTPL |
| INTP2 | FCLA0CTL2_INTPL |
| INTP3 | FCLA0CTL3_INTPL |
| INTP4 | FCLA0CTL4_INTPL |
| INTP5 | FCLA0CTL5_INTPL |
| INTP6 | FCLA0CTL6_INTPL |
| INTP7 | FCLA0CTL7_INTPL |
| INTP8 | FCLA0CTL0_INTPH |
| INTP9*1 | FCLA0CTL1_INTPH |
| INTP10 | FCLA0CTL2_INTPH |
| INTP11 | FCLA0CTL3_INTPH |
| INTP12 | FCLA0CTL4_INTPH |
| INTP13 | FCLA0CTL5_INTPH |
| INTP14*1 | FCLA0CTL6_INTPH |
| INTP15*1 | FCLA0CTL7_INTPH |

Note 1. For the supported products, see **Table 7.4, EI Level Maskable Interrupt Sources**.

See **Section 2, Pin Function** for details of these registers.

## 7.4 Interrupt Controller Control Registers

Writing to the ICxxx, IMRm (m = 0 to 11), FNC, and FIC registers is enabled only in supervisor mode (PSW.UM = 0).

### 7.4.1 List of Registers

Interrupt Controller Control Registers are listed in the following table.

**Table 7.12 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| INTC1 | EI Level Interrupt Control Registers (Channel No.8 to 31) | ICxxx (see **Table 7.4**) | see **Table 7.4**. |
| INTC2 | EI Level Interrupt Control Registers (Channel No.32 to 357) | ICxxx (see **Table 7.4**) | see **Table 7.4**. |
| INTC1 | EI Level Interrupt Mask Registers (m = 0) | IMR0 | FFFE EAF0$_H$ |
| INTC2 | EI Level Interrupt Mask Registers (m = 1 to 11) | IMRm | FFFF B400$_H$ + (04$_H$ × m) |
| INTC1 | FE Level NMI Status Register | FNC | FFFE EA78$_H$ |
| | FE Level Maskable Interrupt Status Register | FIC | FFFE EA7A$_H$ |

## 7.4.2 ICxxx — EI Level Interrupt Control Registers

One of these registers is assigned to each EI level maskable interrupt (EIINT) channel and is used to set the conditions for controlling that channel. This register is initialized by any reset. For each source, see **Table 7.4, EI Level Maskable Interrupt Sources**.

**CAUTION**

**If 0 is written to the RFxxx bit immediately after a peripheral module generates the corresponding interrupt request in edge detection mode (before an interrupt is accepted by the CPU), the request may be lost.**

**Writing 1 to the RFxxx bit immediately after an interrupt is accepted by the CPU may lead to re-issuing of the request.**

**Writing method to these registers contains the use of bit manipulation instructions (set1, clr1, and not1).**

**For bit-manipulation instructions, see also Section 3.3.3, Access to Registers by Using Bit-Manipulation Instructions.**

**Executing a bit-manipulation instruction to the lower bytes including the MKxxx bit has no effect on the RFxxx bit.**

**Access:** ICxxx can be read or written in 16-bit units.
ICxxxH and ICxxxL can be read or written in 8- or 1-bit units.
Access to bits 14, 13, 11 to 8, 5, and 4 by using a SET1, CLR1, or NOT1 instruction is prohibited.

**Address:** See **Table 7.4, EI Level Maskable Interrupt Sources**.

**Value after reset:** $008F_H$ (edge detection), $808F_H$ (level detection)*1

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CTxxx | — | — | RFxxx | — | — | — | — | MKxxx | TBxxx | — | — | P3xxx | P2xxx | P1xxx | P0xxx |
| Value after reset | 0/1*1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R/W | R | R | R | R | R/W | R/W | R | R | R/W | R/W | R/W | R/W |

Note 1. The value after reset differs depending on the detection type of a given interrupt (edge detection: 0, level detection: 1). For details, see **Table 7.4, EI Level Maskable Interrupt Sources**.

**Table 7.13 ICxxx Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | CTxxx | This bit indicates the type of interrupt detection. This bit is read only.<br>0: Edge detection<br>1: Level detection<br>When writing in 8-bit or 16-bit units, write the value after reset. |
| 14, 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | RFxxx | This is an interrupt request flag.<br>The RFxxx bit can be written from a program. Setting the RFxxx bit to 1 generates an EI level maskable interrupt n (EIINTn), just as when an interrupt request is acknowledged.<br>0: No interrupt request is made.<br>1: Interrupt request is made.<br><br>**Input Interface** / **Operation**<br>Edge detection (CTxxx = 0) / This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software.<br>Level detection (CTxxx = 1) / This bit cannot be set or cleared by software. It can only be read.<br>It is not cleared when an interrupt request is acknowledged by the CPU core. |
| 11 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**Table 7.13 ICxxx Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | MKxxx | This is the interrupt request mask bit.<br>When the MKxxx bit is set, interrupt requests from the channel are masked and are not issued to the CPU core. The interrupt pending status is not reflected in the ICSR.PMEI bit for any channels that are masked.<br>When the interrupt request from the channel is masked with MKxxx = 1, the RFxxx still reflects the interrupt request for the channel and can be polled in software. When the MKxxx bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the MKxxx bit is also reflected in the corresponding IMRm register.<br>0: Enables interrupt processing<br>1: Disables interrupt processing |
| 6 | TBxxx | This bit is used to select the way to determine the interrupt vector.<br>0: Direct jumping to an address determined from the level of priority<br>1: Table reference<br><br>For details on the way to determine the interrupt vector, see the *RH850G3KH User's Manual: Software*. |
| 5, 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | P3xxx to P0xxx | These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest.<br>When multiple EI level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core for servicing first. When P3xxx to P0xxx bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority. |

**CAUTION**

Do not access ICxxx registers of interrupt channels listed as "Reserved" in **Table 7.4, EI Level Maskable Interrupt Sources** and of the channels which are not incorporated in the product.

### 7.4.3 IMRm — EI Level Interrupt Mask Registers (m = 0 to 11)

These registers are a collection of the MKxxx bits of the ICxxx registers. Each bit of IMRm reflects the setting of the corresponding MKxxx bit. The setting for IMRm is also reflected in the corresponding MKxxx bit. This register is initialized by any reset.

**Access:** IMRm can be read or written in 32-bit units.
IMRmH and IMRmL can be read or written in 16-bit units.
IMRmHH, IMRmHL, IMRmLH, and IMRmLL can be read or written in 8- or 1-bit units.

**Address:** IMR0: FFFE EAF0$_H$
IMRm (m = 1 to 11): FFFF B400$_H$ + (04$_H$ × m)

**Value after reset:** FFFF FFFF$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | IMRmEIMK(m × 32 + 31) | IMRmEIMK(m × 32 + 30) | IMRmEIMK(m × 32 + 29) | IMRmEIMK(m × 32 + 28) | IMRmEIMK(m × 32 + 27) | IMRmEIMK(m × 32 + 26) | IMRmEIMK(m × 32 + 25) | IMRmEIMK(m × 32 + 24) | IMRmEIMK(m × 32 + 23) | IMRmEIMK(m × 32 + 22) | IMRmEIMK(m × 32 + 21) | IMRmEIMK(m × 32 + 20) | IMRmEIMK(m × 32 + 19) | IMRmEIMK(m × 32 + 18) | IMRmEIMK(m × 32 + 17) | IMRmEIMK(m × 32 + 16) |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | IMRmEIMK(m × 32 + 15) | IMRmEIMK(m × 32 + 14) | IMRmEIMK(m × 32 + 13) | IMRmEIMK(m × 32 + 12) | IMRmEIMK(m × 32 + 11) | IMRmEIMK(m × 32 + 10) | IMRmEIMK(m × 32 + 9) | IMRmEIMK(m × 32 + 8) | IMRmEIMK(m × 32 + 7) | IMRmEIMK(m × 32 + 6) | IMRmEIMK(m × 32 + 5) | IMRmEIMK(m × 32 + 4) | IMRmEIMK(m × 32 + 3) | IMRmEIMK(m × 32 + 2) | IMRmEIMK(m × 32 + 1) | IMRmEIMK(m × 32 + 0) |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 7.14 IMRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | IMRmEIMK (m × 32 + 31) to IMRmEIMK (m × 32 + 0) | These are interrupt mask bits for EI level maskable interrupt (EIINT) channels 0 to 357.<br>0: Enables interrupt servicing<br>1: Disables interrupt servicing |

**CAUTION**

MKxxx bits which correspond to channels listed as “Reserved” in **Table 7.4, EI Level Maskable Interrupt Sources**, and to channels which are not incorporated in the product must be set to “1”.

### 7.4.4 FNC — FE Level NMI Status Register

This register indicates the status of an FE level non-maskable interrupt (FENMI).

**Access:** FNC is a read-only register that can be read in 16-bit units.
FNCH is a read-only register that can be read in 8- or 1-bit units.

**Address:** FNC: FFFE EA78$_H$
FNCH: FFFE EA79$_H$

**Value after reset:** 0000$_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | FNRF | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 7.15 FNC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | FNRF | Interrupt request flag<br>0: No interrupt request<br>1: Interrupt request occurred<br><br>This bit is automatically cleared when an FE level NMI interrupt request is acknowledged by the CPU core. |
| 11 to 0 | Reserved | When read, the value after reset is returned. |

### 7.4.5 FIC — FE Level Maskable Interrupt Status Register

This register indicates the status of an FE level maskable interrupt (FEINT).

**Access:** FIC is a read-only register that can be read in 16-bit units.
FICH is a read-only register that can be read in 8- or 1-bit units.

**Address:** FIC: FFFE EA7A$_H$
FICH: FFFE EA7B$_H$

**Value after reset:** 8000$_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | FIRF | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 7.16 FIC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | FIRF | Interrupt request flag<br>0: No interrupt request<br>1: Interrupt request occurred<br><br>This bit cannot be set or cleared by software. It can only be read. |
| 11 to 0 | Reserved | When read, the value after reset is returned. |

## 7.5 EI Level Maskable Interrupt Select Registers

The following registers are used to select an EI level maskable interrupt.

### 7.5.1 List of Registers

Interrupt select registers are listed in the following table.

**Table 7.17 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| SL_INTC | INTC1 Interrupt Select Register | SELB_INTC1 | FFC0 $1000_H$ |
| | INTC2 Interrupt Select Register | SELB_INTC2 | FFC0 $1004_H$ |

## 7.5.2 SELB_INTC1 — INTC1 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled.

**NOTE**

The channel described in each bit setting indicates the channel of an interrupt and the priority. For details on channels, see **Table 7.4, EI Level Maskable Interrupt Sources**.

**Access:** This register can be read or written in 16-bit units.

**Address:** FFC0 $1000_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | SELB_INTC1_12 | SELB_INTC1_11 | SELB_INTC1_10 | SELB_INTC1_9 | SELB_INTC1_8 | SELB_INTC1_7 | SELB_INTC1_6 | SELB_INTC1_5 | SELB_INTC1_4 | SELB_INTC1_3 | SELB_INTC1_2 | SELB_INTC1_1 | SELB_INTC1_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 7.18 SELB_INTC1 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | SELB_INTC1_12 | Interrupt channel selection<br>0: INTADCA0I2 (Channel 20)<br>INTCSIH0IJC (Channel 32)<br>1: INTCSIH0IJC_1 (Channel 20)<br>INTADCA0I2_2 (Channel 32) |
| 11 | SELB_INTC1_11 | Interrupt channel selection<br>0: INTTAUD0I14 (Channel 15)<br>INTCSIH3IJC (Channel 161)<br>1: INTCSIH3IJC_1 (Channel 15)<br>INTTAUD0I14_2 (Channel 161) |
| 10 | SELB_INTC1_10 | Interrupt channel selection<br>0: INTTAUD0I12 (Channel 14)<br>INTCSIH3IRE (Channel 160)<br>1: INTCSIH3IRE_1 (Channel 14)<br>INTTAUD0I12_2 (Channel 160) |
| 9 | SELB_INTC1_9 | Interrupt channel selection<br>0: INTTAUD0I10 (Channel 13)<br>INTCSIH3IR (Channel 159)<br>1: INTCSIH3IR_1 (Channel 13)<br>INTTAUD0I10_2 (Channel 159) |
| 8 | SELB_INTC1_8 | Interrupt channel selection<br>0: INTTAUD0I2 (Channel 9)<br>INTCSIH3IC (Channel 158)<br>1: INTCSIH3IC_1 (Channel 9)<br>INTTAUD0I2_2 (Channel 158) |
| 7 | SELB_INTC1_7 | Interrupt channel selection<br>0: INTTAUD0I8 (Channel 12)<br>INTCSIH2IJC (Channel 135)<br>1: INTCSIH2IJC_1 (Channel 12)<br>INTTAUD0I8_2 (Channel 135) |
| 6 | SELB_INTC1_6 | Interrupt channel selection<br>0: INTTAUD0I6 (Channel 11)<br>INTCSIH2IRE (Channel 134)<br>1: INTCSIH2IRE_1 (Channel 11)<br>INTTAUD0I6_2 (Channel 134) |

Table 7.18 SELB_INTC1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 5 | SELB_INTC1_5 | Interrupt channel selection<br>0: INTTAUD0I4 (Channel 10)<br>INTCSIH2IR (Channel 133)<br>1: INTCSIH2IR_1 (Channel 10)<br>INTTAUD0I4_2 (Channel 133) |
| 4 | SELB_INTC1_4 | Interrupt channel selection<br>0: INTTAUD0I0 (Channel 8)<br>INTCSIH2IC (Channel 132)<br>1: INTCSIH2IC_1 (Channel 8)<br>INTTAUD0I0_2 (Channel 132) |
| 3 | SELB_INTC1_3 | Interrupt channel selection<br>0: INTCSIG0IR (Channel 28)<br>INTCSIH1IJC (Channel 119)<br>1: INTCSIH1IJC_1 (Channel 28)<br>INTCSIG0IR_2 (Channel 119) |

| 1 | SELB_INTC1_1 | Interrupt channel selection<br>0: INTTAPA0IVLY0 (Channel 17)<br>INTCSIH1IR (Channel 117)<br>1: INTCSIH1IR_1 (Channel 17)<br>INTTAPA0IVLY0_2 (Channel 117) |
| 0 | SELB_INTC1_0 | Interrupt channel selection<br>0: INTTAPA0IPEK0 (Channel 16)<br>INTCSIH1IC (Channel 116)<br>1: INTCSIH1IC_1 (Channel 16)<br>INTTAPA0IPEK0_2 (Channel 116) |

**CAUTION**

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by SELB_INTC1.

### 7.5.3 SELB_INTC2 — INTC2 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled.

**Access:** This register can be read or written in 16-bit units.

**Address:** FFC0 $1004_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SELB_INTC2_10 | SELB_INTC2_9 | SELB_INTC2_8 | SELB_INTC2_7 | SELB_INTC2_6 | SELB_INTC2_5 | SELB_INTC2_4 | SELB_INTC2_3 | SELB_INTC2_2 | SELB_INTC2_1 | SELB_INTC2_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 7.19 SELB_INTC2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | SELB_INTC2_10 | Interrupt channel 157 selection<br>0: INTTAUB0I15<br>1: INTPWGA31 |
| 9 | SELB_INTC2_9 | Interrupt channel 155 selection<br>0: INTTAUB0I13<br>1: INTPWGA30 |
| 8 | SELB_INTC2_8 | Interrupt channel 153 selection<br>0: INTTAUB0I11<br>1: INTPWGA26 |
| 7 | SELB_INTC2_7 | Interrupt channel 151 selection<br>0: INTTAUB0I9<br>1: INTPWGA19 |
| 6 | SELB_INTC2_6 | Interrupt channel 149 selection<br>0: INTTAUB0I7<br>1: INTPWGA18 |
| 5 | SELB_INTC2_5 | Interrupt channel 147 selection<br>0: INTTAUB0I5<br>1: INTPWGA17 |
| 4 | SELB_INTC2_4 | Interrupt channel 145 selection<br>0: INTTAUB0I3<br>1: INTPWGA16 |
| 3 | SELB_INTC2_3 | Interrupt channel 88 selection<br>0: INTENCA0I1<br>1: INTPWGA7 |
| 2 | SELB_INTC2_2 | Interrupt channel 87 selection<br>0: INTENCA0I0<br>1: INTPWGA6 |
| 1 | SELB_INTC2_1 | Interrupt channel 86 selection<br>0: INTENCA0IUD<br>1: INTPWGA5 |
| 0 | SELB_INTC2_0 | Interrupt channel 85 selection<br>0: INTENCA0IOV<br>1: INTPWGA4 |

**CAUTION**

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by SELB_INTC2.

## 7.6 Interrupt Function System Registers

See **Table 3.30, Interrupt Function System Registers**.

### 7.6.1 FPIPR — FPI Exception Interrupt Priority

See **Table 3.31, FPIPR Register Contents**.

### 7.6.2 ISPR — Priority of Interrupt being Serviced

See **Table 3.32, ISPR Register Contents**.

### 7.6.3 PMR — Interrupt Priority Masking

See **Table 3.33, PMR Register Contents**.

### 7.6.4 ICSR — Interrupt Control Status

See **Table 3.34, ICSR Register Contents**.

### 7.6.5 INTCFG — Interrupt Function Setting

See **Table 3.35, INTCFG Register Contents**.

## 7.7 Operation when Acknowledging an Interrupt

Check whether each interrupt that is reported during instruction execution is acknowledged according to the priority. The procedure for acknowledging each interrupt is shown below.

(1) Check whether the acknowledgment conditions are satisfied and whether interrupts are acknowledged according to their priority.

(2) Calculate the exception handler address according to the current PSW value.*1

(3) For FE-level non-maskable/maskable interrupts, the following processing is performed:

- Save the PC to the FEPC.
- Save the PSW to the FEPSW.
- Store the exception source code in the FEIC.
- Update the PSW and MCTL.*2
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

(4) For EI level exceptions, the following processing is performed:

- Save the PC to the EIPC.
- Save the PSW to the EIPSW.
- Store the exception source code in the EIIC.
- Update the PSW and MCTL.*2
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

**Note 1.** For details, see **Section 7.10, Exception Handler Address**.

**Note 2.** For the values to be updated, see *Table 4.1 Exception Cause List* in the *RH850G3KH User's Manual: Software*.

The following figure shows steps (1) to (4).

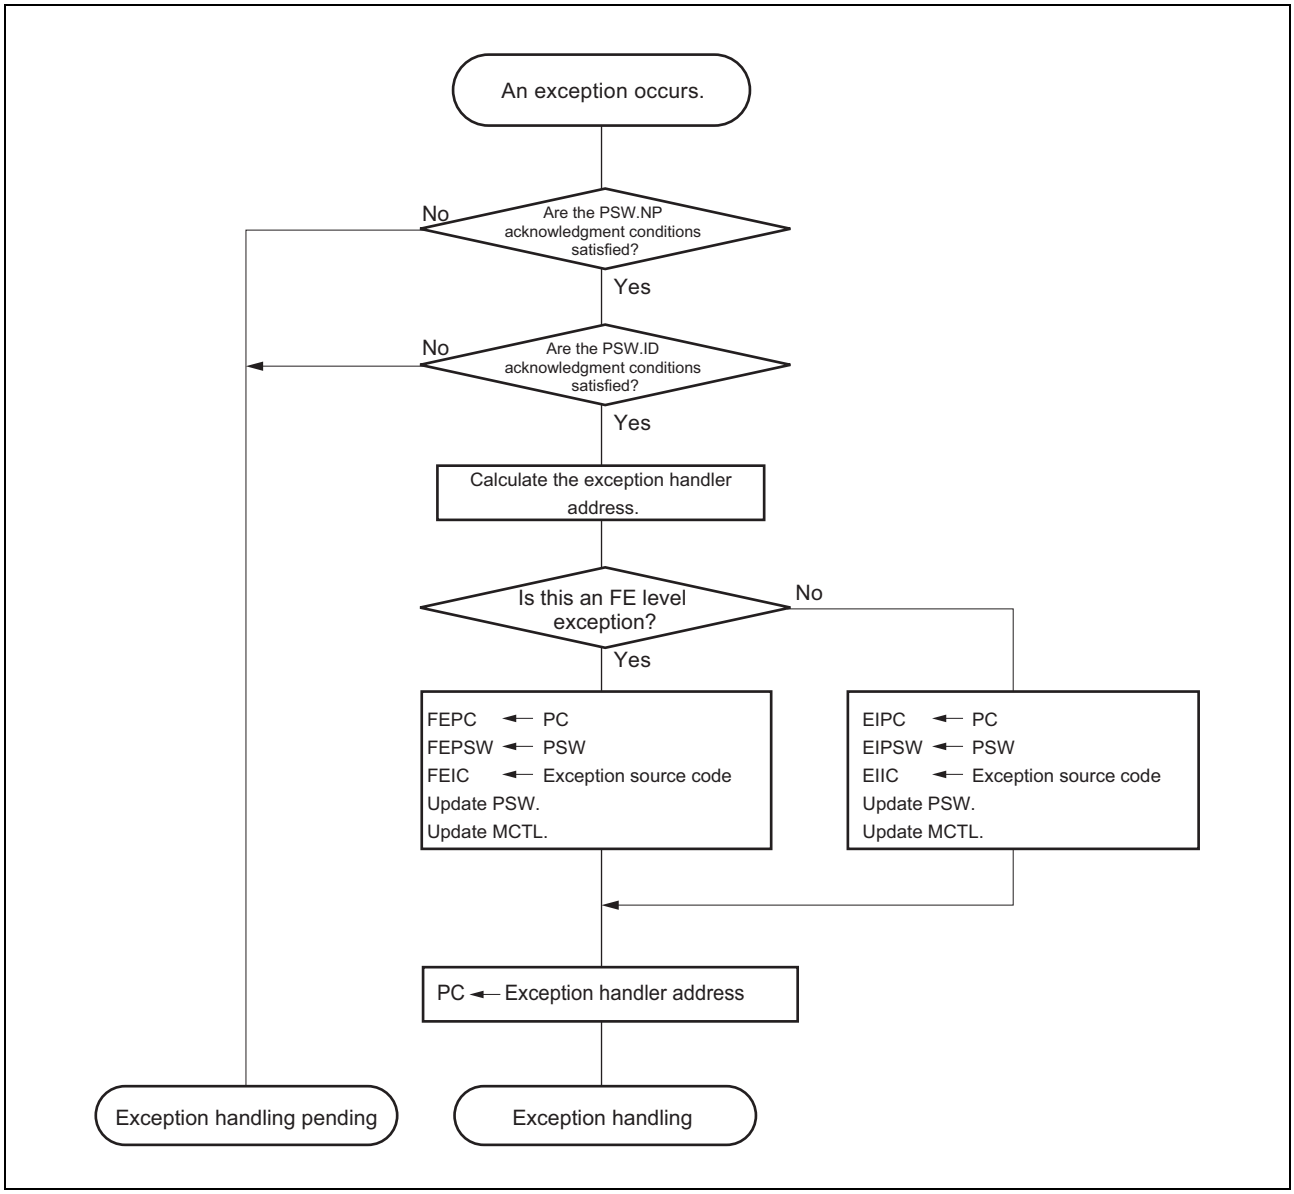

**Figure 7.2 Operation when Acknowledging an Interrupt**

### 7.7.1 Exception Source Codes for Different Types of SYSERR Exceptions

The following table lists exception source codes for the different types of SYSERR exceptions.

**Table 7.20 Exception Source Codes for Different Types of SYSERR Exceptions**

| Exception Source Code | Source of SYSERR Generation |
|---|---|
| $11_H$ | • Detection of an error during the fetching of an instruction from the code flash memory area |
| $13_H$ | • Detection of an error during the fetching of an instruction from the local or retention RAM areas |
| $14_H$ | • Detection of an error during access to data in the code flash area<br>• Detection of an error during read access to a module via the system interconnect or PBUS<br>The exception source code reports an occurrence of a system error factor corresponding to VCIF bit of SEGFLAG register*1 |
| $16_H$ | • Detection of an error during access to data in the local or retention RAM areas<br>The exception source code reports an occurrence of a system error factor corresponding to TCMF bit of SEGFLAG register*1 |
| $19_H$ | • Detection of an error during write access to a module via the PBUS<br>The exception source code reports an occurrence of a system error factor corresponding to APIF bit of SEGFLAG register*1 |
| $1A_H$ | • Detection of an error inside system interconnect<br>The exception source code reports an occurrence of a system error factor corresponding to VCSF bit of SEGFLAG register*1 |

Note 1. See **Section 3.2.3.2, System Error Generator Function (SEG)** for details.

## 7.8 Return from Interrupts

To return from interrupt handling, execute the return instruction (EIRET or FERET) corresponding to each relevant interrupt level.

When a context has been saved in a stack and the like, the context must be restored before executing the return instruction.

The EIRET instruction is used to return from the EI level maskable interrupt handling and the FERET instruction is used to return from FE-level maskable interrupt handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes its control to the return PC address:

(1) When returning from the service routine for an EI-level exception, the PC and PSW values on return are loaded from the EIPC and EIPSW registers.
When returning from the service routine for an FE-level exception, the PC and PSW values on return are loaded from the FEPC and FEPSW registers.

(2) Control is passed to the addresses indicated by the return PC and PSW that were loaded.

(3) When EP = 0 and INTCFG.ISPC = 0, the CPU updates the ISPR register.

The flows for returning from exception handling using the EIRET and FERET instructions are shown below.

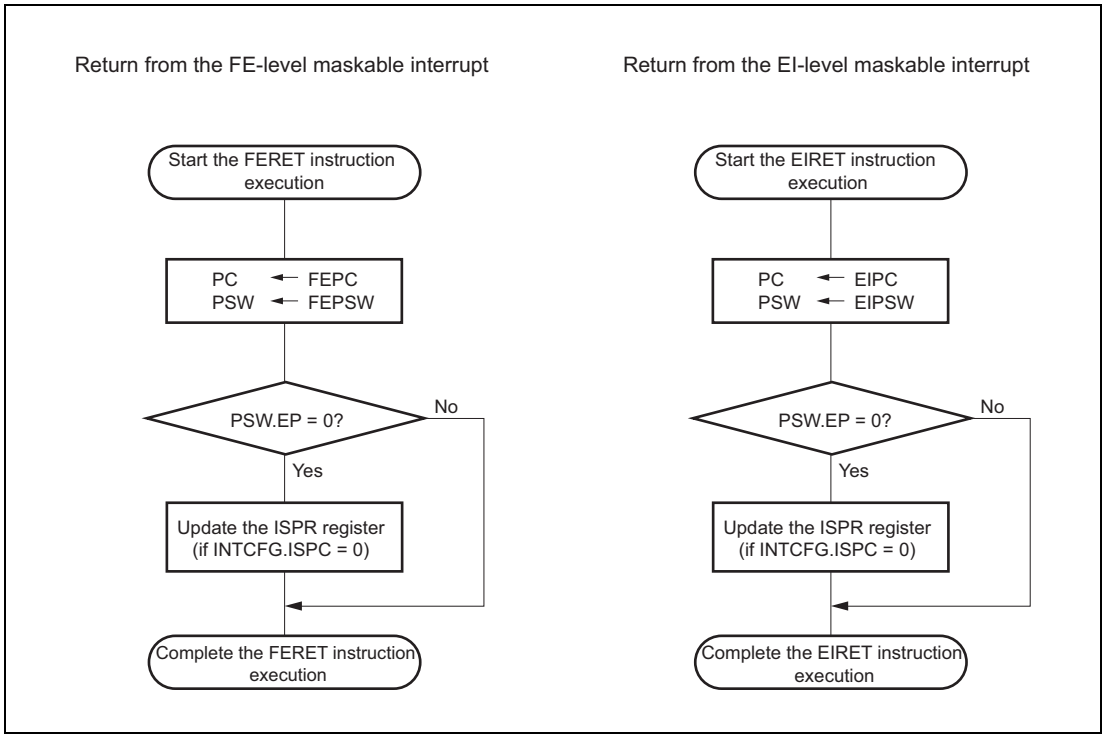

**Figure 7.3 Flow of Return from Interrupts**

## 7.9 Interrupt Operation

### 7.9.1 Interrupt Mask Function of EI Level Maskable Interrupt (EIINT)

Interrupt masking can be specified for each respective interrupt channel of EIINT. Interrupt masking is performed by the following register settings.

**Table 7.21 Operation of the MKxxx Bit**

| ICxxx.MKxxx | Operation |
|---|---|
| 1 | Masks interrupt |
| 0 | Enables interrupt |

The ICxxx.MKxxx bits can also be read and written via the corresponding IMRmEIMKn bits of the IMRm registers. The interrupt mask state is reflected in both the ICxxx registers and the IMRm registers.

**[ Operation example ]**

(1) When a 1 is written to an IMRm.IMRmEIMKn bit, interrupts are prohibited for the corresponding channel.

(2) When the corresponding ICxxx.MKxxx bit is read, 1 is returned.

**CAUTION**

**If the MKxxx bit is set to 0 while an interrupt request is pending (RFxxx = 1), the interrupt service routine will be executed at that time (subject to the rules of interrupt prioritization). Even if an interrupt request is issued in software by setting the RFxxx bit to 1, the interrupt will not occur as long as the interrupt is masked with MKxxx = 1.**

**To cancel an interrupt request that is pending, clear the corresponding RFxxx bit in software.**

### 7.9.2 Interrupt Priority Level Judgment

When FE level non-maskable interrupts (FENMI), FE level maskable interrupts (FEINT), and EI level maskable interrupts (EIINT) are input, priorities including other exceptions are determined, and the exception with the highest priority (including interrupts) is processed. Exceptions occurred at the same time (including interrupts) are processed in a pre-allocated priority order (the default priority order). The priority orders of FENMI, FEINT, and EIINT interrupts are as follows.

FENMI > FEINT > EIINT

See the *RH850G3KH User's Manual: Software* for other exceptions.

For EIINT(INTn) interrupts, the interrupt priority can be set independently for each interrupt source. Specify the interrupt priority with the bits P3xxx to P0xxx. The interrupt priority levels can be set from 0 to 15: 0 is the highest and 15 is the lowest. Among multiple EIINT(INTn) interrupts with the same priority level, the interrupt with the lowest interrupt channel number has priority.

Table 7.22 Example of EIINT (INTn) Interrupt Priority Level Settings and Priority Levels During Operation

| EIINT(INTn) | ICxxx.P[3:0]xxx Setting | Priority Level During Operation |
|---|---|---|
| INT0 | 3 | 10 |
| INT1 | 4 | 11 |
| INT2 | 0 | 1 |
| INT3 | 0 | 2 |
| INT4 | 1 | 3 |
| INT5 | 2 | 6 |
| INT6 | 2 | 7 |
| INT7 | 1 | 4 |
| INT8 | 1 | 5 |
| INT9 | 2 | 8 |
| INT10 | 2 | 9 |

The interrupt controller executes multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing is being executed. When multiple EIINT(INTn) interrupts occur at the same time, the interrupt to be acknowledged is determined by the following procedure.

#### 7.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled

Interrupts with the same or lower priority level as the interrupt currently being handled are held pending.

The priority level of the interrupt currently being handled is stored in the ISPR register.

Interrupts with a higher priority level than the interrupt currently being handled proceed to the next priority judgment stage.

#### 7.9.2.2 Masking through Priority Mask Register (PMR)

Only interrupts enabled by the PMR register proceed to the next priority judgment stage.

For the PMR register, see **Table 3.33, PMR Register Contents**, or the *RH850G3KH User's Manual: Software*.

#### 7.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected

When interrupts are requested simultaneously from multiple sources, the interrupt set the highest priority by ICxxx.P[3:0]xxx bits takes priority.

When there are multiple highest priority interrupts, the lowest interrupt channel number is selected.

#### 7.9.2.4 Interrupt Suspended by CPU

Interrupt acknowledgment is held according to the state of the NP and ID bits of the PSW register. At this time, priority judgment among EIINT interrupts, and priority judgment among EIINT, FEINT and FENMI interrupts are performed even while interrupt acknowledgment is pending, and the interrupt with the highest priority is selected when the acknowledgment condition is satisfied.

**Example**

An EIINT interrupt with the priority level 5 has already been requested and interrupt generation is pending because the value of the PSW.ID bit is 1. If a subsequent EIINT interrupt with the priority

level 3 is requested and the PSW.ID bit is cleared to 0, the latter EIINT interrupt (with the priority level 3) will be generated.

**Figure 7.4** shows an example of multiple interrupt handling when another interrupt request is acknowledged while interrupt processing is being executed.

When an interrupt request signal is acknowledged, the PSW.ID flag is automatically set to 1. Therefore, the ID flag should be cleared to 0 to execute multiple interrupt handling. Specifically, execute the EI instruction and the like in an interrupt handling program to enable the interrupt.

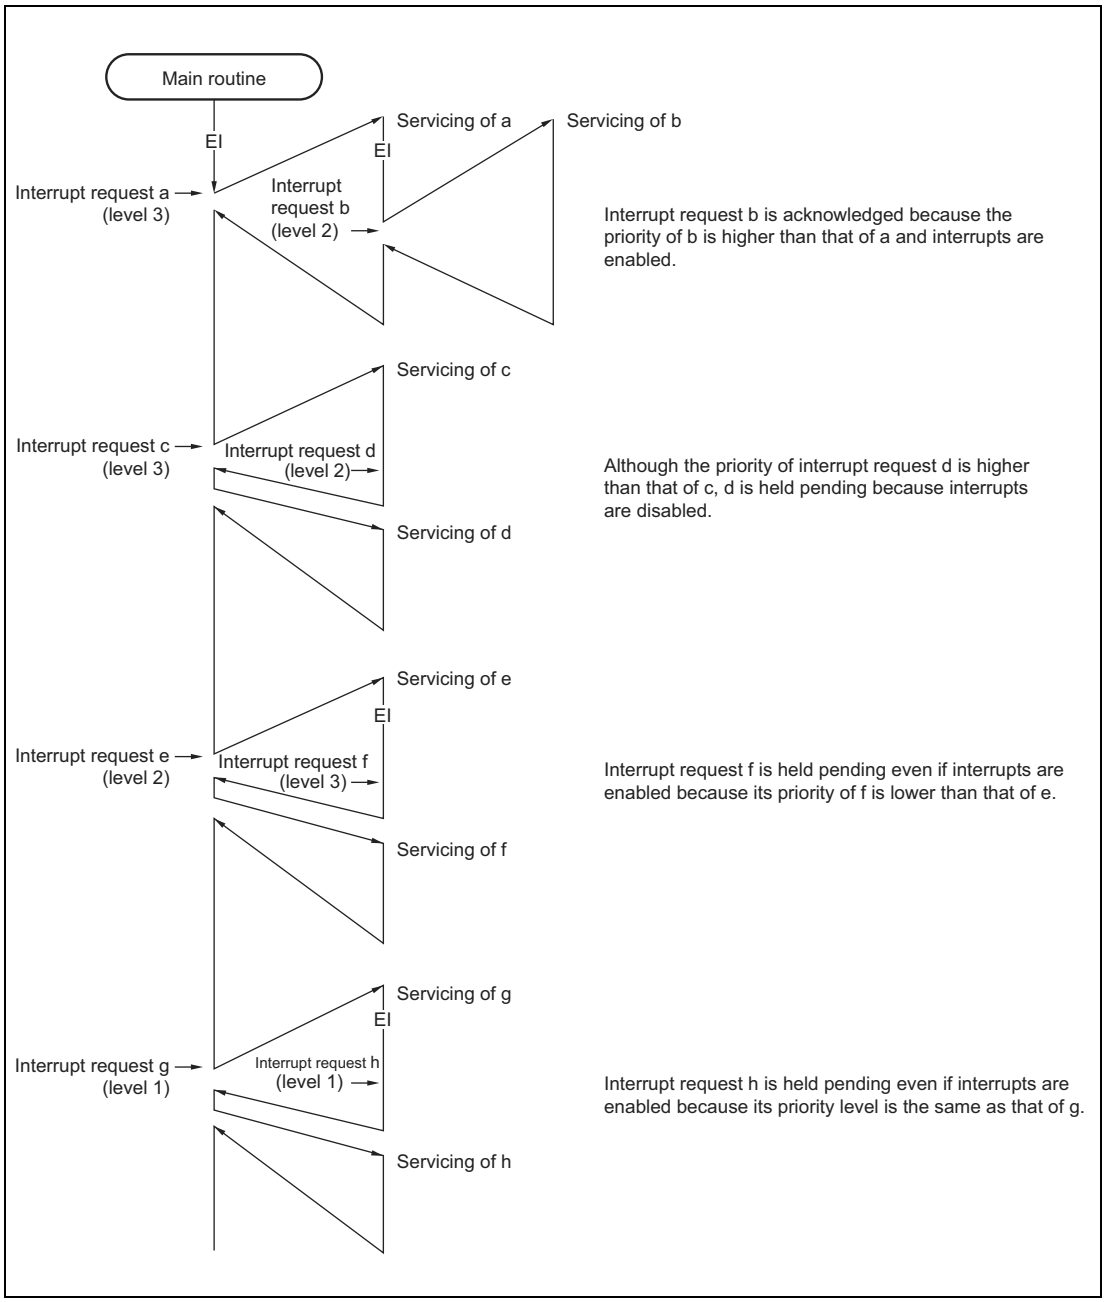

**Figure 7.4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)**

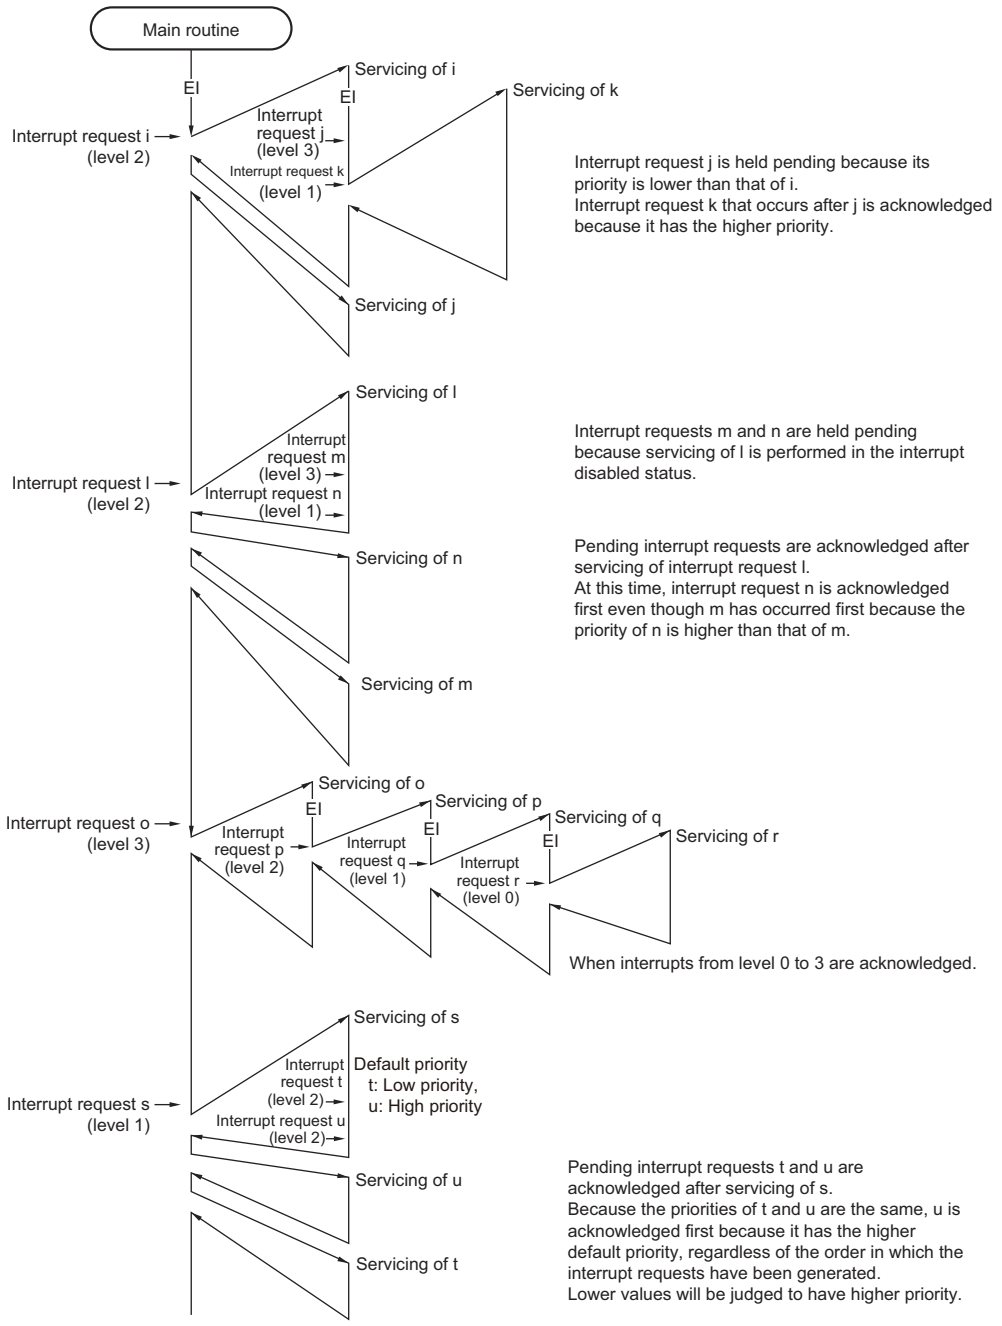


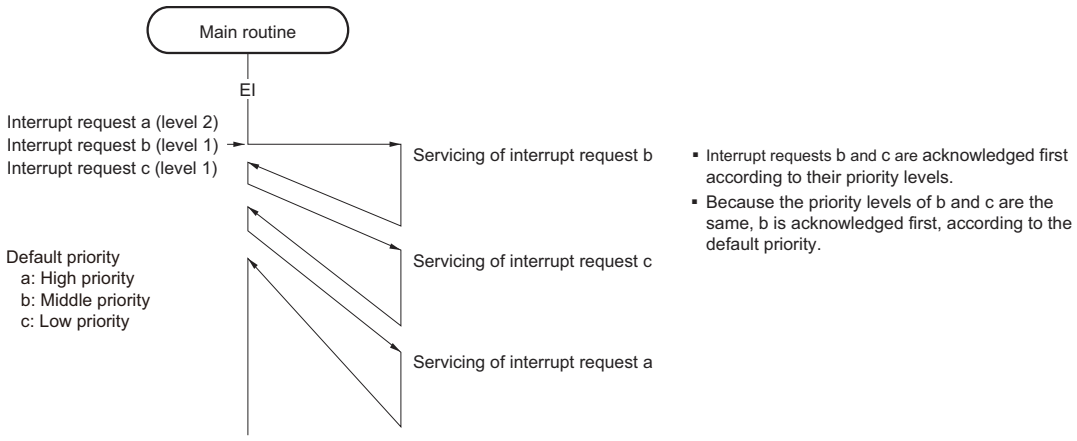
**NOTES**

1. “a” to “u” in the figure are the temporary names of interrupt request signals shown for the sake of explanation.
2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

**Figure 7.5 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (2)**

**CAUTION**

**To perform multiple interrupt servicing, the values of the EIPC and EIPSW registers must be saved before executing the EI instruction. When returning from multiple interrupt servicing, restore the values of EIPC and EIPSW after executing the DI instruction.**



**NOTES**

1. “a” to “u” in the figure are the temporary names of interrupt request signals shown for the sake of explanation.
2. The default priority in the figure indicates the relative priority between two interrupt request signals.

**Figure 7.6 Example of Servicing Simultaneously Generated Interrupt Requests**

### 7.9.3 Interrupt Request Acknowledgement Conditions and the Priority

See the *RH850G3KH User's Manual: Software*.

### 7.9.4 Exception Priority of Interrupts and the Priority Mask

See the *RH850G3KH User's Manual: Software*.

### 7.9.5 Interrupt Priority Mask

See the *RH850G3KH User's Manual: Software*.

### 7.9.6 Priority Mask Function

The priority mask function prohibits all EIINT interrupts of the specified interrupt priority level.

The interrupt priority levels to be masked are specified in the PMR register. Masking and acknowledgment can be set for each priority level.

The following operations are possible using this function:

- Temporary prohibition of interrupts that have a priority level that is lower than a given priority level
- Temporary prohibition of interrupts that have a given priority level

**Table 7.23 Operation of the PMR.PMm Bit**

| PMR.PMm | Operation |
|---|---|
| 0 | Acknowledges requests from priority level m interrupt source. |
| 1 | Masks requests from priority level m interrupt source. |

**Note:** m = 0 to 15

The presence of EIINT interrupts held pending with this function can be checked with **Section 7.9.7, Exception Management**.

For details on the PMR register, see **Table 3.33, PMR Register Contents**, or the *RH850G3KH User's Manual: Software*.

### 7.9.7 Exception Management

Pending interrupts can be checked in the RH850/F1K. For details, see the *RH850G3KH User's Manual: Software*.

## 7.10 Exception Handler Address

In the RH850/F1K, the exception handler address from which the handler is executed after a reset is input or when an exception or interrupt is acknowledged can be changed according to a setting.

The exception handler address for resets and exceptions (including interrupts) is determined with the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, the RBASE register, and the EBASE register. For interrupts, the direct vector method and table reference method can be selected for each channel. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

**CAUTION**

**The exception handler address of EIINT(INTn) selected using the direct vector method differs from that of the V850E2 core products. In the V850E2 core products, a different exception handler address is individually assigned to each interrupt channel (EIINT(INTn)). In the RH850/F1K, one exception handler address is assigned to each interrupt priority. Consequently, interrupts that have the same priority level branch to the same exception handler.**

### 7.10.1 Direct Vector Method

The CPU uses the result of adding the offset shown in **Table 7.24, Selection of Base Register/ Offset Address** to the base address indicated by the RBASE or EBASE register as the exception handler address.

Select whether the RBASE or EBASE register is used as the base address by using the PSW.EBV bit*1. When the PSW.EBV bit is set to 1, the value of the EBASE register is used as the base address. When the PSW.EBV bit is cleared to 0, the value of the RBASE register is used as the base address.

For reset input and some exceptions*2, however, the RBASE register is always used for reference.

In addition, user interrupts see the RINT bit of the corresponding base register, and reduce the offset address according to the bit status. If the RBASE.RINT bit or EBASE.RINT bit is set to 1, all user interrupts are handled using an offset of $100_H$. If the bit is cleared to 0, the offset address is determined according to **Table 7.24, Selection of Base Register/Offset Address**.

**Note 1.** Exception acknowledgment itself may sometimes update the status of the PSW.EBV bit. In this case, the base register is selected based on the updated value.

**Note 2.** The exceptions that always see the RBASE register are determined according to the hardware specifications.

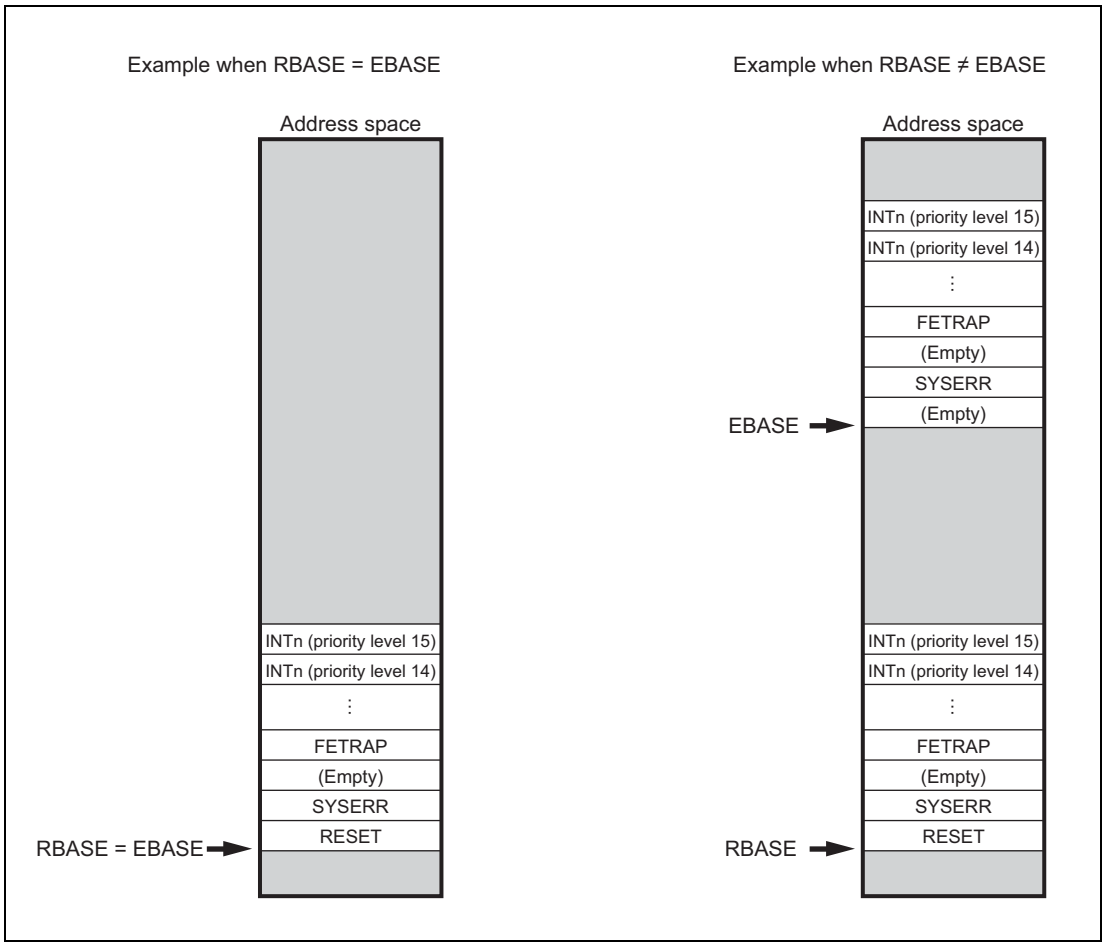


**Figure 7.7 Direct Vector Method**

The table below shows how base register selection and offset address reduction function for each exception to determine the exception handler address. The value of the PSW bit determines the exception handler address on the basis of the value updated by the acknowledgment of an exception.

**Table 7.24 Selection of Base Register/Offset Address**

| Exception/Interrupt | PSW.EBV = 0 | PSW.EBV = 1 | RINT = 0 | RINT = 1 |
|---|---|---|---|---|
| | Base Register | | Offset Address | |
| RESET | RBASE | N.A. | $000_H$ | $000_H$ |
| SYSERR | | EBASE | $010_H$ | $010_H$ |
| Reserved | | | $020_H$ | $020_H$ |
| FETRAP | | | $030_H$ | $030_H$ |
| TRAP0 | | | $040_H$ | $040_H$ |
| TRAP1 | | | $050_H$ | $050_H$ |
| RIE | | | $060_H$ | $060_H$ |
| FPP/FPI | | | $070_H$ | $070_H$ |
| UCPOP | | | $080_H$ | $080_H$ |
| MIP/MDP | | | $090_H$ | $090_H$ |
| PIE | | | $0A0_H$ | $0A0_H$ |
| Debug | | | $0B0_H$ | $0B0_H$ |
| MAE | | | $0C0_H$ | $0C0_H$ |
| Reserved | | | $0D0_H$ | $0D0_H$ |
| FENMI | | | $0E0_H$ | $0E0_H$ |
| FEINT | | | $0F0_H$ | $0F0_H$ |
| INTn (Priority level 0) | | | $100_H$ | $100_H$ |
| INTn (Priority level 1) | | | $110_H$ | |
| INTn (Priority level 2) | | | $120_H$ | |
| INTn (Priority level 3) | | | $130_H$ | |
| INTn (Priority level 4) | | | $140_H$ | |
| INTn (Priority level 5) | | | $150_H$ | |
| INTn (Priority level 6) | | | $160_H$ | |
| INTn (Priority level 7) | | | $170_H$ | |
| INTn (Priority level 8) | | | $180_H$ | |
| INTn (Priority level 9) | | | $190_H$ | |
| INTn (Priority level 10) | | | $1A0_H$ | |
| INTn (Priority level 11) | | | $1B0_H$ | |
| INTn (Priority level 12) | | | $1C0_H$ | |
| INTn (Priority level 13) | | | $1D0_H$ | |
| INTn (Priority level 14) | | | $1E0_H$ | |
| INTn (Priority level 15) | | | $1F0_H$ | |

Base register selection is used to execute exception handling for resets and some hardware errors by using the programs in a relatively reliable area such as ROM instead of the areas that are easily affected by software errors such as RAM and cache area. The user interrupt offset address reduction function is used to reduce the memory occupation size required by the exception handler for specific system-internal operating modes. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

### 7.10.2 Table Reference Method

With the direct vector method, there is one user-interrupt exception handler for each interrupt priority level, and interrupt channels that indicate multiple interrupts with the same priority branch to the same interrupt handler, but some users might want to use different code areas for each interrupt handler from the beginning.

The RH850/F1K uses the table reference method for interrupts that assume the above usage.

If the table reference method is specified as the interrupt channel vector selection method in the interrupt controller and the like, the method for determining the exception handler address when an interrupt request corresponding to that interrupt channel is acknowledged differs as follows:

<1> In any of the following cases, the exception handler address is determined by using the direct vector method:

- When PSW.EBV = 0 and RBASE.RINT = 1
- When PSW.EBV = 1 and EBASE.RINT = 1
- When the interrupt channel setting is not the table reference method

<2> In cases other than <1>, calculate the table reference position.
Exception handler address read position = INTBP register + channel number × 4 bytes

<3> Read word data starting at the interrupt handler address read position calculated in <2>.

<4> Use the word data read in <3> as the exception handler address.

**Table 7.25** shows the exception handler address read positions corresponding to each interrupt channel and **Figure 7.8** shows an overview of the allocation in memory.

**Table 7.25 Exception Handler Address Expansion**

| Type of Interrupt | Exception Handler Address Read Position |
|---|---|
| EI level maskable interrupt channel 0 | INTBP register value + 0 × 4 |
| EI level maskable interrupt channel 1 | INTBP register value + 1 × 4 |
| EI level maskable interrupt channel 2 | INTBP register value + 2 × 4 |
| : | : |
| EI level maskable interrupt channel 356 | INTBP register value + 356 × 4 |
| EI level maskable interrupt channel 357 | INTBP register value + 357 × 4 |

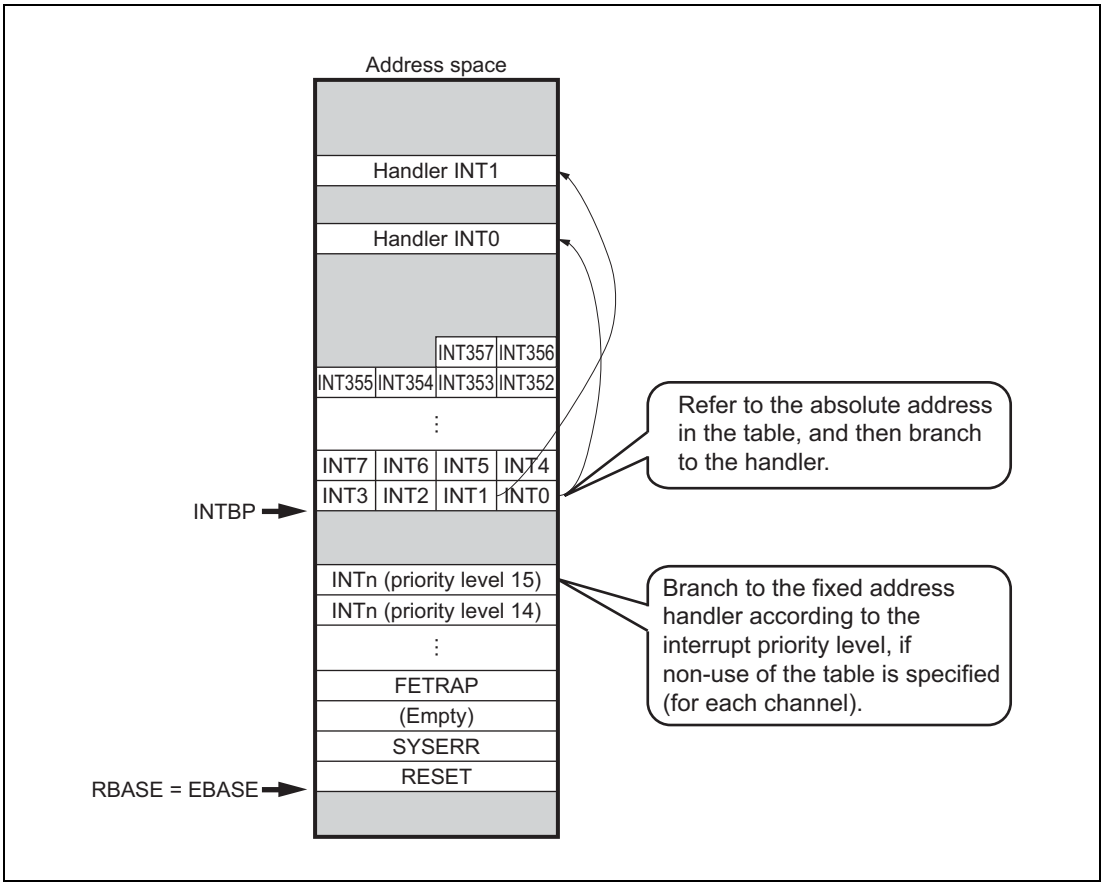

**Figure 7.8 Table Reference Method**

# Section 8 DMA Controller

This section explains about the DMA controller (DMA) in general.

The first part in this section describes the features specific to the RH850/F1K, including the number of channels and register base addresses. The ensuing sections describe the DMA functions and registers.

## 8.1 Features of RH850/F1K DMA Controller

### 8.1.1 Number of Channels

The products of the RH850/F1K series incorporate a DMA with the number of channels indicated below.

**Table 8.1 Number of Channels**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of channels | 16 ch (8ch × 2) | | |

**Table 8.2 Indices**

| Index | Description |
|---|---|
| n | In this section, the DMA units are identified with an index “n” (n = 0, 1) for example, as DMACn. |
| m | In this section, the DMA channels are identified with an index “m” (m = 0 to 15). For example, DSAm is the DMA source address register. |
| i | In this section, the DMAC channels are identified with an index “i” (i = 0 to 7). For example, DMniCM is the DMAC channel master. |

### 8.1.2 Register Base Address

The DMA base address is indicated in the following table.

The DMA register address is expressed as an offset of the base address.

**Table 8.3 Register Base Address**

| Base Address Name | Base Address |
|---|---|
| <DMA_base> | FFFF $8000_H$ |

### 8.1.3 Interrupt Requests

The DMA interrupt requests are listed in the following table.

**Table 8.4 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number |
|---|---|---|
| INTDMA0 | DMA00 transfer completion | 60 |
| INTDMA1 | DMA01 transfer completion | 61 |
| INTDMA2 | DMA02 transfer completion | 62 |
| INTDMA3 | DMA03 transfer completion | 63 |
| INTDMA4 | DMA04 transfer completion | 64 |
| INTDMA5 | DMA05 transfer completion | 65 |
| INTDMA6 | DMA06 transfer completion | 66 |
| INTDMA7 | DMA07 transfer completion | 67 |
| INTDMA8 | DMA10 transfer completion | 68 |
| INTDMA9 | DMA11 transfer completion | 69 |
| INTDMA10 | DMA12 transfer completion | 70 |
| INTDMA11 | DMA13 transfer completion | 71 |
| INTDMA12 | DMA14 transfer completion | 72 |
| INTDMA13 | DMA15 transfer completion | 73 |
| INTDMA14 | DMA16 transfer completion | 74 |
| INTDMA15 | DMA17 transfer completion | 75 |

**Table 8.5 Interrupt Request (FE Level Non-Maskable Interrupts)**

| Unit Interrupt Signal | Description | Interrupt Name |
|---|---|---|
| INTDMAERR | DMA transfer error interrupt | INTDMAERR |

### 8.1.4 DMA Trigger Factors

DMA trigger factors can be selected by setting the DTFRm.REQSEL[6:0] bits.

The following table lists all DMA trigger factors which can be selected by the DTFRm register.

**Table 8.6 DMA Trigger Factors (1/4)**

| DMA Trigger Number DTFRm.REQSEL[6:0] | DMA Trigger Factor | F1K 100 pins | F1K 144 pins | F1K 176 pins |

## 8.2 Overview

### 8.2.1 Overview

Direct memory access (DMA) is used to access data without intervention of the CPU.

DMA includes a DMA transfer module called DMAC. A DMAC includes registers for storing transfer information. DMA has two 8-channel DMAC modules.

In this manual, DTFR denotes the function to select among hardware DMA transfer sources for a DMAC and retain the DMA transfer request. The DTFR can handle 128 types of hardware DMA transfer sources.

The address space that can be used for DMA transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DMA, see **Section 4, Address Space**.

**CAUTION**

**DMA can be used after PEG access permission setting.**

**When accessing from the DMA to the local RAM and the retention RAM in the PE, the PEGSP register, PEGGnMK register (n = 0 to 3), PEGGnBA register (n = 0 to 3) and DMniCM register (ni = 00 to 07, 10 to 17) must be set.**

### 8.2.2 Term Definition

**Table 8.7** shows the terms used in this section.

Table 8.7 List of Term Definitions

| Term | Description |
|---|---|
| DMA transfer | A general term for data transfer carried out by DMA. |
| DMA cycle | A series of actions that consist of reading an amount of data specified by the transfer size (8/16/32/64/128 bits) from the address specified by the source address and writing it to the address specified by the destination address. The first half of the DMA cycle (reading part) is called a read cycle, and the second half (writing part) is called a write cycle. |
| Hardware DMA transfer source | A trigger for a DMA transfer request sent by an internal peripheral device. |
| Hardware DMA transfer request | A DMA transfer request generated by a hardware DMA transfer source |
| Software DMA transfer request | A DMA transfer request generated by software writing to a register. |
| DMA transfer request | A trigger to start DMA transfer with the DMAC. |
| Transfer information | The information required for DMA transfer, including the source address, destination address, transfer data size, and transfer count. |
| Single transfer | DMA transfer consisting of one DMA cycle started by one DMA transfer request. |
| Block transfer 1 | DMA transfer consisting of the number of DMA cycles specified by the transfer count in the transfer information, started by one DMA transfer request. |
| Block transfer 2 | DMA transfer consisting of the number of DMA cycles specified by the address reload count in the transfer information, started by one DMA transfer request. |
| Block transfer | A general term for both block transfer 1 and block transfer 2. |
| Last transfer | The DMA cycle carried out when the transfer count in the transfer information is 1. |
| Address reload transfer | The DMA cycle carried out when the address reload count in the transfer information is 1 if the reload function 2 is used. |
| Suspension | An action of pausing DMA transfer during block transfer. You can resume DMA transfer after suspension. |
| Resume | An action of resuming suspended DMA transfer. |
| Transfer abort | An action of aborting DMA transfer in the middle. You cannot resume DMA transfer after that. |

# 8.3 DMA Function

## 8.3.1 Basic Operation of DMA Transfer

### 8.3.1.1 Transfer Mode

DMA has three transfer modes.

#### Single Transfer

One DMA cycle is executed when a DMA transfer request is acknowledged.

#### Block Transfer 1

The number of DMA cycles specified in the transfer count register are executed when a DMA transfer request is acknowledged.

#### Block Transfer 2

The number of DMA cycles specified by the address reload count are executed when a DMA transfer request is acknowledged. If the value specified in the address reload count is larger than the value in the transfer count register, the number of DMA cycles specified in the transfer count register are executed.

### 8.3.1.2 Executing a DMA Cycle

DMA always executes a write cycle after a read cycle is complete.

For example, if the transfer data size is 128 bits, a write cycle is executed after a read cycle for the 128-bit data is finished. A write cycle never starts in the middle of a read cycle.

### 8.3.1.3 Updating Transfer Information

When a DMA cycle is executed, DMA updates transfer information as follows:

#### Source Address and Destination Address

Transfer information will be updated as described in **Table 8.8** according to the settings in the transfer control register such as the count directions of source address and destination address and transfer data size.

**Table 8.8 Updating the Source Addresses and the Destination Addresses**

| Count Direction | Transfer Data Size | Address after Update |
|---|---|---|
| Increment | 8 bits | (address before update) + $0000_0001_H$ |
| | 16 bits | (address before update) + $0000_0002_H$ |
| | 32 bits | (address before update) + $0000_0004_H$ |
| | 64 bits | (address before update) + $0000_0008_H$ |
| | 128 bits | (address before update) + $0000_0010_H$ |
| Decrement | 8 bits | (address before update) - $0000_0001_H$ |
| | 16 bits | (address before update) - $0000_0002_H$ |
| | 32 bits | (address before update) - $0000_0004_H$ |
| | 64 bits | (address before update) - $0000_0008_H$ |
| | 128 bits | (address before update) - $0000_0010_H$ |
| Fixed | — | Same as the address before update. |

When you use the reload function, a special update rule is applied other than the one described in **Table 8.8** for the last transfer and the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

#### Transfer Count/Address Reload Count

The transfer count is decremented by one for every DMA cycle.

The address reload count is decremented by one for every DMA cycle when the reload function 2 or block transfer 2 is used. When the reload function 2 or block transfer 2 is not used, it is not updated.

When you use the reload function, a special update rule is applied for the last transfer and the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

#### Other transfer information

Other transfer information is not updated during execution of a DMA cycle.

### 8.3.1.4 Last Transfer and Address Reload Transfer

The last transfer means a DMA cycle executed when the value in the transfer count register, which shows the remaining number of transfers, is one. The last transfer differs in operation compared to other DMA cycles as follows.

- The transfer completion flag (DCSTm.TC) is set when the last transfer is complete.
  The channel operation enable (DCENm.DTE) bit is cleared when the last transfer is complete (when continuous transfer is disabled).
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When the reload function 1 is enabled, the reload function 1 is executed at the timing of the last transfer. For details, see **Section 8.3.3, Reload Function**.

The address reload transfer means a DMA cycle executed when the reload function 2 is enabled and the address reload count is one. The reload function 2 is executed during the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

### 8.3.1.5 Transfer Completion Interrupt Output

DMA can output a transfer completion interrupt to external devices.

#### Transfer Completion Interrupt Output

When the transfer completion interrupt output enable (DTCTm.TCE) is set in the transfer control register, a DMAC requests a transfer completion interrupt when the last transfer is complete.

**Figure 8.1** shows the operation of the transfer completion interrupt.

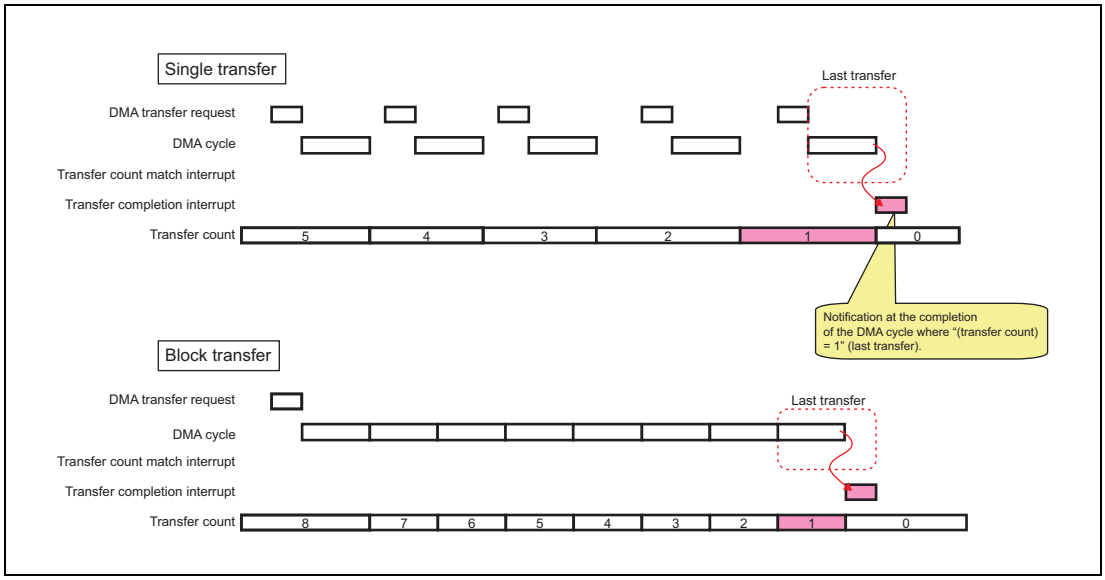

**Figure 8.1 Transfer Completion Interrupt**

### 8.3.1.6 Continuous Transfer

If the continuous transfer is not used, a DMAC sets the transfer completion flag (DCSTm.TC) and clears the channel operation enable (DCENm.DTE) bit when the last transfer is complete. In this case, a DMA transfer request is not accepted when the request is generated after the completion of the last transfer.

If the continuous transfer is used, the channel operation enable (DCENm.DTE) bit is not cleared when the last transfer is complete, and a DMA transfer request can be accepted even when the transfer completion flag is set. If DMA is used for a case where a specified number of DMA transfers are executed repetitively, software overhead associated with clearing the transfer completion flag and setting the channel operation enable bit after the completion of the last transfer can be reduced by using the continuous transfer.

The continuous transfer is enabled by setting the continuous transfer enable (DTCTm.MLE) in the DMAC transfer control register.

The continuous transfer is designed to work with the reload function 1. The continuous transfer function itself does not update the source address register, destination address register, and transfer count register. If, after the last transfer is complete, you want to restore the source address register, destination address register, and transfer count register to the state before the DMA transfer starts, use the reload function 1 and set the values of the source address register, destination address register, and the transfer count register before the DMA transfer starts to the reload source address register, reload destination address register, and reload transfer count register respectively.

**Figure 8.2** shows an operation of continuous transfer by a DMAC.

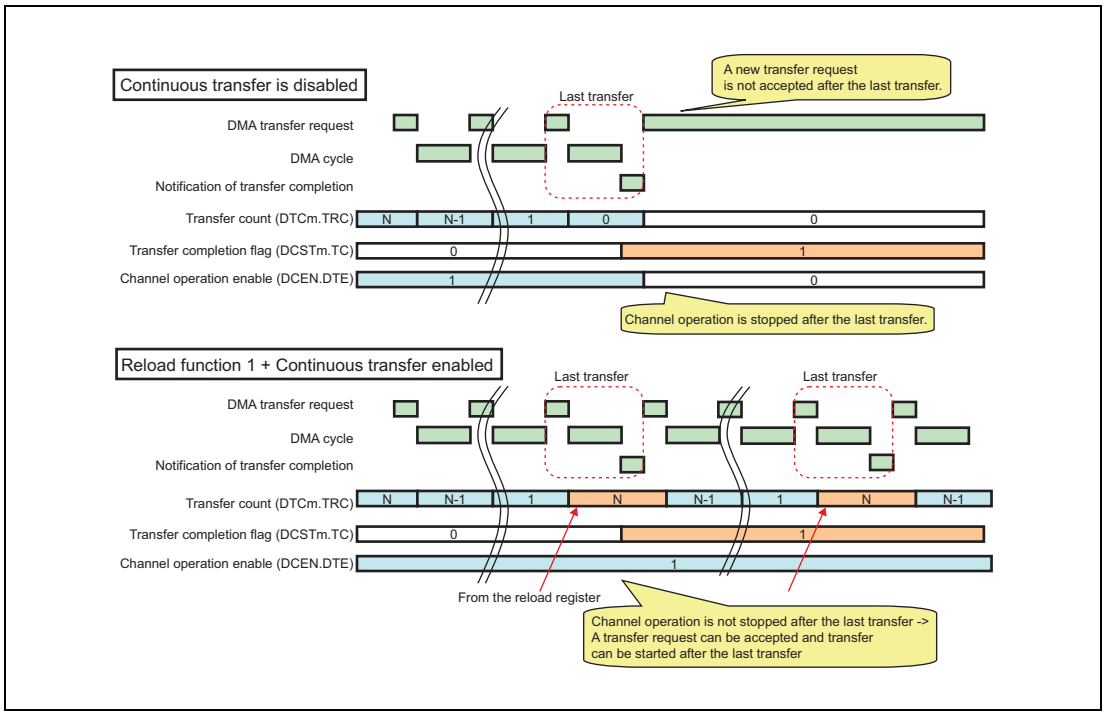

**Figure 8.2 Operation of Continuous Transfer by a DMAC**

## 8.3.2 Channel Priority Order

This subsection explains arbitration between multiple DMA channels.

### 8.3.2.1 DMAC Channel Arbitration

A DMAC select one channel out of eight channels with arbitration. Arbitration is done according to the fixed priority order. The priority order is “channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7” for DMAC0, and “channel 8 > channel 9 > channel 10 > channel 11 > channel 12 > channel 13 > channel 14 > channel 15” for DMAC1.

Arbitration is done for every DMA cycle. No arbitration occurs between the read and write of a DMA cycle.

If, at the timing when one DMA cycle completes in the middle of a block transfer of a channel, there is a DMA transfer request from a channel with a higher priority, a DMA cycle of the channel with the higher priority will be executed as the result of arbitration.

If a DMAC executes the block transfer 1 or block transfer 2, DMAC channel arbitration is done for every DMA cycle, and possibly a DMA cycle of another DMAC channel with a higher priority may interrupt.

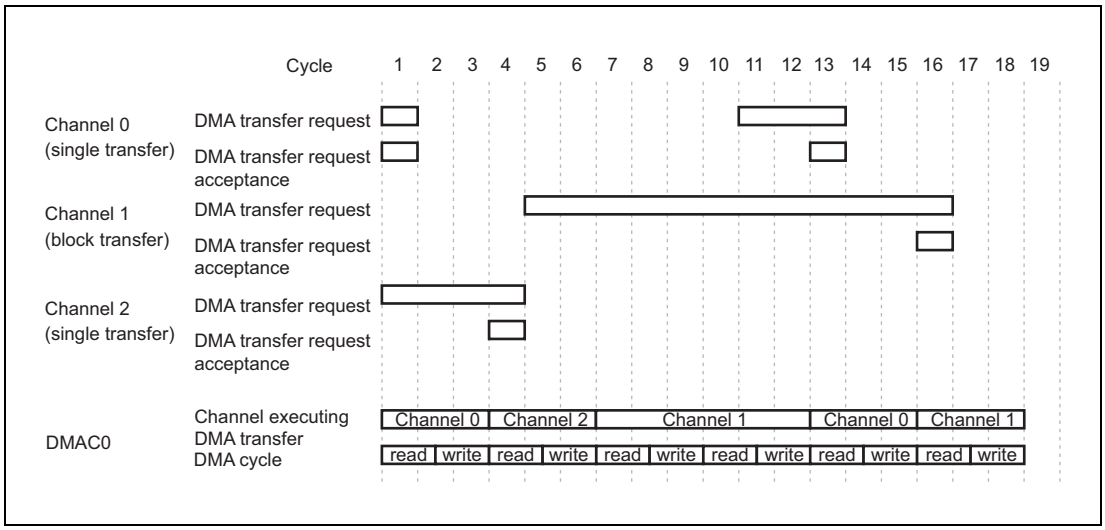

**Figure 8.3 DMAC Channel Arbitration**

Cycle numbers shown in **Figure 8.3** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 8.3**, DMA transfer requests for channels 0 and 2 are generated at Cycle 1. As a result of arbitration, a DMA cycle for channel 0 starts because its priority is higher. At Cycle 4, a DMA cycle for channel 2 starts. At Cycle 5, a DMA transfer request for channel 1 is generated. However, since the DMA cycle for channel 2 is still ongoing, no arbitration is done at this point. At Cycle 7, a DMA cycle for channel 1 starts. Because channel 1 uses block transfer, this DMA cycle continues at Cycle 10 where there are no other DMA transfer requests from other channel. At Cycle 11, a DMA transfer request for channel 0 is generated. However, since the DMA cycle for channel 1 is still ongoing, no arbitration is done at this point. At Cycle 12, the DMA cycle for channel 1 is complete. At Cycle 13, a DMA cycle for channel 0 starts as a result of arbitration between DMA channels 0 and 1.

It should be noted that, even though a block transfer of channel 1 has been already started, a DMA cycle of not channel 1 but channel 0 is executed at Cycle 13 because the priority of the latter is higher. At Cycle 15, the DMA cycle for channel 0 is complete. At Cycle 16, a DMA cycle for channel 1 starts again. At Cycle 18, the last DMA cycle of the block transfer of channel 1 is complete.

#### 8.3.2.2 Interface Arbitration

DMAC0 and DMAC1 work independently and execute DMA transfer.

## 8.3.3 Reload Function

### 8.3.3.1 Overview of the Reload Function

The reload function updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values during DMA transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

### 8.3.3.2 Operation of Reload Function 1

When the reload function 1 is enabled, actions described in **Table 8.9** are executed at the timing of the last transfer according to the reload function 1 setting.

**Table 8.9 Operation of Reload Function 1**

| Reload Function 1 Setting | Register | Action at the Last Transfer |
|---|---|---|
| 00<br>(Reload function 1 disabled.) | Source address | Not reloaded. |
| | Destination address | Not reloaded. |
| | Transfer count | Not reloaded. |
| | Address reload count | Not reloaded. |
| 01<br>(Reload function 1 enabled. Reloading source address and transfer count.) | Source address | The reload source address is copied to this. |
| | Destination address | Not reloaded. |
| | Transfer count | The reload transfer count is copied to this. |
| | Address reload count | • If the reload function 2 is disable: Not reloaded.<br>• If the reload function 2 is enabled: The reload address reload count is copied to this. |
| 10<br>(Reload function 1 enabled. Reloading destination address and transfer count.) | Source address | Not reloaded. |
| | Destination address | The reload destination address is copied to this. |
| | Transfer count | The reload transfer count is copied to this. |
| | Address reload count | • If the reload function 2 is disable: Not reloaded.<br>• If the reload function 2 is enabled: The reload address reload count is copied to this. |
| 11<br>(Reload function 1 enabled. Reloading source address, destination address, and transfer count.) | Source address | The reload source address is copied to this. |
| | Destination address | The reload destination address is copied to this. |
| | Transfer count | The reload transfer count is copied to this. |
| | Address reload count | • If the reload function 2 is disable: Not reloaded<br>• If the reload function 2 is enabled: The reload address reload count is copied to this. |

**Figure 8.4** shows an operation of the reload function 1.

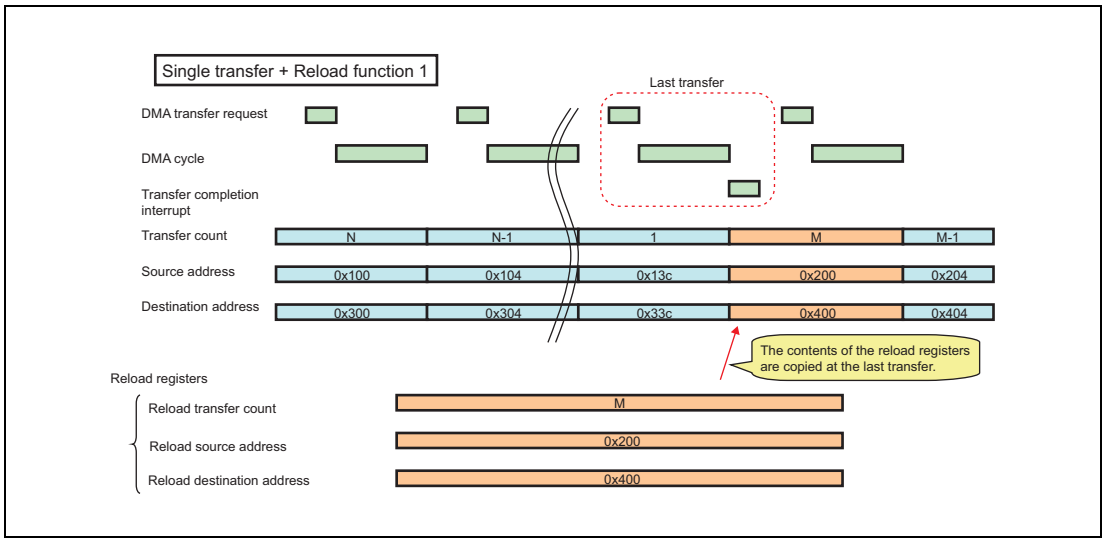

**Figure 8.4 Operation of Reload Function 1**

### 8.3.3.3 Reload Function 2

When the reload function 2 is enabled, actions described in **Table 8.10** are executed at the timing of the address reload transfer according to the reload function 2 setting.

**Table 8.10 Operation of Reload Function 2**

| Reload Function 2 Setting | Register | Action at the Address Reload Transfer |
|---|---|---|
| 00<br>(Reload function 2 disabled.) | Source address | Not reloaded. |
| | Destination address | Not reloaded. |
| | Address reload count | Not reloaded. |
| 01<br>(Reload function 2 enabled.<br>Reloading source address and address reload count.) | Source address | The reload source address is copied to this. |
| | Destination address | Not reloaded. |
| | Address reload count | The reload address reload count is copied to this. |
| 10<br>(Reload function 2 enabled.<br>Reloading destination address and address reload count.) | Source address | Not reloaded. |
| | Destination address | The reload destination address is copied to this. |
| | Address reload count | The reload address reload count is copied to this. |
| 11<br>(Reload function 2 enabled.<br>Reloading source address and destination address and address reload count.) | Source address | The reload source address is copied to this. |
| | Destination address | The reload destination address is copied to this. |
| | Address reload count | The reload address reload count is copied to this. |

**Figure 8.5** shows an operation of the reload function 2.

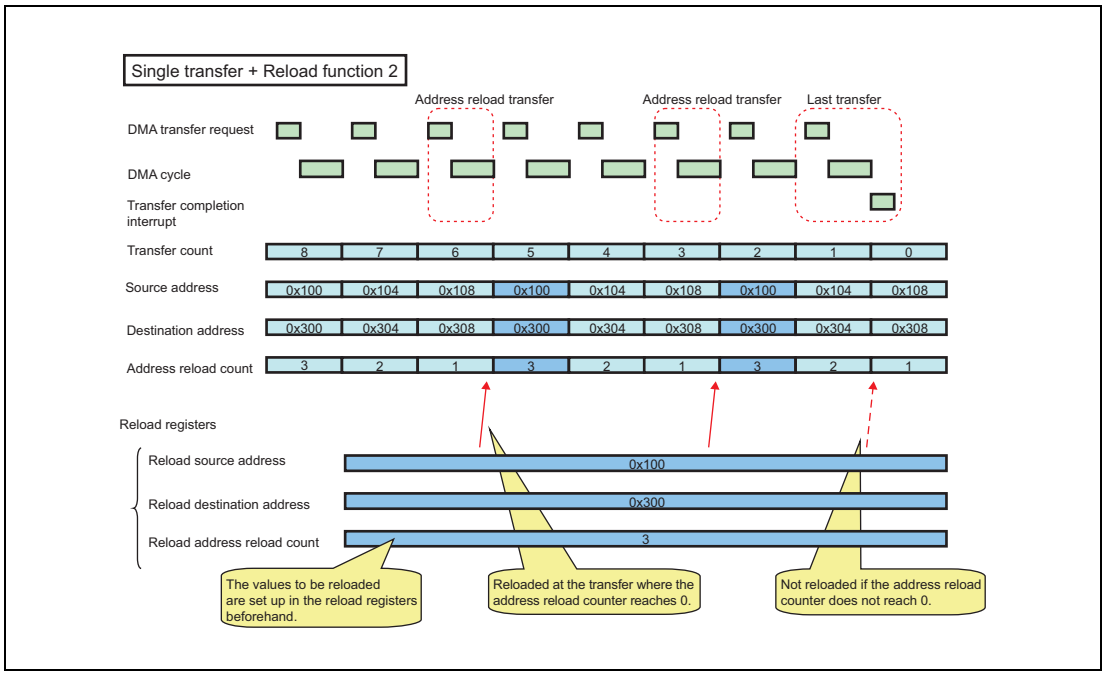

**Figure 8.5 Operation of Reload Function 2**

**Figure 8.6** shows an operation when both the reload function 1 and the reload function 2 are used simultaneously.

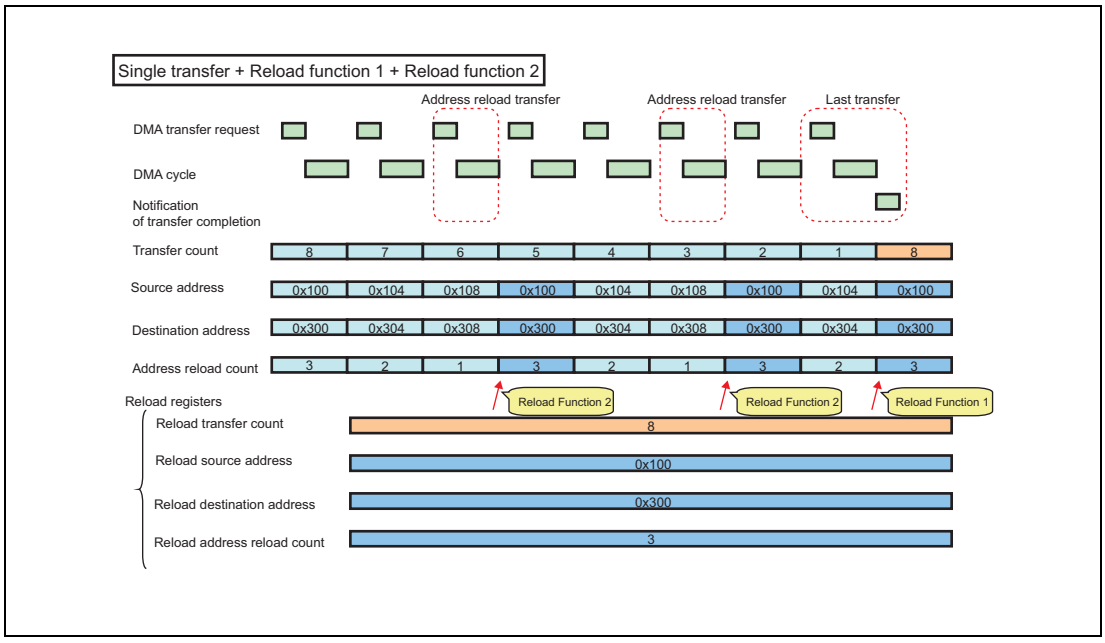

**Figure 8.6 Operation when Combining the Reload Function 1 and the Reload Function 2**

#### 8.3.3.4 Timing of Setting DMAC Reload Registers

You can set up the reload source address register, reload destination address register, and reload transfer count register any time (even during DMA transfer). However, if you update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, there may be a conflict between reloading at the last transfer or address reload transfer and update of the reload register by users. In order to avoid this conflict, setting up reload registers must be completed before the last transfer or address reload transfer starts.

## 8.3.4 Chain Function

### 8.3.4.1 Overview

DMA offers a function called a chain function. With this function, the completion of the DMA cycle or last transfer for one channel can trigger a DMA transfer request for another channel. A DMA transfer request for another channel initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options:

- Always chain: A chain request is generated at the completion of every DMA cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

**Figure 8.7** shows the operation of "always chain."

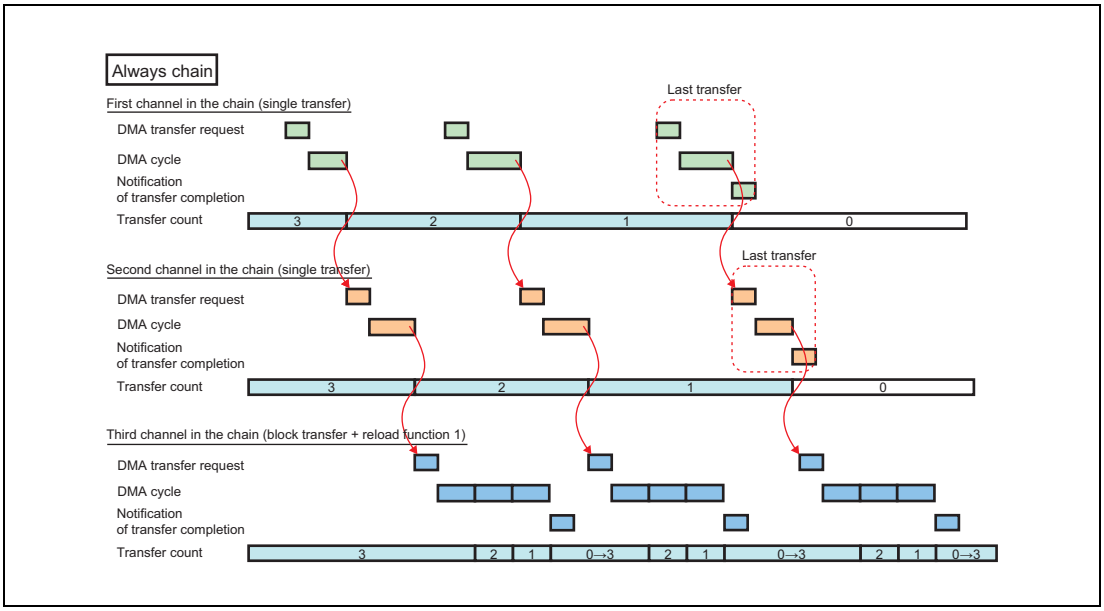

Figure 8.7 Operation of "Always Chain"

**Figure 8.8** shows the operation of "chain at the last transfer."

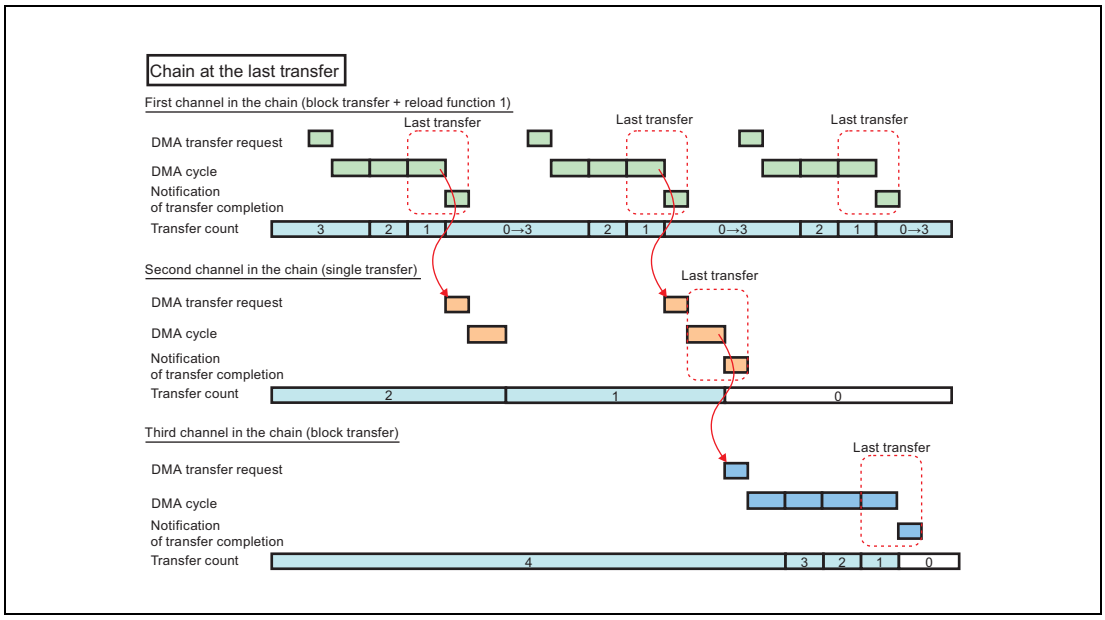

**Figure 8.8 Operation of "Chain at the Last Transfer"**

### 8.3.4.2 Setting Up the Chain Function

For a DMAC, you need to write to the chain enable (DTCTm.CHNE) and the next channel in the chain selection (DTCTm.CHNSEL) in the DMAC transfer control register in order to set up the type of chain function and the next channel number in the chain.

### 8.3.4.3 Caution for Using the Chain Function

The chain function is enabled by setting the software DMA transfer request flag of the next channel in the chain as a part of its function. Therefore, you need to set up the channel settings of the next channel in the chain in the same way as when the software DMA transfer request is used. If you specify a channel using the hardware DMA transfer request for the next channel in the chain, the chain function does not work.

A channel and its next channel in the chain must belong to the same module (DMAC0 and DMAC1). You cannot specify a channel in another module for its next channel in the chain.

## 8.3.5 DMAC Operation

### 8.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request selection assignment (DTCTm.DRS) bit in the DMAC transfer control register (DTCTm) determines whether a hardware DMA transfer request or a software DMA transfer request is used.

In the case of a hardware DMA transfer request for a DMAC, DTFR selects one out of 128 hardware DMA transfer factor and assigned to each channel of the DMAC. This assignment is configured in the DTFR setting registers.

### 8.3.5.2 Generating and Accepting a Software DMA Transfer Request

By setting the software DMA transfer request flag (DCSTm.SR) in the DMAC transfer status register (DCSTm) using the DMAC transfer status set register (DCSTSm), a software DMA transfer request can be generated.

The software DMA transfer request flag is automatically cleared when the DMAC processes the DMA transfer request. The timing when the software DMA transfer request flag is automatically cleared differs depending on the transfer mode of the DMA transfer to be executed.

- In the single transfer mode, the software DMA transfer request flag is cleared whenever the software DMA transfer request is accepted.
- In the block transfer 1 mode, the software DMA transfer request flag is cleared when the last transfer starts.
- In the block transfer 2 mode, the software DMA transfer request flag is cleared when the last transfer or address reload transfer starts.

The software DMA transfer request flag can also be cleared by software using the DMAC transfer status clear register (DCSTCm). When you abort a DMA transfer of a DMAC channel, you must clear the software DMA transfer request flag.

### 8.3.5.3 Executing DMA Transfer

When the DMAC accepts a DMA transfer request for a channel, the DMAC executes DMA transfer of the channel. If there are DMA transfer requests from multiple channels, DMAC does DMAC channel arbitration and decides a channel to be acknowledged.

## 8.4 Suspension, Resume, Transfer Abort, and Clearing of a DMA Transfer Request

### 8.4.1 DMA Suspension and Resume by Software Control

The DMA control register (DMACTL) is used to suspend DMA transfer for all channels.

When the DMA suspension bit (DMACTL.DMASPD) in the DMA control register is set, DMA puts all channels into the suspended state. If all channels are in the suspended state and the DMA suspension bit in the DMA control register is cleared, DMA restores all channels from the suspended state to the normal state and resumes the DMA transfer of the suspended channel.

When all channels are in the suspended state, DMA transfer is suspended for all channels without changing the value of the DCENm.DTE bit of each DMAC channel.

### 8.4.2 Suspension, Resume, and Transfer Abort of a DMAC Channel

You can suspend the DMA transfer of a DMAC channel by clearing the channel operation enable bit (DCENm.DTE) in the DMAC channel operation enable setting register for the channel. If a DMA cycle is ongoing, the DMA transfer of the channel is suspended after the currently ongoing DMA cycle is finished. If you set the DCENm.DTE bit again while the DMA transfer of the channel is suspended, the DMA transfer of the channel is resumed.

If you want to abort the currently ongoing DMA transfer of a DMAC channel, similarly clear the channel operation enable bit (DCENm.DTE) in the DMAC channel operation enable setting register, and then clear the hardware DMA transfer request in the DTFR in the case of a hardware DMA transfer request, or clear the software DMA transfer request flag (DCSTm.SR) using the DMAC transfer request flag clear bit (DCSTCm.SRC) in the DMAC transfer status clear register in the case of a software DMA transfer request.

In case that the continuous transfer enable bit (DTCTm.MLE) is set, the channel operation enable bit (DCENm.DTE) is kept to be set. Even though the channel operation enable bit (DCENm.DTE) is cleared by software during a DMA cycle in a last transfer, the function of the continuous transfer enable bit (DTCTm.MLE) is given high priority and the channel operation enable bit (DCENm.DTE) is set after completion of the last transfer.

If you want to abort an ongoing DMA transfer of a DMAC channel when continuous transfer function is enabled, please clear the continuous transfer enable bit (DTCTm.MLE) first and then clear the channel operation enable bit (DCENm.DTE) to abort DMA transfer of the DMAC channel. Only for the operation, DMAC Transfer Control Register (DTCTm) can be written under the channel operation is enabled (DCENm.DTE = 1).

**Figure 8.9** shows an example of suspension, resume, and transfer abort of a DMAC channel.

In **Figure 8.9**, both channels 0 and 1 execute block transfer. At time tick 1, DMA transfer of channel 1 starts. At time tick 2, a DMA transfer request for channel 0 is accepted. As a result of DMAC channel arbitration, DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 1. At time tick 3, the last transfer of channel 0 is complete, and the remaining DMA transfer in the block transfer of channel 1 starts. At time tick 4, the last transfer of channel 1 is complete. After time tick 5, DMA transfer of channel 0 and DMA transfer of channel 1 are executed similarly. At time tick 7, the DMA transfer of channel 0 is suspended and, as a result of DMAC channel arbitration, the DMA transfer of channel 1 starts. At time tick 8, the last transfer of channel 1 is complete, and then, at time tick 9, the DMA transfer of channel 0 resumes. At time tick 10, the DMA transfer of channel 0 is suspended again, and then, at time tick 11, the DMA transfer of channel 0 is aborted. At time tick 12,

the suspended state for channel 0 is cleared, but the DMA transfer of channel 0 is not executed because the DMA transfer is aborted at time tick 11.

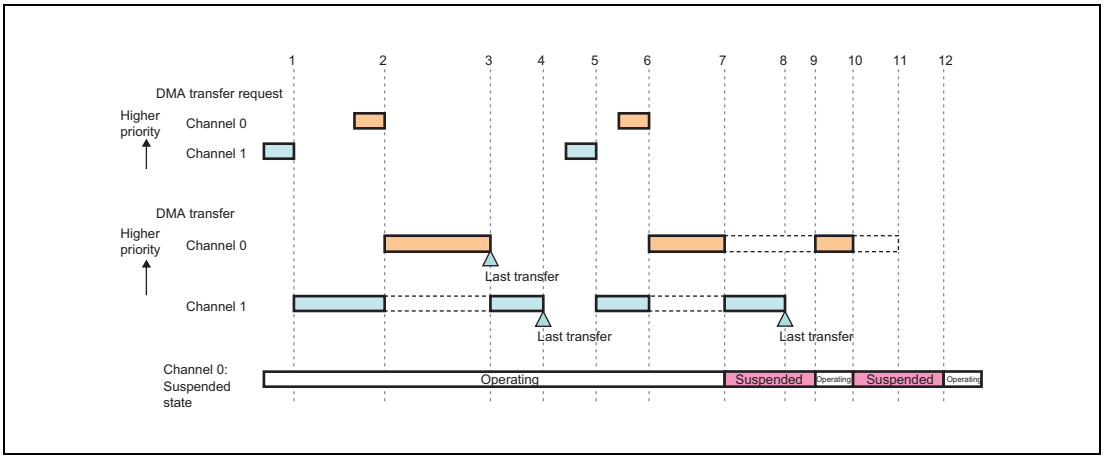

**Figure 8.9 Example of Suspension, Resume, and Transfer Abort of a DMAC Channel**

## 8.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR

If a DMAC uses a hardware DMA transfer request, you can temporarily disable (mask) the hardware DMA transfer request output from the DTFR to the DMAC by clearing the hardware DMA transfer source selection enable bit (DTFRm.REQEN) in the DTFR setting register.

Also, if a hardware DMA transfer source is used, you can clear a hardware DMA transfer request retained in the DTFR by using the hardware DMA transfer request clear (DTFRRQCm.DRQC) bit in the DTFR transfer request clear register.

Even if you suspend or abort DMA transfer of a DMAC channel, the hardware DMA transfer request selection/hold circuit of the DTFR is still running, and consequently, the DTFR may retain a hardware DMA transfer request that was input to the DTFR during the suspension or transfer abort period of the DMAC channel. When you resume or start DMA transfer of a DMAC channel, clear the hardware DMA transfer request retained in the DTFR as required.

In case that DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode, if DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended.

### 8.4.4 List of Suspend, Resume, and Transfer Abort Functions

Table 8.11 List of Suspend, Resume, and Transfer Abort Functions

| Function | How to execute the function | Operation | Possibility of DMA transfer abort | Master that can execute the function (See Section 8.6, Reliability Functions.) |
|---|---|---|---|---|
| DMA suspension and resume by software control | Setting and clearing the DMACTL.DMASPD | All channels are in the suspended state. | Not possible*1 | Special master |
| Suspension and resume of a DMAC channel | Clearing and setting the DCENm.DTE in each channel register*2 | DMA transfer of a channel is suspended. | Possible (by clearing the DMA transfer request flag in suspension state) | Special master, and general master assigned to the channel. |

Note 1. In order to abort DMA transfer, you need to abort transfer for the DMAC channel.

Note 2. In case that the continuous transfer enable bit (DTCTm.MLE) is set, please clear the continuous transfer enable bit (DTCTm.MLE) first before clearing the DCENm.DTE bit to suspend the channel and set the continuous transfer enable bit (DTCTm.MLE) before setting the DCENm.DTE bit to resume the channel.

## 8.5 Error Control

### 8.5.1 Type of Error

DMA can generate the following type of error.

- DMA Transfer Error
  This error is generated when error is detected in the read cycle or write cycle in a DMA cycle.
  This error can be generated in all DMAC channels during execution of DMA transfer.
  A DMA transfer error leads to INTDMAERR interrupt request which is a source of FEINT.

### 8.5.2 DMA Transfer Error

#### 8.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs

When DMA transfer error occurs in a DMAC, the transfer error flag (DCSTm.ER) in the DMAC transfer status register of the channel where the DMA transfer error occurred is set. The DMAC error register (DMACER) shows the transfer error flags of all 16 DMAC channels.

On a channel where the transfer error flag is set, a new DMA cycle is not executed if the transfer disable on transfer error setting (DTCTm.ESE) bit is set. On the other hand, a DMA cycle is executed regardless of the value of the transfer error flag if the transfer error case DMA transfer disable setting (DTCTm.ESE) bit is cleared.

If you want to abort the DMA transfer of a channel where the DMA transfer error occurred is set, follow the procedure to abort DMA transfer of the DMAC channel.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the result of write operation is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address register, destination address register, transfer count register, and address reload count register are updated.

## 8.6 Reliability Functions

### 8.6.1 Overview

In this product, DMA provides the following reliability functions:

- Register access protection function
- Master information inherit function

### 8.6.2 Register Access Protection Function

The register access protection function allows write access to the transfer information of each DMA channel only from the master assigned to the channel and prohibits write access from other masters.

The register access protection function enables you, for example, to prevent the settings of the channel from being updated by masters other than the one assigned to the channel.

#### 8.6.2.1 Identifying the Accessing Master

DMA identifies a master based on the processor element ID number (PEID) of the accessing master, the system protection ID configured by the accessing CPU (SPID), and whether the CPU is in the supervisor mode (PSW.UM=0) or the user mode (PSW.UM=1).

#### 8.6.2.2 Master Access

DMA handles accesses from CPU in the supervisor mode (PSW.UM = 0) as accesses from special masters. Special masters are allowed to read from or write to all DMA registers.

DMA handles the other masters except special masters as general masters. General masters are allowed to read from all DMA registers, but allowed to write to the following specific registers.

- Channel registers of the channels assigned by the channel assignment. (For details, see **Section 8.6.2.3, Channel Assignment**.)

From general masters, write access to registers other than the above is not allowed.

#### 8.6.2.3 Channel Assignment

To each channel, DMA can assign a master so that the master is allowed to use the channel. Channel assignment is configured in the channel master setting register (DMniCM) by the CPU in the supervisor mode (PSW.UM = 0).

In general master access, the master assigned to a channel by the channel assignment is allowed to write the channel registers of the channel. If the channel registers of a channel is written by a master other than the master assigned to the channel, the access is called illegal access. For information about illegal access, see **Section 8.6.2.4, Illegal Access**.

#### 8.6.2.4 Illegal Access

DMA handles the following access as illegal access.

(a) Write access to global registers from general masters

(b) Write access to channel registers from general masters who are not assigned to the channel

DMA never treat read access from any master as illegal access.

DMA's actions against illegal access are as follows:

For both cases (a) and (b),

- Write access is ignored.

Only for the case (b),

- The information about the illegal access is stored in a register access protection violation register.
- The DMAC0 and DMAC1 have their own register access protection violation registers (DM0CMV and DM1CMV respectively).

Only the special master can access the register access protection violation registers. The special master can check whether illegal access has occurred by checking the register access protection violation registers periodically.

In addition, it is recommended that, when a master uses DMA and configures transfer information in the channel registers, the master should check whether the configuration has been successfully completed without illegal access by, for example, reading back the settings.

### 8.6.3 Master Information Inherit Function

In this product, DMA inherits master information that is equivalent to the master information of the master to which the DMA channel is assigned.

The master information that is output from DMA is shown in **Table 8.12**.

**Table 8.12 Master Information That is Output from DMA**

| Meaning | Value that is output from DMA |
|---|---|
| UM | UM bit value in the channel master setting register |
| SPID | SPID bit value in the channel master setting register |
| PEID | PEID bit value in the channel master setting register |
| DMA | 1 |

### 8.6.4 Other Reliability Functions

#### 8.6.4.1 Restriction on the Next Channel in the Chain

The reliability function limits the channels you can select as the next channel in the chain.

When you use the chain function, the channel master settings of a channel and its next channel in the chain must be the same.

The chain function is designed so that a channel and its next channel in the chain are managed by the same master.

When DMA detects that different masters are assigned to a channel and its next channel in the chain, it is deemed illegal and the chain function is suppressed. More specifically, when DMA tries to execute the chain function, DMA compares the chain master settings of the channel and its next channel in the chain, and if the settings are the same for both PEID and UM, the chain function is allowed and a chain request is sent to the next channel. If the channel master settings are not the same for either PEID or UM, a chain request is not sent.

# 8.7 Setting Up DMA Transfer

## 8.7.1 Overview of Setting Up DMA

Table 8.13 Overview of Setting Up DMA

| No. | Master that Configures the Setting | Description | Register | | Necessity of the Setting |
|---|---|---|---|---|---|
| 1 | Special master (CPU in the supervisor mode (UM = 0)) | Overall DMA operation setting | DM00CM to DM17CM | DMAC channel master setting | Mandatory |
| 2 | | Status clear | CMVC | Channel protection violation clear register | Recommended |
| 3 | Master assigned to the DMAC channel | Channel setting | DSAm | DMAC source address | Mandatory |
| 4 | | | DDAm | DMAC destination address | Mandatory |
| 5 | | | DTCm | DMAC transfer count | Mandatory |
| 6 | | | DTCTm | DMAC transfer control | Mandatory |
| 7 | | | DRSAm | DMAC reload source address | Mandatory if the reload function is used |
| 8 | | | DRDAm | DMAC reload destination address | Mandatory if the reload function is used |
| 9 | | | DRTCm | DMAC reload transfer count | Mandatory if the reload function is used |
| 10 | | | DTFRm | DTFR setting register | Mandatory |
| 11 | | Status clear | DCSTCm | DMAC transfer status clear | Mandatory |
| 12 | | | DTFRRQCm | DTFR transfer request clear | Recommended |
| 13 | | Channel operation enable | DCENm | DMAC channel operation enable setting | Mandatory |

## 8.7.2 Setting Up the Overall DMA Operation

You need to set up the overall DMA operation before you start using DMA.

To configure the overall DMA operation, the special master (a CPU in the supervisor mode (UM = 0)) needs to set up global registers. Global registers can be set up only by special master access. For details, see **Section 8.6, Reliability Functions**.

The following register must be set up to configure the overall DMA operation.

- DMAC channel master setting registers (DMniCM)

These registers configure channel assignment. (For details, see **Section 8.6, Reliability Functions**.)

If the DMAC channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

Also, if errors are detected in the following registers while the overall DMA operation is set up, clearing the errors is recommended.

- DMAC0 register access protection violation register (DM0CMV)
- DMAC1 register access protection violation register (DM1CMV)

## 8.7.3 Setting Up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC.

To configure the DMA channel setting, each channel's master assigned by the channel assignment sets channel registers.

### 8.7.3.1 Setting Up the DMAC Channel Setting

Follow the procedure below to set up the DMAC channel setting in case of using DMAC.

#### (1) Disabling the DMAC Channel Operation

If the channel operation enable (DCENm.DTE) in the DMAC channel operation enable setting register (DCENm) is set, clear the DCENm.DTE bit to disable the channel operation.

#### (2) Setting Up the Transfer Information

When you set up the transfer information of the DMAC, the following registers need to be set up.

- DMAC source address register (DSAm)
- DMAC destination address register (DDAm)
- DMAC transfer count register (DTCm)
- DMAC transfer control register (DTCTm)
- DMAC reload source address register (DRSAm)
- DMAC reload destination address register (DRDAm)
- DMAC reload transfer count register (DRTCm)

### (3) Setting Up the DMA Transfer Request

While setting the transfer information, you need to set up the DMA transfer request selection assignment (DTCTm.DRS) bit in the DMAC transfer control register (DTCTm) to define whether the hardware or software DMA transfer request is used.

You cannot use both the hardware and software DMA transfer requests for the same channel at the same time.

If you use the hardware DMA transfer request, you need to select the source used as the hardware DMA transfer request out of 128 hardware DMA transfer sources using the hardware DMA transfer source selection (DTFRm.REQSEL) in the DTFR setting register. Also, you need to enable the hardware DMA transfer source selection (DTFRm.REQEN) in the same register.

The DTFR may retain a hardware DMA transfer request before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (DTFRRQm.DRQ) retained in the DTFR using the DTFR transfer request clear register (DTFRRQCm) if necessary.

If you use the software DMA transfer request, disable the hardware DMA transfer source selection (DTFRm.REQEN) in the DTFR setting register.

### (4) Clearing the Transfer Status

The DMAC transfer status register (DCSTm) may retain the result of the previous DMA transfer, so clear the flags in the DMAC transfer status register using the DMAC transfer status clear register (DCSTCm).

### (5) Enabling the DMAC Channel Operation

Set the channel operation enable (DCENm.DTE) bit in the DMAC channel operation enable setting register to enable the channel operation.

After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and become ready for DMA transfer.

# 8.8 Global Registers

## 8.8.1 List of Global Register Address

The global register addresses are listed in the table below.

For <DMA_base>, see **Section 8.1.2, Register Base Address**.

**Table 8.14 List of Global Register Addresses**

| Unit Name | Register Name | Register Symbol | Address | Access Permission | |
|---|---|---|---|---|---|
| | | | | Special Master | General Master |
| DMAC | DMA control register | DMACTL | <DMA_base> + $0000_H$ | √ | —*1 |
| | DMAC error register | DMACER | <DMA_base> + $0020_H$ | √ | √ |
| | DMAC0 register access protection violation register | DM0CMV | <DMA_base> + $0030_H$ | √ | —*1 |
| | DMAC1 register access protection violation register | DM1CMV | <DMA_base> + $0034_H$ | √ | —*1 |
| | Register access protection violation clear register | CMVC | <DMA_base> + $003C_H$ | √ | —*1 |
| | DMAC0 channel 0 channel master setting | DM00CM | <DMA_base> + $0100_H$ | √ | —*1 |
| | DMAC0 channel 1 channel master setting | DM01CM | <DMA_base> + $0104_H$ | √ | —*1 |
| | DMAC0 channel 2 channel master setting | DM02CM | <DMA_base> + $0108_H$ | √ | —*1 |
| | DMAC0 channel 3 channel master setting | DM03CM | <DMA_base> + $010C_H$ | √ | —*1 |
| | DMAC0 channel 4 channel master setting | DM04CM | <DMA_base> + $0110_H$ | √ | —*1 |
| | DMAC0 channel 5 channel master setting | DM05CM | <DMA_base> + $0114_H$ | √ | —*1 |
| | DMAC0 channel 6 channel master setting | DM06CM | <DMA_base> + $0118_H$ | √ | —*1 |
| | DMAC0 channel 7 channel master setting | DM07CM | <DMA_base> + $011C_H$ | √ | —*1 |
| | DMAC1 channel 0 channel master setting | DM10CM | <DMA_base> + $0120_H$ | √ | —*1 |
| | DMAC1 channel 1 channel master setting | DM11CM | <DMA_base> + $0124_H$ | √ | —*1 |
| | DMAC1 channel 2 channel master setting | DM12CM | <DMA_base> + $0128_H$ | √ | —*1 |
| | DMAC1 channel 3 channel master setting | DM13CM | <DMA_base> + $012C_H$ | √ | —*1 |
| | DMAC1 channel 4 channel master setting | DM14CM | <DMA_base> + $0130_H$ | √ | —*1 |
| | DMAC1 channel 5 channel master setting | DM15CM | <DMA_base> + $0134_H$ | √ | —*1 |
| | DMAC1 channel 6 channel master setting | DM16CM | <DMA_base> + $0138_H$ | √ | —*1 |
| | DMAC1 channel 7 channel master setting | DM17CM | <DMA_base> + $013C_H$ | √ | —*1 |

Note 1. The registers are read only for general master.

## 8.8.2 Details of Global Registers

### 8.8.2.1 DMACTL — DMA Control Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0000_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DMA SPD |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 8.15 DMACTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DMASPD | DMA suspension<br>This bit indicates that DMA transfer for all channels is suspended. If a user writes 1 to this bit, DMA transfer for all channels can be suspended. If a user writes 0 to this bit, suspension of DMA transfer for all channels can be released. The suspension controlled by this bit is independent from the suspension controlled by the transfer enable bit (DCENm.DTE) of each DMAC channel. That means, if this bit is set to 1, all DMA transfers are suspended regardless of the values of the DCENm.DTE bit of each DMAC channel.<br>Writing to this bit does not affect the DCENm.DTE bit of each DMAC channel.<br>0: DMA suspension cleared<br>1: DMA suspension request/DMA suspension ongoing |

### 8.8.2.2 DMACER — DMAC Error Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA_base> + $0020_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 8.16 DMACER Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 8 | DM1ER[7:0] | DMAC1 DMA transfer error status<br>These bits show the DMA transfer error status of channels 0 through 7 of the DMAC1.<br>Each bit is mapped from the DCSTm.ER bit of each channel of the DMAC1 and is read-only.<br>0: DMA transfer error is not generated<br>1: DMA transfer error is generated |
| 7 to 0 | DM0ER[7:0] | DMAC0 DMA transfer error status<br>These bits show the DMA transfer error status of channels 0 through 7 of the DMAC0.<br>Each bit is mapped from the DCSTm.ER bit of each channel of the DMAC0 and is read-only.<br>0: DMA transfer error is not generated<br>1: DMA transfer error is generated |

### 8.8.2.3 DM0CMV — DMAC0 Register Access Protection Violation Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA_base> + $0030_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | PEID2 | PEID1 | PEID0 | SPID1 | SPID0 | UM | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | VCH2 | VCH1 | VCH0 | — | — | — | VF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 8.17 DM0CMV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset is returned. |
| 22 to 17 | PEID[2:0]<br>SPID[1:0]<br>UM | Illegal access master information<br>These bits retain the accessing master information of the first illegal access after the DM0CMV.VF bit is cleared to 0.<br>If illegal access occurs while the DM0CMV.VF bit is 1, these bits do not change.<br>These bits are read-only and cannot be cleared. |
| 16 to 7 | Reserved | When read, the value after reset is returned. |
| 6 to 4 | VCH[2:0] | Channel where an illegal access occurred.<br>These bits retain the channel number (0 to 7) of the first illegal access after the DM0CMV.VF bit is cleared to 0.<br>If illegal access occurs while the DM0CMV.VF bit is 1, these bits do not change.<br>These bits are read-only and cannot be cleared. |
| 3 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | VF | Illegal access flag<br>This bit shows whether illegal access occurred in the DMAC0.<br>0: No illegal access has occurred in the DMAC0<br>1: Illegal access has occurred in the DMAC0<br>If illegal access occurs in the DMAC0 while this bit is 0, this bit is set, and DM0CMV.PEID[2:0], DM0CMV.SPID[1:0], DM0CMV.UM and DM0CMV.VCH[2:0] store their respective information.<br>If illegal access occurs in the DMAC0 while this bit is 1, this bit remains 1, and the contents of DM0CMV.PEID[2:0], DM0CMV.SPID[1:0], DM0CMV.UM and DM0CMV.VCH[2:0] do not change.<br>This bit can be cleared by using the CMVC register. |

### 8.8.2.4 DM1CMV — DMAC1 Register Access Protection Violation Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA_base> + $0034_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | PEID2 | PEID1 | PEID0 | SPID1 | SPID0 | UM | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | VCH2 | VCH1 | VCH0 | — | — | — | VF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 8.18 DM1CMV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset is returned. |
| 22 to 17 | PEID[2:0]<br>SPID[1:0]<br>UM | Illegal access master information<br>These bits retain the accessing master information of the first illegal access after the DM1CMV.VF bit is cleared to 0.<br>If illegal access occurs while the DM1CMV.VF bit is 1, these bits do not change.<br>These bits are read-only and cannot be cleared. |
| 16 to 7 | Reserved | When read, the value after reset is returned. |
| 6 to 4 | VCH[2:0] | Channel where an illegal access occurred.<br>These bits retain the channel number (0 to 7) of the first illegal access after the DM1CMV.VF bit is cleared to 0.<br>If illegal access occurs while the DM1CMV.VF bit is 1, these bits do not change.<br>These bits are read-only and cannot be cleared. |
| 3 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | VF | Illegal access flag<br>This bit shows whether illegal access occurred in the DMAC1.<br>0: No illegal access has occurred in the DMAC1<br>1: Illegal access has occurred in the DMAC1<br>If illegal access occurs in the DMAC1 while this bit is 0, this bit is set, and DM1CMV.PEID[2:0], DM1CMV.SPID[1:0], DM1CMV.UM and DM1CMV.VCH[2:0] store their respective information.<br>If illegal access occurs in the DMAC1 while this bit is 1, this bit remains 1, and the contents of DM1CMV.PEID[2:0], DM1CMV.SPID[1:0], DM1CMV.UM and DM1CMV.VCH[2:0] do not change.<br>This bit can be cleared by using the CMVC register. |

### 8.8.2.5 CMVC — Register Access Protection Violation Clear Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $003C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DM1VC | DM0VC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 8.19 CMVC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DM1VC | DMAC1 illegal access flag clear<br>The DMAC1 illegal access flag (DM1CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0. |
| 0 | DM0VC | DMAC0 illegal access flag clear<br>The DMAC0 illegal access flag (DM0CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0. |

### 8.8.2.6 DMniCM — DMAC Channel Master Setting (ni = 00 to 07 and 10 to 17)

**Access:** This register can be read or written in 32-bit units.

**Address:** DM0iCM: <DMA_base> + $0100_H$ + $4_H$ × Ch. No. i (i = 0 to 7)
DM1iCM: <DMA_base> + $0120_H$ + $4_H$ × Ch. No. i (i = 0 to 7)

**Value after reset:** $0000\ 0010_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | PEID2 | PEID1 | PEID0 | SPID1 | SPID0 | UM | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R |

**Table 8.20 DMniCM Register Contents**

| Bit Position | Bit Name | Function ion |
|---|---|---|
| 31 to 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 4 | PEID[2:0] | Channel master PEID setting<br>Specifies the PEID information of the master assigned to the channel. |
| 3, 2 | SPID[1:0] | Channel master SPID setting<br>Specifies the SPID information used by the master assigned to the channel. |
| 1 | UM | Channel master UM setting<br>0: Enables access in supervisor mode.<br>1: Enables access in user mode and supervisor mode. |
| 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**CAUTION**

DM00CM to DM07CM configure the channel master information of the DMAC0 channel 0 to 7 respectively.

DM10CM to DM17CM configure the channel master information of the DMAC1 channel 0 to 7 respectively.

For information about the functions this register offers, see **Section 8.6, Reliability Functions**.

# 8.9 DMAC Channel Registers

## 8.9.1 DMAC Channel Register Addresses

The DMAC channel registers are listed in the table below.

For <DMA_base>, see **Section 8.1.2, Register Base Address**.

**Table 8.21 DMAC Channel Register Addresses**

| Unit Name | Register Name | Register Symbol | Address | Access Permission | |
|---|---|---|---|---|---|
| | | | | Special Master | General Master |
| DMAC | DMAC source address | DSAm | <DMA_base> + $0400_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC destination address | DDAm | <DMA_base> + $0404_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC transfer count | DTCm | <DMA_base> + $0408_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC transfer control | DTCTm | <DMA_base> + $040C_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC reload source address | DRSAm | <DMA_base> + $0410_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC reload destination address | DRDAm | <DMA_base> + $0414_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC reload transfer count | DRTCm | <DMA_base> + $0418_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC channel operation enable setting | DCENm | <DMA_base> + $0420_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC transfer status | DCSTm | <DMA_base> + $0424_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC transfer status set | DCSTSm | <DMA_base> + $0428_H$ + $40_H$ × [channel number] | √ | √ |
| | DMAC transfer status clear | DCSTCm | <DMA_base> + $042C_H$ + $40_H$ × [channel number] | √ | √ |
| | DTFR setting | DTFRm | <DMA_base> + $0430_H$ + $40_H$ × [channel number] | √ | √ |
| | DTFR transfer request status | DTFRRQm | <DMA_base> + $0434_H$ + $40_H$ × [channel number] | √ | √ |
| | DTFR transfer request clear | DTFRRQCm | <DMA_base> + $0438_H$ + $40_H$ × [channel number] | √ | √ |

Note 1. The [channel number] in the offset addresses and “m” in the register symbols are numbers in the range from 0 to 15, and the correspondence is as follows.

| Channel number m | Channel |
|---|---|
| 0 | DMAC0 channel 0 |
| 1 | DMAC0 channel 1 |
| 2 | DMAC0 channel 2 |
| 3 | DMAC0 channel 3 |
| 4 | DMAC0 channel 4 |
| 5 | DMAC0 channel 5 |
| 6 | DMAC0 channel 6 |
| 7 | DMAC0 channel 7 |
| 8 | DMAC1 channel 0 |
| 9 | DMAC1 channel 1 |
| 10 | DMAC1 channel 2 |
| 11 | DMAC1 channel 3 |
| 12 | DMAC1 channel 4 |
| 13 | DMAC1 channel 5 |
| 14 | DMAC1 channel 6 |
| 15 | DMAC1 channel 7 |

## 8.9.2 Details of DMAC Channel Registers

The “m” in the register symbols indicates the DMA channel number (m = 0 to 15).

### 8.9.2.1 DSAm — DMAC Source Address Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0400_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SA31 | SA30 | SA29 | SA28 | SA27 | SA26 | SA25 | SA24 | SA23 | SA22 | SA21 | SA20 | SA19 | SA18 | SA17 | SA16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SA15 | SA14 | SA13 | SA12 | SA11 | SA10 | SA9 | SA8 | SA7 | SA6 | SA5 | SA4 | SA3 | SA2 | SA1 | SA0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 8.22 DSAm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | SA[31:0] | Source address<br>Specifies the DMA transfer source address. These bits are updated whenever a DMA cycle is executed. If you read from these bits, the transfer source address for the next DMA cycle is read. |

**CAUTIONS**

1. It is forbidden to write to these bits when the channel operation is enabled (DCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the source address is updated.
3. DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.)
   The correct operation is not guaranteed if you set otherwise than the following table.

| Data Size | SA3 | SA2 | SA1 | SA0 |
|---|---|---|---|---|
| 8 bits | × | × | × | × |
| 16 bits | × | × | × | 0 |
| 32 bits | × | × | 0 | 0 |
| 64 bits | × | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

### 8.9.2.2 DDAm — DMAC Destination Address Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0404_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DA31 | DA30 | DA29 | DA28 | DA27 | DA26 | DA25 | DA24 | DA23 | DA22 | DA21 | DA20 | DA19 | DA18 | DA17 | DA16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DA15 | DA14 | DA13 | DA12 | DA11 | DA10 | DA9 | DA8 | DA7 | DA6 | DA5 | DA4 | DA3 | DA2 | DA1 | DA0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 8.23 DDAm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | DA[31:0] | Destination address<br>Specifies the DMA transfer destination address. These bits are updated whenever a DMA cycle is executed. If you read from these bits, the transfer destination address for the next DMA cycle is read. |

**CAUTIONS**

1. It is forbidden to write to these bits when the channel operation is enabled (DCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
3. DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.)
   The correct operation is not guaranteed if you set otherwise than the following table.

| Data Size | DA3 | DA2 | DA1 | DA0 |
|---|---|---|---|---|
| 8 bits | × | × | × | × |
| 16 bits | × | × | × | 0 |
| 32 bits | × | × | 0 | 0 |
| 64 bits | × | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

### 8.9.2.3 DTCm — DMAC Transfer Count Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0408_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ARC15 | ARC14 | ARC13 | ARC12 | ARC11 | ARC10 | ARC9 | ARC8 | ARC7 | ARC6 | ARC5 | ARC4 | ARC3 | ARC2 | ARC1 | ARC0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TRC15 | TRC14 | TRC13 | TRC12 | TRC11 | TRC10 | TRC9 | TRC8 | TRC7 | TRC6 | TRC5 | TRC4 | TRC3 | TRC2 | TRC1 | TRC0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 8.24 DTCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | ARC[15:0] | Address reload count<br>Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. If you read from those bits during DMA transfer, the address reload count for the next DMA cycle is read.<br>When the reload function 2 or block transfer 2 is used, DTCm.ARC[15:0] is decremented by one for every DMA cycle. When the reload function 2 or block transfer 2 is not used, DTCm.ARC[15:0] is not updated.<br>If the value is 0000H, it means that the number of transfers until the address reload when the reload function 2 is used and the number of transfers when the block transfer 2 is used are 65536. |
| 15 to 0 | TRC[15:0] | Transfer count<br>Configures the number of transfers. DTCm.TRC[15:0] is decremented by one whenever a DMA cycle is executed. If you read from those bits, the remaining number of transfers for the next DMA cycle is read. If the reload function is not used, after the last transfer is complete, the value at the completion (0000H) is retained. |

| TRC15-0 | Operation |
|---|---|
| $0000_H$ | The number of transfers is 65536, or the transfer is complete. |
| $0001_H$ | The number of transfers is 1, or remaining transfer count is 1. |
| : | : |
| $FFFF_H$ | The number of transfers is 65535, or remaining transfer count is 65535. |

**CAUTIONS**

1. It is forbidden to write to those bits when the channel operation is enabled (DCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.

### 8.9.2.4 DTCTm — DMAC Transfer Control Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $040C_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | ESE | DRS | — | — | — | — | — | CHNSEL2 | CHNSEL1 | CHNSEL0 | CHNE1 | CHNE0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | TCE | MLE | RLD2M1 | RLD2M0 | RLD1M1 | RLD1M0 | DACM1 | DACM0 | SACM1 | SACM0 | DS2 | DS1 | DS0 | TRM1 | TRM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 8.25 DTCTm Register Contents (1/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 27 | ESE | DMA transfer disable on transfer error setting<br>Specifies whether to execute a DMA cycle when the DCSTm.ER bit is set due to DMA transfer error.<br>If this bit is cleared to 0, even when the DCSTm.ER bit is set due to DMA transfer error, the following DMA cycles can be executed. If this bit is set to 1, the following DMA cycles are not executed when the DCSTm.ER bit is set due to DMA transfer error.<br>0: DMA cycles are executed while the DCSTm.ER bit is set.<br>1: DMA cycles are not executed while the DCSTm.ER bit is set. |
| 26 | DRS | DMA transfer request selection assignment<br>Selects the type of DMA transfer requests to be accepted.<br>0: Software DMA transfer request<br>1: Hardware DMA transfer request |
| 25 to 21 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 18 | CHNSEL[2:0] | Selection of next channel in the chain<br>Specifies the next channel in the chain.<br>The next channel must be another channel in the same DMAC. You cannot specify a channel in the different DMAC. It is prohibited to specify the channel as the next channel in the chain. (If you do, the correct operation is not guaranteed.) |
| 17, 16 | CHNE[1:0] | Chain enable<br>Selects the chain function.<br>00: Disabled<br>01: Chain at the last transfer<br>A chain request is generated at the completion of the DMA cycle when the remaining transfer count is one.<br>10: Setting prohibited. (The operation is not guaranteed.)<br>11: Always chain<br>A chain request is generated at the completion of every DMA cycle. |
| 15 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 | TCE | Transfer completion interrupt enable<br>If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer. |

**Table 8.25 DTCTm Register Contents (2/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 13 | MLE | Continuous transfer enable<br>If this bit is set, the DCENm.DTE bit is not cleared at the completion of DMA transfer. Even if the DCSTm.TC bit is not cleared, DMA transfer starts when there is a DMA transfer request.<br>0: The DCENm.DTE bit is cleared at the completion of DMA transfer. The next DMA transfer starts only after the DCSTm.TC bit is cleared.<br>1: The DCENm.DTE bit is not cleared at the completion of DMA transfer. Even if the DCSTm.TC bit is not cleared, DMA transfer starts when there is a DMA transfer request. |
| 12, 11 | RLD2M[1:0] | Reload function 2 setting<br>Specifies the reload function 2.<br>00: Reload function 2 is disabled.<br>01: Reload function 2 is enabled.<br>The source address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1.<br>10: Reload function 2 is enabled.<br>The destination address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1.<br>11: Reload function 2 is enabled.<br>The source address, destination address, and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. |
| 10, 9 | RLD1M[1:0] | Reload function 1 setting<br>Specifies the reload function 1.<br>00: Reload function 1 is disabled.<br>01: Reload function 1 is enabled.<br>The source address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.)<br>10: Reload function 1 is enabled.<br>The destination address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.)<br>11: Reload function 1 is enabled.<br>The source address, destination address, and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) |
| 8, 7 | DACM[1:0] | Destination address count direction<br>Specifies the count direction of the destination address.<br>**DACM1 / DACM0 / Direction of Count**<br>0 / 0 / Increment<br>0 / 1 / Decrement<br>1 / 0 / Fixed<br>1 / 1 / Setting prohibited (The operation is not guaranteed.) |
| 6, 5 | SACM[1:0] | Source address count direction<br>Specifies the count direction of the source address.<br>**SACM1 / SACM0 / Direction of Count**<br>0 / 0 / Increment<br>0 / 1 / Decrement<br>1 / 0 / Fixed<br>1 / 1 / Setting prohibited (The operation is not guaranteed.) |

**Table 8.25 DTCTm Register Contents (3/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 4 to 2 | DS[2:0] | Transfer data size<br>Specifies the transfer data size. |
| 1, 0 | TRM[1:0] | Transfer mode<br>Specifies the DMA transfer mode.<br>00: Single transfer<br>01: Block transfer 1 (The number of transfers is specified by the transfer count.)<br>10: Block transfer 2 (The number of transfers is specified by the address reload count.)<br>11: Setting prohibited (The operation is not guaranteed.) |

| DS2 | DS1 | DS0 | Transfer Data Size |
|---|---|---|---|
| 0 | 0 | 0 | 8 bits |
| 0 | 0 | 1 | 16 bits |
| 0 | 1 | 0 | 32 bits |
| 0 | 1 | 1 | 64 bits |
| 1 | 0 | 0 | 128 bits |
| Other than the above | | | Setting prohibited (The operation is not guaranteed.) |

**CAUTIONS**

1. Except for the case to clear DTCTm.MLE bit, it is forbidden to write to those bits when the channel operation is enabled (DCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If forbidden settings are used for each bits, the correct operation is not guaranteed.

### 8.9.2.5 DRSAm — DMAC Reload Source Address Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0410_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RSA31 | RSA30 | RSA29 | RSA28 | RSA27 | RSA26 | RSA25 | RSA24 | RSA23 | RSA22 | RSA21 | RSA20 | RSA19 | RSA18 | RSA17 | RSA16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RSA15 | RSA14 | RSA13 | RSA12 | RSA11 | RSA10 | RSA9 | RSA8 | RSA7 | RSA6 | RSA5 | RSA4 | RSA3 | RSA2 | RSA1 | RSA0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 8.26 DRSAm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | RSA[31:0] | Reload source address<br>Specifies the source address to be reloaded to the DMA source address register when the reload function 1 or reload function 2 is used. |

**CAUTION**

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

| Data Size | RSA3 | RSA2 | RSA1 | RSA0 |
|---|---|---|---|---|
| 8 bits | × | × | × | × |
| 16 bits | × | × | × | 0 |
| 32 bits | × | × | 0 | 0 |
| 64 bits | × | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

### 8.9.2.6 DRDAm — DMAC Reload Destination Address Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0414_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 8.27 DRDAm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | RDA[31:0] | Reload destination address<br>Specifies the destination address to be reloaded to the DMA destination address register when the reload function 1 or reload function 2 is used. |

**CAUTION**

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

| Data Size | RDA3 | RDA2 | RDA1 | RDA0 |
|---|---|---|---|---|
| 8 bits | × | × | × | × |
| 16 bits | × | × | × | 0 |
| 32 bits | × | × | 0 | 0 |
| 64 bits | × | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

### 8.9.2.7 DRTCm — DMAC Reload Transfer Count Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0418_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RARC15 | RARC14 | RARC13 | RARC12 | RARC11 | RARC10 | RARC9 | RARC8 | RARC7 | RARC6 | RARC5 | RARC4 | RARC3 | RARC2 | RARC1 | RARC0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 8.28 DRTCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | RARC[15:0] | Reload address reload count<br>Specifies the value to be reloaded to the address reload count in the transfer count register at the timing of reload when the reload function 2 is used. |
| 15 to 0 | RTRC[15:0] | Reload transfer count<br>Specifies the value to be reloaded to the transfer count in the transfer count register at the timing of reload when the reload function 1 is used. |

### 8.9.2.8 DCENm — DMAC Channel Operation Enable Setting Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0420_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DTE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 8.29 DCENm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DTE | Channel operation enable<br>Specifies whether to enable or disable the transfer operation of the channel. If the DCENm.DTE bit is 1, DMA transfer starts when there is a DMA transfer request. If the DTCTm.MLE bit is 0, this bit is automatically cleared when DMA transfer is completed. In addition, if 0 is written to the DCENm.DTE bit during DMA transfer, the DMA transfer is suspended. If 1 is written to the DCENm.DTE bit during suspension, the suspension is cleared and the DMA transfer resumes.<br>0: Channel operation is disabled/Channel suspended<br>1: Channel operation is enabled/Channel suspension cleared |

### 8.9.2.9 DCSTm — DMAC Transfer Status Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA_base> + $0424_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | ERWR | — | — | CY | ER | — | — | TC | — | — | DR | SR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 8.30 DCSTm Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 12 | Reserved | When read, the value after reset is returned. |
| 11 | ERWR | DMA Transfer Error occurring cycle<br>This bit is updated at the same time as setting of the DMA transfer error flag (DCSTm.ER), indicating in which cycle of read or write the DMA transfer error occurred. This bit is not updated when a new DMA transfer error occurs after the DCSTm.ER bit has been set. If the DCSTm.ER bit is cleared, this bit is also cleared to 0.<br>0: DMA transfer error occurs in the read cycle.<br>1: DMA transfer error occurs in the write cycle. |
| 10, 9 | Reserved | When read, the value after reset is returned. |
| 8 | CY | DMA cycle execution state<br>This bit shows whether a DMA cycle is ongoing in this channel.<br>0: DMA cycle is not ongoing.<br>1: DMA cycle is ongoing. |
| 7 | ER | Transfer error flag<br>This bit is set when DMA transfer error is generated. If this bit is 1 and the DTCTm.ESE bit is set, a DMA cycle is not executed even when a DMA transfer request is generated.<br>0: No DMA transfer error is generated<br>1: DMA transfer error is generated |
| 6, 5 | Reserved | When read, the value after reset is returned. |
| 4 | TC | Transfer completion flag<br>This bit is set at the completion of the last transfer and indicates that the DMA transfer is complete. If the DTCTm.MLE bit is 0 and this bit is 1, a DMA cycle is not executed when a DMA transfer request is generated.<br>0: DMA transfer is incomplete<br>1: DMA transfer is complete |
| 3, 2 | Reserved | When read, the value after reset is returned. |
| 1 | DR | Hardware DMA transfer request status<br>This bit shows whether there is a hardware DMA transfer request (DMARQ) from the DTFR.<br>This bit changes regardless of the value of the DCENm.DTE bit when a hardware DMA transfer request from the DTFR is generated. If the software DMA transfer request has been selected in the transfer request selection bit (DTCTm.DRS) in the DMAC transfer control register, this bit is not set even when a hardware DMA transfer request is input from the DTFR.<br>0: There is no hardware DMA transfer request<br>1: There is a hardware DMA transfer request |

Table 8.30 DCSTm Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | SR | Software DMA transfer request flag<br>This bit shows whether there is a software DMA transfer request. This bit is automatically cleared when executing the DMA transfer. A user can set this bit by writing 1 to the DCSTSm.SRS bit in the DMAC transfer status set register (DCSTSm). In addition, a user can clear this bit by writing 1 to the DCSTCm.SRC bit in the DMAC transfer status clear register (DCSTCm), but if this is done, the ongoing DMA transfer is aborted and cannot be resumed.<br>0: There is no software DMA transfer request<br>1: There is a software DMA transfer request |

### 8.9.2.10 DCSTSm — DMAC Transfer Status Set Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0428_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

**Table 8.32 DCSTCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ERC | Transfer error flag clear<br>The DMA transfer error flag (DCSTm.ER) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.. |
| 6, 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | TCC | Transfer completion flag clear<br>The transfer completion flag (DCSTm.TC) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.. |
| 3 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SRC | Software DMA transfer request flag clear<br>The software DMA transfer request flag (DCSTm.SR) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.. |

### 8.9.2.12 DTFRm — DTFR Setting Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA_base> + $0430_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | REQSEL6 | REQSEL5 | REQSEL4 | REQSEL3 | REQSEL2 | REQSEL1 | REQSEL0 | REQEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 8.33 DTFRm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 1 | REQSEL[6:0] | Hardware DMA transfer source selection<br>Selects one out of 128 hardware DMA transfer sources as the hardware DMA transfer request.<br>000_0000: Select the DMACTRG[0] input<br>:<br>111_1111: Select the DMACTRG[127] input |
| 0 | REQEN | Hardware DMA transfer source selection enable<br>This bit enables/disables the hardware DMA transfer source selection.<br>0: Hardware DMA transfer source selection is disabled.<br>1: Hardware DMA transfer source selection is enabled.<br>If this bit is 0, even when the hardware DMA transfer source selected by the DTFRm.REQSEL[6:0] bits is activated, it is not recognized as a hardware DMA transfer request, and a hardware DMA transfer request is not generated. |

### 8.9.2.13 DTFRRQm — DTFR Transfer Request Status Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA_base> + $0434_H$ + $40_H$ × Ch. No. m (m = 0 to 15)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 8.35 DTFRRQCm Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DRQC | Hardware DMA transfer request clear<br>A user can clear the DTFRRQm.DRQ bit by writing 1 to this bit.<br>When read, this bit is always read as 0. |

# Section 9 Reset Controller

## 9.1 Overview

Several system reset functions are provided in order to initialize CPU core and peripheral functions as well as their associated registers.

A reset can be caused by the following events:

- External reset ($\overline{\text{RESET}}$)
- Power-on-clear (POCRES)
- Watchdog timer reset (WDTA0RES, WDTA1RES)
- Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$)
- Low-voltage indicator reset ($\overline{\text{LVIRES}}$)
- Software reset (SWRES)
- Debugger reset ($\overline{\text{DBRES}}$)
- Core voltage monitor reset ($\overline{\text{CVMRES}}$)
- Transition to DeepSTOP mode

### 9.1.1 Reset Sources

Reset levels and reset sources are shown below.

Various reset sources are assigned to the different levels of the reset.

**Table 9.1 Reset Sources and Reset Targets**

| Reset Level | Reset Source | Clock Generator (except PLL)/ Real-Time Clock/CVM/LVI | Always-On Area Modules*1 | Isolated area Modules*2 |
|---|---|---|---|---|
| 1 | Power-on-clear (POCRES)<br>Debugger reset ($\overline{\text{DBRES}}$) | Reset | Reset | Reset |
| 2 | External reset ($\overline{\text{RESET}}$)<br>Watchdog timer reset (WDTA0RES, WDTA1RES)<br>Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$)<br>Core voltage monitor reset ($\overline{\text{CVMRES}}$)<br>Low voltage indicator reset ($\overline{\text{LVIRES}}$)<br>Software reset (SWRES) | Not reset target*3 | Reset | Reset |
| 3 | Reset by DeepSTOP mode | Not reset target | Not reset target | Reset |

Note 1. Clock generator, real-time clock, CVM, and LVI are excluded.
Note 2. PLL is included.
Note 3. In clock monitor reset, oscillator-related registers for clock monitoring are initialized.

Reset level 1: Initializes the entire microcontroller.

Reset level 2: For a quick return to normal operating mode by eliminating the oscillator stabilization time, initializes the entire microcontroller except for the clock generator and the real-time clock.

Reset level 3: At the transition to DeepSTOP mode, initializes all the Isolated area (ISO area).

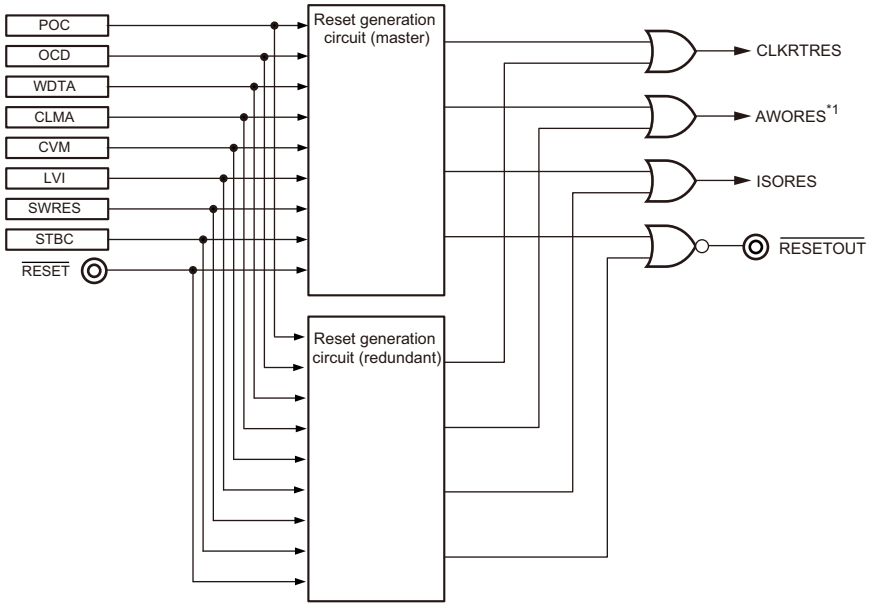
If Power-on-clear (POCRES), Core voltage monitor reset (CVMRES), or Clock monitor reset (CLMA0RES, CLMA1RES, CLMA2RES) generates while writing to Retention RAM, Retention RAM data is not retained.

If reset source other than shown above is generated while writing to Retention RAM, Retention RAM data can be retained. In this case, data value will be before or after writing.

### 9.1.2 Reset Controller Redundancy

The reset controller of the microcontroller has a redundant configuration, and includes duplicated reset generation circuits. Such configuration enables initialization of the reset targeted area without failure even if one of the two reset generation circuits fails.

The configuration of the reset generation circuits is shown in the figure below.



Note 1. Real-time clock is excluded.

**Figure 9.1 Reset Controller Redundancy**

At the generation of a reset, the same reset source signal is input to two reset generation circuits.

According to the reset source, the two reset generation circuits output the Always-On area reset signal (AWORES), Isolated area reset signal (ISORES), clock generator/real-time clock reset signal (CLKRTRES), and $\overline{\text{RESETOUT}}$ signal.

The AWORES, ISORES, CLKRTRES, and $\overline{\text{RESETOUT}}$ signals are generated by executing the logical OR of the signals output from two reset generation circuits. Thus, a reset signal is generated normally even if one of the two reset generation circuits fails.

Whether a reset generation circuit operates normally can be checked by reading and comparing the reset factor registers of the respective reset generation circuits.

### 9.1.3 Reset Output ($\overline{\text{RESETOUT}}$)

When a reset source of reset level 1 or 2 is generated, a reset output signal ($\overline{\text{RESETOUT}}$) is output to the outside. Reset output is used to reset external devices at the same time as a reset is generated inside the microcontroller.

For details, see **Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

### 9.1.4 Reset Flag

To identify a reset source, two registers with a flag for each reset source are provided. The main elements of the reset controller are shown in **Figure 9.2, Block Diagram of the Reset Controller**.

### 9.1.5 Clock Supply

The clock supply to the reset controller is shown in the following table.

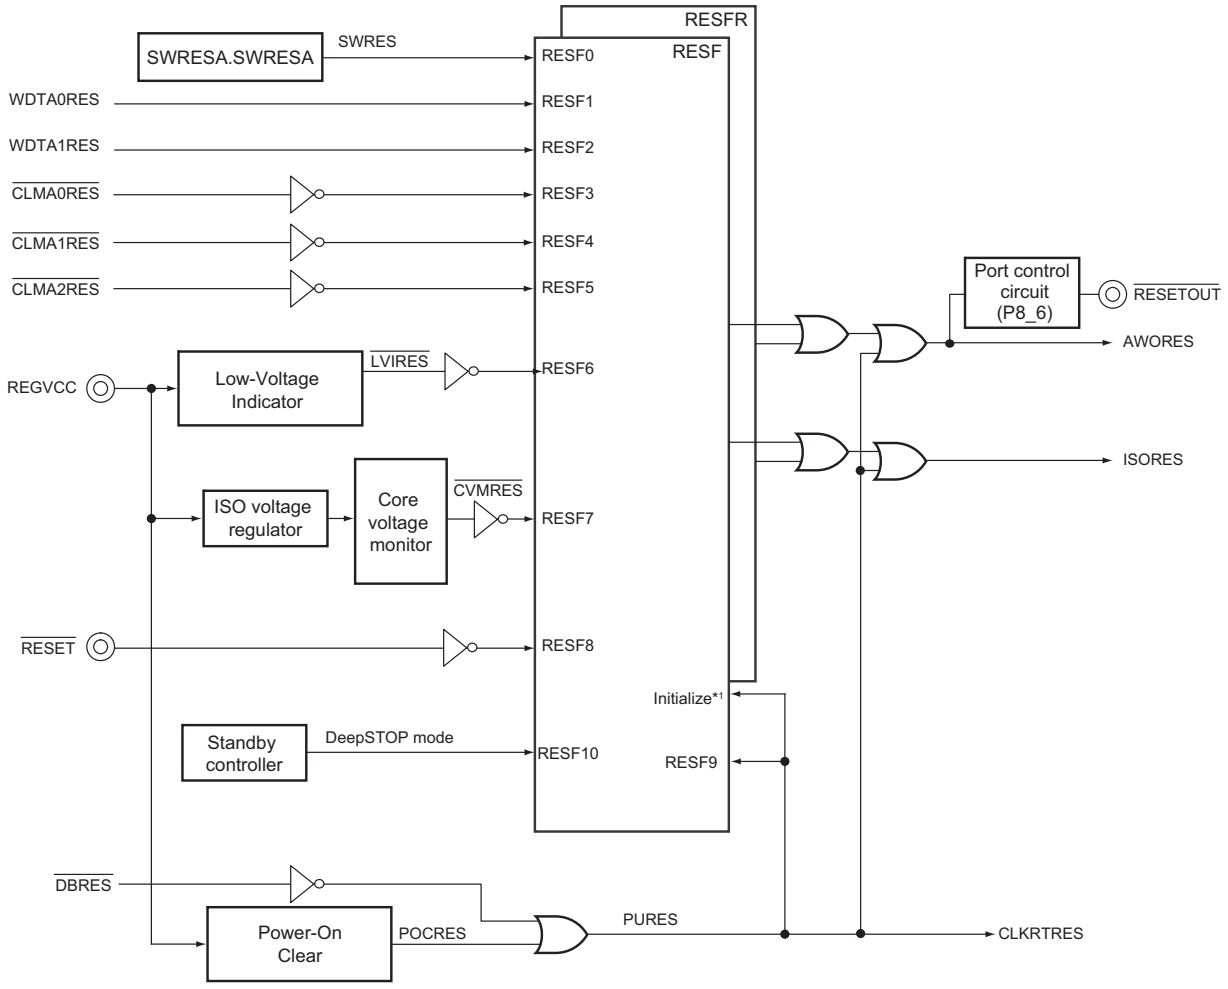
**Table 9.2 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name |
|---|---|---|
| Reset | Register access clock | CPUCLK4 |

## 9.2 Configuration

### 9.2.1 Block Diagram

A block diagram of the reset controller is shown below.



Note 1. Registers RESF and RESFR are initialized by PURES.
After an initialization, bits RESF9 and RESFR9 are set to 1.

**Figure 9.2 Block Diagram of the Reset Controller**

### (1) Reset signals

The reset controller manages the generation of three reset signals upon occurrence of reset signals from various reset sources:

- Always-On area (AWO area) reset (AWORES)
  AWORES is generated by all reset sources except the transition to DeepSTOP mode.
  AWORES resets all modules in the Always-On area (AWO area) except clock generation circuit, real-time clock, core voltage monitor, and low-voltage detection circuit.
- Isolated area (ISO area) reset (ISORES)
  ISORES is generated by all reset sources.
  ISORES resets all modules (including PLL) in the Isolated area (ISO area).
- CLKRTRES
  CLKRTRES is generated by the power-on clear or debugger reset sources.
  CLKRTRES resets the clock generation circuit (excluding PLL) and real-time clock.

The power-up reset (PURES) is generated by the power-on clear and debugger reset sources.

Following the generation of an AWORES reset, with the exception of the PLL, all clock-generation circuits that were operating at the time (LS IntOSC, HS IntOSC, MainOSC, SubOSC) continue to operate. On the generation of a $\overline{\text{CLMA0RES}}$ reset, the HS IntOSC that was the target for CLMA0 monitoring is reset. On the generation of a $\overline{\text{CLMA1RES}}$ reset, the MainOSC that was the target for CLMA1 monitoring is reset.

The PURES initializes all of the clock generation circuits. It is necessary to restart the clock generation circuit after recovery from the PURES.

The CPU reset is the Isolated area (ISO area) reset (ISORES) to the CPU sub system.

### (2) Reset flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) hold a flag for each reset source, and this flag is set when the corresponding reset is asserted.

All reset flags except RESF9 and RESFR9 are initialized by a power-up reset (PURES). (Bits RESF9 and RESFR9 are set to 1 after initialization.) In addition, all the bits can be cleared by software.

For details, see **Section 9.1.4, Reset Flag**.

### (3) On-chip module resets

#### (a) Watchdog timer resets

The watchdog timers 0, 1 can generate two types of resets: WDTA0RES and WDTA1RES.
For details, see **Section 9.4.6, Watchdog Timer (WDTA) Reset**.

#### (b) Clock monitor resets

The clock monitors can generate three resets: $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, and $\overline{\text{CLMA2RES}}$.
For details, see **Section 9.4.8, Clock Monitor (CLMA) Reset**.

#### (c) Debugger reset

A reset is generated by a command from a debugger. This leads to a generation of power-up reset PURES. For details, see **Section 9.4.9, Debugger Reset**.

### (4) Software controlled reset (SWRES)

A software reset SWRES can be generated by use of the software reset register SWRESA.

For details, see **Section 9.4.7, Software Reset**.

### (5) Reset output signal

During reset and after release from the reset, port P8_6 outputs low level as $\overline{\text{RESETOUT}}$ function. For details, see **Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

### (6) Power supply monitoring

The following power supply detection circuits observe the level of the external power supply REGVCC.

#### (a) Low-Voltage Indicator

The low-voltage indicator (LVI) generates the $\overline{\text{LVIRES}}$ reset, if the voltage level of REGVCC drops below a certain level. The level can be adjusted and the $\overline{\text{LVIRES}}$ can be masked.
For details, see **Section 9.4.3, Low-Voltage Indicator (LVI) Reset**.

#### (b) Power-On-Clear

The power-on-clear circuit (POC) continuously compares the power supply voltage REGVCC with an internal reference voltage. Thus, a reset is generated when the power supply voltage goes below a certain level.
For details, see **Section 9.4.2, Power-On-Clear (POC) Reset**.

#### (c) Core Voltage Monitor

A reset can be generated when the core voltage monitor (CVM) detects over- or undervoltage in core voltage. (Output/not output can be set by option byte.)
For details, see **Section 9.4.4, Core Voltage Monitor (CVM) Reset**.

### (7) Masking of reset sources in debugging mode

The following reset sources can be masked during debugging:

**Table 9.3 Reset Sources to be Masked during Debugging**

| Reset Source | Maskable/Non-maskable |
|---|---|
| Power-on clear (POCRES) | — |
| Debugger reset ($\overline{\text{DBRES}}$) | — |
| External reset ($\overline{\text{RESET}}$) | √ |
| Low-voltage indicator reset ($\overline{\text{LVIRES}}$) | √ |
| Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$) | √ |
| Watchdog timer reset (WDTA0RES, WDTA1RES) | √ |
| Core voltage monitor reset ($\overline{\text{CVMRES}}$) | √ |
| Software reset (SWRES) | √ |
| Reset by DeepSTOP mode | — |

## 9.3 Registers

This section contains a description of all registers of the reset controller.

### 9.3.1 Reset Controller Registers Overview

The reset controller is controlled and operated by the following registers:

**Table 9.4 Reset Controller Registers Overview**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| **RESCTL** | **Reset flag registers** | | |
| | Reset factor register | RESF | FFF8 $0760_H$ |
| | Reset factor clear register | RESFC | FFF8 $0768_H$ |
| | Redundant reset factor register | RESFR | FFF8 $0860_H$ |
| | Redundant reset factor clear register | RESFCR | FFF8 $0868_H$ |
| | **Software reset control register** | | |
| | Software reset register | SWRESA | FFF8 $0A04_H$ |
| | **Cyclic RUN mode reset vector address register** | | |
| | Cyclic RUN mode RBASE register | CYCRBASE | FFF8 $3600_H$ |

**NOTES**

1. For the LVI related, RAM store related, and CVM related registers, see **Section 11, Supply Voltage Monitor**.
2. As for the protection registers, see **Section 5, Write-Protected Registers**.

## 9.3.2 Details of Reset Flag Registers

### 9.3.2.1 RESF — Reset Factor Register

This register contains information about which type of resets occurred after the last power-on clear reset. This register is initialized by a power-up reset PURES.

Each reset condition sets the corresponding flag in the register.

For example, if a clock monitor reset $\overline{\text{CLMA0RES}}$ occurs after a watchdog timer reset WDTA0RES, RESF reads 0000 000A$_H$.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 0760$_H$

**Value after reset:** 0000 0200$_H$ / 0000 0300$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | RESF10 | RESF9 | RESF8 | RESF7 | RESF6 | RESF5 | RESF4 | RESF3 | RESF2 | RESF1 | RESF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1/0*1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. For details, see **Figure 9.4, When $\overline{\text{RESET}}$ is Released before Execution of Flash Sequence**.

**Table 9.5 RESF Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is returned. |

### 9.3.2.2 RESFC — Reset Factor Clear Register

This register clears the reset flags of the RESF register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFF8 0768$_H$

**Value after reset:** Undefined

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 9.3.2.3 RESFR — Redundant Reset Factor Register

This register is a duplication of the reset factor register. This register is initialized by a power-up reset PURES.

In accordance with the setting conditions for each bit in the reset factor register, the same bits are set in this register.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 $0860_H$

**Value after reset:** $0000\ 0200_H$ / $0000\ 0300_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 9.3.3 Details of Software Reset Control Registers

### 9.3.3.1 SWRESA — Software Reset Register

This register is used to generate a software reset SWRES. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFF8 0A04$_H$

**Value after reset:** Undefined

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 9.3.4 Details of Cyclic RUN Mode Reset Vector Address Register

### 9.3.4.1 CYCRBASE — Cyclic RUN mode RBASE Register

This register is used to specify the reset vector address (RBASE) of the CPU, when the CPU returns to Cyclic RUN mode from DeepSTOP mode. The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Update of this register is only permitted when the chip is in RUN mode. Do not change the value in Cyclic RUN mode.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $3600_H$

**Value after reset:** FEBF $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CYCRBASE[31:16] | | | | | | | | | | | | | | | |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R | R |

**Table 9.10 CYCRBASE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 9 | CYCRBASE | Reset vector base address (RBASE) in Cyclic RUN mode.<br>Specifies the RBASE value in Cyclic RUN mode.<br>The default value is set to the start address of the Retention RAM. |
| 8 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## 9.4 Functional Description

### 9.4.1 Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) provide reset flags for each reset source.

If a reset has occurred, the corresponding flag is set. According to this, the source of the reset is evaluated.

RESF and RESFR are initialized by a power-up reset PURES (POCRES or $\overline{\text{DBRES}}$) (though bits RESF9 and RESFR9 are set to 1 after initialization). In addition, flags in RESF and RESFR can be cleared by the reset factor clear register (RESFC) and the redundant reset factor clear register (RESFRC).

Each reset source can set the corresponding flag independently from other reset sources.

### 9.4.2 Power-On-Clear (POC) Reset

The power-on-clear circuit (POC) constantly compares the power supply voltage REGVCC with the internal reference voltage $V_{POC}$. It ensures that the microcontroller only operates as long as the power supply exceeds a certain level.

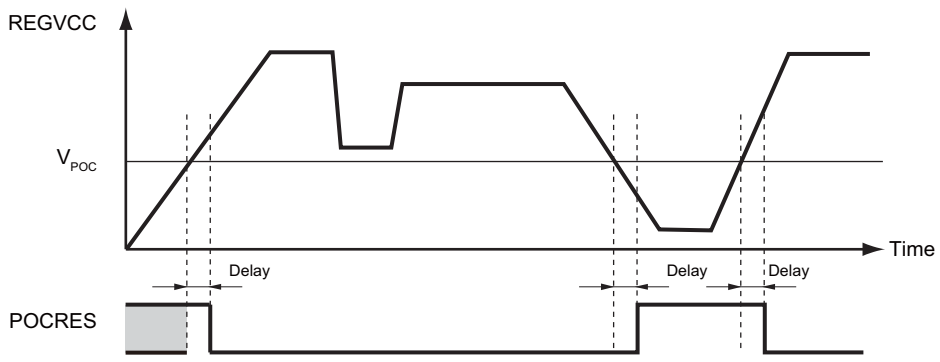
If REGVCC falls below the internal reference voltage (REGVCC < $V_{POC}$), the internal reset signal POCRES and a power-up reset PURES are generated.

For details on the specification of the internal voltage reference level $V_{POC}$, see **Section 40, Electrical Characteristics**.

The reset factor register (RESF) and the redundant reset factor register (RESFR) are cleared by the power-on clear reset. RESF9 and RESFR9 are set to 1 after initialization.

The power-on-clear function holds the microcontroller in reset state as long as the power supply voltage does not exceed the threshold level $V_{POC}$.

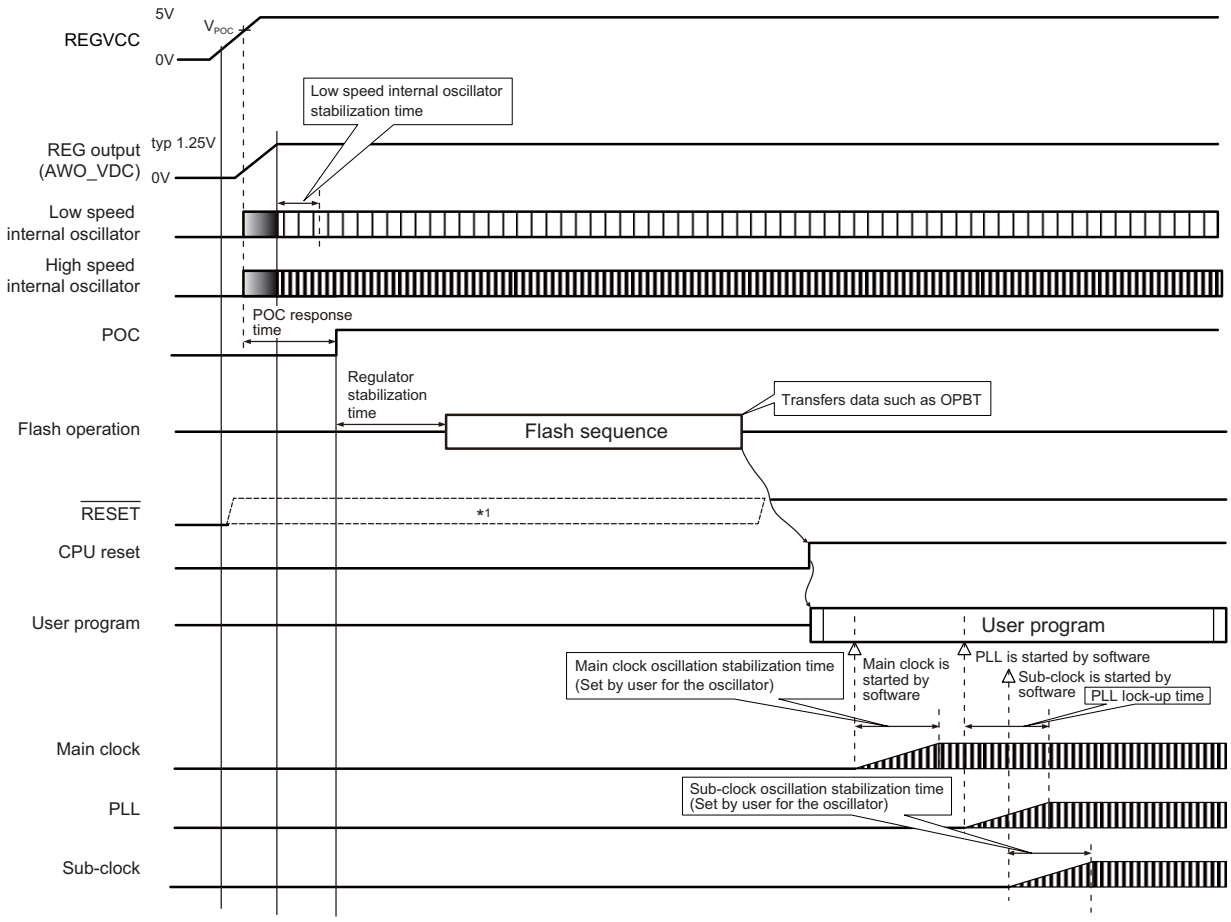
The following figure illustrates the timing of a POCRES.



**Note:** Delay:
When the REGVCC exceeds the $V_{POC}$, the POCRES is released after certain delay. When the REGVCC falls below the $V_{POC}$, the POCRES is asserted after certain delay.
See **Section 40, Electrical Characteristics** for the delay time.

**Figure 9.3 POC Reset Timing**

### (1) Overview of CPU system startup after power-on-clear



Note 1. The timing of releasing the $\overline{\text{RESET}}$ pin depends on the external circuit of the microcontroller.
If the $\overline{\text{RESET}}$ pin is low level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 1. If the $\overline{\text{RESET}}$ pin is high level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 0.

**Figure 9.4 When $\overline{\text{RESET}}$ is Released before the Flash Sequence is Completed**

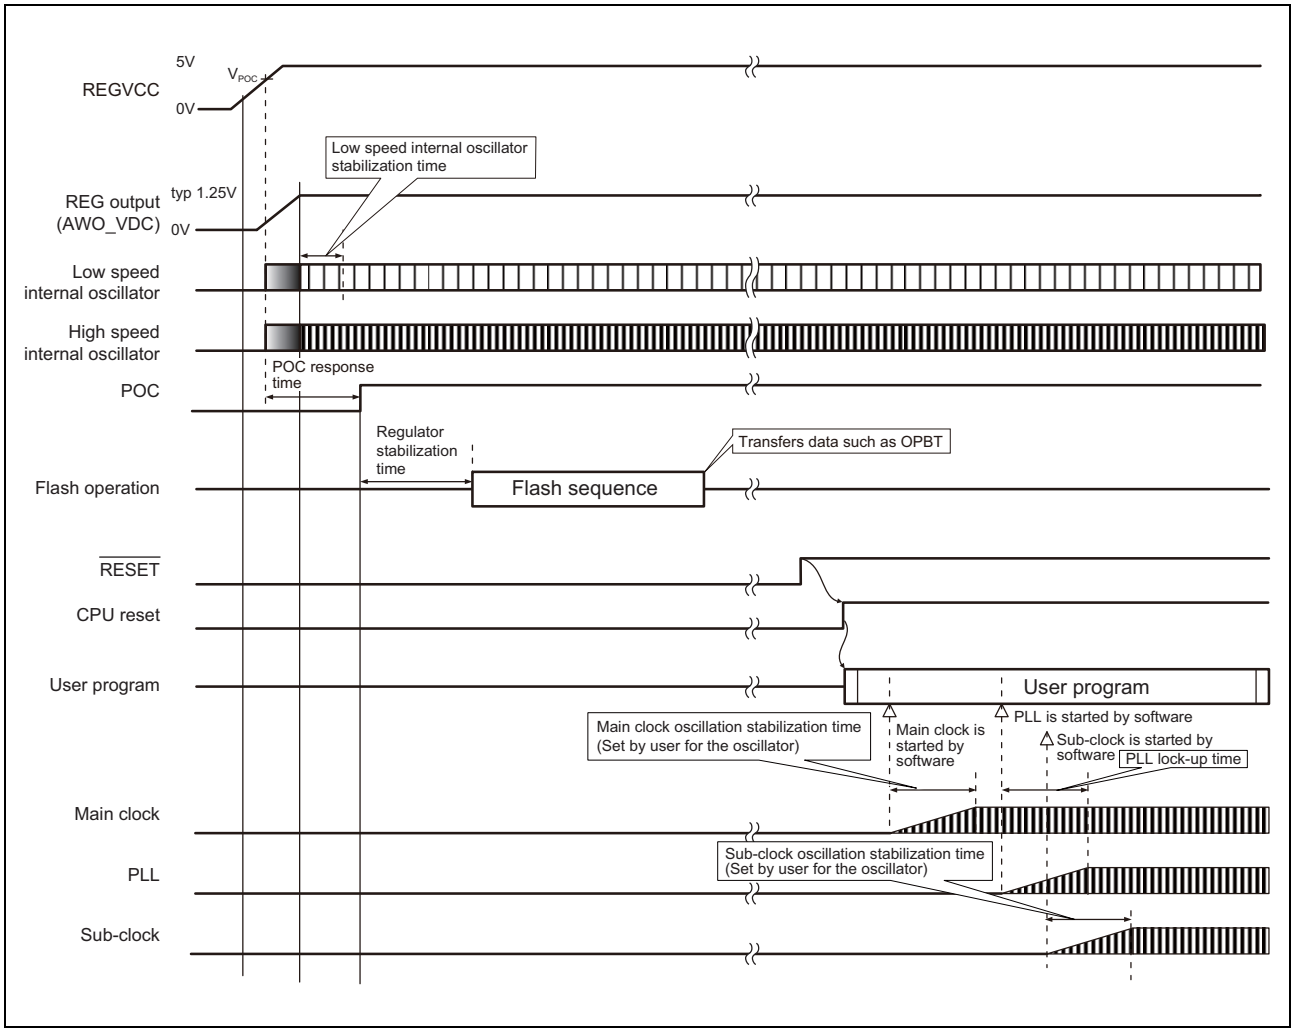


**Figure 9.5 When $\overline{\text{RESET}}$ is Released after the Flash Sequence is Completed**

### 9.4.3 Low-Voltage Indicator (LVI) Reset

The low-voltage indicator (LVI) constantly compares the power supply voltage REGVCC with the LVI internal reference voltage $V_{LVI}$.

When setting the LVI detection voltage and releasing the LVIRESMK, if REGVCC falls below the internal reference voltage (REGVCC < $V_{LVI}$), the internal reset signal $\overline{\text{LVIRES}}$ is generated.

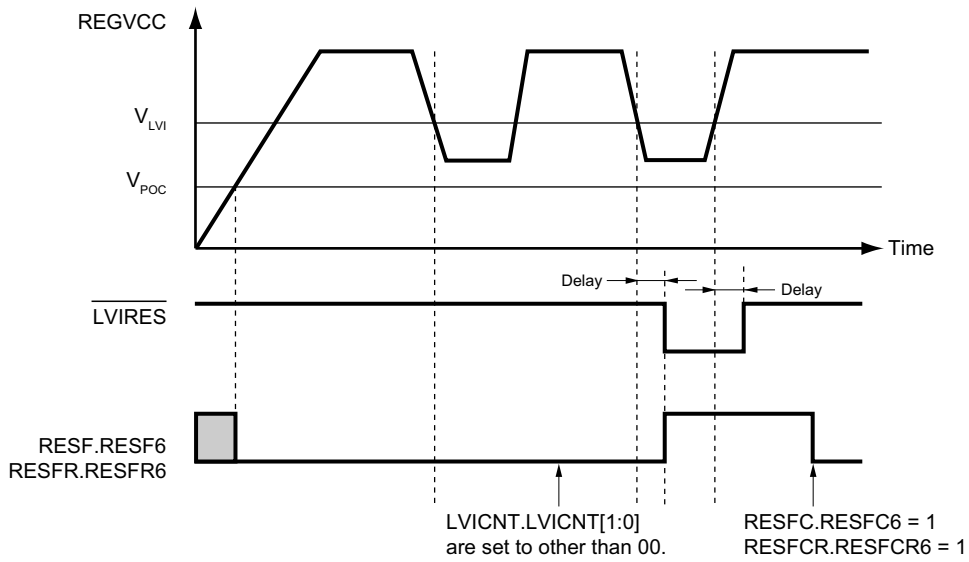
Additionally, the $\overline{\text{LVIRES}}$ flags (bits RESF.RESF6 and RESFR.RESFR6) are set.

After that, even if REGVCC exceeds $V_{LVI}$, bits RESF.RESF6 and RESFR.RESFR6 are not cleared automatically. They are cleared as described below.

- Setting the RESFC.RESFC6 bit to 1 clears the RESF.RESF6 bit.
  Setting the RESFCR.RESFCR6 bit to 1 clears the RESFR.RESFR6 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

For details on the LVI functions, see **Section 11, Supply Voltage Monitor**.

The following figure illustrates the timing of a $\overline{\text{LVIRES}}$ and bits RESF.RESF6 and RESFR.RESFR6.



**Note:** Delay:
When REGVCC falls below $V_{LVI}$, $\overline{\text{LVIRES}}$ is asserted and the VLVI reset flags (RESF.RESF6 and RESFR.RESFR6) are set after a certain delay. After that, when REGVCC exceeds $V_{LVI}$, $\overline{\text{LVIRES}}$ is released after a certain delay.
See **Section 40, Electrical Characteristics** for the delay time.

**Figure 9.6 LVI Reset Timing**

### 9.4.4 Core Voltage Monitor (CVM) Reset

Core voltage monitor is used to monitor the core voltage inside the microcontroller.

The reset $\overline{\text{CVMRES}}$ is generated if the core voltage is not in the specified voltage range while CVM is enabled. Moreover, the $\overline{\text{CVMRES}}$ flags (RESF.RESF7 and RESFR.RESFR7) are set.

After that, the RESF.RESF7 and RESFR.RESFR7 bits are not automatically cleared even if the core voltage returns to the specified voltage range. The RESF.RESF7 and RESFR.RESFR7 bits are cleared as described below.

- Setting the RESFC.RESFC7 bit to 1 clears the RESF.RESF7 bit.
  Setting the RESFCR.RESFCR7 bit to 1 clears the RESFR.RESFR7 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off. Once $\overline{\text{CVMRES}}$ is generated upon high voltage detection, the microcontroller stays in the reset state. To cancel this state, it is mandatory to use the external reset ($\overline{\text{RESET}}$) input. Release the external reset ($\overline{\text{RESET}}$) after the voltage level becomes lower than the high detection voltage.

For details on the CVM function, see **Section 11, Supply Voltage Monitor**.

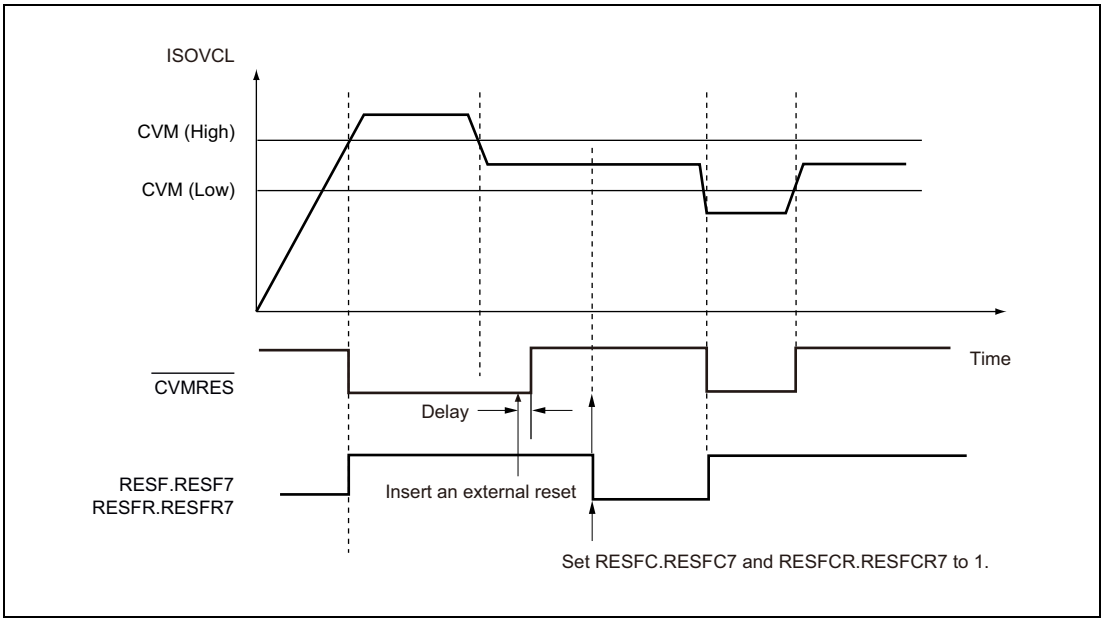


**Figure 9.7 CVM Reset Timing**

### 9.4.5 External Reset ($\overline{\text{RESET}}$)

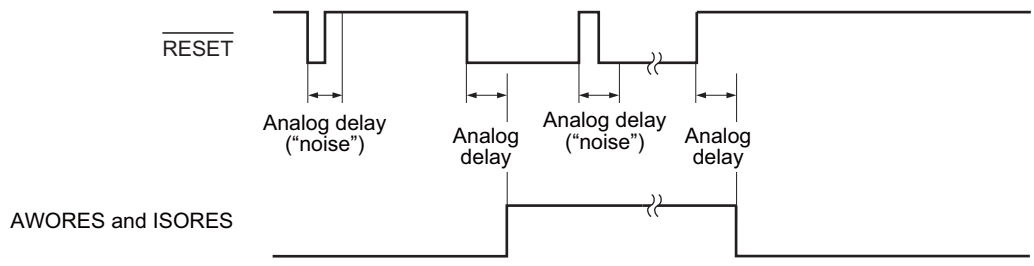
When a low level input is applied to the $\overline{\text{RESET}}$ pin, a reset is asserted and the RESF.RESF8 and RESFR.RESFR8 bits are set.

After that, bits RESF.RESF8 and RESFR.RESFR8 are not cleared automatically, even if the low-level input to the $\overline{\text{RESET}}$ pin is released. Bits RESF.RESF8 and RESFR.RESFR8 are cleared as described below.

- Setting the RESFC.RESFC8 bit to 1 clears the RESF.RESF8 bit.
  Setting the RESFCR.RESFCR8 bit to 1 clears the RESFR.RESFR8 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

The $\overline{\text{RESET}}$ pin includes an analog noise filter to prevent erroneous resets due to noise.

The following figure shows the timing when AWORES and ISORES are generated by an external reset. This figure also shows the effect of the noise filter.



**Note:** The analog delay is caused by the analog filter. The filter regards pulses up to a certain width as noise and suppresses them.
For the minimum $\overline{\text{RESET}}$ pulse width, see **Section 40, Electrical Characteristics**.

**Figure 9.8 External Reset ($\overline{\text{RESET}}$)**

### 9.4.6 Watchdog Timer (WDTA) Reset

The watchdog timers can be configured to generate a reset if the overflow time is exceeded. After a watchdog timer reset is asserted, the corresponding watchdog timer reset flags (the RESF.RESF1 and RESFR.RESFR1 bits for WDTA0RES, and the RESF.RESF2 and RESFR.RESFR2 bits for WDTA1RES) are set.

After that, bits RESF.RESF1 and RESFR.RESFR1 (or bits RESF.RESF2 and RESFR.RESFR2) are not cleared automatically, even if WDTA0RES (or WDTA1RES) is released.

Bits RESF.RESF1 and RESFR.RESFR1, and bits RESF.RESF2 and RESFR.RESFR2 are cleared as described below.

- WDTA0RES:
  Setting the RESFC.RESFC1 bit to 1 clears the RESF.RESF1 bit.
  Setting the RESFCR.RESFCR1 bit to 1 clears the RESFR.RESFR1 bit.
- WDTA1RES:
  Setting the RESFC.RESFC2 bit to 1 clears the RESF.RESF2 bit.
  Setting the RESFCR.RESFCR2 bit to 1 clears the RESFR.RESFR2 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

### 9.4.7 Software Reset

The software reset SWRES can be asserted by setting SWRESA.SWRESA to 1.

SWRES sets the reset flag RESF.RESF0 and the RESFR.RESFR0 bit.

RESF.RESF0 and RESFR.RESFR0 are not cleared automatically. RESF.RESF0 and RESFR.RESFR0 are cleared as described below.

- Setting the RESFC.RESFC0 bit to 1 clears the RESF.RESF0 bit.
  Setting the RESFCR.RESFCR0 bit to 1 clears the RESFR.RESFR0 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

### 9.4.8 Clock Monitor (CLMA) Reset

The clock monitors can generate the following resets:

- $\overline{\text{CLMA0RES}}$, if a frequency abnormality in HS IntOSC is detected
- $\overline{\text{CLMA1RES}}$, if a frequency abnormality in MainOSC is detected
- $\overline{\text{CLMA2RES}}$, if a frequency abnormality in PLL is detected

When the Clock Monitor detects frequency abnormality of the respective clocks, resets $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, and $\overline{\text{CLMA2RES}}$ are generated.

In addition, flags $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, and $\overline{\text{CLMA2RES}}$ (RESF.RESF3, RESFR.RESFR3, RESF.RESF4, RESFR.RESFR4, RESF.RESF5, and RESFR.RESFR5) are set.

These flags are not cleared automatically. They are cleared as described below.

- $\overline{\text{CLMA0RES}}$:
  Setting the RESFC.RESFC3 bit to 1 clears the RESF.RESF3 bit.
  Setting the RESFCR.RESFCR3 bit to 1 clears the RESFR.RESFR3 bit.
- $\overline{\text{CLMA1RES}}$:
  Setting the RESFC.RESFC4 bit to 1 clears the RESF.RESF4 bit.
  Setting the RESFCR.RESFCR4 bit to 1 clears the RESFR.RESFR4 bit.
- $\overline{\text{CLMA2RES}}$:
  Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.
  Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

### 9.4.9 Debugger Reset

Debugger reset ($\overline{\text{DBRES}}$) is generated via a debugger command. $\overline{\text{DBRES}}$ activates PURES, and therefore operates in the same way as the power-on-clear reset POCRES:

- The clock generators are reset and stop operating. The clock generators should be restarted after release from the reset state.
- The reset factor register RESF and the redundant reset factor register RESFR are cleared (Bits RESF9 and RESFR9 are set to 1 after initialization.).

### 9.4.10 Reset Vector Address of CPU

The default value of the reset vector base address (RBASE) of CPU is set to 0000 $0000_H$ at shipment. In Cyclic RUN mode, the reset vector base address is automatically switched to the address specified by the CYCRBASE register. After returning to the RUN mode, the reset vector base address automatically switches back to the default address.

For details about the RBASE register, see **Section 3, CPU System**.

# Section 10 Power Supply Circuit

This section describes the power supply and power domains of the RH850/F1K.

## 10.1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area is always on in all operating modes and stand-by modes.

The power supply of the Isolated area can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.

For operation of the device, the following voltages are required:

- Power supply voltage REGVCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltage EVCC for the I/O ports.
- Power supply voltages A0VREF and A1VREF*1 for the A/D converters and the separated I/O ports.

**Note 1.** Only available for 144 pin, and 176 pin devices.

### 10.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.

**Table 10.1 Power Supply Pins**

| Power Supply | Power Supply Pins | Power Supply for |
|---|---|---|
| Power supply for internal circuits | REGVCC | • On-chip voltage regulators for the Always-On area and Isolated area<br>• Port group IP0*2<br>• MainOSC<br>• SubOSC*2<br>• POC / LVI |
| | AWOVCL*1 | |
| | AWOVSS | |
| | ISOVCL*1 | |
| | ISOVSS | |
| Power supply for I/O port | EVCC | • $\overline{\text{RESET}}$<br>• FLMD0<br>(176 pin devices)<br>• Port groups JP0, P0, P1, P2, P8, P9, P10, P11, P12, P18, P20<br>(144 pin devices)<br>• Port groups JP0, P0, P1, P8, P9, P10, P11, P12, P18, P20<br>(100 pin devices)<br>• Port groups JP0, P0, P8, P9, P10, P11 |
| | EVSS | |
| Power supply for A/D converters | A0VREF | • Analog circuits of ADCA0, port group AP0 |
| | A0VSS | |
| | A1VREF | (144 pin and 176 pin devices)<br>• Analog circuits of ADCA1, port group AP1 |
| | A1VSS | |

**Note:** See **Section 40, Electrical Characteristics** for the voltage range of each power supply.

Note 1. Pin to connect a stabilization capacitor for on-chip voltage regulator.

Note 2. Supported only by the 144 pin and 176 pin devices.

### 10.1.2 Block Diagram of Power Domains

The figure below shows the overview of power supply circuit.

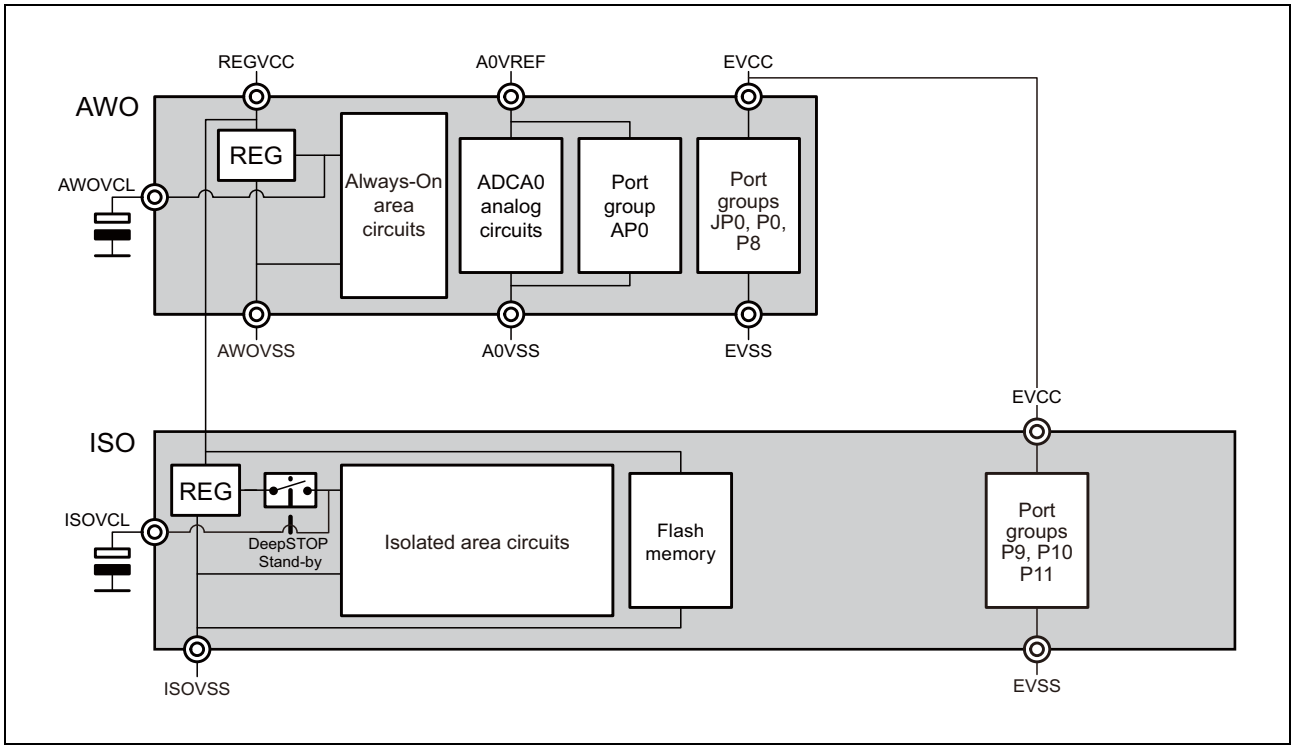


**Figure 10.1 Overview of Power Supply Circuit (100 pin)**

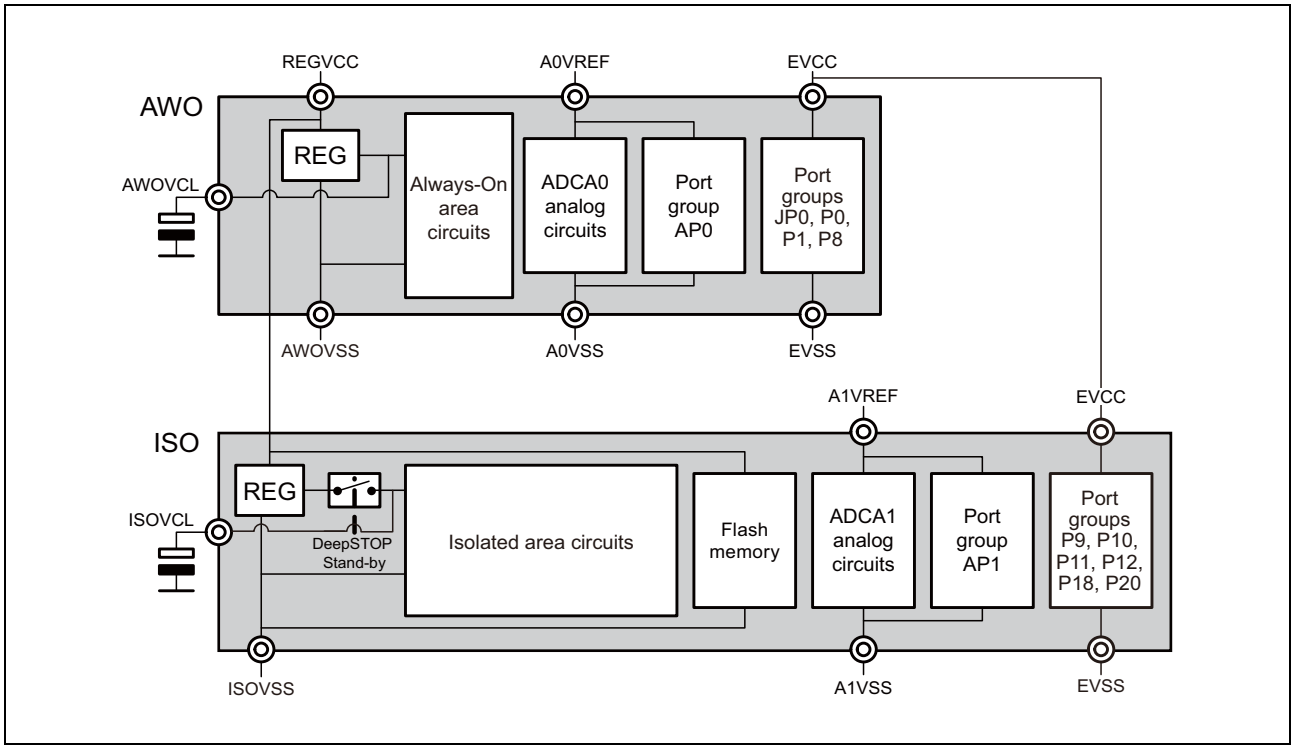

**Figure 10.2 Overview of Power Supply Circuit (144 pin)**

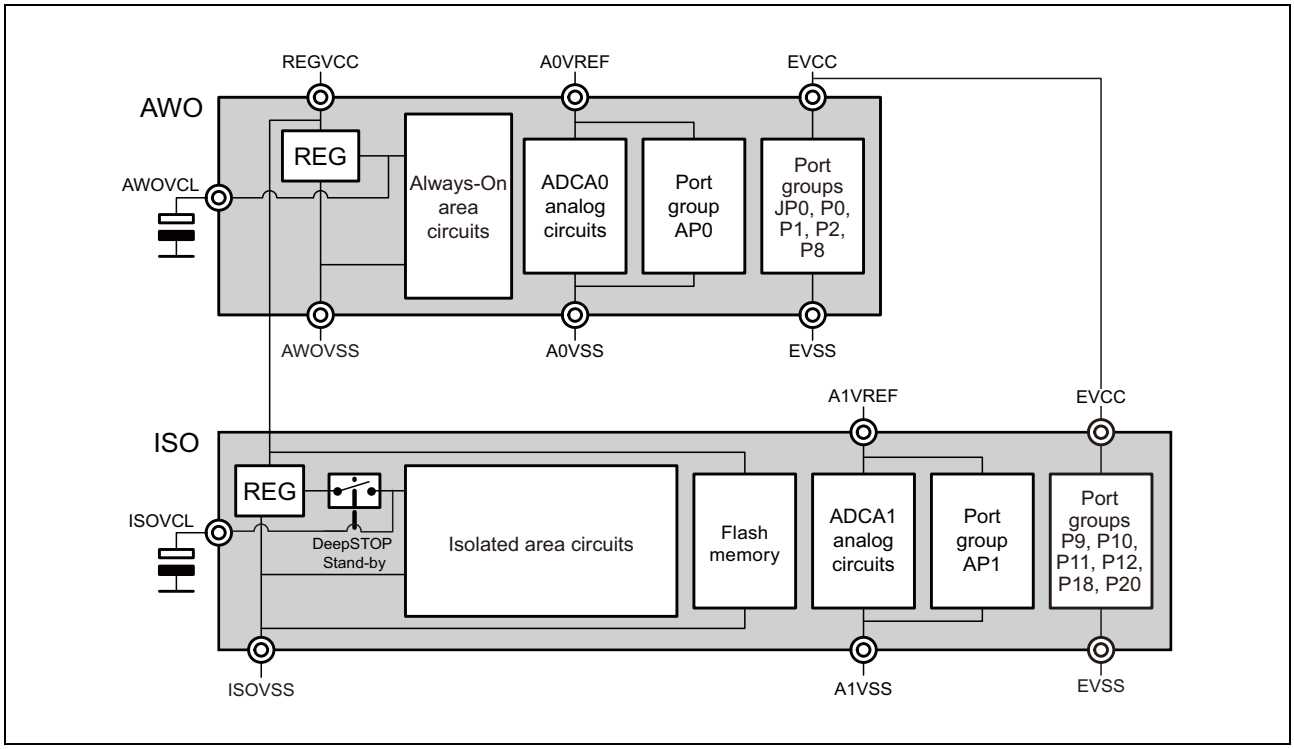

**Figure 10.3 Overview of Power Supply Circuit (176 pin)**

### 10.1.3 Power Domains Arrangement

The table below lists the microcontroller functional modules for each power domain.

**Table 10.2 Functional Modules and Power Domain**

| Power Domain | Functions |
|---|---|
| Always-On area (AWO area) | • STBC, Reset controller<br>• Retention RAM<br>• MainOSC, SubOSC, LS IntOSC, HS IntOSC, CLMA0, CLMA1<br>• WDTA0, RTCAn, TAUJ0, ADCA0, LPS<br>• Port groups JP0, P0, P1, P2, P8, AP0, IP0 |
| Isolated area (ISO area) | • CPU subsystem<br>• Code flash, Data flash, Local RAM<br>• PLL, CLMA2<br>• WDAT1, DCRAn, TAUDn, TAUBn, TAUJ1, OSTMn, PWM-Diag, CSIGn, CSIHn, RSCANn, RLIN2m, RLIN3n, RIICn, ADCA1, Motor Control, ENCAn, KRn<br>• Port groups P9, P10, P11, P12, P18, P20, AP1 |

# Section 11 Supply Voltage Monitor

This section explains in general about the supply voltage monitor.

The first part in this section describes the supply voltage monitor function, and the ensuing sections describe the registers.

This supply voltage monitor is for detecting and control of a power supply failure. However, the supply voltage monitor does not detect all of the possible failures.

Therefore, a power supply monitoring with an external device is required for the following terminals, in case that the customer's system requires an appropriate failure detection and control for Functional Safety.

- REGVCC
- EVCC
- A0VREF
- A1VREF
- AWOVCL
- ISOVCL

For the detail of required power supply specification for power supply monitoring with external device, see **Section 40.8, Power Management Characteristics**.

## 11.1 Overview

### 11.1.1 Functional Overview

The supply voltage monitor continuously monitors multiple external and internal supply voltages in order to ensure that the device operates with a supply voltage within the specified range. If the voltage drops below the reference voltage or comparison voltage, an interrupt request signal or internal reset signal is generated. The following table lists the supply voltage monitor functions.

**Table 11.1 Supply Voltage Monitor Functions**

| Function Name | Monitor Voltage | Signal Generated when Voltage Drops below Certain Level |
|---|---|---|
| Power-On Clear (POC) | REGVCC | Internal reset signal |
| Low-Voltage Indicator Circuit (LVI) | REGVCC | Internal reset signal, interrupt request signal |
| Core Voltage Monitor (CVM) | Isolated area voltage | Internal reset signal |
| RAM Retention Voltage Indicator (VLVI) | REGVCC | — |

**NOTES**

1. The RAM Retention Voltage Indicator sets the very-low voltage detection flag (VLVF) when the voltage drops below the RAM retention voltage.
2. When the internal core voltage monitor (CVM) is used for customer's system as the functional safety measure, the voltage of the Always-On area (AWO area) shall be monitored by the external voltage monitor.

### 11.1.2 Power-On Clear (POC)

The POC continuously monitors the external power supply voltage REGVCC. This ensures that the microcontroller only operates at or above power-on-clear detection voltage ($V_{POC}$).

If REGVCC falls below the POC detection voltage (REGVCC < $V_{POC}$), the internal reset signal (POCRES) is generated.

For details, see **Section 9.4.2, Power-On-Clear (POC) Reset**.

### 11.1.3 Low Voltage Indicator Circuit (LVI)

The LVI continuously compares the external power supply voltage REGVCC with the LVI reference voltage $V_{LVI}$.

If REGVCC falls below the reference voltage (REGVCC < $V_{LVI}$), an internal reset signal or interrupt request signal is generated.

#### 11.1.3.1 LVI Reference Voltage

The LVI reference voltage $V_{LVI}$ can be selected from three different levels by LVICNT.LVICNT[1:0].

If LVICNT.LVICNT[1:0] is set to $00_B$, the LVI is disabled.

For the specification of the reference voltage level $V_{LVI}$, see **Section 11.2.2.1, LVICNT — LVI Control Register**.

#### 11.1.3.2 LVI Reset (LVIRES)

When the LVI detection voltage is set and LVIRESMK is cleared, if REGVCC falls below the reference voltage (REGVCC < $V_{LVI}$), the internal reset signal $\overline{\text{LVIRES}}$ is generated.

For the specification of $\overline{\text{LVIRES}}$ generation, see **Section 9.4.3, Low-Voltage Indicator (LVI) Reset**.

### 11.1.3.3 LVI Interrupt (INTLVIL/INTLVIH)

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REGVCC falls below the reference voltage (REGVCC (MIN) < $V_{LVI}$), the LVI interrupt INTLVIL is generated.

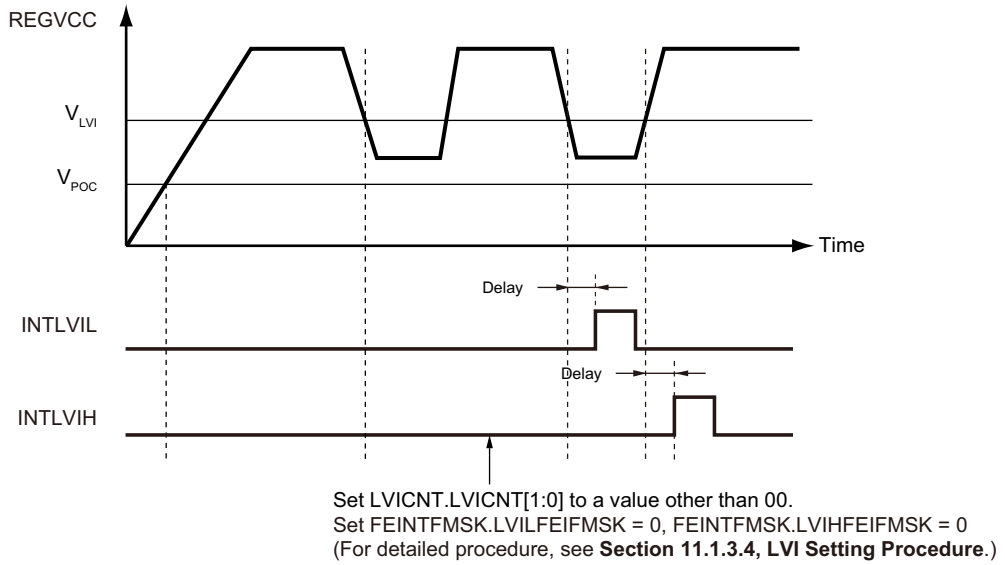
To use the LVI as an interrupt source, the INTLVIL interrupt must be unmasked.

INTLVIL interrupt can be used as wake-up source from all of standby modes. For details, see Section 14, Stand-By Controller (STBC).

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REGVCC exceeds the reference voltage (REGVCC (MIN > $V_{LVI}$), LVI interrupt INTLVIH is generated.

When LVI is used as an interrupt source, INTLVIH interrupt must be unmasked.

The following figure illustrates the timing of INTLVIL/INTLVIH.



**Note:** Delay:
When REGVCC falls below $V_{LVI}$, INTLVIL is generated after a certain delay.
After that, when REGVCC exceeds $V_{LVI}$, INTLVIH is generated after a certain delay.
See **Section 40, Electrical Characteristics** for delay time.

**Figure 11.1 INTLVIL/INTLVIH Generation Timing**

### 11.1.3.4 LVI Setting Procedure

The setting procedures for LVI are shown below.

**(1) Using LVI as the reset source**

(1) Mask LVI reset. (LVICNT.LVIRESMK = 1)*1

(2) Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)

(3) Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*1

(4) Insert ample wait time by software (see **Section 40, Electrical Characteristics**).

(5) Unmask LVI reset. (LVICNT.LVIRESMK = 0)*1

**(2) Using LVI as the interrupt source (FEINT)**

(1) Mask LVI reset. (LVICNT.LVIRESMK = 1)*1

(2) Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)

(3) Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*1

(4) Insert ample wait time by software (see **Section 40, Electrical Characteristics**).

(5) Unmask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 0, FEINTFMSK.LVIHFEIFMSK = 0)

**Note 1.** Follow the register protection sequence to set LVICNT register because it is a write-protected register. For details on the write-protected registers, see **Section 5, Write-Protected Registers**.

**CAUTION**

**If REGVCC is not stable around the LVI detection level ($V_{LVI}$), correct judgment of whether INTLVIH or INTLVIL interrupt processing should proceed may not be possible.**

**For example, if multiple interrupts consisting of both INTLVIH and INTLVIL occur during INTLVIL interrupt processing due to REGVCC being unstable, the software cannot detect which type of interrupt was generated last.**

**Consequently, if the last interrupt generated was an INTLVIL interrupt, regardless of REGVCC (min.) being greater than $V_{LVI}$, the software erroneously judges that REGVCC (min.) < $V_{LVI}$.**

**Accordingly, take measures such as programming the software so that LVI detection interrupt processing is completed before a next LVI interrupt. Also, consider control of REGVCC.**

### 11.1.3.5 Clock Supply to the LVI

The clock supply to the LVI is shown in the following table.

**Table 11.2 Clock Supply to the LVI**

| Unit Name | Unit Clock Name | Supply Clock Name |
|---|---|---|
| LVI | Register access clock | CPUCLK4 |

### 11.1.4 Core Voltage Monitor (CVM)

The core voltage monitor (CVM) monitors the Isolated area voltage (referred to as “core voltage” below) in the microcontroller.

If the regulator output voltage is outside of the specified range, the internal reset signal ($\overline{\text{CVMRES}}$) is generated.

If the CVM detects an abnormal high voltage, the power supply to the Isolated area is switched off in addition to a reset being generated.

When operation shifts to diagnostic mode (DIAG mode), the CVM enters the abnormal core voltage detection state. An abnormal core voltage detected state can be intentionally created by using the DIAG mode so that the CVM abnormal voltage detected flag can be checked for failures.

**CAUTION**

**The CVM cannot detect drifts in the voltage being supplied to the on-chip voltage regulator and Isolated area, or the increase or decrease of voltage.**

#### 11.1.4.1 CVM Reset ($\overline{\text{CVMRES}}$)

If the core voltage exceeds the specified level while high-voltage monitor is enabled (CVMDE.H_D_E = 1), then $\overline{\text{CVMRES}}$ is generated and the power supply to the Isolated area is stopped.

If the core voltage falls below the specified level while low voltage monitor is enabled (CVMDE.L_D_E = 1), $\overline{\text{CVMRES}}$ is generated.

For the specification of $\overline{\text{CVMRES}}$ generation, see **Section 9.4.4, Core Voltage Monitor (CVM) Reset**.

#### 11.1.4.2 CVM Setting

Use the option byte to enable the high-voltage monitor and the low-voltage monitor. For details, see **Section 37.9, Option Bytes**.

#### 11.1.4.3 Diagnostic (DIAG) Mode

This product supports diagnostic mode.

In diagnostic (DIAG) mode, whether the CVM abnormal voltage detection flag is set to 1 can be checked.

In diagnostic mode, $\overline{\text{CVMRES}}$ is not output.

The setting procedure for diagnostic mode is described below.

Set the registers according to this procedure. Otherwise the operation is not guaranteed.

(1) Set CVMDIAG.CVM_DIAG_MASK.*1

(2) Set CVMDIAG.CVM_DIAG.*1

(3) Wait for 12 µs.*2

(4) Read the CVMF register to confirm that the H_V_F and L_V_F bits are set to 1 (if these bits are 0, the CVM does not operate normally, requiring error handling).

(5) Clear CVMDIAG.CVM_DIAG.*1

(6) Clear the CVMF register.*1

(7) Read the CVMF register to confirm that the H_V_F and L_V_F bits are set to 0 (if these bits are 1, go back to step 5 again).

(8) Clear CVMDIAG.CVM_DIAG_MASK.*1

**Note 1.** Follow the register protection sequence to set CVMF and CVMDIAG registers because these are write-protected registers. For details, see **Section 5, Write-Protected Registers**.

**Note 2.** At least 50 µs must elapse after the following conditions are fulfilled before step (4) is started.

- Release from HALT state
- Release from STOP mode
- Release from the reset state, when a reset other than a reset due to the CVM is generated in RUN/HALT state
- The CPU clock is switched
- Operation of the MainOSC is started or stopped
- Operation of the PLL is started or stopped

#### 11.1.4.4 Clock Supply to the CVM

The clock supply to the CVM is shown in the following table.

**Table 11.3 Clock Supply to the CVM**

| Unit Name | Unit Clock Name | Supply Clock Name |
|---|---|---|
| CVM | Register access clock | CPUCLK4 |

### 11.1.5 RAM Retention Voltage Indicator (Very-Low-Voltage Detection Circuit, VLVI)

The very-low-voltage detection circuit (VLVI) is used to detect the RAM retention voltage, and continuously compares the power supply voltage REGVCC with the RAM retention voltage $V_{VLVI}$.

See **Section 40, Electrical Characteristics** for the specification of the RAM retention voltage level $V_{VLVI}$.

#### 11.1.5.1 Clock Supply to the VLVI

The clock supply to the VLVI is shown in the following table.

**Table 11.4 Clock Supply to the VLVI**

| Unit Name | Unit Clock Name | Supply Clock Name |
|---|---|---|
| VLVI | Register access clock | CPUCLK4 |

#### 11.1.5.2 Retention RAM Content Retention

If the power supply voltage REGVCC does not fall below $V_{VLVI}$, the content of the Retention RAM (RRAM) is retained. See **Section 9.1.1, Reset Sources** for retention during reset.

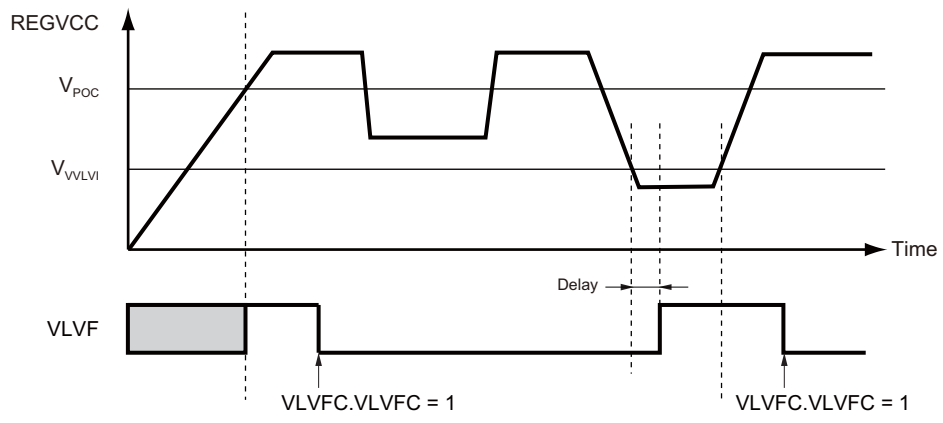
If REGVCC falls below $V_{VLVI}$, the RRAM content cannot be guaranteed. Thus the entire RRAM must be restored before continuing operation.

If REGVCC falls below the RAM retention voltage (REGVCC < $V_{VLVI}$), the VLVF.VLVF bit is set.

After that, even if REGVCC exceeds $V_{VLVI}$, the VLVF.VLVF bit is not cleared automatically. It is cleared by

- setting VLVFC.VLVFC bit to 1.

The following figure illustrates the timing of VLVF.



**Note:** Delay:
When REGVCC falls below $V_{VLVI}$, the VLVF bit is set to 1 after a certain delay.
See **Section 40, Electrical Characteristics** for delay time.

**Figure 11.2 VLVF Operation Timing**

### 11.1.6 Block Diagram

The block diagram of the supply voltage monitor is shown below.

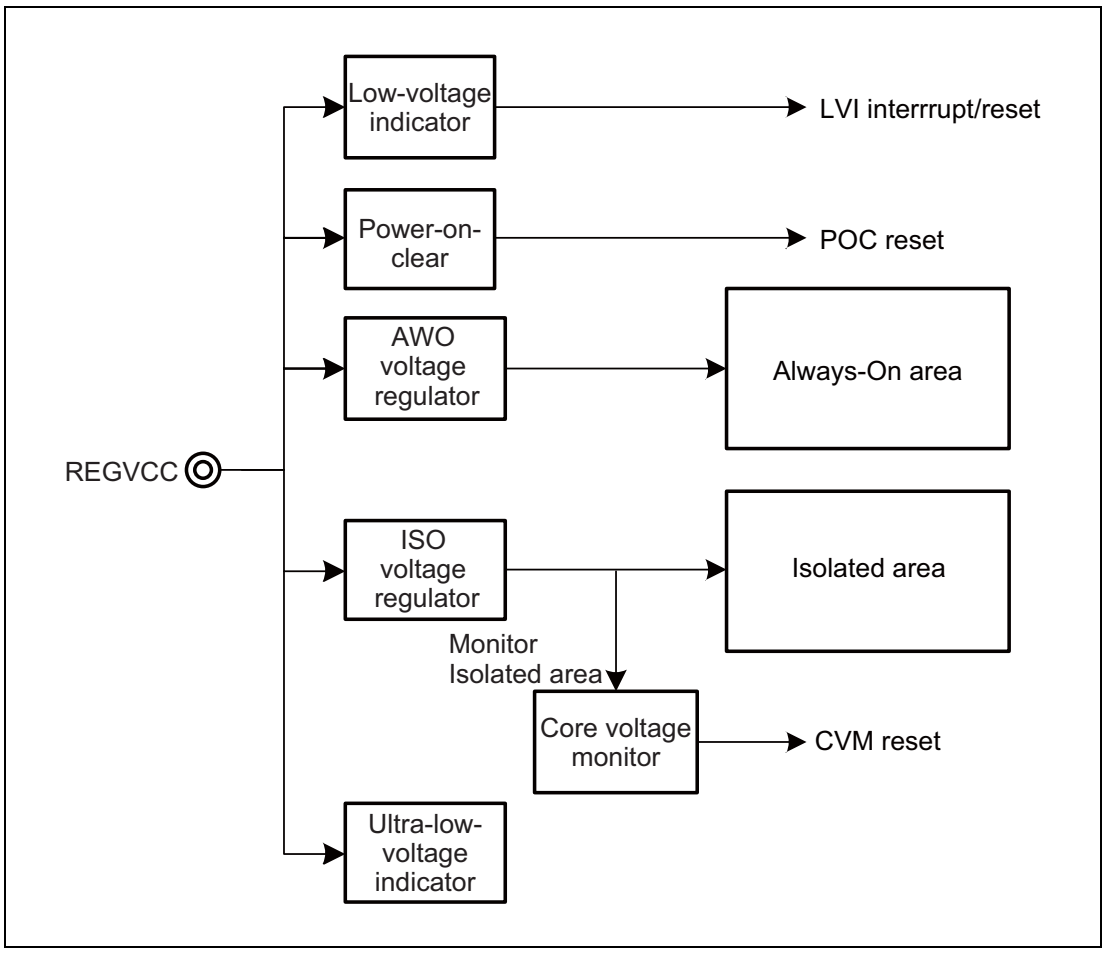


**Figure 11.3 Supply Voltage Monitor**

## 11.2 Registers

### 11.2.1 List of Registers

The following table lists the supply voltage monitor registers.

**Table 11.5 Power Supply Voltage Monitor Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| SVM | **Low-voltage indicator reset control register** | | |
| | LVI control register | LVICNT | FFF8 $0A00_H$ |
| | **Core voltage monitor control register** | | |
| | CVM factor register | CVMF | FFF8 $3100_H$ |
| | CVM detection enable register | CVMDE | FFF8 $3104_H$ |
| | CVM diagnostic mode setting register | CVMDIAG | FFF8 $3114_H$ |
| | **Very-low-voltage detection control register** | | |
| | Very-low-voltage detection register | VLVF | FFF8 $0980_H$ |
| | Very-low-voltage detection clear register | VLVFC | FFF8 $0988_H$ |

## 11.2.2 Low-Voltage Indicator Reset Control Registers

### 11.2.2.1 LVICNT — LVI Control Register

This register is used to control the Low-Voltage Indicator and to select the LVI detection level.

This register is initialized by power-up reset PURES.

The correct write sequence using the PROTCMD0 register is required in order to update this register For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 0A00$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | LVIRESMK | LVICNT[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

**Table 11.6 LVICNT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | LVIRESMK | Mask LVI Reset<br>0: LVI reset is not masked<br>1: LVI reset is masked |
| 1, 0 | LVICNT[1:0] | Detection Level<br>0 0: LVI is ignored<br>0 1: 4.0+/-0.1 V (drop), 4.0+/-0.13 V (rise)<br>1 0: 3.7+/-0.1 V (drop), 3.7+/-0.13 V (rise)<br>1 1: 3.5+/-0.1 V (drop), 3.5+/-0.13 V (rise) |

**NOTE**

To use an LVI interrupt, LVI reset must be masked (LVIRESMK = 1) by LVIRESMK.

## 11.2.3 Core Voltage Monitor Control Registers

### 11.2.3.1 CVMF — CVM Factor Register

This register records the core voltage failure state generated after the last power-up reset PURES. The L_V_F bit and the H_V_F bit are set to 1 by hardware when the CVM detects core voltage failure.

If the L_V_F or H_V_F bit of this register is set to 1, that bit is not updated until it is initialized by a power-up reset PURES or by writing 0 to the CVMF.L_V_F or CVMF.H_V_F bit. However, it continuously monitors an error signal from the core voltage monitoring circuit in diagnostic mode.

The correct write sequence using the PROTCMDCVM register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $3100_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

### 11.2.3.2 CVMDE — CVM Detection Enable Register

This register is used to indicate the voltage detection enabled or disabled state.
This register is initialized only by power-up reset PURES.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 $3104_H$

**Value after reset:** The value after reset depends on the option byte setting.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 11.2.3.3 CVMDIAG — CVM Diagnostic Mode Setting Register

This register sets the CVM diagnostic mode.

This register is initialized only by power-up reset PURES.

For details on the register settings in diagnostic mode, see **Section 11.1.4.3, Diagnostic (DIAG) Mode**.

The correct write sequence using the PROTCMDCVM register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $3114_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 11.2.4 Very-Low-Voltage Detection Control Registers

### 11.2.4.1 VLVF — Very-Low-Voltage Detection Register

The very-low-voltage detection register (VLVF) shows the state of the RAM retention voltage detection.

This register is set upon detection of a voltage below the RAM retention voltage ($V_{VLVI}$).

If VLVF is set, the Retention RAM content cannot be guaranteed.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 $0980_H$

**Value after power on:** 0000 $0001_H$
This register is not initialized by any reset source.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

# Section 12 Clock Controller

This section explains in general about the clock controller.

The first part in this section describes the specific features of the clock controller of the RH850/F1K microcontrollers. The ensuing sections describe the clock oscillation circuit, clock selectors, and clock output function that make up the clock controller.

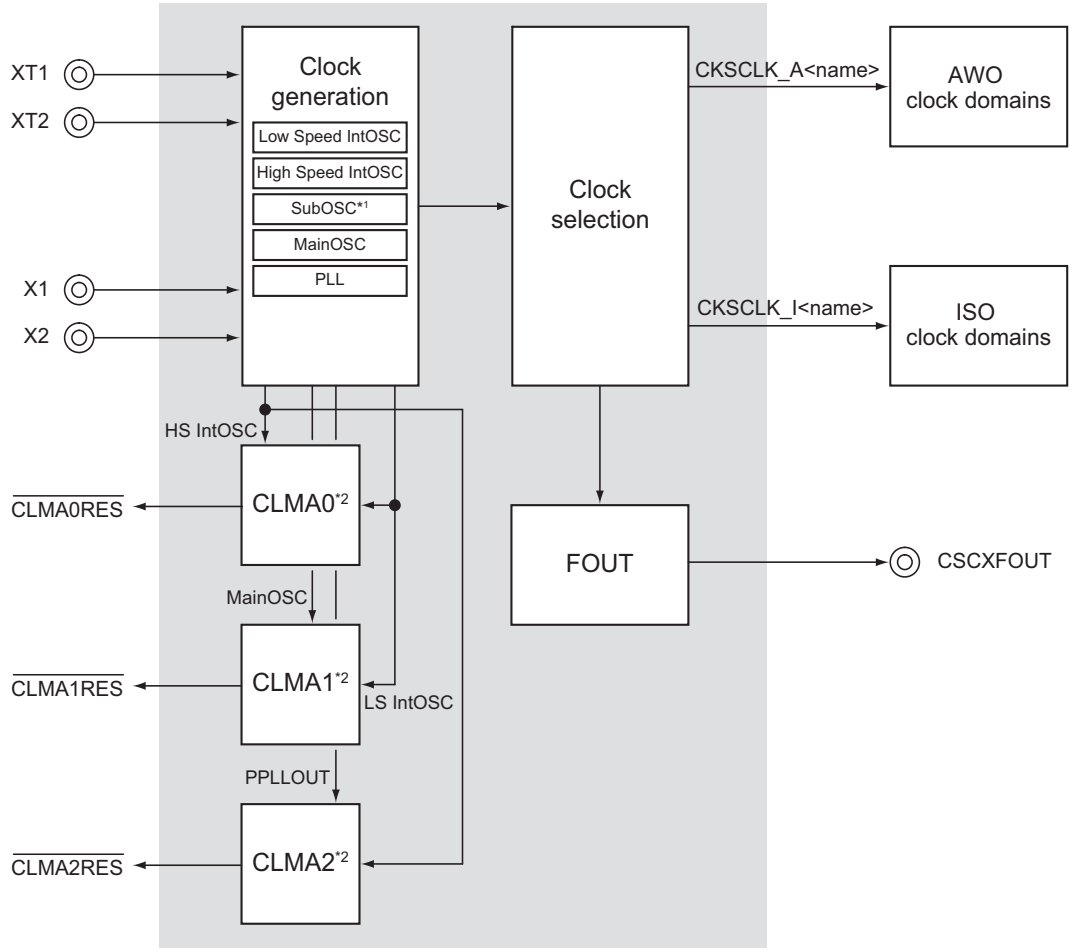
## 12.1 Features of Clock Controller of RH850/F1K

The clock controller of the RH850/F1K microcontrollers has the following features.

- Five on-chip clock oscillators
  - Main Oscillator (MainOSC) with an oscillation frequency of 16, 20, and 24 MHz
  - Sub Oscillator (SubOSC) with an oscillation frequency of 32.768 kHz*1
  - High Speed Internal Oscillator (HS IntOSC) with a nominal frequency of 8 MHz (Typ.)
  - Low Speed Internal Oscillator (LS IntOSC) with a nominal frequency of 240 kHz (Typ.)
  - PLL
- Fine management of clock supply to peripheral modules through clock domains
- On-chip clock monitor that detects clock anomalies when the Main Oscillator, High Speed Internal Oscillator, or PLL are in use. See Section 13, Clock Monitor (CLMA).
- Clock output (FOUT)

**Note 1.** The Sub Oscillator is supported only for the 144 pin and 176 pin products.

**Figure 12.1** shows the schematic diagram of the clock controller.



Note 1. Supported only by 144 pin and 176 pin products.
Note 2. See Section 13, Clock Monitor (CLMA) for details of clock monitors.

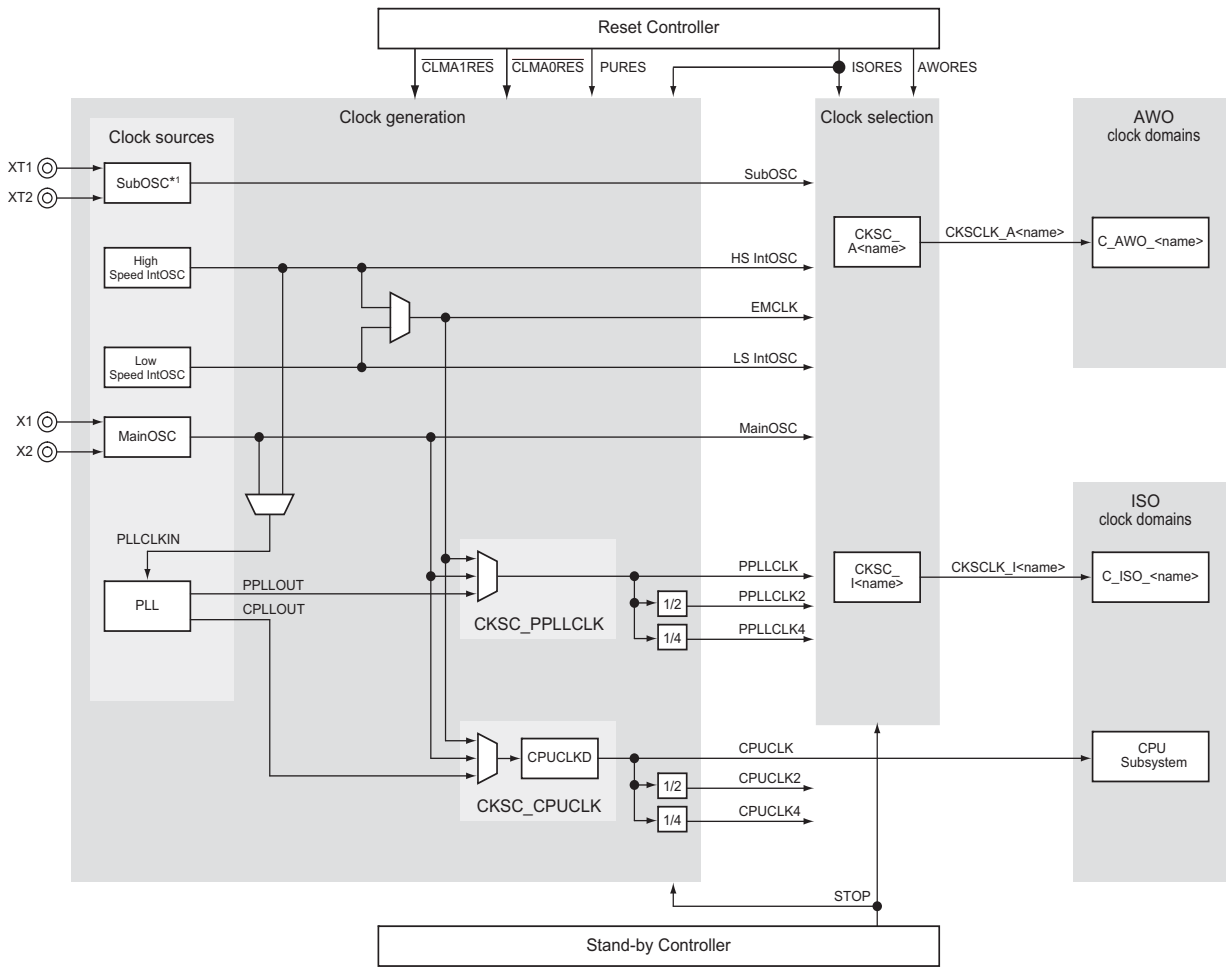
**Figure 12.1 Clock Controller Overview**

## 12.2 Configuration of Clock Controller

This section describes the configuration of the clock controller.

The clock controller is composed of clock oscillators and clock generation circuits that generate the clocks for the CPU and the peripheral modules, a clock selector for selecting the optimum clock, and clock domains for the CPU and the peripheral modules.

**Figure 12.2** shows the configuration of the clock controller.



Note 1. Supported only by 144 pin and 176 pin products.

**Figure 12.2 Clock Controller Configuration**

**NOTE**

**Clock domain and clock control register naming conventions**

The clock signals and their control registers, etc., described in this section are named according to the following naming conventions to reflect the power domain or clock domain to which they belong. The placeholder “<name>” is used to identify the target module in the clock domain:

- Clock domain names:
  - C_AWO_<name>: Always-On area*1 clock domain
  - C_ISO_<name>: Isolated area*1 clock domain
- Domain clock names:
  - CKSCLK_A<name>: Always-On area domain clock
  - CKSCLK_I<name>: Isolated area domain clock
- Clock selector names:
  - CKSC_A<name>: Always-On area clock selector
  - CKSC_I<name>: Isolated area clock selector
- Clock selector registers:
  - CKSC_A<name>S_CTL: Always-On area source clock selector register
  - CKSC_A<name>D_CTL: Always-On area source clock divider register
  - CKSC_I<name>S_CTL: Isolated area source clock selector register
  - CKSC_I<name>D_CTL: Isolated area source clock divider register

**Example**

The clock signal CKSCLK_AADCA (placeholder <name> = ADCA) is the clock supplied to the clock domain C_AWO_ADCA in the Always-On area. This clock is selected by the clock selector register CKSC_AADCAS_CTL.

**Note 1.** Always-On area and Isolated area refer to the power supply domains. Always-On area (AWO area) is an always-on power supply, and Isolated area (ISO area) is an a power supply that is switched on or off by the operation mode.
For details, see **Section 10, Power Supply Circuit**.

### 12.2.1 Clock Generation Circuits

Five clock oscillators are provided:

Four clock oscillators are located on the Always-On area (AWO area) and PLL is located on the Isolated area (ISO area).

#### Main Oscillator (MainOSC)

The MainOSC generates the main clock X.
Generation of the clock X requires the connection of an external resonator to X1 and X2.
The clock X is used as the reference clock for the PLL.

#### Sub Oscillator (SubOSC)

The SubOSC generates the sub-clock XT, which runs at a frequency of 32.768 kHz (Typ.). Generation of the sub clock XT requires the connection of an external resonator to XT1 and XT2.
This clock is mainly used for real-time clock applications.

#### High Speed Internal Oscillator (HS IntOSC)

The HS IntOSC generates the clock RH, which runs at a frequency of 8 MHz (Typ.).

#### Low Speed Internal Oscillator (LS IntOSC)

The LS IntOSC generates the clock RL, which runs at a frequency of 240 kHz (Typ.). It starts operation at power up and cannot be stopped, hence it is always operating.

#### PLL

The PLL circuits generate high speed operation clocks CPLLOUT and PPLLOUT for normal operation of the microcontroller.

The clocks supplied by the clock oscillators (X, XT, RH, RL, CPLLOUT, PPLLOUT) and their divided clocks (CPUCLK, CPUCLK2, CPUCLK4, PPLLCLK, PPLLCLK2, and PPLLCLK4) are all generated in the clock generation circuit.

### 12.2.2 Clock Selection

The clocks generated by the clock oscillators are input to the clock selectors CKSC_A<name>/ CKSC_I<name>.

Domain clocks CKSCLK_A<name>/CKSCLK_I<name> are selected by dedicated clock selectors from clocks directly input from the oscillators, or in some cases from clocks that have been divided by clock dividers.

- CKSC_I<name>S_CTL/CKSC_I<name>D_CTL registers: determine the clock for the Isolated area clock domains.
- CKSC_A<name>S_CTL/CKSC_A<name>D_CTL registers: determine the clock for the Always-On area clock domains.

Note that not all available clocks generated by the clock oscillators are input to each clock selector.

The following clocks are supplied to the CPU and related modules from the clock generation circuit.

#### Emergency Clock (EMCLK)

The emergency clock EMCLK is supplied by the

- HS IntOSC, if it is active
- LS IntOSC, if the HS IntOSC is inactive

The selection is done automatically after CLMA0 reset is occurred, so if the HS IntOSC becomes lower than the limit for any reason, vital modules of the microcontroller are still in operation, since the LS IntOSC does not stop.

#### CPU Subsystem Clock (CPUCLK)

The CPU Subsystem clock CPUCLK is derived from PLL clock CPLLOUT, MainOSC, and EMCLK. The CPU clock selector CKSC_CPUCLK incorporates the selector CPUCLKS, followed by the clock divider CPUCLKD.

The CPUCLK clock divider provides the frequency-divided CPUCLK2 clock signal and CPUCLK4 clock signal derived from CPUCLK.

### 12.2.3 Clock Domains

The clock controller allows selection of the respective clocks for the CPU and peripheral modules. The clock control scope is called the clock domain. For the correspondence between the CPU and peripheral modules and clock domains, see **Section 12.5.3, Clock Domain Settings**.

### 12.2.4 Resetting Clock Oscillators

The clock oscillators on the Always-On area are reset by the PURES signal.

The HS IntOSC is reset when $\overline{\text{CLMA0RES}}$ is generated and the MainOSC is reset when $\overline{\text{CLMA1RES}}$ is generated.

The clock oscillator on the Isolated area is reset by the ISORES signal.

For further details on the clock oscillators, see **Section 12.3, Clock Oscillators**.

**CAUTION**

**For the specifications of the frequencies, acceptable variation, and other parameters of the clock generators, see Section 40, Electrical Characteristics.**

# 12.3 Clock Oscillators

## 12.3.1 Main Oscillator (MainOSC)

The Main Oscillator generates the clock X. X is also used as the PLL input clock PLLCLKIN.

**Figure 12.3** shows the basic configuration and signals of the MainOSC.

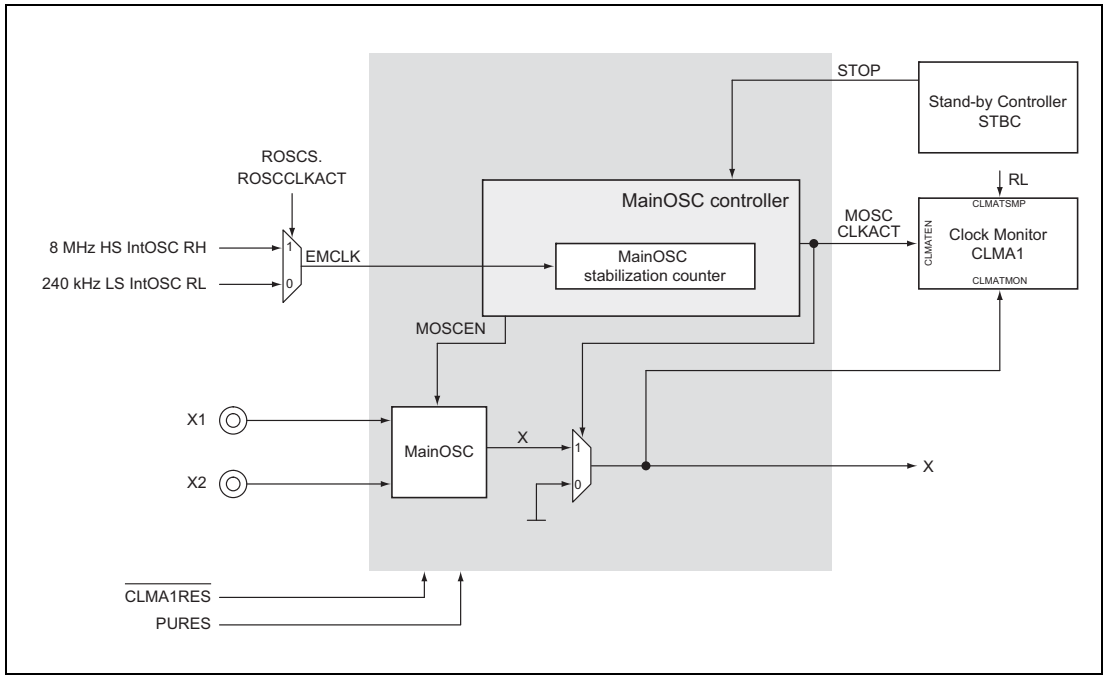


**Figure 12.3 Main Oscillator (MainOSC)**

### MainOSC

The MainOSC stops operating after reset is released. To use the MainOSC, set the MainOSC enable trigger bit (MOSCE.MOSCENTRG) to 1 to start the MainOSC.

### MainOSC stabilization

The MOSCST.MOSCCLKST[16:0] bits set the MainOSC oscillation stabilization time.
The MainOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting. The oscillation stabilization time can be set to up to $2^{17}$ –1 EMCLK cycles.
As long as the MainOSC is not stable, the MOSCCLKACT signal disables the X output.
When the MainOSC stabilization counter reaches the value specified in MOSCST.MOSCCLKST[16:0], X is assumed to be stable and MOSCCLKACT switches from 0 to 1 to enable output of X when a waveform is output from MainOSC.

Stable and active X clock is indicated by MOSCS.MOSCCLKACT = 1.

### MainOSC amplification gain

By using MOSCC.MOSCAMPSEL[1:0], the MainOSC's input frequency, determined by the external resonator, can be selected from 16MHz, 20 MHz, and 24 MHz.

### MainOSC STOP requests in stand-by mode

The STOP signal from the Stand-by Controller requests the MainOSC Controller to switch off the X clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

The stop request mask bit MOSCSTPM.MOSCSTPMSK controls whether the MainOSC is stopped during stand-by or continues operation:

- MOSCSTPM.MOSCSTPMSK = 0:
  The STOP request signal is not masked, so the MainOSC is stopped in stand-by.
  If the MainOSC is in operation before stand-by, it is automatically re-started after wake-up from stand-by, and the MainOSC stabilization counter counts the oscillation stabilization time.
  However, the STOP request is masked under the following conditions, even if MOSCSTPM.MOSCSTPMSK = 0. Therefore, the MainOSC will continue to operate even in stand-by mode.
  - If the stop mask is set (CKSC_xxxx_STPM = 0000 $0003_H$) for a clock domain for which the MainOSC is selected.
- MOSCSTPM.MOSCSTPMSK = 1:
  The STOP request signal is not masked, so the MainOSC continues to operate in stand-by.

### Clock monitor control

The MainOSC activity signal MOSCCLKACT enables or disables supervision by the Clock Monitor CLMA1. In case the MainOSC is inactive (MOSCCLKACT = 0), supervision of its output clock X by CLMA1 is also disabled.

### MainOSC enable/disable trigger

The MainOSC can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger MOSCE.MOSCENTRG = 1 starts the MainOSC.
  Note that setting the enable trigger is only effective if the MainOSC is inactive, i.e. if MOSCS.MOSCCLKACT = 0.
- Disable trigger MOSCE.MOSCDISTRG = 1 stops the MainOSC.
  Note that setting the disable trigger is only effective if the MainOSC is active (MOSCCLKACT = 1) and the MainOSC stop requests are not masked (MOSCSTPM.MOSCSTPMSK = 0).

### Direct clock input to X1

A clock waveform from an external clock source can be supplied to X1 pin. In this case, set the MOSCM bit of MOSCM register to 1 before clock input to X1 pin is supplied.

### 12.3.2 Sub Oscillator (SubOSC)

The Sub Oscillator generates the sub clock XT. XT has usually a frequency of 32.768 kHz and is used for the Real-time Clock.

**Figure 12.4** shows the basic structure and signals of the SubOSC.

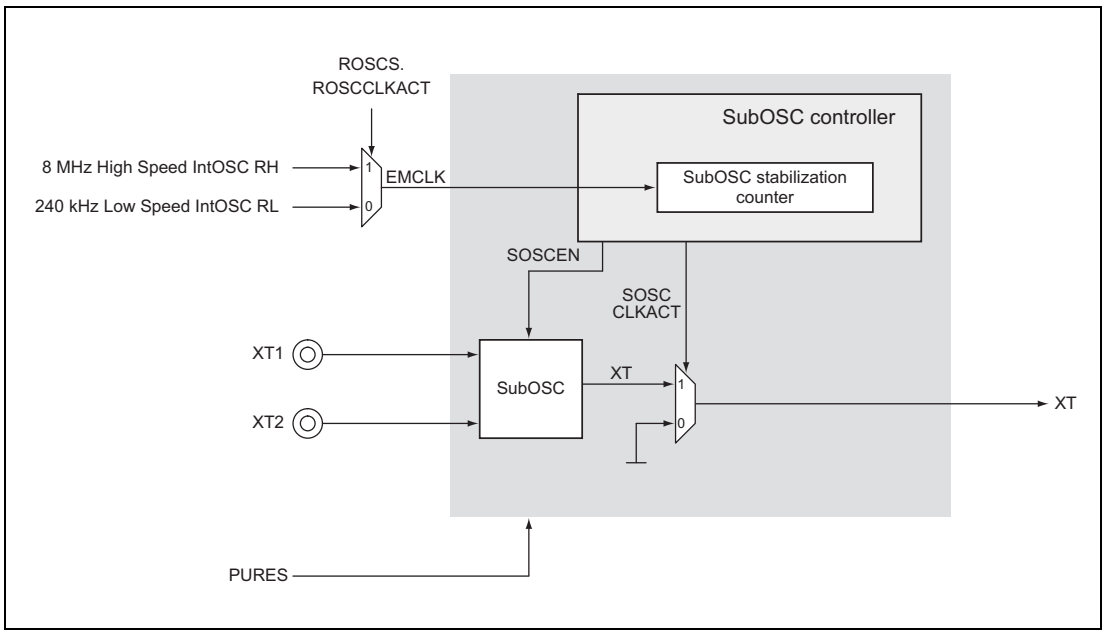

**Figure 12.4 Sub Oscillator (SubOSC)**

#### SubOSC enable

The SubOSC stops operating after reset is released. To use the SubOSC, set SubOSC enable trigger bit (SOSCE.SOSCENTRG) to 1 to start the SubOSC.

#### SubOSC stabilization

The SOSCST.SOSCCLKST[29:0] bits set the SubOSC oscillation stabilization time.
The SubOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting.
As long as the SubOSC is not stable, the SOSCCLKACT signal disables the XT output.
When the SubOSC stabilization counter reaches the value specified in SOSCST.SOSCCLKST[29:0], XT is assumed to be stable and SOSCCLKACT switches from 0 to 1 to enable output of XT.
Secure the stabilization time longer than 2 seconds.
Stable and active XT clock is indicated by SOSCS.SOSCCLKACT = 1.

#### SubOSC input frequencies

The SubOSC input frequency is 32.768 kHz (Typ.).

#### SubOSC enable trigger/disable trigger

SubOSC can be enabled or disabled by using enable/disable trigger control bit.

- Enable trigger SOSCE.SOSCENTRG = 1 starts the SubOSC.
  Note that setting the enable trigger is only effective if the SubOSC is inactive, i.e. if SOSCS.SOSCCLKACT = 0.

- Disable trigger SOSCE.SOSCDISTRG = 1 stops the SubOSC. Note that setting the disable trigger is only effective if the SubOSC is active; that is, if SOSCS.SOSCCLKACT = 1.

### 12.3.3 High Speed Internal Oscillator (HS IntOSC)

The High Speed Internal Oscillator generates the clock RH. RH has a nominal frequency of 8 MHz.

**Figure 12.5** shows the basic configuration and signals of the HS IntOSC.

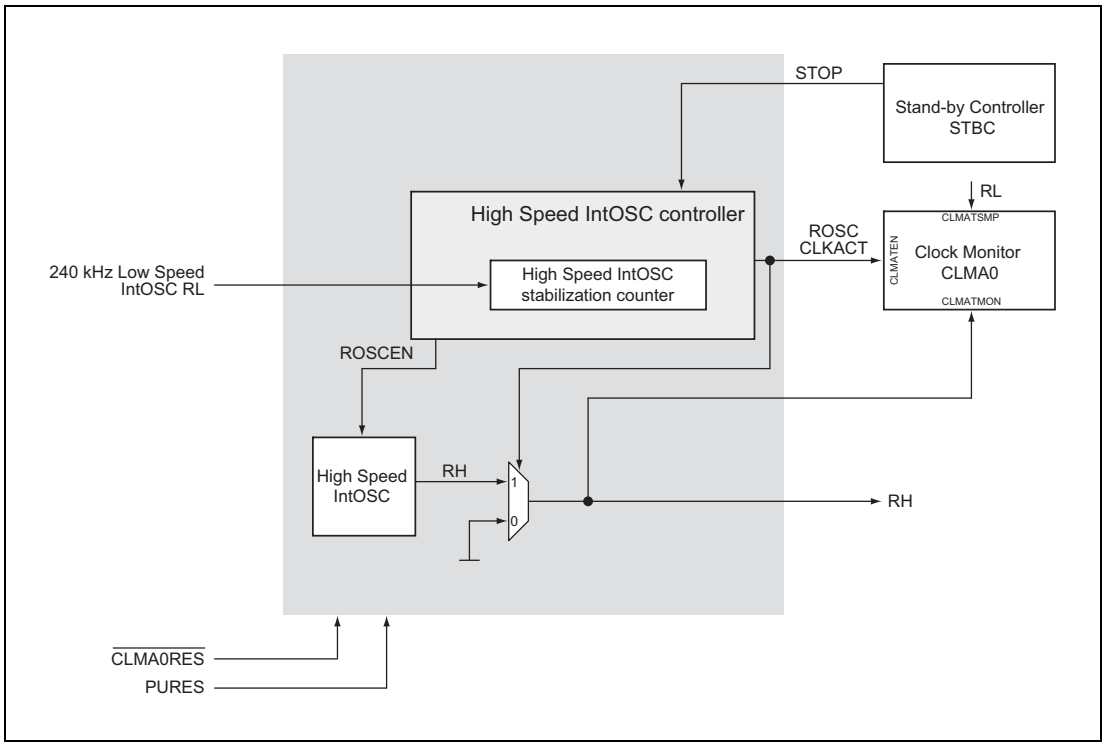

**Figure 12.5 High Speed Internal Oscillator (HS IntOSC)**

After reset release the HS IntOSC starts operation.

**NOTE**

The HS IntOSC can neither be stopped nor started by software. It can only be stopped in stand-by mode. On the other hand, when CLMA0 is reset, the HS IntOSC can be enabled to stop by software.

#### HS IntOSC stabilization

HS IntOSC outputs RH when it is stabilized.
Stable and active RH clock is indicated by ROSCS.ROSCCLKACT = 1.

#### HS IntOSC STOP requests in stand-by mode

The STOP signal from the Stand-By Controller requests the HS IntOSC Controller to switch off the RH clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).
The stop request mask bit ROSCSTPM.ROSCSTPMSK controls whether the HS IntOSC is stopped during stand-by or continues operation:

- ROSCSTPM.ROSCSTPMSK = 0:
  The STOP request signal is not masked, so the HS IntOSC is stopped during stand-by and automatically restarted after wake-up from stand-by.
  However, the STOP request is masked under the following conditions, even if ROSCSTPM.ROSCSTPMSK = 0. Therefore, the HS IntOSC will continue to operate even in stand-by mode.
  - If the stop mask is set (CKSC_xxxx_STPM = $0000_0003_H$) for a clock domain for which the HS IntOSC is selected.
  - If the low power sampler (LPS) is operating
- ROSCSTPM.ROSCSTPMSK = 1:
  The STOP request signal is masked, so the HS IntOSC continues to operate during stand-by.

### Clock Monitor control

The HS IntOSC activity signal ROSCCLKACT enables or disables supervision by the Clock Monitor CLMA0. In case the HS IntOSC is inactive (ROSCCLKACT = 0), supervision of its output clock by CLMA0 is also deactivated.

The HS IntOSC clock RH is used as the sampling clock for Clock Monitor CLMA2.

### HS IntOSC disable trigger

The disable trigger, ROSCE.ROSCDISTRG = 1 stops the HS IntOSC.

The setting of the disable trigger is enabled when HS IntOSC is active (ROSCS.ROSCCLKACT = 1) and HS IntOSC stop requests are not masked (ROSCSTPM.ROSCSTPMSK = 0).

### HS IntOSC user calibration function

The HS IntOSC user trimming register (ROSCUT) enables adjustment of the HS IntOSC frequency. The initial value of ROSCUT is the preset value of the HS IntOSC trimming data. Overwrite the value with “read value + 1” or “read value – 1” until the HS IntOSC frequency reaches the target frequency range.

### 12.3.4 Low Speed Internal Oscillator (LS IntOSC)

The Low Speed Internal Oscillator generates the clock RL. RL has a nominal frequency of 240 kHz.

**Figure 12.6** shows the basic configuration and signals of the LS IntOSC.

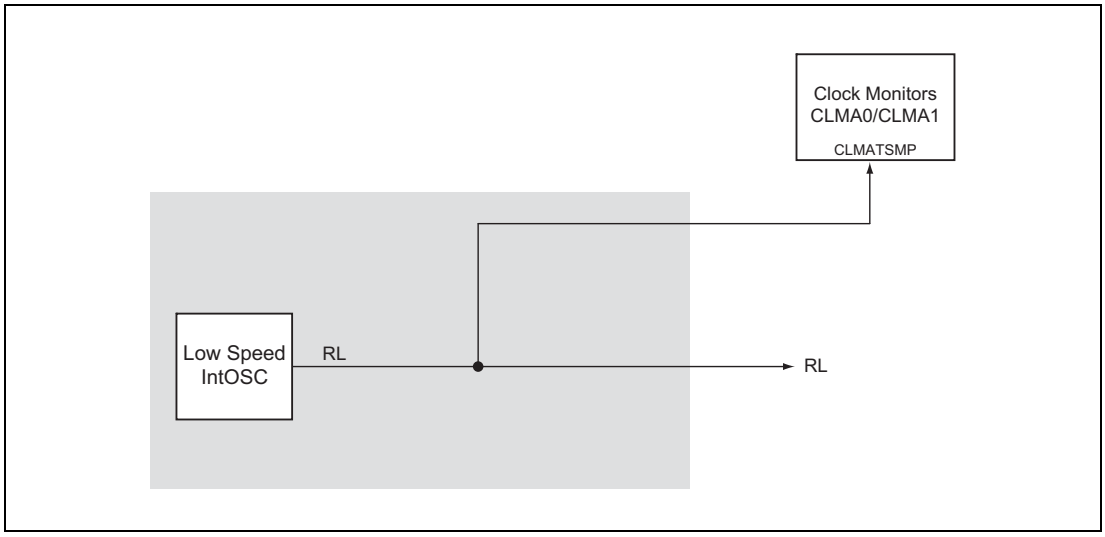

**Figure 12.6 Low Speed Internal Oscillator (LS IntOSC)**

After reset release the LS IntOSC starts operation. It cannot be stopped.

The LS IntOSC clock RL is used as the sampling clock for the Clock Monitors CLMA0 and CLMA1.

### 12.3.5 PLL

The MainOSC or HS IntOSC is input to the Phase-Locked Loops (PLL) clock oscillator as PLLCLKIN. The PLL output clocks CPLLOUT and PPLLOUT serve as the main operation clocks for the microcontroller.

**Figure 12.7** shows the basic configuration and signals of the PLL.

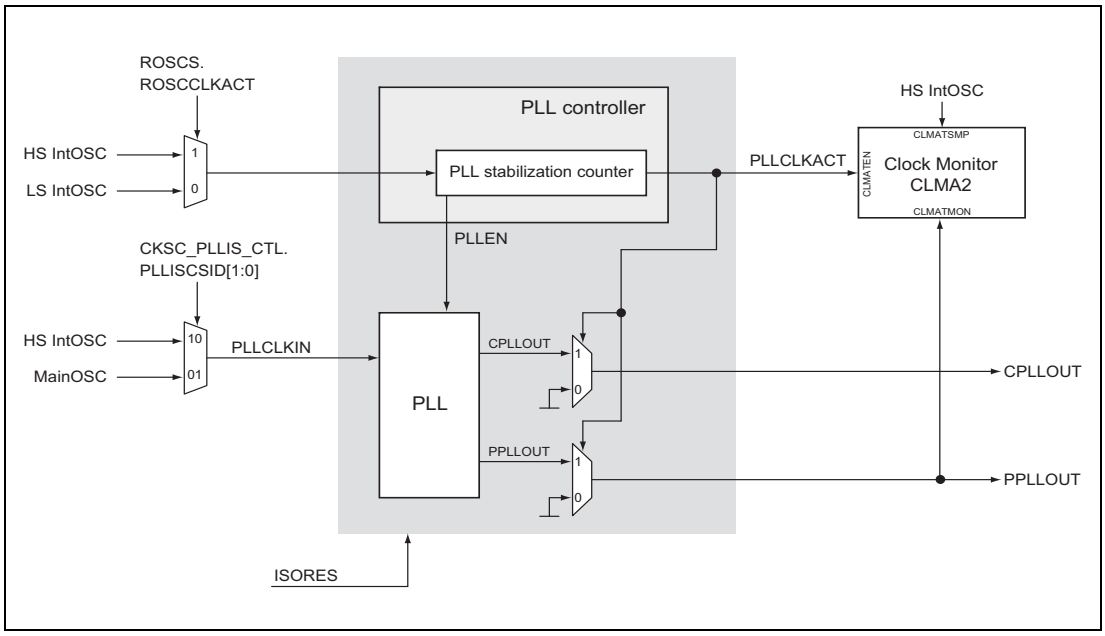

Figure 12.7 PLL

#### PLL enable

The PLL stops operating after reset is released. To use the PLL, set the PLL enable trigger bit (PLLE.PLLENTRG) to 1 to start the PLL.

#### PLL stabilization

The PLL stabilization counter starts counting the stabilization time.
As long as the PLL is not stable, the PLLCLKACT signal disables the PPLLOUT and CPLLOUT outputs.
When the PLL stabilization counter reaches the predefined value, PPLLOUT and CPLLOUT are assumed to be stable and PLLCLKACT switches from 0 to 1 to enable output of PPLLOUT and CPLLOUT.

The stable and active state of the PPLLOUT and CPLLOUT clocks is indicated by PLLS.PLLCLKACT = 1.

#### PLL in stand-by modes

In STOP mode, the PLL is automatically disabled and resumes operation after wake-up from STOP mode, if it was operating before entering STOP mode.

The PLL is also automatically disabled when transitioning to DeepSTOP mode. However, after restoring from DeepSTOP mode, the PLL needs to be reconfigured.

In Cyclic RUN and Cyclic STOP mode, the PLL is not available. Do not enable the PLL by using the PLL Enable register in Cyclic RUN mode.

### Clock Monitor control

The PLL activity signal PLLCLKACT enables or disables supervision by the Clock Monitor CLMA2. In case the PLL is inactive (PLLCLKACT = 0), supervision of the output clock PPLLOUT by CLMA2 is also deactivated.

### PLL enable/disable trigger

The PLL can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger PLLE.PLLENTRG = 1 starts the PLL
  Note that setting the enable trigger is only effective if the PLL is inactive, i.e. if PLLS.PLLCLKACT = 0.
- Disable trigger PLLE.PLLDISTRG = 1 stops the PLL
  Note that setting the disable trigger is only effective if the PLL is active, i.e. if PLLS.PLLCLKACT = 1.

### PLL input clock (PLLCLKIN) selection

The PLL input clock (PLLCLKIN) can be selected from MainOSC and HS IntOSC by using the CKSC_PLLIS_CTL register.

The maximum frequency of CPLLOUT and PPLLOUT is limited when the HS IntOSC is selected as PLL input clock.

### 12.3.5.1 PLL Parameters

The PLL is configured by a set of parameters, loaded from the control register PLLC and CKSC_CPUCLKD_CTL.

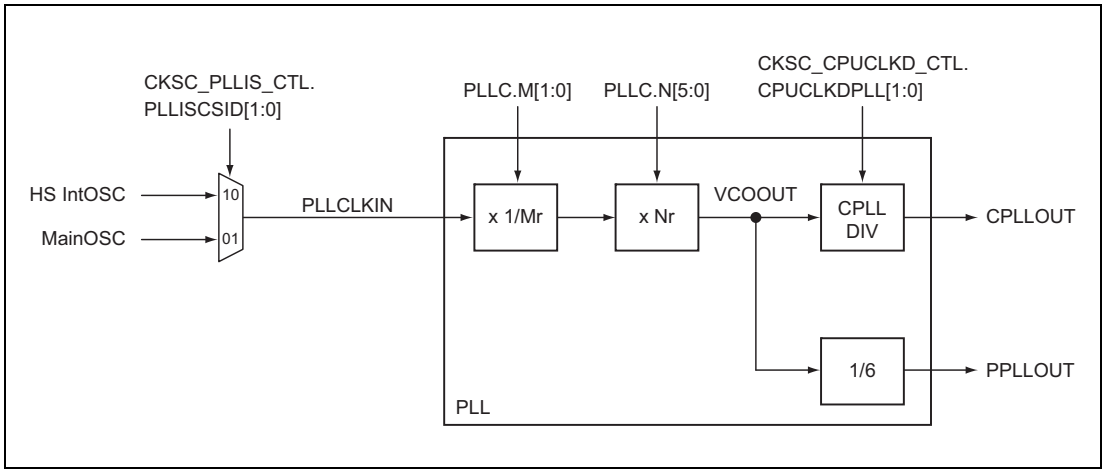

**Figure 12.8 PLL Circuit**

#### CPLLOUT and PPLLOUT

The PLL has two clock outputs: “CPLLOUT” and “PPLLOUT”. CPLLOUT is one of the clock sources of the CPU subsystem, and PPLLOUT is one of the clock sources of the peripheral modules. CPLLOUT and PPLLOUT share the same clock source “VCOOUT”, which is the output of the voltage controlled oscillator (VCO). The clock frequency of VCOOUT is calculated by the following formula:

$$f_{VCOOUT} = f_{PLLCLKIN} \times (Nr / Mr)$$

The clock frequency of CPLLOUT “$f_{CPLL}$” and that of PPLLOUT “$f_{PPLL}$” are integer fractions of the VCO output frequency $f_{VCOOUT}$. $f_{CPLL}$ and $f_{PPLL}$ are calculated by the following formulas:

$$f_{CPLL} = f_{VCOOUT} \times 1/Pr = f_{PLLCLKIN} \times (Nr / Mr) \times 1/Pr$$

$$f_{PPLL} = f_{VCOOUT} \times 1/6 = f_{PLLCLKIN} \times (Nr / Mr) \times 1/6$$

The values Nr and Mr are derived from PLLC register bits:

$$Nr = PLLC.N[5:0] + 1$$

$$Mr = PLLC.M[1:0] + 1$$

The setting range of Mr: $1 \leq Mr \leq 3$

The value Pr is derived from CKSC_CPUCLKD_CTL. CPUCLKDPLL[1:0], and the value is 4, 5, or 6.

# 12.4 Registers

## 12.4.1 List of Registers

The registers of the clock controller are listed below.

**Table 12.1 List of Clock Controller Registers (1/2)**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| CLKCTL | **Clock oscillator registers:** | | |
| | MainOSC enable register | MOSCE | FFF8 1100$_H$ |
| | MainOSC status register | MOSCS | FFF8 1104$_H$ |
| | MainOSC control register | MOSCC | FFF8 1108$_H$ |
| | MainOSC stabilization time register | MOSCST | FFF8 110C$_H$ |
| | MainOSC stop mask register | MOSCSTPM | FFF8 1118$_H$ |
| | MOSC mode control register | MOSCM | FFF8 111C$_H$ |
| | SubOSC enable register | SOSCE*1 | FFF8 1200$_H$ |
| | SubOSC status register | SOSCS*1 | FFF8 1204$_H$ |
| | SubOSC stabilization time register | SOSCST*1 | FFF8 120C$_H$ |
| | HS IntOSC enable register | ROSCE | FFF8 1000$_H$ |
| | HS IntOSC status register | ROSCS | FFF8 1004$_H$ |
| | HS IntOSC stop mask register | ROSCSTPM | FFF8 1018$_H$ |
| | PLL enable register | PLLE | FFF8 9000$_H$ |
| | PLL status register | PLLS | FFF8 9004$_H$ |
| | PLL control register | PLLC | FFF8 9008$_H$ |
| | PLL input clock selection register | CKSC_PLLIS_CTL | FFF8 A700$_H$ |
| | PLL input clock active register | CKSC_PLLIS_ACT | FFF8 A708$_H$ |
| | PPLLCLK source clock selection register | CKSC_PPLLCLKS_CTL | FFF8 A010$_H$ |
| | PPLLCLK source clock active register | CKSC_PPLLCLKS_ACT | FFF8 A018$_H$ |
| | HS IntOSC user trimming register | ROSCUT | FFF8 101C$_H$ |
| | **Clock selectors registers:** | | |
| | C_AWO_WDTA clock divider register | CKSC_AWDTAD_CTL | FFF8 2000$_H$ |
| | C_AWO_WDTA clock divider active register | CKSC_AWDTAD_ACT | FFF8 2008$_H$ |
| | C_AWO_WDTA stop mask register | CKSC_AWDTAD_STPM | FFF8 2018$_H$ |
| | C_AWO_TAUJ source clock selection register | CKSC_ATAUJS_CTL | FFF8 2100$_H$ |
| | C_AWO_TAUJ source clock active register | CKSC_ATAUJS_ACT | FFF8 2108$_H$ |
| | C_AWO_TAUJ clock divider register | CKSC_ATAUJD_CTL | FFF8 2200$_H$ |
| | C_AWO_TAUJ clock divider active register | CKSC_ATAUJD_ACT | FFF8 2208$_H$ |
| | C_AWO_TAUJ stop mask register | CKSC_ATAUJD_STPM | FFF8 2218$_H$ |
| | C_AWO_RTCA source clock selection register | CKSC_ARTCAS_CTL*1 | FFF8 2300$_H$ |
| | C_AWO_RTCA source clock active register | CKSC_ARTCAS_ACT*1 | FFF8 2308$_H$ |
| | C_AWO_RTCA clock divider register | CKSC_ARTCAD_CTL*1 | FFF8 2400$_H$ |
| | C_AWO_RTCA clock divider active register | CKSC_ARTCAD_ACT*1 | FFF8 2408$_H$ |
| | C_AWO_RTCA stop mask register | CKSC_ARTCAD_STPM*1 | FFF8 2418$_H$ |
| | C_AWO_ADCA source clock selection register | CKSC_AADCAS_CTL | FFF8 2500$_H$ |
| | C_AWO_ADCA source clock active register | CKSC_AADCAS_ACT | FFF8 2508$_H$ |
| | C_AWO_ADCA clock divider register | CKSC_AADCAD_CTL | FFF8 2600$_H$ |
| | C_AWO_ADCA clock divider active register | CKSC_AADCAD_ACT | FFF8 2608$_H$ |

Table 12.1 List of Clock Controller Registers (2/2)

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| CLKCTL | C_AWO_ADCA stop mask register | CKSC_AADCAD_STPM | FFF8 $2618_H$ |
| | C_AWO_FOUT source clock selection register | CKSC_AFOUTS_CTL | FFF8 $2700_H$ |
| | C_AWO_FOUT source clock active register | CKSC_AFOUTS_ACT | FFF8 $2708_H$ |
| | C_AWO_FOUT stop mask register | CKSC_AFOUTS_STPM | FFF8 $2718_H$ |
| | C_ISO_CPUCLK source clock selection register | CKSC_CPUCLKS_CTL | FFF8 $A000_H$ |
| | C_ISO_CPUCLK source clock active register | CKSC_CPUCLKS_ACT | FFF8 $A008_H$ |
| | C_ISO_CPUCLK clock divider register | CKSC_CPUCLKD_CTL | FFF8 $A100_H$ |
| | C_ISO_CPUCLK clock divider active register | CKSC_CPUCLKD_ACT | FFF8 $A108_H$ |
| | C_ISO_PERI1 source clock selection register | CKSC_IPERI1S_CTL | FFF8 $A200_H$ |
| | C_ISO_PERI1 source clock active register | CKSC_IPERI1S_ACT | FFF8 $A208_H$ |
| | C_ISO_PERI2 source clock selection register | CKSC_IPERI2S_CTL | FFF8 $A300_H$ |
| | C_ISO_PERI2 source clock active register | CKSC_IPERI2S_ACT | FFF8 $A308_H$ |
| | C_ISO_LIN source clock selection register | CKSC_ILINS_CTL | FFF8 $A400_H$ |
| | C_ISO_LIN source clock active register | CKSC_ILINS_ACT | FFF8 $A408_H$ |
| | C_ISO_ADCA source clock selection register | CKSC_IADCAS_CTL*1 | FFF8 $A500_H$ |
| | C_ISO_ADCA source clock active register | CKSC_IADCAS_ACT*1 | FFF8 $A508_H$ |
| | C_ISO_ADCA clock divider register | CKSC_IADCAD_CTL*1 | FFF8 $A600_H$ |
| | C_ISO_ADCA clock divider active register | CKSC_IADCAD_ACT*1 | FFF8 $A608_H$ |
| | C_ISO_LIN clock divider register | CKSC_ILIND_CTL | FFF8 $A800_H$ |
| | C_ISO_LIN clock divider active register | CKSC_ILIND_ACT | FFF8 $A808_H$ |
| | C_ISO_LIN stop mask register | CKSC_ILIND_STPM | FFF8 $A818_H$ |
| | C_ISO_CAN source clock selection register | CKSC_ICANS_CTL | FFF8 $A900_H$ |
| | C_ISO_CAN source clock active register | CKSC_ICANS_ACT | FFF8 $A908_H$ |
| | C_ISO_CAN stop mask register | CKSC_ICANS_STPM | FFF8 $A918_H$ |
| | C_ISO_CANOSC clock divider register | CKSC_ICANOSCD_CTL | FFF8 $AA00_H$ |
| | C_ISO_CANOSC clock divider active register | CKSC_ICANOSCD_ACT | FFF8 $AA08_H$ |
| | C_ISO_CANOSC stop mask register | CKSC_ICANOSCD_STPM | FFF8 $AA18_H$ |
| | C_ISO_CSI source clock selection register | CKSC_ICSIS_CTL | FFF8 $AB00_H$ |
| | C_ISO_CSI source clock active register | CKSC_ICSIS_ACT | FFF8 $AB08_H$ |
| | C_ISO_IIC source clock selection register | CKSC_IIICS_CTL | FFF8 $AC00_H$ |
| | C_ISO_IIC source clock active register | CKSC_IIICS_ACT | FFF8 $AC08_H$ |

Note 1. Supported only by 144 pin and 176 pin products.

## 12.4.2 Clock Oscillator Registers

### 12.4.2.1 MOSCE — MainOSC Enable Register

This register is used to start and stop the MainOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1100$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MOSCDISTRG | MOSCENTRG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 12.2 MOSCE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | MOSCDISTRG | MainOSC Disable Trigger*1,*3<br>MOSCSTPM.MOSCSTPMSK = 0<br>0: No function<br>1: Stops MainOSC<br><br>MOSCSTPM.MOSCSTPMSK=1<br>When writing this bit while MOSCSTPM.MOSCSTPMSK = 1, the write value should be 0.<br>0: No function<br>1: Setting Prohibited<br>This bit is automatically cleared to 0 by hardware after MainOSC is disabled. |
| 0 | MOSCENTRG | MainOSC Enable Trigger*2,*3<br>0: No function<br>1: Starts MainOSC<br>This bit is automatically cleared to 0 by hardware after MainOSC is enabled. |

Note 1. Follow the procedure given below for stopping the MainOSC by using MOSCDISTRG.

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
2. Confirm that the MainOSC is active (MOSCS.MOSCCLKACT = 1).
3. Check that there is no clock domain for which the MainOSC is selected. If the MainOSC is selected for a clock domain, disable the setting or select a clock source other than MainOSC.
4. Confirm that the MainOSC stop mask register is NOT set to "MainOSC continues operation in stand-by mode". Otherwise, set the register to “MainOSC stops operation in stand-by mode” (MOSCSTPM.MOSCSTPMSK = 0).
5. Stop the MainOSC (MOSCE.MOSCDISTRG = 1).
6. Confirm that the MainOSC has been stopped (MOSCS.MOSCCLKACT = 0).

Note 2. Follow the procedure given below for starting the MainOSC by using MOSCENTRG

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped

(both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).

2. Confirm that the MainOSC is inactive (MOSCS.MOSCCLKACT = 0).
3. Start the MainOSC (MOSCE.MOSCENTRG = 1).
4. Confirm that the MainOSC has been started (MOSCS.MOSCCLKACT = 1).

Note 3. Starting and stopping the MainOSC at the same time by using the start and stop bits, i.e., by setting MOSCE.MOSCENTRG = 1 and MOSCE.MOSCDISTRG = 1 at the same time is not allowed.

### 12.4.2.2 MOSCS — MainOSC Status Register

This register provides active status information about the MainOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 $1104_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1*1 | 0*1 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | MOSCCLKACT | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

**Table 12.3 MOSCS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | MOSCCLKACT | MainOSC Active Status<br>0: MainOSC is inactive<br>1: MainOSC is active |
| 1, 0 | Reserved | When read, an undefined value is returned. |

### 12.4.2.3 MOSCC — MainOSC Control Register

This register is used to specify amplification gain of the MainOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $1108_H$

**Value after reset:** 0000 $0004_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MOSCAMPSEL [1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 12.4 MOSCC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | MOSC AMPSEL[1:0] | MainOSC Amplification Gain Selection<br>00: Amplification gain for fx = 24MHz<br>01: Amplification gain for fx = 20MHz<br>10: Amplification gain for fx = 16MHz<br>11: Setting prohibited |

**CAUTION**

Set this register when MainOSC is stopped.

### 12.4.2.4 MOSCST — MainOSC Stabilization Time Register

This register determines the MainOSC stabilization time.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 110C$_H$

**Value after reset:** 0000 44C0$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MOSCCLKST16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MOSCCLKST[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 12.5 MOSCST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 17 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 to 0 | MOSC CLKST[16:0] | The MOSCCLKST[16:0] bits specify the count value for the MainOSC stabilization counter.<br>• If HS IntOSC active (ROSCS.ROSCCLKACT = 1): Stabilization time = MOSCCLKST[16:0] / $f_{RH}$<br>• If HS IntOSC inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = MOSCCLKST[16:0] / $f_{RL}$ |

**NOTE**

See **Section 40, Electrical Characteristics** for information about the MainOSC stabilization time.

**CAUTION**

Set this register when MainOSC is stopped.

### 12.4.2.5 MOSCSTPM — MainOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1118$_H$

**Value after reset:** 0000 0002$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | MOSCSTPMSK | MainOSC Stop Request Mask<br>0: MainOSC stops operation in stand-by mode.<br>MainOSC stops operation in the case the MainOSC disable trigger MOSCE.MOSCDISTRG is set to 1.<br>1: MainOSC continues operation in stand-by mode.<br>MainOSC continues operation even in the case the MainOSC disable trigger MOSCE.MOSCDISTRG is set to 1. |

### 12.4.2.6 MOSCM — MainOSC Mode Control Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 111C$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 12.7 MOSCM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | MOSCM | MainOSC Mode control<br>0: OSC mode. (default)<br>1: EXCLK mode. MainOSC amplifier is disabled. |

**CAUTION**

Set this register when MainOSC is stopped.

### 12.4.2.7 SOSCE — SubOSC Enable Register

This register is used to start and stop the SubOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1200$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SOSCDISTRG | SOSCENTRG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 12.8 SOSCE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SOSCDISTRG | SubOSC Disable Trigger*1,*2,*3<br>0: No function<br>1: Stops SubOSC<br>This bit is automatically cleared to 0 by hardware after SubOSC is disabled. |
| 0 | SOSCENTRG | SubOSC Enable Trigger*3<br>0: No function<br>1: Starts SubOSC<br>This bit is automatically cleared to 0 by hardware after SubOSC is enabled. |

Note 1. Follow the procedure given below for stopping the SubOSC by using SOSCDISTRG.

1. Confirm that the SubOSC is neither waiting for being enabled nor stopped (SOSCE.SOSCDISTRG = 0 and SOSCE.SOSCENTRG = 0).
2. Confirm that the SubOSC is active (SOSCS.OSCCLKACT = 1).
3. Check that there is no clock domain for which the SubOSC is selected. If the SubOSC is selected for a clock domain, disable the setting or select a clock source other than the SubOSC.
4. Stop the SubOSC (SOSCE.SOSCDISTRG = 1).
5. Confirm that the SubOSC has been stopped (SOSCS.SOSCCLKACT = 0).

Note 2. Follow the procedure given below for starting the SubOSC by using SOSCDISTRG.

1. Confirm that the SubOSC is neither waiting for being enabled nor stopped (SOSCE.SOSCDISTRG = 0 and SOSCE.SOSCENTRG = 0).
2. Confirm that the SubOSC is inactive (SOSCS.OSCCLKACT = 0).
3. Start the SubOSC (SOSCE.SOSCENTRG = 1).
4. Confirm that the SubOSC has been started (SOSCS.SOSCCLKACT = 1).

Note 3. Starting and stopping the SubOSC at the same time by using the start and stop bits, i.e., by setting SOSCE.SOSCENTRG = 1 and SOSSCE.SOSCDISTRG = 1 at the same time is not allowed.

### 12.4.2.8 SOSCS — SubOSC Status Register

This register provides active status information about the SubOSC.

This register is initialized by the power-up reset signal PURES.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 1204$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1*1 | 0*1 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | SOSCCLKACT | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

**Table 12.9 SOSCS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | SOSCCLKACT | SubOSC Activation Status<br>0: SubOSC is inactive<br>1: SubOSC is active |
| 1, 0 | Reserved | When read, an undefined value is returned. |

### 12.4.2.9 SOSCST — SubOSC Stabilization Time Register

This register determines the SubOSC stabilization time.

This register is initialized by the power-up reset signal PURES.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 120C$_H$

**Value after reset:** 010C 8E00$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | SOSCCLKST[29:16] | | | | | | | | | | | | | |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 12.10 SOSCST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 29 to 0 | SOSCCLKST [29:0] | The SOSCCLKST[29:0] bits specify the count value for the SubOSC stabilization time counter.<br>• If the HS IntOSC is active (ROSCS.ROSCCLKACT = 1): Stabilization time = SOSCCLKST[29:0] / $f_{RH}$<br>• If the HS IntOSC is inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = SOSCCLKST[29:0] / $f_{RL}$ |

**NOTE**

See **Section 40, Electrical Characteristics** for information about the SubOSC stabilization time.

**CAUTION**

Set this register when SubOSC is stopped.

### 12.4.2.10 ROSCE — HS IntOSC Enable Register

This register is used to stop the HS IntOSC operation.

The correct write sequence using thePROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

**CAUTION**

Set the ROSCE.ROSCDISTRG bit only when the $\overline{\text{CLMA0RES}}$ has occurred. In other cases, setting this bit is prohibited.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $1000_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 12.11 ROSCE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ROSCDISTRG | HS IntOSC Disable Trigger<br>ROSCSTPM.ROSCSTPMSK = 0<br>0: No function<br>1: Stops HS IntOSC<br><br>ROSCSTPM.ROSCSTPMSK = 1<br>Setting prohibited |
| 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 12.4.2.11 ROSCS — HS IntOSC Status Register

This register provides active status information about the HS IntOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 $1004_H$

**Value after reset:** $0000\ 0007_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1*1 | 0*1 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | ROSCCLKACT | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

**Table 12.12 ROSCS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | ROSCCLKACT | HS IntOSC Active Status<br>0: HS IntOSC is inactive<br>1: HS IntOSC is active |
| 1, 0 | Reserved | When read, an undefined value is returned. |

### 12.4.2.12 ROSCSTPM — HS IntOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $1018_H$

**Value after reset:** 0000 $0002_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ROSCSTPMSK |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 12.13 ROSCSTPM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ROSCSTPMSK | HS IntOSC Stop Request Mask<br>0: HS IntOSC stops operation in stand-by mode<br>1: HS IntOSC continues operation in stand-by mode<br>Do not set the HS IntOSC disable trigger ROSCE.ROSCDISTRG to 1 while ROSCSTPMSK bit is set to 1. |

### 12.4.2.13 PLLE — PLL Enable Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $9000_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PLLDIS TRG | PLLEN TRG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 12.14 PLLE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | PLLDISTRG | PLL Disable Trigger*1,*4<br>0: No function<br>1: Stops PLL<br>This bit is automatically cleared to 0 by hardware after PLL is disabled. |
| 0 | PLLENTRG | PLL Enable Trigger*2,*3,*4<br>0: No function<br>1: Starts PLL<br>This bit is automatically cleared to 0 by hardware after PLL is activated. |

Note 1. Follow the procedure given below for stopping the PLL by using PLLDISTRG.

1. Confirm that the PLL is neither waiting for being enabled nor stopped (both PLLE.PLLDISTRG = 0 and PLLE.PLLENTRG = 0).
2. Confirm that the PLL is active (PLLS.PLLCLKACT = 1).
3. Check that there is no clock domain for which the PLL is selected. If the PLL is selected for a clock domain, disable the setting or select a clock source other than the PLL.
4. Stop the PLL (PLLE.PLLDISTRG = 1).
5. Confirm that the PLL has been stopped (PLLS.PLLCLKACT = 0).

Note 2. Before starting PLL using PLLENTRG, confirm that the PLL input clock (MainOSC or HS IntOSC, selected by the CKSC_PLLIS_CTL) is operating.

Note 3. Follow the procedure given below for starting the PLL by using PLLENTRG.

1. Confirm that the PLL is neither waiting for being enabled nor stopped (both PLLE.PLLDISTRG = 0 and PLLE.PLLENTRG = 0).
2. Confirm that the PLL is inactive (PLLS.PLLCLKACT = 0).
3. Start the PLL (PLLE.PLLENTRG = 1).
4. Confirm that the PLL has been started (PLLS.PLLCLKACT = 1).

Note 4. Starting and stopping the PLL at the same time by using the start and stop bits, i.e., by setting PLLE.PLLENTRG = 1 and PLLE.PLLDISTRG = 1 at the same time is not allowed.

### 12.4.2.14 PLLS — PLL Status Register

This register provides active status information about the PLL.

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 9004$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1*1 | 0*1 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | PLLCLKACT | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

**Table 12.15 PLLS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | PLLCLKACT | PLL Active Status<br>0: PLL is inactive<br>1: PLL is active |
| 1, 0 | Reserved | When read, an undefined value is returned. |

### 12.4.2.15 PLLC — PLL Control Register

This register is used to set the PLL VCO output clock frequency $f_{VCOOUT}$, shown in **Section 12.3.5.1, PLL Parameters**.

This register can only be written, if the PLL is disabled.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $9008_H$

**Value after reset:** 0001 $133B_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| | | $30_H$ (Nr = 49) | 392.0 | N/A | N/A | 65.3*2 | 65.3*2 |
| | | $2F_H$ (Nr = 48) | 384.0 | N/A | N/A | 64.0*2 | 64.0*2 |

Note 1. The CPLLOUT frequency is defined by CKSC_CPUCLKD_CTL.CPUCLKDPLL[1:0]. Refer to the CKSC_CPUCLKD_CTL register description.

Note 2. Typical frequencies. User calibration of HS IntOSC is required before setting HS IntOSC as PLLCLKIN.

### 12.4.2.16 PLL Input Clock Selection

#### (1) CKSC_PLLIS_CTL — PLL Input Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register can only be written, if the PLL is disabled.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A700$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.18 CKSC_PLLIS_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | PLLISCSID [1:0] | Source Clock Setting for PLL input clock<br>$01_B$: MainOSC (Default)<br>$10_B$: HS IntOSC*1<br>Other than above: Setting prohibited |

Note 1. The maximum frequency of CPLLOUT and PPLLOUT is limited when the HS IntOSC is selected as the PLL input clock.

**CAUTION**

Set this register when PLL is stopped.

### (2) CKSC_PLLIS_ACT — PLL Input Clock Active Register

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A708$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.19 CKSC_PLLIS_ACT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | PLLISACT[1:0] | Source clock for currently active PLL input clock |

### 12.4.2.17 PPLLCLK Source Clock Selection

#### (1) CKSC_PPLLCLKS_CTL — PPLLCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A010$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 12.20 CKSC_PPLLCLKS_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | PPLLCLKSCSID [1:0] | Source Clock Setting for PPLLCLK<br>$00_B$: Setting prohibited<br>$01_B$: EMCLK (default)<br>$10_B$: MainOSC<br>$11_B$: PPLLOUT |

### (2) CKSC_PPLLCLKS_ACT — PPLLCLK Source Clock Active Register

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A018$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.21 CKSC_PPLLCLKS_ACT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | PPLLCLKSACT [1:0] | Source clock for currently active PPLLCLK*[1] |

Note 1. The data read from this register is $00_B$ if the selected source clock for all of the following clock domains is other than PPLLCLK (or PPLLCLK2):
C_ISO_PERI1, C_ISO_PERI2, C_ISO_LIN, C_ISO_ADCA, C_ISO_CAN, C_ISO_CSI, C_ISO_IIC

### 12.4.2.18 ROSCUT — HS IntOSC User Trimming Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 101C$_H$

**Value after reset:** 0000 0XXX$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 12.22 ROSCUT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 to 0 | FADJUST[8:0] | Frequency Adjustment parameters of HS IntOSC.<br>The value after reset of this register is pre-set value of HS IntOSC trimming data. Overwrite this register with “read value + 1” or “read value – 1” until the HS IntOSC frequency becomes target frequency range. |

## 12.4.3 Clock Selector Control Register

### 12.4.3.1 WDTA0 Clock Domain C_AWO_WDTA

#### (1) CKSC_AWDTAD_CTL — C_AWO_WDTA Clock Divider Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2000$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | AWDTADCSID [1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 12.23 CKSC_AWDTAD_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | AWDTADCSID [1:0] | Clock Divider Setting for C_AWO_WDTA<br>$00_B$: Setting prohibited<br>$01_B$: LS IntOSC / 128 (default)<br>$10_B$: LS IntOSC / 1<br>$11_B$: Setting prohibited |

**CAUTION**

Confirm that CKSC_AWDTAD_CTL is CKSC_AWDTAD_ACT before setting the CKSC_AWDTAD_CTL register.

### (2) CKSC_AWDTAD_ACT — C_AWO_WDTA Clock Divider Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2008$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | AWDTADACT [1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0*1 | 0*1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. The value in the inactive state. When the value becomes 01$_B$ after entering the active state.

**Table 12.24 CKSC_AWDTAD_ACT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | AWDTADACT [1:0] | Clock divider for currently active C_AWO_WDTA |

### (3) CKSC_AWDTAD_STPM — C_AWO_WDTA Stop Mask Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2018$_H$

**Value after reset:** 0000 0002$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | AWDTADSTPMSK |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**CAUTION**

Do not change the “1” value after reset of bit 1.

**Table 12.25 CKSC_AWDTAD_STPM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | AWDTADSTPMSK*1 | 0: Clock domain C_AWO_WDTA is stopped in stand-by mode.<br>1: Clock domain C_AWO_WDTA is not stopped in stand-by mode. |

Note 1. The mode transition time can be optimized by setting 1 to this bit.

### 12.4.3.2 TAUJ Clock Domain C_AWO_TAUJ

#### (1) CKSC_ATAUJS_CTL — C_AWO_TAUJ Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $2100_H$

**Value after reset:** 0000 $0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**CAUTION**

Do not change the “1” value after reset of bit 1.

**Table 12.30 CKSC_ATAUJD_STPM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ATAUJD STPMSK | 0: Clock domain C_AWO_TAUJ is stopped in stand-by mode.<br>1: Clock domain C_AWO_TAUJ is not stopped in stand-by mode. |

### 12.4.3.3 RTCA Clock Domain C_AWO_RTCA

#### (1) CKSC_ARTCAS_CTL — C_AWO_RTCA Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by a power-up reset PURES.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2300$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 12.31 CKSC_ARTCAS_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | ARTCASCSID [1:0] | Source Clock Setting for C_AWO_RTCA<br>$00_B$: Disable (default)<br>$01_B$: SubOSC*1<br>$10_B$: MainOSC*2<br>$11_B$: LS IntOSC |

Note 1. Supported only by the 144 pin and 176 pin products.

Note 2. To avoid supplying a clock signal equal to or higher than 4 MHz to the C_AWO_RTCA clock domain, check that CKSC_ARTCAD_ACT = 0000 0000$_H$ (disabled) before setting CKSC_ARTCAS_CTL to $10_B$ (MainOSC).

### (2) CKSC_ARTCAS_ACT — C_AWO_RTCA Source Clock Active Register

This register is initialized by a power-up reset PURES.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2308$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**CAUTION**

Do not change the “1” value after reset of bit 1.

**Table 12.35 CKSC_ARTCAD_STPM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ARTCAD STPMSK | 0: Clock domain C_AWO_RTCA is stopped in stand-by mode.<br>1: Clock domain C_AWO_RTCA is not stopped in stand-by mode. |

### 12.4.3.4 ADCA0 Clock Domain C_AWO_ADCA

#### (1) CKSC_AADCAS_CTL — C_AWO_ADCA Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $2500_H$

**Value after reset:** 0000 $0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.38 CKSC_AADCAD_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | AADCADCSID [1:0] | Clock Divider Setting for C_AWO_ADCA<br>$00_B$: Setting prohibited<br>$01_B$: CKSC_AADCAS_CTL selection /1 (default)<br>$10_B$: CKSC_AADCAS_CTL selection /2*1<br>$11_B$: Setting prohibited |

Note 1. Make sure that the frequency of CKSC_AADCA is no less than 8 MHz after division by 2.

### (4) CKSC_AADCAD_ACT — C_AWO_ADCA Clock Divider Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2608$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | AADCADACT [1:0] | Clock divider for currently active for C_AWO_ADCA |

### (5) CKSC_AADCAD_STPM — C_AWO_ADCA Stop Mask Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2618$_H$

**Value after reset:** 0000 0002$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**CAUTION**

Do not change the “1” value after reset of bit 1.

**Table 12.40 CKSC_AADCAD_STPM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | AADCAD STPMSK | 0: Clock domain C_AWO_ADCA is stopped in stand-by mode.<br>1: Clock domain C_AWO_ADCA is not stopped in stand-by mode. |

### 12.4.3.5 FOUT Clock Domain C_AWO_FOUT

#### (1) CKSC_AFOUTS_CTL — C_AWO_FOUT Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2700$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.41 CKSC_AFOUTS_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | AFOUTSCSID [2:0] | Source Clock Setting for C_AWO_FOUT*1<br>$000_B$: Disabled (default)<br>$001_B$: MainOSC<br>$010_B$: HS IntOSC<br>$011_B$: LS IntOSC<br>$100_B$: SubOSC*2<br>$101_B$: PPLLCLK4<br>$110_B$: PPLLCLK4<br>$111_B$: Setting prohibited |

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK4.

Note 2. Supported only by the 144 pin and 176 pin products.

### (2) CKSC_AFOUTS_ACT — C_AWO_FOUT Source Clock Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2708$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.42 CKSC_AFOUTS_ACT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 to 0 | AFOUTSACT [2:0] | Source clock for currently active C_AWO_FOUT |

### (3) CKSC_AFOUTS_STPM — C_AWO_FOUT Stop Mask Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2718$_H$

**Value after reset:** 0000 0002$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**CAUTION**

Do not change the “1” value after reset of bit 1.

**Table 12.43 CKSC_AFOUTS_STPM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | AFOUTS STPMSK | 0: Clock domain C_AWO_FOUT is stopped in stand-by mode.<br>1: Clock domain C_AWO_FOUT is not stopped in stand-by mode. |

### 12.4.3.6 CPU Clock Domain C_ISO_CPUCLK

#### (1) CKSC_CPUCLKS_CTL — C_ISO_CPUCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A000$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

**Table 12.44 CKSC_CPUCLKS_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | CPUCLKSCSID [1:0] | Source Clock Setting for C_ISO_CPUCLK<br>$00_B$: Setting prohibited<br>$01_B$: EMCLK (default)<br>$10_B$: MainOSC<br>$11_B$: CPLLOUT |

**CAUTION**

The clock source selected for the C_ISO_CPUCLK clock domain should not be stopped by software.

### (2) CKSC_CPUCLKS_ACT — C_ISO_CPUCLK Source Clock Active Register

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A008$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | CPUCLKSACT [1:0] | Source clock for currently active C_ISO_CPUCLK |

### (3) CKSC_CPUCLKD_CTL — C_ISO_CPUCLK Clock Divider Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A100$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 4, 3 | CPUCLKDPLLACT[1:0] | Clock divider for currently active CPLLDIV. |
| 2 to 0 | CPUCLKDACT[2:0] | Clock divider for currently active C_ISO_CPUCLK |

### 12.4.3.7 Peripheral Clock Domains C_ISO_PERI1 and C_ISO_PERI2

#### (1) CKSC_IPERI1S_CTL — C_ISO_PERI1 Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $A200_H$

**Value after reset:** 0000 $0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | IPERI1SACT [1:0] | Source clock for currently active C_ISO_PERI1 |

### (3) CKSC_IPERI2S_CTL — C_ISO_PERI2 Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A300$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 12.4.3.8 RLIN Clock Domains C_ISO_LIN

#### (1) CKSC_ILINS_CTL — C_ISO_LIN Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A400$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

**Table 12.52 CKSC_ILINS_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | ILINSCSID[2:0] | Source Clock Setting for C_ISO_LIN*1<br>$000_B$: Disabled<br>$001_B$: PPLLCLK2 (default)<br>$010_B$: MainOSC<br>$011_B$: PPLLCLK2<br>$100_B$: HS IntOSC<br>Other than above: Setting prohibited |

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK2.

### (2) CKSC_ILINS_ACT — C_ISO_LIN Source Clock Active Register

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A408$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.53 CKSC_ILINS_ACT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 to 0 | ILINSACT[2:0] | Source clock for currently active C_ISO_LIN |

### (3) CKSC_ILIND_CTL — C_ISO_LIN Clock Divider Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A800$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 12.54 CKSC_ILIND_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | ILINDCSID[1:0] | Clock Divider Setting for C_ISO_LIN<br>$00_B$: Setting prohibited<br>$01_B$: CKSC_ILINS_CTL selection /1 (default)<br>$10_B$: CKSC_ILINS_CTL selection /4<br>$11_B$: CKSC_ILINS_CTL selection /8 |

**NOTE**

The setting of this register is only applicable to RLIN30. The settings $10_B$ (CKSC_ILINS_CTL selection / 4) and $11_B$ (CKSC_ILINS_CTL selection /8) are only available in UART mode.

### (4) CKSC_ILIND_ACT — C_ISO_LIN Clock Divider Active Register

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A808$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | ILINDACT[1:0] | Clock divider for currently active C_ISO_LIN |

### (5) CKSC_ILIND_STPM — C_ISO_LIN Stop Mask Register

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A818$_H$

**Value after reset:** 0000 0002$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**CAUTION**

Do not change the “1” value after reset of bit 1.

**Table 12.56 CKSC_ILIND_STPM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ILINDSTPMSK | 0: Clock domain C_ISO_LIN is stopped in stand-by mode.<br>1: Clock domain C_ISO_LIN is not stopped in stand-by mode. |

### 12.4.3.9 ADCA1 Clock Domain C_ISO_ADCA

#### (1) CKSC_IADCAS_CTL — C_ISO_ADCA Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A500$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 12.57 CKSC_IADCAS_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | IADCASCSID [1:0] | Source Clock Setting for C_ISO_ADCA<br>$00_B$: Disabled<br>$01_B$: HS IntOSC (default)<br>$10_B$: MainOSC<br>$11_B$: PPLLCLK2 |

**CAUTION**

The CKSC_IADCAS_CTL register and the CKSC_IADCAD_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 2 to 4.8”.

(1) Frequency [MHz] specified by the C_ISO_CPUCLK source clock selection register (CKSC_CPUCLKS_CTL) and C_ISO_CPUCLK clock divider selection register (CKSC_CPUCLKD_CTL)

(2) Frequency [MHz] specified by the C_ISO_ADCA source clock selection register (CKSC_IADCAS_CTL) and the C_ISO_ADCA clock divider selection register (CKSC_IADCAD_CTL)

### (2) CKSC_IADCAS_ACT — C_ISO_ADCA Source Clock Active Register

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A508$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | IADCASACT [1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.58 CKSC_IADCAS_ACT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | IADCASACT [1:0] | Source clock for currently active C_ISO_ADCA |

### (3) CKSC_IADCAD_CTL — C_ISO_ADCA Clock Divider Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A600$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.59 CKSC_IADCAD_CTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | IADCADCSID [1:0] | Clock Divider Setting for C_ISO_ADCA<br>$00_B$: Setting prohibited<br>$01_B$: CKSC_IADCAS_CTL selection /1 (default)<br>$10_B$: CKSC_IADCAS_CTL selection /2*1<br>$11_B$: Setting prohibited |

Note 1. Make sure that the frequency of CKSC_IADCA is no less than 8 MHz after division by 2.

**CAUTION**

The CKSC_IADCAS_CTL register and the CKSC_IADCAD_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of "(1) / (2) = 2 to 4.8".

(1) Frequency [MHz] specified by the C_ISO_CPUCLK source clock selection register (CKSC_CPUCLKS_CTL) and C_ISO_CPUCLK clock divider selection register (CKSC_CPUCLKD_CTL)

(2) Frequency [MHz] specified by the C_ISO_ADCA source clock selection register (CKSC_IADCAS_CTL) and the C_ISO_ADCA clock divider selection register (CKSC_IADCAD_CTL)

### (4) CKSC_IADCAD_ACT — C_ISO_ADCA Clock Divider Active Register

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A608$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | IADCADACT [1:0] | Clock divider for currently active C_ISO_ADCA |

### 12.4.3.10 RS-CAN Clock Domains C_ISO_CAN and C_ISO_CANOSC

#### (1) CKSC_ICANS_CTL — C_ISO_CAN Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A900$_H$

**Value after reset:** 0000 0003$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**CAUTION**

Do not change the “1” value after reset of bit 1.

**Table 12.63 CKSC_ICANS_STPM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ICANS STPMSK | 0: Clock domain C_ISO_CAN is stopped in stand-by mode.<br>1: Clock domain C_ISO_CAN is not stopped in stand-by mode. |

### (4) CKSC_ICANOSCD_CTL — C_ISO_CANOSC Clock Divider Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 AA00$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ICANOSCD STPMSK | 0: Clock domain C_ISO_CANOSC is stopped in stand-by mode.<br>1: Clock domain C_ISO_CANOSC is not stopped in stand-by mode. |

### 12.4.3.11 CSI Clock Domain C_ISO_CSI

#### (1) CKSC_ICSIS_CTL — C_ISO_CSI Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 AB00$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.68 CKSC_ICSIS_ACT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 to 0 | ICSISACT[2:0] | Source clock for currently active C_ISO_CSI |

### 12.4.3.12 IIC Clock Domain C_ISO_IIC

#### (1) CKSC_IIICS_CTL — C_ISO_IIC Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 AC00$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.70 CKSC_IIICS_ACT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1, 0 | IIICSACT[1:0] | Source clock for currently active C_ISO_IIC |

# 12.5 Clock Domain Setting Method

## 12.5.1 Clock Domain Setting

### 12.5.1.1 Overview of Clock Selector Register

The clock selector for a clock domain C_AWO_<name>/C_ISO_<name> can be controlled by the following registers:

- Source clock selection registers
  These registers select the clock to be used as the domain clock from the available source clocks.
  - AWO source clock selection: CKSC_A<name>S_CTL
  - ISO source clock selection: CKSC_I<name>S_CTL
- Clock divider selection registers
  These registers specify the clock division ratio for the selected source clock.
  - AWO clock divider: CKSC_A<name>D_CTL
  - ISO clock divider: CKSC_I<name>D_CTL
- Source clock active registers and clock divider active registers
  These registers return the currently active source clock selection and division ratio, respectively.
  - AWO source clock active register/clock divider active register: CKSC_A<name>S_ACT/ CKSC_A<name>D_ACT
  - ISO source clock active register/clock divider active register: CKSC_I<name>S_ACT/ CKSC_I<name>D_ACT

**NOTE**

- Not all clock selectors provide all the control functions described above.
- The symbol “I”, which indicates the power domain, is not added to the names of registers within clock domain C_ISO_CPUCLK.

#### 12.5.1.2 Setting Procedure for Clock Domain

Procedure of setting up clock domain is described as below:

1. Set up a source clock
   - Select a source clock. (CKSC_A<name>S_CTL, CKSC_I<name>S_CTL)
   - Confirm completion of selection. (CKSC_A<name>S_ACT, CKSC_I<name>S_ACT)*1
2. Setting a clock divider
   - Select a clock divider. (CKSC_A<name>D_CTL, CKSC_I<name>D_CTL)
   - Confirm completion of selection. (CKSC_A<name>D_ACT, CKSC_I<name>D_ACT)*2

**Note 1.** Continue processing after CKSC_A<name>S_ACT and CKSC_I<name>S_ACT are updated with the new values written to CKSC_A<name>S_CTL and CKSC_I<name>S_CTL.

**Note 2.** Continue processing after CKSC_A<name>D_ACT and CKSC_I<name>D_ACT are updated with the new values written to CKSC_A<name>D_CTL and CKSC_I<name>D_CTL.

**CAUTION**

**The source clock to be selected must be operating before performing these settings.**

**The behavior and performance are not guaranteed if setup is performed while the source clock is stopped.**

**Access to a peripheral module is prohibited while the clock is not supplied to the module.**

### 12.5.2 Stopping the Clock in Stand-by Mode

In stand-by mode (STOP mode, DeepSTOP mode, and Cyclic STOP mode), clock domain C_AWO_<name>/C_ISO_<name> can be configured to stop or continue its clock CKSCLK_A<name>/CKSCLK_I<name> in response to clock stop requests from the stand-by controller.

The clock stop mask registers are used to determine the operation status of the clock in stand-by mode:

- CKSC_A<name>_STPM.A<name>STPMSK/CKSC_I<name>_STPM.I<name>STPMSK = 0:
  The STOP request signal is not masked, so the domain clock CKSCLK_A<name>/CKSCLK_I<name> is stopped during stand-by mode.
  If the domain clock was in operation before transition to stand-by mode, it is automatically re-started after wake-up from stand-by mode.
  If there is another clock domain for which the same source clock is selected and its stop mask setting is set to 1 (CKSC_A<name>_STPM.A<name>STPMSK/CKSC_I<name>_STPM.I<name>STPMSK=1), the source clock will continue operation in stand-by mode.
  The CPU clock domain C_ISO_CPUCLK is always stopped in stand-by mode.
- CKSC_A<name>_STPM.A<name>STPMSK/CKSC_I<name>_STPM.I<name>STPMSK = 1:
  The STOP request signal is masked, so CKSCLK_A<name>/CKSCLK_I<name> continues to operate during stand-by.
  The source clock selected for the target clock domain will also continue to operate in stand-by mode.
  Supply of a clock signal to the clock domains in the Isolated area will be stopped in DeepSTOP mode.

### 12.5.3 Clock Domain Settings

The following table shows a selectable source clock, a frequency division ratio, and a register to be used for each clock domain.

**Table 12.71 List of Selectable Clocks (1/2)**

| Clock Domain | Clock Name | Selectable Register | | Frequency Divided Register | | Maximum Frequency | Applicable Unit |
|---|---|---|---|---|---|---|---|
| C_AWO_WDTA | CKSCLK_AWDTA | — | **LS IntOSC** | CKSC_AWDTAD_CTL | 1/1 | 240 kHz | WDTA0 |
| | | | | | **1/128** | | |
| C_AWO_TAUJ | CKSCLK_ATAUJ | CKSC_ATAUJS_CTL | MainOSC | CKSC_ATAUJD_CTL | **1/1** | 40 MHz | TAUJ0 |
| | | | **HS IntOSC** | | 1/2 | | |
| | | | LS IntOSC | | 1/4 | | |
| | | | PPLLCLK2 | | 1/8 | | |
| | | | Disable | | — | | |
| C_AWO_RTCA | CKSCLK_ARTCA | CKSC_ARTCAS_CTL | MainOSC | CKSC_ARTCAD_CTL | 1/1 | 4 MHz | RTCA0 |
| | | | LS IntOSC | | 1/2 | | |
| | | | SubOSC*1 | | 1/4 | | |
| | | | **Disable** | | 1/8 | | |

**Note:** The items written in **bold** are the initial setting clocks for each register.

Note 1. Supported only by 144 pin and 176 pin products.

Note 2. These settings are only supported by ADVANCED/PREMIUM products.

Note 3. Operation at 120MHz/96MHz is only supported by ADVANCED/PREMIUM products.

Note 4. The setting of this register only applies to RLIN30. The settings 1/4 and 1/8 are only available in UART mode.

Note 5. CKSC_CPUCLKS_CTL selects selection of MainOSC, CPLLOUT and EMCLK. CKSC_CPUCLKD_CTL.CPUCLKDPLL[1:0] selects CPLLOUT clock frequency.

**CAUTION**

**To stop the clock source selected for the clock domain before transitioning to STOP/ DeepSTOP mode, select “Disable” for that clock domain in advance. Do not stop the source clock of a clock domain for which “Disable” cannot be selected while functions are operating on that clock domain. To stop the clock source selected for the domain by transitioning to STOP/DeepSTOP mode, “Disable” does not need to be selected. Instead of setting “Disable”, select “Stop” for the clock domain in stand-by mode by using the stop mask register.**

# 12.6 Frequency Output Function (FOUT)

The frequency output function (FOUT) allows the clock to be output the clock as the external signal. Furthermore, the frequency can be divided by the clock divider before it is output.

## 12.6.1 Functional Overview

**Figure 12.9** shows the configuration of the frequency output function.

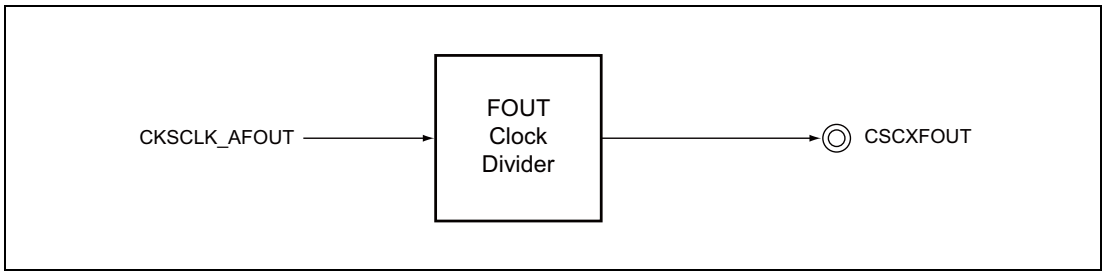

**Figure 12.9 Frequency Output Function**

The clock output function outputs the CKSCLK_AFOUT clock divided by 1 to 63 through the clock divider from CSCXFOUT. Division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register. Clock output frequency $f_{CSCXFOUT}$ is expressed by the following equation.

$$f_{CSCXFOUT} = (\text{CKSCLK_AFOUT clock frequency}) / N$$

Clock output starts when, after CKSCLK_AFOUT is set and the clock output for the pin function is selected, division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register.

When a new division ratio is written to the FOUTDIV.FOUTDIV[5:0] bits, it becomes effective in synchronization with the CSCXFOUT output clock. Accordingly, the division ratio can be changed even while the CSCXFOUT clock is operating. The clock output is stopped by writing $000_H$ to the FOUTDIV[5:0] bits.

## 12.6.2 Clock Supply

The clock supply to the CSCXFOUT is shown in the following table.

**Table 12.72 Clock Supply**

| Module | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| CSCXFOUT | PCLK | CPUCLK4 | Bus clock (Register access) |
| | CKSCLK_AFOUT | CKSCLK_AFOUT | Clock source of FOUT clock divider |

## 12.6.3 Registers

### 12.6.3.1 List of Registers

The FOUT registers are listed in the following table.

**Table 12.73 Register of the CSCXFOUT Clock Divider**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| CLKCTL | Clock divider register | FOUTDIV | FFF8 $2800_H$ |
| | Clock divider status register | FOUTSTAT | FFF8 $2804_H$ |

### 12.6.3.2 FOUTDIV — Clock Division Ratio Register

This register defines the clock divisor.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2800$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 12.6.3.3 FOUTSTAT — Clock Divider Status Register

This register indicates the clock output status.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2804$_H$

**Value after reset:** 0000 0001$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 12.75 FOUTSTAT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | FOUTCLKACT | Clock Divider Active<br>0: Frequency output is stopped.<br>1: Frequency output is ongoing. |
| 0 | FOUTSYNC | Clock Divider Synchronized<br>0: The clock divider is in the process of synchronization.<br>1: The clock divider is stable (or stopped). |

# Section 13 Clock Monitor (CLMA)

This section describes clock monitor (CLMA).

The first section describes the attributes specific to the RH850/F1K microcontrollers, including the number of channels, register base addresses, and input/output signal names. The ensuing sections describe the functions relevant to all operations.

## 13.1 Features of RH850/F1K CLMA

### 13.1.1 Number of Channels

The RH850/F1K microcontrollers incorporate CLMA with the following number of channels.

**Table 13.1 Number of Channels**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of channels | | 3 | |
| Name | | CLMA0, CLMA1, CLMA2 | |

### 13.1.2 Register Base Addresses

The CLMA base addresses are listed in the following table.

The CLMA register addresses are expressed as an offset of the base address.

**Table 13.2 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <CLMA0_base> | FFF8 $C000_H$ |
| <CLMA1_base> | FFF8 $D000_H$ |
| <CLMA2_base> | FFF8 $E000_H$ |

### 13.1.3 Clock Supply to CLMA

The clocks monitored by CLMA and the CLMA sampling clocks are indicated below.

**Table 13.3 Clock Supply**

| Channel Name | Unit Clock Name | Supply Clock Name |
|---|---|---|
| CLMA0 | CLMATMON (monitored clock) | HS IntOSC |
| | CLMATSMP (sampling clock) | LS IntOSC |
| | Register access clock | CPUCLK4 |
| CLMA1 | CLMATMON (monitored clock) | MainOSC |
| | CLMATSMP (sampling clock) | LS IntOSC |
| | Register access clock | CPUCLK4 |
| CLMA2 | CLMATMON (monitored clock) | PPLLOUT |
| | CLMATSMP (sampling clock) | HS IntOSC |
| | Register access clock | CPUCLK4 |

### 13.1.4 Reset Sources

The reset sources of the CLMA are listed in the following table. The CLMA are initialized by these reset sources.

**Table 13.4 Reset Sources**

| Channel Name | Reset Source |
|---|---|
| CLMA0 | Reset sources other than transition to DeepSTOP mode (AWORES) |
| CLMA1 | Reset sources other than transition to DeepSTOP mode (AWORES) |
| CLMA2 | All reset sources (ISORES) |
| Common Registers (CLMATEST, CLMATESTS) | Power-up reset PURES (power-on-clear or debugger reset) |

### 13.1.5 Internal Input/Output Signals

The internal input/output signals of CLMA are listed in the following table.

**Table 13.5 Internal Input/Output Signals**

| Unit Signal Name | Description | Connection |
|---|---|---|
| $\overline{\text{CLMATRES}}$ | CLMA0 error reset output | Reset controller ($\overline{\text{CLMA0RES}}$) |
| $\overline{\text{CLMATRES}}$ | CLMA1 error reset output | Reset controller ($\overline{\text{CLMA1RES}}$) |
| $\overline{\text{CLMATRES}}$ | CLMA2 error reset output | Reset controller ($\overline{\text{CLMA2RES}}$) |

## 13.2 Overview

### 13.2.1 Functional Overview

Clock monitor CLMA detects frequency abnormalities in the monitored clock. It uses sampling clock CLMATSMP to monitor whether the frequency of input clock CLMATMON is within a specific range. Upon detection of an abnormal clock, it outputs a reset request signal.

The main components of the clock monitor are shown in **Figure 13.1**.

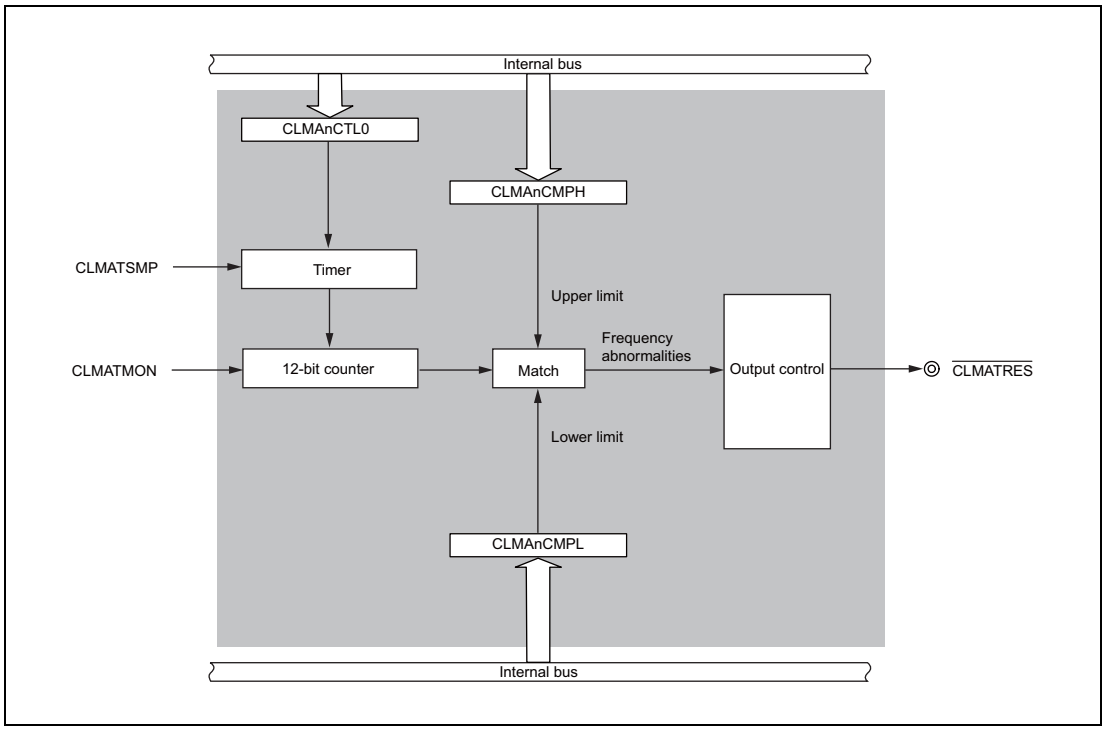

**Figure 13.1 Block Diagram of the Clock Monitor**

**NOTE**

Once enabled, only a reset can disable the CLMAn.

## 13.3 Enabling CLMA

Clock monitoring is started by the clock monitor when CLMAnCTL0.CLMAnCLME = 1.

When the monitored clock is stopped by a register operation or transition to stand-by mode, the corresponding clock monitor is automatically disabled. After the monitored clock starts oscillation again and becomes stable, the clock monitor also starts operation.

Since CLMA2 is initialized on return from DeepSTOP, the CLMA2 register must be set again before further operation is started.

## 13.4 Functions

### 13.4.1 Detection of Abnormal Clock Frequencies

#### Detection Method

1. CLMAn counts the rising edges of the monitored clock CLMATMON within 16 cycles of the sampling clock CLMATSMP and then compares the counter value with the specified thresholds:
   - CLMAnCMPL.CLMAnCMPL[11:0] defines the lower threshold.
   - CLMAnCMPH.CLMAnCMPH[11:0] defines the upper threshold.
2. When CLMATMON frequency*1 is lower than the limit, the counter falls below CLMAnCMPL.CLMAnCMPL[11:0].
3. When the frequency of CLMATMON is higher than the limit, the counter exceeds CLMAnCMPH.CLMAnCMPH[11:0].

**Note 1.** There is a case that the abnormal state is not detected when the monitor clock completely stops.

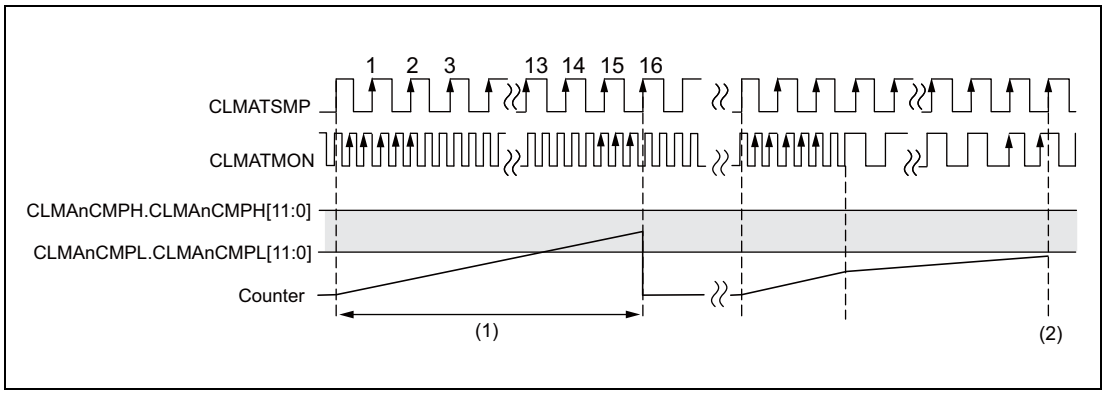

**Figure 13.2 Example: $f_{CLMATMON}$ is Lower than the Specified Limit**

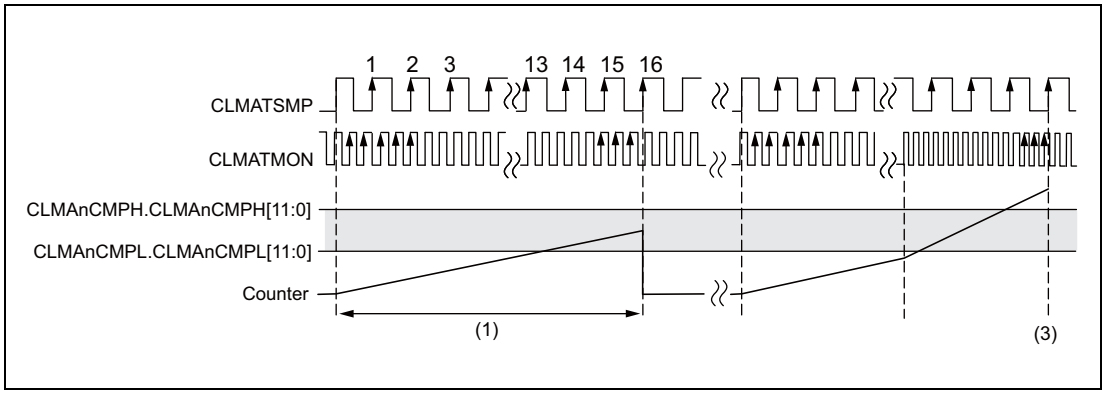

**Figure 13.3 Example: $f_{CLMATMON}$ is Higher than the Specified Limit**

**NOTE**

Even if $f_{CLMATMON}$ exceeds or falls below the specified limits during a sampling interval, the counter might be within the valid range.

Abnormal $f_{CLMATMON}$ is detected after one sampling interval.

**(1) Calculation method of the thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**

The compare registers CLMAnCMPL and CLMAnCMPH are configured with the minimum and maximum number of clock cycles of CLMATMON that are assumed to be valid within 16 cycles of the sampling clock CLMATSMP.

The expected number of clock cycles is denoted by N.

$$\frac{16}{f_{CLMATSMP}} = \frac{N}{f_{CLMATMON}}$$

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMP}} \times 16$$

Considering the allowed frequency deviations of CLMATMON and CLMATSMP, the threshold values can be calculated by the following formulas:

$$\text{Lower threshold} = N_{min} = \frac{f_{CLMATMON(dmin)}}{f_{CLMATSMP(max)}} \times 16 - 1$$

$$\text{Upper threshold} = N_{max} = \frac{f_{CLMATMON(max)}}{f_{CLMATSMP(min)}} \times 16 + 1$$

**NOTE**

The jitter of the PLL is covered by “+1” and “–1” in the formulas.

**Example:**

When $f_{CLMATSMP}$ = 240 kHz (±8%) and $f_{CLMATMON}$ = 16 MHz (±5%), the recommended threshold values are as follows:

$N_{min}$ = 15,200 / 259.2 × 16 – 1
= 937.27
CLMAnCMPL = 937 = $03A9_H$

$N_{max}$ = 16,800 / 220.8 × 16 + 1
= 1218.39
CLMAnCMPH = 1219 = $04C3_H$

**Minimum thresholds**

The following restrictions must be taken into account:

- CLMAnCMPL ≥ $0001_H$
- CLMAnCMPH ≥ CLMAnCMPL + $0003_H$

**(2) Definition of the initial value input to the threshold registers**

The reset values of the threshold registers are set so that the maximum frequency deviation of the monitored clock is allowed:

- CLMAnCMPL[11:0] = $001_H$
- CLMAnCMPH[11:0] = $3FF_H$

## 13.4.2 Notification of Abnormal Clock Frequency

If $f_{CLMATMON}$ exceeds the upper threshold or falls below the lower threshold, this is indicated as follows:

1. The reset request signal $\overline{\text{CLMATRES}}$ is set to low level.
2. The system reset (AWORES or ISORES) is generated and CLMAn is reset.

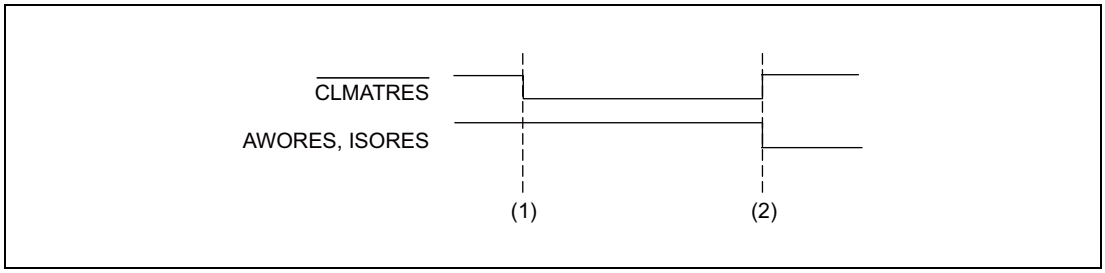

**Figure 13.4 Error Request Signal Output if $f_{CLMATMON}$ Exceeds Upper Threshold**

**CAUTION**

**For usage notes for CLMAn abnormality detection, see Section 13.6, Usage Notes for CLMAn.**

## 13.5 Registers

### 13.5.1 List of Registers

The following table lists the CLMA registers.

<CLMAn_base> is defined in **Section 13.1.2, Register Base Addresses**.

**Table 13.6 List of Clock Monitor Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| CLMAn | CLMAn control register 0 | CLMAnCTL0 | <CLMAn_base> + $00_H$ |
| | CLMAn compare register L | CLMAnCMPL | <CLMAn_base> + $08_H$ |
| | CLMAn compare register H | CLMAnCMPH | <CLMAn_base> + $0C_H$ |
| | CLMA test register | CLMATEST | FFF8 $C100_H$ |
| | CLMA test status register | CLMATESTS | FFF8 $C104_H$ |
| | CLMAn emulation register 0 | CLMAnEMU0 | <CLMAn_base> + $18_H$ |

### 13.5.2 CLMAnCTL0 — CLMAn Control Register 0

This register enables the clock monitor CLMAn.

The correct write sequence using the CLMAnPCMD register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 8-bit units.

**Address:** <CLMAn_base> + $00_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | CLMAnCLME |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 13.7 CLMAnCTL0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CLMAnCLME | Enables or disables the clock monitor.<br>0: CLMAn is disabled.<br>1: CLMAn is enabled. |

**CAUTION**

After the CLMAnCTL0.CLMAnCLME bit is set to 1, writing 0 to this bit is ignored. The only condition for clearing the bit is a reset (AWORES, ISORES). In addition, the bit is cleared when the CLMATEST.RESCLM bit is set to 1 during self-test of CLMAn.

### 13.5.3 CLMAnCMPH — CLMAn Compare Register H

This register specifies the upper limit of frequency.

It can only be written when CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

For details, see **Section 13.4.1 (1) Calculation method of the thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CLMAn_base> + $0C_H$

**Value after reset:** $03FF_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | CLMAnCMPH[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 13.8 CLMAnCMPH Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | CLMAnCMPH [11:0] | Specifies the upper threshold.<br>• The recommended value is $f_{CLMATMON\ (max)}$ / $f_{CLMATSMP\ (min)}$ × 16 +1.<br>• The minimum value is CLMAnCMPL + $0003_H$. |

### 13.5.4 CLMAnCMPL — CLMAn Compare Register L

This register specifies the lower limit of frequency.
It can only be written when CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

For details, see **Section 13.4.1 (1) Calculation method of the thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CLMAn_base> + $08_H$

**Value after reset:** $0001_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | CLMAnCMPL[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 13.9 CLMAnCMPL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | CLMAnCMPL [11:0] | Specifies the lower threshold.<br>• The recommended value is $f_{CLMATMON\ (min)}$ / $f_{CLMATSMP\ (max)}$ × 16 – 1<br>• The minimum value is $0001_H$. |

### 13.5.5 CLMATEST — CLMA Test Register

This register is used to control self-test of CLMA0, CLMA1, and CLMA2.

The correct write sequence using the PROTCMDCLMA register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 C100$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by a power-up reset PURES (power-on-clear or debugger reset).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 13.5.6 CLMATESTS — CLMA Test Status Register

This register is used to confirm the self-test result of CLMA0, CLMA1, and CLMA2.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 C104$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by a power-up reset PURES (power-on-clear or debugger reset).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 13.11 CLMATESTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | CLMA2ERRS | CLMA2 Error Status<br>0: Errors are not detected<br>1: Errors are detected |
| 1 | CLMA1ERRS | CLMA1 Error Status<br>0: Errors are not detected<br>1: Errors are detected |
| 0 | CLMA0ERRS | CLMA0 Error Status<br>0: Errors are not detected<br>1: Errors are detected |

### 13.5.7 CLMAnEMU0 — CLMAn Emulation Register 0

This register is used to set pseudo flags for emulation.

This register can be accessed only during break by debugger and is reset by break release.

**Access:** This register can be read or written in 8-bit units.

**Address:** <CLMAn_base> + $18_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | CLMAnSLFST | CLMAnSLSLW |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 13.12 CLMAnEMU0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLMAnSLFST | Specifies whether $f_{CLMATMON}$ is assumed to be high.<br>0: CLMATMON is assumed to be within the normal frequency range<br>1: CLMATMON is assumed to exceed the upper threshold. |
| 0 | CLMAnSLSLW | Specifies whether $f_{CLMATMON}$ is assumed to be low.<br>0: CLMATMON is assumed to be within the normal frequency range<br>1: CLMATMON is assumed to fall below the lower threshold. |

**CAUTION**

It is prohibited to emulate a low and high CLMATMON at the same time. Thus CLMAnEMU0 must not be set to $03_H$.

## 13.6 Usage Notes for CLMAn

Do not use a clock for which the CLMAn bit indicates an abnormality. The behavior and performance are not guaranteed if such a clock is used. When CLMA0 detects clock abnormality, modifying the clock domain settings is prohibited.

**Table 13.13** provides usage notes for each CLMAn.

**Table 13.13 Usage Notes for CLMAn**

| Monitor Clock | CPU Clock after CLMA Reset Release | Note |
|---|---|---|
| HS IntOSC (CLMA0) | EMCLK*1 | Set ROSCE.ROSCDISTRG to 1.*1<br>Do not set the control registers of the MainOSC and the PLL. After $\overline{\text{CLMA0RES}}$ occurs, modifying any of the clock domain settings is prohibited. |
| MainOSC (CLMA1) | EMCLK (= HS IntOSC) | Do not set control registers of the MainOSC and the PLL. After occurrence of the $\overline{\text{CLMA1RES}}$, do not select a clock whose source clock is the MainOSC or the PLL. |
| PLL (CLMA2) | EMCLK (= HS IntOSC) | Do not set control registers of the PLL. After occurrence of the $\overline{\text{CLMA2RES}}$, do not select a clock whose source clock is the PLL. |

Note 1. The state of EMCLK after reset by $\overline{\text{CLMA0RES}}$ depends on the state of HS IntOSC oscillation. If HS IntOSC is completely stopped, LS IntOSC is supplied as EMCLK. If HS IntOSC continues oscillating but the frequency is outside of the lower threshold and the upper threshold of CLMA0, HS IntOSC is still supplied as EMCLK. After setting the ROSCE.ROSCDISTRG bit to 1, EMCLK is switched from HS IntOSC to LS IntOSC.

# Section 14 Stand-By Controller (STBC)

This section describes the functions of the stand-by controller (STBC), the registers, and various stand-by modes.

## 14.1 Functions

### 14.1.1 Types of Stand-By Mode

The RH850/F1K supports STOP mode and DeepSTOP mode for system-level low power status. In addition, the RH850/F1K supports cyclic operation (Cyclic RUN mode and Cyclic STOP mode) which supports low-power operation of limited functions. Transition between each mode is described in the **Section 14.1.5, Transition to Stand-By Mode**.

- RUN mode
  RUN mode is a normal operation mode where the CPU is operating and all of other modules can operate. The CPU can enter “HALT” state by executing the “HALT” instruction to stop its operation in this mode.
- STOP mode
  STOP mode is a chip-level stand-by mode in which the clock supply to a certain clock domain can be stopped.
  STOP mode is entered when the STBC0STPT.STBC0STPTRG bit is set to 1.
  The clock supply to clock domains can continue even in STOP mode by setting CKSC_xxx_STPM.xxxSTPMSK = 1. For details on the CKSC_xxx_STPM register, see **Section 12, Clock Controller**.
- DeepSTOP mode
  DeepSTOP mode is a chip-level stand-by mode to reduce power consumption further than STOP mode. In addition to the clock supply stop, the power supply to the Isolated area is switched off.
  DeepSTOP mode is entered when the STBC0PSC.STBC0DISTRG is set to 1.
- Cyclic RUN mode
  Cyclic RUN mode is a low-power operation mode in which limited modules can operate at low speed. In this mode, only the CPU, the peripheral functions in the Always-On area, RLIN3 and CSIG0 can operate. Data/Code flash memory and PLL are not available.
  The CPU executes the instructions in the retention RAM.
  In this mode, the CPU can issue the “HALT” instruction to enter HALT state.
  The mode transition to Cyclic RUN mode from DeepSTOP mode is triggered by wake-up factor 2, and the mode transition to Cyclic RUN mode from Cyclic STOP mode is triggered by either wake-up factor 1 or wake-up factor 2.
  CSIG0 cannot be wake-up factor.
- Cyclic STOP mode
  Cyclic STOP mode is a STOP mode in cyclic operation, and the CPU halts its operation.
  This mode is entered by setting the STBC0STPT.STBC0STPTRG bit to 1 in Cyclic RUN mode.

## 14.1.2 Wake-Up Control

### 14.1.2.1 Wake-Up Factors for Stand-By Modes

The stand-by controller can initiate return from stand-by mode by the following wake-up factors.

**Table 14.1 Wake-Up Factor 1 (1/2)**

| Wake-Up Factor | Unit | STOP →RUN | DeepSTOP →RUN | Cyclic RUN →RUN*1 | Cyclic STOP →RUN*1 |
|---|---|---|---|---|---|
| TNMI | Port | √ | √ | √ | √ |
| WDTA0NMI | WDTA0 | √ | √ | √ | √ |
| INTLVIL*3 | LVI | √ | √ | √ | √ |
| INTP0 | Port | √ | √ | √ | √ |
| INTP1 | Port | √ | √ | √ | √ |
| INTP2 | Port | √ | √ | √ | √ |
| INTWDTA0 | WDTA0 | √ | √ | √ | √ |
| INTP3 | Port | √ | √ | √ | √ |
| INTP4 | Port | √ | √ | √ | √ |
| INTP5 | Port | √ | √ | √ | √ |
| INTP10 | Port | √ | √ | √ | √ |
| INTP11 | Port | √ | √ | √ | √ |
| WUTRG1 | LPS0 | √ | √ | √ | √ |
| INTTAUJ0I0 | TAUJ0 | √ | √ | √ | √ |
| INTTAUJ0I1 | TAUJ0 | √ | √ | √ | √ |
| INTTAUJ0I2 | TAUJ0 | √ | √ | √ | √ |
| INTTAUJ0I3 | TAUJ0 | √ | √ | √ | √ |
| WUTRG0 | LPS0 | √ | √ | √ | √ |
| INTP6 | Port | √ | √ | √ | √ |
| INTP7 | Port | √ | √ | √ | √ |
| INTP8 | Port | √ | √ | √ | √ |
| INTP12 | Port | √ | √ | √ | √ |
| INTP9 | Port | √ | √ | √ | √ |
| INTP13 | Port | √ | √ | √ | √ |
| INTP14 | Port | √ | √ | √ | √ |
| INTP15 | Port | √ | √ | √ | √ |
| INTRTCA01S | RTCA0 | √ | √ | √ | √ |
| INTRTCA0AL | RTCA0 | √ | √ | √ | √ |
| INTRTCA0R | RTCA0 | √ | √ | √ | √ |
| INTDCUTDI | JTAG | √ | √ | √ | √ |
| INTKR0 | KR0 | √ | — | — | — |
| INTRCANGRECC0*2 | RSCAN0 | √ | — | — | — |
| INTRCAN0REC*2 | RSCAN0 | √ | — | — | — |
| INTRCAN1REC*2 | RSCAN0 | √ | — | — | — |
| INTRCAN2REC*2 | RSCAN0 | √ | — | — | — |
| INTRCAN3REC*2 | RSCAN0 | √ | — | — | — |
| INTRCAN4REC*2 | RSCAN0 | √ | — | — | — |

**Table 14.1 Wake-Up Factor 1 (2/2)**

| Wake-Up Factor | Unit | STOP →RUN | DeepSTOP →RUN | Cyclic RUN →RUN*1 | Cyclic STOP →RUN*1 |
|---|---|---|---|---|---|
| INTRCAN5REC*2 | RSCAN0 | √ | — | — | — |
| INTRCANGRECC1*2 | RSCAN1 | √ | — | — | — |
| INTRCAN6REC*2 | RSCAN1 | √ | — | — | — |

Note 1. The mode returns to RUN mode via DeepSTOP mode. When the transition from Cyclic STOP to Cyclic RUN is made by wake-up factor 1, if the transition to DeepSTOP by STBC0PSC.STBC0DISTRG is made without clearing wake-up factor 1, the transition to RUN mode is made.

Note 2. By using the INTP external interrupt assigned to the alternate-function pin shared with the CAN reception pin, wake-up from stand-by modes such as DeepSTOP is possible. As the trigger for waking up from DeepSTOP, use a pin of port P0 or P1, which is assigned to the Always-On area.
To clear the wake-up factor flag, the interrupt request must be cleared in each CAN module.

Note 3. Cannot be cleared while REGVCC is below the reference voltage (REGVCC (min.) < VLVI).
To clear the wake-up factor flag (WUF0[2]), WUFC0[2] must be set while WUFMSK0[2] = 1 and REGVCC is above the reference voltage (REGVCC (min.) > VLVI). The INTLVIH interrupt can be used to check that REGVCC is above the reference voltage.

**Table 14.2 Wake-Up Factor 2**

| Wake-Up Factor | Unit | DeepSTOP → Cyclic RUN | Cyclic STOP → Cyclic RUN |
|---|---|---|---|
| INTADCA0I0 | ADCA0 | √*1 | √*1 |
| INTADCA0I1 | ADCA0 | √*1 | √*1 |
| INTADCA0I2 | ADCA0 | √*1 | √*1 |
| INTRLIN30 | RLIN30 | — | √ |
| INTTAUJ0I0 | TAUJ0 | √ | √ |
| INTTAUJ0I1 | TAUJ0 | √ | √ |
| INTTAUJ0I2 | TAUJ0 | √ | √ |
| INTTAUJ0I3 | TAUJ0 | √ | √ |
| INTRLIN31 | RLIN31 | — | √ |
| INTRLIN32 | RLIN32 | — | √ |
| INTRTCA01S | RTCA0 | √ | √ |
| INTRTCA0AL | RTCA0 | √ | √ |
| INTRTCA0R | RTCA0 | √ | √ |
| INTRLIN33 | RLIN33 | — | √ |
| INTRLIN34 | RLIN34 | — | √ |
| INTRLIN35 | RLIN35 | — | √ |

Note 1. These wake-up factors are only available in LPS analog input mode.

**CAUTION**

**For the pins of the function used for the wake-up factors from DeepSTOP, use the multiplexed functions of the ports assigned to the Always-On area.**

#### 14.1.2.2 Setting of Wake-Up Factors

Wake-up factors for returning from stand-by modes are controlled by the following stand-by controller registers:

- Wake-up factor registers: WUF0, WUF20, WUF_ISO0

  Upon occurrence of an effective wake-up factor, the associated wake-up factor flag is set to 1. By checking these registers and their flags, it is possible to identify the wake-up factor.

- Wake-up factor mask registers: WUFMSK0, WUFMSK20, WUFMSK_ISO0

  Each bit of these registers is assigned to a certain wake-up factor. Wake-up by this factor is enabled if its mask bit is set to 0. Wake-up factors assigned to both wake-up factor 1 and 2 should not be enabled at the same time.

- Wake-up factor clear registers: WUFC0, WUFC20, WUFC_ISO0

  By setting the applicable bits in these registers to 1, the wake-up factor bit (WUFy) in the wake-up factor registers (WUF0, WUF20, WUF_ISO0) can be cleared.

**NOTE**

The wake-up factor flags in the wake-up factor registers (WUF0, WUF20, and WUF_ISO0) only indicate the occurrence of wake-up factor. These flags do not indicate a transition from stand-by mode to normal mode.

The assignment of the wake-up factors to the control register bits and status register bits are shown in the following tables.

For details about the wake-up control and status registers, see **Section 14.2.2.3, WUF0/WUF20/WUF_ISO0 — Wake-Up Factor Registers**, **Section 14.2.2.4, WUFMSK0/WUFMSK20/WUFMSK_ISO0 — Wake-Up Factor Mask Registers**, and **Section 14.2.2.5, WUFC0/WUFC20/WUFC_ISO0 — Wake-Up Factor Clear Registers**.

Table 14.3 Wake-Up Factor 1 Register Assignment

| Wake-Up Factor | Register Bit Assignment | | | Unit | 100 pins | 144 pins | 176 pins |
|---|---|---|---|---|---|---|---|
| TNMI | WUF0[0] | WUFMSK0[0] | WUFC0[0] | Port | √ | √ | √ |
| WDTA0NMI | WUF0[1] | WUFMSK0[1] | WUFC0[1] | WDTA0 | √ | √ | √ |

| INTRLIN35 | WUF20[15] | WUFMSK20[15] | WUFC20[15] | RLIN35 | — | √ | √ |

### 14.1.3 On-Chip Debug Wake-Up

The On-Chip Debug unit (OCD) generates a wake-up event while the microcontroller runs the application program in the following cases:

- The debugger issues a stop request
- A breakpoint is hit

In either case all stand-by modes are terminated, provided the OCD debug event is enabled as a wake-up factor via the WUFMSK0 register.

**CAUTION**

**If the OCD wake-up event is disabled, it is not possible to wake up from stand-by modes via an On-chip debugger request.**

**The OCD wake-up event can be enabled as a wake-up factor for all stand-by modes by setting WUFMSK0[31] = 0.**

**When the hot plug-in function is used, make sure to enable the OCD wake-up event and return from stand-by mode by INTDCUTDI interrupt.**

### 14.1.4 I/O Buffer Control

This section describes the behavior of the I/O buffers during various stand-by modes.

The port groups in the Isolated area support the I/O buffer hold state. The port groups in the Always-On area remain their state before entering stand-by mode.
For details on the port group assignment to the Isolated area and to the Always-On area, see **Section 10, Power Supply Circuit**.

#### 14.1.4.1 I/O Buffer Hold State

During the I/O buffer hold state, the I/O buffers maintains the state it was in before entering this state. Therefore, no external or internal signal can change the state of the I/O buffer until the I/O buffer hold state is terminated.

#### 14.1.4.2 I/O Buffers during STOP Mode

In STOP mode, the I/O buffers remain their state before entering STOP mode (I/O buffer hold state is not entered).

#### 14.1.4.3 I/O Buffers during DeepSTOP Mode

In DeepSTOP mode, the I/O buffers of port groups in the Isolated area transition to I/O buffer hold state.

After wake-up from DeepSTOP, the I/O buffers remain in I/O buffer hold state until the state is canceled by software. To cancel I/O buffer hold state, follow the steps shown below.

1. Re-configure the peripheral or port function.
2. Set IOHOLD.IOHOLD = 0.

The following table is a summary of the I/O buffer in the Isolated area during stand-by mode and after wake-up.

**Table 14.5 Buffer Operation during Stand-by Mode and after Wake-Up (I/O buffers in the Isolated area)**

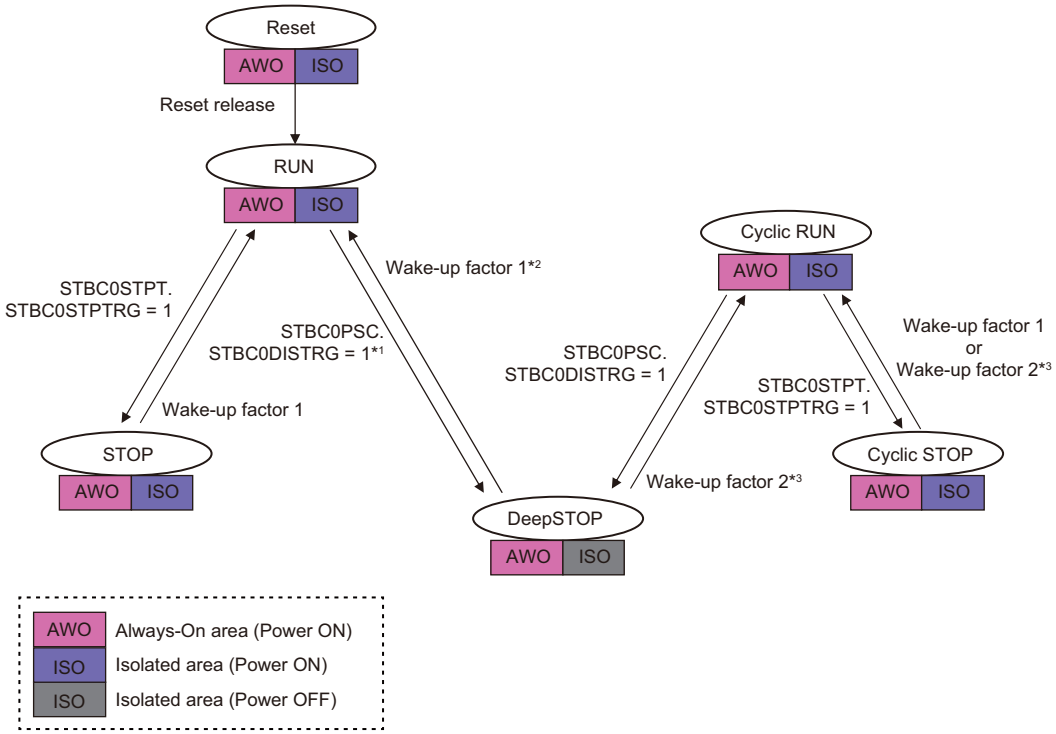
| | Before Stand-By | During Stand-By | After Wake-Up |
|---|---|---|---|
| STOP mode | Normal operation | | |
| DeepSTOP mode | Normal operation | I/O buffer hold state | I/O buffer hold state *1 |

Note 1. Set the IOHOLD.IOHOLD bit to “0” to release the I/O buffer hold state.

The port groups in the Always-On area don't support I/O buffer hold state. They continue operation and remain its state before entering DeepSTOP. In the case an alternative function of modules in Isolated area is assigned to the pin in the Always-On area, the state of the I/O buffer may change in the transition to the DeepSTOP due to initialization of the modules in the Isolated area by ISORES. To avoid this behavior, it is recommended to change to function of modules in Always-On area (e. g. Port mode) before entering DeepSTOP.

### 14.1.5 Transition to Stand-By Mode

The figure below shows transition between RUN mode and stand-by mode.



Note 1. Set a clock other than the PLL clock as the CPU clock source.
Note 2. To return from DeepSTOP to RUN, ISO peripheral function registers must be set again. The CPU starts the operation from the reset address on the code flash.
Note 3. The CPU starts the operation from the reset address on the retention RAM.

**NOTE**

The mode transition time can be optimized by setting 1 to AWDTADSTPMSK bit of CKSC_AWDTAD_STPM register.

**Figure 14.1 Transition to Stand-By Mode**

### 14.1.6 Clock Supply

The clock supply to the stand-by controller is shown in the following table.

**Table 14.6 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name |
|---|---|---|
| Stand-by controller | Register access clock | CPUCLK2 |
| | | EMCLK |

## 14.2 Registers

### 14.2.1 List of Registers

The following table lists the stand-by controller registers.

**Table 14.7 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| STBC0 | Power save control register | STBC0PSC | FFF8 $0100_H$ |
| | Power stop trigger register | STBC0STPT | FFF8 $0110_H$ |
| STBC_WUF0 | Wake-up factor registers | WUF0 | FFF8 $0400_H$ |
| STBC_WUF20 | | WUF20 | FFF8 $0520_H$ |
| STBC_WUFISO | | WUF_ISO0 | FFF8 $8110_H$ |
| STBC_WUF0 | Wake-up factor mask registers | WUFMSK0 | FFF8 $0404_H$ |
| STBC_WUF20 | | WUFMSK20 | FFF8 $0524_H$ |
| STBC_WUFISO | | WUFMSK_ISO0 | FFF8 $8114_H$ |
| STBC_WUF0 | Wake-up factor clear registers | WUFC0 | FFF8 $0408_H$ |
| STBC_WUF20 | | WUFC20 | FFF8 $0528_H$ |
| STBC_WUFISO | | WUFC_ISO0 | FFF8 $8118_H$ |
| STBC_IOHOLD | I/O buffer hold control register | IOHOLD | FFF8 $0B00_H$ |

## 14.2.2 Details of Stand-By Controller Control Registers

### 14.2.2.1 STBC0PSC — Power Save Control Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $0100_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | STBC0DISTRG | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R |

**Table 14.8 STBC0PSC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | STBC0DISTRG | 0: No effect<br>1: Transition to DeepSTOP mode<br>This bit is cleared automatically after transition to the DeepSTOP mode. |
| 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

### 14.2.2.2 STBC0STPT — Power Stop Trigger Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 $0110_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| 0 | STBC0STPTRG | 0: No effect.<br>1: Transition to STOP mode<br>– In RUN mode: Transition to STOP mode<br>– In Cyclic RUN mode: Transition to Cyclic STOP mode<br>This bit is cleared automatically after transition to the STOP / Cyclic STOP mode. |

### 14.2.2.3 WUF0/WUF20/WUF_ISO0 — Wake-Up Factor Registers

These registers indicate the generation of wake-up factors.

WUF0 and WUF20 are initialized by all reset sources except the transition to DeepSTOP mode (AWORES). WUF_ISO0 is initialized by all reset sources (ISORES).

**Access:** These registers are read-only registers that can be read in 32-bit units.

**Address:** WUF0: FFF8 $0400_H$
WUF20: FFF8 $0520_H$
WUF_ISO0: FFF8 $8110_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | WUF31 | WUF30 | WUF29 | WUF28 | WUF27 | WUF26 | WUF25 | WUF24 | WUF23 | WUF22 | WUF21 | WUF20 | WUF19 | WUF18 | WUF17 | WUF16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 14.10 WUF0/WUF20/WUF_ISO0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | WUFy | Indicates the generation of a wake-up factor.<br>0: Wake-up factor is not generated<br>1: Wake-up factor is generated |

**NOTE**

While the WUFMSKy bit in the wake-up factor mask register is 1, WUFy is not set to 1 at the generation of a wake-up factor.

#### Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.3, Wake-Up Factor 1 Register Assignment** and **Table 14.4, Wake-Up Factor 2 Register Assignment**.

The bit to which a wake-up factor is not assigned is read as the value “0”.

### 14.2.2.4 WUFMSK0/WUFMSK20/WUFMSK_ISO0 — Wake-Up Factor Mask Registers

These registers enable wake-up factors.

WUFMSK0 and WUFMSK20 are initialized by all reset sources except the transition to DeepSTOP mode (AWORES). WUFMSK_ISO0 is initialized by all reset sources (ISORES).

**Access:** These registers can be read or written in 32-bit units.

**Address:** WUFMSK0: FFF8 0404$_H$
WUFMSK20: FFF8 0524$_H$
WUFMSK_ISO0: FFF8 8114$_H$

**Value after reset:** WUFMSK0: FFFF FFFF$_H$
WUFMSK20: FFFF FFFF$_H$
WUFMSK_ISO0: FFFF FFFF$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | WUFMSK31 | WUFMSK30 | WUFMSK29 | WUFMSK28 | WUFMSK27 | WUFMSK26 | WUFMSK25 | WUFMSK24 | WUFMSK23 | WUFMSK22 | WUFMSK21 | WUFMSK20 | WUFMSK19 | WUFMSK18 | WUFMSK17 | WUFMSK16 |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | WUFMSK15 | WUFMSK14 | WUFMSK13 | WUFMSK12 | WUFMSK11 | WUFMSK10 | WUFMSK09 | WUFMSK08 | WUFMSK07 | WUFMSK06 | WUFMSK05 | WUFMSK04 | WUFMSK03 | WUFMSK02 | WUFMSK01 | WUFMSK00 |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 14.11 WUFMSK0/WUFMSK20/WUFMSK_ISO0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | WUFMSKy | Enables/disables a wake-up factor.<br>0: Wake-up factor is enabled<br>1: Wake-up factor is disabled |

**NOTE**

While the WUFMSKy bit is 1, WUFy of the wake-up factor register is not set to 1 at the generation of a wake-up factor.

#### Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.3, Wake-Up Factor 1 Register Assignment** and **Table 14.4, Wake-Up Factor 2 Register Assignment**.

When writing to these registers, write the value “1” to the bits to which wake-up factors are not assigned.

### 14.2.2.5 WUFC0/WUFC20/WUFC_ISO0 — Wake-Up Factor Clear Registers

These registers clear the WUFy bits in the wake-up factor registers.

**Access:** These registers are write-only registers that can be written in 32-bit units.

**Address:** WUFC0: FFF8 $0408_H$
WUFC20: FFF8 $0528_H$
WUFC_ISO0: FFF8 $8118_H$

**Value after reset:** Undefined

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | WUFC 31 | WUFC 30 | WUFC 29 | WUFC 28 | WUFC 27 | WUFC 26 | WUFC 25 | WUFC 24 | WUFC 23 | WUFC 22 | WUFC 21 | WUFC 20 | WUFC 19 | WUFC 18 | WUFC 17 | WUFC 16 |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | WUFC 15 | WUFC 14 | WUFC 13 | WUFC 12 | WUFC 11 | WUFC 10 | WUFC 09 | WUFC 08 | WUFC 07 | WUFC 06 | WUFC 05 | WUFC 04 | WUFC 03 | WUFC 02 | WUFC 01 | WUFC 00 |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

**Table 14.12 WUFC0/WUFC20/WUFC_ISO0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | WUFCy | Clears the wake-up factor bit WUFy in the wake-up factor registers.<br>0: WUFy is not modified<br>1: WUFy is cleared |

#### Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.3, Wake-Up Factor 1 Register Assignment** and **Table 14.4, Wake-Up Factor 2 Register Assignment**.

When writing to these registers, write the value “0” to the bits to which wake-up factors are not assigned.

### 14.2.2.6 IOHOLD — I/O Buffer Hold Control Register

This register specifies the hold state of the I/O buffer in DeepSTOP mode. The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 0B00$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | IOHOLD |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 14.13 IOHOLD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | IOHOLD | 0: I/O hold state is released<br>1: I/O hold state<br>This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is prohibited. To release the I/O hold state after the wake-up, set this bit to 0 by software. |

## 14.3 Mode Transition

This section explains the mode transition procedures.

### 14.3.1 STOP Mode

In STOP mode, most of the clock supplies to the Always-On area and the Isolated area are stopped. The clock stop mask registers control clock supply to related clock domains in stand-by mode. Stop all of the peripheral functions before transition to STOP mode if the clock supply to the function will be stopped in STOP mode.

The transition procedure (example) to STOP mode is shown below.

#### Preparation for stand-by

- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag (ICxxx.RFxxx = 0).
  - Mask the interrupts for non-wake-up factors (ICxxx.MKxxx = 1).
  - Release the masks of the interrupts for wake-up factors (ICxxx.MKxxx = 0).
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC_ISO0 registers).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK_ISO0 registers).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK_ISO0 registers).
- Set the clock stop mask register to select the clock domains to be stopped and the ones to continue operating (using the CKSC_xxx_STPM.xxxxSTPMSK bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register to select the clock sources to be stopped and the ones to continue operating (using the MOSCSTPMSK bit in the MOSCSTPM register and the ROSCSTPMSK bit in the ROSCSTPM register).

#### Start of stand-by

Set the STBC0STPTRG bit in the STBC0STPT register to 1 to transition to STOP mode.

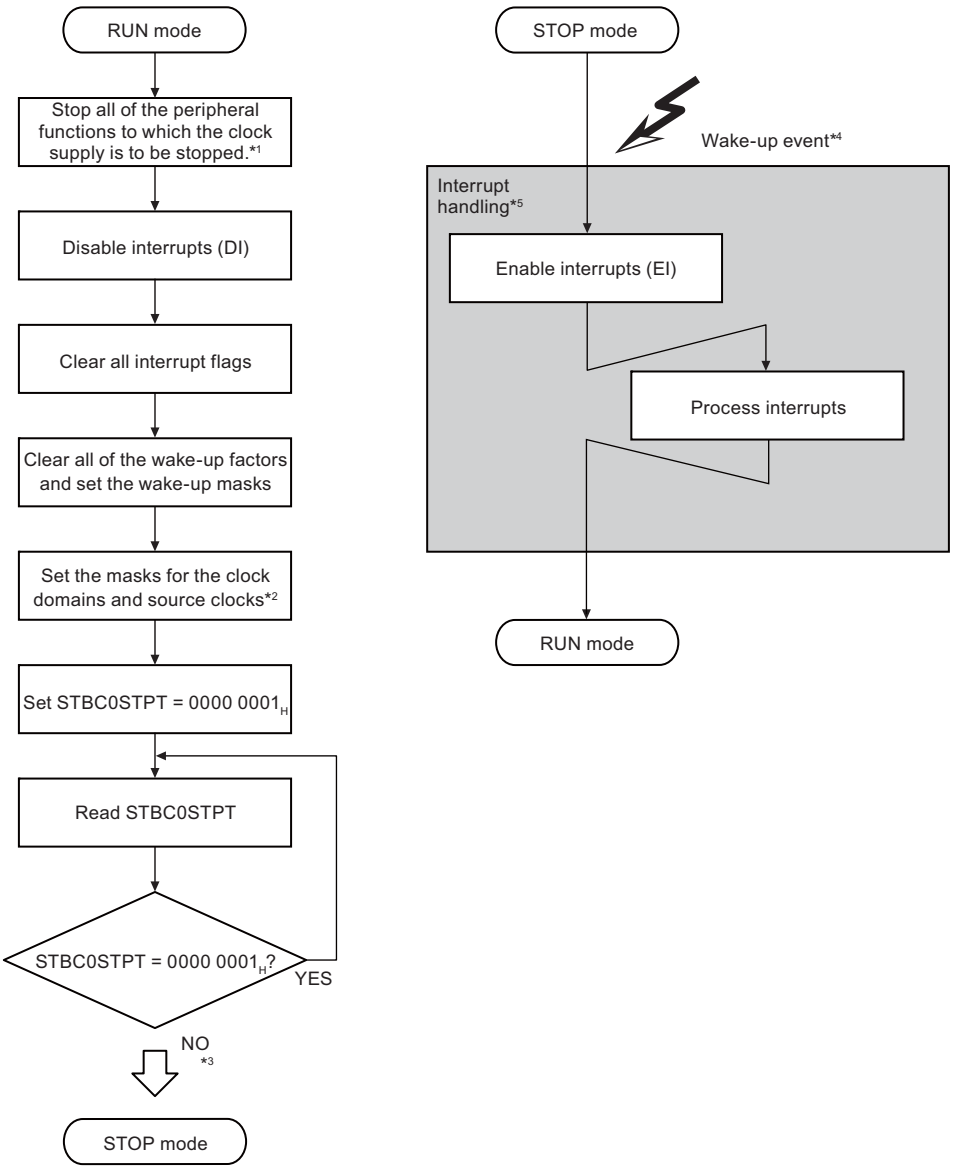
#### End of stand-by

When a wake-up factor is generated, the microcontroller returns from STOP mode.

#### Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0, WUF_ISO0).

When an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.



Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the STOP mode, the operation of the peripheral function may be incorrect. Before the transition to the STOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

Note 2. Though the clock mask can be set before this flow is started, it must be set before $0000\ 0001_H$ is written to STBC0STPT.

Note 3. The clock supply to the CPU is stopped and the operation transitions to the STOP mode while checking that STBC0STPT = $0000\ 0001_H$.

Note 4. STBC0STPT is set to $0000\ 0000_H$ at the generation of a wake-up factor. The generated wake-up factor can be checked by the WUF0 and WUF_ISO0 registers.

Note 5. This processing is optional. It is required when executing the interrupt handling after the wake-up.

**Figure 14.2 Example of STOP Mode Transition**

### 14.3.2 DeepSTOP Mode

In DeepSTOP mode, the clock supply to all areas and the power supply to the Isolated area are stopped. However, clock supply to peripheral functions in the Always-On area can be continued by setting the clock stop mask register.

Select the clock other than the PLL as the CPU operating clock, before the transition to DeepSTOP mode.

The transition procedure (example) to DeepSTOP mode is shown below.

#### Preparation for stand-by

- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag (ICxxx.RFxxx = 0).
  - Mask the interrupts for non-wake-up factors (ICxxx.MKxxx = 1).
  - Release the masks of the interrupts for wake-up factors (ICxxx.MKxxx = 0).
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC20 registers).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK20 registers).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK20 registers).

**CAUTION**

**When a wake-up factor is assigned to both wake-up factor 1 registers and wake-up factor 2 registers, it can be used only in one of them.**

- Set the clock stop mask register to select the clock domains to be stopped and the ones to continue operating (using the CKSC_xxx_STPM.xxxxSTPMSK bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register to select the clock sources to be stopped and the ones to continue operating (using the MOSCSTPMSK bit in the MOSCSTPM register and the ROSCSTPMSK bit in the ROSCSTPM register).

#### Start of stand-by

Set the STBC0DISTRG bit in the STBC0PSC register to 1 to transition to DeepSTOP mode.

#### End of stand-by

When a wake-up factor is generated, the microcontroller returns from DeepSTOP mode.

### Wake-up handling

- When returned from DeepSTOP mode due to wake-up factor 1, the microcontroller starts the operation from the reset vector address.

  If one of the following interrupts has been generated before recovery from DeepSTOP mode to RUN mode, the microcontroller restarts operation from the exception handler address:

  – FENMI: FENMI handler address ($E0_H$)
  – FEINT: FEINT handler address ($F0_H$)

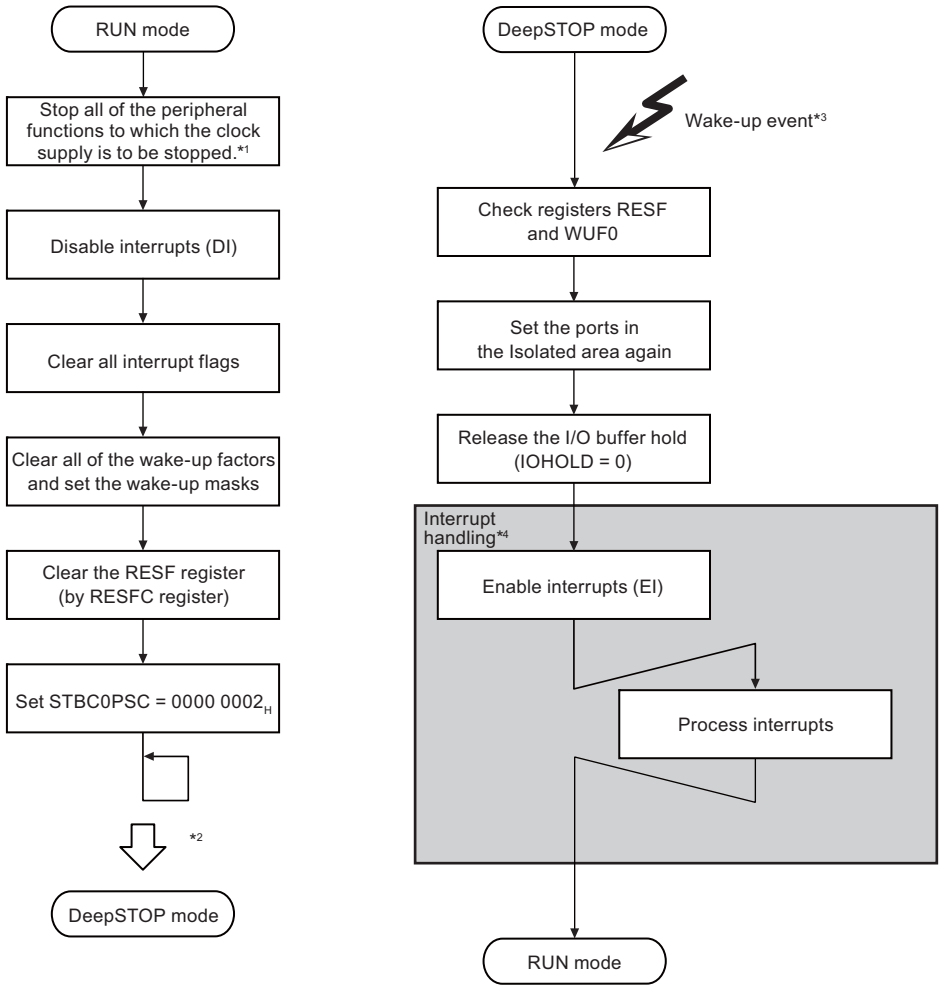
  Note that the General-purpose registers and Local RAM are undefined value after return from DeepSTOP mode.

- The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0).
- The ports in the Isolated area maintain the I/O buffer hold state.
  Release the I/O buffer hold state by executing the following steps:

  1. Re-configure the peripheral functions and port functions.

  2. Set IOHOLD.IOHOLD = 0.

- To execute an interrupt of the wake-up factor after the wake-up, evaluate the information of wake-up factor flag by software and set the interrupt request flag in the interrupt control register. Then, when an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.



Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the DeepSTOP mode, the operation of the peripheral function may be incorrect. Before the transition to the DeepSTOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

Note 2. After setting STBC0PSC = 0000 $0002_H$, wait for the transition to the DeepSTOP mode by the unconditional loop.

Note 3. The CPU starts the program from the reset vector after the generation of a wake-up factor. The return from the DeepSTOP mode by a reset can be checked by the RESF register. In addition, the generated wake-up factor can be checked by the WUF0 register.

Note 4. This processing is optional. It is required when executing the interrupt handling after the wake-up.

**Figure 14.3 Example of DeepSTOP Mode Transition**

### 14.3.3 Cyclic RUN Mode

In Cyclic RUN mode, the functions except the CPU, peripheral functions in Always-On area (AWO area), RLIN3, and CSIG0 are stopped. In this mode, PLL and Flash Memory are not available. The transition procedure (example) to Cyclic RUN mode is shown below.

#### Preparation of Cyclic RUN

Allocate the program for Cyclic RUN to the Retention RAM. The reset vector base address (RBASE) in Cyclic RUN operation should be specified in the CYCRBASE register described in **Section 9. Reset controller**. Note that neither the code flash memory nor the data flash memory is available in Cyclic RUN mode.

The instruction to transition to DeepSTOP mode should be arranged in the interrupt exception handler or a polling routine of interrupt request which is used as the source of returning to the RUN mode.

For details on the exception vector, see *the RH850G3KH User's Manual: Software*.

**CAUTION**

**Do not change the PSW.EBV bit from its value after reset in Cyclic RUN mode (Do not set the PSW.EBV bit to 1 in Cyclic RUN mode).**

- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC20 register).
  - Mask the non-wake-up factor (the WUFMSK20 register).
  - Release the masks of the wake-up factors (the WUFMSK20 register).
- Transition to DeepSTOP mode. For details on the transition to DeepSTOP mode, see **Section 14.3.2, DeepSTOP Mode**.

#### Start of Cyclic RUN

The operation transitions to Cyclic RUN mode from DeepSTOP mode at the generation of wake-up factor 2.

The operation transitions to Cyclic RUN mode from Cyclic STOP mode at the generation of wake-up factors 1 and 2.

The microcontroller starts operation from the reset vector address of Cyclic RUN mode specified by the CYCRBASE register. If one of the following interrupts has been generated during recovery from DeepSTOP mode to Cyclic RUN mode, the microcontroller restart operation from the exception handler address:

- FENMI: FENMI handler address in Cyclic RUN mode (CYCRBASE + $E0_H$)
- FEINT: FEINT handler address in Cyclic RUN mode (CYCRBASE + $F0_H$)

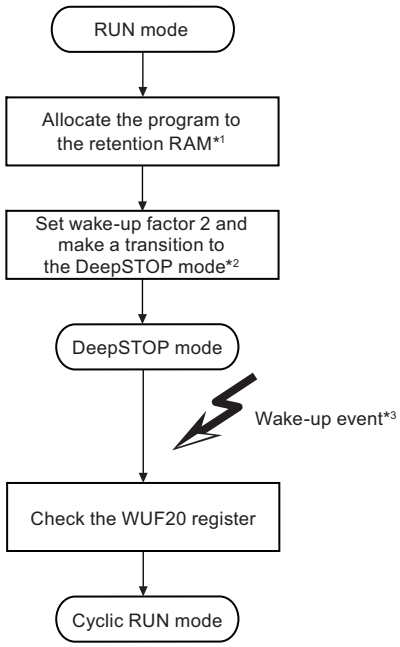
Note that the General-purpose registers and Local RAM are undefined value after the transition to Cyclic RUN mode from DeepSTOP mode.

#### End of Cyclic RUN

The Cyclic RUN mode ends at the transition to the Cyclic STOP mode by setting the STBC0STPT.STBC0STPTRG bit to 1, or at the transition to the DeepSTOP mode by setting the STBC0PSC.STBC0DISTRG bit to 1.

### Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF20).



Note 1. When the mode transitions from the Cyclic RUN mode to the RUN mode by a wake-up factor, the transition to the DeepSTOP mode should be made in the processing of the interrupt vector for the wake-up factor. In that case, allocate the interrupt processing program to the retention RAM as well.

Note 2. Before the transition to the DeepSTOP mode, clear the flag for wake-up factor 2 in the WUFC20 register and set wake-up factor 2 that is to be used in the WUFMSK20 register. Other parts of the procedure for transition to DeepSTOP mode are the same as the normal procedure.

Note 3. The CPU starts the program from the address specified by CYCRBASE register after the generation of a wake-up factor. The generated wake-up factor can be checked by the WUF20 register.

**Figure 14.4 Example of Cyclic RUN Mode Transition**

### 14.3.4 Cyclic STOP Mode

In Cyclic STOP mode, the functions except the peripheral functions in the Always-On area (AWO area) and RLIN3 are stopped.

The transition procedure (example) to Cyclic STOP mode is shown below.

#### Preparation for Cyclic STOP

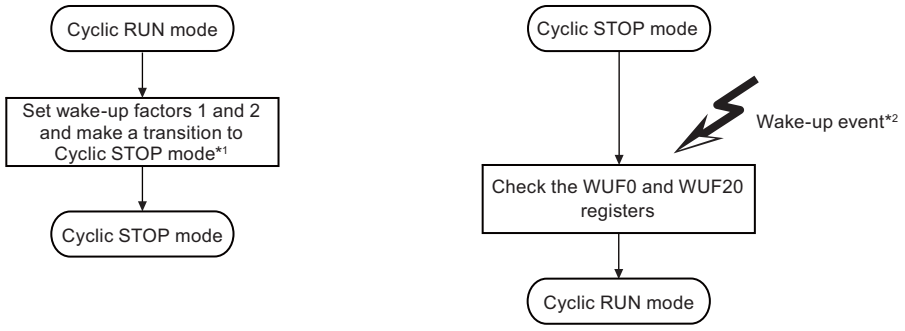
- Transition to Cyclic RUN mode.
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC20 register).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK20 register).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK20 register).

#### Start of Cyclic STOP

Set the STBC0STPT.STBC0STPTR bit to 1 to transition to Cyclic STOP mode.

#### End of Cyclic STOP

The operation transitions to Cyclic RUN mode at the generation of wake-up factor 1 or 2.



Note 1. Set wake-up factors 1 and 2 to be used for transitioning to RUN mode and Cyclic RUN mode, respectively. When the mode transitions to RUN mode by wake-up factor 1, the transition processing to DeepSTOP mode should be added in Cyclic RUN mode.

Note 2. When a wake-up factor is generated in Cyclic STOP mode, the mode transitions to Cyclic RUN mode and the operation starts immediately after the processing shifted to Cyclic STOP mode. The generated wake-up factors can be checked by the WUF0 and WUF20 registers.

**Figure 14.5 Example of Cyclic STOP Mode Transition**

## 14.4 Writing to the Stand-By Controller Related Registers

The following stand-by controller registers are write-protected registers.

- STBC0PSC register
- STBC0STPT register
- IOHOLD register

The write-protected registers are protected against the illegal writing due to an incorrect program operation.

For details on the write-protected sequence, see **Section 5, Write-Protected Registers**.

## 14.5 Clock Oscillator Behavior During Stand-By Mode Transition

The following figures explain clock oscillator behavior during stand-by mode transition. The clock oscillators restart operation automatically if they are used before entering stand-by.

- If MainOSC and PLL are enabled before entering STOP mode, they restart oscillation automatically during wake-up from STOP mode, and CPU restarts operation after oscillations of these clock sources become stable.
- If MainOSC is enabled before entering DeepSTOP mode, it restarts oscillation automatically during wake-up from DeepSTOP mode, and CPU restarts operation after oscillation of MainOSC becomes stable. PLL is not restarted automatically even if it is enabled before entering DeepSTOP mode.
- If MainOSC is enabled before entering Cyclic STOP mode, it restarts oscillation automatically during wake-up from Cyclic STOP mode. CPU restarts operation after oscillation of MainOSC becomes stable.

Note that behavior of HS IntOSC and MainOSC in the following figures is in the case they stop oscillation during stand-by mode. HS IntOSC and MainOSC continue oscillation during stand-by mode if their stop mask register is set to 1 (ROSCSTPMSK bit of ROSCSTPM register and MOSCSTPMSK bit of MOSCSTPM register respectively) or there is a clock domain which uses the source clock during stand-by by setting its stop mask bit (CKSC_xxxx_STPM = $0000_0003_H$).

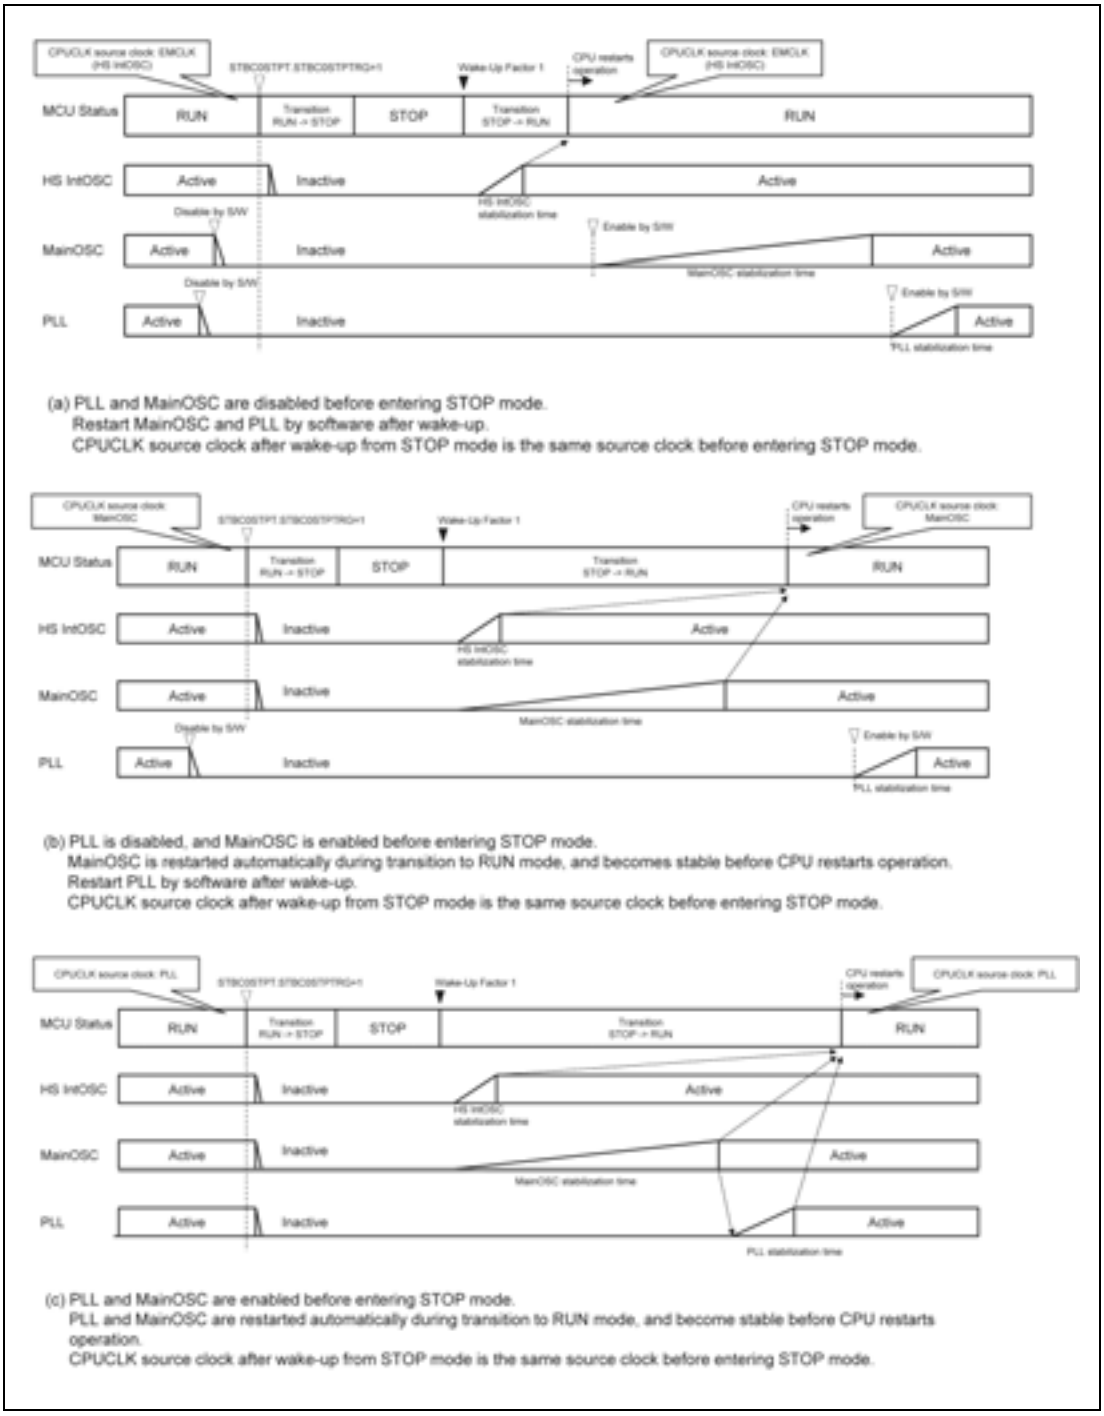


**Figure 14.6 Clock oscillators behavior in stand-by mode transition (RUN → STOP → RUN)**

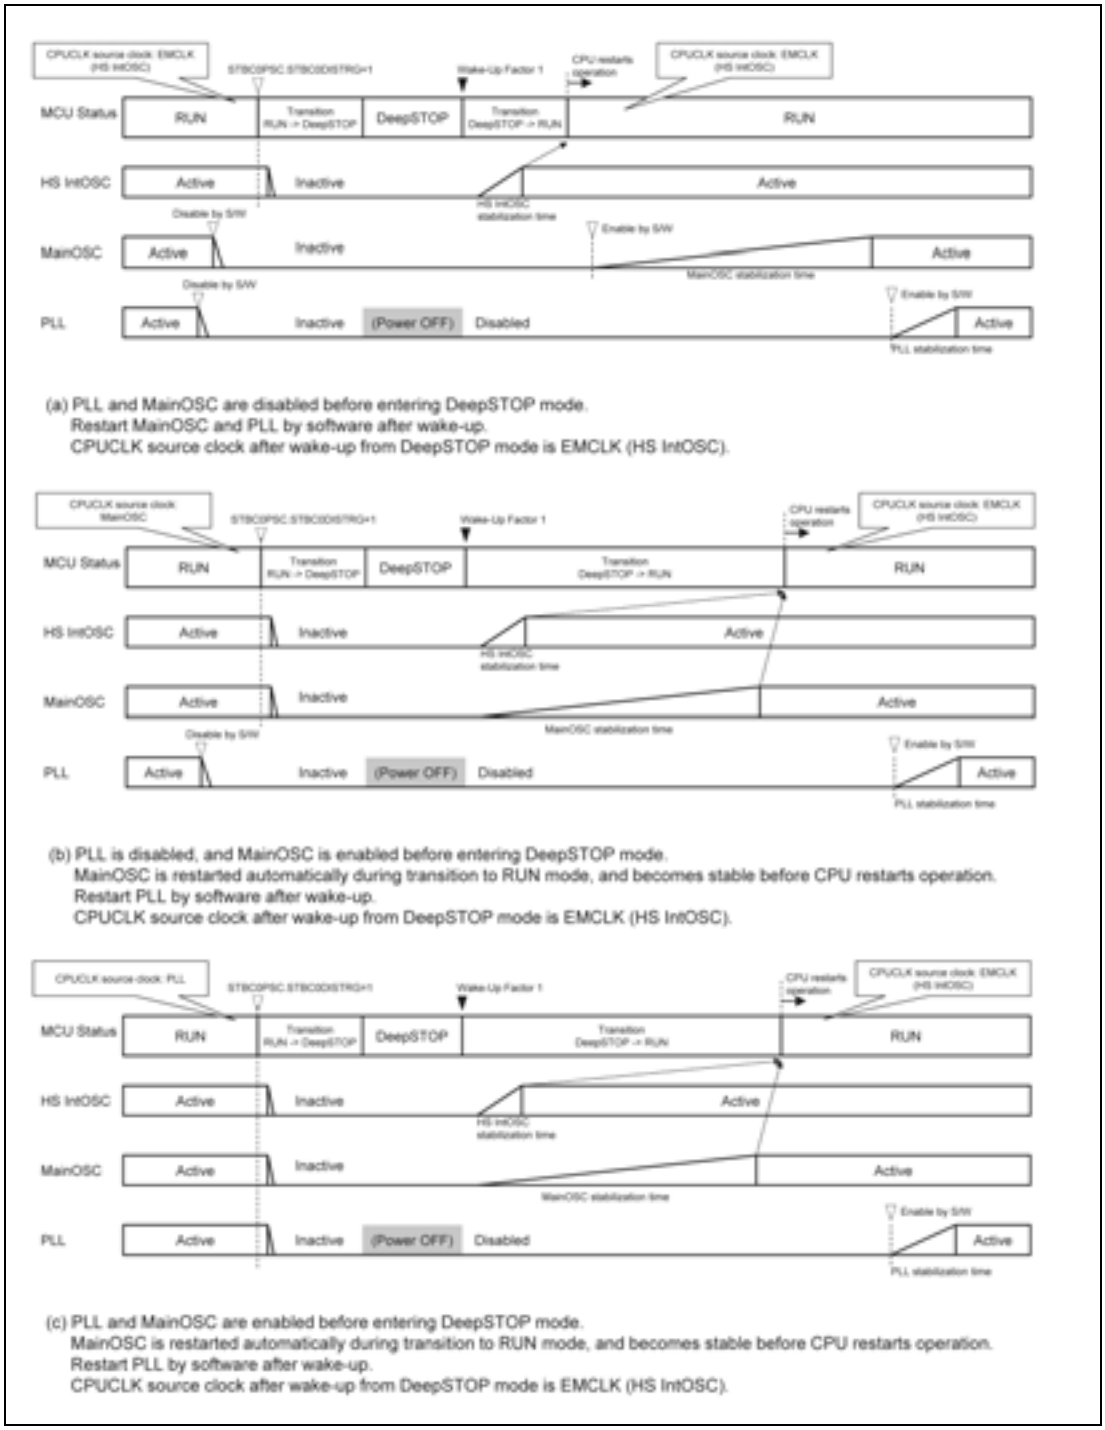

**Figure 14.7 Clock oscillators behavior in stand-by mode transition (RUN → DeepSTOP → RUN)**

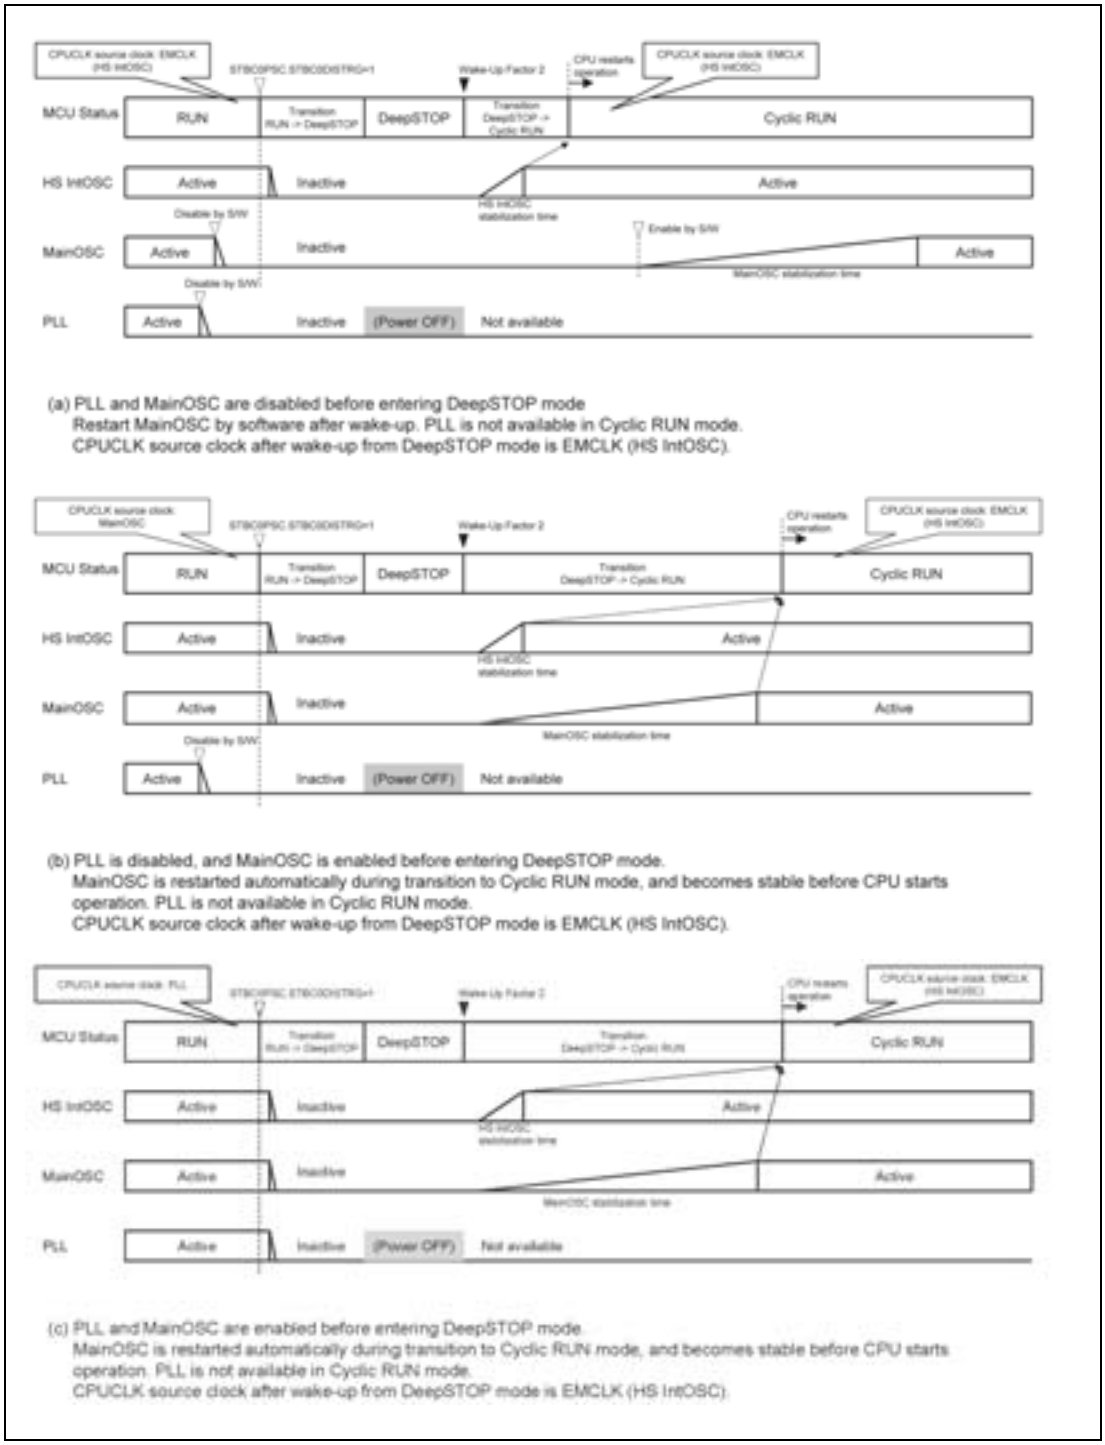

**Figure 14.8 Clock oscillators behavior in stand-by mode transition (RUN → DeepSTOP → Cyclic RUN)**

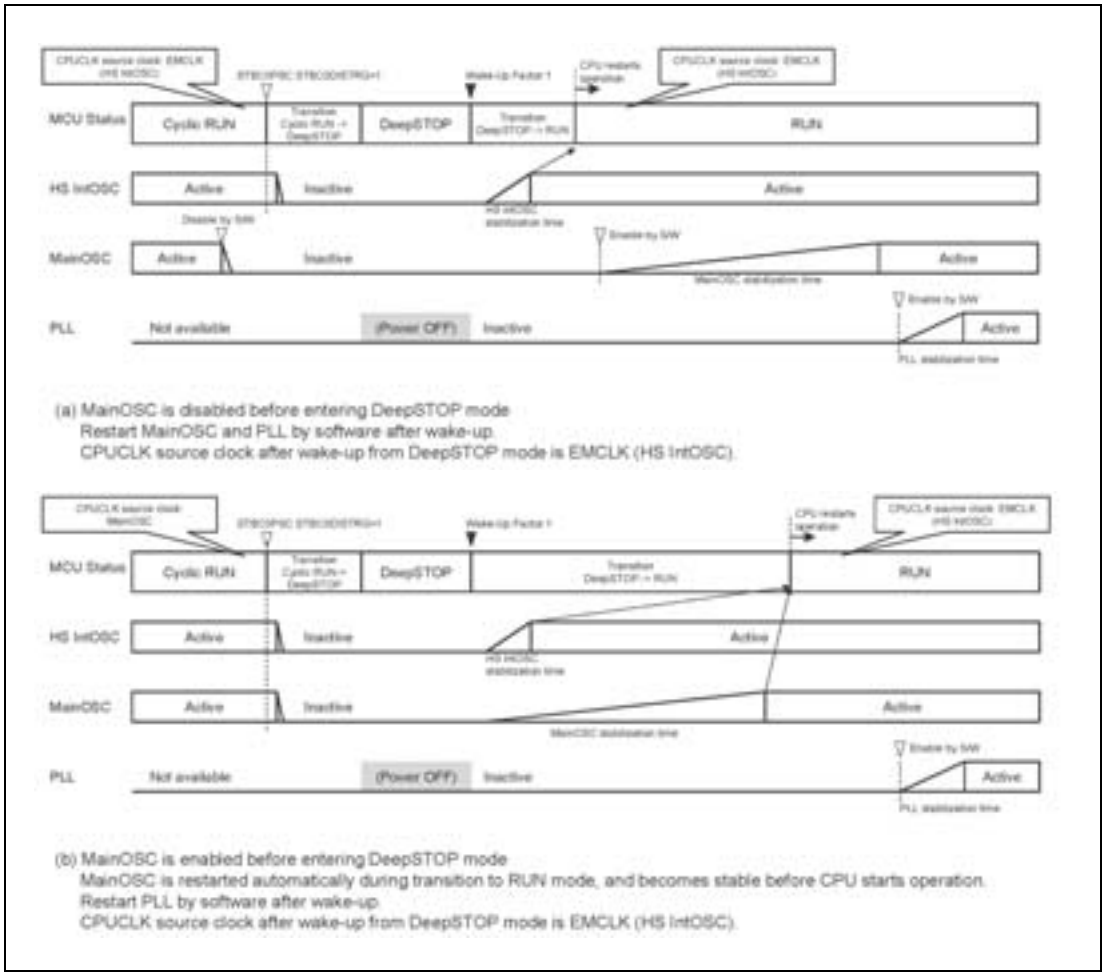

**Figure 14.9 Clock oscillators behavior in stand-by mode transition (Cyclic RUN → DeepSTOP → RUN)**

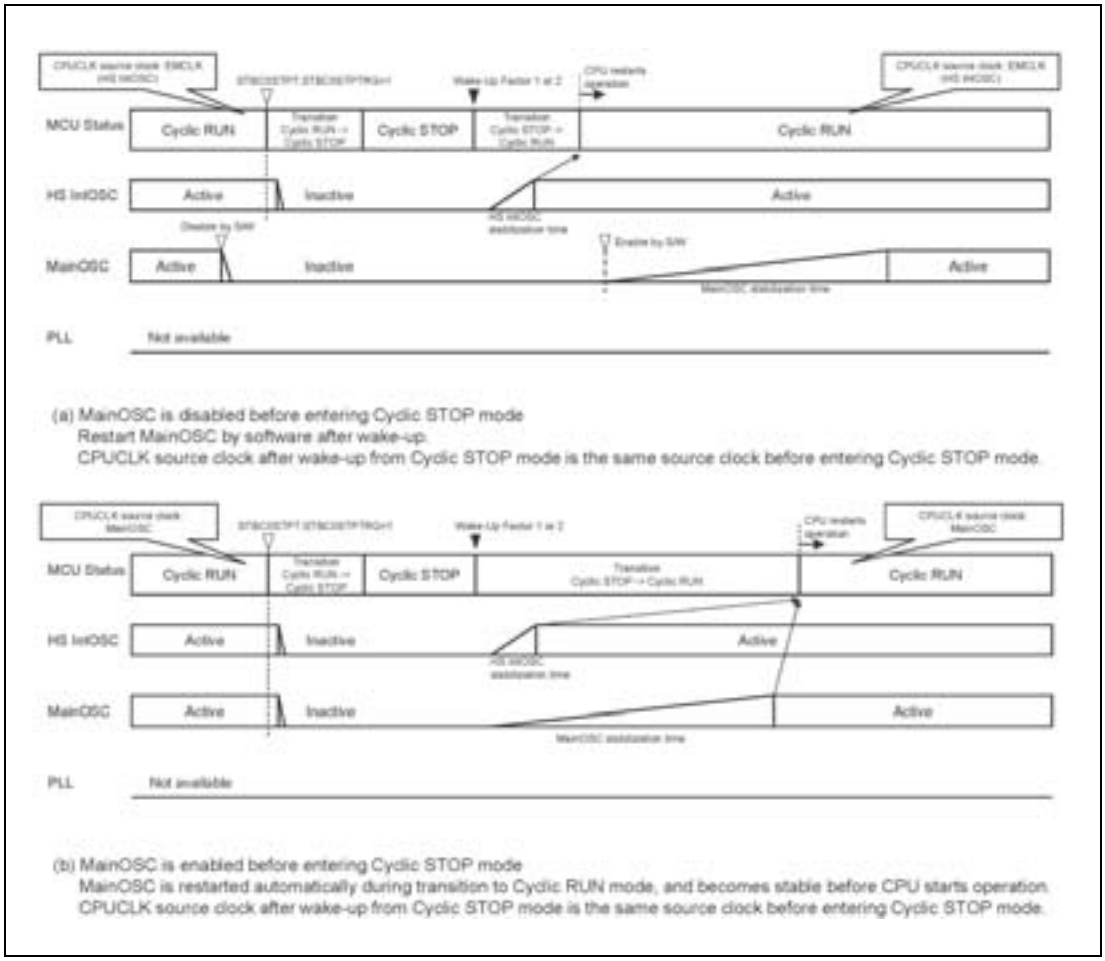

**Figure 14.10 Clock oscillators behavior in stand-by mode transition (Cyclic RUN → Cyclic STOP → Cyclic RUN)**

## 14.6 Cautions when Using Stand-By Modes

### 14.6.1 Cautions Concerning Transitioning to DeepSTOP Mode When Using a Debugger

When using a debugger, executing a program that causes the mode to transition to DeepSTOP mode immediately after the program is started may cause improper communication between the OCD emulator and microcontroller because the microcontroller will enter DeepSTOP mode before the preparations for communication between the OCD emulator and microcontroller are completed.

The communication preparation period depends on the OCD emulator's host PC environment and the operating frequency of the microcontroller, so when performing debugging that causes the program to enter DeepSTOP mode immediately after the program starts, insert a wait between reset release and the DeepSTOP execution instruction so that the debugger starts normally.

In DeepSTOP mode, the debugging controller stops. For return from DeepSTOP mode by the debugger, see **Section 14.1.3, On-Chip Debug Wake-Up**.

# Section 15 Low-Power Sampler (LPS)

This section contains a generic description of the low-power sampler (LPS).

The first part in this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the LPS.

## 15.1 Features of RH850/F1K LPS

### 15.1.1 Number of Units

This microcontroller has the following number of LPS units.

**Table 15.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | 1 | 1 |
| Name | LPSn (n = 0) | LPSn (n = 0) | LPSn (n = 0) |

**Table 15.2 Unit Configurations and Channels**

| Unit Name LPSn | Channels per Unit | Function | Channel Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|---|---|---|
| LPS0 | 1 | Digital port input m for port polling | DPINm | 17 ch | 24 ch | 24 ch |
| | | Analog input m for A/D converter | ADCA0Im | 16 ch | 16 ch | 16 ch |

**Table 15.3 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual LPS units are identified by the index “n” (n = 0). |
| m | Throughout this section, the number of digital port input channels for LPS port polling is indicated by the index “m” (m = 0 to 23) and the number of analog input channels for A/D converter is indicated by the index “m” (m = 0 to 15) |
| k | The external multiplexer select output signal is indicated by the index “k”. |
| x | LPS sequence start trigger input signal is indicated by the index “x”. |

**NOTE**

Descriptions of functions and registers in this section are based on the maximum configurations. Adjust the indices in the text to the proper value for each product. When writing a value to a register that will result in writing to bits outside the range of the index for the product you are using, write the value after reset to these bits.

The following table shows values indicated by the indices of each product.

**Table 15.4 Indices of Products**

| Indices of Each Product |
|---|
| 100 pins, 144 pins, 176 pins |
| k = 0 to 2 |
| x = 0 to 3 |

### 15.1.2 Register Base Address

The LPS base address is shown in the following table.

LPS register addresses are given as offsets from the base addresses.

**Table 15.5 Register Base Address**

| Base Address Name | Base Address |
|---|---|
| <LPS0_base> | FFF8 $3000_H$ |

### 15.1.3 Clock Supply

The LPS clock supply is shown in the following table.

If the operation request signal for the low-power sampler (LPS) is at the active level, the clock for clock domains for which the HS IntOSC is selected also operates.

To stop the function of a clock domain, set the target clock domain to “disabled” before making a transition to standby mode.

**Table 15.6 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name |
|---|---|---|
| LPSn | Register access clock | CPUCLK2 |
| | | EMCLK |
| | Operating clock | EMCLK |

### 15.1.4 Interrupt Request

The LPS interrupt requests are listed in the following table.

**Table 15.7 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **LPS0** | | | |
| INTCWEND | Port polling end interrupt (LPS) | 112 | — |
| INTDPE | Digital port error interrupt (LPS) | 356 | — |
| INTAPE | Analog port error interrupt (LPS) | 357 | — |
| INTADCA0I0*1 | ADCA0 SG1 end interrupt | 18 | 4 |
| INTADCA0I1*1 | ADCA0 SG2 end interrupt | 19 | 5 |
| INTADCA0I2*1 | ADCA0 SG3 end interrupt | 20, 32 | 6 |

Note 1. These signals are output from ADCA0.

### 15.1.5 Reset Sources

The LPS reset sources are shown in the following table. The LPS is initialized by these reset sources.

**Table 15.8 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| LPS0 | All reset sources except transition to DeepSTOP mode (AWORES) |

### 15.1.6 External Input/Output Signals

External input/output signals of LPS are listed below.

**Table 15.9 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **LPS0** | | |
| DPO | Port output signal for digital input | DPO |
| DPSELk | External multiplexer select output signal for digital port | SELDPk |
| DPINm | Digital port input signal | DPINm |
| APO | Port output signal for analog input | APO |
| ADCA0SELk*1 | External analog multiplexer (MPX) output pin | ADCA0SELk |
| ADCA0Im*1 | ADCA input channel signal | ADCA0Im |

Note 1. These signals are input/output of ADCA0. For details, see Section 31, A/D Converter (ADCA).

### 15.1.7 Internal Input/Output Signals

Internal input/output signals for connecting the LPS and the STBC or the LPS and the TAUJ are listed below.

**Table 15.10 Internal Input/Output Signals**

| Unit Signal Name | Description | Connected to |
|---|---|---|
| WUTRG0 | LPS wake-up source trigger 0 output signal | STBC |
| WUTRG1 | LPS wake-up source trigger 1 output signal | STBC |
| INTTAUJ0Ix | LPS sequence start trigger x input signal | TAUJ0 |

## 15.2 Overview

### 15.2.1 Functional Overview

To monitor the external input without consuming CPU resources, the low-power sampler (LPS) can check the digital input ports and analog input ports without using the CPU. The figure below shows a connection example between the main components of the LPS and the external circuit.

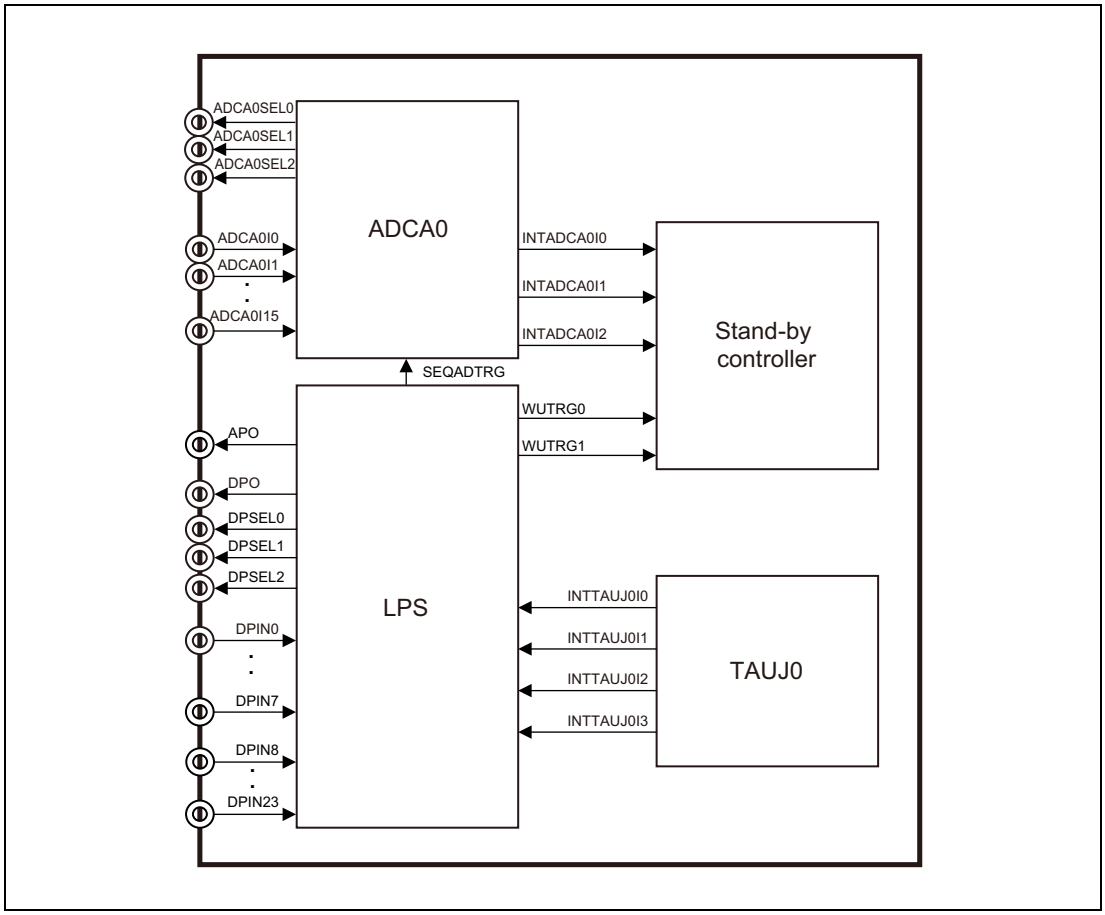

**Figure 15.1 Block Diagram of the LPS**

**CAUTION**

**DPSEL2 to DPSEL0 are assigned to the same pins as DPIN10 to DPIN8 as alternative-function. They cannot be used simultaneously.**

# 15.3 Registers

## 15.3.1 List of Registers

LPS registers are listed in the following table.

For details about <LPS0_base>, see **Section 15.1.2, Register Base Address**.

**Table 15.11 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| LPS0 | LPS control register | SCTLR | <LPS0_base > + $00_H$ |
| | Event flag register | EVFR | <LPS0_base > + $04_H$ |
| | DPIN select register 0 | DPSELR0 | <LPS0_base > + $08_H$ |
| | DPIN select register M | DPSELRM | <LPS0_base > + $0C_H$ |
| | DPIN select register H | DPSELRH | <LPS0_base > + $10_H$ |
| | DPIN data set register 0 | DPDSR0 | <LPS0_base > + $14_H$ |
| | DPIN data set register M | DPDSRM | <LPS0_base > + $18_H$ |
| | DPIN data set register H | DPDSRH | <LPS0_base > + $1C_H$ |
| | DPIN data input monitor register 0 | DPDIMR0 | <LPS0_base > + $20_H$ |
| | DPIN data input monitor register 1 | DPDIMR1 | <LPS0_base > + $24_H$ |
| | DPIN data input monitor register 2 | DPDIMR2 | <LPS0_base > + $28_H$ |
| | DPIN data input monitor register 3 | DPDIMR3 | <LPS0_base > + $2C_H$ |
| | DPIN data input monitor register 4 | DPDIMR4 | <LPS0_base > + $30_H$ |
| | DPIN data input monitor register 5 | DPDIMR5 | <LPS0_base > + $34_H$ |
| | DPIN data input monitor register 6 | DPDIMR6 | <LPS0_base > + $38_H$ |
| | DPIN data input monitor register 7 | DPDIMR7 | <LPS0_base > + $3C_H$ |
| | Count value register | CNTVAL | <LPS0_base > + $40_H$ |
| | LPS operation status register | SOSTR | <LPS0_base > + $44_H$ |

## 15.3.2 SCTLR — LPS Control Register

This register is used to configure the LPS.

**Access:** This register can be read or written in 32-bit units.

**Address:** <LPS0_base> + $00_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | NUMDP2 | NUMDP1 | NUMDP0 | TJIS1 | TJIS0 | ADEN | DPEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 15.12 SCTLR Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 7 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 6 to 4 | NUMDP[2:0] | These bits specify the number of times the port is read in digital input mode. If two or more times are specified, the external multiplexer is controlled by the DPSEL[2:0] pins.<br>The bits for which comparison is enabled in the DPSELR0, DPSELRM, and DPSELRH registers are compared regardless of the repeat number setting, and WUTRG will be generated according to the results.<br>**NUMDP[2:0] / Number of Times the Port Is Read**<br>$000_B$ One time<br>$001_B$ Two times<br>$010_B$ Three times<br>$011_B$ Four times<br>$100_B$ Five times<br>$101_B$ Six times<br>$110_B$ Seven times<br>$111_B$ Eight times<br>These bits should be set before the TAUJ0 and sequence operations are started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0).<br>(When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.) |
| 3, 2 | TJIS[1:0] | Sequence Start Trigger Select<br>00: INTTAUJ0I0<br>01: INTTAUJ0I1<br>10: INTTAUJ0I2<br>11: INTTAUJ0I3<br>These bits should be set before the sequence operation is started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0).<br>(When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.) |
| 1 | ADEN | 0: Analog input mode is disabled<br>1: Analog input mode is enabled |

Table 15.12 SCTLR Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | DPEN | 0: Digital input mode is disabled<br>1: Digital input mode is enabled |

### 15.3.3 EVFR — Event Flag Register

This register indicates the result of comparing the data sequentially captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers.

**Access:** This register can be read or written in 32-bit units.

**Address:** <LPS0_base> + $04_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DINEVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 15.13 EVFR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | DINEVF | This bit indicates the result of comparing the data captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers.<br>Read:<br>0: The result of comparison is a match.<br>1: The result of comparison is a mismatch.<br>Write:<br>0: Clear the bit.<br>1: Prohibited.<br>This bit is set to 1 when a mismatch is detected even in one bit. Only 0 can be written to clear this bit. |

### 15.3.4 DPSELR0 — DPIN Select Register 0

This register specifies the compare target bits in the DPDSR0 and DPDIMR0 registers.

Write to the DPSELR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** This register can be read or written in 32-bit units.

**Address:** <LPS0_base> + $08_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | D0EN_23 | D0EN_22 | D0EN_21 | D0EN_20 | D0EN_19 | D0EN_18 | D0EN_17 | D0EN_16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | D0EN_15 | D0EN_14 | D0EN_13 | D0EN_12 | D0EN_11 | D0EN_10 | D0EN_9 | D0EN_8 | D0EN_7 | D0EN_6 | D0EN_5 | D0EN_4 | D0EN_3 | D0EN_2 | D0EN_1 | D0EN_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 15.14 DPSELR0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 23 to 0 | D0EN_n<br>(n = 23 to 0) | These bits enable or disable comparing each bit of the first data captured at the digital input pins and stored in the DPDIMR0 register with the comparison target data in the DPDSR0 register.<br>0: Disables comparison.<br>1: Enables comparison. |

### 15.3.5 DPSELRM — DPIN Select Register M

This register specifies the compare target bits in the DPDSRM and DPDIMRm (m = 4 to 1) registers.

Write to the DPSELRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** DPSELRM can be read or written in 32-bit units.
DPSELRML and DPSELRMH can be read or written in 16-bit units.
DPSELR1, DPSELR2, DPSELR3, and DPSELR4 can be read or written in 8-bit units.

**Address:** DPSELRM: <LPS0_base> + $0C_H$
DPSELRML: <LPS0_base> + $0C_H$,
DPSELRMH: <LPS0_base> + $0E_H$
DPSELR1: <LPS0_base> + $0C_H$,
DPSELR2: <LPS0_base> + $0D_H$,
DPSELR3: <LPS0_base> + $0E_H$,
DPSELR4: <LPS0_base> + $0F_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | D4EN_7 | D4EN_6 | D4EN_5 | D4EN_4 | D4EN_3 | D4EN_2 | D4EN_1 | D4EN_0 | D3EN_7 | D3EN_6 | D3EN_5 | D3EN_4 | D3EN_3 | D3EN_2 | D3EN_1 | D3EN_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | D2EN_7 | D2EN_6 | D2EN_5 | D2EN_4 | D2EN_3 | D2EN_2 | D2EN_1 | D2EN_0 | D1EN_7 | D1EN_6 | D1EN_5 | D1EN_4 | D1EN_3 | D1EN_2 | D1EN_1 | D1EN_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 15.15 DPSELRM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | D4EN_n (n = 7 to 0) | These bits enable or disable comparing each bit of the fifth data captured at the digital input pins and stored in the DPDIMR4 register with the comparison target data in the DPDSR4 register.<br>0: Disables comparison.<br>1: Enables comparison. |
| 23 to 16 | D3EN_n (n = 7 to 0) | These bits enable or disable comparing each bit of the fourth data captured at the digital input pins and stored in the DPDIMR3 register with the comparison target data in the DPDSR3 register.<br>0: Disables comparison.<br>1: Enables comparison. |
| 15 to 8 | D2EN_n (n = 7 to 0) | These bits enable or disable comparing each bit of the third data captured at the digital input pins and stored in the DPDIMR2 register with the comparison target data in the DPDSR2 register.<br>0: Disables comparison.<br>1: Enables comparison. |
| 7 to 0 | D1EN_n (n = 7 to 0) | These bits enable or disable comparing each bit of the second data captured at the digital input pins and stored in the DPDIMR1 register with the comparison target data in the DPDSR1 register.<br>0: Disables comparison.<br>1: Enables comparison. |

### 15.3.6 DPSELRH — DPIN Select Register H

This register specifies the compare target bits in the DPDSRH and DPDIMRm (m = 7 to 5) registers.

Write to the DPSELRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** DPSELRH can be read or written in 32-bit units.
DPSELRHL and DPSELRHH can be read or written in 16-bit units.
DPSELR5, DPSELR6, and DPSELR7 can be read or written in 8-bit units.

**Address:** DPSELRH: <LPS0_base> + $10_H$
DPSELRHL: <LPS0_base> + $10_H$,
DPSELRHH: <LPS0_base> + $12_H$
DPSELR5: <LPS0_base> + $10_H$,
DPSELR6: <LPS0_base> + $11_H$,
DPSELR7: <LPS0_base> + $12_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | D7EN_7 | D7EN_6 | D7EN_5 | D7EN_4 | D7EN_3 | D7EN_2 | D7EN_1 | D7EN_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | D6EN_7 | D6EN_6 | D6EN_5 | D6EN_4 | D6EN_3 | D6EN_2 | D6EN_1 | D6EN_0 | D5EN_7 | D5EN_6 | D5EN_5 | D5EN_4 | D5EN_3 | D5EN_2 | D5EN_1 | D5EN_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 15.16 DPSELRH Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 23 to 16 | D7EN_n<br>(n = 7 to 0) | These bits enable or disable comparing each bit of the eighth data captured at the digital input pins and stored in the DPDIMR7 register with the compare target data in the DPDSR7 register.<br>0: Disables comparison.<br>1: Enables comparison. |
| 15 to 8 | D6EN_n<br>(n = 7 to 0) | These bits enable or disable comparing each bit of the seventh data captured at the digital input pins and stored in the DPDIMR6 register with the compare target data in the DPDSR6 register.<br>0: Disables comparison.<br>1: Enables comparison. |
| 7 to 0 | D5EN_n<br>(n = 7 to 0) | These bits enable or disable comparing each bit of the sixth data captured at the digital input pins and stored in the DPDIMR5 register with the compare target data in the DPDSR5 register.<br>0: Disables comparison.<br>1: Enables comparison. |

### 15.3.7 DPDSR0 — DPIN Data Set Register 0

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR0 register.

Write to the DPDSR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** This register can be read or written in 32-bit units.

**Address:** <LPS0_base> + $14_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 15.17 DPDSR0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 23 to 0 | D0_n<br>(n = 23 to 0) | Data to be compared with the first digital port input (DPINm) |

### 15.3.8 DPDSRM — DPIN Data Set Register M

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR4 to DPDIMR1 registers.

Write to the DPDSRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** DPDSRM can be read or written in 32-bit units.
DPDSRML and DPDSRMH can be read or written in 16-bit units.
DPDSR1, DPDSR2, DPDSR3, and DPDSR4 can be read or written in 8-bit units.

**Address:** DPDSRM: <LPS0_base> + $18_H$
DPDSRML: <LPS0_base> + $18_H$,
DPDSRMH: <LPS0_base> + $1A_H$
DPDSR1: <LPS0_base> + $18_H$,
DPDSR2: <LPS0_base> + $19_H$,
DPDSR3: <LPS0_base> + $1A_H$,
DPDSR4: <LPS0_base> + $1B_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 15.18 DPDSRM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | D4_n (n = 7 to 0) | Data to be compared with the fifth digital port input (DPINm) |
| 23 to 16 | D3_n (n = 7 to 0) | Data to be compared with the fourth digital port input (DPINm) |
| 15 to 8 | D2_n (n = 7 to 0) | Data to be compared with the third digital port input (DPINm) |
| 7 to 0 | D1_n (n = 7 to 0) | Data to be compared with the second digital port input (DPINm) |

### 15.3.9 DPDSRH — DPIN Data Set Register H

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR7 to DPDIMR5 registers.

Write to the DPDSRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** DPDSRH can be read or written in 32-bit units.
DPDSRHL and DPDSRHH can be read or written in 16-bit units.
DPDSR5, DPDSR6, and DPDSR7 can be read or written in 8-bit units.

**Address:** DPDSRH: <LPS0_base> + $1C_H$
DPDSRHL: <LPS0_base> + $1C_H$,
DPDSRHH: <LPS0_base> + $1E_H$
DPDSR5: <LPS0_base> + $1C_H$,
DPDSR6: <LPS0_base> + $1D_H$,
DPDSR7: <LPS0_base> + $1E_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 15.19 DPDSRH Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 23 to 16 | D7_n<br>(n = 7 to 0) | Data to be compared with the eighth digital port input (DPINm) |
| 15 to 8 | D6_n<br>(n = 7 to 0) | Data to be compared with the seventh digital port input (DPINm) |
| 7 to 0 | D5_n<br>(n = 7 to 0) | Data to be compared with the sixth digital port input (DPINm) |

## 15.3.10 DPDIMR0 — DPIN Data Input Monitor Register 0

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 23)) in digital input mode. DPDIMR0 stores the data acquired for the first time.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <LPS0_base> + $20_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 15.20 DPDIMR0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | When read, the value after reset is returned. |
| 23 to 0 | D0M_n (n = 23 to 0) | The first digital port input (DPINm) data |

## 15.3.11 DPDIMR1 — DPIN Data Input Monitor Register 1

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR1 stores the data acquired for the second time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0_base> + $24_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | D1M_7 | D1M_6 | D1M_5 | D1M_4 | D1M_3 | D1M_2 | D1M_1 | D1M_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 15.21 DPDIMR1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | D1M_n (n = 7 to 0) | The second digital port input (DPINm) data |

## 15.3.12 DPDIMR2 — DPIN Data Input Monitor Register 2

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR2 stores the data acquired for the third time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0_base> + $28_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | D2M_7 | D2M_6 | D2M_5 | D2M_4 | D2M_3 | D2M_2 | D2M_1 | D2M_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 15.22 DPDIMR2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | D2M_n (n = 7 to 0) | The third digital port input (DPINm) data |

## 15.3.13 DPDIMR3 — DPIN Data Input Monitor Register 3

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR3 stores the data acquired for the fourth time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0_base> + $2C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | D3M_7 | D3M_6 | D3M_5 | D3M_4 | D3M_3 | D3M_2 | D3M_1 | D3M_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 15.23 DPDIMR3 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | D3M_n (n = 7 to 0) | The fourth digital port input (DPINm) data |

### 15.3.14 DPDIMR4 — DPIN Data Input Monitor Register 4

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR4 stores the data acquired for the fifth time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0_base> + $30_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | D4M_7 | D4M_6 | D4M_5 | D4M_4 | D4M_3 | D4M_2 | D4M_1 | D4M_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 15.24 DPDIMR4 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | D4M_n (n = 7 to 0) | The fifth digital port input (DPINm) data |

### 15.3.15 DPDIMR5 — DPIN Data Input Monitor Register 5

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR5 stores the data acquired for the sixth time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0_base> + $34_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | D5M_7 | D5M_6 | D5M_5 | D5M_4 | D5M_3 | D5M_2 | D5M_1 | D5M_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 15.25 DPDIMR5 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | D5M_n (n = 7 to 0) | The sixth digital port input (DPINm) data |

### 15.3.16 DPDIMR6 — DPIN Data Input Monitor Register 6

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR6 stores the data acquired for the seventh time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0_base> + $38_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | D6M_7 | D6M_6 | D6M_5 | D6M_4 | D6M_3 | D6M_2 | D6M_1 | D6M_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 15.26 DPDIMR6 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | D6M_n (n = 7 to 0) | The seventh digital port input (DPINm) data |

### 15.3.17 DPDIMR7 — DPIN Data Input Monitor Register 7

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 7)) in multiplexer mode. DPDIMR7 stores the data acquired for the eighth time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0_base> + $3C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | D7M_7 | D7M_6 | D7M_5 | D7M_4 | D7M_3 | D7M_2 | D7M_1 | D7M_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 15.27 DPDIMR7 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | D7M_n (n = 7 to 0) | The eighth digital port input (DPINm) data |

### 15.3.18 CNTVAL — Count Value Register

This register specifies the stabilization time of the external circuits (digital signal source and analog signal source).

- In digital mode
  The time from when the DPO output is set to 1 to the time when the port input is acquired for the first time
- In analog mode
  The time from when the APO output is set to 1 to the time when the LPS outputs the A/D conversion trigger to the ADCA0

Write to the CNTVAL register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**CAUTION**

In analog mode, make sure to secure the stabilization time longer than 1 μs for the stabilization of the A/D converter.

**Access:** This register can be read or written in 16-bit units.

**Address:** <LPS0_base> + $40_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CNT17 | CNT16 | CNT15 | CNT14 | CNT13 | CNT12 | CNT11 | CNT10 | CNT07 | CNT06 | CNT05 | CNT04 | CNT03 | CNT02 | CNT01 | CNT00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 15.28 CNTVAL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 8 | CNT1n<br>(n = 7 to 0) | These bits set the stabilization time of the external circuit (analog signal source).<br>Stabilization time = $(1/f_{RH})$ × 16 × CNT1n (set value) |
| 7 to 0 | CNT0n<br>(n = 7 to 0) | These bits set the stabilization time of the external circuit (digital signal source).<br>Stabilization time = $(1/f_{RH})$ × 16 × CNT0n (set value) |

### 15.3.19 SOSTR — LPS Operation Status Register

This register indicates the operating state of the LPS.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0_base> + $44_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SOF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 15.29 SOSTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | SOF | LPS Operation Status Flag<br>0: Initial state before the occurrence of the start trigger<br>1: LPS operation is in progress (after the start trigger occurs)<br>If the start trigger occurs while the SOF bit is set to 1 (during the LPS operation), the start trigger is canceled. |

## 15.4 Digital Input Mode

With the digital input port DPINm and the externally connected multiplexer, up to 64 input ports can be monitored as shown in **Table 15.30, Combination of Monitored Ports**.

Port DPSELk is used to switch the external multiplexer. The DPSELk output is switched for the number of times specified in the SCTLR register.

TAUJ0 is used to set the timing to check the value input to the port.

**Table 15.30 Combination of Monitored Ports**

| Combination (Number of Ports x Number of Checks) | Ports Used | Total Number |
|---|---|---|
| Direct mode<br>When input ports are checked simultaneously without using the external multiplexer<br>Up to 24 ports × 1 | DPIN23 to DPIN0 | Up to 24 |
| Multiplexer mode<br>When input ports are checked by using a small number of pins and the external multiplexer<br>Up to 8 ports × 8 | DPIN7 to DPIN0<br>DPSEL2 to DPSEL0 | Up to 64 |
| MIX mode<br>When input ports are checked using a combination of the above two modes<br>Up to 14 ports x 1 + Up to 7 ports x 7 | DPIN7 to DPIN0<br>DPIN16 to DPIN11<br>DPSEL2 to DPSEL0*1 | Up to 63 |

Note 1. DPIN16 to DPIN11 and DPIN7 are checked only for the first time. DPIN10 to DPIN8 cannot be used because they are shared with DPSEL2 to DPSEL0.

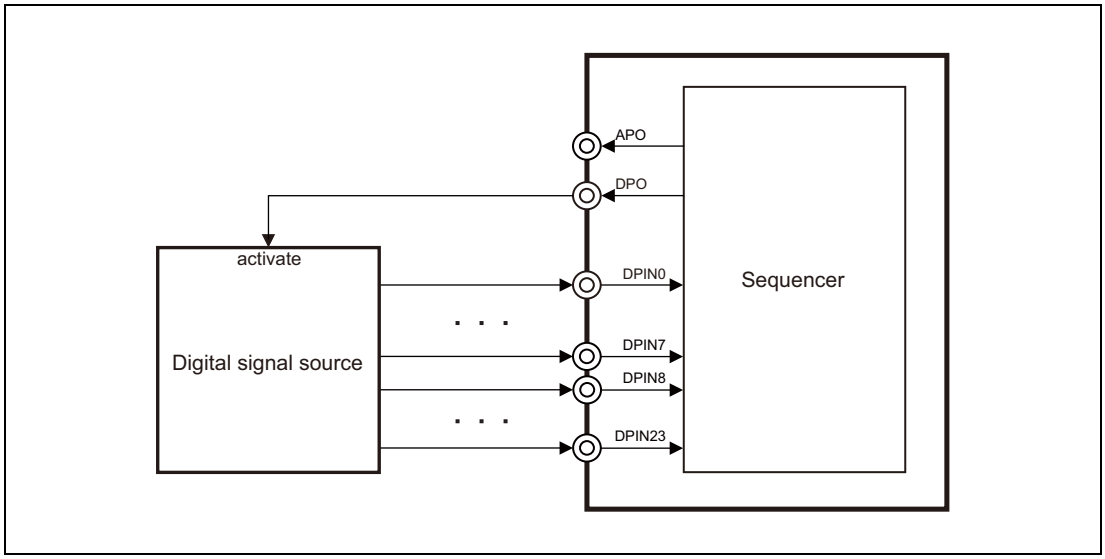

**Figure 15.2 Direct Mode Connection Example**

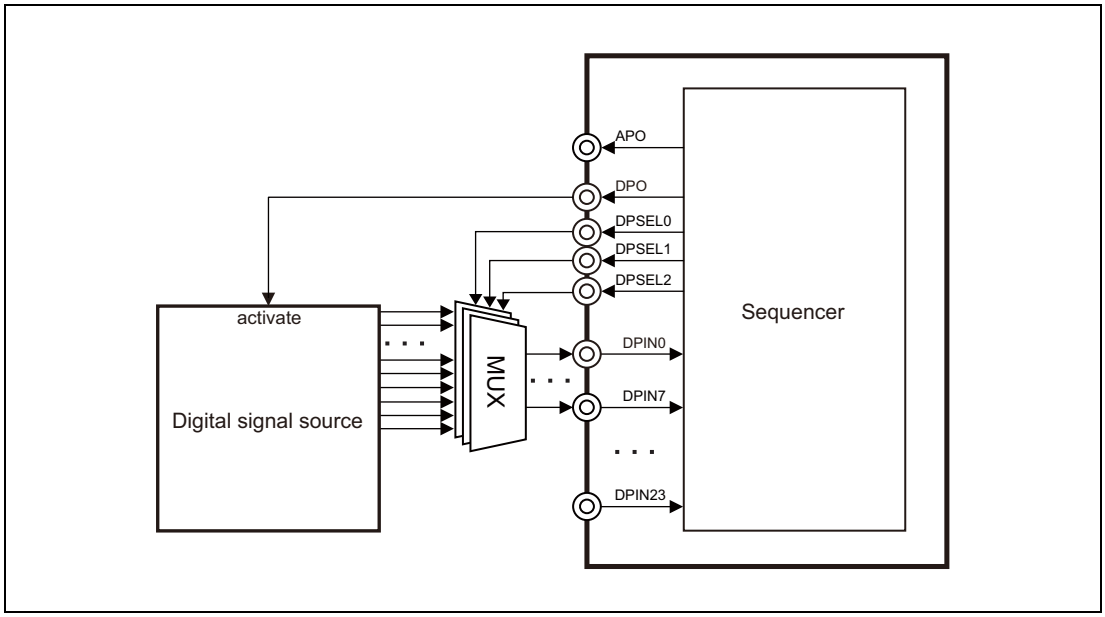

Figure 15.3 Multiplexer Mode Connection Example

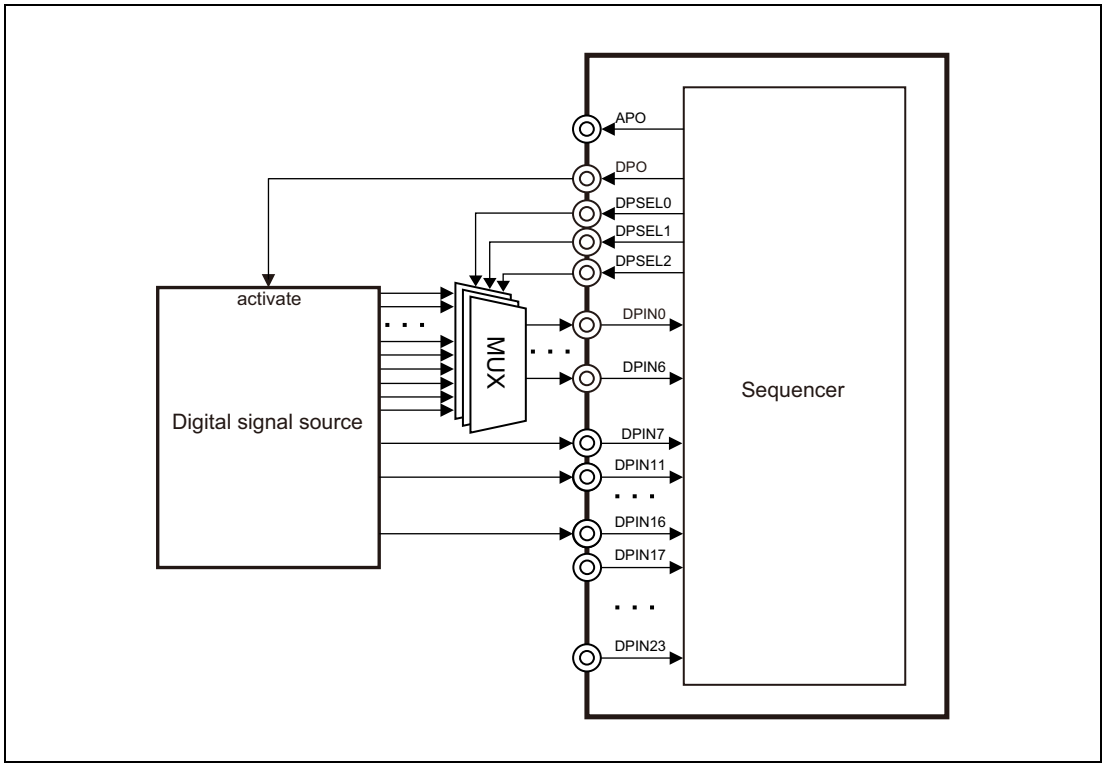

Figure 15.4 MIX Mode Connection Example

**CAUTION**

**DPSEL2 to DPSEL0 are assigned to the same pins as DPIN10 to DPIN8 as alternative-function. They cannot be used simultaneously.**

### Preparation

- Set NUMDP[2:0] and TJIS[1:0] bits in the SCTLR register to specify the number of times the port is to be read, and the TAUJ0 interrupt to be used as sequence start trigger.
- Set TAUJ0 to interval timer mode.
- Set the wait time of the digital signal source by using the lower 8 bits in the CNTVAL register.
- Set expected values in the DPDSR0, DPDSRM and DPDSRH registers.
- Set the ports to be checked in the DPSELR0, DPSELRM, and DPSELRH registers.

### Start

- Start the TAUJ0.
- Set the SCTLR.DPEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJ0. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in stand-by mode, it can only resume operation while the sequencer is running.

Upon completion of checking all ports that have been set, the INTCWEND interrupt occurs. In addition, if the input value of the port is different from the expected value set by the DPDSR0, DPDSRM, or DPDSRH register, the wake-up factor WUTRG0 occurs. The following figures show an example of the operation in digital input mode.

### Stop

To stop the LPS operation in Digital Input Mode (by changing the SCTLR.DPEN bit setting from 1 to 0), follow the procedure shown below. In this example, the P0_0 pin is used as DPO.

1. Set the port register to specify low level output on the pin (P0.P0_0 = 0).
2. Change the setting for the P0_0 pin from the alternative port mode to the port mode (PMC0.PMC0_0 = 0).
3. Set SCTLR.DPEN = 0.

**Note:** The above procedure applies when the P0_0 pin is used as DPO. If the P0_2 pin is used as DPO, specify the P0_2 pin settings in the same way.

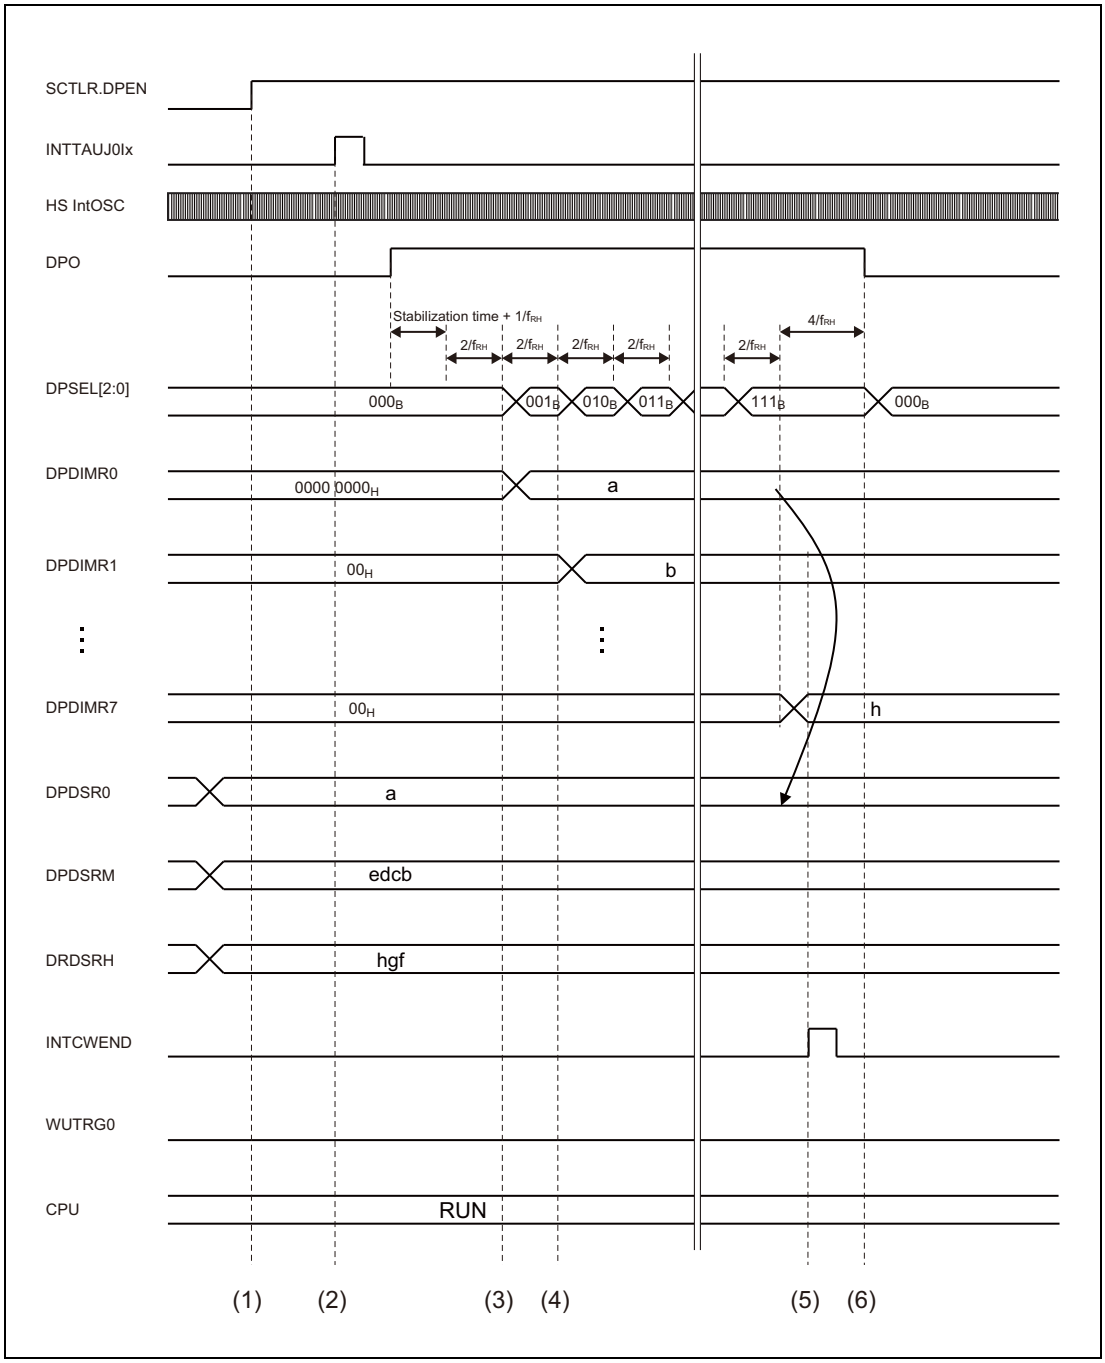

**Figure 15.5 Operation of Digital Input Mode (8 Ports × 8) when the Input Value is not Changed (RUN Mode)**

(1) Set the SCTLR.DPEN bit to 1 by software to enable the digital input mode of the LPS.

(2) When the INTTAUJ0Ix interrupt specified by the SCTLR.TJIS bit is generated, the sequencer outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.

(3) After the completion of the signal source stabilization, the LPS stores the DPIN[7:0] input value to the DPDIMR0 register and increments the DPSEL[2:0] pins to switch the external multiplexer.

(4) After the switching of the DPSEL[2:0] pins, the LPS stores the values in the DPDIMRn registers in order from DPDIMR1 and continues to increment the DPSEL[2:0] pins.

(5) After the value is stored up to the DPDIMR7 register, the INTCWEND interrupt is generated and the value is compared with the expected value set in the DPDSR0, DPDSRM, and DPDSRH registers.

(6) When the value is not different from the expected value, the wake-up factor WUTRG0 is not generated. The LPS stops the DPO output and returns to the waiting state for the trigger.

High level width of the DPO pin is calculated by the following formula. For the Stabilization time, see **Section 15.3.18, CNTVAL — Count Value Register**.

High level width of the DPO pin

= Stabilization time + $(1/f_{RH}) \times 1 + (1/f_{RH}) \times 2 \times$ (SCTLR.NUMDP (set value) + 1) + $(1/f_{RH}) \times 4$

= Stabilization time + $(1/f_{RH}) \times$ (2 × SCTLR.NUMDP (set value) + 7)

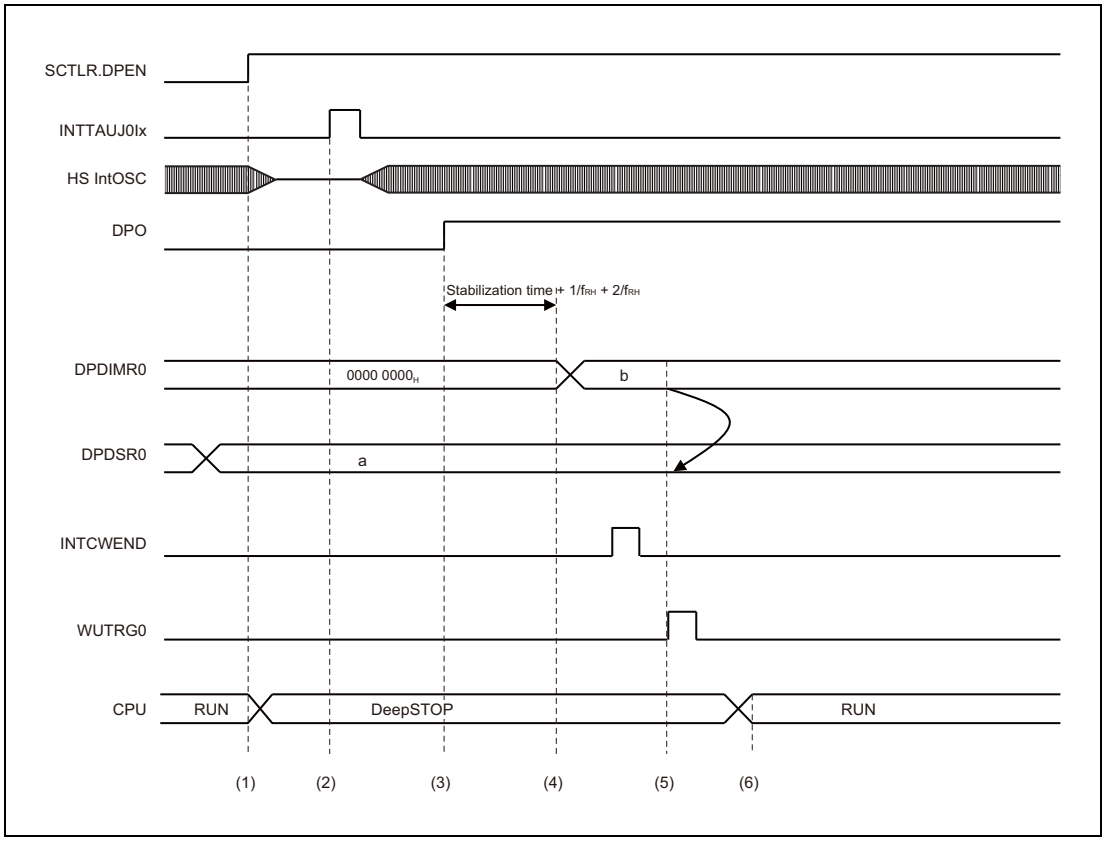

**Figure 15.6 Operation of Digital Input Mode (24 Ports × 1) when the Input Value is Changed (DeepSTOP Mode)**

(1) Set the STBC0PSC.STBC0DISTRG bit to 1 to transition to the DeepSTOP mode, while the SCTLR.DPEN bit is set to 1 by software to enable the digital input mode of the LPS.

(2) When the INTTAUJ0Ix interrupt specified by the SCTLR.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.

(3) After the completion of the HS IntOSC stabilization time, the LPS outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.

(4) After the completion of the signal source stabilization, the LPS stores the DPIN[23:0] input value to the DPDIMR0 register and the INTCWEND interrupt is generated.

(5) The value stored in the DPDIMR0 register is compared with the expected value set in the DPDSR0 register. When the value is different from the expected value, the wake-up factor WUTRG0 is generated.

(6) The CPU returns to RUN mode at the generation of WUTRG0. The DPO pin is driven high until the EVFR.DINEVF bit is cleared to 0 by software.

### 15.4.1 Digital Port Error Interrupt

A level sensitive interrupt indicating a data comparison mismatch is generated. This interrupt is generated not only in stand-by mode but also in RUN mode. The set and clear conditions are shown below.

**Table 15.31 Digital Port Error Interrupt**

| Unit Interrupt Signal | Set Condition | Clear Condition |
|---|---|---|
| INTDPE | When EVFR.DINEVF is set to 1 by hardware | When EVFR.DINEVF is cleared to 0 by software |

## 15.5 Analog Input Mode

The analog input port ADCA0Im (m = 0 to 15) can be monitored.

TAUJ0 is used to set the timing to check the value input to the port.

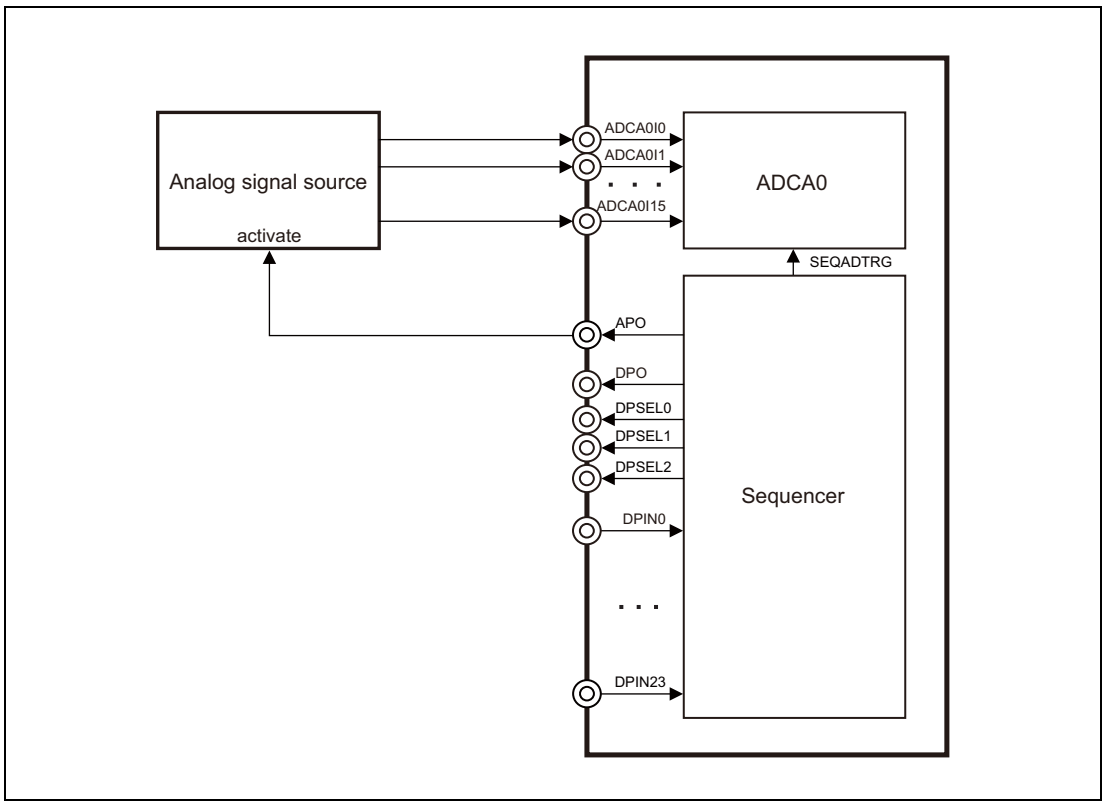

**Figure 15.7 Analog Input Mode Connection Example 1**

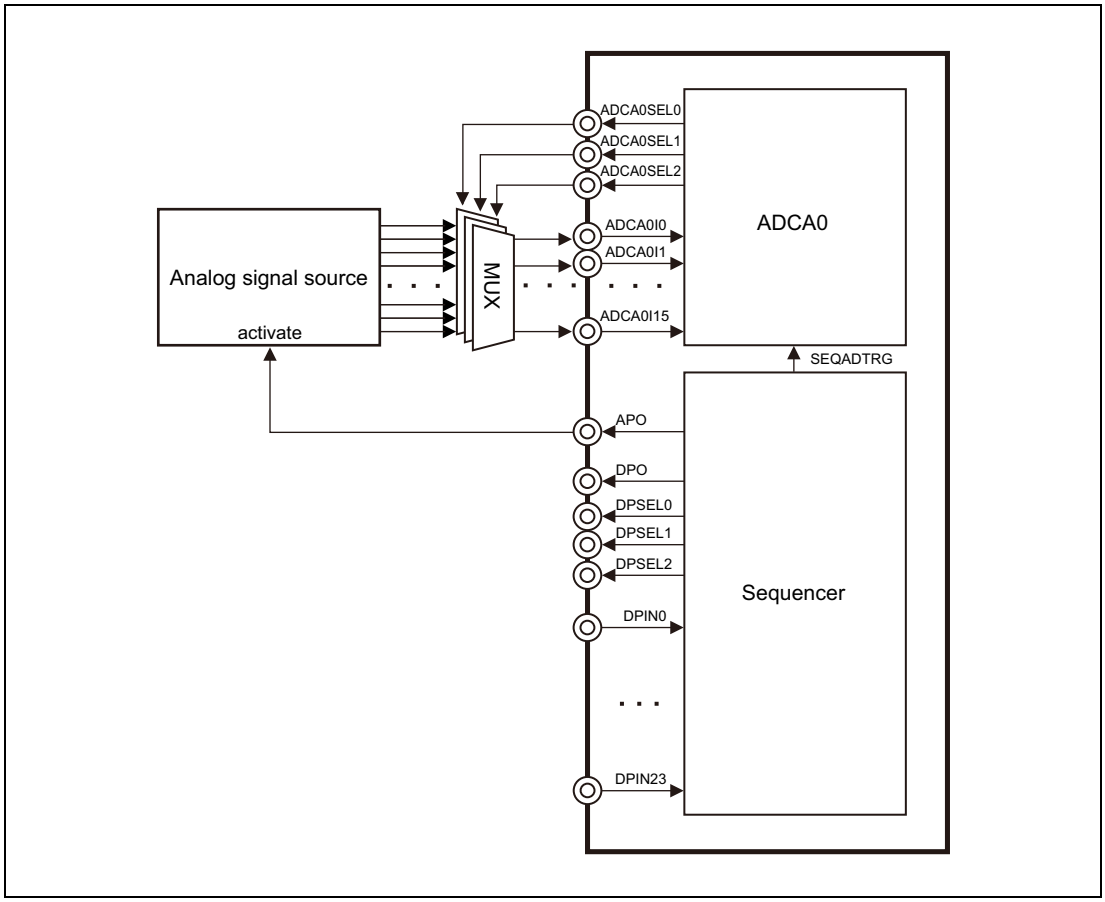

**Figure 15.8 Analog Input Mode Connection Example 2**

### Preparation

- Set TJIS[1:0] bits in the SCTLR register to specify the TAUJ0 interrupt to be used as sequence start trigger.
- Set TAUJ0 to interval timer mode.
- Set the wait time of the analog signal source by using the upper 8 bits in the CNTVAL register.
- Set the ADCA0.

### CAUTIONS

1. **When the LPS is in use, the A/D conversion completion interrupt (INT_SGx) should be output after the conversion of all channels of the LPS has been completed. The setting is as follows.**
   - **Set the ADIE bit in virtual channel register j (ADCA0VCRj) to 0 (a scan group x end interrupt (INT_SGx) is not generated when A/D conversion for virtual channel j ends in SGx.).**
   - **Set the ADIE bit in the scan group x control register (ADCA0SGCRx) to 1 (INT_SGx is output when the scan for SGx ends).**
2. **Over the period from the generation of the LPS sequence start trigger set by the SCLTR.TJIS[1:0] bits to the completion of A/D conversion for all channels of the LPS, only proceed with A/D conversion for PWM-Diag.**
   **LPS acknowledges the A/D conversion completion interrupts of the scan group**

**SG1, SG2 or SG3, but does not recognize the kind of SG (three interrupts are ORed to one interrupt). During LPS operation using one SG, an A/D conversion completion interrupt and A/D error interrupt cannot be set for another SG.**

3. **Over the period from the generation of the LPS sequence start trigger set by the SCLTR.TJIS[1:0] bits to the completion of A/D conversion for all channels of LPS, do not forcibly end A/D conversion by using the ADCA0ADHALTR.HALT bit.**
4. **When the LPS is in use, do not use the following modes.**
   - **Continuous scan mode (the setting ADCA0SGCRx.SCANMD = 1 is prohibited)**
   - **Multicycle scan mode with 2 or more cycles (the settings ADCA0SGMCYCRx.MCYC = $01_B$ and $11_B$ are prohibited)**
   - **Channel repeat mode with 2 or more cycles (the settings ADCA0SGCRx.SCT = $01_B$ and $10_B$ are prohibited)**

### Start

- Start the TAUJ0.
- Set the SCTLR.ADEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJ0. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in stand-by mode, it can only resume operation while the sequencer is running.

To detect whether the analog input value differs from the expected value, use the A/D error interrupt request (INTADCA0ERR) of the A/D converter.

In addition, if the analog input value is different from the expected value, the wake-up factor WUTRG1 occurs.

For details on the A/D error interrupt request (INTADCA0ERR), see **Section 31.4.13, A/D Error Interrupt Request**[*1]. The following figures show an example of the operation in analog input mode.

**Note 1.** In **Section 31 A/D Converter (ADCA)**, the name of the A/D error interrupt request is described as “INT_ADE”.

### Stop

To stop the LPS operation in Analog Input Mode (by changing the SCTLR.ADEN bit setting from 1 to 0), follow the procedure shown below. Note that the P0_1 pin is used as APO.

1. Set the port register to specify low level output on the pin (P0.P0_1 = 0).
2. Change the setting for the P0_1 pin from the alternative port mode to the port mode (PMC0.PMC0_1 = 0).
3. Set SCTLR.ADEN = 0.

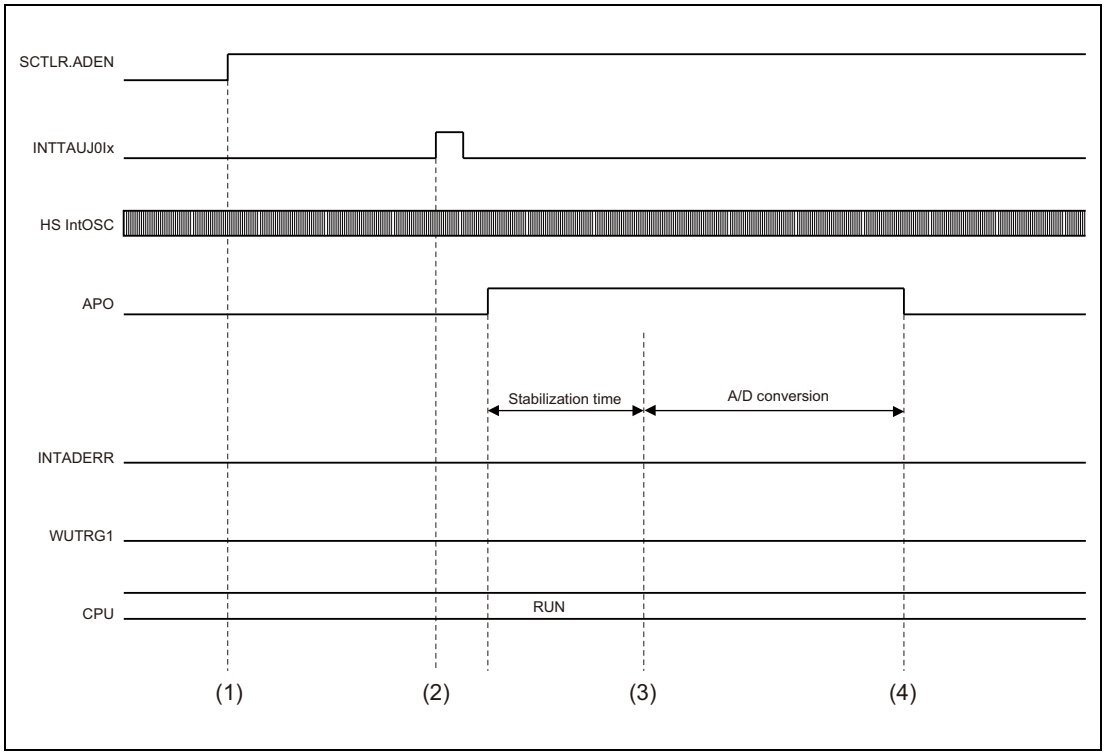

**Figure 15.9 Operation of Analog Input Mode when the Conversion Result is within the Expected Range (RUN Mode)**

(1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTLR.ADEN bit to 1 to enable the analog input mode of the LPS.

(2) When the INTTAUJ0Ix interrupt specified by the SCTLR.TJIS bit is generated, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source. Set the stabilization time not less than 1 µs.

(3) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCA0Im (m = 0 to 15), set in the A/D converter scan group, is started.

(4) When the INTADCA0ERR interrupt is not generated as a result of A/D conversion, the LPS halts the A/D converter and resets the APO pin.

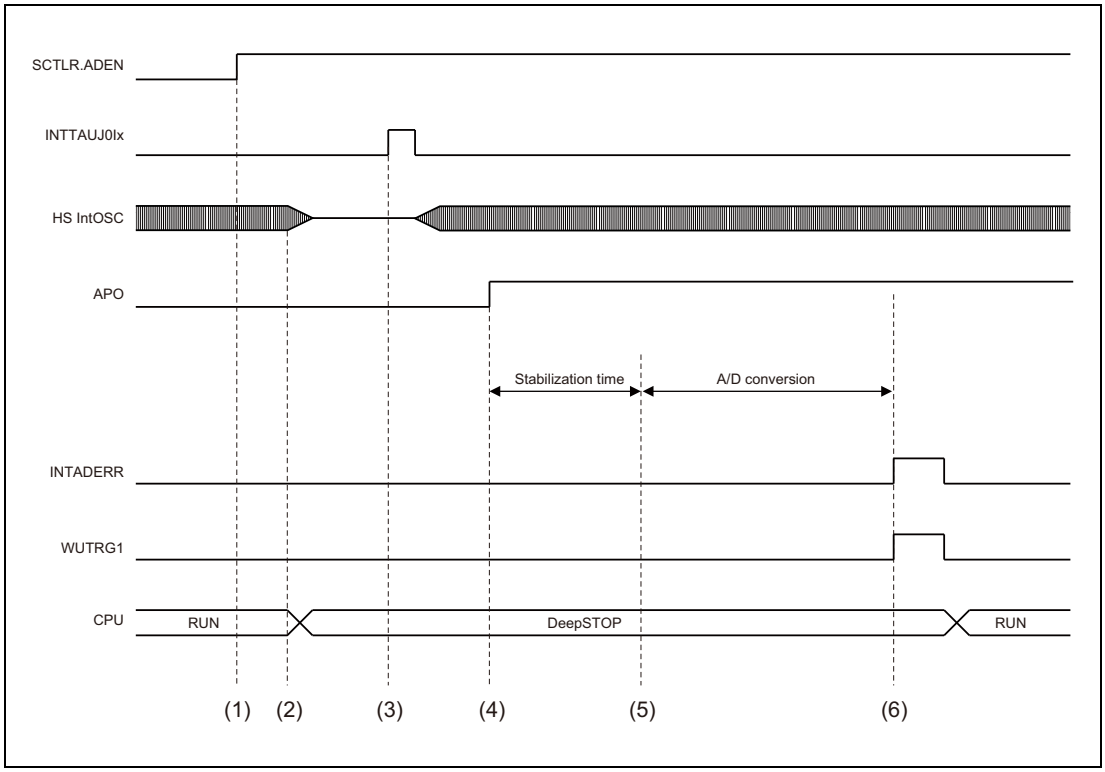

**Figure 15.10 Operation of Analog Input Mode when the Conversion Result is not within the Expected Range (DeepSTOP Mode)**

(1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTLR.ADEN bit to 1 to enable the analog input mode of the LPS.

(2) Set the STBC0PSC.STBC0DISTRG bit to 1 by software to transition to the DeepSTOP mode.

(3) When the INTTAUJ0Ix interrupt specified by the SCTLR.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.

(4) After the completion of the HS IntOSC stabilization, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source.

(5) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCA0Im (m = 0 to 15), set in the A/D converter scan group, is started.

(6) When the INTADCA0ERR interrupt is generated as a result of A/D conversion, the wake-up factor WUTRG1 is generated and the CPU returns to RUN mode. The APO pin is driven high until the upper limit/lower limit error flag of the A/D converter is cleared to 0 by software.

**NOTE**

WUTRG1 is generated when the first ADCA0 SG interrupt occurred after ADCAnULER.UE or ADCAnULER.LE is set.

### 15.5.1 Analog Port Error Interrupt

A level sensitive interrupt indicating a data comparison mismatch is generated. This interrupt is generated not only in the stand-by mode but also in RUN mode. The set and clear conditions are shown below.

**Table 15.32 Analog Port Error Interrupt**

| Unit Interrupt Signal | Set Condition | Clear Condition |
|---|---|---|
| INTAPE | When WUTRG1 is set to 1 by hardware | When both ADCAnULER.UE and ADCAnULER.LE are cleared to 0 by software |

# Section 16 Clocked Serial Interface G (CSIG)

This section contains a generic description of the Clocked Serial Interface G (CSIG).

The first part in this section describes the features specific to RH850/F1K, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the CSIG.

## 16.1 Features of RH850/F1K CSIG

### 16.1.1 Number of Units

This microcontroller has the following number of CSIG units.

Each CSIG unit has one channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

**Table 16.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | 2 | 2 |
| Name | CSIGn (n = 0) | CSIGn (n = 0, 1) | CSIGn (n = 0, 1) |

**Table 16.2 Index**

| Index | Description |
|---|---|
| n | Throughout this section, the individual CSIG units are identified by the index “n” (n = 0, 1): for example, CSIGnCTL0 is the CSIGn control register 0. |

### 16.1.2 Register Base Address

CSIG base addresses are listed in the following table.

CSIG register addresses are given as offsets from the base addresses.

**Table 16.3 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <CSIG0_base> | FFD8 $8000_H$ |
| <CSIG1_base> | FFD8 $A000_H$ |

### 16.1.3 Clock Supply

The CSIG clock supply is shown in the following table.

**Table 16.4 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| CSIGn | PCLK | CKSCLK_ICSI | Communication clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_ICSI | |

### 16.1.4 Interrupt Request

CSIG interrupt requests are listed in the following table.

**Table 16.5 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **CSIG0** | | | |
| INTCSIGTIC | Communication status interrupt | 27,118 | 8 |
| INTCSIGTIR | Receive status interrupt | 28,119 | 9 |
| INTCSIGTIRE | Communication error interrupt | 57 | — |
| **CSIG1** | | | |
| INTCSIGTIC | Communication status interrupt | 223 | 109 |
| INTCSIGTIR | Receive status interrupt | 224 | 110 |
| INTCSIGTIRE | Communication error interrupt | 225 | — |

### 16.1.5 Reset Sources

CSIG reset sources are listed in the following table. CSIG is initialized by these reset sources.

**Table 16.6 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| CSIGn | All reset sources (ISORES) |

### 16.1.6 External Input/Output Signals

External input/output signals of CSIG are listed below.

**Table 16.7 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **CSIG0** | | |
| CSIGTSCK | Serial clock signal | CSIG0SC |
| CSIGTSI | Serial data input signal | CSIG0SI |
| CSIGTSO | Serial data output signal | CSIG0SO |
| $\overline{\text{CSIGTSSI}}$ | Slave select input signal | $\overline{\text{CSIG0SSI}}$ |
| CSIGTRYI | Ready / busy input signal | CSIG0RYI |
| CSIGTRYO | Ready / busy output signal | CSIG0RYO |
| **CSIG1** | | |
| CSIGTSCK | Serial clock signal | CSIG1SC |
| CSIGTSI | Serial data input signal | CSIG1SI |
| CSIGTSO | Serial data output signal | CSIG1SO |
| $\overline{\text{CSIGTSSI}}$ | Slave select input signal | $\overline{\text{CSIG1SSI}}$ |
| CSIGTRYI | Ready / busy input signal | CSIG1RYI |
| CSIGTRYO | Ready / busy output signal | CSIG1RYO |

**Note:** For the port pins that are used as CSIGnSO and CSIGnSC, set the output driving ability to high (PDSCn_m = 1).

### 16.1.7 Data Consistency Check

The port and the alternative function for data consistency check of CSIGnSO (CSIGTSO) output are shown in the following table. See **Section 16.5.10, Error Detection** for details on data consistency checking.

**Table 16.8 Port Pins for Data Consistency Checking**

| Unit Signal Name | Port Pin Name | Alternative Function |
|---|---|---|
| **CSIG0** | | |
| CSIGTSO | P0_13 | ALT_OUT4 |
| | P10_6 | ALT_OUT2 |
| **CSIG1** | | |
| CSIGTSO | P11_9 | ALT_OUT1 |

## 16.2 Overview

### 16.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode or slave mode is selectable.
- Slave select input signal ($\overline{\text{CSIGTSSI}}$) is available.
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, whereas it is determined by the input clock in slave mode.
- Maximum transfer clock frequency:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)
- Clock phases and data phases are selectable.
- Data transfer with MSB first or LSB first is selectable.
- Transfer data length is selectable from 7 to 16 bits in 1-bit units
- Built-in EDL (extended data length) function for transferring more than 16 bits of data.
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Built-in handshake function
- Built-in error detection (data consistency check, parity, overrun)
- Three different interrupt request signals (INTCSIGTIC, INTCSIGTIR, INTCSIGTIRE)
- Built-in LBM (Loop Back Mode) function for self-test

### 16.2.2 Functional Overview Description

The CSIG uses three signals for communication:

- Transmission clock CSIGTSCK (output in master mode, input in slave mode)
- Serial data output signal CSIGTSO
- Serial data input signal CSIGTSI

The CSIGnCTL2 register is used to select whether the CSIG should be operated in master mode or slave mode.

Additional signals can be used for external control and monitoring:

- CSIGTSSI: Slave select input signal
- CSIGTRYO: Ready/busy output signal (handshake signal)
- CSIGTRYI: Ready/busy input signal (handshake signal)

Data transmission is bit-wise and serial and synchronous to the transmission clock.

The following table shows the most important registers for setting up CSIG.

**Table 16.9 Main Registers of CSIG**

| Register | Function |
|---|---|
| CSIGnCTL0 | Provides and stops operating clock and enables/disables data transmission and data reception. |
| CSIGnCTL1 | Controls options such as interrupt timing, extended data length, data consistency check, loop-back mode, handshake, etc. |
| CSIGnCTL2 | Selects master or slave mode, and the transfer clock frequency of the built-in baud rate generator (BRG) in master mode. |
| CSIGnCFG0 | Configures the communication protocol. |

## 16.2.3 Block Diagram

The following block diagram shows the main components of the CSIG.

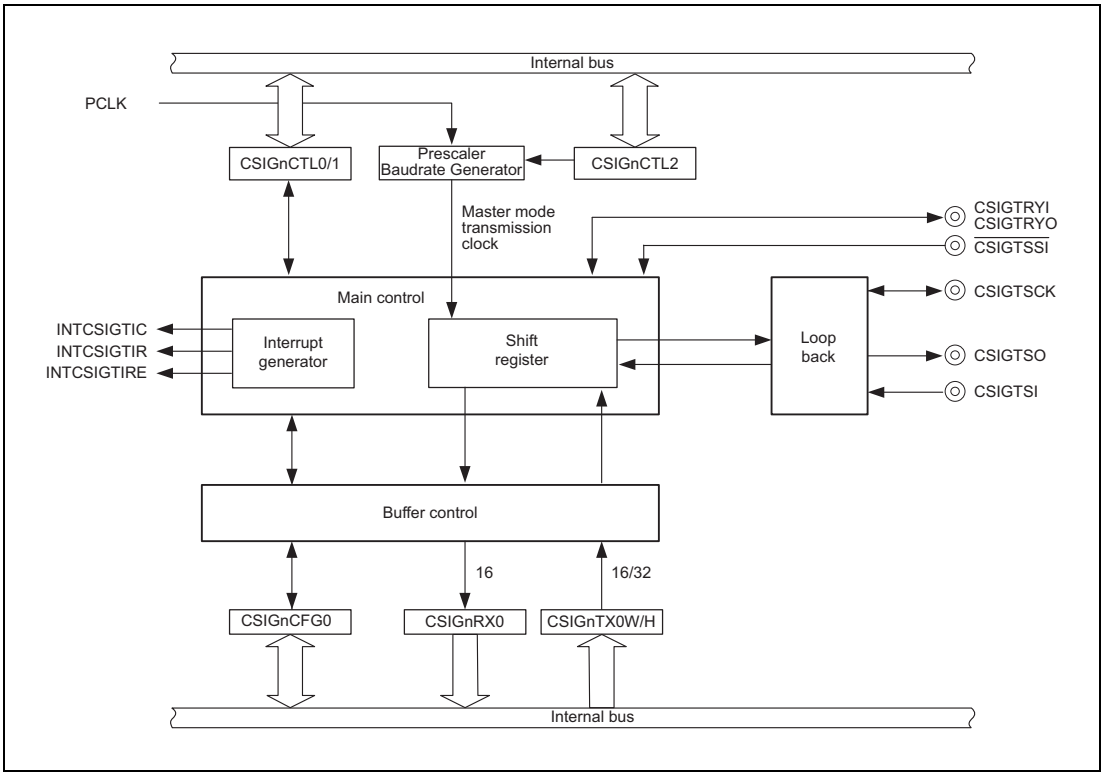

**Figure 16.1 CSIG Block Diagram**

In master mode, the transmission clock CSIGTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

# 16.3 Registers

## 16.3.1 List of Registers

CSIG registers are listed in the following table.

For details on <CSIGn_base>, see **Section 16.1.2, Register Base Address**.

**Table 16.10 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| CSIGn | CSIGn control register 0 | CSIGnCTL0 | <CSIGn_base> + $0000_H$ |
| | CSIGn control register 1 | CSIGnCTL1 | <CSIGn_base> + $0010_H$ |
| | CSIGn control register 2 | CSIGnCTL2 | <CSIGn_base> + $0014_H$ |
| | CSIGn status register 0 | CSIGnSTR0 | <CSIGn_base> + $0004_H$ |
| | CSIGn status clear register 0 | CSIGnSTCR0 | <CSIGn_base> + $0008_H$ |
| | CSIGn Receive-only mode control register 0 | CSIGnBCTL0 | <CSIGn_base> + $1000_H$ |
| | CSIGn configuration register 0 | CSIGnCFG0 | <CSIGn_base> + $1010_H$ |
| | CSIGn transmission register 0 for word access | CSIGnTX0W | <CSIGn_base> + $1004_H$ |
| | CSIGn transmission register 0 for half word access | CSIGnTX0H | <CSIGn_base> + $1008_H$ |
| | CSIGn reception register 0 | CSIGnRX0 | <CSIGn_base> + $100C_H$ |
| | CSIGn emulation register | CSIGnEMU | <CSIGn_base> + $0018_H$ |

## 16.3.2 CSIGnCTL0 — CSIGn Control Register 0

This register controls the operation clock, and enables or disables transmission/reception.

**Access:** This register can be read or written in 8-bit units.

**Address:** <CSIGn_base> + $0000_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CSIGnPWR | CSIGnTXE | CSIGnRXE | — | — | — | — | CSIGnMBS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R | R | R | R | R/W |

**Table 16.11 CSIGnCTL0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | CSIGnPWR | Controls operation clock.<br>0: Stops operation clock.<br>1: Supplies operation clock.<br>Clearing CSIGnPWR to 0 resets the internal circuits, stops operation, and sets the CSIG to standby state. Clock supply to internal circuits stops.<br>If CSIGnPWR is cleared during communication, ongoing communication is aborted. In this case, communication setting must be started from the beginning. |
| 6 | CSIGnTXE | Enables/disables transmission.<br>0: Transmission disabled<br>1: Transmission enabled |
| 5 | CSIGnRXE | Enables/disables reception.<br>0: Reception disabled<br>1: Reception enabled |
| 4 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CSIGnMBS | This bit must be set to 1 (the value after reset is 0). |

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

### 16.3.3 CSIGnCTL1 — CSIGn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake function, and slave select function.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIGn_base> + $0010_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CSIGn CKR | CSIGn SLIT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CSIGn EDLE | — | CSIGn DCS | — | CSIGn LBM | CSIGn SIT | CSIGn HSE | CSIGn SSE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R/W | R/W | R/W |

**Table 16.12 CSIGnCTL1 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | CSIGnCKR | CSIGTSCK clock inversion function<br>0: Default level of CSIGTSCK is high.<br>1: Default level of CSIGTSCK is low.<br>The CSIGnCKR bit is used in combination with the CSIGnCFG0.CSIGnDAP bit.<br>For details, see **Section 16.3.8, CSIGnCFG0 — CSIGn Configuration Register 0**. |
| 16 | CSIGnSLIT | Selects the timing of interrupt INTCSIGTIC.<br>0: Normal interrupt timing (interrupt is generated after the transfer)<br>1: Interrupt generation when CSIGnTX0W/H is empty and available for storing the next data.<br>For details, see **16.4.2, INTCSIGTIC (Communication Status Interrupt)** |
| 15 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | CSIGnEDLE | Enables/disables extended data length (EDL) mode.<br>0: Extended data length mode disabled<br>1: Extended data length mode enabled<br>For details, see **16.5.5.2, Data Length Selection with Extended Data Length**. |
| 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | CSIGnDCS | Enables/disables data consistency check.<br>0: Data consistency check disabled<br>1: Data consistency check enabled<br>For details, see **16.5.10.1, Data Consistency Check**. |
| 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | CSIGnLBM | Controls loop-back mode (LBM).<br>0: Loop-back mode deactivated<br>1: Loop-back mode activated<br>Loop-back mode can be set only in master mode. Set this bit to 0 in slave mode.<br>For details, see **Section 16.5.9, Loop-Back Mode**. |

**Table 16.12 CSIGnCTL1 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 2 | CSIGnSIT | Selects interrupt delay mode.<br>0: No delay<br>1: Half clock delay for all interrupts<br>This bit is only valid in master mode. In slave mode, no delay is generated.<br>For details, see **Section 16.4.1, Interrupt Delay**. |
| 1 | CSIGnHSE | Enables/disables handshake function.<br>0: Handshake function disabled<br>1: Handshake function enabled<br>For details, see **Section 16.5.8, Handshake Function**. |
| 0 | CSIGnSSE | Enables/disables slave select function.<br>0: Input signal $\overline{\text{CSIGTSSI}}$ disabled.<br>1: Input signal $\overline{\text{CSIGTSSI}}$ enabled.<br>If the slave select function is not used, this bit must be set to 0 (see also **Section 16.5.2, Master/Slave Connections**). |

Details about CSIGnCTL1.CSIGnSSE:

**Table 16.13 Operation of the Slave Select Function during Reception**

| CSIGnCTL0. CSIGnRXE | CSIGnCTL1. CSIGnSSE | $\overline{\text{CSIGTSSI}}$ | Receive Operation |
|---|---|---|---|
| 0 | — | — | Reception disabled |
| 1 | 0 | — | Possible |
| 1 | 1 | 0 | Possible |
| 1 | 1 | 1 | Disabled |

**Table 16.14 Operation of the Slave Select Function during Transmission**

| CSIGnCTL0. CSIGnTXE | CSIGnCTL1. CSIGnSSE | $\overline{\text{CSIGTSSI}}$ | Transmit Operation |
|---|---|---|---|
| 0 | — | — | Transmission disabled |
| 1 | 0 | — | Possible |
| 1 | 1 | 0 | Possible |
| 1 | 1 | 1 | Disabled |

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

## 16.3.4 CSIGnCTL2 — CSIGn Control Register 2

This register selects the communication clock.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIGn_base> + $0014_H$

**Value after reset:** $E000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CSIGnPRS[2:0] | | | — | CSIGnBRS[11:0] | | | | | | | | | | | |

**Table 16.15 CSIGnCTL2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 13 | CSIGnPRS [2:0] | Selects the value of the prescaler. |
| 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | CSIGnBRS [11:0] | Selects the transfer clock frequency.<br>Settings of the CSIGnBRS[11:0] bits are valid only in master mode. They are ignored in slave mode. |

| CSIGn PRS2 | CSIGn PRS1 | CSIGn PRS0 | Prescaler Output (PRSOUT) |
|---|---|---|---|
| 0 | 0 | 0 | PCLK (master mode) |
| 0 | 0 | 1 | PCLK / 2 (master mode) |
| 0 | 1 | 0 | PCLK / 4 (master mode) |
| 0 | 1 | 1 | PCLK / 8 (master mode) |
| 1 | 0 | 0 | PCLK / 16 (master mode) |
| 1 | 0 | 1 | PCLK / 32 (master mode) |
| 1 | 1 | 0 | PCLK / 64 (master mode) |
| 1 | 1 | 1 | External clock via CSIGTSCK (slave mode) |

| CSIGnBRS [11:0] | Transfer Clock Frequency of CSIGTSCK |
|---|---|
| 0 | BRG is stopped |
| 1 | PCLK / ($2^{\alpha}$ × 1 × 2) |
| 2 | PCLK / ($2^{\alpha}$ × 2 × 2) |
| 3 | PCLK / ($2^{\alpha}$ × 3 × 2) |
| 4 | PCLK / ($2^{\alpha}$ × 4 × 2) |
| ... | ... |
| 4095 | PCLK / ($2^{\alpha}$ × 4095 × 2) |

**Note:** α = 0 to 6 (value set by CSIGnPRS[2:0])

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

## 16.3.5 CSIGnSTR0 — CSIGn Status Register 0

This register indicates the status of the CSIG.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <CSIGn_base> + $0004_H$

**Value after reset:** $0000\ 0010_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 16.16 CSIGnSTR0 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned. |
| 7 | CSIGnTSF | Transfer Status Flag<br>0: Idle state<br>1: Communication is in progress or being prepared<br>The timing to set or clear this bit is as follows:<br><br>**Master Mode / Timing to Set / Timing to Clear**<br>Tx-only mode: Writing to transmission register: Within a half clock cycle from the last serial clock edge<br>Tx/Rx mode: Writing to transmission register: Within a half clock cycle from the last serial clock edge<br>Rx-only mode: Reading from reception register: Within a half clock cycle from the last serial clock edge<br><br>**Slave Mode / Timing to Set / Timing to Clear**<br>Tx-only mode: Writing to transmission register: Within a half clock cycle from the last serial clock edge<br>Tx/Rx mode: Writing to transmission register: Within a half clock cycle from the last serial clock edge<br>Rx-only mode: CSIGTSCK input: Within a half clock cycle from the last serial clock edge |
| 6 to 4 | Reserved | When read, the value after reset is returned. |
| 3 | CSIGnDCE | Data Consistency Check Error Flag<br>0: No data consistency check error detected<br>1: Data consistency check error detected<br>This bit is cleared by writing 1 to CSIGnSTCR0.CSIGnDCEC.<br>When setting to 1 due to data consistency check error detection and clearing to 0 by CSIGnSTCR0.CSIGnDCEC occur simultaneously, setting to 1 due to data consistency check error detection takes precedence.<br>This bit is initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1, or from 1 to 0. |
| 2 | Reserved | When read, the value after reset is returned. |

**Table 16.16 CSIGnSTR0 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 1 | CSIGnPE | Parity Error Flag<br>0: No parity error detected<br>1: Parity error detected<br>This bit is cleared by writing 1 to CSIGnSTCR0.CSIGnPEC.<br>When setting to 1 due to parity error detection and clearing to 0 by writing to CSIGnSTCR0.CSIGnPEC occur simultaneously, setting to 1 due to parity error detection takes precedence.<br>This bit is initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1, or from 1 to 0. |
| 0 | CSIGnOVE | Overrun Error Flag<br>0: No overrun error detected<br>1: Overrun error detected<br>This bit is cleared by writing 1 to CSIGnSTCR0.CSIGnOVEC.<br>When setting to 1 due to overrun error detection and clearing to 0 by writing to CSIGnSTCR0.CSIGnOVEC occur simultaneously, setting to 1 due to overrun error detection takes precedence.<br>This bit is initialized by the value of CSIGnCTL0.CSIGnPWR changes from 0 to 1, or from 1 to 0. |

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

### 16.3.6 CSIGnSTCR0 — CSIGn Status Clear Register 0

This register clears the status flags of the CSIGnSTR0 status register.

**Access:** This register can be read or written in 16-bit units.
When read, the value $0000_H$ is always returned.

**Address:** <CSIGn_base> + $0008_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 16.17 CSIGnSTCR0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | CSIGnDCEC | Controls the data consistency check error flag clear command.<br>0: No operation. Read value is always 0.<br>1: Clears the data consistency check error flag (CSIGnSTR0.CSIGnDCE). |
| 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CSIGnPEC | Controls the parity error flag clear command.<br>0: No operation. Read value is always 0.<br>1: Clears the parity error flag (CSIGnSTR0.CSIGnPE). |
| 0 | CSIGnOVEC | Controls the overrun error flag clear command.<br>0: No operation. Read value is always 0.<br>1: Clears the overrun error flag (CSIGnSTR0.CSIGnOVE). |

## 16.3.7 CSIGnBCTL0 — CSIGn Rx-Only Mode Control Register 0

This register enables/disables the data transfer in Rx-only mode.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** <CSIGn_base> + $1000_H$

**Value after reset:** $01_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | CSIGnSCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 16.18 CSIGnBCTL0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CSIGnSCE | Disables/enables the start of the next data reception by reading CSIGnRX0.<br>0: Next reception disabled<br>1: Next reception enabled<br>For details, see **Section 16.5.4.2, Receive-Only Mode**. |

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

## 16.3.8 CSIGnCFG0 — CSIGn Configuration Register 0

This register configures the communication protocols such as data length, parity, transfer direction, clock phase, and data phase.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIGn_base> + $1010_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | CSIGnPS[1:0] | | CSIGnDLS[3:0] | | | | — | — | — | — | — | CSIGn DIR | — | CSIGn DAP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R/W | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 16.19 CSIGnCFG0 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 29, 28 | CSIGnPS[1:0] | Specifies parity. |

| CSIGn PS1 | CSIGn PS0 | Transmission | Reception |
|---|---|---|---|
| 0 | 0 | Does not transmit any parity bit. | Does not wait for reception of the parity bit. |
| 0 | 1 | Adds a parity bit fixed to 0. | Waits for reception of the parity bit but does not evaluate it. |
| 1 | 0 | Adds the odd parity bit. | Waits for the odd parity bit. |
| 1 | 1 | Adds the even parity bit. | Waits for the even parity bit. |

| | | |
|---|---|---|
| 27 to 24 | CSIGnDLS [3:0] | Specifies data length.<br>0: Data length is 16 bits<br>1: Data length is 1 bit<br>2: Data length is 2 bits<br>...<br>15: Data length is 15 bits<br>**CAUTION**<br>Do not set bits CSIGnCFG0.CSIGnDLS[3:0] to values 1 to 6 when the extended data length function is disabled with bit CSIGnCTL1.CSIGnEDLE set to 0.<br>Transmitting two consecutive data with a data length of less than 7 bits is prohibited. |
| 23 to 19 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 18 | CSIGnDIR | Selects the serial data direction.<br>0: Data is transmitted/received with MSB first<br>1: Data is transmitted/received with LSB first |
| 17 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**Table 16.19 CSIGnCFG0 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 16 | CSIGnDAP | Data Phase Selection<br>Used in conjunction with CSIGnCTL1.CSIGnCKR bit to select the data phase.<br>Refer to the following table for the selectable clock phases and data phases. |
| 15 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

| CSIGnCTL1.CSIGnCKR | CSIGnDAP | Clock and Data Phase Selection |
|---|---|---|
| 0 | 0 |  |
| 0 | 1 |  |
| 1 | 0 |  |
| 1 | 1 |  |

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

## 16.3.9 CSIGnTX0W — CSIGn Transmission Register 0 for Word Access

This register stores the transmission data and specifies the extended data length.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIGn_base> + $1004_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | CSIGnEDL | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 16.20 CSIGnTX0W Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 29 | CSIGnEDL | Specifies the extended data length.<br>0: Normal operation<br>1: Extended data length enabled<br>The associated data is transmitted as 16-bit data.<br>This bit can only be set if CSIGnCTL1.CSIGnEDLE = 1. |
| 28 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | CSIGnTX[15:0] | Data to be transmitted |

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

## 16.3.10 CSIGnTX0H — CSIGn Transmission Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of CSIGnTX0W register.
The settings specified by the upper 16 bits of CSIGnTX0W are applied to the transmission.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIGn_base> + $1008_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CSIGnTX[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 16.21 CSIGnTX0H Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | CSIGnTX[15:0] | Data to be transmitted |

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

## 16.3.11 CSIGnRX0 — CSIGn Reception Register 0

This register stores the received data.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <CSIGn_base> + $100C_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CSIGnRX[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 16.22 CSIGnRX0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | CSIGnRX [15:0] | Received Data<br>These bits are initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1 or from 1 to 0.<br>When reading, the values of these bits must be read at least 1 clock before the generation of CSIGTIR interrupt. |

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

## 16.3.12 CSIGnEMU — CSIGn Emulation Register

This register controls operation by SVSTOP.

**Access:** This register can be read or written in 8-bit or 1-bit units.
Write to this register when EPC.SVSTOP = 0.

**Address:** <CSIGn_base> + $0018_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CSIGnSVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 16.23 CSIGnEMU Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | CSIGnSVSDIS | Selects whether to continue or stop transmit/receive operation during debugging.<br>• When the EPC.SVSTOP bit is set to 0:<br>Continues transmit/receive operation regardless of the setting of this bit.<br>• When the EPC.SVSTOP bit is set to 1:<br>0: Stops transmit/receive operation.<br>1: Continues transmit/receive operation. |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**CAUTION**

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

### 16.3.13 List of Cautions

Table 16.24 List of Cautions when Configuring the Registers

| Register Name | Bit Name | Cautions |
|---|---|---|
| CSIGnCTL0 | CSIGnPWR | If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, it is necessary to restart the communication. |
| CSIGnCTL0 | CSIGnTXE<br>CSIGnRXE | Do not modify any of these bits while CSIGnCTL0.CSIGnPWR = 0. (These bits can be modified simultaneously with the CSIGnCTL0.CSIGnPWR bit.)<br>Do not modify these bits while CSIGnSTR0.CSIGnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted. |
| CSIGnCTL0 | CSIGnMBS | When writing, be sure to set to this bit to 1. (The value after reset is “0”.)<br>This bit must be modified simultaneously with CSIGnCTL0.CSIGnPWR bit. |
| CSIGnCTL1 | CSIGnCKR | Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. |
| CSIGnCTL1 | CSIGnSLIT<br>CSIGnEDLE<br>CSIGnDCS<br>CSIGnHSE | Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0. |
| CSIGnCTL1 | CSIGnLBM | Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0.<br>Setting of this bit is prohibited in slave mode. |
| CSIGnCTL1 | CSIGnSSE | Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0.<br>Setting this bit to 1 is prohibited in master mode. |
| CSIGnCTL1 | CSIGnSIT | Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0.<br>This bit is only valid in master mode. In slave mode, no delay is generated. |
| CSIGnCTL2 | CSIGnPRS[2:0]<br>CSIGnBRS[11:0] | Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0.<br>Setting of the maximum transfer clock frequency is as follows.<br>• Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)<br>• Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16) |
| CSIGnSTR0 | CSIGnTSF | Writing to this bit is prohibited, and only reading is permitted. |
| CSIGnSTR0 | CSIGnDCE<br>CSIGnPE<br>CSIGnOVE | Writing to these bits is prohibited, and only reading is permitted.<br>These bits are initialized when CSIGnCTL0.CSIGnPWR = 0 → 1 or CSIGnCTL0.CSIGnPWR = 1 → 0. |
| CSIGnBCTL0 | CSIGnSCE | Write to this bit before CSIGnRX0 is read.<br>Fix the CSIGnSCE bit to 0 when the transfer mode is transmit mode or transmit/receive mode. |
| CSIGnCFG0 | CSIGnPS[1:0]<br>CSIGnDLS[3:0]<br>CSIGnDIR<br>CSIGnDAP | Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0. |
| CSIGnTX0W | CSIGnEDL | This bit is valid only when CSIGnCTL1.CSIGnEDLE = 1. |
| CSIGnTX0W<br>CSIGnTX0H | | Write access to these bits are prohibited when CSIGnCTL0.CSIGnTXE = CSIGnCTL0.CSIGnRXE = 0. |
| CSIGnRX0 | | These bits are initialized when CSIGnCTL0.CSIGnPWR = 0 → 1 or CSIGnCTL0.CSIGnPWR = 1→ 0.<br>Read access to this bit is prohibited when CSIGnCTL0.CSIGnTXE = CSIGnCTL0.CSIGnRXE = 0. |
| CSIGnEMU | CSIGnSVSDIS | Modification of this bit is prohibited while SVSTOP = 1. |

## 16.4 Interrupt Sources

CSIG can generate the following interrupts:

- INTCSIGTIC (communication status interrupt)
- INTCSIGTIR (reception status interrupt)
- INTCSIGTIRE (communication error interrupt)

### 16.4.1 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half cycle of the transmission clock CSIGTSCK. This function is not available in slave mode.

The delay is specified by setting CSIGnCTL1.CSIGnSIT = 1. (The setting of the CSIGnSIT bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIGnCTL1.CSIGnSIT = 1 (interrupt delay enabled), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), and CSIGnCFG0.CSIGnDLS[3:0] = $1000_B$ (data length 8 bits).

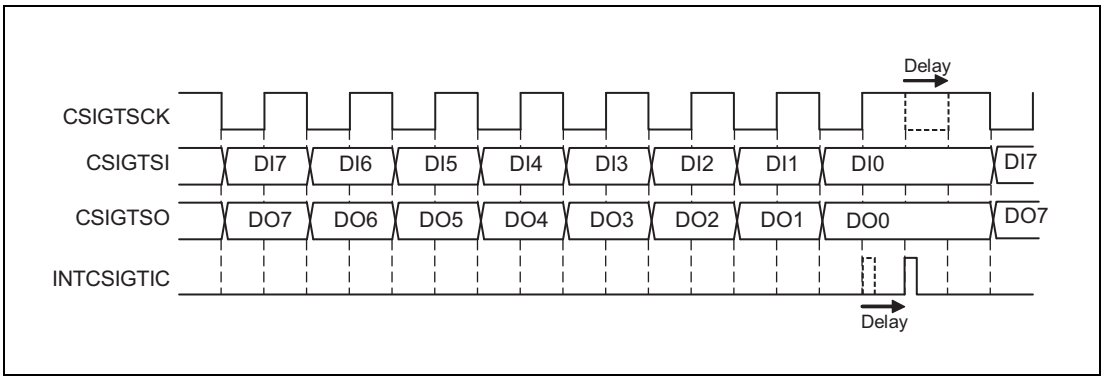

**Figure 16.2 Interrupt Delay Function (CSIGnCTL1.CSIGnSIT = 1)**

### 16.4.2 INTCSIGTIC (Communication Status Interrupt)

This interrupt is normally generated after every data transfer. It can be used to trigger a DMA for writing new transmission data to register CSIGnTX0W or CSIGnTX0H.

The following example assumes master mode and a setting of CSIGnCTL1.CSIGnSIT = 0 (no interrupt delay), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), CSIGnCFG0.CSIGnDLS[3:0] = $1000_B$ (data length 8 bits), and CSIGnCTL1.CSIGnSLIT = 0 (normal interrupt timing).

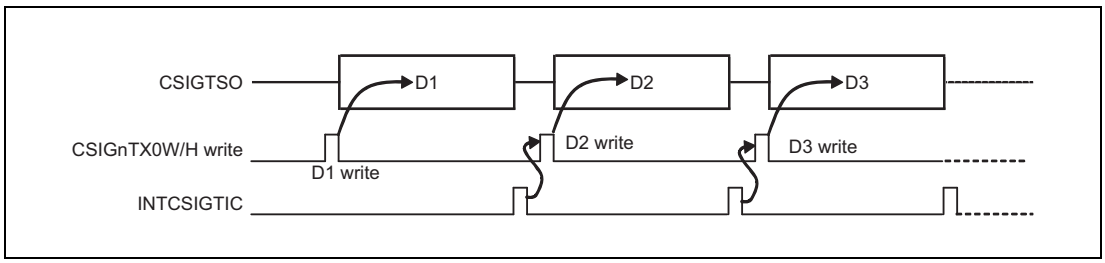

**Figure 16.3 Generation of INTCSIGTIC after Communication (CSIGnCTL1.CSIGnSLIT = 0)**

However, INTCSIGTIC can also be set up to occur when the CSIGnTX0W/H register is empty and available for receiving the next data. This is specified by setting CSIGnCTL1.CSIGnSLIT = 1.

This mode allows more efficient data transfers.

The effect is illustrated in the figure below.

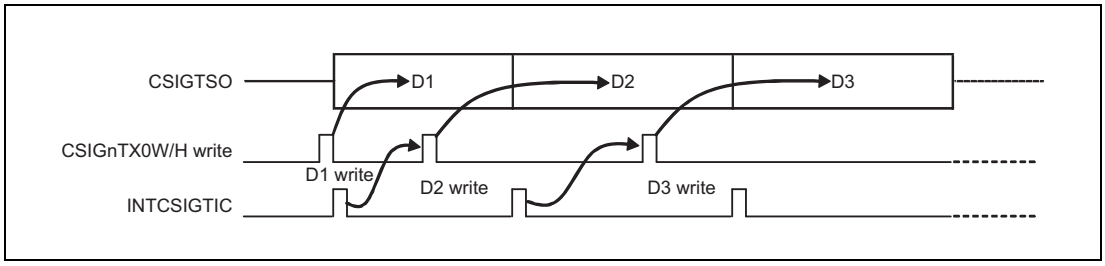

**Figure 16.4 Generation of INTCSIGTIC at the Beginning of Communication**

### 16.4.3 INTCSIGTIR (Reception Status Interrupt)

This interrupt is generated in receive-only and transmit/receive mode after data has been received and is available in the reception register. It can be used to trigger a DMA for reading the received data from CSIGnRX0 register.

The following example assumes master mode and a setting of CSIGnCTL1.CSIGnSIT = 0 (no interrupt delay), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), and CSIGnCFG0.CSIGnDLS[3:0] = $1000_B$ (data length 8 bits).

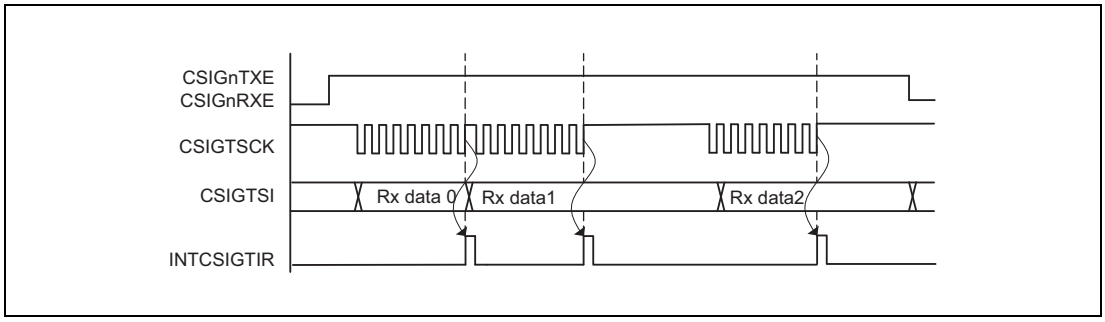

**Figure 16.5 Generation of INTCSIGTIR**

### 16.4.4 INTCSIGTIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

**Table 16.25 Data Error Types**

| Error Type | Communication Status After Error Interrupt | Note |
|---|---|---|
| Parity error | Interrupt is generated and communication continues. | — |
| Data consistency check error | Interrupt is generated and communication continues. | — |
| Overrun error*1 | When CSIGnCTL1.CSIGnHSE = 0 (handshake function disabled) in slave mode, interrupt is generated and communication continues. | When CSIGnCTL1.CSIGnHSE = 1 (handshake function enabled) in slave mode, communication stops due to the handshake. An interrupt is not generated and an overrun error does not occur. |

Note 1. In master mode, overrun errors do not occur.
In slave mode, communication cannot be stopped.

The type of error that caused the generation of INTCSIGTIRE is indicated in register CSIGnSTR0.

For details about the various error types, see **Section 16.5.10, Error Detection**.

# 16.5 Operation

## 16.5.1 Master/Slave Mode

Whether CSIG operates in master mode or in slave mode depends on the setting of bits CSIGnCTL2.CSIGnPRS[2:0]. If master mode is selected, the source of the transmission clock must be selected as well.

### 16.5.1.1 Master Mode

In master mode, the serial transmission clock is generated by the built-in baud rate generator (BRG) and supplied to the slave via signal CSIGTSCK.

Master mode is enabled by setting bits CSIGnCTL2.CSIGnPRS[2:0] to values other than $111_B$. In master mode, the frequency of BRG can be configured by setting bits CSIGnCTL2. CSIGnPRS[2:0] and bits CSIGnCTL2.CSIGnBRS[11:0].

The default level of CSIGTSCK depends on the CSIGTSCK clock inversion function bit; it is high when CSIGnCTL1.CSIGnCKR = 0, and is low when CSIGnCTL1.CSIGnCKR = 1.

The example below shows the communication in master mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

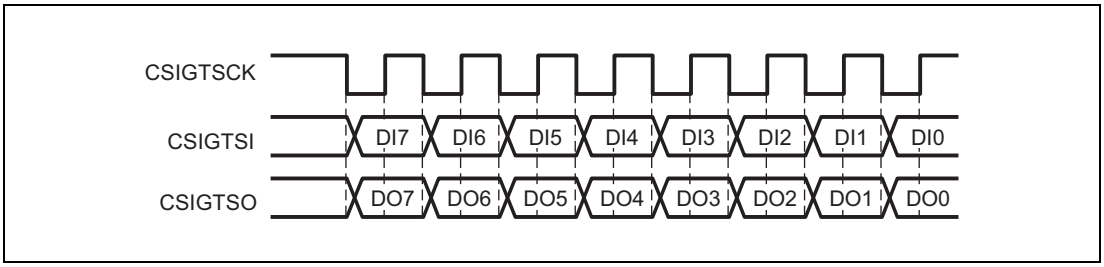

**Figure 16.6 Transmission/Reception in Master Mode**

### 16.5.1.2 Slave Mode

In slave mode, another device is the communication master. The external clock is supplied via the signal CSIGTSCK. Transmit/receive operation starts as soon as a clock signal is detected.

Slave mode is selected by setting CSIGnCTL2.CSIGnPRS[2:0] to $111_B$.

**NOTE**

When using slave mode, disable the baud rate generator (BRG) by setting bits CSIGnCTL2.CSIGnBRS[11:0] to $000_H$.

The example below shows the communication in slave mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

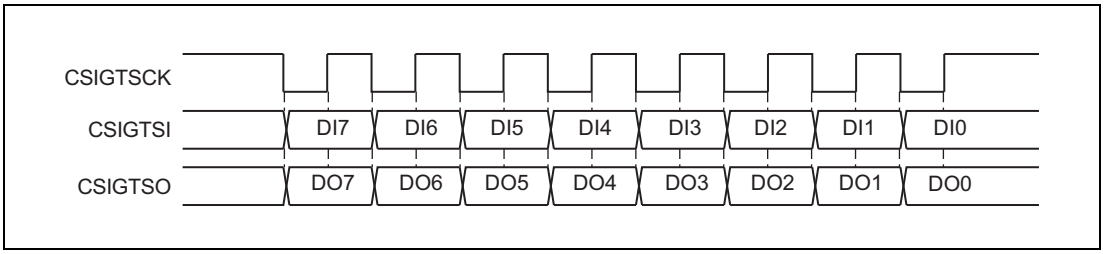

**Figure 16.7 Transmission/Reception in Slave Mode**

## 16.5.2 Master/Slave Connections

### 16.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

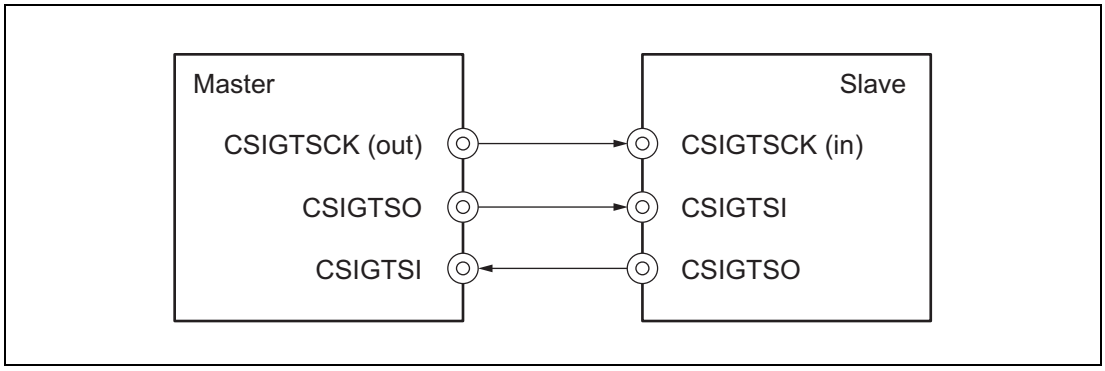

**Figure 16.8 Direct Master/Slave Connection**

### 16.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this case, the master must provide one slave select (SS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text{CSIGTSSI}}$ of the slave.

The $\overline{\text{CSIGTSSI}}$ signal can be enabled or disabled by the CSIGnCTL1.CSIGnSSE bit.

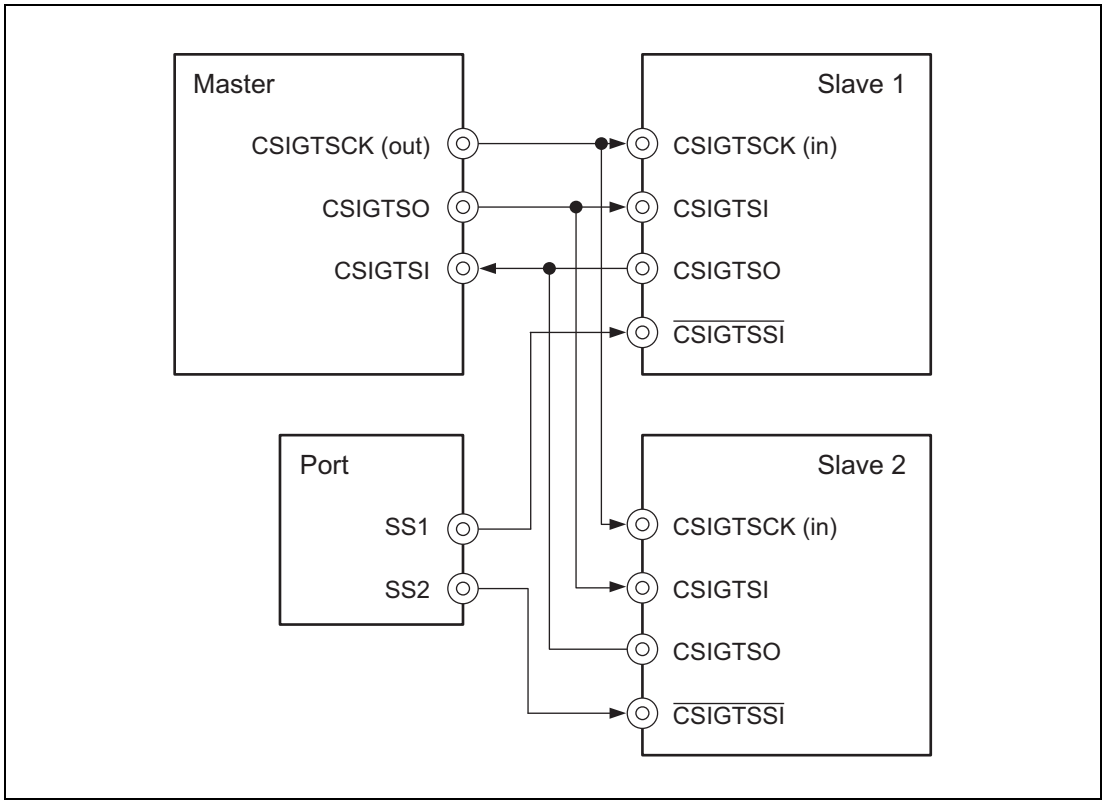

**Figure 16.9 Master to Multiple Slaves Connection**

A slave is selected (enabled) when its $\overline{\text{CSIGTSSI}}$ signal is low.

If it is not selected, the slave will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set (CSIGnCTL0.CSIGnTXE = 1), the CSIGTSO output buffer of the slave which is not selected is disabled and set to input mode in order to avoid interference with the outputs of other selected slaves.

### 16.5.3 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the CSIGnPRS[2:0] and CSIGnBRS[11:0] bits in the CSIGnCTL2 register.

The following figure shows a block diagram of the BRG.

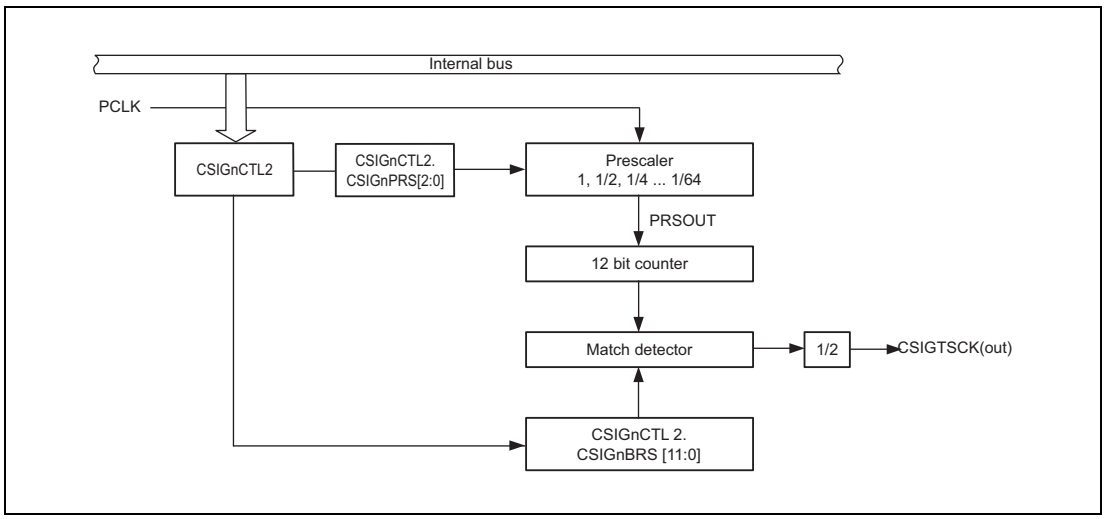

**Figure 16.10 BRG Block Diagram**

Setting CSIGnCTL2.CSIGnBRS[11:0] to $000_H$ disables the BRG.

#### Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated as:

Transfer clock frequency (CSIGTSCK) = PCLK / (division ratio of PCLK) = PCLK / ($2^{\alpha} \times k \times 2$)
where:

$\alpha$ = CSIGnCTL2.CSIGnPRS[2:0] = 0 to 6

k = CSIGnCTL2.CSIGnBRS[11:0] = 1 to 4095

#### Transfer clock frequency upper and lower limits

When specifying the transfer clock frequency, please note the following:

- For the maximum transfer clock frequency of this product in master mode or slave mode, refer to the CSIG timing shown in the electrical characteristics. In addition, in either mode, specify a frequency within the defined range.
- The minimum transfer clock frequency in master mode and slave mode is PCLK/524160.
- The maximum transfer clock frequency is as follows:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)

## 16.5.4 Data Transfer Modes

### 16.5.4.1 Transmit-Only Mode

Setting CSIGnCTL0.CSIGnTXE = 1 and CSIGnCTL0.CSIGnRXE = 0 places CSIG in transmit-only mode. Transmission starts when data to be transmitted is written in the CSIGnTX0W or CSIGnTX0H register.

**CAUTION**

**When the mode transitions from one of the receive modes to transmit-only mode, the data in the CSIGnRX0 buffer becomes undefined after completion of the first transmission.**
**Therefore, the reception register CSIGnRX0 has to be read before switching to transmit-only mode.**

### 16.5.4.2 Receive-Only Mode

Setting CSIGnCTL0.CSIGnTXE = 0 and CSIGnCTL0.CSIGnRXE = 1 puts the CSIG in receive-only mode.

In master mode, reception starts when dummy data is read from the CSIGnRX0 register.
All subsequent receptions are triggered by reads from the CSIGnRX0 register, as long as CSIGnBCTL0.CSIGnSCE = 1.

Moreover, CSIGnBCTL0.CSIGnSCE has to be set to 0 before reading the last received data from CSIGnRX0.

The recommended procedure is:

1. Set CSIGnBCTL0.CSIGnSCE = 1.
2. Read CSIGnRX0 (dummy data).
3. Wait for the reception interrupt INTCSIGTIR.
4. Read CSIGnRX0 (received data).
   In case more data receptions follow at step 3, continue to read until all data is received.
   Before reading the last received data from CSIGnRX0, set CSIGnBCTL0.CSIGnSCE = 0.

In slave mode, reception starts when the communication clock CSIGTSCK is received from the master. In this case, it is not necessary to read data from the CSIGnRX0 register of the slave.

**NOTE**

In slave mode, any previously received data must be read from the reception register CSIGnRX0 in order to avoid any overwrite situation.

### 16.5.4.3 Transmit/Receive Mode

Setting CSIGnCTL0.CSIGnTXE = 1 and CSIGnCTL0.CSIGnRXE = 1 puts the CSIG in transmit/receive mode.

Data transfer (transmission and reception) starts when the data to be transmitted is written to the CSIGnTX0W or CSIGnTX0H register.

## 16.5.5 Data Length Selection

### 16.5.5.1 Data Length Selection without Extended Length

Transmission data length is selectable from 7 to 16 bits using the CSIGnDLS[3:0] bits in the CSIGnCFG0 register. The examples below show the communication with MSB first (CSIGnCFG0.CSIGnDIR = 0):

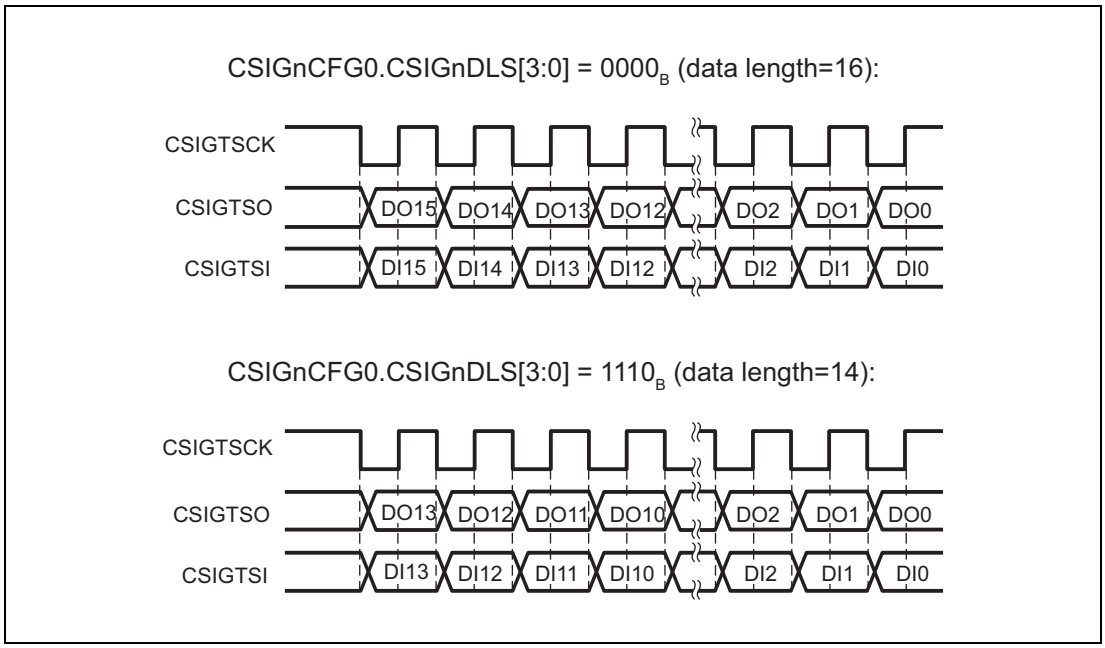

**Figure 16.11 Data Length Selection Function**

### 16.5.5.2 Data Length Selection with Extended Data Length

If the data to be transmitted/received exceeds 16 bits, the extended data length (EDL) function can be used.

The EDL function is enabled by setting the CSIGnCTL1.CSIGnEDLE bit to 1.

The following describes how the EDL function works and how to specify the EDL setting.

- The data has to be broken into 16-bit blocks plus remainder. For example, data of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as “data length” in CSIGnCFG0.CSIGnDLS[3:0] bits.
- Set the CSIGnTX0W.CSIGnEDL bit to 1 to transmit the 16-bit blocks. In this case, the data written to the CSIGnTX0W register is sent as 16-bit data regardless of the setting of the CSIGnCFG0.CSIGnDLS[3:0] bits.
- The transfer completes after the data with the specified data length (the remainder when CSIGnTX0W.CSIGnEDL = 0) has been sent.

**Example**

Example of sending 40 bits of data, $123456789A_H$:

40 bits are split into 2 × 16 bits plus 8 bits.

- Initialize CSIGnCFG0.CSIGnDLS[3:0] = $8_D$.
- To transmit the data $123456789A_H$ with MSB first, write the following sequence to CSIGnTX0W:
  - 2000 $1234_H$ (CSIGnTX0W.CSIGnEDL = 1)
  - 2000 $5678_H$ (CSIGnTX0W.CSIGnEDL = 1)
  - 0000 $009A_H$ (CSIGnTX0W.CSIGnEDL = 0)

The following figure illustrates the timing.

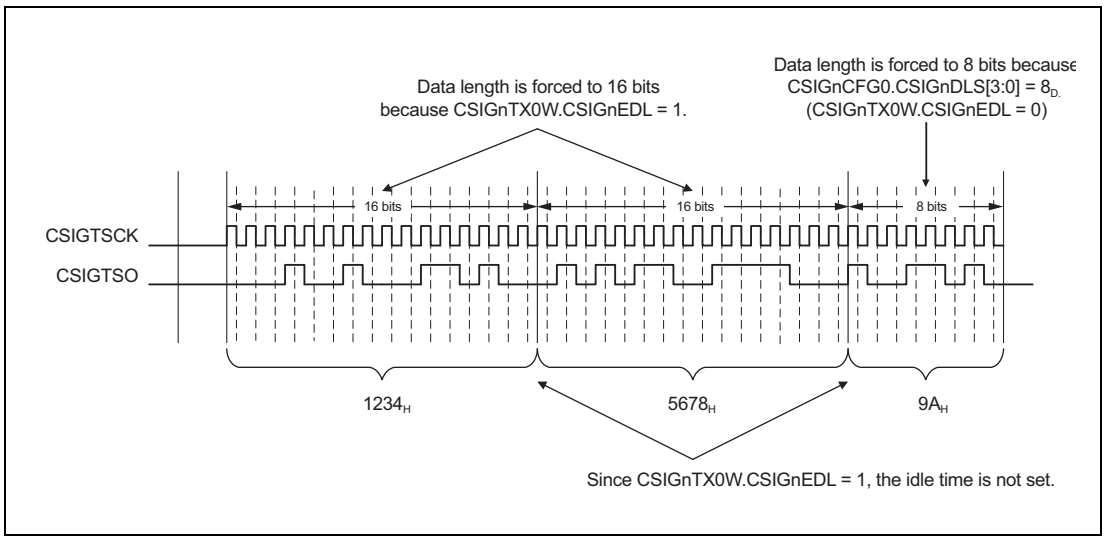

**Figure 16.12 EDL Timing Diagram**

**NOTES**

1. Data length with less than 7 bits can be set only when EDL mode is used.
2. It is not possible to transmit two consecutive data with a data length of less than 7 bits.
3. If parity is enabled, the parity bit is added after the last bit.
4. Example for setting the data direction:
   - Data to be transmitted: $123456_H$
   - MSB first:
     Set CSIGnCFG0.CSIGnDIR to 0.
     Write 2000 $1234_H$ to CSIGnTX0W (EDL bit = 1).
     Write 0000 $0056_H$ to CSIGnTX0W (EDL bit = 0).
   - LSB first:
     Set CSIGnCFG0.CSIGnDIR to 1.
     Write 2000 $3456_H$ to CSIGnTX0W (EDL bit = 1).
     Write 0000 $0012_H$ to CSIGnTX0W (EDL bit = 0).
5. EDL mode cannot be used in the slave mode configured for receive-only mode. (CSIGnCTL2.CSIGnPRS[2:0] = $111_B$, CSIGnCTL0.CSIGnTXE = 0, CSIGnCTL0.CSIGnRXE = 1)

### 16.5.6 Serial Data Direction Selection Function

The serial data direction is selectable using the CSIGnDIR bit in the CSIGnCFG0 register. The examples below show the communication for 8-bit data (CSIGnCFG0.CSIGnDLS[3:0] = $1000_B$):

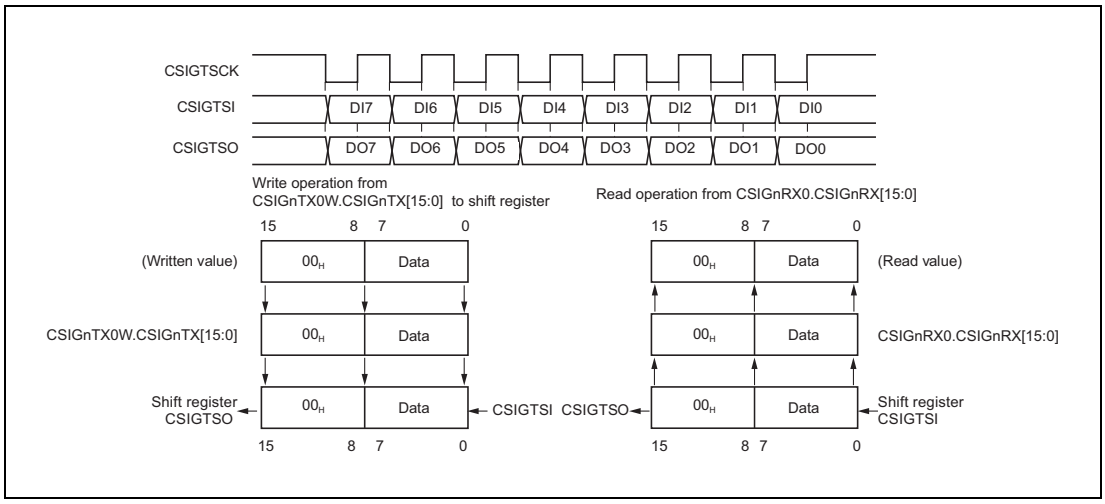

**Figure 16.13 Serial Data Direction Select Function — MSB First (CSIGnDIR = 0)**

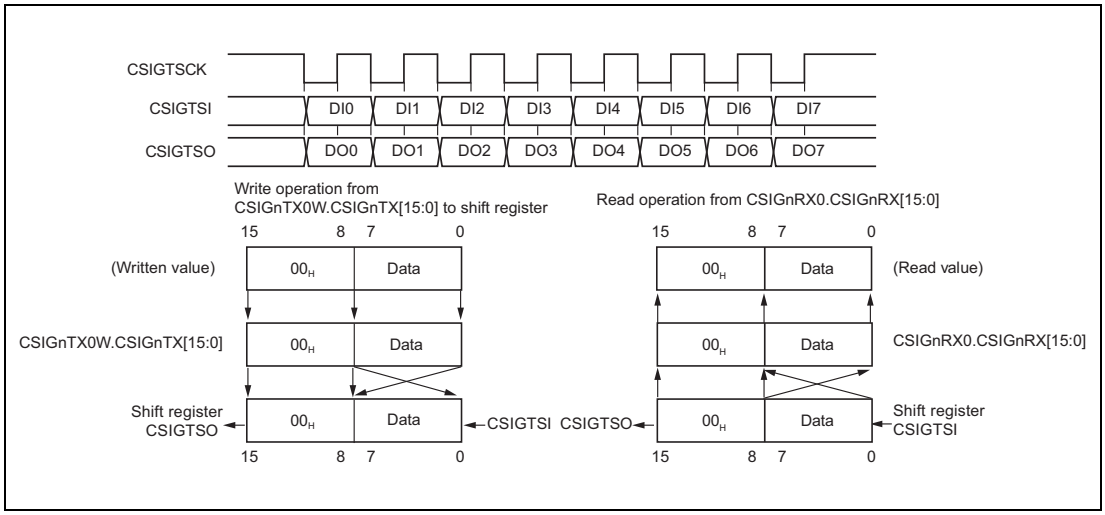

**Figure 16.14 Serial Data Direction Select Function — LSB First (CSIGnDIR = 1)**

### 16.5.7 Communication in Slave Mode

The following figure illustrates the communication signals and timing in slave mode.

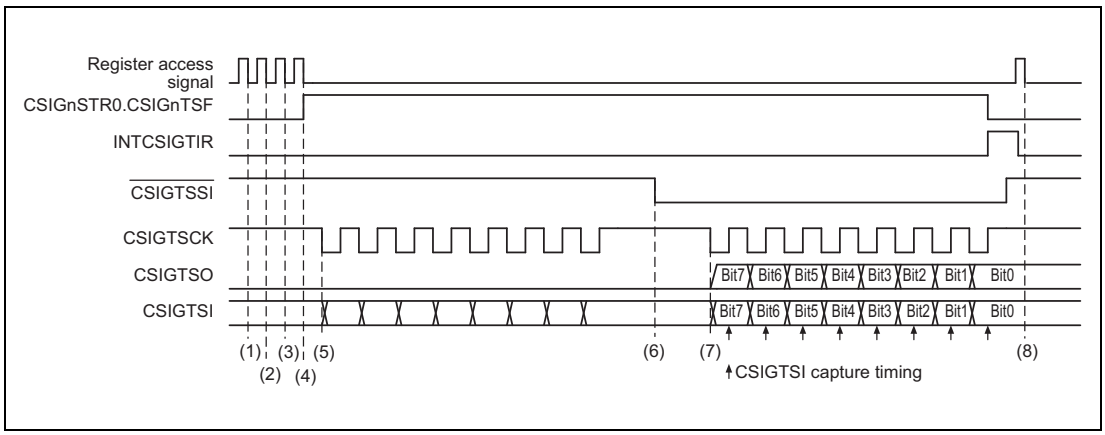

**Figure 16.15 Rx/Tx Communication Timing in Slave Mode**

1. Slave mode is selected (CSIGnCTL2.CSIGnPRS[2:0] = $111_B$), the $\overline{\text{CSIGTSSI}}$ signal is enabled (CSIGnCTL1.CSIGnSSE = 1) and the clock phase is set to the high level (CSIGnCTL1.CSIGnCKR = 1).
2. Data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = $1000_B$).
   Data direction is set to MSB first (CSIGnCFG0.CSIGnDIR = 0).
3. CSIG is set to transmit/receive mode (CSIGnCTL0.CSIGnPWR = 1, CSIGnCTL0.CSIGnTXE = 1, CSIGnCTL0.CSIGnRXE = 1).
4. When transfer data is written to the transmission register CSIGnTX0H, the transfer status flag CSIGnSTR0.CSIGnTSF is automatically set and the CSIG waits until signal $\overline{\text{CSIGTSSI}}$ goes low.
5. While signal $\overline{\text{CSIGTSSI}}$ is high, transmission/reception is not started even if the serial clock is input. CSIGTSO retains the values and input at CSIGTSI is ignored.
6. As soon as $\overline{\text{CSIGTSSI}}$ falls to low level, CSIGTSO is enabled.
7. If the serial clock is input to the CSIG while $\overline{\text{CSIGTSSI}}$ is low, transfer data is sent to CSIGTSO in synchronization with the serial clock, and simultaneously data is received from CSIGTSI.
8. The register CSIGnRX0 is read.

### 16.5.8 Handshake Function

CSIG features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIGnCTL1.CSIGnHSE bit. For handshake, the signals CSIGTRYI and CSIGTRYO are used.

The busy timing depends on the setting of the data phase selection bit CSIGnCFG0.CSIGnDAP.

#### 16.5.8.1 Slave Mode

If CSIGnCTL1.CSIGnHSE = 1, a low-level CSIGTRYO signal is output when the slave becomes busy. This happens when previously received data is still in the CSIGnRX0 register, and the new data cannot be copied from the shift register to CSIGnRX0 (CSIGnRX0 full condition).

The following examples assume a data length of 8 bits.

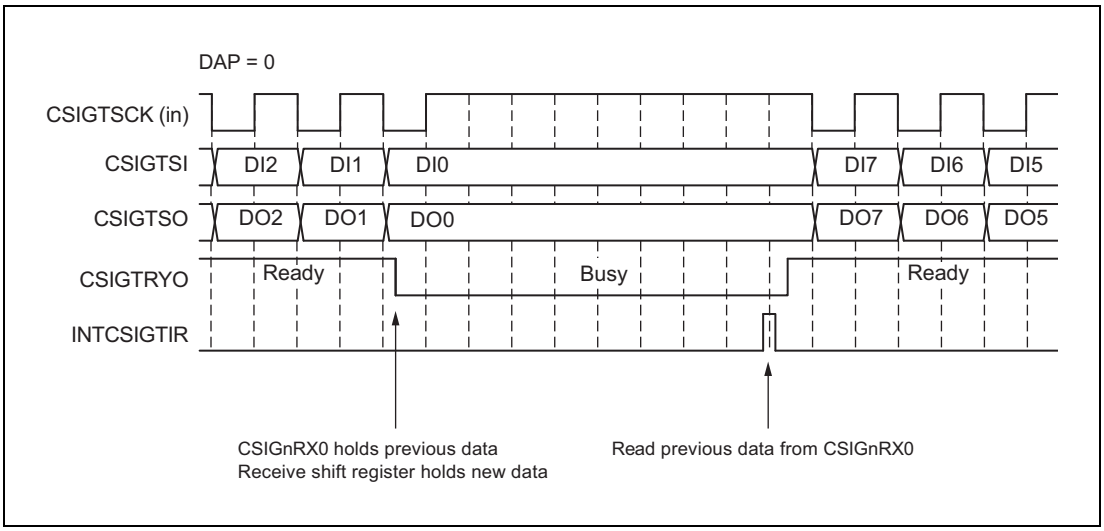

**Figure 16.16 Ready/Busy Signal from Slave (CSIGnCFG0.CSIGnDAP = 0)**

While the slave is busy, the master has to wait (i.e. suspend the transmission clock). The slave sets CSIGTRYO to high (“ready”) as soon as the read from the reception register CSIGnRX0 completes.

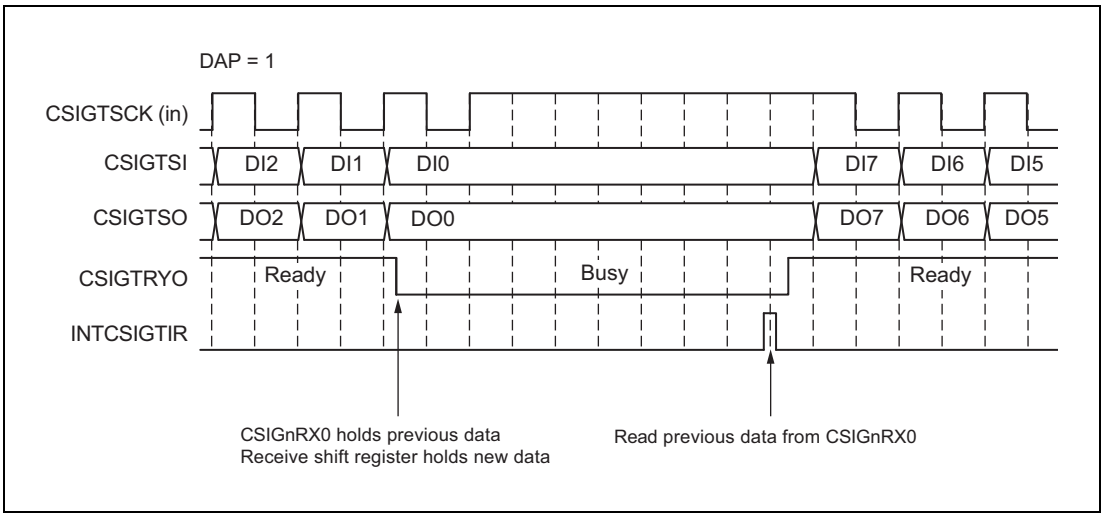

**Figure 16.17 Ready/Busy Signal from Slave (CSIGnCFG0.CSIGnDAP = 1)**

### 16.5.8.2 Master Mode

When the master detects low level of the CSIGTRYI while CSIGnCTL1.CSIGnHSE = 1, subsequent transfers are put on hold, the master goes into wait state and suspends the CSIGTSCK clock.

The CSIGTRYI level is checked at each half clock cycle of CSIGTSCK.

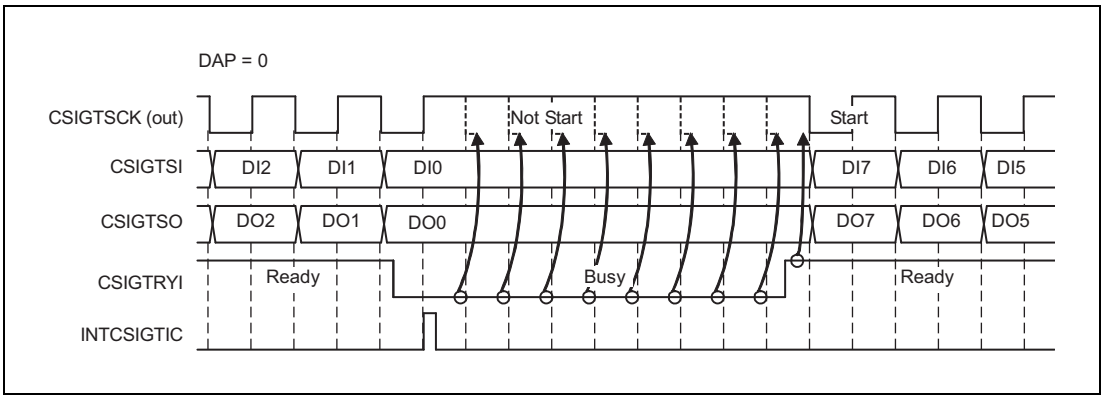

**Figure 16.18 Master's Reaction to CSIGTRYI (CSIGnCFG0.CSIGnDAP = 0)**

If the CSIGTRYI low signal from the slave is received while data transfer is in progress, the serial clock is suspended after the transfer is complete.

The master resumes the communication as soon as CSIGTRYI becomes high (slave is "ready").

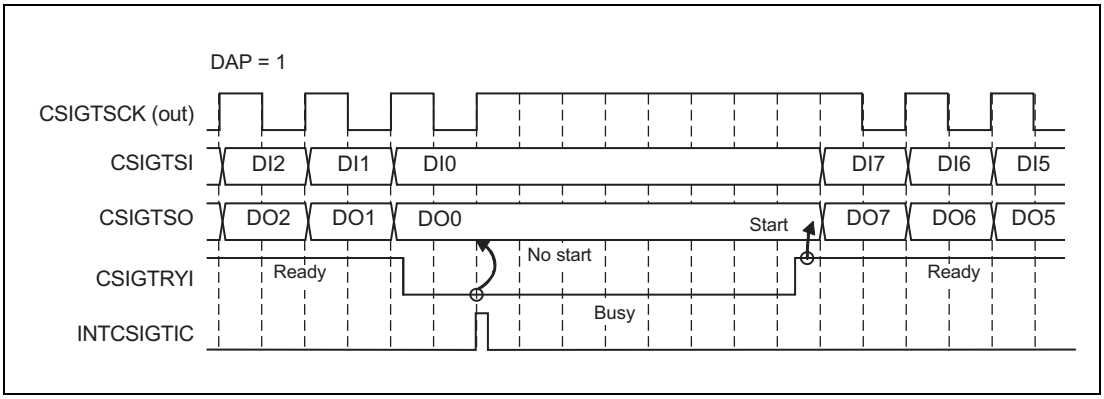

**Figure 16.19 Master's Reaction to CSIGTRYI (CSIGnCFG0.CSIGnDAP = 1)**

**CAUTION**

**If multiple slaves are connected, the master must only detect the CSIGTRYI signal of the slave it has selected for communication.**

**CSIGTRYI of the master must be pulled down by the slave before the next transfer starts. Even if the signal is pulled down by the slave during the transfer, the transfer will continue until it completes.**

### 16.5.9 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIGnCTL1.CSIGnLBM = 1), the transmit and receive signals are internally connected, as shown in the figures below. The signals CSIGTSCK, CSIGTSO, and CSIGTSI are disconnected from the ports. In addition, the CSIGTSO output level is fixed to low, and CSIGTSCK is set to reset level (High). The rest of CSIG works as in normal operation.

In order to test the CSIG, set the loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data.

**Table 16.26 Output Level of Pins**

| Pin | Output Level |
|---|---|
| CSIGTSCK(out) | High level |
| CSIGTSO | Low level (not dependent on the previous value) |
| Interrupt | Normal function |
| CSIGTRYO | Normal function (Low level) |

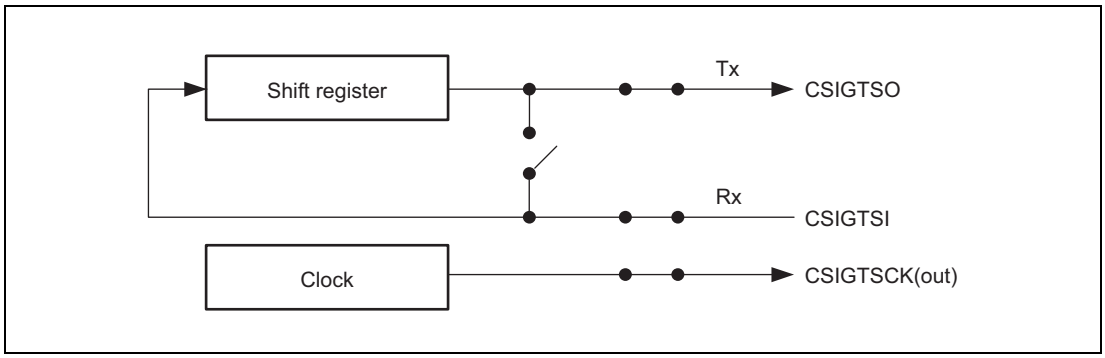

**Figure 16.20 Normal Operation**

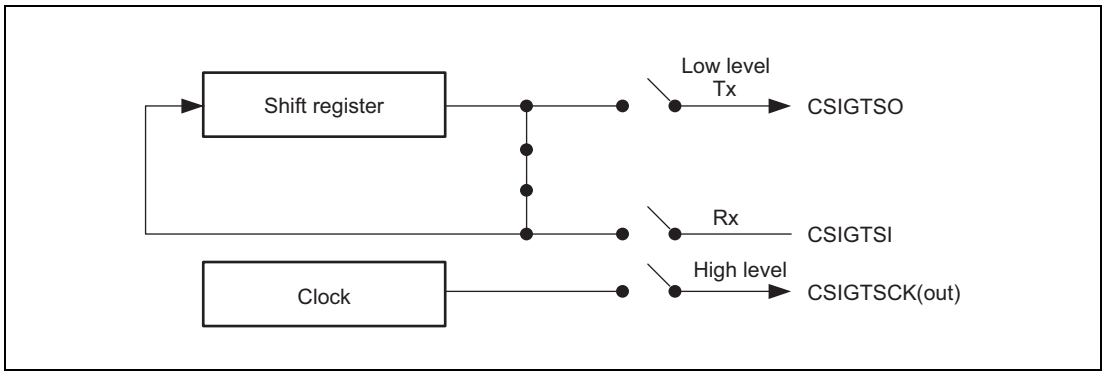

**Figure 16.21 Operation in Loop-Back Mode**

### 16.5.10 Error Detection

CSIG can detect three error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)

Data consistency check error and parity error check functions can be individually enabled or disabled.

If one of these errors is detected, the interrupt INTCSIGTIRE is generated.

#### 16.5.10.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent as an output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIGnCTL1.CSIGnDCS bit (when checking data consistency, make sure that PIPCn.PIPCn_m = 1 for CSIGTSO). It will not be enabled if data transmission is disabled (CSIGnCTL0.CSIGnTXE = 0).

When the data consistency check is enabled, the data transferred from CSIGnTX0W or CSIGnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIGTSO are captured and their logical interpretation is written to the corresponding shift register.

After completion of the transmission, the data sent is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIGTIRE is generated.
- The CSIGnSTR0.CSIGnDCE bit is set.

The data consistency check function is illustrated in the following block diagram.

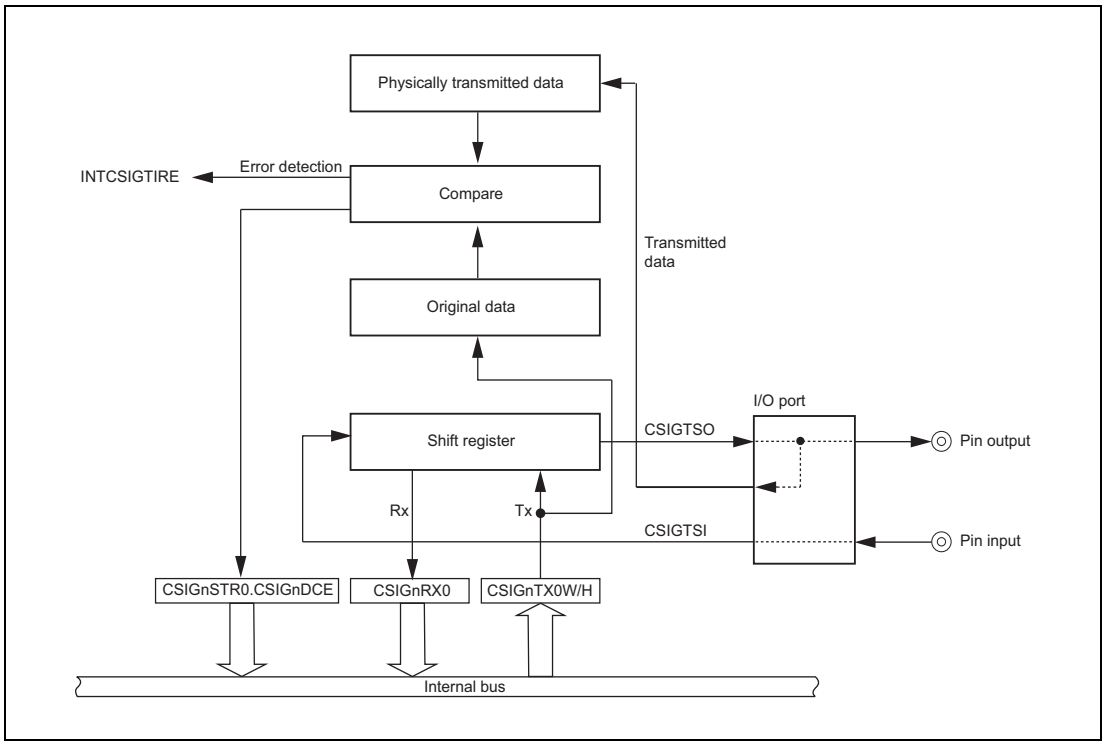

**Figure 16.22 Functional Block Diagram of the Data Consistency Check**

### 16.5.10.2 Parity Check

Parity is a common mean to detect a single bit error during data transmission. CSIG can append a parity bit after the last data bit (even if extended data length is used).

The use and type of parity is specified by CSIGnCFG0.CSIGnPS[1:0].

Parity check is enabled if CSIGnCFG0.CSIGnPS[1] = 1.

The parity bit is checked after reception is complete. If a parity error occurs:

- Interrupt INTCSIGTIRE is generated.
- The CSIGnSTR0.CSIGnPE bit is set.

The following figure shows an example.

Data length is 8 bits. The data transmitted is $05_H$ and $35_H$. Parity type is odd.

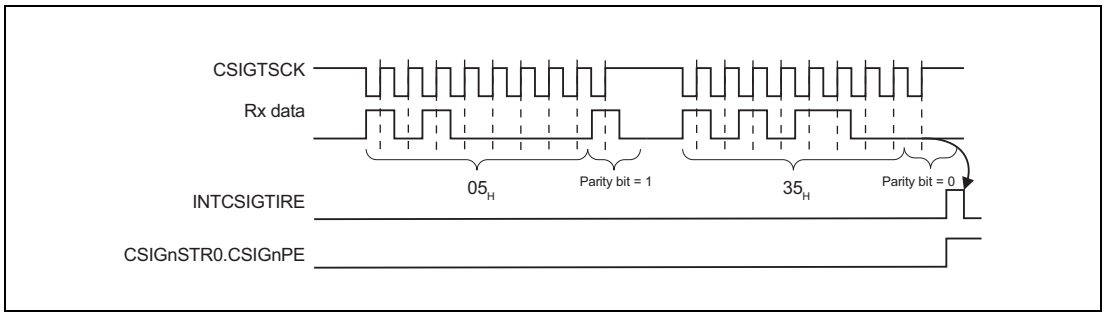

**Figure 16.23 Parity Check Example**

For the first 8 bits, the parity bit is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

For the second 8 bits, the parity bit is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last data bit.

### 16.5.10.3 Overrun Error

This error occurs when previously received data still resides in the reception register CSIGnRX0 because it has not been read, and new data is received.

The overrun error is not generated if data reception is disabled (CSIGnCTL0.CSIGnRXE = 0).

If overrun occurs:

- Interrupt INTCSIGTIRE is generated
- The CSIGnSTR0.CSIGnOVE bit is set
- Data in the CSIGnRX0 register is overwritten and communication continues.

The following figure illustrates the overrun error detection function.

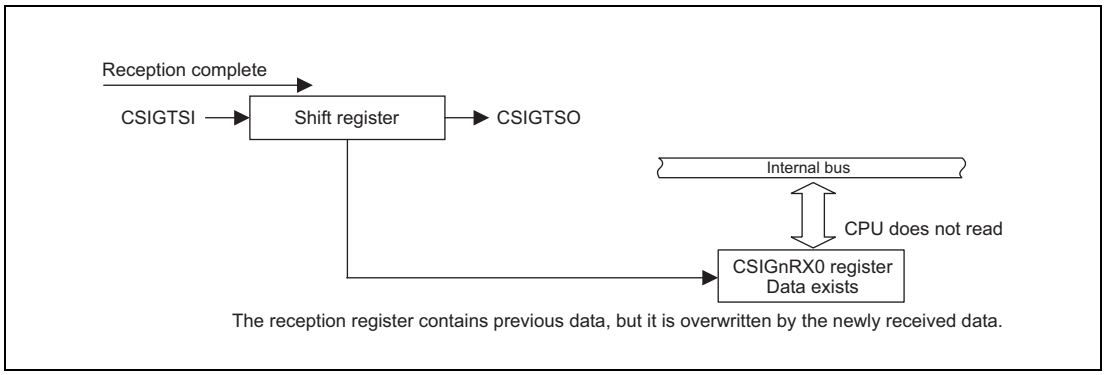

**Figure 16.24 Overrun Error Detection**

The following figure illustrates an example where:

- Rx data 3 is not read
- Rx data 4 is received, and data is overwritten.

Thus an overrun error occurs.

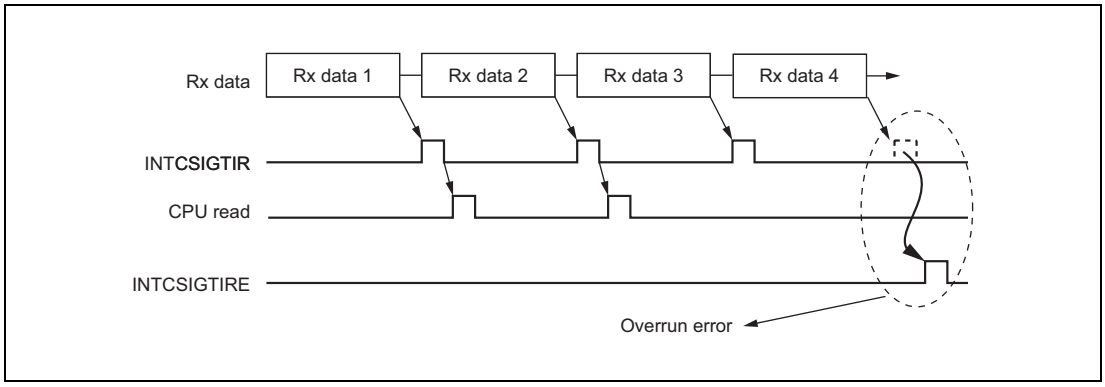

**Figure 16.25 Overrun Error Detection - Example**

**NOTE**

An overrun error can be avoided by using the handshake.

When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

For details see **Section 16.5.8, Handshake Function**.

# 16.6 Operating Procedures

## 16.6.1 Master Mode Transmission/Reception by DMA

This section describes an example of performing the transmission/reception in master mode in combination with a DMA.

The following instructions are based on the assumption that:

- Transmission data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = $1000_B$)
- MSB is transmitted first (CSIGnCFG0.CSIGnDIR = 0)
- INTCSIGTIC interrupt is generated at the end of the transfer (CSIGnCTL1.CSIGnSLIT = 0)
- Normal clock and data phase (CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0)
- The number of data is 10 (0 to 9)

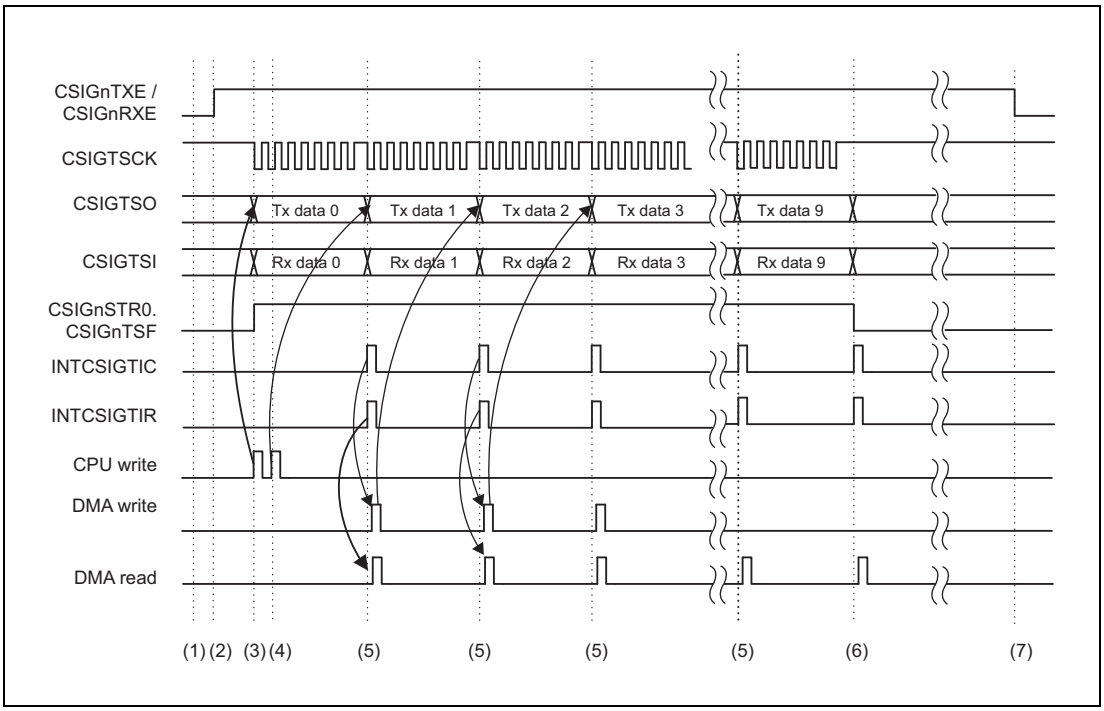

**Figure 16.26 Communication in Master Mode**

**Procedure:**

1. Configure the communication protocol in register CSIGnCFG0. Specify the interrupt timing and operation mode by setting the corresponding bits of the CSIGnCTL1 register and CSIGnCTL2 register.
2. In the CSIGnCTL0 register, set CSIGnPWR = 1 (enable clock), CSIGnTXE = 1 (enable transmission), and CSIGnRXE = 1 (enable reception).
3. Write the first data to be sent to the transmission register CSIGnTX0H. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIGnTX0H. Writing the second data immediately after the first one avoids unnecessary delays between the data.

5. After the transmission or reception of each data, INTCSIGTIC or INTCSIGTIR interrupt is generated. INTCSIGTIC indicates that the next data can be written to CSIGnTX0H. INTCSIGTIR indicates that the reception register CSIGnRX0 must be read.
   In this example, CPU write and DMA write are assumed as equivalent.
6. No more write action is required after the transmission of data 8 completes. Data 9 (the last data) has been written after the transmission of data 7. However, the reception register CSIGnRX0 must be read after the reception of data 8 and 9 completes.
7. Finally, to disable the transmit/receive operation, clear CSIGnCTL0.CSIGnTXE and CSIGnCTL0.CSIGnRXE. When no communication is taking place, set CSIGnCTL0.CSIGnPWR to “0” to minimize the power consumption of the CSIGn.

# Section 17 Clocked Serial Interface H (CSIH)

This section contains a generic description of the Clocked Serial Interface H (CSIH).

The first part in this section describes the features specific to RH850/F1K, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of CSIH.

## 17.1 Features of RH850/F1K CSIH

### 17.1.1 Number of Units

This microcontroller has the following number of CSIH units.

Each CSIH unit has one channel interface.

**Table 17.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of units | 4 | 4 | 4 |
| Name | CSIHn (n = 0 to 3) | CSIHn (n = 0 to 3) | CSIHn (n = 0 to 3) |

**Table 17.2 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual CSIH units are identified by the index “n” (n = 0 to 3): for example, CSIHnCTL0 is the CSIHn control register 0. |
| x | CSIHn has a maximum of 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index “x”: that is, CSx denotes a non-specified chip select signal. |
| y | A variable used for explanation is identified by the index “y”: for example, CSIHnBRSy is the baud rate setting register of CSIHn. |

The following table shows values indicated by the indices of each product.

**Table 17.3 Indices of Products**

| Indices of Each Product | | |
|---|---|---|
| **100 pins** | **144 pins** | **176 pins** |
| For the value of x, see **Table 17.4, Number of Chip Select Signals**. | | |
| y = 0 to 3 | | |

The numbers of chip select signals for each of the CSIH units are listed in the following table.

**Table 17.4 Number of Chip Select Signals**

| Unit Name | Chip Select Index | | |
|---|---|---|---|
| | 100 pins | 144 pins | 176 pins |
| CSIH0 | CSx (x = 0 to 7) | CSx (x = 0 to 7) | CSx (x = 0 to 7) |
| CSIH1 | CSx (x = 0 to 5) | CSx (x = 0 to 5) | CSx (x = 0 to 5) |
| CSIH2 | CSx (x = 0 to 3) | CSx (x = 0 to 5) | CSx (x = 0 to 5) |
| CSIH3 | CSx (x = 0 to 3) | CSx (x = 0 to 3) | CSx (x = 0 to 3) |

### 17.1.2 Register Base Address

CSIH base addresses are listed in the following table.

CSIH register addresses are given as offsets from the base addresses.

**Table 17.5 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <CSIH0_base> | FFD8 $0000_H$ |
| <CSIH1_base> | FFD8 $2000_H$ |
| <CSIH2_base> | FFD8 $4000_H$ |
| <CSIH3_base> | FFD8 $6000_H$ |

### 17.1.3 Clock Supply

The CSIH clock supply is shown in the following table.

**Table 17.6 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| CSIHn | PCLK | CKSCLK_ICSI | Communication clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_ICSI | |

### 17.1.4 Interrupt Requests

CSIH interrupt requests are listed in the following table.

**Table 17.7 Interrupt Requests**

| Unit Interrupt Name | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **CSIH0** | | | |
| INTCSIHTIC | Communication status interrupt | 29 | 70 |
| INTCSIHTIR | Receive status interrupt | 30 | 71 |
| INTCSIHTIRE | Communication error interrupt | 31 | — |
| INTCSIHTIJC | Job completion interrupt | 20, 32 | 72 |
| **CSIH1** | | | |
| INTCSIHTIC | Communication status interrupt | 16, 116 | 28 |
| INTCSIHTIR | Receive status interrupt | 17, 117 | 29 |
| INTCSIHTIRE | Communication error interrupt | 27, 118 | — |
| INTCSIHTIJC | Job completion interrupt | 28, 119 | 30 |
| **CSIH2** | | | |
| INTCSIHTIC | Communication status interrupt | 8, 132 | 89 |
| INTCSIHTIR | Receive status interrupt | 10, 133 | 90 |
| INTCSIHTIRE | Communication error interrupt | 11, 134 | — |
| INTCSIHTIJC | Job completion interrupt | 12, 135 | 91 |
| **CSIH3** | | | |
| INTCSIHTIC | Communication status interrupt | 9, 158 | 41 |
| INTCSIHTIR | Receive status interrupt | 13, 159 | 42 |
| INTCSIHTIRE | Communication error interrupt | 14, 160 | — |
| INTCSIHTIJC | Job completion interrupt | 15, 161 | 43 |

### 17.1.5 Reset Sources

CSIH reset sources are listed in the following table. CSIH is initialized by these reset sources.

**Table 17.8 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| CSIHn | All reset sources (ISORES) |

### 17.1.6 External Input/Output Signals

External input/output signals of CSIH are listed below.

**Table 17.9 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **CSIH0** | | |
| CSIHTSCK | Serial clock signal | CSIH0SC*2 |
| CSIHTSI | Serial data input signal | CSIH0SI |
| $\overline{\text{CSIHTSSI}}$ | Slave select input signal | $\overline{\text{CSIH0SSI}}$ |
| CSIHTRYI | Ready/busy input signal | CSIH0RYI |
| CSIHTSO | Serial data output signal | CSIH0SO*2 |
| CSIHTRYO | Ready/busy output signal | CSIH0RYO |
| CSIHTCSS[7:0]*1 | Chip select signal | CSIH0CSS[7:0]*1 |
| **CSIH1** | | |
| CSIHTSCK | Serial clock signal | CSIH1SC*2 |
| CSIHTSI | Serial data input signal | CSIH1SI |
| $\overline{\text{CSIHTSSI}}$ | Slave select input signal | $\overline{\text{CSIH1SSI}}$ |
| CSIHTRYI | Ready/busy input signal | CSIH1RYI |
| CSIHTSO | Serial data output signal | CSIH1SO*2 |
| CSIHTRYO | Ready/busy output signal | CSIH1RYO |
| CSIHTCSS[5:0]*1 | Chip select signal | CSIH1CSS[5:0]*1 |

| CSIHTRYI | Ready/busy input signal | CSIH3RYI |
| CSIHTSO | Serial data output signal | CSIH3SO*2 |
| CSIHTRYO | Ready/busy output signal | CSIH3RYO |
| CSIHTCSS[3:0]*1 | Chip select signal | CSIH3CSS[3:0]*1 |

Note 1. For the number of chip select signals, see **Table 17.4, Number of Chip Select Signals**.

Note 2. For the port pins that are used as CSIHnSO and CSIHnSC, set the output driving ability to high (PDSCn_m = 1).

**CAUTION**

When port P8_6 is used as CSIH0CSS4, port P8_6 outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.

For details, see **Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

### 17.1.7 Data Consistency Check

The port and the alternative function for data consistency check of CSIHnSO (CSIHTSO) output are shown in the following table. See **Section 17.5.12, Error Detection** for details on data consistency checking.

**Table 17.10 Port Pins for Data Consistency Checking**

| Unit Signal Name | Port Pin Name | Alternative Function |
|---|---|---|
| **CSIH0** | | |
| CSIHTSO | P0_3 | ALT_OUT4 |
| **CSIH1** | | |
| CSIHTSO | P0_5 | ALT_OUT3 |
| | P10_2 | ALT_OUT5 |
| **CSIH2** | | |
| CSIHTSO | P11_2 | ALT_OUT1 |
| **CSIH3** | | |

## 17.2 Overview

### 17.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode or slave mode is selectable
- Multiple slaves configuration and RCB (Recessive Configuration for Broadcasting) are possible since there are to eight configurable chip select output signals
- Slave select input signal ($\overline{\text{CSIHTSSI}}$) is usable
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, whereas it is determined by the input clock in slave mode.
- Maximum transfer clock frequency:
  - Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)
- Clock phases and data phases are selectable
- Data transfer with MSB first or LSB first is selectable
- Transfer data length is selectable from 2 to 16 bits in 1-bit units
- Built-in EDL (extended data length) function for transferring more than 16 bits of data
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Built-in handshake function
- Built-in error detection (data consistency check, parity, time-out, overflow, and overrun)
- Support of job concept
- 128 words I/O buffer memory
- Direct access mode or memory mode (FIFO, dual buffer, and transmit-only buffer) is selectable
- Four different interrupt request signals (INTCSIHTIC, INTCSIHTIR, INTCSIHTIRE, INTCSIHTIJC)
- Built-in LBM (Loop Back Mode) function for self-test
- CPU-controlled high-priority communication function
- Enforced chip select idle setting
- Built-in RCB (Recessive Configuration for Broadcasting) bit
- Built-in JOB enable control bit for AUTOSAR

### 17.2.2 Functional Overview Description

The CSIH uses three signals for communication:

- Transmission clock CSIHTSCK (output in master mode, input in slave mode)
- Data output signal CSIHTSO
- Data input signal CSIHTSI

Additional signals are available for external control and monitoring:

- $\overline{\text{CSIHTSSI}}$: Slave select input signal
- CSIHTRYO: Ready/busy output signal (handshake signal)
- CSIHTRYI: Ready/busy input signal (handshake signal)
- CSIHTCSS[7:0]: Chip select signals

Data transmission is bit-wise and serial, and performed synchronously with the transmission clock.

The following table shows the most important registers for setting up the CSIH.

**Table 17.11 Main Registers of CSIH**

| Register | Function |
|---|---|
| CSIHnCTL0 | Enables/disables serial clock, and permits/ prohibits data transmission and data reception. Defines end-of-job behavior and enables/disables (bypasses) buffering. |
| CSIHnCTL1 | Controls options such as interrupt timing, extended data length, job feature, data consistency check, loop-back mode, handshake, etc. |
| CSIHnCTL2 | Selects master or slave mode, and the transfer clock frequency of the built-in baud rate generator (BRG) in master mode. |
| CSIHnBRSy | Specifies the transfer clock frequency for each chip select signal. |
| CSIHnMCTL0 | Selects memory mode and specifies the time-out value. |
| CSIHnMCTL1 | Controls the memory in FIFO mode. |
| CSIHnMCTL2 | Controls the memory in dual buffer mode. |
| CSIHnCFGx | Configures the communication protocol for each chip select signal. |

### 17.2.3 Block Diagram

The following block diagram shows the main components of the CSIH.

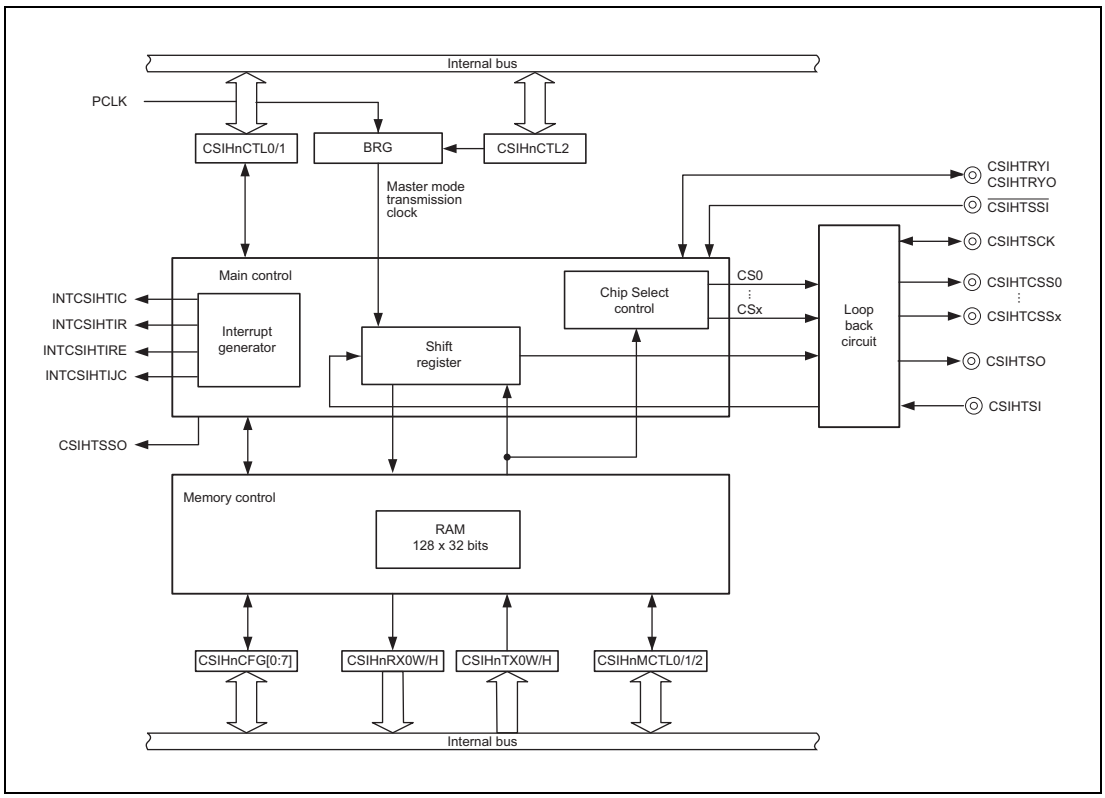

**Figure 17.1 CSIH Block Diagram**

In master mode, the transmission clock CSIHTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

The built-in memory can be configured as FIFO, dual buffer (separate transmit and receive buffers), or transmit-only buffer. It can also be bypassed for data transmission and reception without buffering.

The loop back circuit disconnects the CSIH completely from the ports and supports internal self-test.

**NOTE**

This section describes the following modes:

- The “operating mode” is either master mode or slave mode. The master can control and communicate with several slaves only in master mode (for details, see **Section 17.5.1, Operating Modes (Master/Slave)**).
- The “job mode” is related to the AUTOSAR job concept (for details, see **Section 17.5.3.3, Job Concept**).
- The “memory mode” accords with the various configurations of the associated buffer memory (for details, see **Section 17.5.6, CSIH Buffer Memory**).
- The “data transfer mode” specifies the type of communication – transmit-only, receive-only, or transmit/receive (for details, see **Section 17.5.7, Data Transfer Modes**).

# 17.3 Registers

## 17.3.1 List of Registers

CSIH registers are listed in the following table.

For details about <CSIHn_base>, see **Section 17.1.2, Register Base Address**.

**Table 17.12 List of Registers**

| Module | Register | Symbol | Address |
|---|---|---|---|
| CSIHn | CSIHn control register 0 | CSIHnCTL0 | <CSIHn_base> + $0000_H$ |
| | CSIHn control register 1 | CSIHnCTL1 | <CSIHn_base> + $0010_H$ |
| | CSIHn control register 2 | CSIHnCTL2 | <CSIHn_base> + $0014_H$ |
| | CSIHn status register 0 | CSIHnSTR0 | <CSIHn_base> + $0004_H$ |
| | CSIHn status clear register 0 | CSIHnSTCR0 | <CSIHn_base> + $0008_H$ |
| | CSIHn memory control register 0 | CSIHnMCTL0 | <CSIHn_base> + $1040_H$ |
| | CSIHn memory control register 1 | CSIHnMCTL1 | <CSIHn_base> + $1000_H$ |
| | CSIHn memory control register 2 | CSIHnMCTL2 | <CSIHn_base> + $1004_H$ |
| | CSIHn memory read/write pointer register 0 | CSIHnMRWP0 | <CSIHn_base> + $1018_H$ |
| | CSIHn configuration register 0 | CSIHnCFG0 | <CSIHn_base> + $1044_H$ |
| | CSIHn configuration register 1 | CSIHnCFG1 | <CSIHn_base> + $1048_H$ |
| | CSIHn configuration register 2 | CSIHnCFG2 | <CSIHn_base> + $104C_H$ |
| | CSIHn configuration register 3 | CSIHnCFG3 | <CSIHn_base> + $1050_H$ |
| | CSIHn configuration register 4 | CSIHnCFG4 | <CSIHn_base> + $1054_H$ |
| | CSIHn configuration register 5 | CSIHnCFG5 | <CSIHn_base> + $1058_H$ |
| | CSIHn configuration register 6 | CSIHnCFG6 | <CSIHn_base> + $105C_H$ |
| | CSIHn configuration register 7 | CSIHnCFG7 | <CSIHn_base> + $1060_H$ |
| | CSIHn transmit data register 0 for word access | CSIHnTX0W | <CSIHn_base> + $1008_H$ |
| | CSIHn transmit data register 0 for half word access | CSIHnTX0H | <CSIHn_base> + $100C_H$ |
| | CSIHn receive data register 0 for word access | CSIHnRX0W | <CSIHn_base> + $1010_H$ |
| | CSIHn receive data register 0 for half word access | CSIHnRX0H | <CSIHn_base> + $1014_H$ |
| | CSIHn emulation register | CSIHnEMU | <CSIHn_base> + $0018_H$ |
| | CSIHn baud rate setting register 0 | CSIHnBRS0 | <CSIHn_base> + $1068_H$ |
| | CSIHn baud rate setting register 1 | CSIHnBRS1 | <CSIHn_base> + $106C_H$ |
| | CSIHn baud rate setting register 2 | CSIHnBRS2 | <CSIHn_base> + $1070_H$ |
| | CSIHn baud rate setting register 3 | CSIHnBRS3 | <CSIHn_base> + $1074_H$ |

## 17.3.2 CSIHnCTL0 — CSIHn Control Register 0

This register controls the operation clock, enables/disables transmission/reception, and enables/disables the memory allocated for transmission and/or reception. It forces the stop of communication at the end of the current job.

**Access:** This register can be read or written in 8-bit units.

**Address:** <CSIHn_base> + $0000_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CSIHnPWR | CSIHnTXE | CSIHnRXE | — | — | — | CSIHnJOBE | CSIHnMBS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R | R | R | R/W | R/W |

**Table 17.13 CSIHnCTL0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | CSIHnPWR | Controls the operation clock.<br>0: Stops operation clock.<br>1: Supplies operation clock.<br>Clearing CSIHnPWR to 0 resets the internal circuits, stops operation, and sets CSIH to standby state. Clock supply to internal circuits stops.<br><br>If CSIHnPWR is cleared (to 0) during communication, ongoing communication is immediately aborted. In this case, the communication setting must be reconfigured. |
| 6 | CSIHnTXE | Enables/disables transmission.<br>0: Disables transmission.<br>1: Enables transmission. |
| 5 | CSIHnRXE | Enables/disables reception.<br>0:Disables reception.<br>1: Enables reception. |
| 4 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CSIHnJOBE | Stops communication at the end of the current job (communication ends if data is written to the transmission buffer when CSIHnTX0W.CSIHnEOJ = 1 (job completion)).<br>0: Communication stop is not requested.<br>1: Stops communication.<br>This bit can be used to abort an ongoing job. This bit is cleared to 0 automatically. Even if this bit is set to 1, the read value is always 0.<br>In FIFO mode, the pointer must be cleared by setting CSIHnSTCR0.CSIHnPCT = 1 before the next communication is started |
| 0 | CSIHnMBS | Bypasses the memory for transmission and/or reception data.<br>0: Memory mode<br>CSIH memory is used for transmission and/or reception data.<br>1: Direct access mode<br>CSIH memory is bypassed. |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

### 17.3.3 CSIHnCTL1 — CSIHn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake functionality, and job mode. It selects the active output level of each chip select signal and the behavior of the chip select signals after the transfer of the final data.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIHn_base> + $0010_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | CSIHn SLRS | — | — | — | — | — | CSIHn PHE | CSIHn CKR | CSIHn SLIT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 17.14 CSIHnCTL1 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 25 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 24 | CSIHnSLRS | Sets the internal synchronization timing for receive data input.<br>0: Rising edge of PCLK<br>1: Falling edge of PCLK<br>For differences by the setting, see Data Sheet. |
| 23 to 19 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 18 | CSIHnPHE | Sets the CPU-controlled priority-based communication function.<br>0: The CPU-controlled high-priority communication function is disabled.<br>1: The CPU-controlled high-priority communication function is enabled.<br>To enable the CPU-controlled high-priority communication function, set this bit to 1 and set CSIHnJE = 1. This bit can only be set in transmit-only buffer mode. |
| 17 | CSIHnCKR | CSIHTSCK Clock Inversion Function<br>0: The default level of CSIHTSCK is high<br>1: The default level of CSIHTSCK is low<br>For details, see **Section 17.3.11, CSIHnCFGx — CSIHn Configuration Register x**. |
| 16 | CSIHnSLIT | Selects the timing of interrupt INTCSIHTIC.<br>0: Normal interrupt timing (interrupt is generated after the transfer)<br>1: As soon as the contents of the CSIHnTX0W/H register are transferred to the shift register, an interrupt is generated (this function is activated only in direct access mode/transmit-only buffer mode).<br>For details, see **Section 17.4.3, INTCSIHTIC (Communication Status Interrupt)**. |
| 15 to 8 | CSIHnCSLx | Selects the active output level of chip select signal x (CSIHTCSSx).<br>0: Chip select is active low.<br>1: Chip select is active high.<br>For details, see **Section 17.5.3, Chip Selection (CS) Features**. |
| 7 | CSIHnEDLE | Enables/disables extended data length (EDL) mode.<br>0: Disables extended data length mode.<br>1: Enables extended data length mode.<br>For details, see **Section 17.5.8.2, Data Length Greater than 16 Bits**. |

**Table 17.14 CSIHnCTL1 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 6 | CSIHnJE | Enables/disables job mode.<br>0: Disables job mode.<br>1: Enables job mode.<br>For details, see **Section 17.5.3.3, Job Concept**.<br>The CSIHnCTL0.CSIHnJOBE, CSIHnTX0W.CSIHnEOJ, and CSIHnTX0W.CSIHnCIRE bits are enabled only when CSIHnJE = 1.<br>Setting this bit in slave mode is prohibited.<br>In addition, to enable the CPU-controlled high-priority communication function, set this bit to 1 as well as CSIHnPHE = 1. |
| 5 | CSIHnDCS | Enables/disables data consistency check.<br>0: Disables data consistency check.<br>1: Enables data consistency check.<br>For details, see **Section 17.5.12.1, Data Consistency Check**. |
| 4 | CSIHnCSRI | Defines chip select signal behavior after last data transfer.<br>0: Chip select signal retains the active level.<br>1: Chip select signal returns to the inactive level.<br>The last data is determined at the interrupt timing in direct access mode or FIFO mode. When CSIHnCTL1.CSIHnSLIT = 1, the last data is determined in direct access mode. |
| 3 | CSIHnLBM | Controls loop-back mode (LBM).<br>0: Deactivates loop-back mode.<br>1: Activates loop-back mode.<br>For details, see **Section 17.5.13, Loop-Back Mode**. |
| 2 | CSIHnSIT | Selects interrupt delay mode.<br>0: No delay is generated.<br>1: Half clock delay is generated for all interrupts.<br>This bit is only valid in master mode. In slave mode, no delay is generated.<br>For details, see **Section 17.4.2, Interrupt Delay**. |
| 1 | CSIHnHSE | Enables/disables the handshake function.<br>0: Disables the handshake function.<br>1: Enables the handshake function.<br>For details see **Section 17.5.11, Handshake Function**. |
| 0 | CSIHnSSE | Enables/disables the slave select function.<br>0: Input signal $\overline{\text{CSIHTSSI}}$ is disabled.<br>1: Input signal $\overline{\text{CSIHTSSI}}$ is recognized.<br>If the slave select function is not used, this bit must be set to 0 (see also **Section 17.5.2, Master/Slave Connections**). |

Details about CSIHnCTL1.CSIHnSSE are shown in the following tables.

**Table 17.15 Operation of the Slave Select Function during Reception**

| CSIHnCTL0. CSIHnRXE | CSIHnCTL1. CSIHnSSE | $\overline{\text{CSIHTSSI}}$ | Receive Operation |
|---|---|---|---|
| 0 | — | — | Reception is prohibited |
| 1 | 0 | — | Possible |
| 1 | 1 | 0 | Possible |
| 1 | 1 | 1 | Disabled |

**Table 17.16 Operation of the Slave Select Function during Transmission**

| CSIHnCTL0. CSIHnTXE | CSIHnCTL1. CSIHnSSE | $\overline{\text{CSIHTSSI}}$ | Transmit Operation |
|---|---|---|---|
| 0 | — | — | Transmission is prohibited |
| 1 | 0 | — | Possible |
| 1 | 1 | 0 | Possible |
| 1 | 1 | 1 | Disabled |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

### 17.3.4 CSIHnCTL2 — CSIHn Control Register 2

This register selects operating mode and the reference clock value, and specifies the transfer clock frequency.

For details see **Section 17.5.5, Transmission Clock Selection**.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIHn_base> + $0014_H$

**Value after reset:** $E000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CSIHnPRS[2:0] | | | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 17.17 CSIHnCTL2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 13 | CSIHnPRS[2:0] | These bits select the operation mode and the reference clock value. |
| 12 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

| CSIHnPRS2 | CSIHnPRS1 | CSIHnPRS0 | Selection of Reference Clock (PRSOUT) |
|---|---|---|---|
| 0 | 0 | 0 | PCLK (Master mode) |
| 0 | 0 | 1 | PCLK/2 (Master mode) |
| 0 | 1 | 0 | PCLK/4 (Master mode) |
| 0 | 1 | 1 | PCLK/8 (Master mode) |
| 1 | 0 | 0 | PCLK/16 (Master mode) |
| 1 | 0 | 1 | PCLK/32 (Master mode) |
| 1 | 1 | 0 | PCLK/64 (Master mode) |
| 1 | 1 | 1 | External clock via CSIHTSCK(in) (Slave mode) |

In master mode, the following bits are used to set the transfer clock frequency:

CSIHnCTL2.CSIHnPRS[2:0], CSIHnCFGx.CSIHnBRSS[1:0], CSIHnBRSy.CSIHnBRS[11:0]

In addition, any of the four different transfer clock frequency settings that are specified by the CSIHnBRSy.CSIHnBRS[11:0] bits is selected for each chip select signal. To select the transfer clock frequency setting for each chip select signal, use the CSIHnCFGx.CSIHnBRSS[1:0] bits.

The following table shows the relationship between CSIHnCFGx.CSIHnBRSS[1:0] and CSIHnBRSy.CSIHnBRS[11:0].

| CSIHnCFGx. CSIHnBRSS[1:0] | Transfer Clock Frequency Setting Bit to be Selected |
|---|---|
| 00 | CSIHnBRS0.CSIHnBRS[11:0] |
| 01 | CSIHnBRS1.CSIHnBRS[11:0] |
| 10 | CSIHnBRS2.CSIHnBRS[11:0] |
| 11 | CSIHnBRS3.CSIHnBRS[11:0] |

The following table shows the relationship between the transfer clock frequency and the transfer clock frequency setting (CSIHnBRSy[11:0]) selected by the CSIHnBRSS[1:0] bits when the bit value of the CSIHnPRS[2:0] bits is α.

| CSIHnBRSy[11:0] | Transfer clock frequency |
|---|---|
| 0 | BRG stopped |
| 1 | PCLK / ($2^{\alpha}$ × 1 × 2) |
| 2 | PCLK / ($2^{\alpha}$ × 2 × 2) |
| 3 | PCLK / ($2^{\alpha}$ × 3 × 2) |
| 4 | PCLK / ($2^{\alpha}$ × 4 × 2) |
| ... | … |
| 4095 | PCLK / ($2^{\alpha}$ × 4095× 2) |

When a time-out error is used in slave mode, the clock selected by this setting is used. In slave mode, the CSIHnPRS[2:0] bits are set to $111_B$. In this case, the prescaler has the same setting as when the CSIHnPRS[2:0] bits are set to $000_B$. When using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than $000_H$.

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

### 17.3.5 CSIHnSTR0 — CSIHn Status Register 0

This register indicates the status of CSIH.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <CSIHn_base> + $0004_H$

**Value after reset:** $0000\ 0010_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CSIHnSRP[7:0] | | | | | | | | CSIHnSPF[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| CSIHnOVE | 0 | 0: No error is detected.<br>1: An error is detected. | 0: No error is detected.<br>1: An error is detected. | 0: No error is detected.<br>1: An error is detected. | Fixed to 0 |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

### 17.3.6 CSIHnSTCR0 — CSIHn Status Clear Register 0

This register clears the status flags of the CSIHnSTR0 status register.

**Access:** This register can be read or written in 16-bit units.
When read, the value $0000_H$ is always returned.

**Address:** <CSIHn_base> + $0008_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CSIHn TMOEC | CSIHn OFEC | — | — | — | — | — | CSIHn PCT | — | — | — | — | CSIHn DCEC | — | CSIHn PEC | CSIHn OVEC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R/W | R | R | R | R | R/W | R | R/W | R/W |

**Table 17.20 CSIHnSTCR0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | CSIHnTMOEC | Controls the time-out error flag clear command.<br>0: No operation. The read value is always 0.<br>1: Clears the time-out error flag (CSIHnSTR0.CSIHnTMOE). |
| 14 | CSIHnOFEC | Controls the overflow error flag clear command.<br>0: No operation. The read value is always 0.<br>1: Clears the overflow error flag (CSIHnSTR0.CSIHnOFE). |
| 13 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | CSIHnPCT | Controls the FIFO pointer clear command.<br>0: No operation. The read value is always 0.<br>1: Clears the following FIFO buffer pointers (in FIFO mode, dual buffer mode, and transmit-only buffer mode) and status bits.<br>**FIFO Buffer Pointer / Status Bit**<br>CSIHnMRWP0.CSIHnTRWA[6:0] — CSIHnSTR0.CSIHnSPF[7:0]<br>CSIHnMRWP0.CSIHnRRA[6:0] — CSIHnSTR0.CSIHnSRP[7:0]<br>CSIHnMCTL2.CSIHnSOP[6:0] — CSIHnSTR0.CSIHnFLF, CSIHnSTR0.CSIHnTSF<br>Additionally, the CSIHnSTR0.CSIHnEMF bit is set to 1 (FIFO empty) (in FIFO mode only). |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | CSIHnDCEC | Controls the data consistency check error flag clear command.<br>0: No operation. The read value is always 0.<br>1: Clears the data consistency check error flag (CSIHnSTR0.CSIHnDCE). |
| 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CSIHnPEC | Controls the parity error flag clear command.<br>0: No operation. The read value is always 0.<br>1: Clears the parity error flag (CSIHnSTR0.CSIHnPE). |
| 0 | CSIHnOVEC | Controls the overrun error flag clear command.<br>0: No operation. The read value is always 0.<br>1: Clears the overrun error flag (CSIHnSTR0.CSIHnOVE). |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

## 17.3.7 CSIHnMCTL0 — CSIHn Memory Control Register 0

This register selects the memory mode and the time-out setting.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIHn_base> + $1040_H$

**Value after reset:** $001F_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | CSIHn MMS[1:0] | | — | — | — | CSIHnTO[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

**Table 17.21 CSIHnMCTL0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 to 8 | CSIHnMMS [1:0] | Selects the memory mode.<br>**CSIHn MMS1 / CSIHn MMS0 / Description**<br>0 / 0 / FIFO mode<br>0 / 1 / Dual buffer mode<br>1 / 0 / Transmit-only buffer mode<br>1 / 1 / Prohibited<br>After a change of the memory mode, the respective buffer pointers must be cleared by setting the CSIHnSTCR0.CSIHnPCT bit to 1.<br>In direct access mode, the setting of these bits is ignored. |
| 7 to 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | CSIHnTO[4:0] | Selects the time-out setting in FIFO mode.<br>**CSIHnTO[4:0] / Description**<br>$00000_B$ / No time-out is detected<br>$00001_B$ / Time-out is (1 × 8 × BRG output clocks)<br>$00010_B$ / Time-out is (2 × 8 × BRG output clocks)<br>...<br>$11111_B$ / Time-out is (31 × 8 × BRG output clocks)<br>**CAUTION**<br>Changing the time-out setting is only permitted when CSIHnCTL0.CSIHnPWR = 0.<br>Set the CSIHnTO[4:0] bits to $00000_B$ in direct access mode, dual buffer mode, or transmit-only buffer mode (except FIFO mode).<br>For details about time-out detection, see also **Section 17.5.12.3, Time-Out Error**. |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

### 17.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1

This register selects the conditions to generate the interrupt requests INTCSIHTIC and INTCSIHTIR in FIFO mode.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIHn_base> + $1000_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | CSIHnFES[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | CSIHnFFS[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 17.22 CSIHnMCTL1 Register Contents**

| Bit Position | Bit name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | CSIHnFES[6:0] | Selects the conditions to generate the INTCSIHTIC interrupt (transmit data empty) in FIFO mode.<br>When the number of unsent data to be transmitted in FIFO (checked by the CSIHnSTR0.CSIHnSPF[7:0] bit) and CSIHnMCTL1.CSIHnFES[6:0] match, the FIFO empty flag (CSIHnSTR0.CSIHnEMF bit) is set to 1, and the INTCSIHTIC interrupt request is generated. |
| 15 to 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | CSIHnFFS[6:0] | Selects the conditions to generate the INTCSIHTIR interrupt (receive data full) in FIFO mode.<br>When the number of received data in FIFO (checked by the CSIHnSTR0.CSIHnSRP[7:0] bit) and (128 - CSIHnMCTL1.CSIHnFFS[6:0]) match, the INTCSIHTIR interrupt request is generated. |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

### 17.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2

This register controls the operation of the memory in dual buffer or transmit-only buffer mode and triggers to start communication.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIHn_base> + $1004_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CSIHn BTST | — | — | — | — | — | — | — | CSIHnND[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | CSIHnSOP[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 17.23 CSIHnMCTL2 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | CSIHnBTST | Provides a start trigger for buffer transfer.<br>0: No operation.<br>1: Issues the start transfer command.<br>The read value is always 0.<br>**CAUTION**<br>This bit can only be used in dual buffer mode and transmit-only buffer mode. |
| 30 to 24 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 to 16 | CSIHnND[7:0] | Specifies the number of data for each memory mode.<br>The read value indicates the number of remaining communication data. |

| CSIHn ND[7:0] | Dual Buffer Mode | Transmit-Only Buffer Mode | FIFO Mode | Direct Access Mode |
|---|---|---|---|---|
| $00_H$ | Send 0 data | Send 0 data | No influence | No influence |
| $01_H$ | Send 1 data | Send 1 data | No influence | No influence |
| ... | ... | ... | No influence | No influence |
| $3F_H$ | Send 63 data | Send 63 data | No influence | No influence |
| $40_H$ | Send 64 data | Send 64 data | No influence | No influence |
| ... | Prohibited | ... | No influence | No influence |
| $7F_H$ | Prohibited | Send 127 data | No influence | No influence |
| $80_H$ | Prohibited | Send 128 data | No influence | No influence |
| Other than the above | Setting is prohibited. | | | |

The values are automatically decremented after data transfer (not decremented in direct access mode).

| | | |
|---|---|---|
| 15 to 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**Table 17.23 CSIHnMCTL2 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 6 to 0 | CSIHnSOP[6:0] | Selects the pointer of the data to be sent.<br>If communication is forced to stop by setting CSIHnCTL0.CSIHnPWR to 0 or CSIHnSTCR0.CSIHnPCT to 1, these bits are cleared by hardware.<br>In FIFO mode, these bits indicate the send address. |

| CSIHn SOP[6:0] | Dual Buffer Mode | Transmit-Only Buffer Mode | FIFO Mode | Direct Access Mode |
|---|---|---|---|---|
| $00_H$ | $0000_H$ | $0000_H$ | $0000_H$ | No influence |
| $01_H$ | $0004_H$ | $0004_H$ | $0004_H$ | No influence |
| ... | ... | ... | ... | No influence |
| $3F_H$ | $00FC_H$ | $00FC_H$ | $00FC_H$ | No influence |
| $40_H$ | Prohibited | $0100_H$ | $0100_H$ | No influence |
| ... | Prohibited | ... | ... | No influence |
| $7F_H$ | Prohibited | $01FC_H$ | $01FC_H$ | No influence |

**CAUTION**

In direct access mode, these bits are not incremented.

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

## 17.3.10 CSIHnMRWP0 — CSIHn Memory Read/Write Pointer Register 0

This register sets the pointers for reading from and writing to the dual buffer or transmit-only buffer.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIHn_base> + $1018_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | CSIHnRRA[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | CSIHnTRWA[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 17.24 CSIHnMRWP0 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | CSIHnRRA[6:0] | Selects the read pointer of the receive buffer. |

| CSIHn RRA[6:0] | Dual Buffer Mode | Transmit-Only Buffer Mode | FIFO Mode | Direct Access Mode |
|---|---|---|---|---|
| $00_H$ | $0000_H$ | No influence | $0000_H$ | No influence |
| $01_H$ | $0004_H$ | No influence | $0004_H$ | No influence |
| ... | ... | No influence | ... | No influence |
| $3F_H$ | $00FC_H$ | No influence | $00FC_H$ | No influence |
| $40_H$ | Prohibited | No influence | $0100_H$ | No influence |
| ... | Prohibited | No influence | ... | No influence |
| $7F_H$ | Prohibited | No influence | $01FC_H$ | No influence |

These bits are automatically incremented when received data is read.
If an overrun error is generated while reading the CSIHnRX0W or CSIHnRX0H register, the read pointer is not incremented.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode and transmit-only buffer mode, these bits are not incremented.
To perform write access in transmit-only buffer mode, set $00_H$ to these bits.
In FIFO mode, these bits indicate the read address of the received data.

| | | |
|---|---|---|
| 15 to 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**Table 17.24 CSIHnMRWP0 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 6 to 0 | CSIHnTRWA [6:0] | Selects the read/write pointer of the transmit buffer. |

| CSIHn TRWA[6:0] | Dual Buffer Mode | Transmit-Only Buffer Mode | FIFO Mode | Direct Access Mode |
|---|---|---|---|---|
| $00_H$ | $0000_H$ | $0000_H$ | $0000_H$ | No influence |
| $01_H$ | $0004_H$ | $0004_H$ | $0004_H$ | No influence |
| ... | ... | ... | ... | No influence |
| $3F_H$ | $00FC_H$ | $00FC_H$ | $00FC_H$ | No influence |
| $40_H$ | Prohibited | $0100_H$ | $0100_H$ | No influence |
| ... | Prohibited | ... | ... | No influence |
| $7F_H$ | Prohibited | $01FC_H$ | $01FC_H$ | No influence |

These bits are automatically incremented when the transmission data is written or read.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode, these bits are not incremented.
In FIFO mode, these bits indicate the read/write address of transmission data.

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

## 17.3.11 CSIHnCFGx — CSIHn Configuration Register x

These eight registers configure the prescaler, parity, data length, recessive configuration for broadcasting, serial data direction, clock phase and data phase, idle enforcement configuration, idle time, hold time, inter-data time, and setup for each chip select signal, CSIHTCSSx.

### Slave mode

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is effective.

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock phase and data phase

In slave mode, set all bits other than above in the CSIHnCFG0 register, and the CSIHnCFG1 to CSIHnCFG7 registers to 0.

**Access:** This register can be read or written in 32-bit units.

**Address:** CSIHnCFG0: <CSIHn_base> + $1044_H$
CSIHnCFG1: <CSIHn_base> + $1048_H$
CSIHnCFG2: <CSIHn_base> + $104C_H$
CSIHnCFG3: <CSIHn_base> + $1050_H$
CSIHnCFG4: <CSIHn_base> + $1054_H$
CSIHnCFG5: <CSIHn_base> + $1058_H$
CSIHnCFG6: <CSIHn_base> + $105C_H$
CSIHnCFG7: <CSIHn_base> + $1060_H$

**Value after reset:** $0000\ 0000_H$

| $1110_B$ | 18.0 transmission clock cycles | 18.5 transmission clock cycles |
| $1111_B$ | 20.0 transmission clock cycles | 20.5 transmission clock cycles |

These bits are only available in master mode.

| | | |
|---|---|---|
| 3 to 0 | CSIHnSPx[3:0] | Specifies the setup time for chip select signal x in transmission clock cycles. |

| CSIHnSPx[3:0] | Setup Time |
|---|---|
| $0000_B$ | 0.5 transmission clock cycle |
| $0001_B$ | 1.0 transmission clock cycle |
| $0010_B$ | 1.5 transmission clock cycles |
| $0011_B$ | 2.5 transmission clock cycles |
| $0100_B$ | 3.5 transmission clock cycles |
| $0101_B$ | 4.5 transmission clock cycles |
| $0110_B$ | 6.5 transmission clock cycles |
| $0111_B$ | 8.5 transmission clock cycles |
| $1000_B$ | 9.5 transmission clock cycles |
| $1001_B$ | 10.5 transmission clock cycles |
| $1010_B$ | 11.5 transmission clock cycles |
| $1011_B$ | 12.5 transmission clock cycles |
| $1100_B$ | 14.5 transmission clock cycles |
| $1101_B$ | 16.5 transmission clock cycles |
| $1110_B$ | 18.5 transmission clock cycles |
| $1111_B$ | 20.5 transmission clock cycles |

These bits are only available in master mode.

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

## 17.3.12 CSIHnTX0W — CSIHn Transmit Data Register 0 for Word Access

This register stores transmission data. In addition, it specifies the communication interrupt request, the end-of-job, the extended data length, and the chip select activation.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIHn_base> + $1008_H$

**Value after reset:** $X0XX\ XXXX_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 17.26 CSIHnTX0W Register Contents (1/2)**

| Bit Position | Bit name | Function |
|---|---|---|
| 31 | CSIHnCIRE | Enables the communication interrupt request INTCSIHTIC in dual buffer or transmit-only buffer mode, or the job completion interrupt request INTCSIHTIJC in FIFO mode.<br>0: No interrupt is requested.<br>1: An interrupt is requested. Generates interrupt INTCSIHTIC or INTCSIHTIJC after transmission. For details, see **Section 17.4.3, INTCSIHTIC (Communication Status Interrupt)** and **Section 17.4.6, INTCSIHTIJC (Job Completion Interrupt)**.<br>**CAUTION**<br>This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). |
| 30 | CSIHnEOJ | Specifies the end of a job.<br>0: Indicates that it is not end-of-job data. The job continues.<br>1: Indicates end-of-job data.<br>**CAUTION**<br>This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). This bit must be set to 0 in slave mode. |
| 29 | CSIHnEDL | Specifies whether the associated data requires the extended data length (EDL) option.<br>0: Normal operation<br>1: Enables the extended data length.<br>The associated data is transmitted as a 16-bit packet. No inter-data time or idle time will be inserted after the data is transmitted.<br>If CSIHnCTL1.CSIHnEDLE = 1 and CSIHnTX0W.CSIHnEDL = 1, the subsequent data must have the same CS selection. If CS is modified for the subsequent data, the correct operation is not assured.<br>**CAUTION**<br>This bit is only available if CSIHnCTL1.CSIHnEDLE = 1. |
| 28 to 24 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**Table 17.26 CSIHnTX0W Register Contents (2/2)**

| Bit Position | Bit name | Function |
|---|---|---|
| 23 to 16 | CSIHnCS[7:0] | Activates one or more chip select signals.<br>0: Activates chip select signals x for the associated transmission.<br>1: Deactivates chip select signals x for the associated transmission.<br>Setting CSIHnTX0W.CSIHnCS[7:0] = $FF_H$ is prohibited.<br>**CAUTION**<br>If several chip select signals are enabled for broadcasting, the configuration of one with CSIHnCFGx.CSIHnRCBx = 0 (dominant) is used. In this case, all dominant chip select signals must be set to precisely the same value.<br>In slave mode, set the CSIHnCS[7:0] bit to $FE_H$. |
| 15 to 0 | CSIHnTX[15:0] | Stores the transmission data. |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

### 17.3.13 CSIHnTX0H — CSIHn Transmit Data Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of register CSIHnTX0W.

The settings specified by the upper 16 bits of CSIHnTX0W are applied to the transmission. Set transmit data to CSIHnTX0W before using this register because the value of CSIHnTX0W is undefined after the reset.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIHn_base> + $100C_H$

**Value after reset:** Undefined

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 17.27 CSIHnTX0H Register Contents**

| Bit Position | Bit name | Function |
|---|---|---|
| 15 to 0 | CSIHnTX[15:0] | Stores the transmission data. |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

## 17.3.14 CSIHnRX0W — CSIHn Receive Data Register 0 for Word Access

This register stores the received data.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <CSIHn_base> + $1010_H$

**Value after reset:** $0XXX\ XXXX_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 17.28 CSIHnRX0W Register Contents**

| Bit Position | Bit name | Function |
|---|---|---|
| 31 to 26 | Reserved | When read, the value after reset is returned. |
| 25 | CSIHnRPE | Indicates whether a reception data parity error was detected.<br>0: No parity error was detected on the associated reception data.<br>1: A parity error was detected on the associated reception data. |
| 24 | CSIHnTDCE | Indicates whether a transmission data consistency check error was detected.<br>0: No consistency error was detected on the associated transmission data.<br>1: A consistency error was detected on the associated transmission data. |
| 23 to 16 | CSIHnCSx (x = 7 to 0) | Indicates which chip select signal was activated.<br>0: Chip select x was activated for the associated reception.<br>1: Chip select x was deactivated for the associated reception. |
| 15 to 0 | CSIHnRX[15:0] | Stores the received data. |

**NOTE**

Read this register at least one serial clock cycle before an interrupt is generated.

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

## 17.3.15 CSIHnRX0H — CSIHn Receive Data Register 0 for Half Word Access

This register stores the received data. This register is the same as bits 15 to 0 of register CSIHnRX0W.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <CSIHn_base> + $1014_H$

**Value after reset:** Undefined

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 17.29 CSIHnRX0H Register Contents**

| Bit Position | Bit name | Function |
|---|---|---|
| 15 to 0 | CSIHnRX[15:0] | Stores the received data. |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

## 17.3.16 CSIHnEMU — CSIHn Emulation Register

This register controls operation of SVSTOP.

**Access:** This register can be read or written in 8-bit or 1-bit units.
Perform write operation when (EPC.SVSTOP = 0).

**Address:** <CSIHn_base> + $0018_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CSIHnSVSDIS | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 17.30 CSIHnEMU Register Contents**

| Bit Position | Bit name | Function |
|---|---|---|
| 7 | CSIHn SVSDIS | Selects whether to continue or stop transmit/receive operation during debugging.<br>• When the EPC.SVSTOP bit is set to 0<br>Continues transmit/receive operation regardless of the setting of this bit.<br>• When the EPC.SVSTOP bit is set to 1<br>0: Stops transmit/receive operation.<br>1: Continues transmit/receive operation. |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

## 17.3.17 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3)

This register sets the transfer clock frequency for each chip select signal.

With CSIHnCFG0 to 7.CSIHnBRSSx[1:0] bits, one of the four types of transfer clock frequency settings can be selected for each chip select signal. For details of transfer clock frequency setting, see **Section 17.5.5, Transmission Clock Selection**.

**Access:** This register can be read or written in 16-bit units.

**Address:** CSIHnBRS0: <CSIHn_base> + $1068_H$
CSIHnBRS1: <CSIHn_base> + $106C_H$
CSIHnBRS2: <CSIHn_base> + $1070_H$
CSIHnBRS3: <CSIHn_base> + $1074_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 17.31 CSIHnBRSy Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | CSIHnBRS [11:0] | 0: BRG stopped<br>1: PCLK / ($2^{\alpha}$ × 1 × 2)<br>2: PCLK / ($2^{\alpha}$ × 2 × 2)<br>3: PCLK / ($2^{\alpha}$ × 3 × 2)<br>4: PCLK / ($2^{\alpha}$ × 4 × 2)<br>.<br>.<br>.<br>4095: PCLK / ($2^{\alpha}$ × 4095 × 2)<br><br>α is the value of CSIHnCTL2.CSIHnPRS[2:0]. |

**CAUTION**

When setting this register, see **Table 17.32, Notes on Setting Registers**.

## 17.3.18 List of Cautions

Table 17.32 Notes on Setting Registers (1/3)

| Register Name | Bit Name | Cautions |
|---|---|---|
| CSIHnCTL0 | CSIHnPWR | If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, it is necessary to restart the communication. |
| CSIHnCTL0 | CSIHnTXE<br>CSIHnRXE | Do not modify any of these bits while CSIHnCTL0.CSIHnPWR = 0. (These bits can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.)<br>Do not modify these bits while CSIHnSTR0.CSIHnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted. |
| CSIHnCTL0 | CSIHnJOBE | Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0.<br>This bit is only valid when CSIHnCTL1.CSIHnJE = 1.<br>Setting this bit is prohibited in slave mode. |
| CSIHnCTL0 | CSIHnMBS | Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. (This bit can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.)<br>Modification of this bit is only permitted while CSIHnSTR0.CSIHnTSF = 0.<br>Do not change the mode between FIFO mode and direct access mode while CSIHnCTL0.CSIHnPWR = 1.<br>When the CPU-controlled high-priority communication is enabled, the operation is the same as that in direct access mode regardless of the CSIHnMBS bit setting. |
| CSIHnCTL1 | CSIHnCKR | Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0.<br>When CS is not used, use this bit instead of CSIHnCFGx.CSIHnCKPx and set CSIHnCFGx.CSIHnCKPx to 0.<br>This bit must be used in slave mode. |
| CSIHnCTL1 | CSIHnSLIT<br>CSIHnCSL[7:0]<br>CSIHnEDLE<br>CSIHnDCS<br>CSIHnCSRI<br>CSIHnHSE | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. |
| CSIHnCTL1 | CSIHnPHE<br>CSIHnJE<br>CSIHnLBM | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.<br>Setting of this bit is prohibited in slave mode. |
| CSIHnCTL1 | CSIHnSSE | Modification this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0.<br>Setting this bit to 1 is prohibited in master mode. |
| CSIHnCTL1 | CSIHnSIT | Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0.<br>This bit is only valid in master mode. In slave mode, no delay is generated. |
| CSIHnCTL2 | CSIHnPRS[2:0] | Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0.<br>Setting of the maximum transfer clock frequency is as follows.<br>• Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)<br>• Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16) |
| CSIHnSTR0 | CSIHnSRP[7:0]<br>CSIHnSPF[7:0]<br>CSIHnHPST<br>CSIHnFLF<br>CSIHnEMF<br>CSIHnTSF | Writing to these bits is prohibited, and only reading is permitted. |
| CSIHnSTR0 | CSIHnTMOE<br>CSIHnOFE<br>CSIHnDCE<br>CSIHnPE<br>CSIHnOVE | Writing to these bits is prohibited, and only reading is permitted.<br>These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0. |
| CSIHnSTCR0 | CSIHnPCT | If this bit is set to 1 during communication, ongoing communication is aborted. |
| CSIHnMCTL0 | CSIHnMMS[1:0] | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0 and CSIHnCTL0.CSIHnMBS = 0. |

**Table 17.32 Notes on Setting Registers (2/3)**

| Register Name | Bit Name | Cautions |
|---|---|---|
| CSIHnMCTL0 | CSIHnTO[4:0] | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.<br>Set these bits to 0 in master mode.<br>Set these bits to 0 in direct access, dual buffer, and transmit-only buffer mode. |
| CSIHnMCTL1 | CSIHnFES[6:0]<br>CSIHnFFS[6:0] | Writing to these bits while communication is ongoing is permitted. |
| CSIHnMCTL2 | CSIHnBTST<br>CSIHnND[7:0]<br>CSIHnSOP[6:0] | Writing to these bits is prohibited when CSIHnCTL0.CSIHnPWR = 0.<br>Writing to these bits is prohibited when CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0.<br>Writing to these bits is prohibited when CSIHnSTR0.CSIHnTSF = 1.<br>Writing to these bits is prohibited in direct access or FIFO mode. |
| CSIHnMRWP0 | CSIHnRRA[6:0] | Writing to these bits while communication is ongoing is permitted.<br>Writing to these bits is prohibited in direct access or FIFO mode.<br>When writing is required, set "$00_H$" to these bits in transmit-only buffer mode. |
| CSIHnMRWP0 | CSIHnTRWA[6:0] | Writing to these bits while communication is ongoing is permitted.<br>Writing to these bits is prohibited in direct access or FIFO mode. |
| CSIHnCFGx<br>x = 0 to 7 | CSIHnBRSSx[1:0]<br>CSIHnRCBx<br>CSIHnIDLx<br>CSIHnIDx[2:0]<br>CSIHnHDx[3:0]<br>CSIHnINx[3:0]<br>CSIHnSPx[3:0] | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.<br>These bits must be set to 0 in slave mode. |
| CSIHnCFGx<br>x = 0 to 7 | CSIHnPSx[1:0]<br>CSIHnDLSx[3:0]<br>CSIHnDIRx<br>CSIHnDAPx | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.<br>In slave mode, the CSIHnCFG0 setting is used for the configuration. Therefore, all the bits in CSIHnCFG1 to CSIHnCFG7 must be set to 0. |
| CSIHnCFGx<br>x = 0 to 7 | CSIHnCKPx | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.<br>Set this bit to 0 as CSIHnCTL1.CSIHnCKR must be used in slave mode.<br>If CS is not used, the CSIHnCTL1.CSIHnCKR bit instead of this bit, and clear this bit to 0. |
| CSIHnTX0W | CSIHnEOJ<br>CSIHnCIRE | These bits are only valid when CSIHnCTL1.CSIHnJE = 1.<br>While CSIHnCTL1.CSIHnJE = 0, the values of these bits are ignored even if 1 is read.<br>Set these bits to 0 in slave mode. |
| CSIHnTX0W | CSIHnEDL | This bit is only valid when CSIHnCTL1.CSIHnEDLE = 1.<br>While CSIHnCTL1.CSIHnEDLE = 0, the value of this bit is ignored even if 1 is read. |
| CSIHnTX0W | CSIHnCS[7:0] | In master mode, setting this bit to "$FF_H$" is prohibited.<br>In slave mode, set this bit to "$FE_H$". |
| CSIHnTX0W<br>CSIHnTX0H | | Reading these bits while communication is ongoing is prohibited in FIFO mode.<br>While CSIHnCTL0.CSIHnPWR = 0, reading and writing to these bits is prohibited in FIFO mode.<br>While CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0, writing to these bits are prohibited in direct access mode. |
| CSIHnRX0W | | These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1→ 0.<br>While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode.<br>While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is permitted in the mode (Transmit-only buffer, Dual buffer and Direct access modes) exited FIFO mode.<br>While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited, and reading these bits is permitted.<br>Writing is prohibited and only reading is permitted of these bits while CSIHnCTL0.CSIHnPWR = 1. |

**Table 17.32 Notes on Setting Registers (3/3)**

| Register Name | Bit Name | Cautions |
|---|---|---|
| CSIHnRX0H | | These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1→ 0.<br>While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode.<br>Writing is prohibited and only reading is permitted of these bits while CSIHnCTL0.CSIHnPWR = 1.<br>While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited in the FIFO mode and reading these bits is prohibited in the FIFO mode.<br>In spite of CSIHnCTL0.CSIHnPWR value, writing is prohibited and only reading is permitted of these bits in the mode (Transmit-only buffer, Dual buffer and Direct access modes) exited FIFO mode. |
| CSIHnEMU | CSIHnSVSDIS | Modification of this bit is only permitted while SVSTOP = 0. |
| CSIHnBRSy<br>y = 0 to 3 | | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. |

## 17.4 Interrupt Sources

CSIH can generate the following interrupt requests:

- INTCSIHTIC (communication status interrupt)
- INTCSIHTIR (reception status interrupt)
- INTCSIHTIRE (communication error interrupt)
- INTCSIHTIJC (job completion interrupt)

### 17.4.1 Overview

The communication error interrupt INTCSIHTIRE is generated when an error is detected. The generation of the other interrupts depends on the memory mode, the job mode, and – in case of the job completion interrupt INTCSIHTIJC –also the operating mode.

The job completion interrupt INTCSIHTIJC is only generated when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). It is not available in slave mode.

The following table gives an overview.

**Table 17.33 Interrupt Generation**

| Memory Mode | Interrupt | Interrupt Source | |
|---|---|---|---|
| | | **Job Mode Disabled CSIHnCTL1.CSIHnJE = 0** | **Job Mode Enabled CSIHnCTL1.CSIHnJE = 1** |
| FIFO | INTCSIHTIC | Tx data empty*1 | Tx data empty*1 except job abort*4 |
| | INTCSIHTIR | Rx data full*2 *and* CSIHnCTL0.CSIHnRXE = 1 | Rx data full*2 *and* CSIHnCTL0.CSIHnRXE = 1 |
| | INTCSIHTIRE | Error detected | Error detected |
| | INTCSIHTIJC*3 | Not applicable | CSIHnTX0W.CSIHnCIRE = 1 (except Tx data empty), or job abort*4 |
| Transmit-only buffer | INTCSIHTIC | End of communication | CSIHnTX0W.CSIHnCIRE = 1 *and* (CSIHnCTL0.CSIHnJOBE = 0 *or* CSIHnTX0W.CSIHnEOJ = 0) |
| | INTCSIHTIR | Data received *and* CSIHnCTL0.CSIHnRXE = 1 | Data received *and* CSIHnCTL0.CSIHnRXE = 1 |
| | INTCSIHTIRE | Error detected | Error detected |
| | INTCSIHTIJC*3 | Not applicable | Job abort*4 |
| Dual buffer | INTCSIHTIC | End of communication | CSIHnTX0W.CSIHnCIRE = 1 *and* (CSIHnCTL0.CSIHnJOBE = 0 *or* CSIHnTX0W.CSIHnEOJ = 0) |
| | INTCSIHTIR | End of communication *and* CSIHnCTL0.CSIHnRXE = 1 | Data received *and* CSIHnCTL0.CSIHnRXE = 1 |
| | INTCSIHTIRE | Error detected | Error detected |
| | INTCSIHTIJC*3 | Not applicable | Job abort*4 |
| Direct access | INTCSIHTIC | One data transfer | One data transfer except the state of job abort*4 |
| | INTCSIHTIR | Data received *and* CSIHnCTL0.CSIHnRXE = 1 | Data received *and* CSIHnCTL0.CSIHnRXE = 1 |
| | INTCSIHTIRE | Error detected | Error detected |
| | INTCSIHTIJC*3 | Not applicable | Job abort*4 |

Note 1. “Tx data empty” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFES[6:0].

Note 2. “Rx data full” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFFS[6:0].
Note 3. INTCSIHTIJC is not available in slave mode.
Note 4. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1
During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

### 17.4.2 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half a cycle of the transmission clock, CSIHTSCK. This is not possible in slave mode.

The delay is specified by setting CSIHnCTL1.CSIHnSIT = 1. (The setting of the CSIHnSIT bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIHnCTL1.CSIHnSIT = 1 (interrupt delay enabled), CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0 (clock phase and data phase), and CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$ (data length 8 bits).

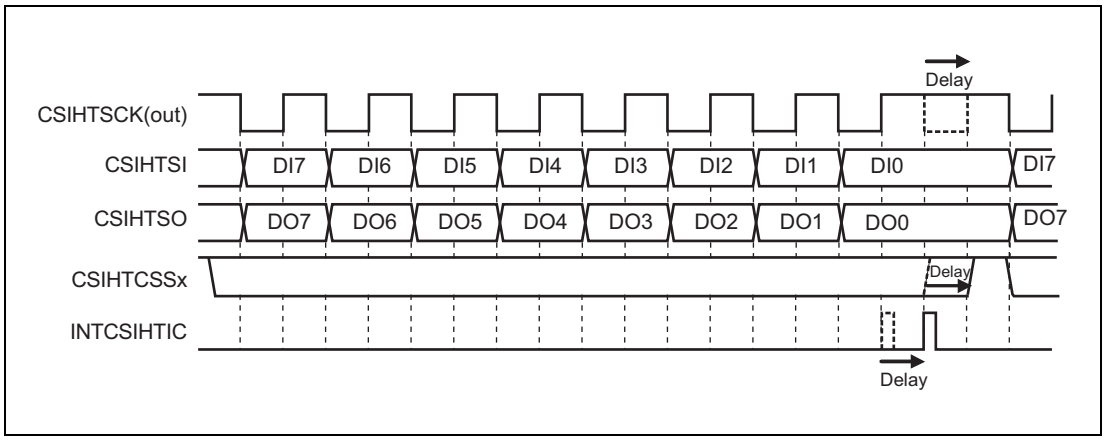

**Figure 17.2 Interrupt Delay Function (CSIHnCTL1.CSIHnSIT = 1)**

Setting CSIHnCTL1.CSIHnSIT = 1 adds a half cycle delay to the transmission clock. This also delays the end of the current chip select signal (CSIHTCSSx).

### 17.4.3 INTCSIHTIC (Communication Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions shown in the following table.

**Table 17.34 INTCSIHTIC Interrupt Generation**

| Memory Mode | Interrupt Source | |
|---|---|---|
| | **Job Mode Disabled CSIHnCTL1.CSIHnJE = 0** | **Job Mode Enabled CSIHnCTL1.CSIHnJE = 1** |
| FIFO | This interrupt is generated just before transmission data in the FIFO runs out, notifying the application that new data should be added. INTCSIHTIC is generated if the number of transmit data remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMTCL1.CSIHnFES[6:0]. | Similar to “when JE is 0”, an interrupt is generated when the number of transmit data remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMCTL1.CSIHnFES[6:0]. However, it is not generated if a job is aborted. |
| Transmit-only buffer, dual buffer | An interrupt is generated at the end of communication. (specified by the CSIHnMTLC2.CSIHnND[7:0] bit) | Generated when data is transmitted while CSIHnTX0W.CSIHnCIRE = 1. Note that if data and job abort*1 are transmitted while CSIHnTX0W.CSIHnCIRE = 1, the INTCSIHTIJC interrupt is generated instead of INTCSIHTIC. |
| Direct access | Generated after every data transfer. | Generated after every data transfer, except when the communication was aborted. |

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1.
During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

### 17.4.3.1 INTCSIHTIC in Direct Access Mode

The examples below show the INTCSIHTIC behavior in direct access mode.

The examples assume:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$)
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

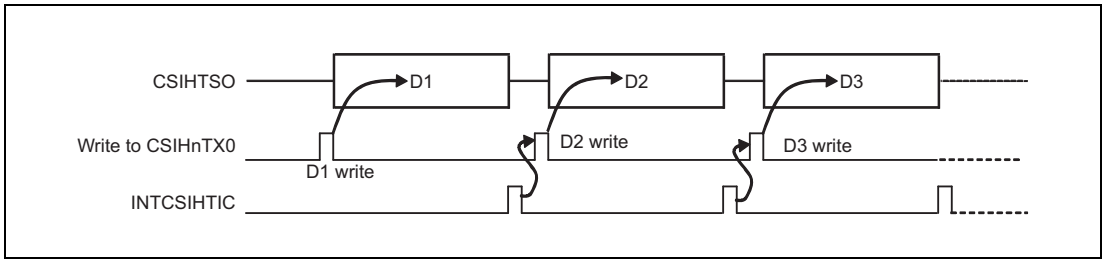

**Figure 17.3 Generation of INTCSIHTIC after Transfer (CSIHnCTL1.CSIHnSLIT = 0)**

If job mode is enabled (CSIHnCTL1.CSIHnJE = 1) and a job ends because data is sent with CSIHnTXOW.CSIHnEOJ = 1 and communication stop is requested (CSIHnCTL0.CSIHnJOBE = 1), then INTCSIHTIC is replaced by the job completion interrupt INTCSIHTIJC.

INTCSIHTIC can also be set up to occur as soon as the CSIHnTX0W/H register becomes empty and available for storing the next data. This is specified by setting CSIHnCTL1.CSIHnSLIT = 1.

The effect is illustrated in the figure below.

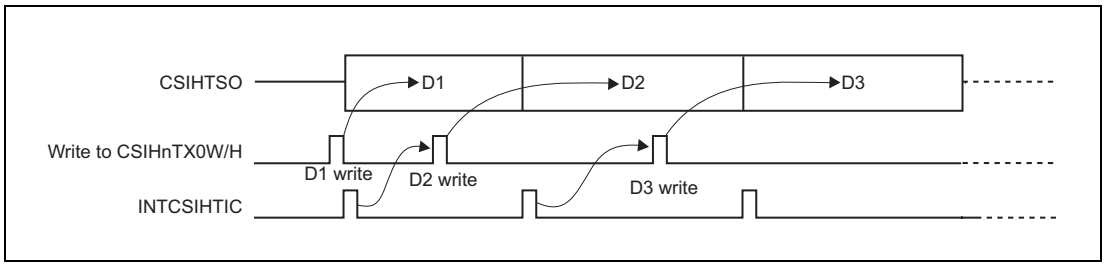

**Figure 17.4 Immediate Generation of INTCSIHTIC (CSIHnCTL1.CSIHnSLIT = 1)**

Thus, the new data can be written in advance.

**NOTE**

During high priority communication in transmit-only buffer mode, the operation is in the same as that in direct access mode.

### 17.4.3.2 INTCSIHTIC in FIFO Mode

The example below shows the INTCSIHTIC behavior in FIFO mode.

The example assumes:

- Master mode
- FIFO mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$)

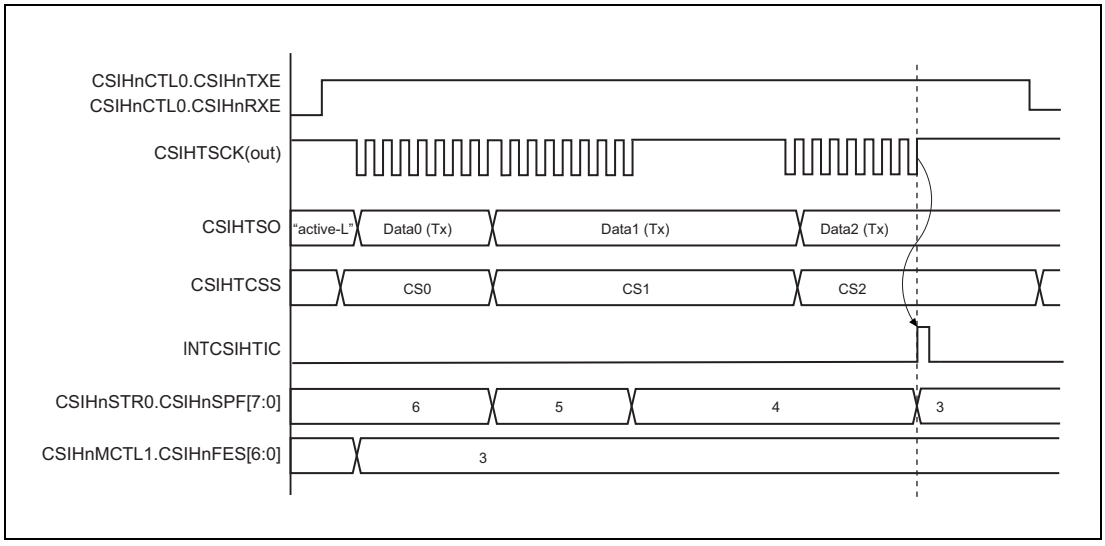

**Figure 17.5 Generation of INTCSIHTIC in FIFO Memory Mode**

The condition for "FIFO empty" is specified in CSIHnMCTL1.CSIHnFES[6:0]. In the example of the diagram above, the number of unsent data in FIFO is set to 3.

CSIHnSTR0.CSIHnSPF[7:0] indicates the number of unsent data. When both match, the interrupt INTCSIHTIC occurs.

### 17.4.3.3 INTCSIHTIC in Job Mode

The example below shows the INTCSIHTIC behavior in job mode.

The example assumes:

- Master mode
- Job mode enabled (CSIHnCTL1.CSIHnJE = 1)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$)
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

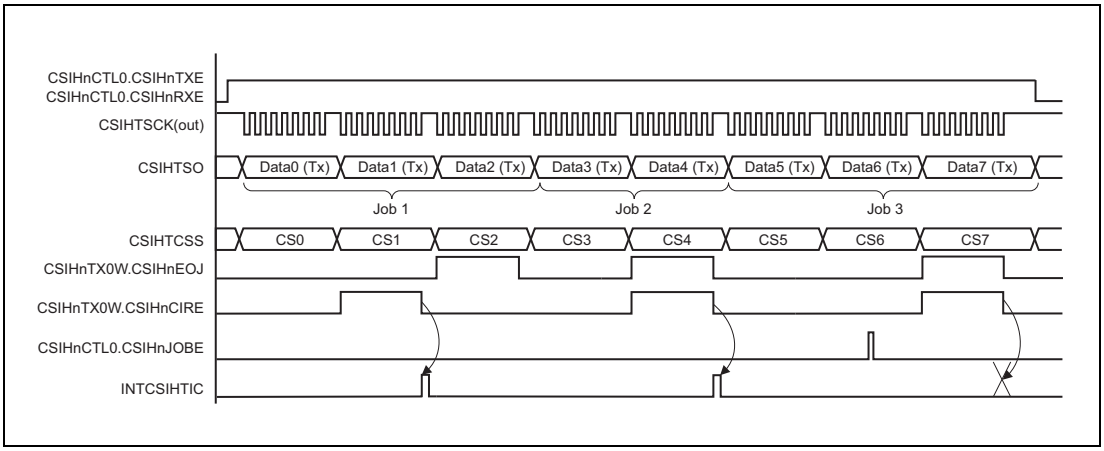

**Figure 17.6 Generation of INTCSIHTIC in Job Mode**

The rules for generating INTCSIHTIC in job mode are shown in the following table.

**Table 17.35 Generation of INTCSIHTIC in Job Mode**

| CSIHnTX0W. CSIHnEOJ | CSIHnTX0W. CSIHnCIRE | INTCSIHTIC |
|---|---|---|
| 0 | 0 | Not generated |
| 0 | 1 | Generated |
| 1 | 0 | Not generated |
| 1 | 1 | CSIHnCTL0.CSIHnJOBE = 0: Generated |
| | | CSIHnCTL0.CSIHnJOBE = 1: Not generated, replaced by interrupt INTCSIHTIJC |

### 17.4.4 INTCSIHTIR (Reception Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions below.

**Table 17.36 INTCSIHTIR Interrupt Generation**

| Memory Mode | Interrupt Source | |
|---|---|---|
| | **Job Mode Disabled CSIHnCTL1.CSIHnJE = 0** | **Job Mode Enabled CSIHnCTL1.CSIHnJE = 1** |
| FIFO | This interrupt occurs when CSIHnCTL0.CSIHnRXE is 1 and the FIFO buffer is almost full with received data, notifying the application that the FIFO must be emptied. INTCSIHTIR is generated, if the number of received data in the FIFO (CSIHnSTR0.CSIHnSRP[7:0]) equals (128 – CSIHnMCTL1.CSIHnFFS[6:0]). | |
| Dual buffer | An interrupt is generated when the communication has finished (as specified by the CSIHnMCTL2.CSIHnND[7:0] bits) and CSIHnCTL0.CSIHnRXE = 1. | An interrupt is generated after every data transfer. |
| Transmit-only buffer, Direct access | An interrupt is generated after every data transfer. | |

#### 17.4.4.1 INTCSIHTIR in Direct Access Mode

The example below shows the INTCSIHTIR behavior in direct access mode.

The example below assumes:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$)

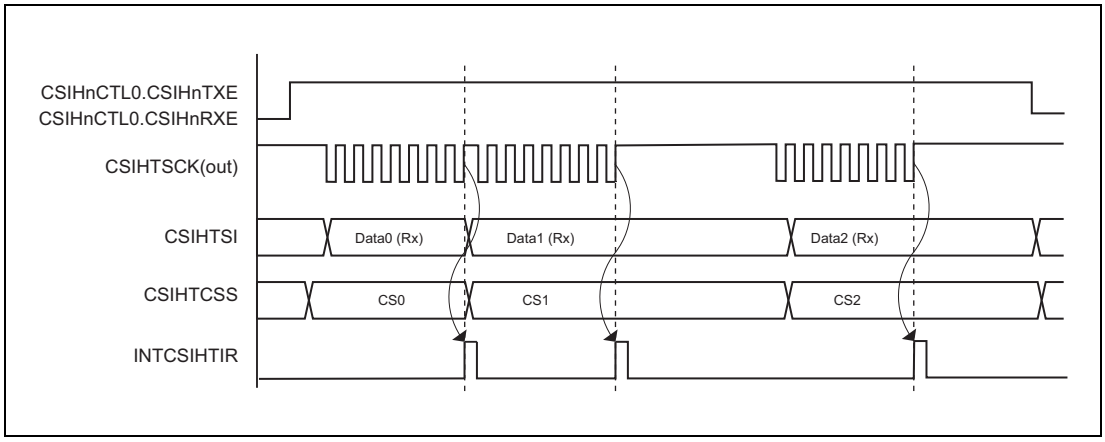

**Figure 17.7 Generation of INTCSIHTIR in Direct Access Mode**

### 17.4.4.2 INTCSIHTIR in Dual Buffer Mode

The example below shows the INTCSIHTIR behavior in dual buffer mode.

The example assumes:

- Master mode
- Dual buffer mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Default clock phase and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$)

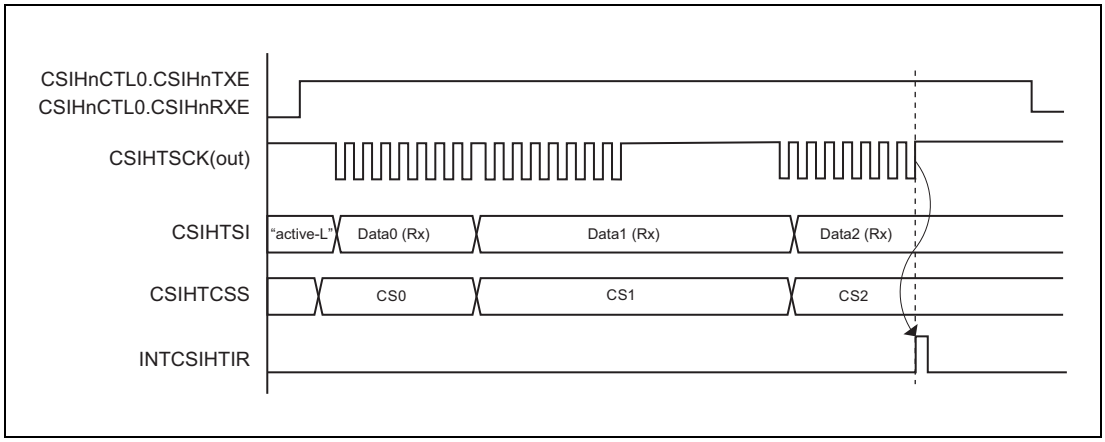

**Figure 17.8 Generation of INTCSIHTIR in Dual Buffer Mode**

### 17.4.5 INTCSIHTIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

For details about interrupt generation timing, see **Section 17.5.12, Error Detection**.

**Table 17.37 Data Error Types**

| Error Type | Communication Status after Error Interrupt | Note |
|---|---|---|
| FIFO overflow error | Communication continues even if an interrupt is generated. | The data is not written to the FIFO buffer and the data that overflowed is lost, but communications started before the error continue. |
| Parity error | Communication continues even if an interrupt is generated. | — |
| Data consistency check error | Communication continues even if an interrupt is generated. | — |
| Time-out error | Communication continues even if an interrupt is generated. | — |
| Overrun error | **Condition for errors 1:**<br>In FIFO mode, when the number of received data is 0 and CPU reads the CSIHnRX0W/H register, an interrupt is generated and communication continues. | — |
| | **Condition for errors 2:**<br>In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled):<br>[1] In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data is retained in the CSIHnRX0W/H register, an interrupt is generated, and communication continues.<br>[2] In FIFO mode, when reception by the FIFO buffer is completed and the buffer is in the full state, an interrupt is generated. Communication continues. | In slave mode, when CSIHnCTL1.CSIHnHSE = 1 (handshake function enabled), communication is suspended due to handshake, an overrun error is not generated. |

The type of error that caused the generation of INTCSIHTIRE is flagged in register CSIHnSTR0.

Additionally a parity error flag and a data consistency check error flag are attached to the received data in CSIHnRX0W.

For details about the various error types, see **Section 17.5.12, Error Detection**.

### 17.4.6 INTCSIHTIJC (Job Completion Interrupt)

This interrupt supports the handling of jobs. See **Section 17.5.3.3, Job Concept**. This interrupt is only available in master mode.

Job mode is enabled by setting CSIHnCTL1.CSIHnJE = 1. When CSIHnCTL1.CSIHnJE = 0, INTCSIHTIJC is not generated.

Depending on the memory mode, this interrupt is generated according to the condition shown in the following table.

**Table 17.38 INTCSIHTIJC Interrupt Generation**

| Memory Mode | Job Mode Disabled CSIHnCTL1.CSIHnJE = 0 | Job Mode Enabled CSIHnCTL1.CSIHnJE = 1 |
|---|---|---|
| FIFO | Not applicable | Indicates that the communication stopped at the end of a job after a job abort*1 was triggered<br>If FIFO empty is not detected, INTCSIHTIJC is generated when CSIHnCIRE is 1. |
| Transmit-only buffer | | Indicates that the communication stopped at the end of a job after a job abort*1 was triggered. |
| Dual buffer | | |
| Direct access | | |

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1

# 17.5 Operation

## 17.5.1 Operating Modes (Master/Slave)

Whether CSIH operates in the master or slave mode determines the source of the serial clock.

### 17.5.1.1 Master Mode

In master mode, the serial transmission clock is generated by the internal baud rate generator (BRG) and supplied to the slave(s) by signal CSIHTSCK.

Master mode is enabled by setting CSIHnCTL2.CSIHnPRS[2:0] to values other than $111_B$. In master mode, the BRG frequency can be specified by setting the CSIHnCTL2.CSIHnPRS[2:0] bits in combination with the CSIHnBRSy.CSIHnBRS[11:0] bits.

#### (1) Chip select signals

In master mode, one or more chip select signals can be used. If several slaves are connected to the master, the chip select signals can be used to select one or more slaves. Only the selected slave is then enabled for communication.

The communication protocol as well as additional parameters are stored separately for each chip select signal. This makes it possible to adapt the data transfer individually to the requirements of each slave. For details, see **Section 17.5.3, Chip Selection (CS) Features**.

#### (2) Clock defaults

The default level of CSIHTSCK depends on the clock phase inversion function bit of the CSIHTSCK, and is high when CSIHnCTL1.CSIHnCKR = 0 and is low when CSIHnCTL1.CSIHnCKR = 1.

The example below shows the communication in master mode for 8-bit data, CSIHnCTL1.CSIHnCKR = 0, CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0, and MSB first.

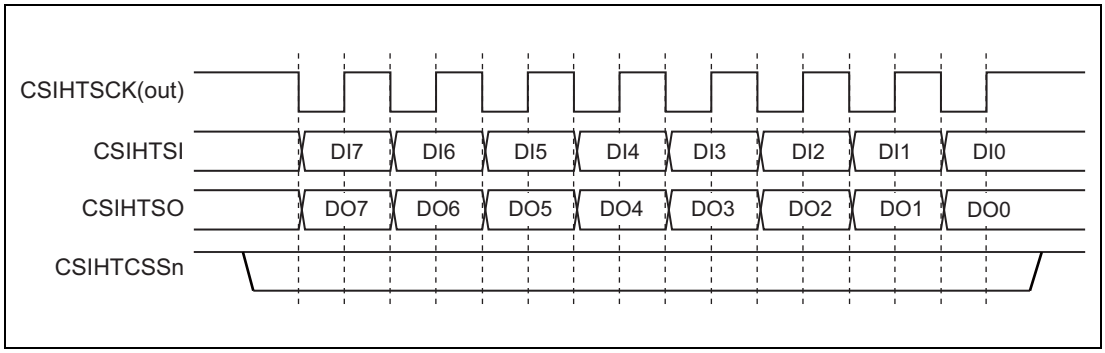

**Figure 17.9 Transmission/Reception in Master Mode**

### 17.5.1.2 Slave Mode

In slave mode, another device is the communication master and supplies the transmission clock. Normal transmit/receive operation is started as soon as a clock signal is detected.

Slave mode is selected by setting the CSIHnCTL2.CSIHnPRS[2:0] bits to $111_B$.

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is enabled (settings of the CSIHnCFG1 - CSIHnCFG7 registers are disabled).

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock phase and data phase

**NOTE**

When using slave mode, disable the baud rate generator (BRG) by setting the CSIHnBRSy.CSIHnBRS[11:0] bits to $000_H$. However, if you are using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than $000_H$.

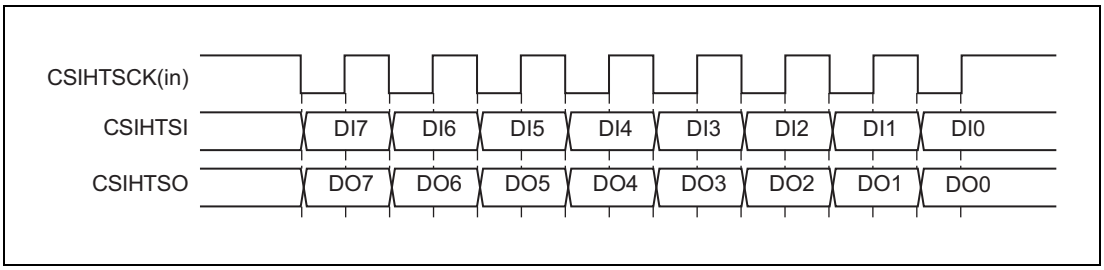

**Figure 17.10 Transmission/Reception in Slave Mode**

## 17.5.2 Master/Slave Connections

### 17.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

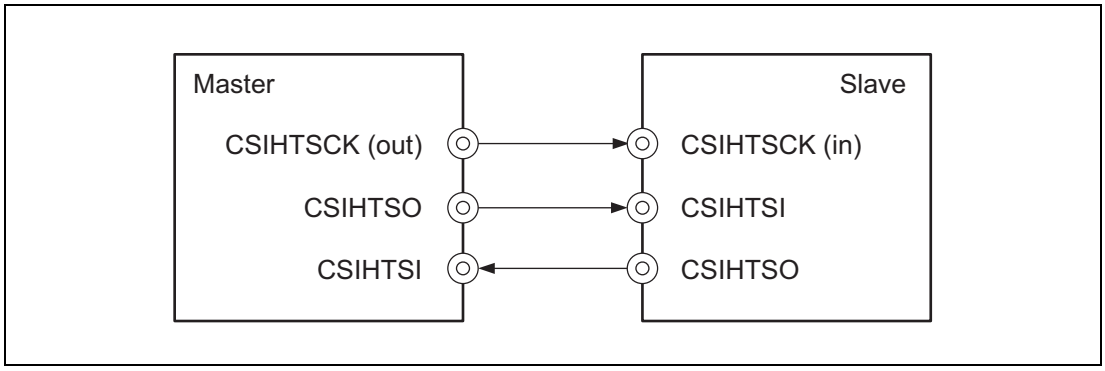

**Figure 17.11 Direct Master/Slave Connection**

### 17.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this example, the master supplies one chip select (CS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text{CSIHTSSI}}$ of the slave.

The $\overline{\text{CSIHTSSI}}$ signal can be enabled/disabled by using the CSIHnCTL1.CSIHnSSE bit.

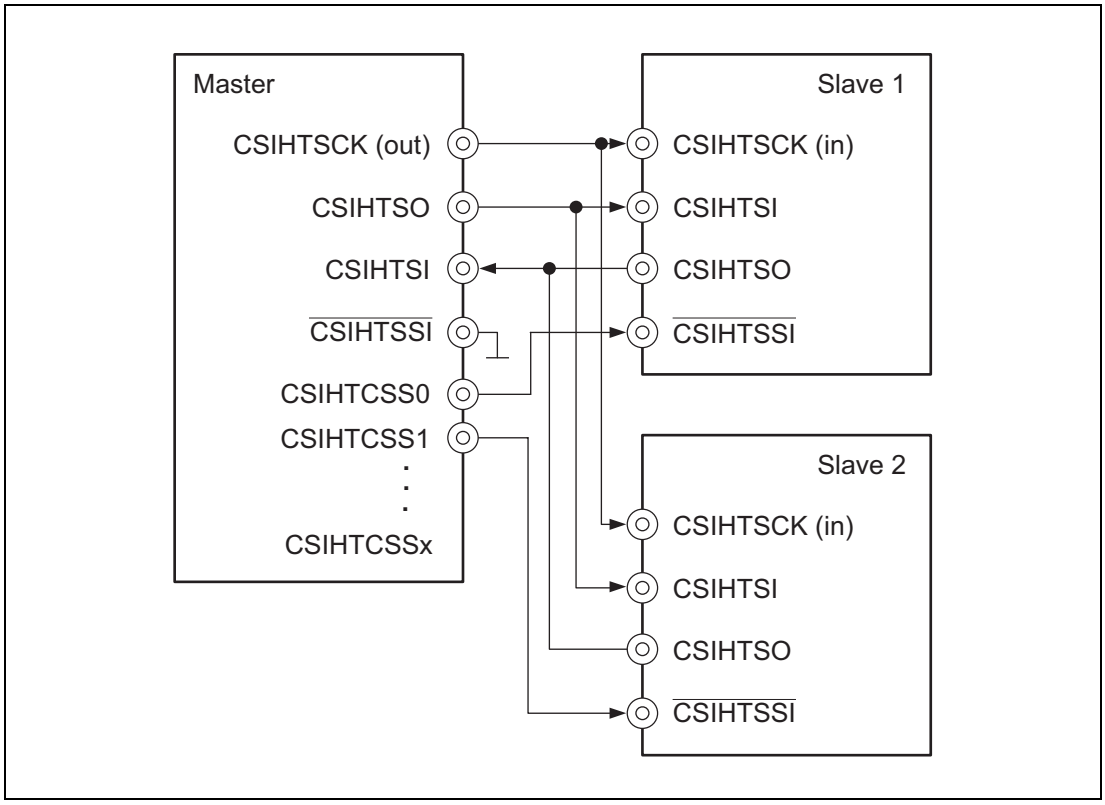

**Figure 17.12 Connections between One Master and Multiple Slaves**

By default, the chip select level is active low. That means, a slave is selected (enabled) as a CSIH slave when its $\overline{\text{CSIHTSSI}}$ signal is low level. However, to adapt the CS to other devices, the output level of each chip select signal can also be programmed to be active high.

If a slave is not selected, it will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set (CSIHnCTL0.CSIHnTXE = 1), the CSIHTSO output of the slaves that are not selected is disabled and set to input mode in order to avoid interference with the output of the selected slave.

### 17.5.3 Chip Selection (CS) Features

The chip select signal, CSIHTCSSx can be used by the master to select one or more slaves for communication.

#### 17.5.3.1 Configuration Registers

The parameters for each chip select signal CSIHTCSSx are defined in the corresponding configuration register CSIHnCFGx. The parameters include the communication protocol and additional CS parameters.

The communication protocol specifies:

- Data length: The number of bits to be sent or received.
  (CSIHnCFGx.CSIHnDLSx[3:0])
- Transfer direction: MSB or LSB first.
  (CSIHnCFGx.CSIHnDIRx)
- Parity usage: Odd, even, 0 parity or none.
  (CSIHnCFGx.CSIHnPSx[1:0])
- Clock phase and data phase.
  (CSIHnCFGx.CSIHnCKPx, CSIHnCFGx.CSIHnDAPx)

Additional parameters for each chip select signal that are only available in master mode are:

- Individual selection of the baud rate generator prescaler for each chip select signal
  (CSIHnCFGx.CSIHnBRSSx[1:0])
- Chip select priority: Categorizes chip select signals into “dominant” and “recessive”. The priority applies if two or more chip selects signals with different configurations are simultaneously activated for message broadcasting. In this case, the configuration specified for dominant chip select signals is used. (CSIHnCFGx.CSIHnRCBx)

The principle is also called “Recessive Configuration for Broadcasting” (RCB).

**CAUTION**

**When specifying multiple chip select signals as dominant, be sure to configure the same settings for all dominant signals.**

- Chip select timing:
  - Setup time $T_{setup}$: The time from when the CS signal becomes active to the start of data output.
    (CSIHnCFGx.CSIHnSPx[3:0])
  - Inter-data time $T_{inter}$: The time between one data and the next data while the same CS signal is active.
    (CSIHnCFGx.CSIHnINx[3:0])
  - Hold time $T_{hold}$: The time during which the CS signal remains active until CS is switched.
    (CSIHnCFGx.CSIHnHDx[3:0])
  - Idle time $T_{idle}$: Inactive time after terminating a CS signal or after every data transfer to the same CSx. (CSIHnCFGx.CSIHnIDx[2:0])

The CS timings of the setup time, the inter-data time, the hold time, and the idle time are illustrated in the figure below. When CSIHnCFGx.CSIHnIDLx bit is set to 1, IDLE time is inserted for every transfer regardless of CS signal.

**Figure 17.13** provides an example of when the default active low setting is specified for the CSIHTCSS1 and CSIHTCSS2 signals (CSIHnCTL1.CSIHnCSL1 bit = 0, CSIHnCTL1.CSIHnCSL2 bit = 0). The active level can be specified individually for each CS.

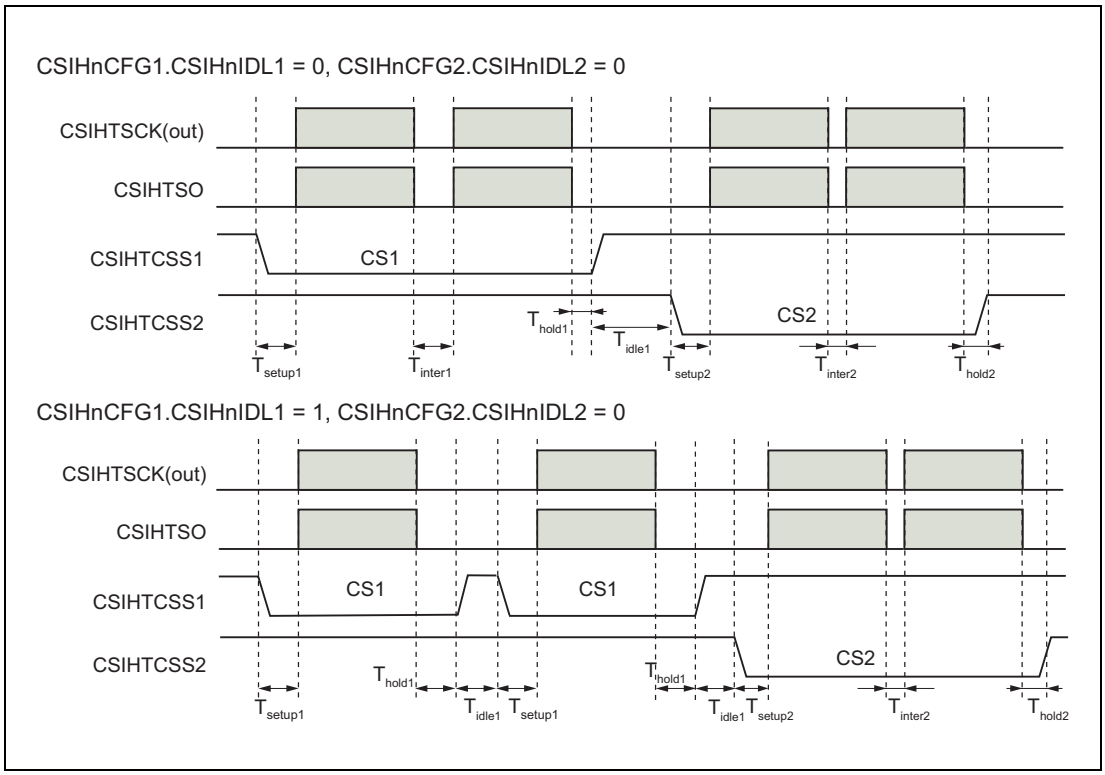

**Figure 17.13 Chip Select Timings**

Note that each CS signal can have a different value for the setup time, inter-data time, hold time, and idle time.

A particular chip select signal is activated by setting the appropriate bit in the transmission register CSIHnTX0W.CSIHnCSx.

CSIHnRX0W.CSIHnCSx in the reception register indicates the chip select signal associated with the received data.

**CAUTION**

**When high priority communication function by CPU control is enabled (CSIHnCTL1.CSIHnPHE = 1), IDLE state is inserted regardless of IDLn bit settings when priority communication mode is changed from low to high and from high to low.**

### 17.5.3.2 CS Example

The following figure shows an example of two consecutive data transmissions.

The first communication uses CS0 to communicate with a single slave. The second enables CS0 and CS1 to broadcast a message to two slaves. The priority of CS0 is set to “recessive: low priority” and the priority of CS1 to “dominant: high priority”. Consequently, the second communication is conducted using the CS1 settings, which are set as dominant.

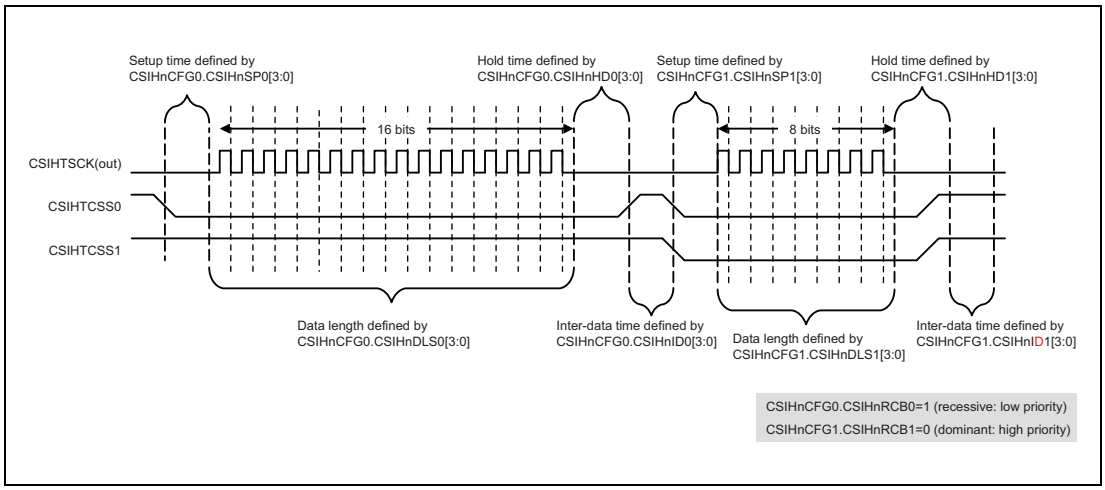

**Figure 17.14 Chip Select and RCB Example**

### 17.5.3.3 Job Concept

In CSIH, a job consists of the number of data targeted for transfer.

#### Job mode enable

The job mode can only be enabled in master mode. The job mode is enabled or disabled by CSIHnCTL1.CSIHnJE, while the CSIH is disabled by CSIHnCTL0.CSIHnPWR = 0.

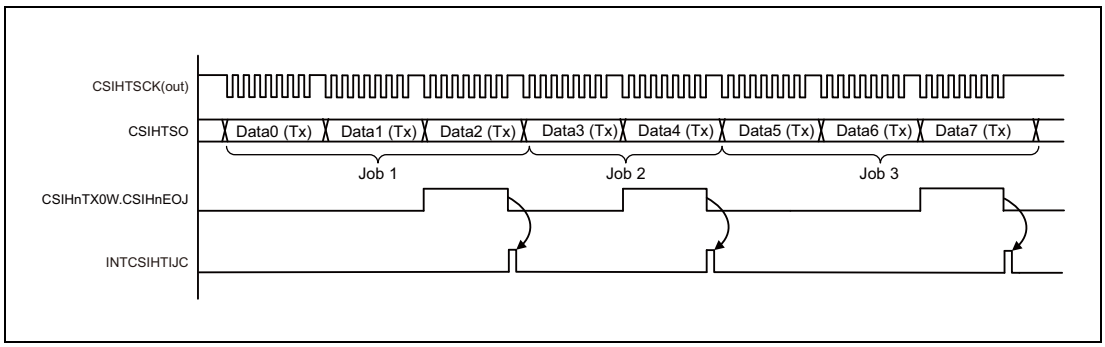

**Figure 17.15 Job Examples**

A job ends by transmitting data with CSIHnTX0W.CSIHnEOJ = 1.

Communication can be specified to stop when a job is finished. This is done by setting CSIHnCTL0.CSIHnJOBE. When CSIHnJOBE is set, the communication continues until the data for which the CSIHnEOJ bit is set is transmitted. After this data is sent, the communication is stopped and the job completion interrupt INTCSIHTIJC is generated.

## 17.5.4 Details of Chip Select Timing

### 17.5.4.1 Changing the Clock Phase

The serial clock level specified by CSIHnCFGx.CSIHnCKPx can be changed while communication is stopped. The minimum value of an idle time is one transmission clock (CSIHTSCK(out)) cycle.

If the idle time is set to 0.5 transmission clock cycles (in CSIHnCFGx.CSIHnIDx[2:0]) and two consecutive data is sent with different CSIHnCFGx.CSIHnCKPx configurations, the idle time is automatically extended to one CSIHTSCK(out) cycle.

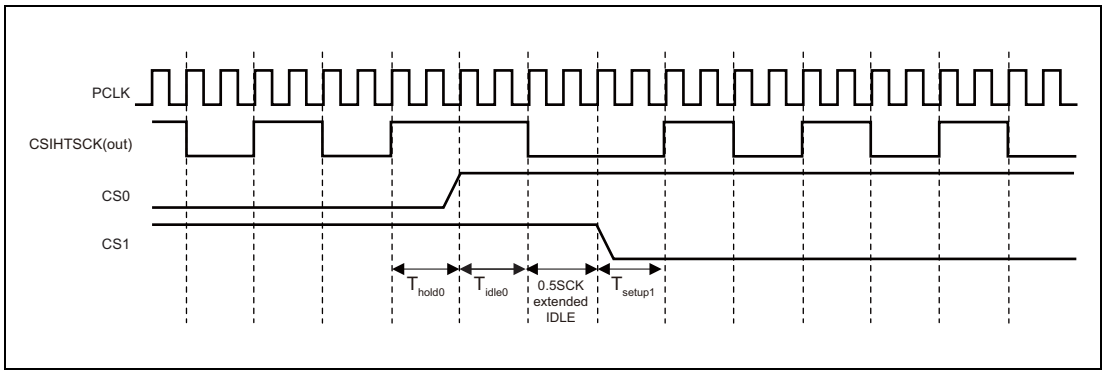

**Figure 17.16 Clock Phase Timing with PCLK/4, $T_{hold}0 = T_{setup1}$ = 0.5CSIHTSCK, $T_{idle0}$ = 0.5CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)**

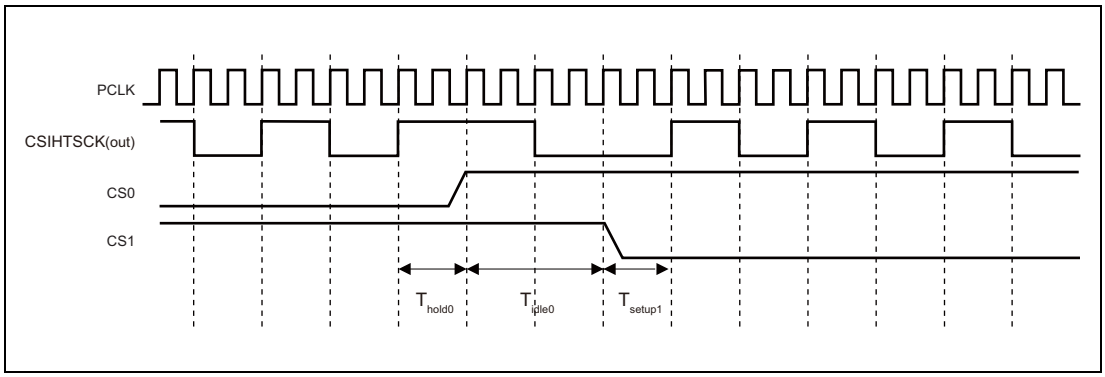

**Figure 17.17 Clock Phase Timing with PCLK/4, $T_{hold}0 = T_{setup1}$ = 0.5CSIHTSCK, $T_{idle0}$ = 1CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)**

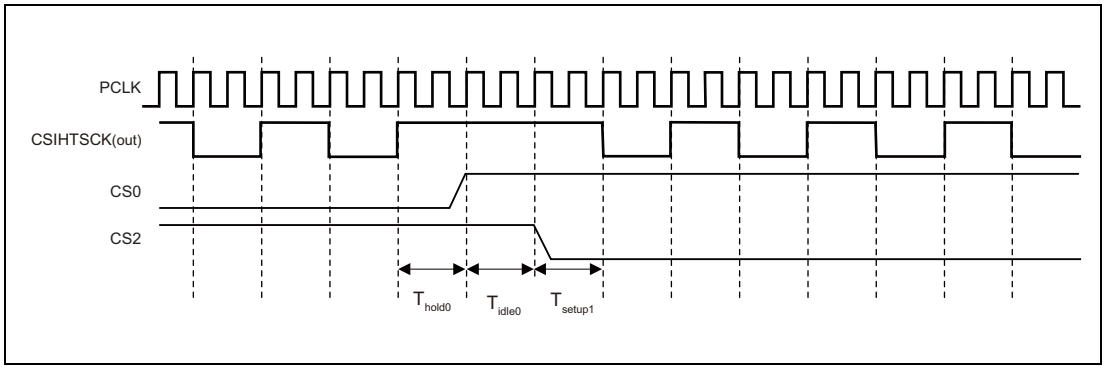

**Figure 17.18 Clock Phase Timing with PCLK/4, $T_{hold}0 = T_{setup1}$ = 0.5CSIHTSCK, $T_{idle0}$ = 0.5CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG2.CSIHnCKP2 = 0 (CSIHTCSS2)**

### 17.5.4.2 Changing the Data Phase

The CSIHnCFGx.CSIHnDAPx bit defines the phase of the data bits relative to the clock.

The relation between the setting of the CSIHnCFGx.CSIHnDAPx bit and the hold and setup times is as follows:

Hold time is the period from the last edge of the serial clock (CSIHTSCK) until the signals on CSIHTCSS[7:0] change to the inactive level.

Setup time is the period from when the signals on CSIHTCSS[7:0] change to the active level until to when the transmission data (CSIHTSO) is output.

Therefore, there is a gap of 0.5 CSIHTSCK cycles until the edge of the serial clock signal (CSIHTSCK) is output according to the CSIHnCFGx.CSIHnDAPx setting.

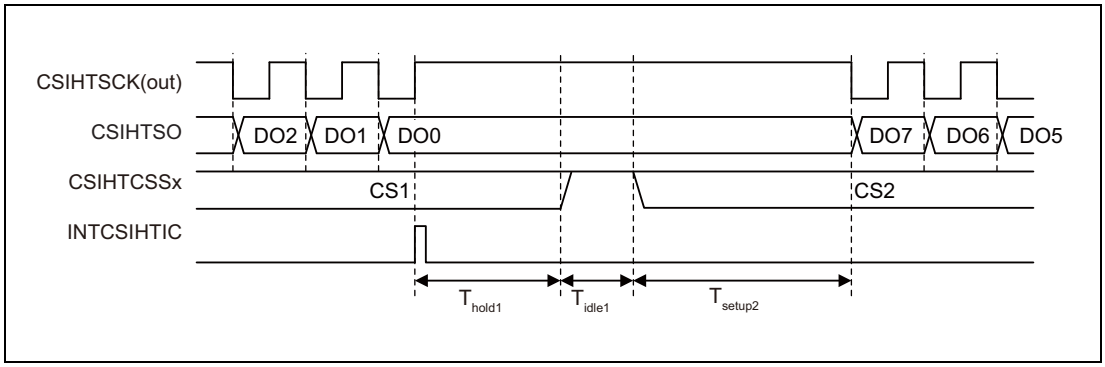

**Figure 17.19 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 = 0 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 0**

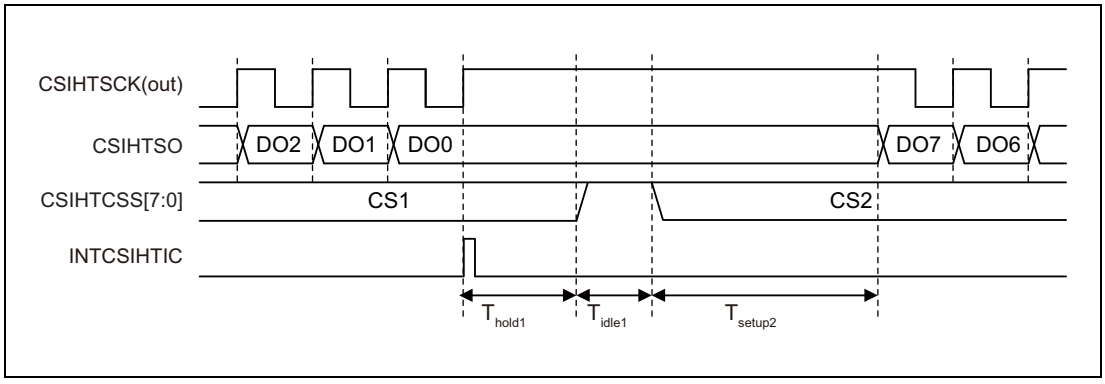

**Figure 17.20 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 1, CSIHnCFG1.CSIHnDAP1 = 0 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 1**

### 17.5.5 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the following bits:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnBRSy.CSIHnBRS[11:0]
- CSIHnCFGx.CSIHnBRSSx[1:0]

The transfer clock frequency of transmission clock CSIHTSCK is determined by the setting of the CSIHnCTL2.CSIHnPRS[2:0] bits and the setting of the CSIHnBRSy.CSIHnBRS[11:0] bits, but any one of CSIHnBRS3 to CSIHnBRS0 can be selected for each chip select signal by using the CSIHnCFGx.CSIHnBRSSx[1:0] bits.

The following figure shows a block diagram of the baud rate generator.

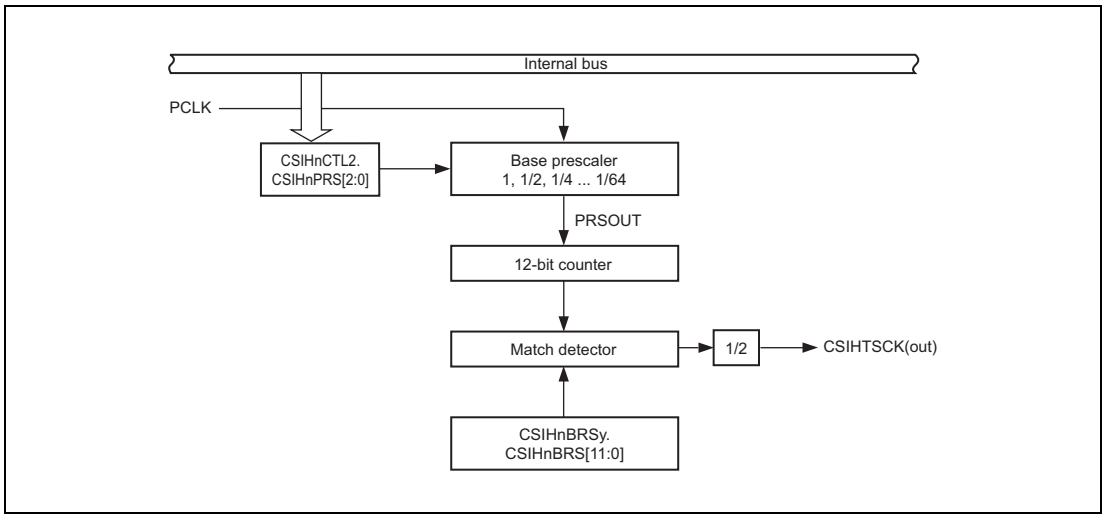

**Figure 17.21 Baud Rate Generator Block Diagram**

By setting CSIHnBRSy.CSIHnBRS[11:0] to $000_H$, the baud rate generator is disabled and all CSIHTSCK are stopped.

#### Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated as:

Transfer clock frequency (CSIHTSCK) = PCLK / (division ratio of PCLK) = PCLK / ($2^{\alpha} \times k \times 2$),

where:

α = CSIHnCTL2.CSIHnPRS[2:0] = 0 to 6

k = CSIHnBRS0.CSIHnBRS0[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 0)
CSIHnBRS1.CSIHnBRS1[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 1)
CSIHnBRS2.CSIHnBRS2[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 2)
CSIHnBRS3.CSIHnBRS3[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 3)

### Transfer clock frequency upper and lower limits

When setting the transfer clock frequency, please note the following:

- The minimum transfer clock frequency in master mode and slave mode is PCLK/524160.
- The maximum transfer clock frequency is as follows:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)

### 17.5.6 CSIH Buffer Memory

The CSIH has a configurable RAM that can be used for buffered I/O. The size is 128 words. One word is comprised of 32-bit data and 7-bit ECC.

The following configurations are available:

| Mode | CSIHnCTL0. CSIHnMBS | CSIHnMCTL0. CSIHnMMS[1:0] |
|---|---|---|
| FIFO mode | 0 | $00_B$ |
| Dual buffer mode | | $01_B$ |
| Transmit-only buffer mode | | $10_B$ |
| Direct access mode | 1 | X |

#### 17.5.6.1 FIFO Mode

In FIFO mode, data can be written to the CSIHnTX0W register without waiting for completion of the transmission, and data can be received without reading the CSIHnRX0W register immediately, provided the FIFO is not full.

Data to be transmitted is stored in the FIFO memory. Transmission and reception occur simultaneously – one data is received as one data is transmitted. That means, received data overwrites the transmitted data in the FIFO.

The CSIH automatically updates the respective FIFO memory pointers when data is written to or read from the FIFO memory, or data is transmitted to or received from the FIFO memory.

**Table 17.39 FIFO Mode**

| Pointer Description | Pointer*1 | Range |
|---|---|---|
| Number of untransmitted words | CSIHnSTR0.CSIHnSPF[7:0] | 0 to 128 |
| Number of words received and stored in the FIFO | CSIHnSTR0.CSIHnSRP[7:0] | 0 to 128 |
| Address for write/read of transmit data | CSIHnMRWP0.CSIHnTRWA[6:0] | $0000_H$ to $01FC_H$ |
| Address for read of received data | CSIHnMRWP0.CSIHnRRA[6:0] | $0000_H$ to $01FC_H$ |
| Address to be sent | CSIHnMCTL2.CSIHnSOP[6:0] | $0000_H$ to $01FC_H$ |

Note 1. The values are automatically updated after each read/write or data transmit/receive operation.

The CSIH status register contains two FIFO status flags:

- CSIHnSTR0.CSIHnFLF: FIFO full
- CSIHnSTR0.CSIHnEMF: FIFO empty

When this mode is started, bit CSIHnSTCR0.CSIHnPCT must be set. By doing this, CSIHnSTR0.CSIHnEMF is not reset, but set.

All FIFO pointers and FIFO flags except CSIHnSTR0.CSIHnEMF are reset and CSIHnSTR0.CSIHnEMF is set.

### 17.5.6.2 Dual Buffer Mode

In this mode, the memory is divided into two parts of equal size; 64 words are allocated to transmission data and 64 words to received data. In dual buffer mode, the respective buffer pointers indicate the values shown in the following table.

**Table 17.40 Dual Buffer Mode**

| Pointer Description | Pointer*1 | Range |
|---|---|---|
| Address of data written to and read from transmit buffer | CSIHnMRWP0.CSIHnTRWA[6:0] | $0000_H$ to $00FC_H$ |
| Address of data read from receive buffer | CSIHnMRWP0.CSIHnRRA[6:0] | $0000_H$ to $00FC_H$ |
| The number of transmit data remaining in the transmit buffer | CSIHnMCTL2.CSIHnND[6:0] | 0 to 64 |
| Address to which data is transmitted | CSIHnMCTL2.CSIHnSOP[6:0] | $0000_H$ to $00FC_H$ |

Note 1. Pointers are automatically incremented after each read/write.

### 17.5.6.3 Transmit-Only Buffer Mode

In this mode, the entire memory is used to save transmission data.

Received data must be read directly from CSIHnRX0W/H.

In transmit-only buffer mode, the respective buffer pointer indicates the values shown in the following table.

**Table 17.41 Transmit-Only Buffer Mode**

| Pointer Description | Pointer*1 | Range |
|---|---|---|
| Address of data written to and read from transmit buffer | CSIHnMRWP0.CSIHnTRWA[6:0] | $0000_H$ to $01FC_H$ |
| The number of transmit data remained in the transmit buffer | CSIHnMCTL2.CSIHnND[6:0] | 0 to 128 |
| Address to which data is transmitted | CSIHnMCTL2.CSIHnSOP[6:0] | $0000_H$ to $01FC_H$ |

Note 1. Pointers are automatically incremented after each read/write.

### 17.5.6.4 Direct Access Mode

In direct access mode, the CSIH memory is completely bypassed:

- Transmission data provided by the CPU to the transmission register CSIHnTX0W or CSIHnTX0H is directly copied to the shift register.
- Reception data is directly copied from the shift register to the reception register CSIHnRX0W or CSIHnRX0H.

## 17.5.7 Data Transfer Modes

### 17.5.7.1 Transmit-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 0 puts the CSIH in transmit-only mode. Start of transmission depends on the memory mode:

- In case of FIFO or direct access mode, transmission starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, transmission starts when the CSIHnMCTL2.CSIHnBTST bit is set.

### 17.5.7.2 Receive-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 0 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in receive-only mode.

In master mode, start of reception depends on the memory mode:

- In case of FIFO or direct access mode, reception starts when dummy data is written to the CSIHnTX0W or CSIHnTX0H register.

In slave mode, reception starts as soon as the CSIHTSCK transmission clock is received from the master. It is not necessary to write data to the CSIHnTX0W or CSIHnTX0H register of the slave.

- In case of dual buffer mode or transmit-only buffer mode, reception starts when the CSIHnMCTL2.CSIHnBTST bit is set.

### 17.5.7.3 Transmit/Receive Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in transmit/receive mode.

Start of communication (transmission and reception) depends on the memory mode:

- In case of FIFO or direct access mode, communication starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, communication starts when the CSIHnMCTL2.CSIHnBTST bit is set.

### 17.5.7.4 Summary

The following table summarizes this section. It shows how data transfer is started in the various memory, operating, and transfer modes.

**Table 17.42 Start of Data Transfer**

| Memory and Operating Mode | | Transfer Mode | |
|---|---|---|---|
| | | Transmit-Only<br>Transmit/Receive | Receive-Only |
| FIFO, direct access | Master | Writing to the CSIHnTX0W register or the CSIHnTX0H register | Writing to the CSIHnTX0W register or the CSIHnTX0H register |
| | Slave | Clock reception from master | Incoming clock from the master |
| Transmit-only buffer, dual buffer | Master | CSIHnMCTL2.CSIHnBTST = 1 | CSIHnMCTL2.CSIHnBTST = 1 |
| | Slave | Clock reception from master | Clock reception from master |

## 17.5.8 Data Length Selection

### 17.5.8.1 Data Length from 2 to 16 Bits

The length of a data packet is selectable for each chip select signal from 2 to 16 bits using CSIHnCFGx.CSIHnDLSx[3:0]. The examples below show the communication with MSB first (CSIHnCFGx.CSIHnDIRx = 0).

Data length = 16 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $0000_B$):

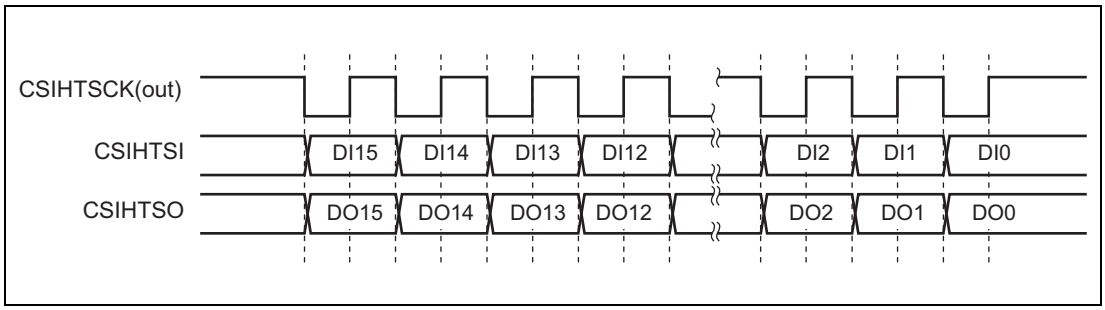

**Figure 17.22 16 Bit Data Length, MSB First**

Data length = 14 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1110_B$):

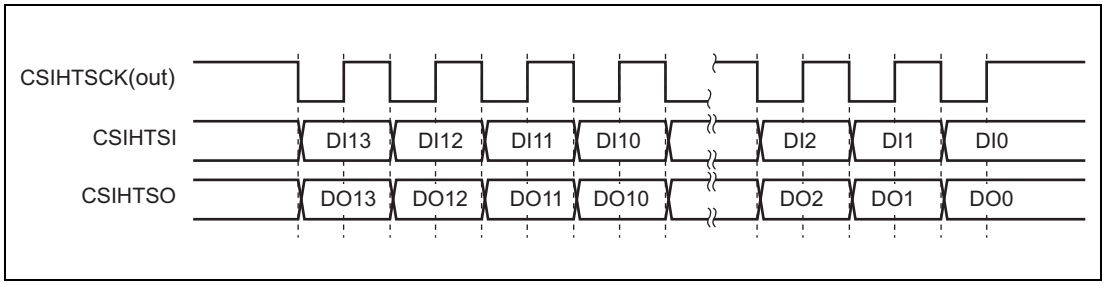

**Figure 17.23 14 Bit Data Length, MSB First**

### 17.5.8.2 Data Length Greater than 16 Bits

If the data to be sent/received exceeds 16 bits, the extended data length (EDL) function can be used.

EDL function is enabled by setting the CSIHnCTL1.CSIHnEDLE bit to 1.

EDL function works as follows:

- The data has to be broken into 16-bit blocks plus remainder. For example, data of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as “data length” in CSIHnCFGx.CSIHnDLSx[3:0].
- For transmitting the 16-bit blocks, CSIHnTX0W.CSIHnEDL must be set to 1. In this case, the data written to CSIHnTX0W is sent as a 16-bit data length regardless of the CSIHnCFGx.CSIHnDLSx[3:0] bit setting.
- The transfer is complete after a block with the specified data length (the remainder of data specified with CSIHnTX0W.CSIHnEDL = 0) has been sent.

#### Example

Example for sending 40-bit data ($123456789A_H$) to CS0:

40 bits are split into two 16-bit blocks plus 8 bits.

- Initialize CSIHnCFG0.CSIHnDLS0[3:0] = 8.
- To transmit $123456789A_H$ with MSB first, write the following sequence to CSIHnTX0W:
  - $20FE\ 1234_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - $20FE\ 5678_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - $00FE\ 009A_H$ (CSIHnTX0W.CSIHnEDL = 0)

The following figure illustrates the timing.

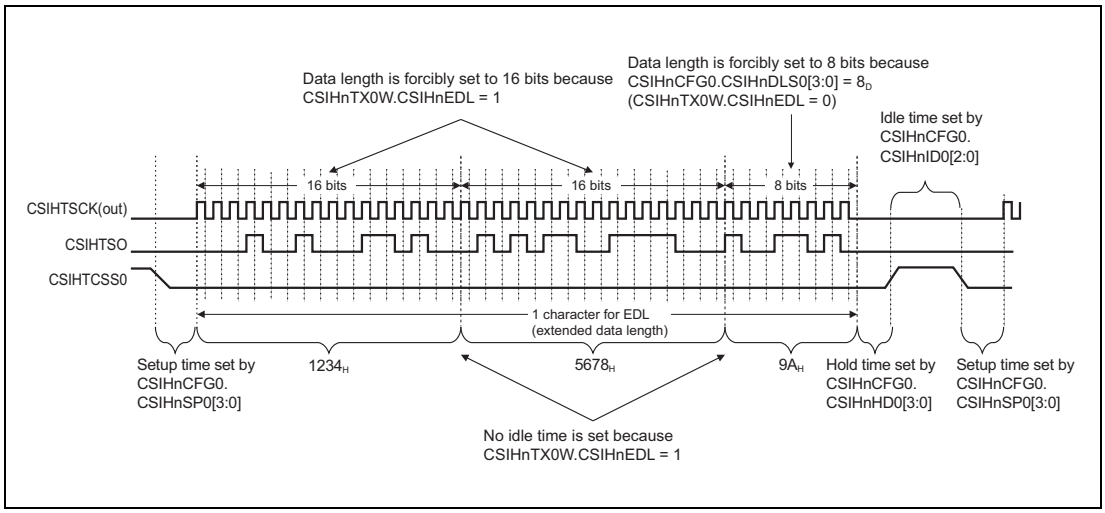

**Figure 17.24 EDL Timing Diagram**

## NOTES

1. 1-bit data length is allowed only when using the EDL mode.
2. If parity is enabled, the parity bit is added after the last bit.
3. When data is sent using extended data length (EDL) function, use the same chip select signal.
4. Example for configuring the data direction:
   - Data to be sent:$123456_H$
   - MSB first:
     Set CSIHnCFGx.CSIHnDIRx = 0
     Write CSIHnTX0W = 20FE $1234_H$ (EDL bit = 1)
     Write CSIHnTX0W = 00FE $0056_H$ (EDL bit = 0)
   - LSB first:
     Set CSIHnCFGx.CSIHnDIRx = 1
     Write CSIHnTX0W = 20FE $3456_H$ (EDL bit = 1)
     Write CSIHnTX0W = 00FE $0012_H$ (EDL bit = 0)
5. Operation is not guaranteed if CSIHnTX0W.CSIHnEOJ and CSIHnTX0W.CSIHnEDL are simultaneously set to “1” while CSIHnCTL1.CSIHnJE = 1 and CSIHnCTL1.CSIHnEDLE = 1.
6. EDL mode cannot be used in receive-only mode of slave mode. (CSIHnCTL2.CSIHnPRS[2:0] = $111_B$, CSIHnCTL0.CSIHnTXE = 0, CSIHnCTL0.CSIHnRXE = 1)

### 17.5.9 Serial Data Direction Selection

The serial data direction is selectable for each chip select signal using the CSIHnDIRx bit in the CSIHnCFGx register.

The examples below show communication for a data length of 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).

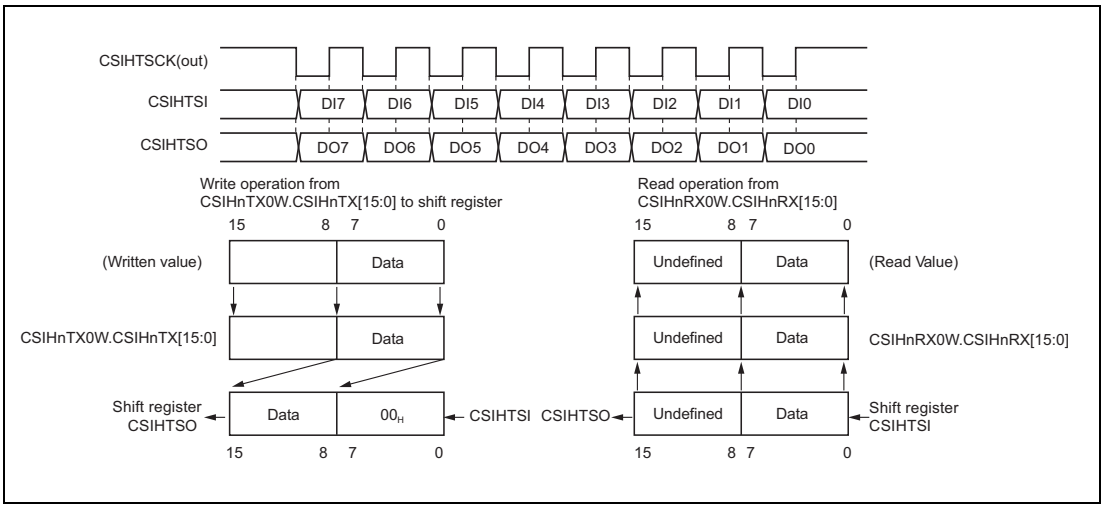

**Figure 17.25 Serial Data Direction Select Function - MSB First (CSIHnDIRx = 0)**

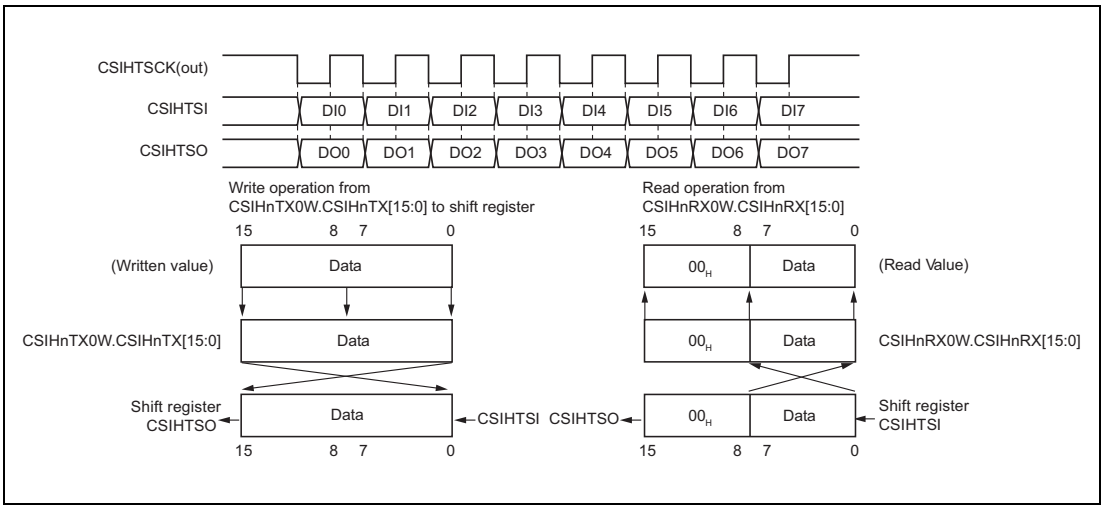

**Figure 17.26 Serial Data Direction Select Function - LSB First (CSIHnDIRx = 1)**

### 17.5.10 Slave Select (SS) Function

The Slave Select (SS) function enables communication between one master and multiple slaves (SPI communications).

In master mode, the master device outputs the slave select signal (CSIHTCSSx) to a slave. Communication by a device in slave mode is enabled when the slave input select signal (CSIHTSSI) is at the low level.

See the **Section 17.5.2, Master/Slave Connections**, for examples of connections using the SS function.

#### 17.5.10.1 Communication Timing Using SS Function

The following figure illustrates the communication signal and timings using the SS function.

In slave mode, the data transfer configuration is determined by the CSIHnCFG0 register.

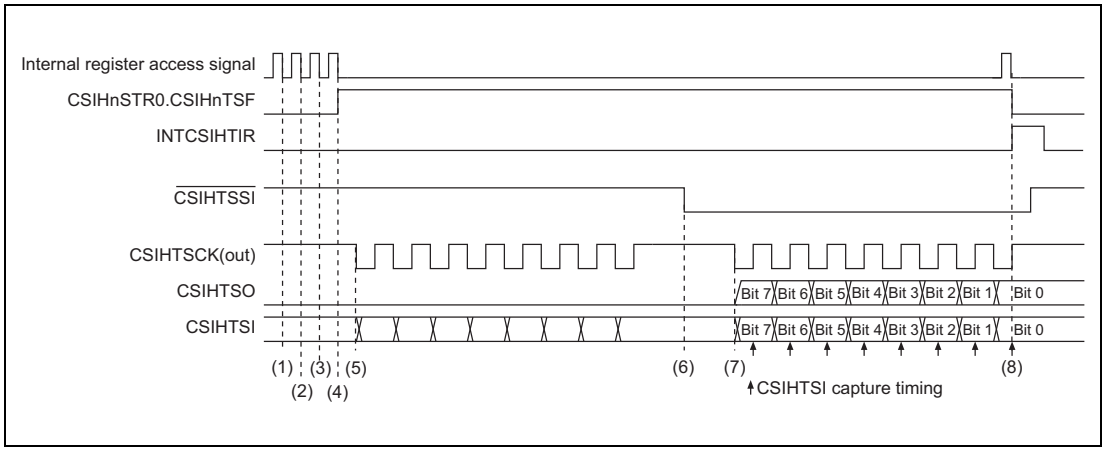

**Figure 17.27 Tx/Rx Timing of Communication Using SS Function**

(1) CSIH enters slave mode by setting CSIHnCTL2.CSIHnPRS[2:0] = $111_B$. CSIHnCFG0.CSIHnCKP0 and CSIHnCFG0.CSIHnDAP0 are 0.

(2) The data length is 8 bits (CSIHnCFG0.CSIHnDLS0[3:0] = $1000_B$). The data direction is MSB first (CSIHnCFG0.CSIHnDIR0 = 0).

(3) The transmit/receive mode is set (CSIHnCTL0.CSIHnTXE = 1, CSIHnCTL0.CSIHnRXE = 1, and CSIHnCTL0.CSIHnPWR = 1). Communication start is permitted.

(4) The transfer status flag CSIHnSTR0.CSIHnTSF is automatically set when transfer data is written to the CSIHnTX0W or CSIHnTX0H transmission register during direct access mode or FIFO mode.

(5) While the signal $\overline{\text{CSIHTSSI}}$ is at high level, transmission/reception is not started, even if an external transmission clock CSIHTSCK is input. Input to CSIHTSI is ignored.

(6) $\overline{\text{CSIHTSSI}}$ falling to low level indicates that CSIHTSO is enabled and ready for transmission.

(7) As soon as the external clock signal CSIHTSCK is detected, the slave transmits data to CSIHTSO and simultaneously captures data from CSIHTSI.

(8) Interrupt INTCSIHTIR indicates that the reception is complete. The CSIHnRX0W/H register can be read.

### 17.5.10.2 CSIHTSSO Operation

| CSIHnPWR | CSIHnTXE | CSIHnRXE | CSIHnSSE | CSIHTSSO |
|---|---|---|---|---|
| 0 | — | — | — | H |
| 1 | — | — | 0 | H |
| | 0 | | 1 | H |
| | 1 | | 1 | Inverse value of $\overline{\text{CSIHTSSI}}$ level |

The CSIHTSSO pin is a signal to control the I/O function of the chip's SO pin when using the SS function.

The CSIHTSO pin is enabled when the CSIHTSSO pin is "High" (the chip's SO pin is being driven).

The CSIHTSO pin is disabled when the CSIHTSSO pin is "Low" (the chip's SO pin is not being driven).

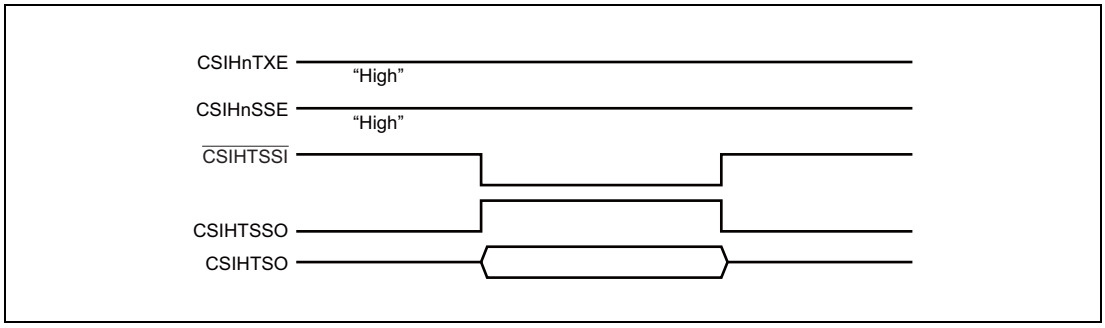

**Figure 17.28 Operation of CSIHTSSO**

**CAUTION**

**If $\overline{\text{CSIHTSSI}}$ pin is changed during communication (CSIHnSTR0.CSIHnTSF = 1), current communication is not guaranteed.**

### 17.5.11 Handshake Function

CSIH features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIHnCTL1.CSIHnHSE bit. For handshake, the signals CSIHTRYI and CSIHTRYO are used.

The busy timing depends on the data phase selection bit CSIHnCFGx.CSIHnDAPx.

#### 17.5.11.1 Slave Mode

If CSIHnCTL1.CSIHnHSE = 1, a low-level CSIHTRYO signal is output when the slave becomes busy. This can happen in two cases:

1. When the next data to be sent is not ready:
   When the slave is in transmit-only mode or transmit/receive mode (CSIHnCTL0.CSIHnTXE = 1) and is in any of the states listed below, the CSIHTRYO outputs the busy state (low level).

**Table 17.43 Memory Mode and Slave Transfer State**

| Memory Mode | Slave Transfer State |
|---|---|
| Direct access mode | When there is no more data to be sent |
| FIFO mode | When there is no more data to be sent (CSIHnSTR0.CSIHnEMF = 1) |
| Dual buffer mode | When CSIHnMCTL2.CSIHnBTST is not set to 1 |
| Transmit-only buffer mode | |

The following examples assume an eight-bit data length.

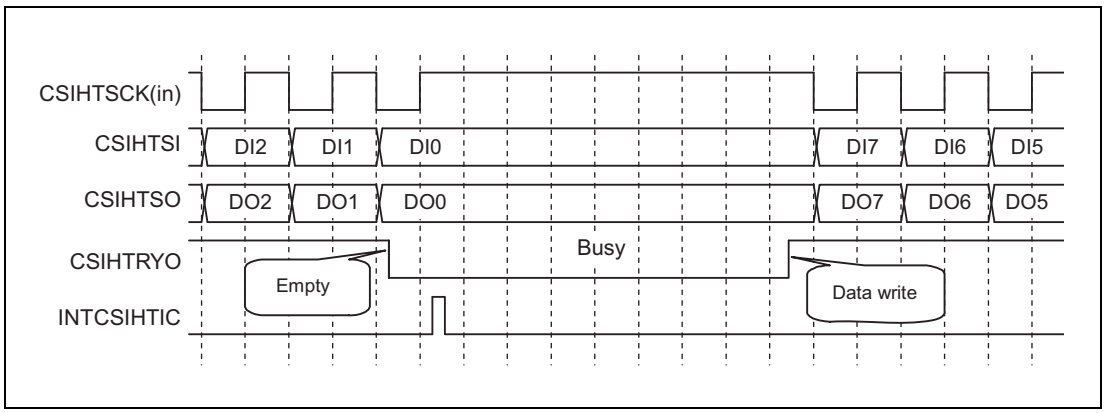

**Figure 17.29 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 0)**

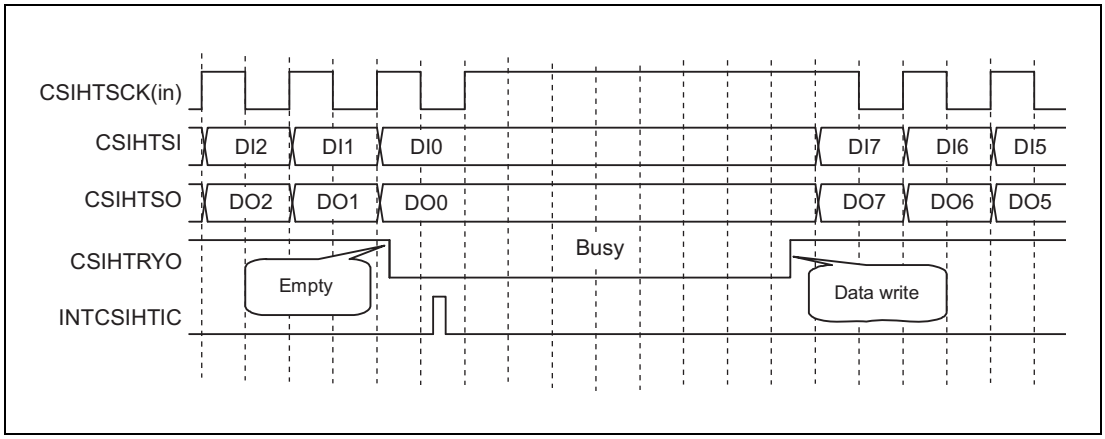

**Figure 17.30 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 1)**

2. When receive register is full:
   When slave is configured in receive-only mode or transmit/receive mode (CSIHnCTL0.CSIHnRXE = 1), and new data cannot be copied from a shift register to CSIHnRX0W/H because the previously received data is still in the CSIHnRX0W/H register (CSIHnRX0W/H is full).
   When CSIHnCTL0.CSIHnRXE is 1 and is in any of the following states, CSIHTRYO outputs busy state (low level).

**Table 17.44 Memory Mode and Slave Reception State**

| Memory Mode | Slave Reception State |
|---|---|
| Direct access mode | When CSIHnRX0W or CSIHnRX0H is full |
| FIFO mode | When received data is remaining in buffer (CSIHnSTR0.CSIHnFLF = 1) |
| Dual buffer mode | No applicable case |
| Transmit-only buffer mode | When CSIHnRX0W or CSIHnRX0H is full |

The following examples assume an eight-bit data length.

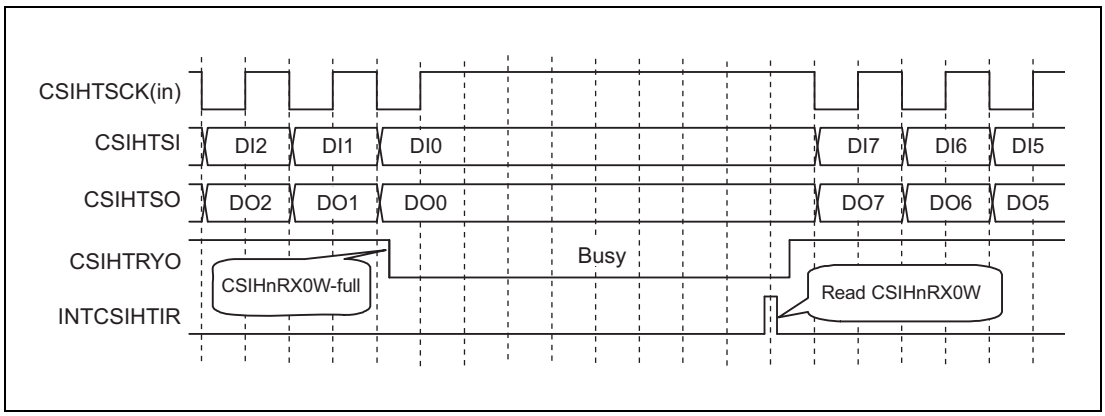

**Figure 17.31 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 0)**

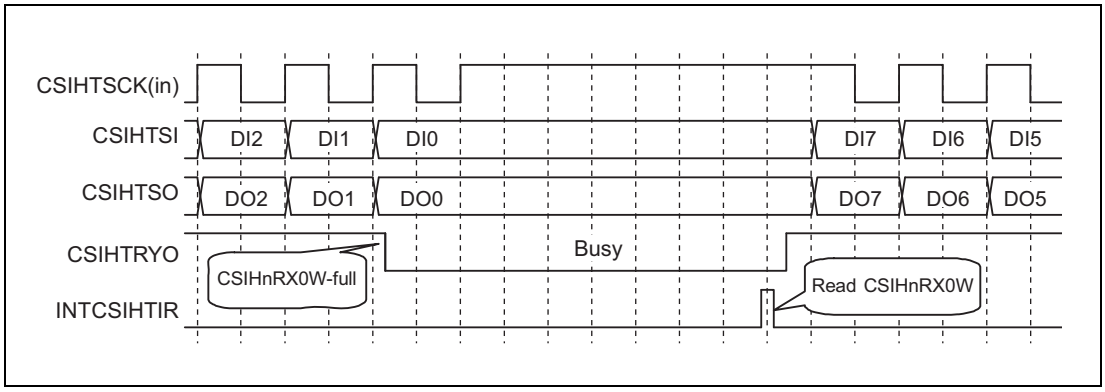

**Figure 17.32 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 1)**

### 17.5.11.2 Master Mode

When the master detects CSIHTRYI = 0 while CSIHnCTL1.CSIHnHSE = 1, the subsequent transfers are put on hold, the master goes into wait state and suspends the CSIHTSCK clock.

The CSIHTRYI level is checked at each half clock cycle of CSIHTSCK.

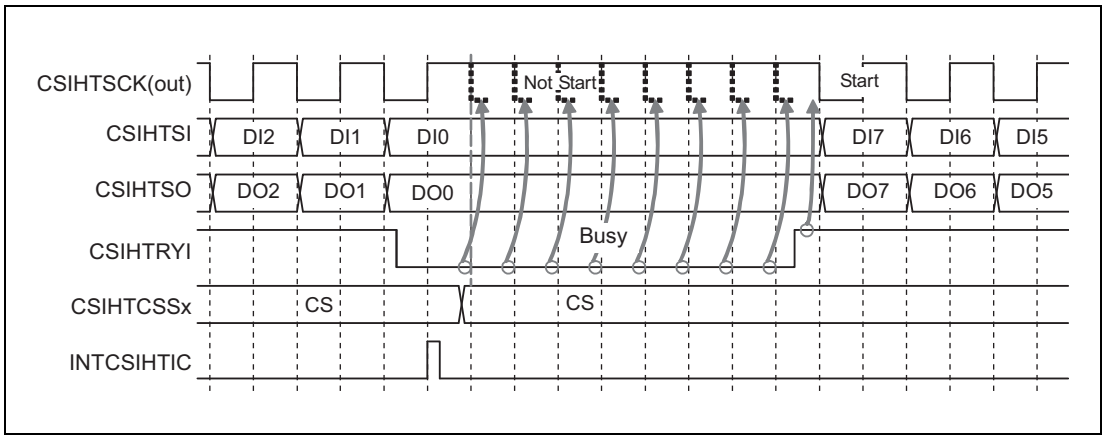

**Figure 17.33 Master's Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 0)**

The CSIHTRYI signal must be pulled down by the slave before the next transfer starts. If this is done while data transfer is in progress, the serial clock from the master is suspended after the transfer is complete.

The master resumes the communication as soon as CSIHTRYI becomes high (the slave is "ready").

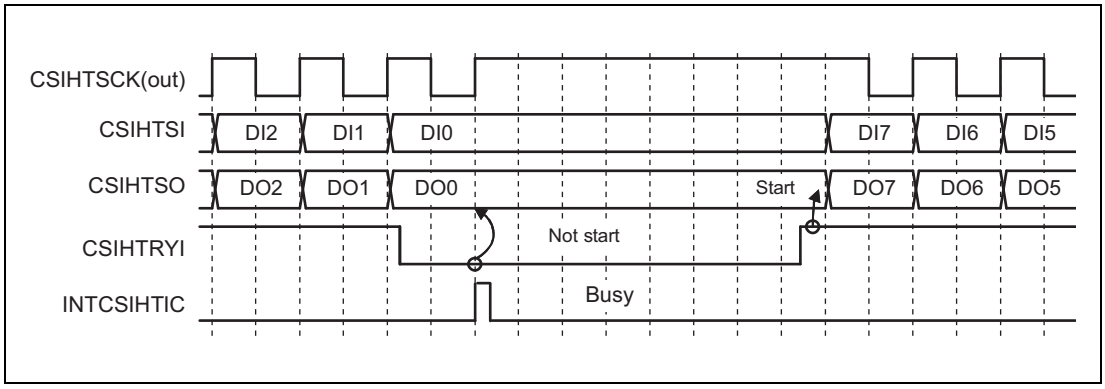

**Figure 17.34 Master's Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 1)**

**CAUTIONS**

1. **If multiple slaves are connected, the master must only detect the CSIHTRYI signal of the slave it has selected for communication.**
2. **Even when the CSIHTRYI pin of the master detects a CSIHTRYO signal from the slave during data transfer, the communication is not put on hold but continues until the data transfer is completed.**

### 17.5.12 Error Detection

CSIH can detect five error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)
- Time-out error (in FIFO mode)
- Overflow error (in FIFO mode)

Check for parity, data consistency and time-out errors can be enabled/disabled individually.

If any of these errors is detected, the interrupt request INTCSIHTIRE is generated and the corresponding flags are set.

#### 17.5.12.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent as output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIHnCTL1.CSIHnDCS bit (when checking data consistency, make sure that PIPCn.PIPCn_m = 1). It will not be enabled if data transmission is disabled (CSIHnCTL0.CSIHnTXE = 0).

When the data consistency check is active, the data transferred from CSIHnTX0W or CSIHnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIHTSO are read back via the CSIHTDCS signal into the corresponding shift register.

After completion of the transmission, the sent data is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnDCE bit is set.

Additionally, CSIHnRX0W.CSIHnTDCE of data that contains the error is set.

The data consistency check function is illustrated in the following block diagram.

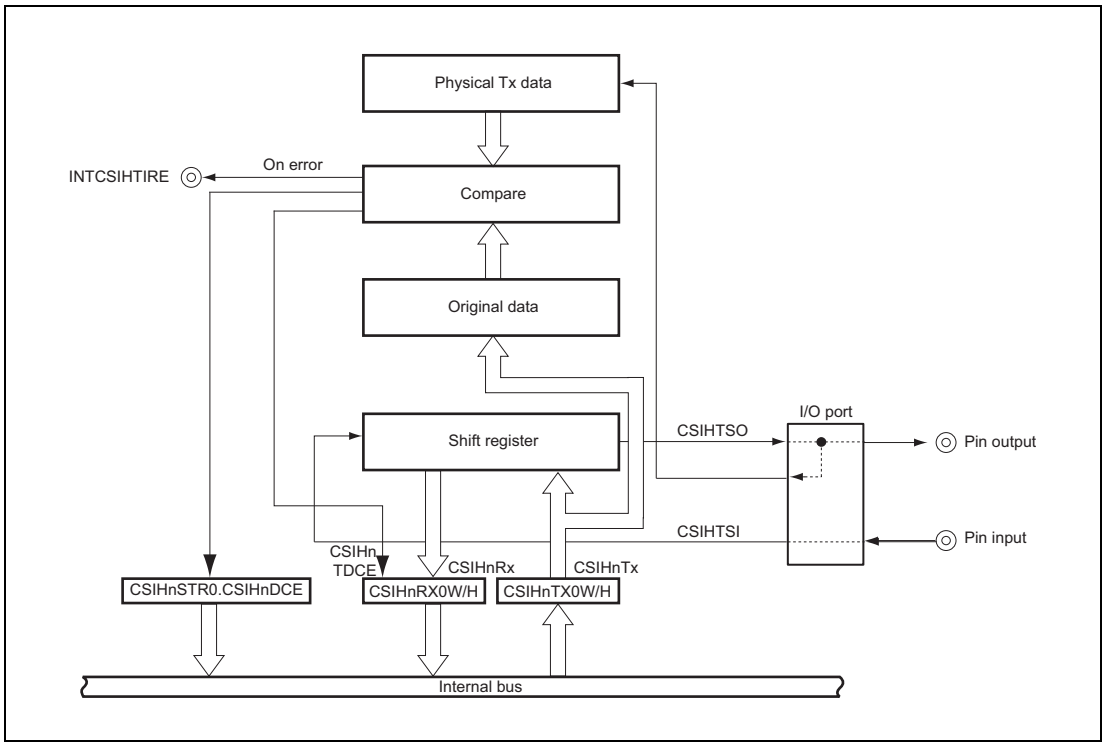

**Figure 17.35 Data Consistency Check Functional Block Diagram**

### 17.5.12.2 Parity Check

CSIH can append a parity bit to the last data bit (even if extended data length is used).

The use and type of parity is specified in CSIHnCFGx.CSIHnPSx[1:0].

Parity check is enabled if CSIHnCFGx.CSIHnPSx[1] = 1.

The parity bit is checked after a reception is complete. In case of parity error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnPE bit is set.

Additionally, CSIHnRX0W.CSIHnRPE of data that contains the error is set.

The figure below shows an example.

- Data length is 8 bits.
- The data to be transmitted is $05_H$ and $35_H$.
- Data direction is LSB first.
- Parity type is odd.

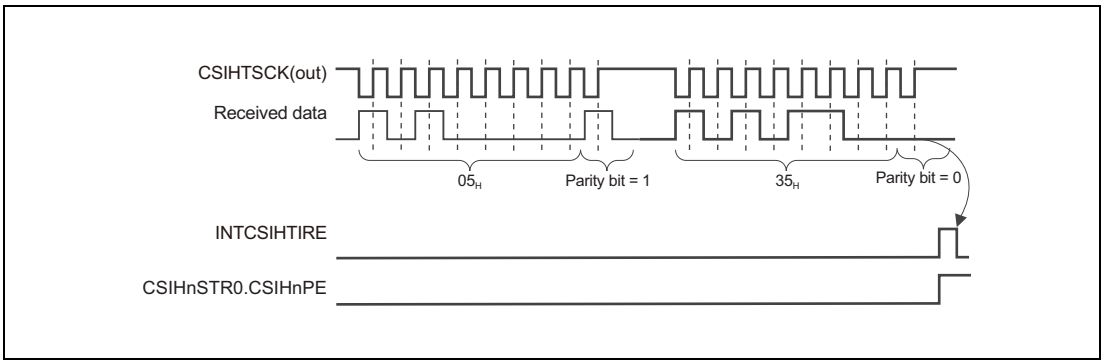

**Figure 17.36 Parity Check Example**

The parity bit of the first data is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

The parity bit of the second data is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last bit of the data.

### 17.5.12.3 Time-Out Error

Time-out errors can be checked only in slave FIFO mode.

This error occurs if neither of the following occurred within a certain period of time:

- Received data in FIFO is read
- FIFO receives data from CSIHTSI

The time-out time is defined in CSIHnMCTL0.CSIHnTO[4:0] in units of "8 x transmission clock CSIHTSCK". A time-out error occurs when the specified time is exceeded (the time-out time is not detected when CSIHnMCTL0.CSIHnTO[4:0] = $00000_B$).

The dedicated time-out counter is set by the CSIHnCTL2.CSIHnPRS[2:0] and CSIHnBRSy.CSIHnBRS[11:0] bits.

If the value of the CSIHnBRSy.CSIHnBRS[11:0] bits is left as $000_H$, the dedicated time-out counter does not operate.

The dedicated time-out counter measures the time between the last and the next read operation.

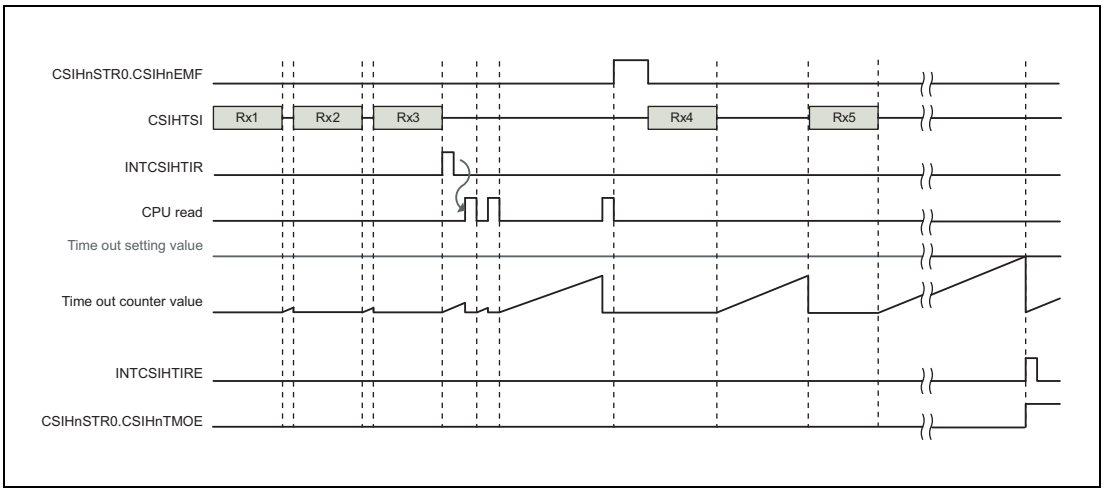

**Figure 17.37 Time-Out Check Functional Timing Diagram**

The start timing of the time-out counter is as follows:

- When reception is completed
- When data read from the CPU is completed
  (The counter does not start if the buffer is empty.)
- When a time-out error is detected

After a time-out error is detected, if data is still available in FIFO, the time-out counter restarts.

If the value set by bits CSIHnMCTL0.CSIHnTO[4:0] is reached again, the INTCSIHTIRE interrupt is output again.

The timeout counter continues to count until received data is read. To stop the counter, read all received data or set CSIHnSTCR0.CSIHnPCT to 1. Note that the pointer is cleared if you perform the latter.

The counter is reset at the following timing:

- Data is read once.
- A new data item is received.

- A timeout error is detected.
- The CSIHnSTCR0.CSIHnPCT bit is set to 1.

If a timeout error occurs, the following occur:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnTMOE bit is set.

### 17.5.12.4 Overflow Error

An overflow error can occur in FIFO mode. It occurs when transmission data is written to the CSIHnTX0W register while the FIFO buffer is filled with received data.

#### Example

100 data packets have been transmitted. That means, the FIFO contains 100 received data packets. The application starts to read the received data.

While the read operation is in progress, the application begins to write another set of 50 transmission data packets to the FIFO. However, only 10 received data packets have been read up to now, and 90 are still in the FIFO.

In this case, only 38 buffers are available for new transmission data. When the CPU tries to write the 39th data, an overflow error occurs.

This is illustrated in the following figure.

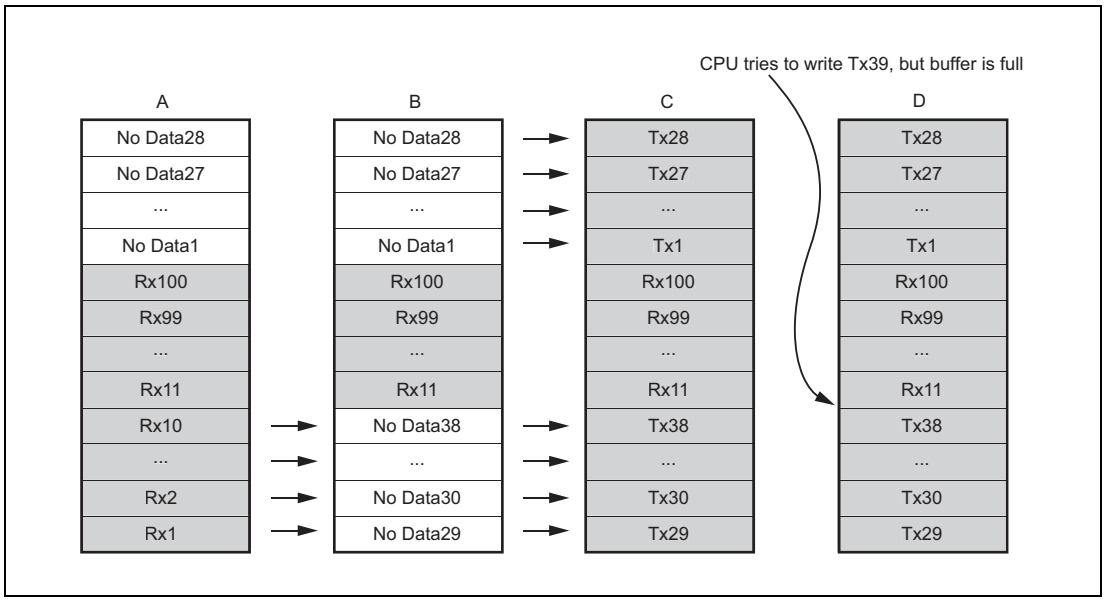

**Figure 17.38 FIFO Overview**

The 39th and subsequent data packets are discarded. The figure below shows the overflow timing.

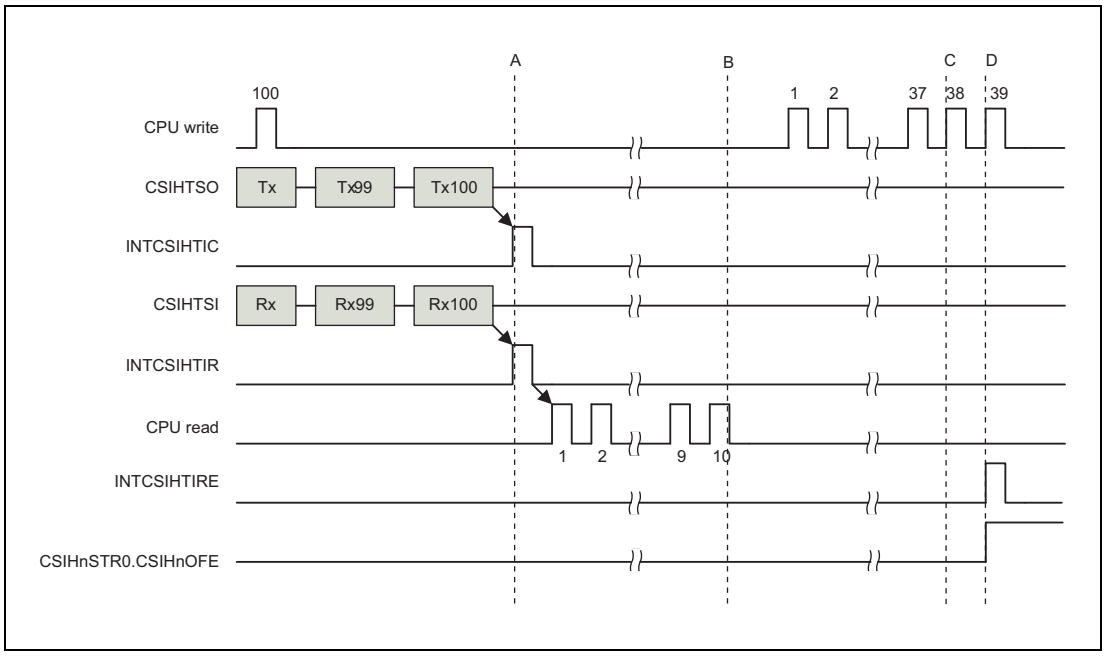

**Figure 17.39 FIFO Overflow Timing**

In case of overflow error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnOFE bit is set.

### 17.5.12.5 Overrun Error

An overrun error can occur in direct access, transmit-only buffer, and FIFO modes. It does not occur in dual buffer mode. The overrun error does not occur if data reception is disabled (CSIHnCTL0.CSIHnRXE = 0).

There are two conditions for overrun errors.

#### Condition for errors 1

- In FIFO mode, if the CPU reads the CSIHnRX0W/H register when the number of received data is 0.

#### Condition for errors 2

- In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled):
  - In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data remains in the CSIHnRX0W/H register.
  - In FIFO mode, when reception is completed while the FIFO buffer is still full of receive data.

#### (1) Direct access/transmit-only buffer

In direct access and transmit-only buffer modes, this error occurs when newly received data cannot be transferred from the shift register to the reception register CSIHnRX0W/H. This happens when CSIHnRX0W/H was not read and therefore contains previously received data.

The following figure illustrates the overrun error detection function.

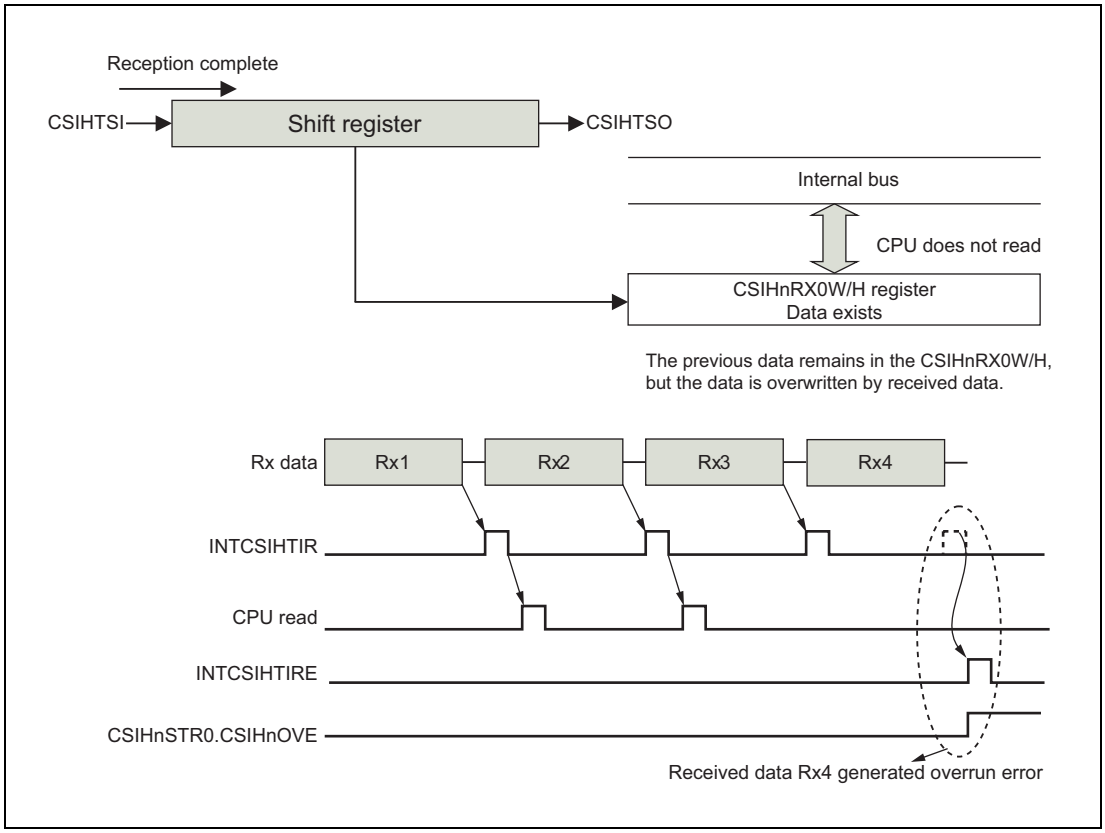

**Figure 17.40 Overrun Error Detection in Direct Access and Transmit-Only Buffer Modes**

**NOTE**

An overrun error can be avoided in slave mode by using handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

### (2) FIFO mode

In FIFO mode, this error occurs if:

1. Newly received data cannot be transferred from the shift register to the FIFO because the FIFO is full.

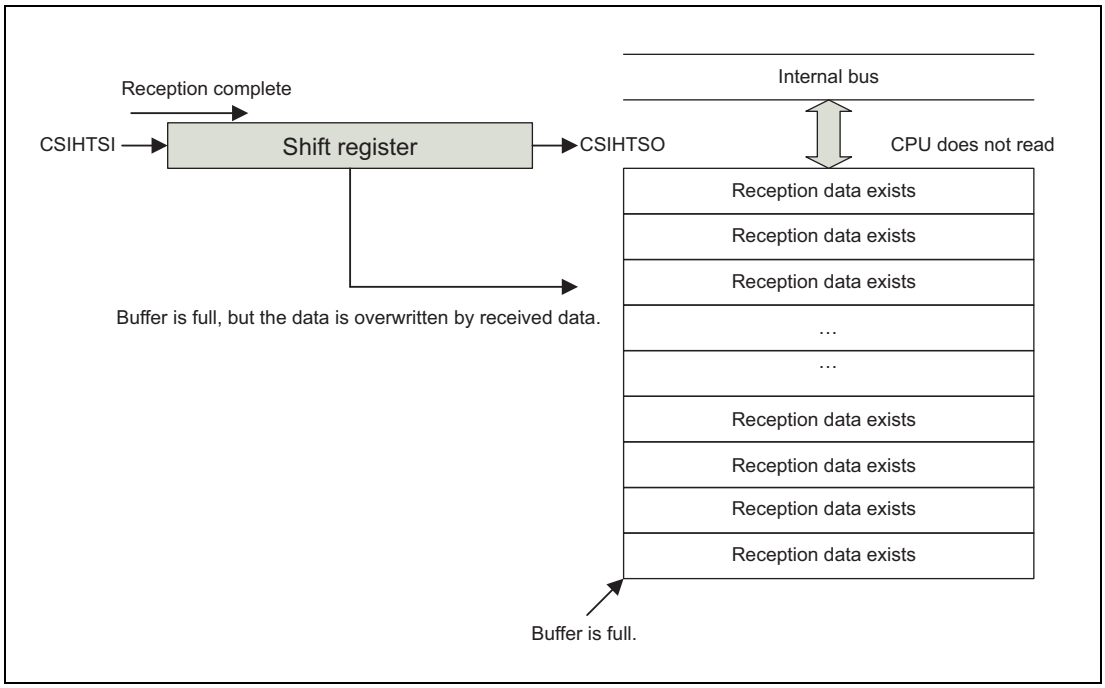

**Figure 17.41 Overrun Error Detection in FIFO Mode (FIFO Full)**

**NOTE**

An overrun error can be avoided in slave mode by using the handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

2. The CPU attempts to read non-existent receive data.

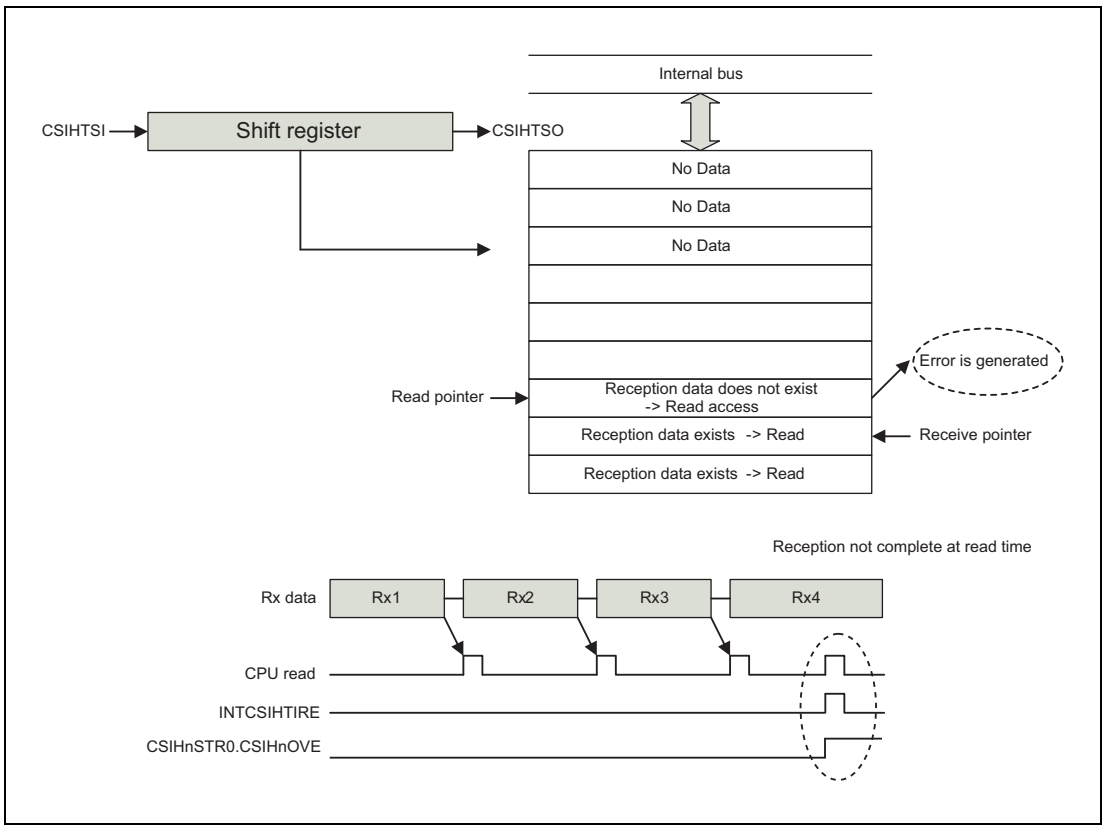

**Figure 17.42 Overrun Error Detection in FIFO Mode (No Data)**

In case of overrun error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnOVE bit is set.
- Received data is overwritten and the communication continues.
  (When the CPU tries to read non-existent data, it waits until reception is completed and then resumes reading.)

For details see **Section 17.5.11, Handshake Function**.

### 17.5.13 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIHnCTL1.CSIHnLBM = 1), CSIHTCSSx is fixed to the inactive level (the active level is defined by the CSIHnCTL1.CSIHnCSLx value). The transmit and receive signals are internally connected, as shown in the figures below. The signals CSIHTSCK, CSIHTSO, CSIHTSI, and CSIHTCSSx are disconnected from the ports. In addition, the CSIHTSO output level is fixed to low, and CSIHTSCK is set to reset level (High) regardless of the value of the CSIHnCFGx.CSIHnCKPx. The rest of CSIH works as in normal operation.

In order to test CSIH, put it in loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data. Any connected device remains unaffected by the loop-back test.

**Table 17.45 Pin Output Level in Loop-Back Mode**

| Pin Name | Output level |
|---|---|
| CSIHTSCK(out) | High level |
| CSIHTCSS[7:0] | Inactive level |
| CSIHTSO | Low level (not dependent on the previous value) |
| Interrupt | Normal function |
| CSIHTRYO | Normal function (Low level) |

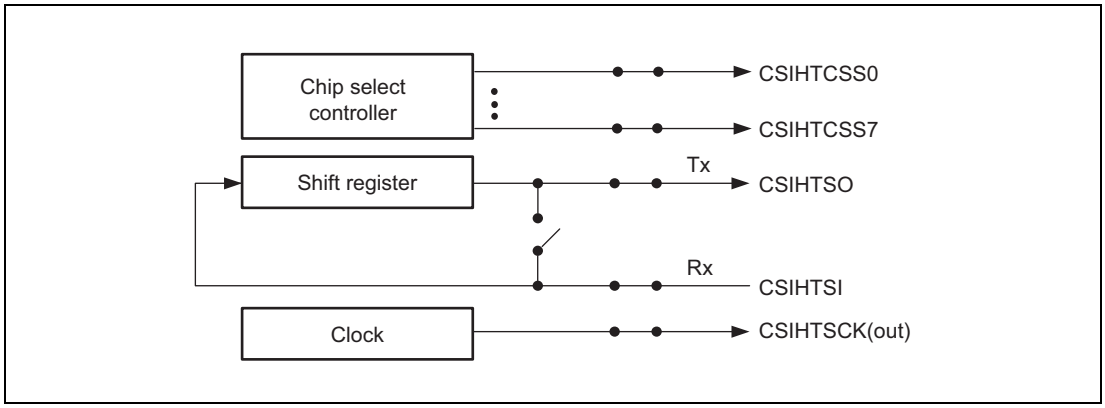

**Figure 17.43 Normal Operation**

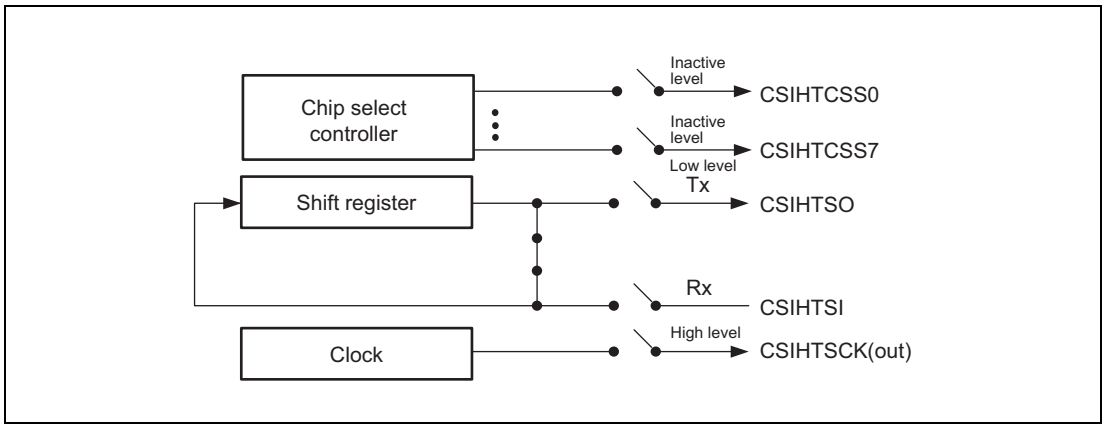

**Figure 17.44 Loop-Back Mode Operation**

### 17.5.14 CPU-Controlled High Priority Communication Function

CSIH has a function to abort low priority communication to perform high priority communication if it receives a high-priority communication request from the CPU while low-priority communication is being used. This function supports transmit-only buffer mode as low priority communication and only direct access mode as high-priority communication. To enable this function, CSIHnCTL1.CSIHnPHE and CSIHnCTL1.CSIHnJE must be set to 1.

The following figure illustrates CPU-controlled high-priority communication.

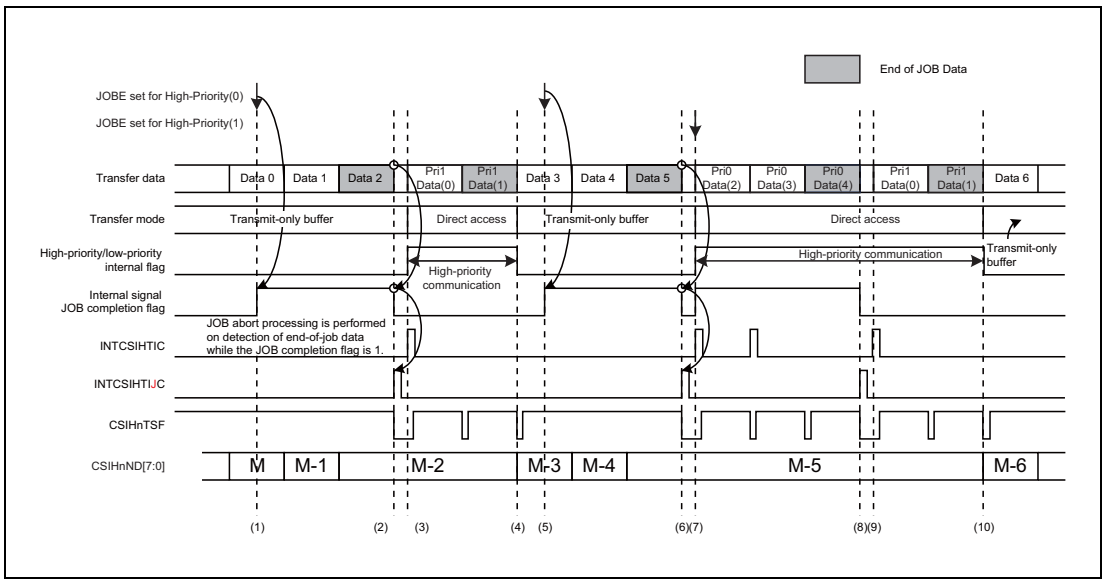

**Figure 17.45 Example of CPU-Controlled High-Priority Communication**

(1) By setting CSIHnCTL0.CSIHnJOBE = 1 during low-priority communication, start of high-priority communication following end-of-job data is notified, and the internal signal flag is set.

(2) When end-of-job data is detected, the current low-priority communication is aborted and the INTCSIHTIJC interrupt occurs. The internal signal job completion flag is cleared due to the communication abort, and memory mode is automatically switched to direct access mode for the subsequent high-priority communication.

(3) The CPU detects the interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H.

(4) When end-of-job data is detected, communication is aborted. At this time, because the internal signal end-of-job flag is set to 0, the CSIH determines that the next communication is low-priority, automatically switches memory mode to transmit-only buffer mode, and then resumes the aborted low-priority communication.

(5) Same as (1) above.

(6) Same as (2) above.

(7) The CPU detects an interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H. The CPU sets CSIHnCTL0.CSIHnJOBE = 1 again to notify that the next communication is high-priority.

(8) When end-of-job data is detected, communication is aborted and the INTCSIHTIJC interrupt is generated. At this time, the CPU determines that the subsequent communication is also high-priority because the internal signal JOB completion flag is 1, and waits for communication to start.

(9) Same as (3) above.

(10) Same as (4) above.

**CAUTION**

**Memory mode is switched automatically when communication is changed from low priority to high priority (from transmit-only buffer mode to direct access mode) and from high priority to low priority (from direct access mode to transmit-only buffer mode).**

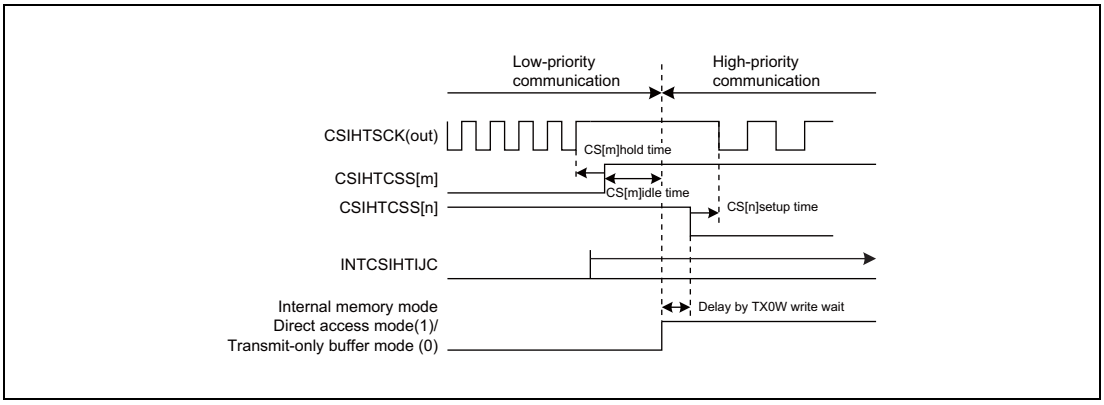

**Figure 17.46 Transition from Low-Priority Mode to High-Priority Mode**

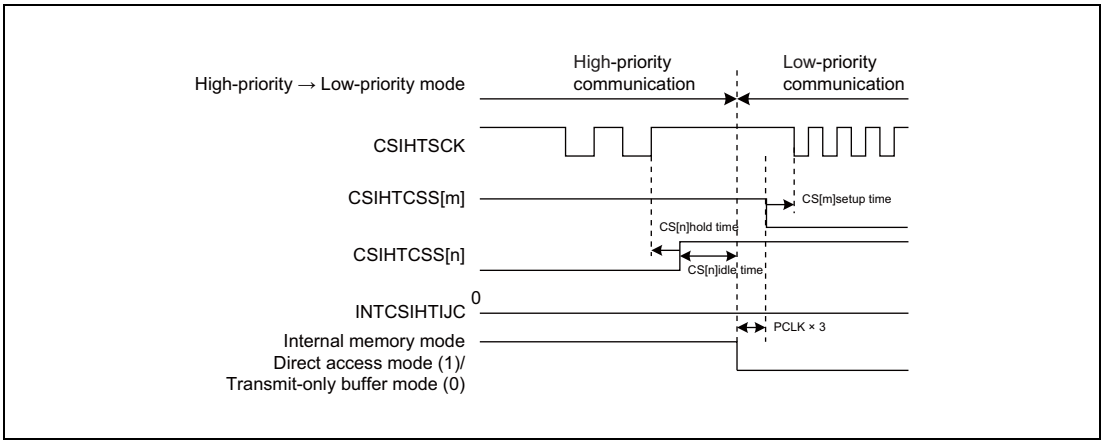

**Figure 17.47 Transition from High-Priority Mode to Low-Priority Mode**

Do not conduct write operation of communication data or CSIHnCTL0.CSIHnJOBE bit operation during setting inhibited period to switch low and high priority communication mode correctly.

CSIHnTX0W register write inhibited period:

- Period from when CSIHnJOBE bit is set for switching to high priority communication mode to when INTCSIHTIJC interrupt is detected.
- Period from when the last data of high priority communication (End of JOB data) is written to when the CSIHnHPST state = 0 is detected.

CSIHnJOBE register write inhibited period:

- Period from when CSIHnJOBE bit is set for switching to high priority communication mode to when INTCSIHTIJC interrupt is detected.

During high communication mode period, there is no setting inhibited period for CSIHnJOBE bit. It is possible to set CSIHnJOBE bit before writing communication data. For example, to communicate multiple JOB data in high priority mode, it is possible to set CSIHnJOBE bit before writing the first communication data.

**CAUTION**

**When CSIHnJOBE bit is set right before the last communication of high priority communication ends, different operations are required depending on the timing at which setting of CSIHnJOBE bit is internally detected.**

**If the setting of the CSIHnJOBE bit is detected before the transfer of the last bit is completed, high priority communication mode continues.**

**When setting of the CSIHnJOBE bit is detected after the transfer of the last bit is completed, the mode temporarily returns to low priority communication. After detection of End of JOB data in low priority communication, the mode changes back to high priority communication.**

### 17.5.15 Enforced Chip Select Idle Setting

It is possible to insert an idle state between two consecutive data transfers by setting CSIHnCFGx.CSIHnIDLx.

1. When CSIHnCFGx.CSIHnIDLx = 0
   If the next CSIHTCSSx is the same as the previous one, an idle state is not inserted, but an inter-data time is inserted instead.
   If the next CSIHTCSSx is different from the previous one, an idle state is inserted.
2. When CSIHnCFGx.CSIHnIDLx = 1
   An idle state is always inserted even if a next CSIHTCSSx is not different from the previous one.

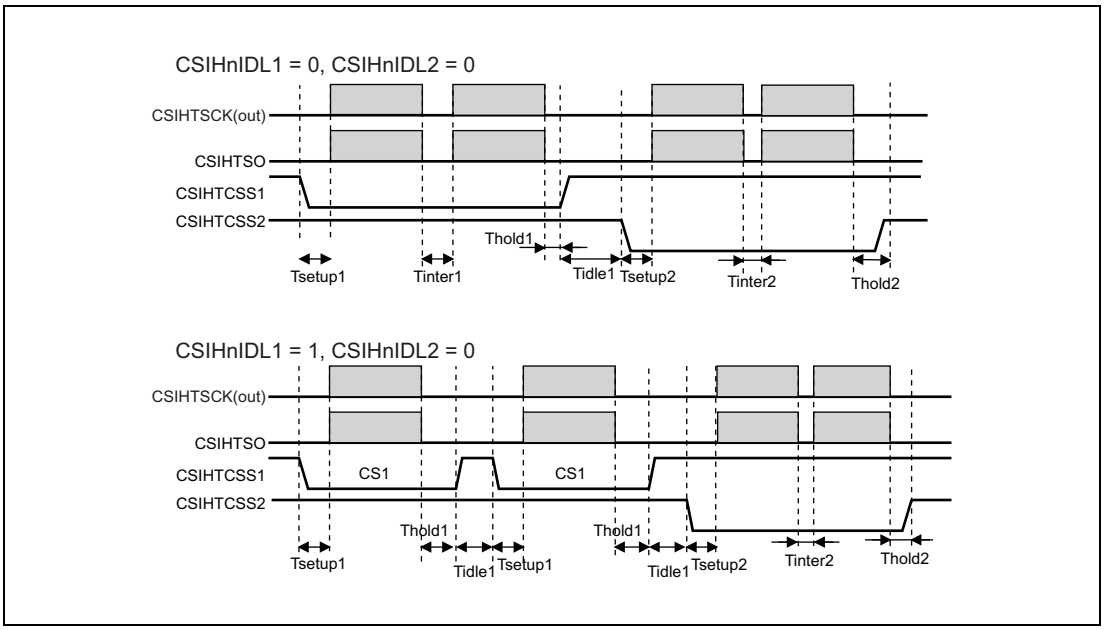

**Figure 17.48 Enforced Chip Select Idle Setting Example**

**CAUTION**

**If the CPU-controlled high priority communication function is enabled (CSIHnCTL1.CSIHnPHE = 1), when the mode is switched from low priority communication to high priority communication or from high priority communication to low priority communication, an IDLE state is inserted regardless of the setting of CSIHnCFGx.CSIHnIDLx bit.**

## 17.6 Operating Procedures

The examples and procedures below are described according to the memory mode in the following order:

- Direct access mode
- Transmit-only buffer mode
- Dual buffer mode
- FIFO mode

### 17.6.1 Procedures in Direct Access Mode

Two examples for a master are provided, one with job mode disabled, and the other with job mode enabled.

#### 17.6.1.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below assumes the following conditions:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)

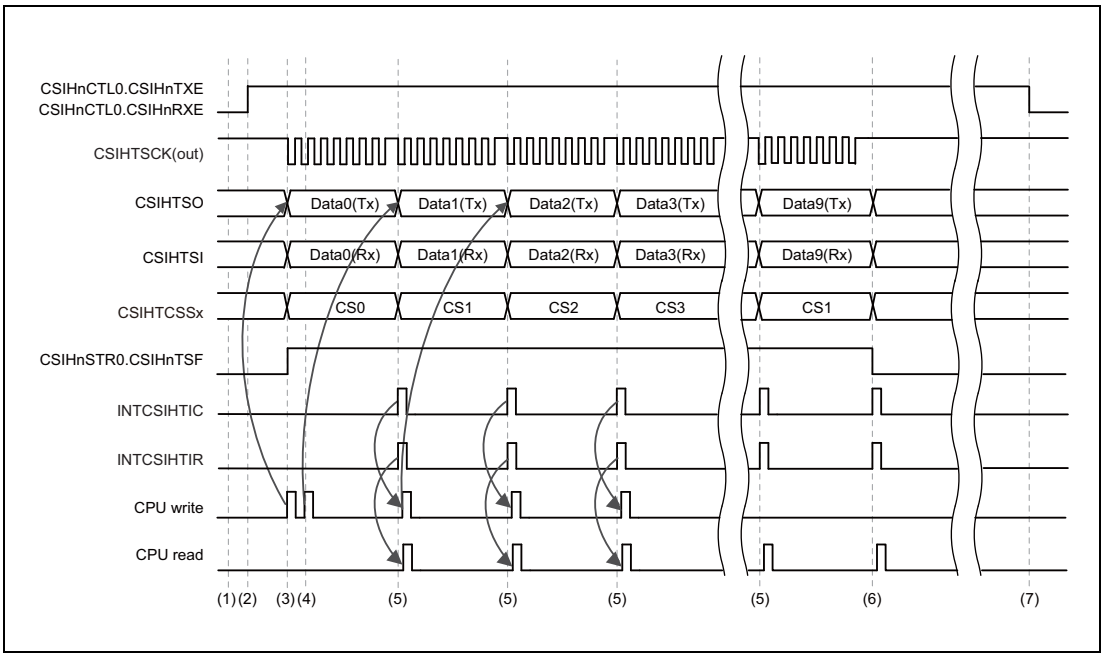

**Figure 17.49 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 0**

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register, CSIHnTX0W. Within the same write operation, activate CS0. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIHnTX0W. If required, you can change the CS to address a different device. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated:
   - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
   - INTCSIHTIR indicates that the reception register CSIHnRX0W must be read.
6. No more write action is required after completion of data 8. Data 9 (the last data) has been written in advance.
   However, reception register CSIHnRX0W must be read after completion of writing data 8 and 9.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 17.6.1.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)
- Two jobs, each transmitting three data.

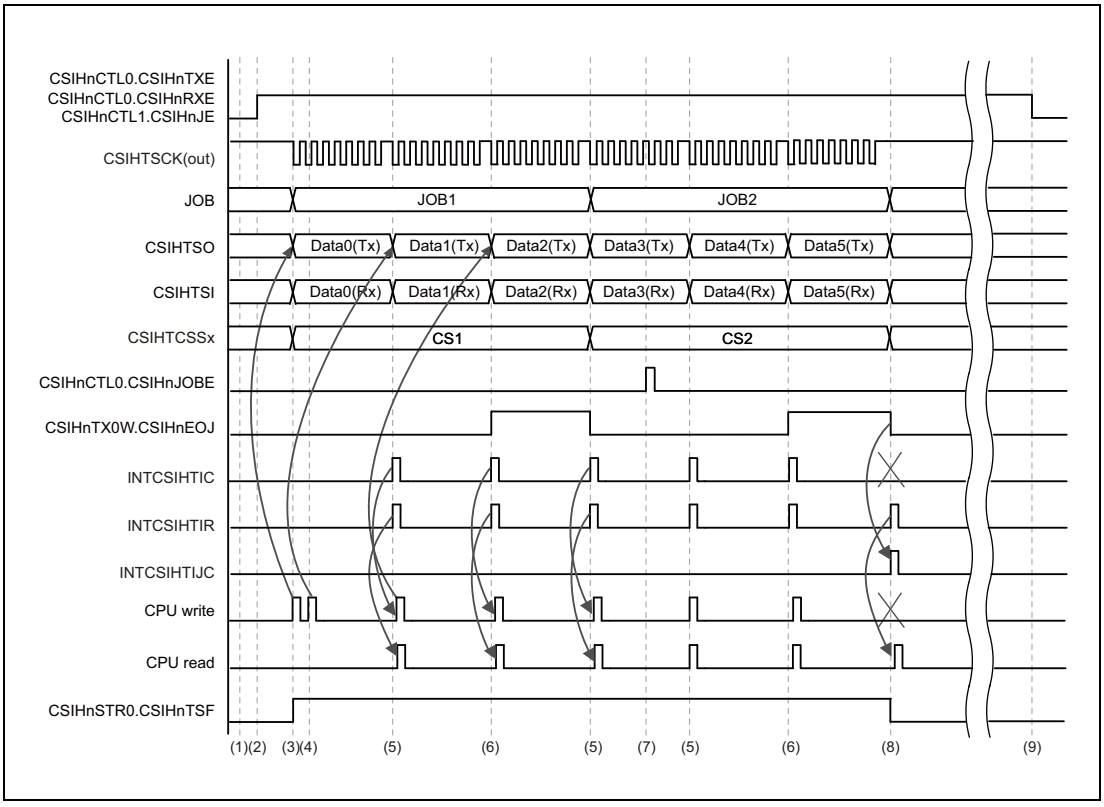

**Figure 17.50 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 1**

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1 and CS2.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits the reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
   The CSIHnSTR0.CSIHnTSF flag indicates that communication is in progress.
4. Write the second data to CSIHnTX0W. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
   - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
   - INTCSIHTIR indicates that the reception register, CSIHnRX0W must be read.
6. Setting CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent. After that, the next job may begin.
7. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of the current job (JOB2).
8. After the forced stop of communication, the interrupt request, INTCSIHTIC is replaced by INTCSIHTIJC. INTCSIHTIR is generated as usual.
   The interrupt request, INTCSIHTIJC indicates that the communication was forcibly stopped at the end of the current job.
   The interrupt request, INTCSIHTIC is not generated. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.
   To start another transmission without stopping communication, perform steps 3 and later.

### 17.6.2 Procedures in Transmit-Only Buffer Mode

Two examples for a master is provided, one with job mode disabled, and the other one with job mode enabled.

#### 17.6.2.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = $09_H$).
- The transfer start address is $10_H$ (CSIHnMCTL2.CSIHnSOP[6:0] = $10_H$).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0,CSIHnMCTL0.CSIHnMMS[1:0] = $10_B$)

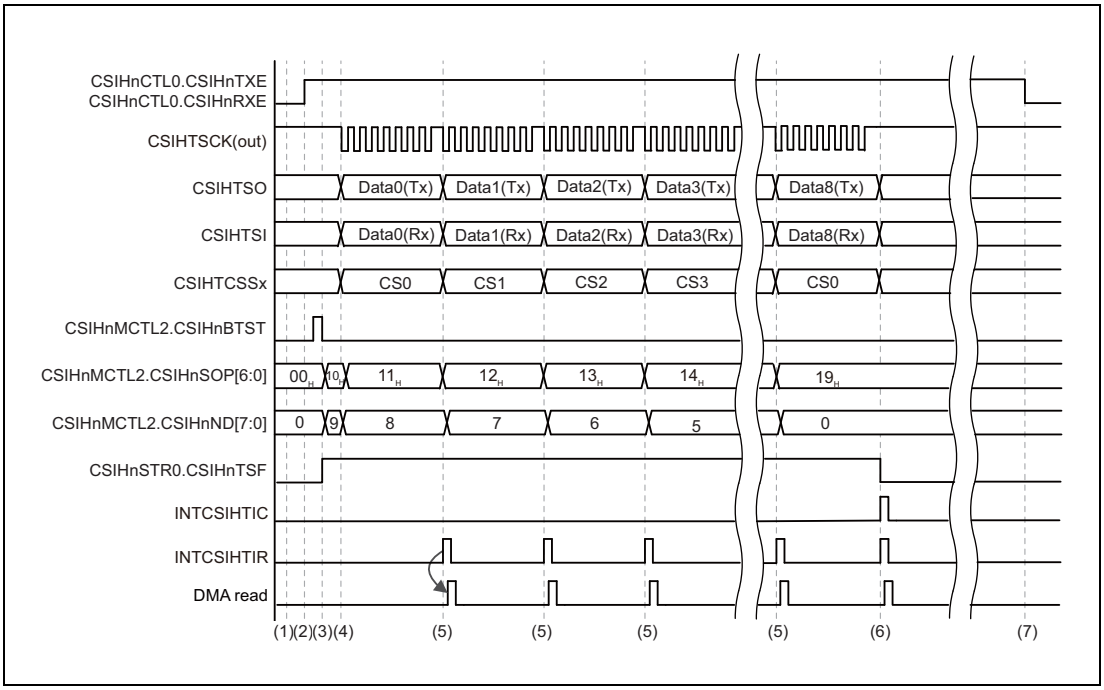

**Figure 17.51 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 0**

**NOTE**

The procedure of writing the data into the buffer is not described here.

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = $10_B$ (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission/reception is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates that the receive register CSIHnRX0W must be read.
6. When all transmissions are complete, the interrupt request, INTCSIHTIC is generated.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 17.6.2.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = $08_H$).
- The transfer start address is $10_H$ (CSIHnMCTL2.CSIHnSOP[6:0] = $10_H$).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0,CSIHnMCTL0.CSIHnMMS[1:0] = $10_B$)

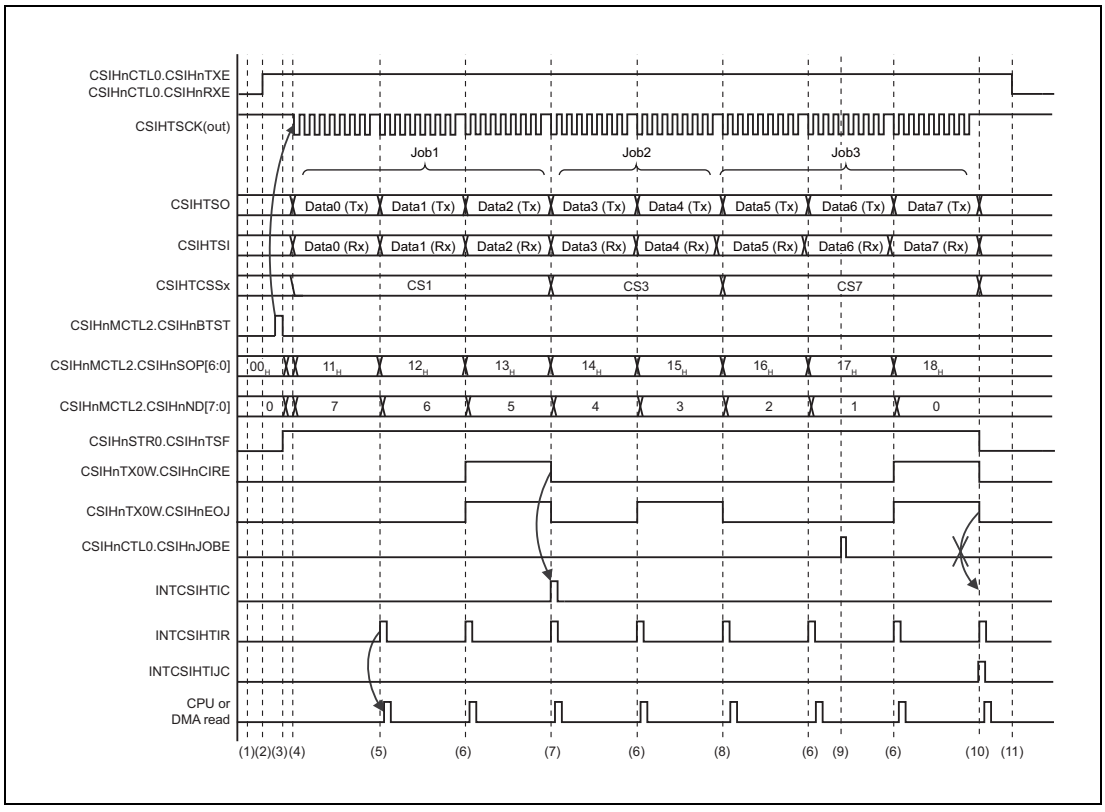

**Figure 17.52 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 1**

**NOTE**

The process of writing the data into the buffer is not described.

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1, CS3, and CS7.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = $10_B$ (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates that the receive register CSIHnRX0W must be read.
6. The CSIHnTX0W.CSIHnEOJ = 1 setting indicates that the last data of the current job is sent.
7. The interrupt request INTCSIHTIC is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CHABnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
10. After the forced stop of communication, interrupt requests INTCSIHTIJC and INTCSIHTIR are generated at the end of job3.
    The INTCSIHTIJC interrupt request indicates that the communication was forcibly stopped at the end of the current job.
    The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 17.6.3 Procedures in Dual Buffer Mode

Examples when job mode is enabled in master mode, disabled in master mode, and disabled in slave mode are provided below.

#### 17.6.3.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).
- The transmission direction is MSB first (CHABnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = $09_H$).
- The transfer start address is $10_H$ (CSIHnMCTL2.CSIHnSOP[6:0] = $10_H$).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = $01_B$)

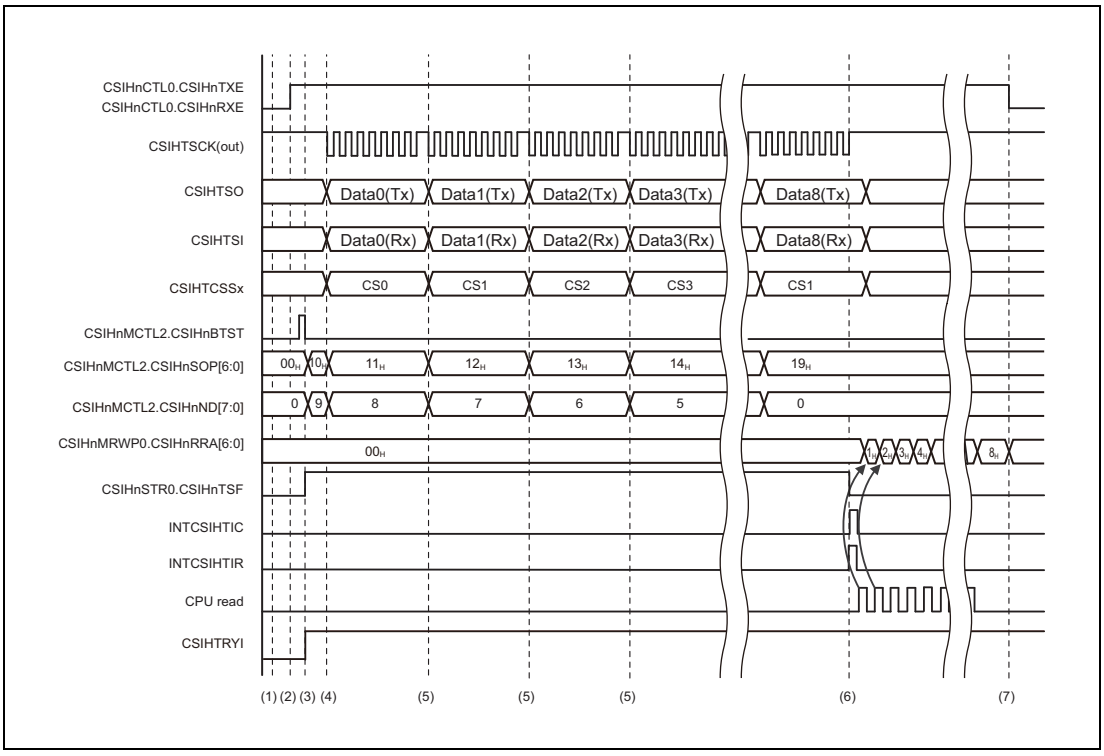

**Figure 17.53 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0**

**NOTE**

The process of writing the data into the buffer is not described.

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0]. Set CSIHnMCTL0.CSIHnMMS[1:0] = $01_B$ (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits the reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Permit buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
   The interrupt requests INTCSIHTIC and INTCSIHTIR are not generated.
6. When the last data is transmitted/received, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
   The CPU starts to read the received data from the receive buffer. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0]. These bits are incremented after each data is read.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 17.6.3.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = $08_H$).
- The transfer start address is $00_H$ (CSIHnMCTL2.CSIHnSOP[6:0] = $00_H$).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = $01_B$)

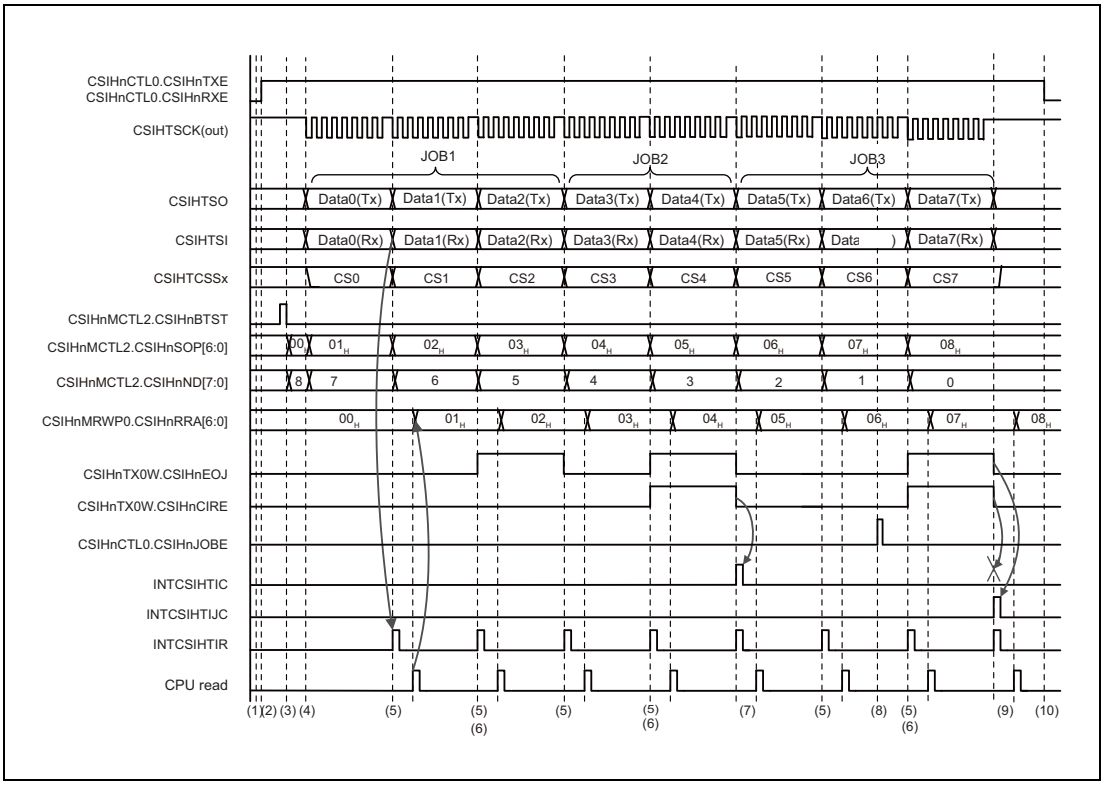

**Figure 17.54 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 1**

**NOTE**

The process of writing the data into the buffer is not described.

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS0 to CS7.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = $01_B$ (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented, and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission. This is repeated until the last data is transmitted/received.
5. The INTCSIHTIR interrupt request is generated everytime data is received.
   The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
6. CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent.
7. The INTCSIHTIC interrupt request is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
9. After the forced stop of communication, interrupt requests INTCSIHTIJC and INTCSIHTIR are generated at the end of JOB3.
   The INTCSIHTIJC interrupt request indicates that the communication was forcibly stopped at the end of the current job.
   The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. Additionally, the transmission data available in register CSIHnTX0W is not sent.
10. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 17.6.3.3 Transmit/Receive in Slave Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCTL1.CSIHnCKR = 0, CSIHnCFG0.CSIHnDAP0 = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = $09_H$).
- The transfer start address is $10_H$ (CSIHnMCTL2.CSIHnSOP[6:0] = $10_H$).
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = $01_B$)
- Handshake function is enabled (CSIHnCTL1.CSIHnHSE = 1)

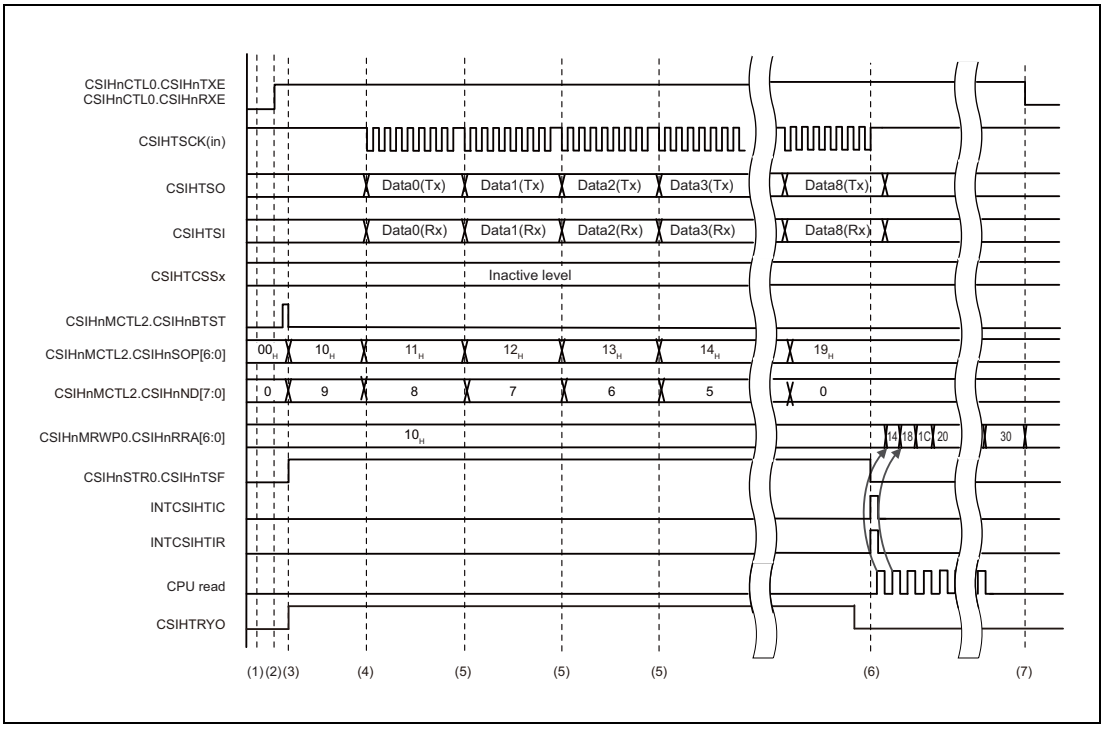

**Figure 17.55 Slave in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0**

**NOTE**

The process of writing the data into the buffer is not described.

**Procedure:**

1. Configure the communication protocol in register CSIHnCFG0.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = $01_B$ (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Specify the transfer start address by setting the CSIHnMCTL2.CSIHnSOP[6:0] bits and the number of data by setting the CSIHnMCTL2.CSIHnND[7:0] bits. Permit the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started when the input clock is received from the master. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
   The interrupt requests INTCSIHTIC and INTCSIHTIR are not generated because transmission data is sent from the buffer, and received data is stored in the buffer.
6. When the last data is transmitted/received, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
   The CPU starts to read the received data that is stored in the receive buffer. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0]. These bits are incremented after each data is read.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 17.6.4 Procedures in FIFO Mode

Two examples for a master is provided, one with job mode disabled, the other one with job mode enabled.

#### 17.6.4.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = $00_B$)

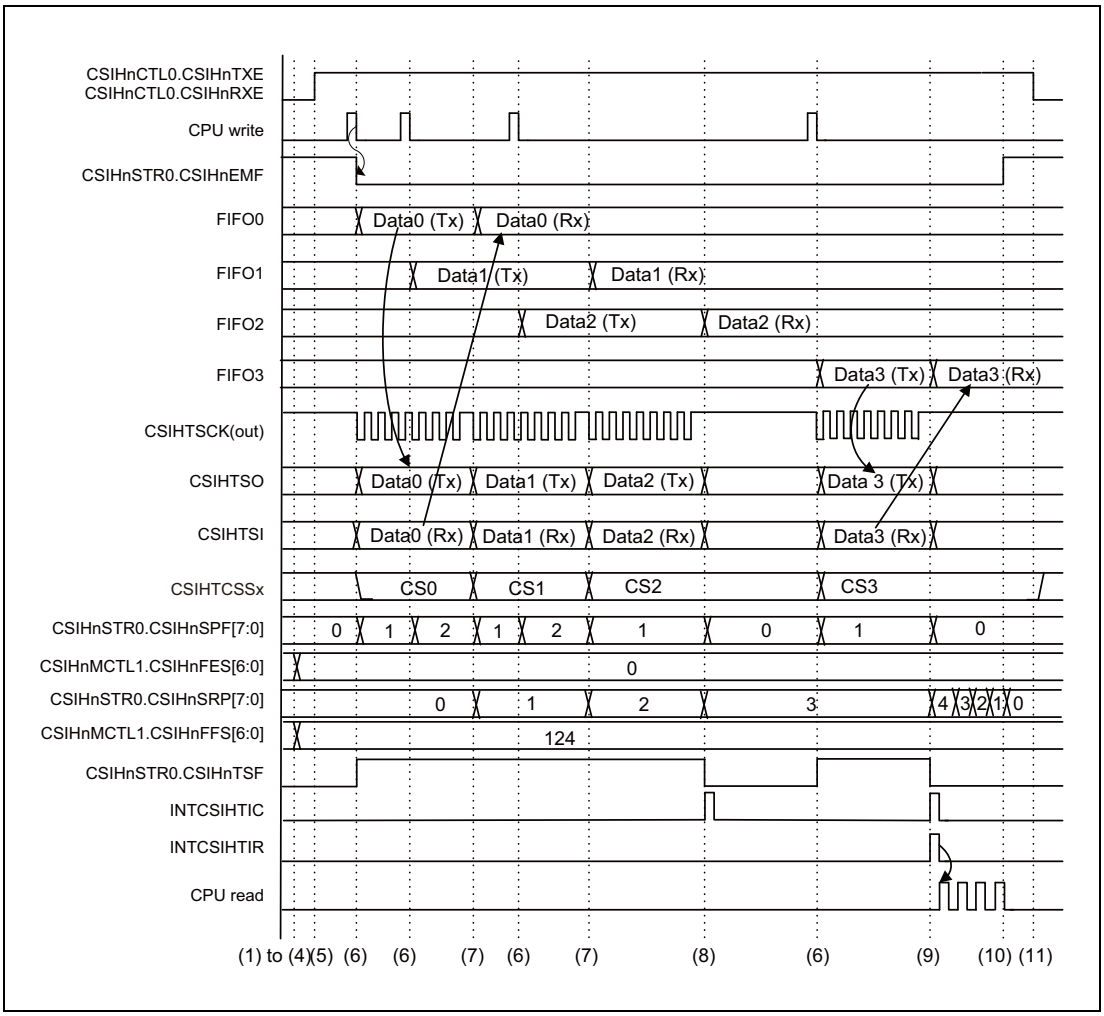

**Figure 17.56 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 0**

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. Specify the job mode disable and master mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2. Specify the FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] = $00_B$. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
2. Set CSIHnSTCR0.CSIHnPCT = 1 to clear all buffer pointers.
3. Check that CSIHnSTR0.CSIHnFLF = 0, CSIHnSTR0.CSIHnEMF = 1, and CSIHnSTR0.CSIHnSPF[7:0] = $00_H$.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the INTCSIHTIC interrupt output.
   Specify the conditions for generating the INTCSIHTIR interrupt request in the CSIHnMCTL1.CSIHnFFS[6:0] bits.
5. Set CSIHnCTL0.CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the first transmit data to the transmit register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
   Check that CSIHnSTR0.CSIHnEMF = 0.
7. The current transmission is completed. As the CSIHnFES[6:0] bits are not the same as the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is not generated.
8. As the CSIHnFES[6:0] bits are the same as the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is generated.
9. When CSIHnFFS[6:0] = 128 - CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. Since CSIHnFES[6:0] = CSIHnSPF[7:0], the interrupt request INTCSIHTIC is generated. After the generation of an interrupt, the CPU starts reading received data that is stored in the receive buffer.
10. When the CPU completes reading the received data that is stored in the receive buffer, CSIHnSTR0.CSIHnEMF is set to 1 and the FIFO buffer becomes empty.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. In addition, if communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

### 17.6.4.2 Transmit/Receive Mode when Job Mode is Enabled in Master Mode

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_B$).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- JOB1 consists of four data, JOB2 consists of three data, and JOB3 consists of five data.
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = $00_B$)

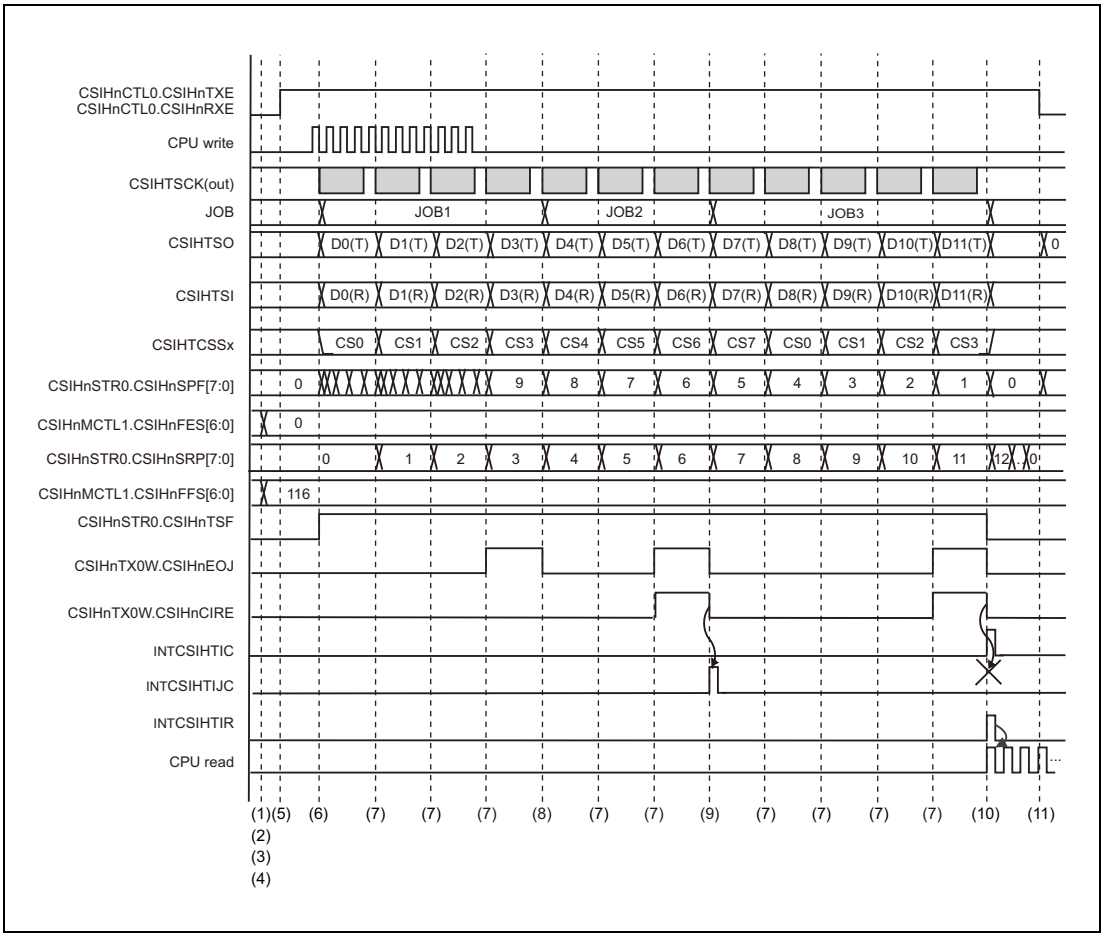

**Figure 17.57 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 1**

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. Set job mode disable and master mode in the corresponding bits of the CSIHnCTL1 and CSIHnCTL2 registers. Set FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] to $00_B$. This example uses chip select signals CS0 to CS7.
2. Set CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
3. Make sure that CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to $00_H$.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the INTCSIHTIC interrupt request. With CSIHnMCTL1.CSIHnFFS[6:0], specify the conditions for generating the INTCSIHTIR interrupt request.
5. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the first data to be sent to the CSIHnTX0W transmission register. Transmission starts automatically when the first data becomes available.
   Make sure CSIHnSTR0.CSIHnEMF is set to 0.
7. The current transmission is completed. Since CSIHnFES[6:0] is not the same as CSIHnSPF[7:0], the interrupt request INTCSIHTIC is not generated.
8. The INTCSIHTIJC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. The INTCSIHTIJC interrupt request is generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
10. The INTCSIHTIC interrupt request is generated because CSIHnFES[6:0] = CSIHnSPF[7:0]. INTCSIHTIC is generated so that INTCSIHTIJC is not generated.
    When CSIHnFFS[6:0] = 128 - CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. After the generation of the INTCSIHTIR interrupt, CPU starts reading the received data stored in received buffer.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

# 17.7 Detection and Correction of Errors in CSIHn RAM

## 17.7.1 ECC for the CSIHn RAM

**Table 17.46** gives an outline of the ECC functions for the CSIH RAM.

**Table 17.46 List of the ECC Functions for the CSIHn RAM**

| Item | Outline of Functions |
|---|---|
| ECC error detection/ correction | The RAM is checked for ECC errors.<br>The following options are selectable.<br>• 2-bit error detection and 1-bit error detection/correction<br>• 2-bit error detection and 1-bit error detection<br>The ECC error detection/correction can be disabled by using through mode.<br>With the initial settings, error detection/correction is enabled. |
| Error notification | When an ECC error is generated, an interrupt signal is generated.<br>• Error notification can be enabled or disabled when an ECC 2-bit error is detected.<br>• Error notification can be enabled or disabled when an ECC 1-bit error is detected.<br>In the initial setting, 2-bit error notification is enabled and 1-bit error notification is disabled.<br>However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed. |
| Error status | Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available.<br>A bit for clearing the error status is provided. |
| Address capture | Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error , and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared). |

## 17.7.2 Interrupt Request

**Table 17.47** lists the ECC interrupt request of CSIHn RAM.

**Table 17.47 CSIHn ECC Interrupt Request (FE-Level Maskable Interrupt)**

| Unit interrupt signal | Description | Name | DMA Trigger Number |
|---|---|---|---|
| INTECCDCSIHn | CSIHn ECC Bit error interrupt | INTECCDCSIH0 | — |
| | | INTECCDCSIH1 | |
| | | INTECCDCSIH2 | |
| | | INTECCDCSIH3 | |

### 17.7.3 Register Base Address

Table 17.48 Register Base Addresses

| Base Address Name | Base Address |
|---|---|
| <ECCCSIH0_base> | FFC7 $0100_H$ |
| <ECCCSIH1_base> | FFC7 $0200_H$ |
| <ECCCSIH2_base> | FFC7 $0300_H$ |
| <ECCCSIH3_base> | FFC7 $0400_H$ |

### 17.7.4 List of Registers

ECC for the CSIHn RAM Registers are listed in the following table.

For details about <ECCCSIHn_base>, see **Section 17.7.3, Register Base Address**.

Table 17.49 List of Registers

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| ECCCSIHn | CSIHn ECC Control Register | ECCCSIHnCTL | <ECCCSIHn_base> + $00_H$ |
| | CSIHn ECC Test Mode Control Register | ECCCSIHnTMC | <ECCCSIHn_base> + $04_H$ |
| | CSIHn ECC Encode/Decode Input/Output Replacement Test Register | ECCCSIHnTED | <ECCCSIHn_base> + $0C_H$ |
| | CSIHn ECC Redundant Bit Data Control Test Register | ECCCSIHnTRC | <ECCCSIHn_base> + $08_H$ |
| | CSIHn ECC Error Address Register 0 | ECCCSIHnAD0 | <ECCCSIHn_base> + $10_H$ |
| | CSIHn ECC Decode Syndrome Data Register | ECCCSIHnSYND | <ECCCSIHn_base> + $0B_H$ |
| | CSIHn ECC 7-Bit Redundant Bit Data Hold Test Register | ECCCSIHnHORD | <ECCCSIHn_base> + $0A_H$ |
| | CSIHn ECC Encode Test Register | ECCCSIHnECRD | <ECCCSIHn_base> + $09_H$ |
| | CSIHn ECC Redundant Bit Input/Output Replacement Register | ECCCSIHnERDB | <ECCCSIHn_base> + $08_H$ |
| SL_READTEST | ECCREAD Test Select Register | SELB_READTEST | FFC7 $8000_H$ |

## 17.7.5 ECCCSIHnCTL — CSIHn ECC Control Register

The ECCCSIHnCTL register controls the mode of the ECC and the status for CSIH.

Bits 7, 5, 4 and 3 should be set (written) while the CSIHn operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be $01_B$.

**Access:** This register can be read or written in 16-bit units.

**Address:** <ECCCSIHn_base> + $00_H$

**Value after reset:** Undefined

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | EMCA1 | EMCA0 | — | — | ECCOVFF | ECER2C | ECER1C | — | ECTHM | — | EC1ECP | EC2EDIC | EC1EDIC | ECER2F | ECER1F | ECEMF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | — |
| R/W | R/W*1 | R/W*1 | R | R | R | R/W*1 | R/W*1 | R | R/W | R | R/W | R/W | R/W | R | R | R |

Note 1. These bits are always read as 0.

**Table 17.50 ECCCSIHnCTL Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | EMCA1 | Access Control Bits 1 and 0 to ECC Mode Selection<br>These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are $01_B$, writing to bit 7 is enabled. |
| 14 | EMCA0 | |
| 13, 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | ECCOVFF | By detecting an error while the error status is set and the new error has anotheraddress than the already latched (not cleared or reset is not issued), this bit is set and error notification is generated.<br><br>0: Overflow is not occurerred afterr reset of clealing ECER2F and ECER1F.<br>1: Error address register overflowed<br><br>**Note:** This bit clear condition is as follows.<br>(1) Reset<br>(2) Writing ECER2C = 1 or ECER1C = 1<br>(3) Selecting through mode enable (ECTHM = 1) |
| 10 | ECER2C | 2-Bit ECC Error Detection Flag Clear<br>This bit clears 2-bit error detection flags of ECER2F (bit 2).<br>This bit is always read as 0. Writing 0 is ignored.<br>Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit.<br>When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. |
| 9 | ECER1C | 1-Bit ECC Error Detection Correction Accumulation Flag Clear<br>This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored.<br>Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit.<br>When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. |
| 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ECTHM | ECC Function through Mode Selection<br>Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function.<br>When writing to this bit, write $01_B$ to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function.<br>0: Passing through mode is disabled (normal operation mode).<br>1: Passing through mode is enabled. (ECC function disable) |

**Table 17.50 ECCCSIHnCTL Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | EC1ECP | 1-Bit Error Correction Enable<br>This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled.<br>0: When 1-bit error is detected, the error will be corrected.<br>1: When 1-bit error is detected, the error will not be corrected. |
| 4 | EC2EDIC | 2-Bit Error Detection Interrupt Control<br>This bit controls whether to generate an interrupt when 2-bit error is detected.<br>0: When 2-bit error is detected, an INTECCDCSIHn interrupt will not be generated.<br>1: When 2-bit error is detected, an INTECCDCSIHn interrupt will be generated. |
| 3 | EC1EDIC | 1-Bit Error Detection Interrupt Control<br>This bit controls whether to generate an interrupt when 1-bit error is detected.<br>0: When 1-bit error is detected, an INTECCDCSIHn interrupt will not be generated.<br>1: When 1-bit error is detected, an INTECCDCSIHn interrupt will be generated. |
| 2 | ECER2F | 2-Bit Error Detection Flag<br>This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (INTECCDCSIHn) is output.<br>Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM = 1), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated.<br>0: 2-bit error has not occurred since this bit was cleared.<br>1: 2-bit error has occurred.<br>This bit is read-only. Writing 0 or 1 does not change internal state. |
| 1 | ECER1F | 1-Bit Error Detection/Correction Flag<br>This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. When through mode is enabled (ECTHM = 1), this bit is cleared.<br>0: 1-bit error has not occurred since this bit was cleared.<br>1: 1-bit error has occurred.<br>This bit is read-only. Writing 0 or 1 does not change internal state. |
| 0 | ECEMF | ECC Error Message Flag<br>This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled (ECTHM = 1) and there is no 1-bit error in decode circuit input data.<br>0: The current RAM output data does not have bit errors.<br>1: The current RAM output data have bit errors. |

**CAUTION**

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

## 17.7.6 ECCCSIHnTMC — CSIHn ECC Test Mode Control Register

The ECCCSIHnTMC register is used to switch to the test mode, and this register is for test mode control.

This register can be used when CSIHn is not accessed to RAM.

When writing to bit 7, ETMA1 and ETMA0 need to be $10_B$.

**Access:** This register can be read or written in 16-bit units.

**Address:** <ECCCSIHn_base> + $04_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ETMA1 | ETMA0 | — | — | — | — | — | — | ECTMCE | — | — | ECTRRS | ECREOS | ECENS | ECDCS | ECREIS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W*1 | R/W*1 | R | R | R | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W |

Note 1. These bits are always read as 0.

**Table 17.51 ECCCSIHnTMC Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | ETMA1 | Access Control Bits 1 and 0 to ECC Test Mode<br>These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.<br>When these bits are $10_B$, writing to bits 7 is enabled. |
| 14 | ETMA0 | |
| 13 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ECTMCE | ECC Test Mode Enable<br>This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write $10_B$ to the ETMA1 and ETMA0 bits at the same time.<br>0: Access to the test mode registers and bits is disabled.<br>1: Access to the test mode registers and bits is enabled.<br><br>Test registers: ECCCSIHnTED, ECCCSIHnTRC, ECCCSIHnSYND, ECCCSIHnHORD, ECCCSIHnECRD, ECCCSIHnERDB<br>Register test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS |
| 6, 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | ECTRRS | ECC RAM Read Test Mode Selection<br>This bit selects the targets for reading when the ECCCSIHnTED and ECCCSIHnERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: Read value of the ECCCSIHnTED register will be the write value of the ECCCSIHnTED register. Read value of the ECCCSIHnERDB register will be the write value of the ECCCSIHnERDB register.<br>1: Read value of the ECCCSIHnTED register can read RAM data. Read value of the ECCCSIHnERDB register will be the ECC Data to be written to RAM. |
| 3 | ECREOS | ECC Redundant Bit Output Data Selection<br>This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the ECCCSIHnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously).<br>This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: ECC data is generated for write data is stored in RAM.<br>1: The value of ECCCSIHnERDB Register is stored in RAM. |

**Table 17.51 ECCCSIHnTMC Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 2 | ECENS | ECC Encoder Input Selection<br>This bit specifies data written to RAM or the value of the ECCCSIHnTED register as the input to the ECC encoder.<br>Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously).<br>This bit is cleared when ECTMCE = 0 (cleared synchronously).<br>0: ECC data is generated from write data to RAM<br>1: ECC data is generated from register value of the ECCCSIHnTED. |
| 1 | ECDCS | ECC Decoder Input Selection<br>This bit specifies which data is for generation of syndrome code and error detection, RAM data or the value of ECCCSIHnTED. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). ### 17.7.7 ECCCSIHnTED — CSIHn ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

This register value is used to generate ECC data or syndrome code.

This register can be accessed when ECC test mode in enabled (ECCCSIHnTMC.ECTMCE = 1). When ECCCSIHnTMC.ECTMCE = 0, writing to this register is ignored and 0000 $0000_H$ is read.

This register can be used when CSIHn is not accessed to RAM.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ECCCSIHn_base> + $0C_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ECEDB[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 17.52 ECCCSIHnTED Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | ECEDB[31:0] | When ECCCSIHnTMC.ECENS = 1, these bits generate ECC data from value of this register and store the register value in RAM.<br>When ECCCSIHnTMC.ECDCS = 1, these bits generate syndrome code from the value of the register and store the register value in ECC decode syndrome data register (ECCCSIHnSYND).<br>In addition, when ECCCSIHnTMC.ECTRRS = 1, RAM data [31:0] instead of written data is read for the value of this register. |

## 17.7.8 ECCCSIHnTRC — CSIHn ECC Redundant Bit Data Control Test Register

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers, ECCCSIHnSYND, ECCCSIHnHORD, ECCCSIHnECRD, and ECCCSIHnERDB.

This register can be accessed when ECC test mode is enabled (ECCCSIHnTMC.ECTMCE = 1). When ECCCSIHnTMC.ECTMCE = 0, writing to this register is ignored and 0000 $0000_H$ is read.

This register can be used when CSIHn is not accessed to RAM.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ECCCSIHn_base> + $08_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 17.7.9 ECCCSIHnAD0 — CSIHn ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ECCCSIHn_base> + $10_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 17.53 ECCCSIHnAD0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset is returned. |
| 30 to 0 | ECEAD[30:0] | ECEAD0 is a read-only register to hold the address at which an ECC error has occurred.<br>If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECEAD0 as the address at which the ECC error has occurred.<br>The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the lat ter is stored.<br>Only one address can be held in ECEAD0 |

## 17.7.10 ECCCSIHnSYND — CSIHn ECC Decode Syndrome Data Register

This register is a read-only register for storing generated syndrom data in ECC test mode.

Writing to this register is ignored.

This register is read-only when ECC test mode is enabled (ECCCSIHnTMC.ECTMCE = 1). When ECC test mode is disabled (ECCCSIHnTMC.ECTMCE = 0), $00_H$ is read.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ECCCSIHn_base> + $0B_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | SYND6 | SYND5 | SYND4 | SYND3 | SYND2 | SYND1 | SYND0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 17.54 ECCCSIHnSYND Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | SYND[6:0] | These bits store generated syndrome code as needed. |

## 17.7.11 ECCCSIHnHORD — CSIHn ECC 7-Bit Redundant Bit Data Hold Test Register

This register is for storing ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (ECCCSIHnTMC.ECTMCE = 1). When ECC test mode is disabled (ECCCSIHnTMC.ECTMCE = 0), $00_H$ is read.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ECCCSIHn_base> + $0A_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | HORD6 | HORD5 | HORD4 | HORD3 | HORD2 | HORD1 | HORD0 |

| R/W | R | R | R | R | R | R | R | R |

**Table 17.55 ECCCSIHnHORD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | HORD[6:0] | These bits store ECC code for read RAM data as needed.<br>When ECCCSIHnTMC.ECTRRS =1 and if ECCCSIHnTED register is read, ECC code is stored. |

## 17.7.12 ECCCSIHnECRD — CSIHn ECC Encode Test Register

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (ECCCSIHnTMC.ECTMCE = 1). When ECC test mode is disabled (ECCCSIHnTMC.ECTMCE = 0), $00_H$ is read.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ECCCSIHn_base> + $09_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | ECRD6 | ECRD5 | ECRD4 | ECRD3 | ECRD2 | ECRD1 | ECRD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 17.56 ECCCSIHnECRD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECRD[6:0] | These bits can read ECC data generated at the time of RAM data writing and can read ECC data for data written in the ECCCSIHnTED register when ECCCSIHnTMC.ECENS =1. |

### 17.7.13 ECCCSIHnERDB — CSIHn ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles test data.

This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode in enabled (ECCCSIHnTMC.ECTMCE = 1). When ECCCSIHnTMC.ECTMCE = 0, writing to this register is ignored and $00_H$ is read.

**Access:** This register can be read or written in 8-bit units.

**Address:** <ECCCSIHn_base> + $08_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | ERDB6 | ERDB5 | ERDB4 | ERDB3 | ERDB2 | ERDB1 | ERDB0 |

**Table 17.57 ECCCSIHnERDB Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ERDB[6:0] | These bits can store this register value as ECC data when ECCCSIHnTMC.ECREOS = 1. When the register is read while ECCCSIHnTMC.ECREIS =1, the value read from these bits is ECC data read from the RAM.<br>When ECCCSIHnTMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instated of written data. |

## 17.7.14 SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the CSIHn ECC registers and RS-CANn ECC registers.

Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

**Access:** This register can be read or written in 16-bit units.

**Address:** FFC7 $8000_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

# Section 18 LIN Master Interface (RLIN2)

This section contains a generic description of the LIN master interface (RLIN2).

The first part in this section describes the features specific to RH850/F1K, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RLIN2.

## 18.1 Features of RH850/F1K RLIN2

### 18.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN2 units and channels.

**Table 18.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | 2 | 3 |
| Name | RLIN24n (n = 0) | RLIN24n (n = 0, 1) | RLIN24n (n = 0 to 2) |

**Table 18.2 Configurations of RLIN2 Units and Correspondence between the Number of Channels per Unit and the Channel Numbers of the Units**

| Unit Name RLIN24n | Channels per Unit | Unit Channel Number (i) | Channel Name RLIN2m | RH850/F1K 100 pins (3 ch) | RH850/F1K 144 pins (6 ch) | RH850/F1K 176 pins (10 ch) |
|---|---|---|---|---|---|---|
| RLIN240 | 4 | 0 | RLIN20 | √ | √ | √ |
| | | 1 | RLIN21 | √ | √ | √ |
| | | 2 | RLIN22 | √ | √ | √ |
| | | 3 | RLIN23 | | √ | √ |
| RLIN241 | 4 | 0 | RLIN24 | | √ | √ |
| | | 1 | RLIN25 | | √ | √ |
| | | 2 | RLIN26 | | | √ |
| | | 3 | RLIN27 | | | √ |
| RLIN242 | 2 | 0 | RLIN28 | | | √ |
| | | 1 | RLIN29 | | | √ |

**Table 18.3 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual RLIN2 units are identified by the index “n” (n = 0 to 2). |
| m | Throughout this section, the individual channels are identified by the index “m” (m = 0 to 9). |
| i | Throughout this section, the individual channels of units that compose RLIN2 are identified by the index “i” (i = 0 to 3). |
| b | Throughout this section, the individual data buffers implemented in RLIN2 are identified by the index “b” (b = 1 to 8). |

For example, RLN24nGLWBR are the LIN wake-up baud rate select registers, which are the global registers of RLIN2. RLN24nmLiMD are the LIN mode registers, which are the channel registers.

The following lists the indices corresponding to each product.

**Table 18.4 Indices Correspondence of Each Product**

| Indices Correspondence of Each Product | | |
|---|---|---|
| **100 pins** | **144 pins** | **176 pins** |
| i = 0 to 2 (RLIN240) | i = 0 to 3 (RLIN240)<br>i = 0, 1 (RLIN241) | i = 0 to 3 (RLIN240, 1)<br>i = 0,1 (RLIN242) |
| b = 1 to 8 | b = 1 to 8 | b = 1 to 8 |

## 18.1.2 Register Base Addresses

RLIN2 base addresses are listed in the following table.

RLIN2 register addresses are given as offsets from the base addresses.

**Table 18.5 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <RLIN240_base> | FFCE 0000$_H$ |
| <RLIN241_base> | FFCE 0080$_H$ |
| <RLIN242_base> | FFCE 0100$_H$ |

## 18.1.3 Clock Supply

The RLIN2 clock supply is shown in the following table.

**Table 18.6 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| RLIN24n | LIN communication clock sources | CKSCLK_ILIN | Communication clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_ILIN | |

## 18.1.4 Interrupt Request

RLIN2 interrupt requests are listed in the following table.

**Table 18.7 Interrupt Requests (1/2)**

| Unit Interrupt Signal | Description | Interrupt Number |
|---|---|---|
| **RLIN240** | | |
| INTRLIN0 | RLIN20 interrupt | 58 |
| INTRLIN1 | RLIN21 interrupt | 59 |
| INTRLIN2 | RLIN22 interrupt | 162 |
| INTRLIN3 | RLIN23 interrupt | 163 |

Table 18.7 Interrupt Requests (2/2)

| Unit Interrupt Signal | Description | Interrupt Number |
|---|---|---|
| **RLIN241** | | |
| INTRLIN4 | RLIN24 interrupt | 226 |
| INTRLIN5 | RLIN25 interrupt | 227 |
| INTRLIN6 | RLIN26 interrupt | 275 |
| INTRLIN7 | RLIN27 interrupt | 276 |
| **RLIN242** | | |
| INTRLIN8 | RLIN28 interrupt | 285 |
| INTRLIN9 | RLIN29 interrupt | 286 |

### 18.1.5 Reset Sources

RLIN2 reset sources are listed in the following table. RLIN2 is initialized by these reset sources.

Table 18.8 Reset Sources

| Unit Name | Reset Source |
|---|---|
| RLIN24n | All reset sources (ISORES) |

### 18.1.6 External Input/Output Signals

External input/output signals of RLIN2 are listed in the following table.

Table 18.9 External Input/Output Signals

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **RLIN240** | | |
| RLIN2mRX (m = 0 to 3) | RLIN240 receive data input | RLIN2mRX (m = 0 to 3) |
| RLIN2mTX (m = 0 to 3) | RLIN240 transmit data output | RLIN2mTX (m = 0 to 3) |
| **RLIN241** | | |
| RLIN2mRX (m = 4 to 7) | RLIN241 receive data input | RLIN2mRX (m = 4 to 7) |
| RLIN2mTX (m = 4 to 7) | RLIN241 transmit data output | RLIN2mTX (m = 4 to 7) |
| **RLIN242** | | |
| RLIN2mRX (m = 8, 9) | RLIN242 receive data input | RLIN2mRX (m = 8, 9) |
| RLIN2mTX (m = 8, 9) | RLIN242 transmit data output | RLIN2mTX (m = 8, 9) |

# 18.2 Overview

## 18.2.1 Functional Overview

The LIN Master Interface is a hardware LIN communication controller that complies with LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005), and automatically performs frame communication and error determination.

**Table 18.10** shows the LIN Master Interface specifications.

**Table 18.10 LIN Master Interface Specifications**

| Item | | Specifications |
|---|---|---|
| Channel count | | 10 channels (In this product, 2-channel version and 4-channel version of RLIN2 is included.) |
| LIN communication function | Protocol | LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005) |
| | Variable frame structure | • Transmission break width: 13 to 28 Tbits<br>• Transmission break delimiter width: 1 to 4 Tbits<br>• Inter-byte space (header): 0 to 7 Tbits (space between Sync field and ID field)*1<br>• Response space: 0 to 7 Tbits*1<br>• Inter-byte space: 0 to 3 Tbits (space between data bytes in response area)<br>• Transmit wake-up: 1 to 16 Tbits |
| | Checksum | • Automatic operation for both transmission and reception<br>• Classic or enhanced selectable (for each frame) |
| | Response field data byte count | Variable from 0 to 8 bytes |
| | Frame communication modes | • Mode in which header transmission and response transmission/reception are started with a single transmission start request<br>• Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode) |
| | Wake-up transmission and reception | Available in LIN wake-up mode<br>• Wake-up transmission (1 to 16 Tbits)<br>• Wake-up reception<br>Low-level width of input signals measured |
| | Status | • Successful frame/wake-up transmission<br>• Successful header transmission<br>• Successful frame/wake-up reception*2<br>• Successful data 1 reception<br>• Error detection<br>• Operation mode<br>(LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode) |
| | Error status | • Bit error<br>• Checksum error<br>• Frame timeout error<br>• Physical bus error<br>• Framing error |
| | Baud rate selection | Baud rate conforming to the LIN specifications generated using baud rate generator |
| | Test mode | Self-test mode for user evaluation |
| | Interrupt function | • Successful frame/wake-up transmission<br>• Successful frame/wake-up reception*2<br>• Error detection<br><br>The logical OR of these three events is the interrupt source (INTRLINm) for each channel. |

Note 1. Since the same register is used for configuration, the inter-byte space (header) = response space.
Note 2. For wake-up reception, the input signal low-level width count is indicated.

## 18.2.2 Block Diagram

**Figure 18.1** shows a block diagram of the LIN master interface.

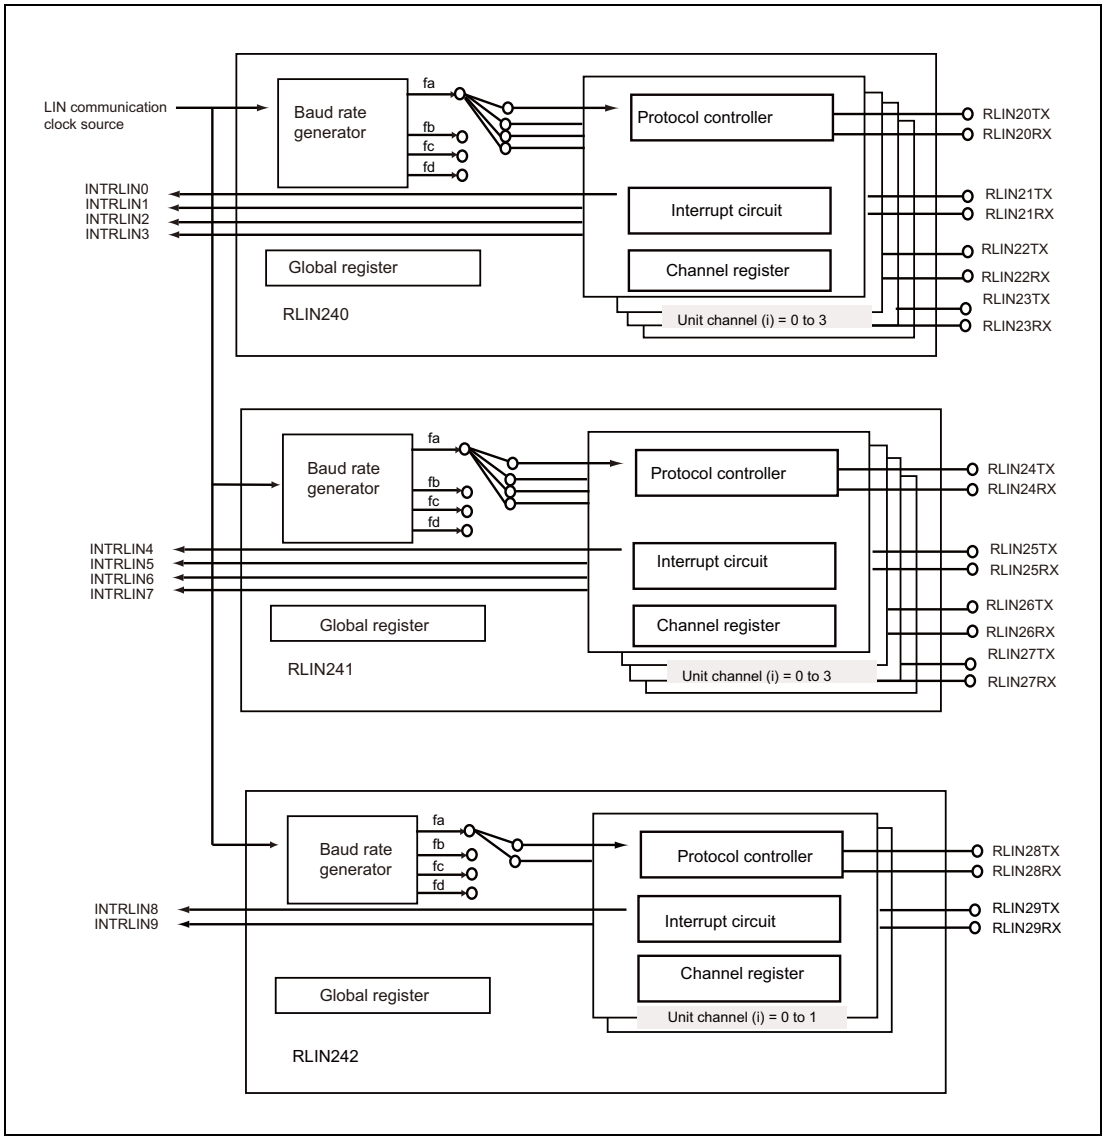

**Figure 18.1 LIN Master Interface Block Diagram (176 Pins, RLIN2 10 Channels Embedded)**

## 18.3 Registers

The registers of the LIN master interface include global registers and channel registers. As the global registers are allocated for each unit, they can be individually set for each unit. As the channel registers are allocated for each channel, they can individually control each channel.

### 18.3.1 List of Registers

RLIN2 registers are listed in the following table.

For details about <RLIN24n_base>, see **Section 18.1.2, Register Base Addresses**.

**Table 18.11 Registers**

| Module | Register | Symbol | Address |
|---|---|---|---|
| **Global registers** | | | |
| RLN24n | LIN wake-up baud rate select register | RLN24nGLWBR | <RLIN24n_base> + $01_H$ |

| | LIN data buffer 8 register | RLN24nmLiDBR8 | <RLIN24n_base> + $1F_H$ + i × $20_H$ |

**Note:** When writing to a register not used, write the value after reset.

## 18.3.2 Global Registers

### 18.3.2.1 RLN24nGLWBR — LIN Wake-Up Baud Rate Select Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nGLWBR: <RLIN24n_base> + $01_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | LWBR0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 18.12 RLN24nGLWBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | LWBR0 | Wake-up Baud Rate Select<br>0: In LIN wake-up mode, the clock specified by the LCKS bit setting in the RLN24nmLiMD registers is used (when LIN 1.3 is used).<br>1: In LIN wake-up mode, the clock fa is used regardless of the setting of the LCKS bit in the RLN24nmLiMD registers (when LIN 2.X is used). |

Set the RLN24nGLWBR register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

#### LWBR0 Bit (Wake-Up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN24nGLWBR register to 0. This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.
When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. With this setting, fa is selected as the LIN system clock ($f_{LIN}$) during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register (the LCKS bit is not changed) and the 2.5-Tbit or longer low-level width of the input signal can be measured.
Setting the baud rate to 19200 bps while fa is selected allows the 130 µs or longer low-level width of the input signal to be detected during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register.

### 18.3.2.2 RLN24nGLBRP0 — LIN Baud Rate Prescaler 0 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nGLBRP0: <RLIN24n_base> + $02_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LBRP0[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.13 RLN24nGLBRP0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | LBRP0[7:0] | Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the LIN communication clock source by N+1.<br>Setting range: $00_H$ to $FF_H$ |

Set the RLN24nGLBRP0 register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

The value set in this register is used to control the frequency of baud rate clock source fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the LIN communication clock source by N+1.

### 18.3.2.3 RLN24nGLBRP1 — LIN Baud Rate Prescaler 1 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nGLBRP1: <RLIN24n_base> + $03_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LBRP1[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.14 RLN24nGLBRP1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | LBRP1[7:0] | Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the LIN communication clock source by M+1.<br>Setting range: $00_H$ to $FF_H$ |

Set the RLN24nGLBRP1 register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the LIN communication clock source by M+1.

### 18.3.2.4 RLN24nGLSTC — LIN Self-Test Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nGLSTC: <RLIN24n_base> + $04_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | LSTM |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.15 RLN24nGLSTC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | — | Writing $A7_H$, $58_H$, and $01_H$ successively to the RLN24nGLSTC register places the module in LIN self-test mode. |
| 0 | LSTM | LIN Self-Test Mode<br>0: The module is not in LIN self-test mode.<br>1: The module is in LIN self-test mode. |

The RLN24nGLSTC register cancels protection of LIN self-test mode.

Set the RLN24nGLSTC register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

Writing $A7_H$, $58_H$, and $01_H$ successively to the RLN24nGLSTC register places the module into LIN self-test mode.

When successive writing is completed and the module is placed in LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For details about transitioning to LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

When read, bits 6 to 1 return "$000000_B$", and bit 7 returns an undefined value.

#### LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For details about exiting LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN24nGLSTC register if it is not a part of successive writing of $A7_H$, $58_H$, and $01_H$.

## 18.3.3 Channel Registers

### 18.3.3.1 RLN24nmLiMD — LIN Mode Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiMD: <RLIN24n_base> + $08_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | LCKS[1:0] | | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R | R |

**Table 18.16 RLN24nmLiMD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3, 2 | LCKS[1:0] | LIN System Clock Select<br>b3 b2<br>0 0: fa (Clock generated by baud rate prescaler 0)<br>0 1: fb (1/2 clock generated by baud rate prescaler 0)<br>1 0: fc (1/8 clock generated by baud rate prescaler 0)<br>1 1: fd (1/2 clock generated by baud rate prescaler 1) |
| 1, 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Set the RLN24nmLiMD register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

#### LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.
With $00_B$ set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).
With $01_B$ set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).
With $10_B$ set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).
With $11_B$ set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When the LWBR0 bit in the RLN24nGLWBR is 1 (when LIN 2.x is used) and the RLN24nmLiMST register is $01_H$ (LIN wake-up mode), regardless of the setting of the LCKS bit, fa is input to the protocol controller (LCKS bit is not changed).

### 18.3.3.2 RLN24nmLiBFC — LIN Break Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiBFC: <RLIN24n_base> + $09_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | BDT[1:0] | | BLT[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.17 RLN24nmLiBFC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5, 4 | BDT[1:0] | Transmission Break Delimiter (High Level) Width Select<br>b5 b4<br>0 0: 1 Tbit<br>0 1: 2 Tbits<br>1 0: 3 Tbits<br>1 1: 4 Tbits |
| 3 to 0 | BLT[3:0] | Transmission Break (Low Level) Width Select<br>b3 b0<br>0 0 0 0: 13 Tbits<br>0 0 0 1: 14 Tbits<br>0 0 1 0: 15 Tbits<br>:<br>1 1 1 0: 27 Tbits<br>1 1 1 1: 28 Tbits |

Set the RLN24nmLiBFC register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

#### BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header.
1 Tbit to 4 Tbits can be specified.

#### BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header.
13 Tbits to 28 Tbits can be specified.

### 18.3.3.3 RLN24nmLiSC — LIN Space Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiSC: <RLIN24n_base> + $0A_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | IBS[1:0] | | — | IBHS[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R/W | R/W | R/W |

**Table 18.18 RLN24nmLiSC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5, 4 | IBS[1:0] | Inter-Byte Space Select<br>b5 b4<br>0 0: 0 Tbit<br>0 1: 1 Tbit<br>1 0: 2 Tbits<br>1 1: 3 Tbits |
| 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 to 0 | IBHS[2:0] | Inter-Byte Space (Header)/Response Space Select<br>b2 b0<br>0 0 0: 0 Tbit<br>0 0 1: 1 Tbit<br>0 1 0: 2 Tbits<br>0 1 1: 3 Tbits<br>1 0 0: 4 Tbits<br>1 0 1: 5 Tbits<br>1 1 0: 6 Tbits<br>1 1 1: 7 Tbits |

Set the RLN24nmLiSC register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

#### IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.
0 Tbit to 3 Tbits can be specified.
These bits are enabled only during response transmission; they are disabled during response reception.

#### IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.
0 Tbit to 7 Tbits can be specified.
The response space setting is enabled only during response transmission; the setting is disabled during response reception.
The inter-byte space (header) value is equal to the response space value.

### 18.3.3.4 RLN24nmLiWUP — LIN Wake-Up Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiWUP: <RLIN24n_base> + $0B_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WUTL[3:0] | | | | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R | R |

**Table 18.19 RLN24nmLiWUP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | WUTL[3:0] | Wake-up Transmission Low Level Width Select<br>b7 b4<br>0 0 0 0: 1 Tbit<br>0 0 0 1: 2 Tbits<br>0 0 1 0: 3 Tbits<br>0 0 1 1: 4 Tbits<br>:<br>1 1 0 0: 13 Tbits<br>1 1 0 1: 14 Tbits<br>1 1 1 0: 15 Tbits<br>1 1 1 1: 16 Tbits |
| 3 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Set the RLN24nmLiWUP register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

#### WUTL[3:0] Bits (Wake-Up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.
1 Tbit to 16 Tbits can be specified.
When the LWBR0 bit in the RLN24nGLWBR is 1 (when LIN 2.x is used), regardless of the setting of the LCKS bit in the RLN24nmLiMD register, fa is selected as the LIN system clock ($f_{LIN}$) (LCKS bit is not changed).

### 18.3.3.5 RLN24nmLiIE — LIN Interrupt Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiIE: <RLIN24n_base> + $0C_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | ERRIE | FRCIE | FTCIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

**Table 18.20 RLN24nmLiIE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 | ERRIE | Error Detection Interrupt Request Enable<br>0: Disables error detection interrupt request.<br>1: Enables error detection interrupt request. |
| 1 | FRCIE | Successful Frame/Wake-up Reception Interrupt Request Enable<br>0: Disables successful frame/wake-up reception interrupt request.<br>1: Enables successful frame/wake-up reception interrupt request. |
| 0 | FTCIE | Successful Frame/Wake-up Transmission Interrupt Request Enable<br>0: Disables successful frame/wake-up transmission interrupt request.<br>1: Enables successful frame/wake-up transmission interrupt request. |

Set the RLN24nmLiIE register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

#### ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables interrupt request upon detection of an error.
With 0 set, the interrupt request is not generated when the ERR flag in the RLN24nmLiST register is set to 1.
With 1 set, the interrupt request is generated when the ERR flag in the RLN24nmLiST register is set to 1.
Errors that constitute interrupt sources are bit errors, physical bus errors, frame timeout errors, framing errors, and checksum errors.
Detection of a bit error, physical bus error, frame timeout error, and framing error can be enabled or disabled using the RLN24nmLiEDE register.

#### FRCIE Bit (Successful Frame/Wake-Up Reception Interrupt Request Enable)

The FRCIE bit enables or disables interrupt request upon successful reception of a frame or a wake-up signal (counting of low level width of the input signal).
With 0 set, the interrupt request is not generated when the FRC flag in the RLN24nmLiST register is set to 1.
With 1 set, the interrupt request is generated when the FRC flag in the RLN24nmLiST register is set to 1.

#### FTCIE Bit (Successful Frame/Wake-Up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables interrupt request upon successful transmission of a frame or a wake-up signal.
With 0 set, the interrupt request is not generated when the FTC flag in the RLN24nmLiST register is set to 1.
With 1 set, the interrupt request is generated when the FTC flag in the RLN24nmLiST register is set to 1.

### 18.3.3.6 RLN24nmLiEDE — LIN Error Detection Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiEDE: <RLIN24n_base> + $0D_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | FERE | FTERE | PBERE | BERE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 18.21 RLN24nmLiEDE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | FERE | Framing Error Detection Enable<br>0: Disables framing error detection.<br>1: Enables framing error detection. |
| 2 | FTERE | Frame Timeout Error Detection Enable<br>0: Disables frame timeout error detection.<br>1: Enables frame timeout error detection. |
| 1 | PBERE | Physical Bus Error Detection Enable<br>0: Disables physical bus error detection.<br>1: Enables physical bus error detection. |
| 0 | BERE | Bit Error Detection Enable<br>0: Disables bit error detection.<br>1: Enables bit error detection. |

Set the RLN24nmLiEDE register while the OMM0 bit in the RLN24nmLiMST register is $0_B$ (LIN reset mode).

#### FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is indicated in the FER flag in the RLN24nmLiEST register.
For details on the framing error, see **Section 18.14, Error Status**.

#### FTERE Bit (Frame Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error.
With 0 set, the frame timeout error is not detected.
With 1 set, the frame timeout error is detected.
When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN24nmLiEST register.
For details on the frame timeout error, see **Section 18.14, Error Status**.

#### PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.
With 0 set, the physical bus error is not detected.
With 1 set, the physical bus error is detected.
When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN24nmLiEST register.
For details on the physical bus error, see **Section 18.14, Error Status**.

#### BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is indicated in the BER flag in the RLN24nmLiEST register.
For details on the bit error, see **Section 18.14, Error Status**.

### 18.3.3.7 RLN24nmLiCUC — LIN Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiCUC: <RLIN24n_base> + $0E_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | OM1 | OM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 18.22 RLN24nmLiCUC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | OM1 | LIN Mode Select<br>0: LIN wake-up mode.<br>1: LIN operation mode. |
| 0 | OM0 | LIN Reset<br>0: Transition to LIN reset mode.<br>1: Exit LIN reset mode. |

Set the RLN24nmLiCUC register to $01_H$ to transition to LIN wake-up mode or to $03_H$ to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN24nmLiCUC register to $03_H$ after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN24nmLiMST register before writing another value.

#### OM1 Bit (LIN Mode Select)

The OM1 bit selects the operating mode (LIN wake-up mode or LIN operation mode) that is entered after exiting LIN reset mode.
Setting this bit to 0 selects LIN wake-up mode.
Setting this bit to 1 selects LIN operation mode.
This bit is enabled only when the OMM0 bit in the RLN24nmLiMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN24nmLiTRC register is 1.

#### OM0 Bit (LIN Reset)

The OM0 bit selects whether to transition to or exit LIN reset mode.
Setting this bit to 0 causes RLIN2 to enter LIN reset mode.
Setting this bit to 1 causes RLIN2 to exit LIN reset mode.

### 18.3.3.8 RLN24nmLiTRC — LIN Transmission Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiTRC: <RLIN24n_base> + $10_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | RTS | FTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 18.23 RLN24nmLiTRC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | RTS | Response Transmission Start<br>0: Response transmission is stopped in frame separate mode.<br>1: Response transmission is started in frame separate mode. |
| 0 | FTS | Frame Transmission/Wake-up Transmission/Reception Start<br>0: Frame Transmission/wake-up transmission/reception is stopped.<br>1: Frame Transmission/wake-up transmission/reception is started. |

#### RTS Bit (Response Transmission Start)

Set the RTS bit (response transmit start bit) to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame transmission and transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write $02_H$ to the RLN24nmLiTRC register using the store instruction.
Writing a value to this bit is disabled when the OMM0 bit is 0 (LIN reset mode). When the OMM1 bit is 0 (LIN wake-up mode), do not write 1.
Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is stopped).

#### FTS Bit (Frame Transmission/Wake-Up Transmission/Reception Start)

Set the FTS bit to 1 to start frame/wake-up transmission.
Also set this bit to 1 to allow wake-up reception (counting of the low level width of the input signal).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit is 0 (LIN reset mode).
This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

### 18.3.3.9 RLN24nmLiMST — LIN Mode Status Register

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** RLN24nmLiMST: <RLIN24n_base> + $11_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | OMM1 | OMM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 18.24 RLN24nmLiMST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OMM1 | LIN Mode Status Monitor<br>0: LIN wake-up mode.<br>1: LIN operation mode. |
| 0 | OMM0 | LIN Reset Status Monitor<br>0: LIN reset mode.<br>1: Not in LIN reset mode. |

#### OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.
When the OMM0 bit is $0_B$ (LIN reset mode), the value of this bit is disabled.

#### OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

### 18.3.3.10 RLN24nmLiST — LIN Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiST: <RLIN24n_base> + $12_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | HTRC | D1RC | — | — | ERR | — | FRC | FTC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R/W | R/W |

**Table 18.25 RLN24nmLiST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | HTRC | Successful Header Transmission Flag<br>0: Header transmission has not been completed.<br>1: Header transmission has been completed. |
| 6 | D1RC | Successful Data 1 Reception Flag<br>0: Data 1 reception has not been completed.<br>1: Data 1 reception has been completed. |
| 5, 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | ERR | Error Detection Flag<br>0: No error has been detected.<br>1: Error has been detected. |
| 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | FRC | Successful Frame/Wake-up Reception Flag<br>0: Frame or wake-up reception has not been completed.<br>1: Frame or wake-up reception has been completed. |
| 0 | FTC | Successful Frame/Wake-up Transmission Flag<br>0: Frame or wake-up transmission has not been completed.<br>1: Frame or wake-up transmission has been completed. |

The RLN24nmLiST register is automatically cleared to $00_H$ upon transition to LIN reset mode and start of the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains $00_H$.

Writing to this register is prohibited while the FTS bit in the RLN24nmLiTRC register is 1 (frame transmission or wake-up transmission/reception is started)

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value from before 1 was written.
"1" is set upon completion of header transmission, but an interrupt request is not generated.
To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

#### D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value from before 1 is written.
"1" is set upon completion of Data 1 reception, but an interrupt request is not generated.
To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

#### ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when the value of any of the flags of the RLN24nmLiEST registers is 1). Here, an interrupt request is generated if the ERRIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN24nmLiEST register while in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

#### FRC Flag (Successful Frame/Wake-Up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value from before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request is generated if the FRCIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled).
To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

#### FTC Flag (Successful Frame/Wake-Up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value from before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request is generated if the FTCIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled).
To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

### 18.3.3.11 RLN24nmLiEST — LIN Error Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiEST: <RLIN24n_base> + $13_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | CSER | — | FER | FTER | PBER | BER |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R | R/W | R/W | R/W | R/W |

**Table 18.26 RLN24nmLiEST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | CSER | Checksum Error Flag<br>0: Checksum error has not been detected.<br>1: Checksum error has been detected. |
| 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | FER | Framing Error Flag<br>0: Framing error has not been detected.<br>1: Framing error has been detected. |
| 2 | FTER | Frame Timeout Error Flag<br>0: Frame timeout error has not been detected.<br>1: Frame timeout error has been detected. |
| 1 | PBER | Physical Bus Error Flag<br>0: Physical bus error has not been detected.<br>1: Physical bus error has been detected. |
| 0 | BER | Bit Error Flag<br>0: Bit error has not been detected.<br>1: Bit error has been detected. |

The RLN24nmLiEST register is automatically cleared to $00_H$ upon transition to LIN reset mode and start of the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains $00_H$.

When the FTS bit in the RLN24nmLiTRC register is 1 (frame transmission or wake-up transmission/ reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value from before 1 is written.
The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

### FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value from before 1 is written.
The FER flag is set to 1 upon framing error detection when the FERE bit of the RLN24nmLiEST register is 1 (framing error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

### FTER Flag (Frame Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value from before 1 is written.
The FTER flag is set to 1 upon frame timeout error detection when the FTERE bit of the RLN24nmLiEDE register is 1 (frame timeout error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

### PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value from before 1 is written.
The PBER flag is set to 1 upon physical bus error detection when the PBERE bit of the RLN24nmLiEDE register is 1 (physical bus error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

### BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value from before 1 is written.
The BER flag is set to 1 upon bit error detection when the BERE bit of the RLN24nmLiEDE register is 1 (bit error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

### 18.3.3.12 RLN24nmLiDFC — LIN Data Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiDFC: <RLIN24n_base> + $14_H$ + i × $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | FSM | CSM | RFT | RFDL[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.27 RLN24nmLiDFC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 6 | FSM | Frame Separate Mode Select<br>0: Frame separate mode is not set.<br>1: Frame separate mode is set. |
| 5 | CSM | Checksum Select<br>0: Classic checksum mode<br>1: Enhanced checksum mode |
| 4 | RFT | Response Field Communication Direction Select<br>0: Reception<br>1: Transmission |
| 3 to 0 | RFDL[3:0] | Response Field Length Select<br>b3 b0<br>0 0 0 0: 0 bytes + checksum<br>0 0 0 1: 1 byte + checksum<br>0 0 1 0: 2 bytes + checksum<br>:<br>0 1 1 1: 7 bytes + checksum<br>1 0 0 0: 8 bytes + checksum<br>Settings other than the above are prohibited. |

Set the RLN24nmLiDFC register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

#### FSM Bit (Frame Separate Mode Select)

The FSM bit sets the response transmission mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN24nmLiTRC register is 1), response is transmitted/received without the RTS bit in the RLN24nmLiTRC register being set.
With 1 set, frame separate mode is selected. When the RTS bit of the RLN24nmLiTRC register is set to 1 during header transmission, response transmission is executed after header transmission has ended.
For response reception (the RFT bit is 0), set the FSM bit to 0.
When transitioning to LIN self-test mode, set this bit to 0 before transition.
For details on frame separate mode, see **Section 18.11.1, Transmission of LIN Frames**.

#### CSM Bit (Checksum Select)

The CSM bit sets checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When frame timeout error detection is enabled (the FTERE bit in the RLN24nmLiEDE register is 1), the timeout time depends on the setting of this bit. For details, see **Section 18.14, Error Status**.

#### RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

#### RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.

### 18.3.3.13 RLN24nmLiIDB — LIN ID Buffer Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiIDB: <RLIN24n_base> + $15_H$ + i × $20_H$

**Value after reset:** Undefined

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IDP1 | IDP0 | ID[5:0] | | | | | |
| Value after reset | — | — | — | — | — | — | — | — |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.28 RLN24nmLiIDB Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | IDP1 | Parity Setting (P1)<br>Sets the parity bit (P1) to be transmitted in the ID field. |
| 6 | IDP0 | Parity Setting (P0)<br>Sets the parity bit (P0) to be transmitted in the ID field. |
| 5 to 0 | ID[5:0] | ID Setting<br>Sets the 6-bit ID value to be transmitted in the ID field. |

Set the RLN24nmLiIDB register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted prior to communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

#### IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 sets P0 and IDP1 sets P1.
Since parity is not automatically calculated, set the calculation value. Note that even if the specified calculation result is incorrect, it is transmitted as is.

#### ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

### 18.3.3.14 RLN24nmLiCBR — LIN Checksum Buffer Register

**Access:** This register is a read-only register that can be read in 8-bit units. In LIN self-test mode, this register can be read or written in 8-bit units.

**Address:** RLN24nmLiCBR: <RLIN24n_base> + $16_H$ + i × $20_H$

**Value after reset:** Undefined

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CKSM[7:0] | | | | | | | |
| Value after reset | — | — | — | — | — | — | — | — |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.29 RLN24nmLiCBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | CKSM[7:0] | Holds the checksum value transmitted or received. |

while in LIN operation mode, this register operates as follows:

- When the RFT bit in the RLN24nmLiDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN24nmLiDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN24nmLiDFC register is 1 (transmission):
  After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.
  Writing to this register is invalid.
- When the RFT bit in the RLN24nmLiDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

Set the RLN24nmLiCBR register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

### 18.3.3.15 RLN24nmLiDBRb — LIN Data Buffer b Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiDBR1: <RLIN24n_base> + $18_H$ + i × $20_H$
RLN24nmLiDBR2: <RLIN24n_base> + $19_H$ + i × $20_H$
RLN24nmLiDBR3: <RLIN24n_base> + $1A_H$ + i × $20_H$
RLN24nmLiDBR4: <RLIN24n_base> + $1B_H$ + i × $20_H$
RLN24nmLiDBR5: <RLIN24n_base> + $1C_H$ + i × $20_H$
RLN24nmLiDBR6: <RLIN24n_base> + $1D_H$ + i × $20_H$
RLN24nmLiDBR7: <RLIN24n_base> + $1E_H$ + i × $20_H$
RLN24nmLiDBR8: <RLIN24n_base> + $1F_H$ + i × $20_H$

**Value after reset:** Undefined

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LDB[7:0] | | | | | | | |
| Value after reset | — | — | — | — | — | — | — | — |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.30 RLN24nmLiDBRb Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | LDB[7:0] | Sets the data to be transmitted or allows the received data to be read.<br>Setting range: $00_H$ to $FF_H$ |

- For response transmission:

  The LiDBRb registers specify the data to be transmitted in the response field.
  Configure these registers when:

  – The RFT bit in RLN24nmLiDFC register is 1 (transmission).
  – The FSM bit in RLN24nmLiDFC register is 0 (not frame separate mode).
  – The FTS bit in RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/ reception is stopped).

  or

  – The RFT bit in RLN24nmLiDFC register is 1 (transmission).
  – The FSM bit in RLN24nmLiDFC register is 1 (frame separate mode).
  – The RTS bit in RLN24nmLiTRC register is 0 (response transmission is stopped).

- For response reception:

  The LiDBRb registers hold the data received in the response field.
  The received data is overwritten. If an error is detected, the data prior to reception interruption is stored in the register.
  Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/ reception is started)

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted prior to communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

## 18.4 Interrupt Sources

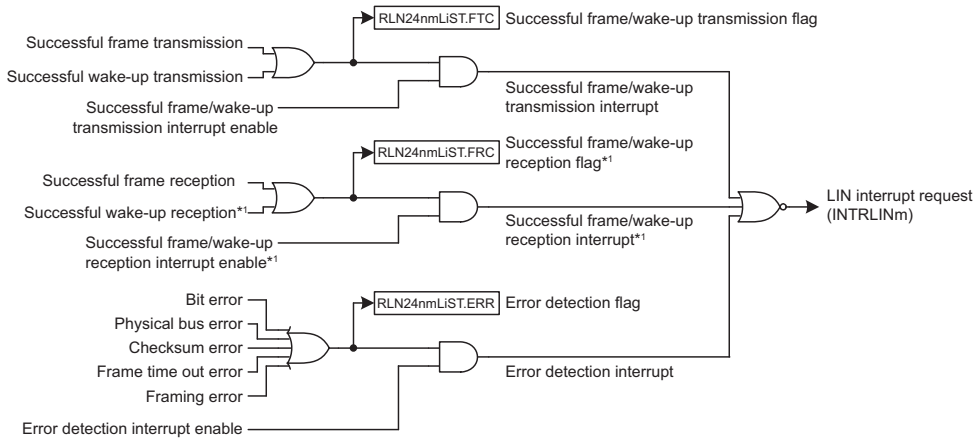
The LIN interrupts are interrupt requests generated by the LIN master interface.

There are three interrupt sources for each channel; successful frame/wake-up transmission, successful frame/wakeup reception, and error detection.

Interrupt requests from these three sources are ORed to generate one interrupt request “LIN interrupt”.

The respective interrupt request is output when the corresponding flag in the RLN24nmLiST register is set to 1 while the corresponding bit in the RLN24nmLiIE register is 1 (interrupt enabled). However, if an interrupt is requested when the corresponding flag in the RLN24nmLiST register has been set to 1, it is ignored. Therefore, clear the corresponding flag to 0 to enable the interrupt again.

**Figure 18.2** shows a block diagram of the LIN interrupt.



Note 1. The wake-up receive signal indicates the input signal low level width count.

**Figure 18.2 LIN Interrupt Block Diagram**

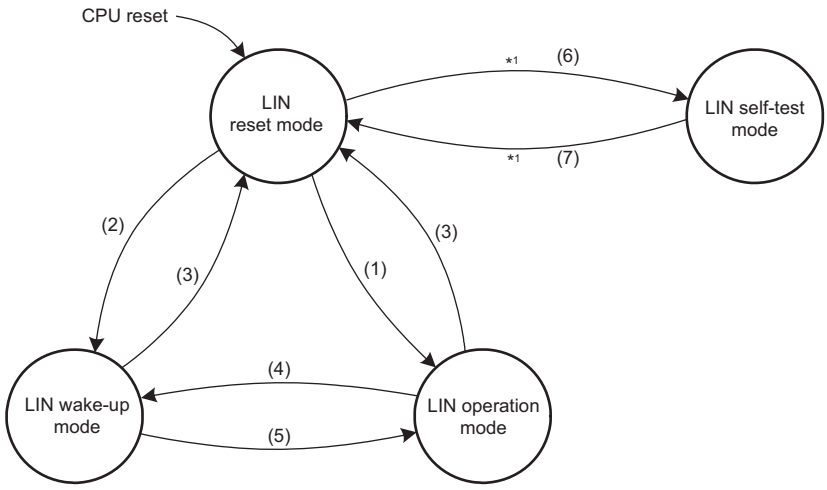
## 18.5 Modes

The LIN master interface provides the following four modes:

- LIN reset mode
- LIN operation mode
- LIN wake-up mode
- LIN self-test mode

The mode transitions except LIN self-test mode is controlled independently for respective channels.

**Figure 18.3** shows mode transitions. **Table 18.31** describes mode transition conditions. **Table 18.32** lists operations available in each mode.



Note 1. See **Section 18.15, LIN Self-Test Mode** for the details.

**Figure 18.3 Mode Transitions**

**Table 18.31 Transition Condition of Each Mode**

| | Mode Transition | | | Transition Condition |
|---|---|---|---|---|
| (1) | LIN reset mode | → | LIN operation mode | RLN24nmLiCUC.OM1,OM0 = $11_B$ |
| (2) | LIN reset mode | → | LIN wake-up mode | RLN24nmLiCUC.OM1,OM0 = $01_B$ |
| (3) | LIN wake-up mode<br>LIN operation mode | → | LIN reset mode | RLN24nmLiCUC.OM0 = $0_B$ |
| (4) | LIN operation mode | → | LIN wake-up mode | RLN24nmLiCUC.OM1,OM0 = $01_B$ |
| (5) | LIN wake-up mode | → | LIN operation mode | RLN24nmLiCUC.OM1,OM0 = $11_B$ |
| (6) | LIN reset mode | → | LIN self-test mode | See **Section 18.15, LIN Self-Test Mode**. |
| (7) | LIN self-test mode | → | LIN reset mode | See **Section 18.15, LIN Self-Test Mode**. |

**Table 18.32 Operations Available in Each Mode**

| LIN Operation Mode | LIN Wake-Up Mode | LIN Self-Test Mode |
|---|---|---|
| Header transmission<br>Response transmission<br>Response reception<br>Error detection | Wake-up transmission<br>Wake-up reception<br>Error detection | self-test |

Whether a transition has been made to LIN reset mode, LIN operation mode, or LIN wake-up mode can be verified by reading the OMM1 and OMM0 bits in the RLN24nmLiMST register.

For a description of LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

## 18.6 LIN Reset Mode

Setting the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The transition to LIN reset mode can be verified by determining that the OMM0 bit in the RLN24nmLiMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication stops.

From LIN reset mode, transitions to LIN operation mode, LIN wake-up mode, and LIN self-test mode can be made.

When the mode transitions to LIN reset mode, the following registers are initialized to their reset values and retain their initial values while in LIN reset mode:

- RLN24nmLiTRC register
- RLN24nmLiST register
- RLN24nmLiEST register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN24nGLWBR register
- RLN24nGLBRP0 register
- RLN24nGLBRP1 register
- RLN24nmLiMD register
- RLN24nmLiBFC register
- RLN24nmLiSC register
- RLN24nmLiWUP register
- RLN24nmLiIE register
- RLN24nmLiEDE register
- RLN24nmLiDFC register
- RLN24nmLiIDB register
- RLN24nmLiCBR register
- RLN24nmLiDBRb register

## 18.7 LIN Operation Mode

While in LIN operation mode, frame processing (header transmission, response transmission, response reception, and error detection) is performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN24nmLiCUC register to $11_B$ changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN24nmLiMST register to $11_B$. Communication settings should be performed after the RLN24nmLiMST register has become $11_B$.

## 18.8 LIN Wake-Up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) is performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN24nmLiCUC register to $01_B$ changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN24nmLiMST register to $01_B$. Communication settings should be performed after the RLN24nmLiMST register has become $01_B$.

# 18.9 Header Transmission/Response Transmission/Response Reception

## 18.9.1 Header Transmission

**Figure 18.4** shows the operation of the LIN master interface in header transmission. **Table 18.33** shows processing in header transmission.

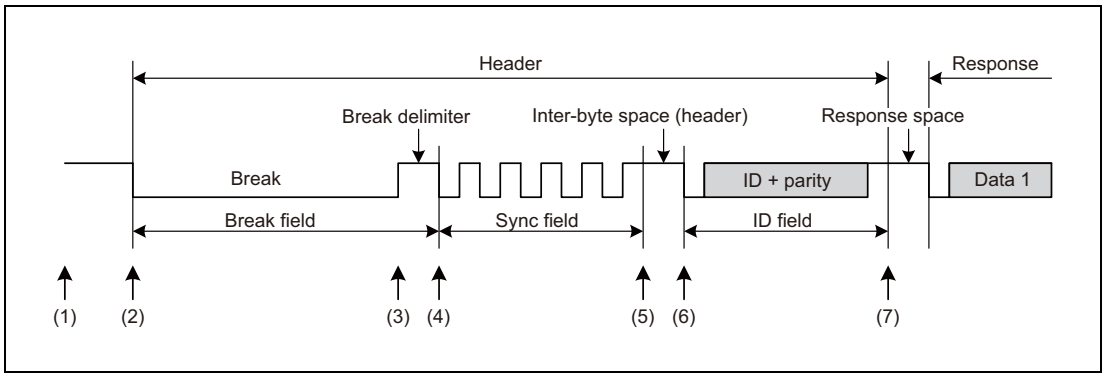


**Figure 18.4 Operation in Header Transmission**

**Table 18.33 Processing in Header Transmission**

| | Software Processing | LIN Master Interface Processing |
|---|---|---|
| (1) | • Sets a baud rate<br>• Enables interrupts<br>• Enables error detection<br>• Sets frame configuration parameters<br>• Transitions to LIN operation mode<br>• Sets information on the frame to be transmitted (ID, parity, data length, response direction, checksum method, and transmission data) | Waits for the FTS bit in the RLN24nmLiTRC register to be set by software (idle). |
| (2) | Sets the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started) | Transmits a break. |
| (3) | Waits for an interrupt request | Transmits a break delimiter. |
| (4) | | Transmits a sync field ($55_H$). |
| (5) | | Transmits an inter-byte space (header). |
| (6) | | Transmits an ID field. |
| (7) | | Sets the successful header transmission flag. |

**NOTE**

For information about error detection, see **Section 18.14, Error Status**.

### 18.9.2 Response Transmission

**Figure 18.5** shows the operation of the LIN master interface in response transmission. **Table 18.34** shows the processing in response transmission.

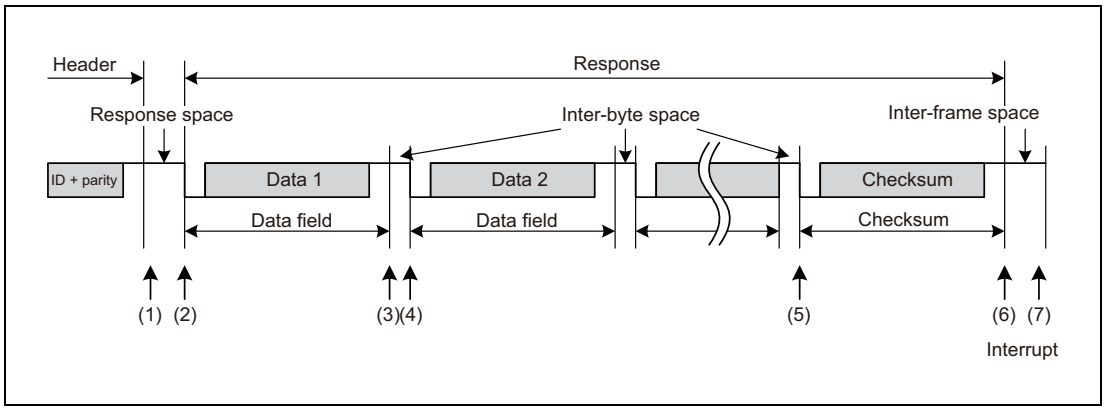

**Figure 18.5 Operation in Response Transmission**

**Table 18.34 Processing in Response Transmission**

| | Software Processing | LIN Master Interface Processing |
|---|---|---|
| (1) | (When in frame separate mode)<br>• Sets the RTS bit in the RLN24nmLiTRC register to 1 (response transmission started)<br>(When not in frame separate mode)<br>• Waits for an interrupt request | (When in frame separate mode)<br>• Waits for the RTS bit in the RLN24nmLiTRC register to be set to 1 by software. (During this time, “1” is output.)<br>• When the bit is set to 1, sends a response space.<br>(When not in frame separate mode)<br>• Sends a response space. |
| (2) | Waits for an interrupt request | Transmits data 1. |
| (3) | | Transmits an inter-byte space. |
| (4) | | • Transmits data 2.<br>• Transmits an inter-byte space<br>• Transmits data 3.<br>• Transmits an inter-byte space<br>(Repeats the transmission of data and inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN24nmLiDFC register.)<br>:<br>: |
| (5) | | Transmits the checksum. |
| (6) | | • Sets the successful frame/wake-up transmission flag.<br>• Sets the FTS bit in the RLN24nmLiTRC register to 0 (frame transmission or wake-up transmission/reception stopped)<br>(When in frame separate mode)<br>• Sets the RTS bit in the RLN24nmLiTRC register to 0 (response transmission stopped). |
| (7) | • Processing after communication Checks the RLN24nmLiST register, and clears flags. | Idle |

**NOTE**

For information about error detection, see **Section 18.14, Error Status**.

### 18.9.3 Response Reception

**Figure 18.6** shows the operation of the LIN master interface in response reception. **Table 18.35** shows the processing in response reception.

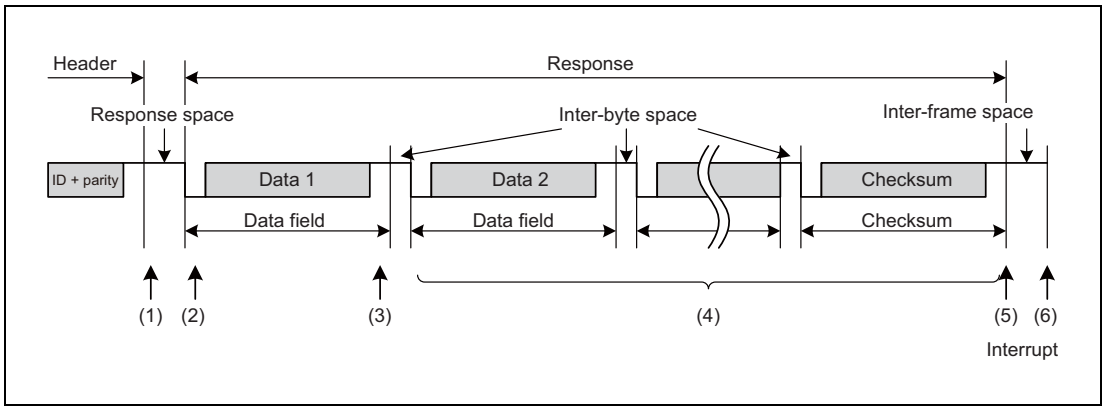

**Figure 18.6 Operation in Response Reception**

**Table 18.35 Processing in Response Reception**

| | Software Processing | LIN Master Interface Processing |
|---|---|---|
| (1) | Waits for an interrupt request (no processing). | Waits for detection of a start bit. |
| (2) | Waits for an interrupt request. | Receives data 1 when the start bit is detected. |
| (3) | | Sets the successful data 1 reception flag. |
| (4) | | • Receives data 2 when the start bit is detected.<br>• Receives data 3 when the start bit is detected.<br>(Repeats the reception of data as many times as the data length specified in bits RFDL[3:0] in the RLN24nmLiDFC register.)<br>⋮<br>• Receives the checksum when the start bit is detected. |
| (5) | | • Evaluates the checksum.<br>• Sets the successful frame/wake-up reception flag.<br>• Sets the FTS bit in the RLN24nmLiTRC register to 0 (frame transmission or wake-up transmission/reception stopped). |
| (6) | • Processing after communication<br>Reads the received data.<br>Checks the RLN24nmLiST register, and clears flags. | Idle |

**NOTE**

For information about error detection, see **Section 18.14, Error Status**.

# 18.10 Data Transmission/Reception

## 18.10.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag of the RLN24nmLiEST register (see **Section 18.14, Error Status**).

In the LIN master interface, because data is generated every 1 Tbit = $16f_{LIN}$, the sampling point for received data is the 13th clock cycle (81.25% position).

**Figure 18.7** shows an example of data transmission timing.

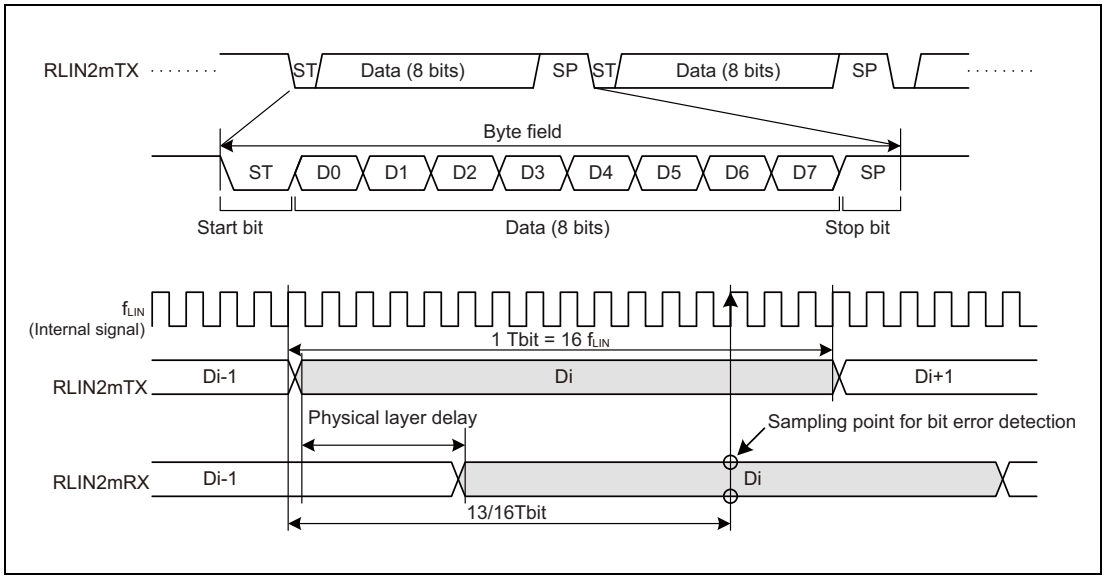

**Figure 18.7 Example of Data Transmission Timing**

### 18.10.2 Data Reception

Data reception is performed by using the synchronized RLIN2mRX signal (an internal signal) that is the input from the RLIN2mRX pin synchronized with the LIN system clock ($f_{LIN}$).

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN2mRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN2mRX signal is low level. The falling edge is not recognized as a start bit if the RLIN2mRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

The bit sampling period after detection of the start bit is one Tbit.

**Figure 18.8** shows an example of data reception timing.

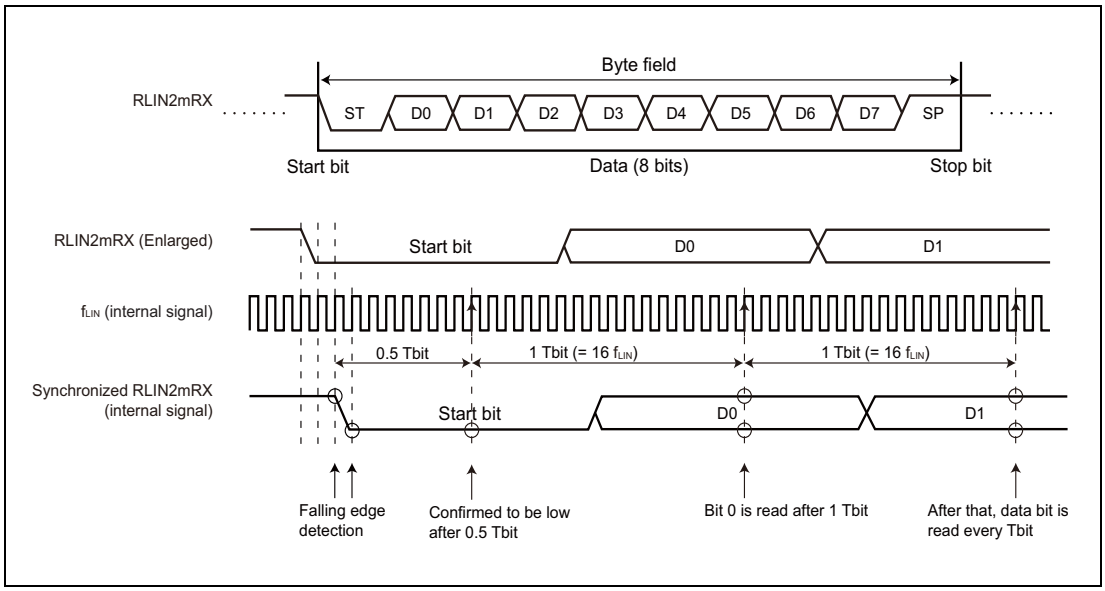

**Figure 18.8 Example of Data Reception Timing**

# 18.11 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN master interface sends or receives data continuously.

## 18.11.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-byte transmission, the contents stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN24nmLiDBR5 to RLN24nmLiDBR8 are not transmitted. The transmitted checksum data is stored in the RLN24nmLiCBR register.

**Figure 18.9** shows the LIN transmission processing and the corresponding buffers.

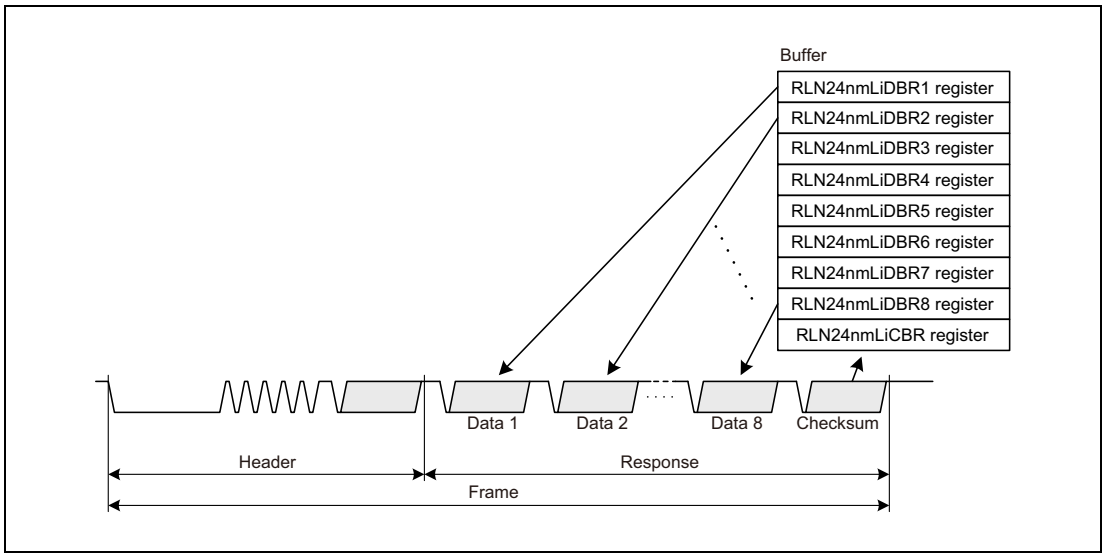

**Figure 18.9 LIN Transmission Processing and Corresponding Buffers**

### (1) Frame Separate Mode

Setting the FSM bit in the RLN24nmLiDFC register to 1 sets the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN24nmLiST register is set to 1 (successful header transmission).

### 18.11.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame are stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR4, respectively; no data is stored in registers RLN24nmLiDBR5 to RLN24nmLiDBR8. The received checksum data is stored in the RLN24nmLiCBR register.

**Figure 18.10** shows the LIN reception processing and the corresponding buffers.

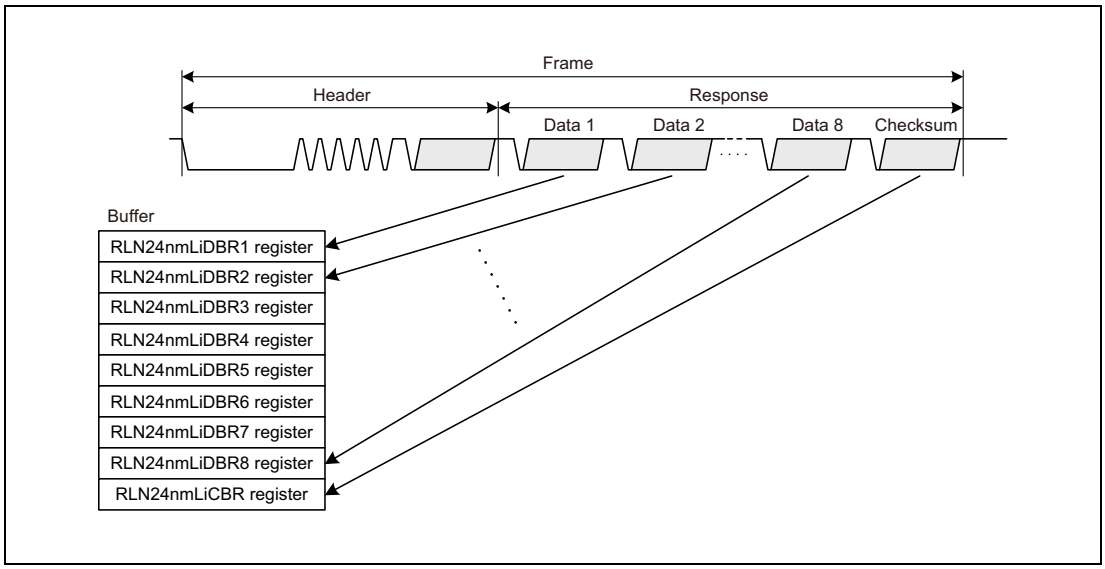

**Figure 18.10 LIN Reception Processing and Corresponding Buffers**

#### (1) Reception of Data 1

When the reception of the first byte of data is finished, the D1RC flag in the RLN24nmLiST register is set to 1 (successful data 1 reception).

## 18.12 Wake-Up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

### 18.12.1 Wake-Up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN24nmLiDFC register to 1 (transmission) and the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal is set using the WUTL[3:0] bits in the RLN24nmLiWUP register. However, if the value of the LWBR0 bit of the RLN24nGLWBR register is 1 (when LIN 2.x is used), the LIN system clock ($f_{LIN}$) has the low-level width of fa (JW) regardless of the setting of the LCKS bit of the RLN24nmLiMD register. By setting the baud rate to 19200 bps when fa is selected and setting the WUTL[3:0] bits of the RLN24nmLiWUP register to $0100_B$ (5 Tbits), 260 µs low level width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN24nmLiMD register.

If a wake-up low level is output without any error, the FTC flag in the RLN24nmLiST register is set to 1 (successful frame or wake-up transmission); when the FTCIE bit in the RLN24nmLiIE register is 1 (successful frame/wake-up transmission interrupt enabled), an interrupt request is generated.

If an error is detected, wake-up transmission is aborted and the error flag for the error detected (the PBER flag or BER flag in the RLN24nmLiEST register) is set to 1 (physical bus error detection / bit error detection).

**Figure 18.11** shows the wake-up transmission timing.

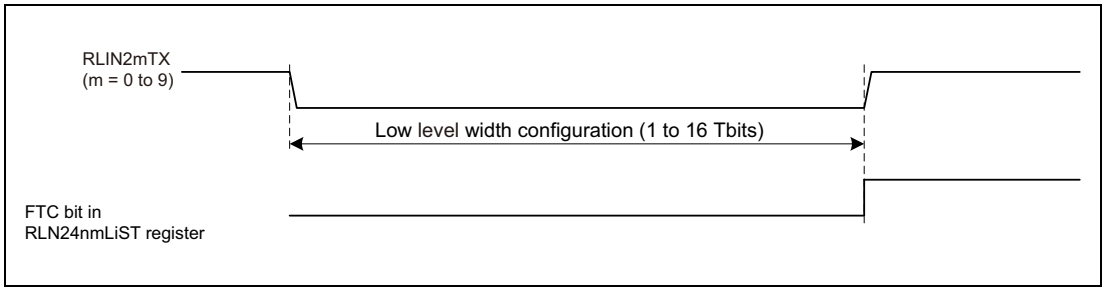

**Figure 18.11 Wake-Up Transmission Timing**

### 18.12.2 Wake-Up Reception

The detection of a wake-up signal involves the use of an input signal low level width count function.

The input signal low level width count function measures the low level width of the input signal to the RLIN2mRX pin, using the same sampling point as data reception. This allows an input signal of $f_{LIN}$ with a low-level width of 2.5-Tbit or longer to be measured.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN24nGLWBR register to 0. When LIN Specification Package Revision 2.x is used, set LWBR0 bit to 1.

When LWBR0 bit is set to 1, regardless of the setting of the LCKS bit in the RLN24nmLiMD register, fa is selected as the LIN system clock ($f_{LIN}$) (the LCKS bit is not changed).

Setting the baud rate to 19200 bps while fa is selected allows an input signal with a low-level width of 130 µs or longer to be detected during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register.

When using this function, in LIN wake-up mode set the RFT bit in the RLN24nmLiDFC register to 0 (reception), and the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN24nmLiST register is set to 1 (successful frame or wake-up reception) and if the FRCIE bit in the RLN24nmLiIE register is 1 (successful frame or wake-up reception interrupt enabled), an interrupt request is generated.

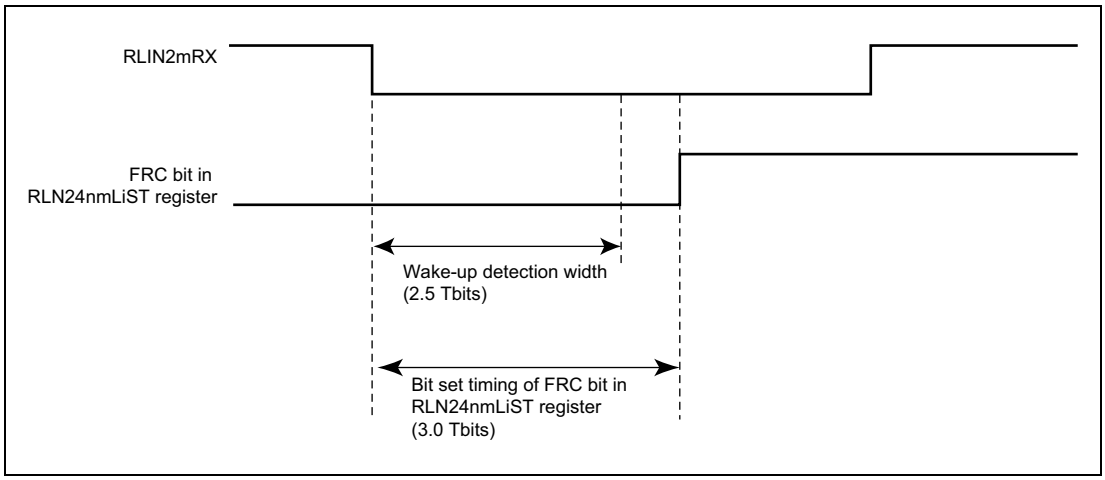

**Figure 18.12 Input Signal Low Level Count Function**

### 18.12.3 Wake-Up Collision

If the master node and the slave node transmit wake-up signals simultaneously, a collision will occur on the LIN bus; however the a collision of wake-up signals is not detected in the LIN master interface.

## 18.13 Status

During LIN mode operation, the LIN master interface can detect seven types of statuses.

Three of these statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, can generate interrupt requests.

**Table 18.36** shows the types of statuses.

**Table 18.36 Types of Statuses**

| Status | Status Set Condition | Status Clear Condition | Operation Mode Capable of Status Detection | Corresponding Bit | Interrupt |
|---|---|---|---|---|---|
| Reset | After the OM0 bit in the RLN24nmLiCUC register is set to not-LIN-reset-mode, if the LIN master interface actually exits LIN reset mode. | After the OM0 bit in the RLN24nmLiCUC register is set to LIN reset mode, if the LIN master interface enters LIN reset mode. | All modes | OMM0 bit in the RLN24nmLiMST register | — |
| Operation mode | After the OM1 bit in the RLN24nmLiCUC register is set to LIN operation mode, if the LIN master interface actually enters LIN operation mode. | After the OM1 bit in the RLN24nmLiCUC register is set to LIN wake-up mode, if the LIN master interface enters LIN wake-up mode. | • LIN operation mode<br>• LIN wake-up mode | OMM1 bit in the RLN24nmLiMST register | — |
| Successful frame/wake-up transmission | When a frame (header transmission + response transmission) or a wake-up signal is transmitted successfully. | • When the next communication is started<br>• When cleared by software<br>• After transition to LIN reset mode | • LIN operation mode<br>• LIN wake-up mode | FTC flag in the RLN24nmLiST register | √ |
| Successful frame/wake-up reception | When a frame (header transmission + response reception) or a wake-up signal is received successfully. | • When the next communication is started<br>• When cleared by software<br>• After transition to LIN reset mode | • LIN operation mode<br>• LIN wake-up mode | FRC flag in the RLN24nmLiST register | √ |
| Error detection | If any of the CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN24nmLiEST register is set to 1 (error detected). | • When the next communication is started<br>• When cleared by software*1<br>• After transition to LIN reset mode | • LIN operation mode<br>• LIN wake-up mode | ERR flag in the RLN24nmLiST register | √ |
| Successful data 1 reception | When the RFT bit in the RLN24nmLiDFC register is 0 (reception) and the first byte of the response field is received successfully.*2 | • When the next communication is started<br>• When cleared by software<br>• After transition to LIN reset mode | LIN operation mode | D1RC flag in the RLN24nmLiST register | — |
| Successful header transmission | When a header field is transmitted successfully. | • When the next communication is started<br>• When cleared by software<br>• After transition to LIN reset mode | LIN operation mode | HTRC flag in the RLN24nmLiST register | — |

Note 1. While in LIN operation mode, the ERR flag in the RLN24nmLiST register is cleared to 0 by writing 0 to the CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN24nmLiEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN24nmLiDFC register are $0000_B$ (0 bytes + checksum).

# 18.14 Error Status

## 18.14.1 Types of Error Statuses

The LIN master interface can detect five types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN24nmLiEST register.

All error statuses represent interrupt sources.

**Table 18.37** shows the types of error statuses.

**Table 18.37 Types of Error Statuses**

| Status | Error Detection Condition | Operating Mode Capable of Error Detection | Communication | Selection of Detection Enable/ Disable | Corresponding Bit |
|---|---|---|---|---|---|
| Bit error | The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1 | • LIN operation mode<br>• LIN wake-up mode | Aborted | √ | BER flag in the RLN24nmLiEST register |
| Physical bus error | • LIN bus is detected to be high level when sending a break<br>• LIN bus is detected to be low level when sending a break delimiter<br>• LIN bus is detected to be high level when sending a wake-up | • LIN operation mode<br>• LIN wake-up mode | Aborted | √ | PBER flag in the RLN24nmLiEST register |
| Frame timeout error | A frame transmission/reception does not complete within a given time*2 | LIN operation mode | Aborted | √ | FTER flag in the RLN24nmLiEST register |
| Framing error | In response field reception, the stop bit of each data byte is low level | LIN operation mode | Aborted | √ | FER flag in the RLN24nmLiEST register |
| Checksum error | In response field reception, checksum test results in an error | LIN operation mode | — | × | CSER flag in the RLN24nmLiEST register |

Note 1. If a bit error is detected, the process is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. The timeout time depends on the response field data length (the RFDL[3:0] bits in the RLN24nmLiDFC register) and the checksum selection (the CSM bit in the RLN24nmLiDFC register), and this can be calculated according to the following formula:
When classic checksum is selected (when the CSM bit in the RLN24nmLiDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced checksum is selected (when the CSM bit in the RLN24nmLiDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.

The error status is cleared when the next communication is started, when it is cleared by software, or at a transition to LIN reset mode.

## 18.14.2 Target Time Domain for Error Detection

**Figure 18.13** shows the time domain in which the LIN master interface monitors for error detection.

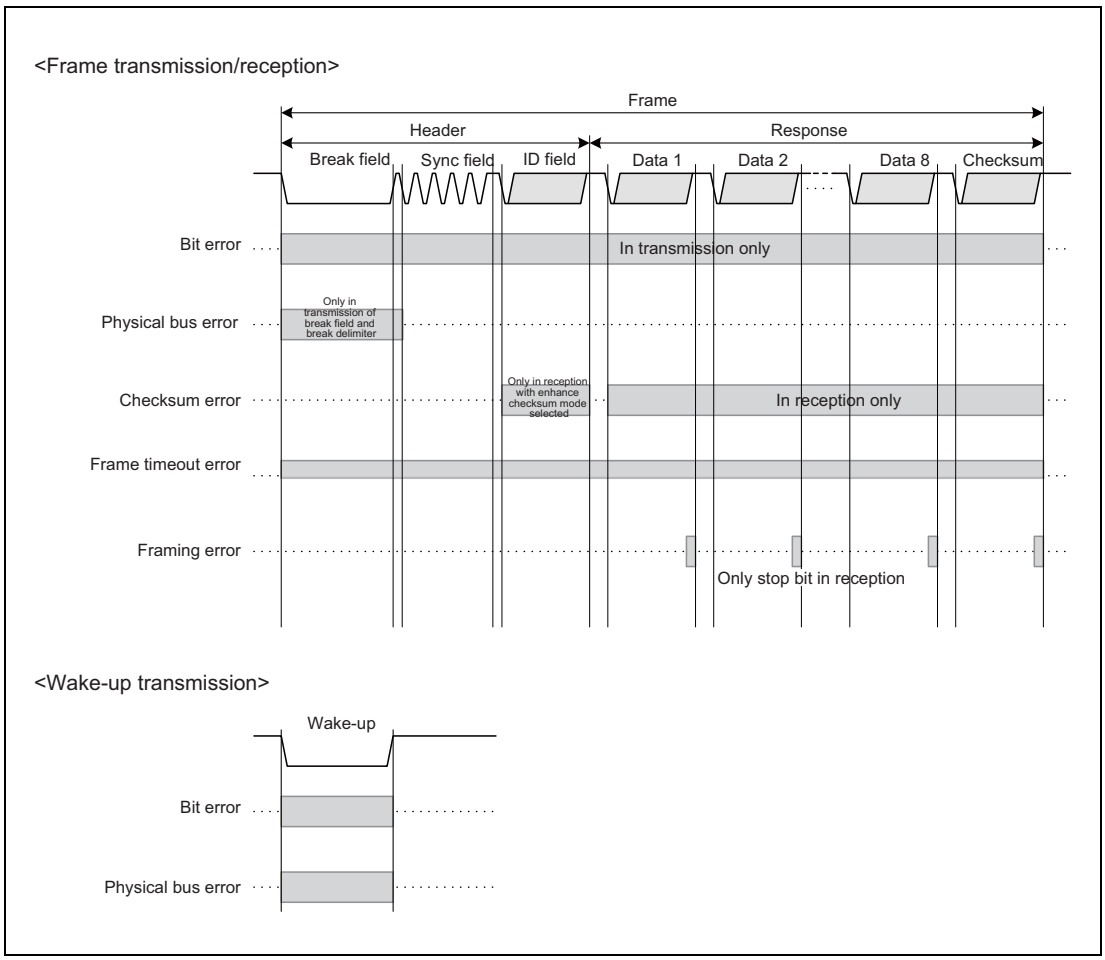

**Figure 18.13 Target Time Domain for Error Detection**

## 18.15 LIN Self-Test Mode

The LIN master interface provides LIN self-test mode. When the LIN master interface enters LIN self-test mode, RLIN2mTX and RLIN2mRX are disconnected from the external pins, and are internally connected in the LIN master interface. Thus, the frame transmitted from RLIN2mTX is looped back to RLIN2mRX.

Two types of self-test can be performed:

- LIN self-test mode (transmission): header transmission and response transmission
- LIN self-test mode (reception): header transmission and response reception

In LIN self-test mode, the operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator. Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps].

In LIN self-test mode, the following functions are not supported:

- LIN wake-up mode
- Frame separate mode

Do not use these functions.

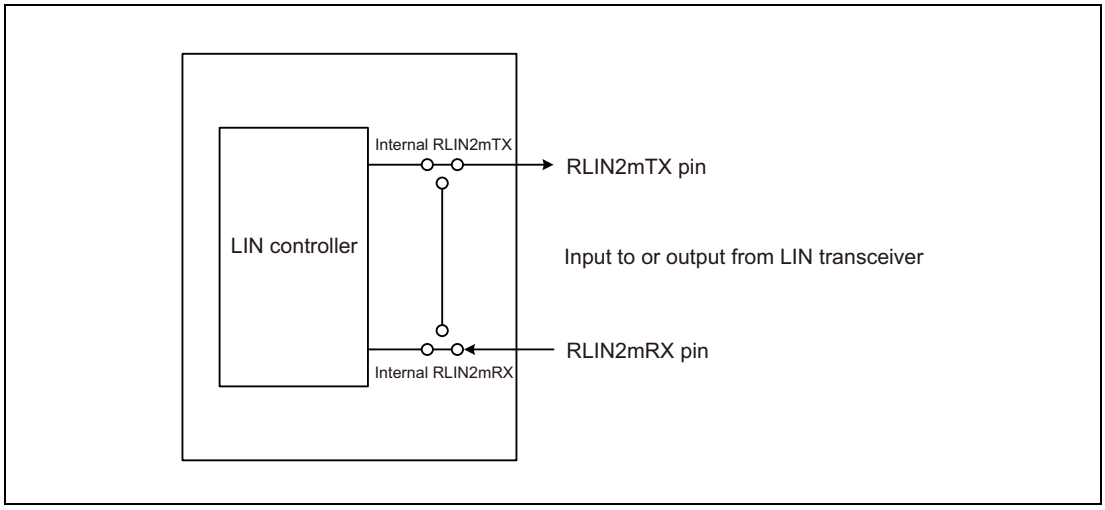

**Figure 18.14 Connection in LIN Reset Mode, LIN Wake-Up Mode, and LIN Operation Mode**

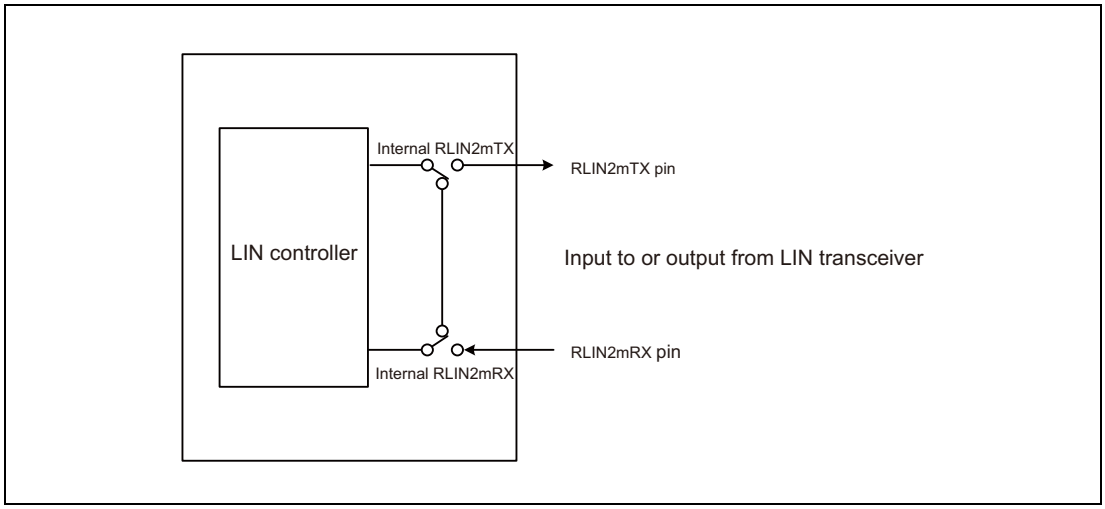

**Figure 18.15 Connection in LIN Self-Test Mode**

### 18.15.1 Transition to LIN Self-Test Mode

Writing to the RLN24nGLSTC register enables LIN self-test mode.

The LSTM bit in the RLN24nGLSTC register being set to 1 indicates that the mode has transitioned to LIN self-test mode.

A specific sequence is required to transition to LIN self-test mode. In this sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Switch all channels of the unit to LIN reset mode.
  Set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN24nmLiMST register and confirm that it is 0 (LIN reset mode).
- 1st write: RLN24nGLSTC register = $1010\ 0111_B$ ($A7_H$)
- 2nd write: RLN24nGLSTC register = $0101\ 1000_B$ ($58_H$)
- 3rd write: RLN24nGLSTC register = $0000\ 0001_B$ ($01_H$)
- Confirm that all channels have transitioned to LIN self-test mode
  Read the LSTM bit in the RLN24nGLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the 1st write step. In addition, if a write to another LIN-related register in the same unit is performed during transition to LIN self-test mode (three consecutive write operations to the RLN24nGLSTC register), the transition is also canceled.

### 18.15.2 Transmission in LIN Self-Test Mode

To execute a self-test on transmission, perform the procedure below:

- Set the baud rate related registers.
  RLN24nGLBRP0 register = xxxx $xxxx_B$ *1
  RLN24nGLBRP1 register = xxxx $xxxx_B$ *1
  RLN24nmLiMD register = 0000 $xx00_B$ *1
- Set interrupt enable register and error enable related registers.
  RLN24nmLiIE register = 0000 $0xxx_B$ *2
  RLN24nmLiEDE register = 0000 $xxxx_B$
- Set the break field and space related registers.
  RLN24nmLiBFC register = 00xx $xxxx_B$
  RLN24nmLiSC register = 00xx $0xxx_B$
- Exit the LIN reset mode.
  Write $11_B$ to the OM1 and OM0 bits in the RLN24nmLiCUC register, and check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are $11_B$.
- Set the transmit frame related registers.
  RLN24nmLiDFC register = 00x1 $xxxx_B$
  RLN24nmLiIDB register = xxxx $xxxx_B$
  RLN24nmLiDBR1 to RLN24nmLiDBR8 registers = xxxx $xxxx_B$
- Start header transmission → response transmission
  Set the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started).
  The LIN self-test mode (transmission) is executed, interrupts are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN master interface.
  To suspend the LIN self-test mode (transmission) while it is running, set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode), which causes a transition to the LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN24nmLiIDB, RLN24nmLiDBRb, and RLN24nmLiCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN24nmLiTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN24nmLiTRC register is cleared.

**NOTE**

x: Don't care

**Note 1.** The settings of the following registers are not reflected in the operation of the LIN self-test mode:
the RLN24nGLBRP0 register, the RLN24nGLBRP1 register, and the LCKS bit in the RLN24nmLiMD register. Therefore, setting these registers is not necessary.

**Note 2.** If necessary, set the related registers described in **Section 7, Exception/Interrupts**.

### 18.15.3 Reception in LIN Self-Test Mode

To execute a self-test on reception, perform the procedure below:

- Set the baud rate related registers.
  RLN24nGLBRP0 register = xxxx $xxxx_B$*1
  RLN24nGLBRP1 register = xxxx $xxxx_B$*1
  RLN24nmLiMD register = 0000 $xx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN24nmLiIE register = 0000 $0xxx_B$*2
  RLN24nmLiEDE register = 0000 $x0xx_B$
- Set the break field and space related registers.
  RLN24nmLiBFC register = 00xx $xxxx_B$
  RLN24nmLiSC register = 00xx $0xxx_B$*1
- Exit the LIN reset mode.
  Write $11_B$ to the OM1 and OM0 bits in the RLN24nmLiCUC register, and check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are $11_B$.
- Set the receive frame related registers.
  RLN24nmLiDFC register = 00x0 $xxxx_B$
  RLN24nmLiIDB register = xxxx $xxxx_B$
  RLN24nmLiDBR1 to RLN24nmLiDBR8 registers = xxxx $xxxx_B$
  RLN24nmLiCBR register = xxxx $xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, perform the calculation and specify the calculated value in the RLN24nmLiCBR register. By specifying an incorrect checksum, the checksum error can be tested.
- Start header transmission → response reception
  Set the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started).
  The LIN self-test mode (reception) is executed, interrupts are generated, and status and error status are also updated.
  To suspend the LIN self-test mode (reception) while it is running, set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode), which causes a transition to the LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN24nmLiIDB, RLN24nmLiDBRb, and RLN24nmLiCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN24nmLiTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN24nmLiTRC register is cleared.

**NOTE**

x: Don't care

**Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode:
the RLN24nGLBRP0 register, the RLN24nGLBRP1 register, the LCKS bit in the RLN24nmLiMD register, and the IBS bit and IBHS bit (response space only) in the RLN24nmLiSC register. Therefore, setting these registers is not necessary.

**Note 2.** If necessary, set the related registers described in **Section 7, Exception/Interrupts**.

### 18.15.4 Exiting LIN Self-Test Mode

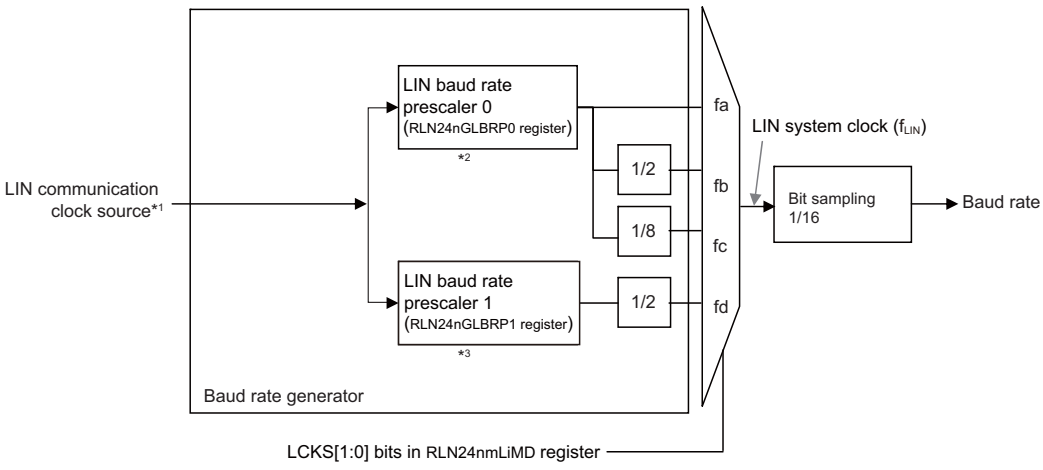
To exit LIN self-test mode, perform the procedure below:

- Switch all channels of the unit to LIN reset mode.
  Write 0 to the OM0 bit in the RLN24nmLiCUC register to make a transition to LIN reset mode. However, if the OMM1 and OMM0 bits in the RLN24nmLiMST register are not $11_B$ in any channels of the unit after the transition to LIN self-test mode, write $11_B$ to the OM1 and OM0 bits in the RLN24nmLiCUC register in any one channel. Check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are set to $11_B$, and then make a transition to LIN reset mode.
- Verify that the LIN master interface has exited LIN self-test mode.
  Read the LSTM bit in the RLN24nGLSTC register and confirm that it is not 0 (not in LIN self-test mode)
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN24nmLiMST register and confirm that it is 0 (LIN reset mode).

## 18.16 Baud Rate Generator

The LIN system clock ($f_{LIN}$) is obtained by dividing the LIN communication clock source frequency by the baud rate generator, and the baud rate is obtained by dividing that clock by 16. The inverse of this baud rate is called the bit time (Tbit).

**Figure 18.16** shows a block diagram of baud rate generation.



Note 1. For the LIN communication clock source, see **12.5.3, Clock Domain Settings**.
Note 2. According to the RLN24nGLBRP0 register, the clock frequency is divided by N + 1 (N = 0 to 255).
Note 3. According to the RLN24nGLBRP1 register, the clock frequency is divided by M + 1 (M = 0 to 255).

**Figure 18.16 Block Diagram of Baud Rate Generation**

Set the LIN communication clock source in a range from 4 MHz to 40 MHz.

By setting the RLN24nGLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting system clock frequencies are fa = 19200 × 16, fb = 9600 × 16, and fc = 2400 × 16. These system clock frequencies are divided by 16 in the bit timing generator, enabling baud rates of 19200 bps, 9600 bps, and 2400 bps to be generated. Also, by setting the RLN24nGLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting system clock frequency is fd = 10417 × 16. This system clock frequency is divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

The formula for calculating baud rate is shown below.

*Baud rate*:

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP0 + 1) ÷ 16 [bps] (When fa is selected)

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP0 + 1) ÷ 2 ÷ 16 [bps] (When fb is selected)

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP0 + 1) ÷ 8 ÷ 16 [bps] (When fc is selected)

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP1 + 1) ÷ 2 ÷ 16 [bps] (When fd is selected)

# Section 19 LIN/UART Interface (RLIN3)

This section contains a generic description of the LIN/UART interface (RLIN3).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RLIN3.

## 19.1 Features of RH850/F1K RLIN3

### 19.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN3 units.

Each RLIN3 unit has a single channel interface. “Number of channels” therefore has the same meaning as “number of units” in this section.

**Table 19.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of units | 4 | 6 | 6 |
| Name | RLIN3n (n = 0 to 3) | RLIN3n (n = 0 to 5) | RLIN3n (n = 0 to 5) |

**Table 19.2 Unit Configurations and Channels**

| Unit Name (Channel Name) RLIN3n | Channels per Unit | RH850/F1K 100 pins (4 ch) | RH850/F1K 144 pins (6 ch) | RH850/F1K 176 pins (6 ch) |
|---|---|---|---|---|
| RLIN30 | 1 | √ | √ | √ |
| RLIN31 | 1 | √ | √ | √ |
| RLIN32 | 1 | √ | √ | √ |
| RLIN33 | 1 | √ | √ | √ |
| RLIN34 | 1 | | √ | √ |
| RLIN35 | 1 | | √ | √ |

**Note:** The channel names are same as those of the corresponding units.

**Table 19.3 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual RLIN3 units are identified by the index “n” (n = 0 to 5): for example, RLN3nLCUC is the LIN control register. |
| b | Throughout this section, the individual transmit/received data buffers of RLIN3n are identified by the index “b” (b = 1 to 8): for example, RLN3nLDBRb is the data buffer register. |

The following lists the index value corresponding to each product.

**Table 19.4 Index Correspondence of Each Product**

| Index Correspondence to Product |
|---|
| All products |
| b = 1 to 8 |

### 19.1.2 Register Base Address

RLIN3 base addresses are listed in the following table.

RLIN3 register addresses are given as offsets from the base addresses.

**Table 19.5 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <RLIN30_base> | FFCE 2000$_H$ |
| <RLIN31_base> | FFCE 2040$_H$ |
| <RLIN32_base> | FFCE 2080$_H$ |
| <RLIN33_base> | FFCE 20C0$_H$ |
| <RLIN34_base> | FFCE 2100$_H$ |
| <RLIN35_base> | FFCE 2140$_H$ |

### 19.1.3 Clock Supply

The RLIN3 clock supply is shown in the following table.

**Table 19.6 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| RLIN3n | LIN communication clock sources | CKSCLK_ILIN*1,*2 | Communication clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_ILIN | |

Note 1. The clock domain CKSCLK_ILIN divided clock can be supplied only to RLIN30 channel.

Note 2. Set the LIN communication clock source in the range of 4 MHz to 40 MHz.

### 19.1.4 Interrupt Request

RLIN3 interrupt requests are listed in the following table.

**Table 19.7 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **RLIN30** | | | |
| INTRLIN3n (n = 0) | RLIN30 interrupt | 33 | — |
| INTRLIN3nUR0 (n = 0) | RLIN30 transmit interrupt | 34 | 10 |
| INTRLIN3nUR1 (n = 0) | RLIN30 receive completion interrupt | 35 | 11 |
| INTRLIN3nUR2 (n = 0) | RLIN30 status interrupt | 36 | — |
| **RLIN31** | | | |
| INTRLIN3n (n = 1) | RLIN31 interrupt | 120 | — |
| INTRLIN3nUR0 (n = 1) | RLIN31 transmit interrupt | 121 | 86 |
| INTRLIN3nUR1 (n = 1) | RLIN31 receive completion interrupt | 122 | 87 |
| INTRLIN3nUR2 (n = 1) | RLIN31 status interrupt | 123 | — |
| **RLIN32** | | | |
| INTRLIN3n (n = 2) | RLIN32 interrupt | 164 | — |
| INTRLIN3nUR0 (n = 2) | RLIN32 transmit interrupt | 165 | 44 |
| INTRLIN3nUR1 (n = 2) | RLIN32 receive completion interrupt | 166 | 45 |
| INTRLIN3nUR2 (n = 2) | RLIN32 status interrupt | 167 | — |
| **RLIN33** | | | |
| INTRLIN3n (n = 3) | RLIN33 interrupt | 228 | — |
| INTRLIN3nUR0 (n = 3) | RLIN33 transmit interrupt | 229 | 111 |
| INTRLIN3nUR1 (n = 3) | RLIN33 receive completion interrupt | 230 | 112 |
| INTRLIN3nUR2 (n = 3) | RLIN33 status interrupt | 231 | — |
| **RLIN34** | | | |
| INTRLIN3n (n = 4) | RLIN34 interrupt | 232 | — |
| INTRLIN3nUR0 (n = 4) | RLIN34 transmit interrupt | 233 | 50 |
| INTRLIN3nUR1 (n = 4) | RLIN34 receive completion interrupt | 234 | 51 |
| INTRLIN3nUR2 (n = 4) | RLIN34 status interrupt | 235 | — |
| **RLIN35** | | | |
| INTRLIN3n (n = 5) | RLIN35 interrupt | 236 | — |
| INTRLIN3nUR0 (n = 5) | RLIN35 transmit interrupt | 237 | 113 |
| INTRLIN3nUR1 (n = 5) | RLIN35 receive completion interrupt | 238 | 114 |
| INTRLIN3nUR2 (n = 5) | RLIN35 status interrupt | 239 | — |

### 19.1.5 Reset Sources

RLIN3 reset sources are listed in the following table. RLIN3 is initialized by these reset sources.

**Table 19.8 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| RLIN3n | All reset sources (ISORES) |

### 19.1.6 External Input/output Signals

External input/output signals of RLIN3 are listed below.

**Table 19.9 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **RLIN30** | | |
| RLIN3nRX (n = 0) | RLIN30 receive data input | RLIN30RX |
| RLIN3nTX (n = 0) | RLIN30 transmit data output | RLIN30TX |
| **RLIN31** | | |
| RLIN3nRX (n = 1) | RLIN31 receive data input | RLIN31RX |
| RLIN3nTX (n = 1) | RLIN31 transmit data output | RLIN31TX |
| **RLIN32** | | |
| RLIN3nRX (n = 2) | RLIN32 receive data input | RLIN32RX |
| RLIN3nTX (n = 2) | RLIN32 transmit data output | RLIN32TX |
| **RLIN33** | | |
| RLIN3nRX (n = 3) | RLIN33 receive data input | RLIN33RX |
| RLIN3nTX (n = 3) | RLIN33 transmit data output | RLIN33TX |
| **RLIN34** | | |
| RLIN3nRX (n = 4) | RLIN34 receive data input | RLIN34RX |
| RLIN3nTX (n = 4) | RLIN34 transmit data output | RLIN34TX |
| **RLIN35** | | |
| RLIN3nRX (n = 5) | RLIN35 receive data input | RLIN35RX |
| RLIN3nTX (n = 5) | RLIN35 transmit data output | RLIN35TX |

## 19.2 Overview

### 19.2.1 Functional Overview

The LIN/UART interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602, and automatically performs frame communication and error determination.

The LIN/UART interface is provided with UART mode and can also be used as a UART.

The appropriate mode should be used for the LIN/UART interface according to the application: LIN master, LIN slave, or UART.

**LIN master**

- LIN reset mode
- LIN mode (LIN master mode)
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

**LIN slave**

- LIN reset mode
- LIN mode (LIN slave mode [auto baud rate] or LIN slave mode [fixed baud rate])
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

**UART**

- LIN reset mode
- UART mode

**Table 19.10** shows the LIN/UART interface specifications.

**Table 19.10 LIN/UART Interface Specifications (1/3)**

| Item | | Specifications | |
|---|---|---|---|
| | Channel count | Up to 6 channels | |
| LIN communication function | Protocol | LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602 | |
| | Variable frame structure | Master | • Break transmission width: 13 to 28 Tbits<br>• Break delimiter transmission width: 1 to 4 Tbits<br>• Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*1<br>• Transmission response space width: 0 to 7 Tbits*1<br>• Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area)<br>• Transmission wake-up width: 1 to 16 Tbits |
| | | Slave | • Break reception width : 9.5 or 10.5 Tbits [for fixed baud rate]<br>: 10 or 11 Tbits [for auto baud rate]<br>• Transmission response space width: 0 to 7 Tbits<br>• Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area)<br>• Transmission wake-up width: 1 to 16 Tbits |
| | Checksum | • Automatic operation for both transmission and reception<br>• Classic or enhanced selectable (for each frame) | |
| | Response field data byte count | Variable from 0 to 8 bytes<br>Multi-byte (9 or more bytes) response transmission and reception also possible | |
| | Frame communication modes | Master | • Mode in which header transmission and response transmission/reception are started with a single transmission start request<br>• Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode) |
| | | Slave | • Mode in which header is automatically received with fixed baud rate<br>• Mode in which header is automatically received with the baud rate set according to the sync field measurement result of the sync field and break field detected |
| | Wake-up transmission and reception | LIN wake-up mode provided<br>• Wake-up transmission (1 to 16 Tbits)<br>• Wake-up reception<br>Low-level width of input signals measured | |
| | Status | Master | • Successful frame/wake-up transmission<br>• Successful header transmission<br>• Successful frame/wake-up reception*2<br>• Successful data 1 reception<br>• Error detection<br>• Operation mode<br>(LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode) |
| | | Slave | • Successful response/wake-up transmission<br>• Successful response/wake-up reception*2<br>• Successful header reception<br>• Successful data 1 reception<br>• Error detection<br>• Operation mode<br>(LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode) |

Table 19.10 LIN/UART Interface Specifications (2/3)

| Item | | Specifications | |
|---|---|---|---|
| LIN communication function | Error status | Master | • Bit error<br>• Checksum error<br>• Frame timeout error/response timeout error<br>• Physical bus error<br>• Framing error<br>• Response preparation error |
| | | Slave | • Bit error<br>• Checksum error<br>• Frame timeout error/response timeout error<br>• Sync field error<br>• ID parity error<br>• Framing error<br>• Response preparation error |
| | Baud rate selection | Baud rates conforming to the LIN specifications generated using baud rate generator | |
| | Test mode | Self-test mode for user evaluation | |
| | Interrupt function | Master | • Successful header/frame/wake-up transmission<br>• Successful frame/wake-up reception*2<br>• Error detection |
| | | Slave | • Successful response/wake-up transmission<br>• Successful Header/response/wake-up reception*2<br>• Error detection |
| UART communication function | Data buffer | • Transmission data buffer/transmission data buffer for wait (exclusively for transmission; data length of 1. Character length of 7, 8, and 9 bits supported)<br>• UART buffer (exclusively for transmission; variable data length from 1 to 9. Character length of 7 and 8 bits supported)<br>• Reception data buffer (exclusively for reception; data length of 1. Character length of 7, 8, and 9 bits supported) | |
| | Data format | Character length: 7 or 8 bits<br>Length of 9 bits supported by using the expansion bit. | |
| | | Transmission stop bit: 1 or 2 bits | |
| | | Parity function: odd, even, 0, or none | |
| | | LSB- or MSB-first transfer selectable | |
| | | Reverse input/output of transmission/reception data possible | |
| | Status | • Transmission status<br>• Reception status<br>• Successful UART buffer transmission<br>• Error detection<br>• Expansion bit detection<br>• ID match<br>• Reset mode status | |
| | Error status | • Bit error<br>• Framing error<br>• Parity error<br>• Overrun error | |
| | Baud rate selection | With the built-in baud rate generator, any baud rate can be set. | |
| | When a certain expansion bit is at the expected level, the data received can be compared to the 8-bit data preset in the register. | | |

Table 19.10 LIN/UART Interface Specifications (3/3)

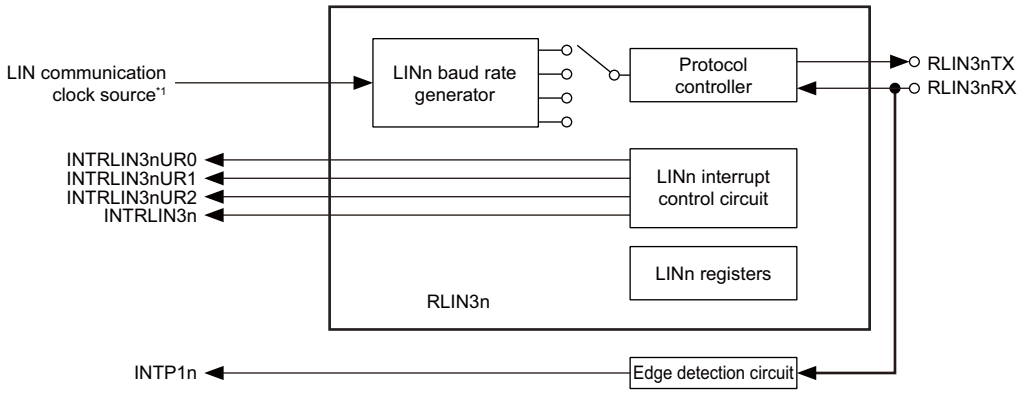
| Item | | Specifications |
|---|---|---|
| UART communication function | Reception of the stop bit is guaranteed. (Start of transmission can be delayed when start of transmission is attempted during reception of the stop bit). | |
| | Interrupt function | • Transmission start/complete<br>• Reception complete<br>• Status/error detection |

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the input signal low-level width count is indicated.

### 19.2.2 Block Diagram

**Figure 19.1** shows a block diagram of the LIN/UART interface.



Note 1. For the LIN communication clock source, see **Section 12.5.3, Clock Domain Settings**.

**Figure 19.1 LIN/UART Interface Block Diagram**

### 19.2.3 Terms used in block diagram

- RLIN3nTX, RLIN3nRX: LIN/UART interface I/O pins
- LINn baud rate generator: Generates the LIN/UART interface communication clock
- LINn registers: LIN/UART interface registers
- LINn interrupt control circuit: Controls interrupt requests generated by the LIN/UART interface

# 19.3 Registers

## 19.3.1 List of Registers

RLIN3 registers are listed in the following table.

For details about <RLIN3n_base>, see **Section 19.1.2, Register Base Address**.

**Table 19.11 List of Registers (1/2)**

| Module Name | Register Name | Symbol | Address | LIN Master | LIN Slave | UART |
|---|---|---|---|---|---|---|
| RLN3n | LIN wake-up baud rate select register | RLN3nLWBR | <RLIN3n_base> + $01_H$ | √ | √ | √ |
| | LIN / UART baud rate prescaler 01 register | RLN3nLBRP01 | <RLIN3n_base> + $02_H$ | — | √ | √ |
| | LIN / UART baud rate prescaler 0 register | RLN3nLBRP0 | <RLIN3n_base> + $02_H$ | √ | √ | √ |
| | LIN / UART baud rate prescaler 1 register | RLN3nLBRP1 | <RLIN3n_base> + $03_H$ | √ | √ | √ |
| | LIN self-test control register | RLN3nLSTC | <RLIN3n_base> + $04_H$ | √ | √ | — |
| | LIN / UART mode register | RLN3nLMD | <RLIN3n_base> + $08_H$ | √ | √ | √ |
| | LIN break field configuration register/ UART configuration register | RLN3nLBFC | <RLIN3n_base> + $09_H$ | √ | √ | √ |
| | LIN / UART space configuration register | RLN3nLSC | <RLIN3n_base> + $0A_H$ | √ | √ | √ |
| | LIN wake-up configuration register | RLN3nLWUP | <RLIN3n_base> + $0B_H$ | √ | √ | — |
| | LIN interrupt enable register | RLN3nLIE | <RLIN3n_base> + $0C_H$ | √ | √ | — |
| | LIN / UART error detection enable register | RLN3nLEDE | <RLIN3n_base> + $0D_H$ | √ | √ | √ |
| | LIN / UART control register | RLN3nLCUC | <RLIN3n_base> + $0E_H$ | √ | √ | √ |
| | LIN / UART transmission control register | RLN3nLTRC | <RLIN3n_base> + $10_H$ | √ | √ | √ |
| | LIN / UART mode status register | RLN3nLMST | <RLIN3n_base> + $11_H$ | √ | √ | √ |
| | LIN / UART status register | RLN3nLST | <RLIN3n_base> + $12_H$ | √ | √ | √ |
| | LIN / UART error status register | RLN3nLEST | <RLIN3n_base> + $13_H$ | √ | √ | √ |
| | LIN data field configuration register | RLN3nLDFC | <RLIN3n_base> + $14_H$ | √ | √ | √ |
| | LIN / UART ID buffer register | RLN3nLIDB | <RLIN3n_base> + $15_H$ | √ | √ | √ |
| | LIN checksum buffer register | RLN3nLCBR | <RLIN3n_base> + $16_H$ | √ | √ | — |
| | UART data buffer 0 register | RLN3nLUDB0 | <RLIN3n_base> + $17_H$ | — | — | √ |
| | LIN / UART data buffer 1 register | RLN3nLDBR1 | <RLIN3n_base> + $18_H$ | √ | √ | √ |
| | LIN / UART data buffer 2 register | RLN3nLDBR2 | <RLIN3n_base> + $19_H$ | √ | √ | √ |
| | LIN / UART data buffer 3 register | RLN3nLDBR3 | <RLIN3n_base> + $1A_H$ | √ | √ | √ |
| | LIN / UART data buffer 4 register | RLN3nLDBR4 | <RLIN3n_base> + $1B_H$ | √ | √ | √ |
| | LIN / UART data buffer 5 register | RLN3nLDBR5 | <RLIN3n_base> + $1C_H$ | √ | √ | √ |
| | LIN / UART data buffer 6 register | RLN3nLDBR6 | <RLIN3n_base> + $1D_H$ | √ | √ | √ |
| | LIN / UART data buffer 7 register | RLN3nLDBR7 | <RLIN3n_base> + $1E_H$ | √ | √ | √ |
| | LIN / UART data buffer 8 register | RLN3nLDBR8 | <RLIN3n_base> + $1F_H$ | √ | √ | √ |
| | UART operation enable register | RLN3nLUOER | <RLIN3n_base> + $20_H$ | — | — | √ |
| | UART option register 1 | RLN3nLUOR1 | <RLIN3n_base> + $21_H$ | — | — | √ |
| | UART transmission data register | RLN3nLUTDR | <RLIN3n_base> + $24_H$ | — | — | √ |
| | UART transmission data register L | RLN3nLUTDRL | <RLIN3n_base> + $24_H$ | — | — | √ |
| | UART transmission data register H | RLN3nLUTDRH | <RLIN3n_base> + $25_H$ | — | — | √ |
| | UART reception data register | RLN3nLURDR | <RLIN3n_base> + $26_H$ | — | — | √ |
| | UART reception data register L | RLN3nLURDRL | <RLIN3n_base> + $26_H$ | — | — | √ |

**Table 19.11 List of Registers (2/2)**

| Module Name | Register Name | Symbol | Address | LIN Master | LIN Slave | UART |
|---|---|---|---|---|---|---|
| RLN3n | UART reception data register H | RLN3nLURDRH | <RLIN3n_base> + $27_H$ | — | — | √ |
| | UART wait transmission data register | RLN3nLUWTDR | <RLIN3n_base> + $28_H$ | — | — | √ |
| | UART wait transmission data register L | RLN3nLUWTDRL | <RLIN3n_base> + $28_H$ | — | — | √ |
| | UART wait transmission data register H | RLN3nLUWTDRH | <RLIN3n_base> + $29_H$ | — | — | √ |

**Note:** √: Used, —: Not used
When writing to an unused register, write the value after reset.

## 19.3.2 LIN Master Related Registers

### 19.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $01_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NSPB[3:0] | | | | LPRS[2:0] | | | LWBR0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.12 RLN3nLWBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | NSPB[3:0] | Bit Sampling Count Select<br>b7 b4<br>0 0 0 0: 16 samplings<br>1 1 1 1: 16 samplings<br>Settings other than the above are prohibited. |
| 3 to 1 | LPRS[2:0] | Prescaler Clock Select<br>b3 b1<br>0 0 0: 1/1<br>0 0 1: 1/2<br>0 1 0: 1/4<br>0 1 1: 1/8<br>1 0 0: 1/16<br>1 0 1: 1/32<br>1 1 0: 1/64<br>1 1 1: 1/128 |
| 0 | LWBR0 | Wake-up Baud Rate Select<br>0: In LIN wake-up mode, the clock specified in the LCKS bit of the RLN3nLMD register is used. (LIN1.3)<br>1: In LIN wake-up mode, the clock fa is used regardless of the setting in the LCKS bit of the RLN3nLMD register. (LIN2.x) |

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### NSPB[3:0] Bits (Bit Sampling Count Select)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In LIN master mode (LIN/UART mode select bits in LIN mode register = $00_B$), set these bits to $0000_B$ or $1111_B$ (16 sampling).

#### LPRS[2:0] Bits (Prescaler Clock Select)

These bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

#### LWBR0 Bit (Wake-up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.
When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects fa as the LIN system clock ($f_{LIN}$) during LIN wake-up mode regardless of the setting of the

RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.

Setting the baud rate to 19200 bps while fa is selected allows an input signal with a low-level width of 130 us or longer to be detected in the LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

### 19.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $02_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LBRP0[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.13 RLN3nLBRP0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | LBRP0[7:0] | Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1.<br>Setting range: $00_H$ to $FF_H$ |

Configure the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by N + 1.

### 19.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $03_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LBRP1[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.14 RLN3nLBRP1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | LBRP1[7:0] | Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1.<br>Setting range: $00_H$ to $FF_H$ |

Configure the RLN3nLBRP1 register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M+1.

### 19.3.2.4 RLN3nLSTC — LIN Self-Test Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $04_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | LSTM |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.15 RLN3nLSTC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | — | Writing $A7_H$, $58_H$, and $01_H$ successively to the RLN3nLSTC register places the module into LIN self-test mode. |
| 0 | LSTM | LIN Self-Test Mode<br>0: The module is not in LIN self-test mode.<br>1: The module is in LIN self-test mode. |

The RLN3nLSTC register cancels protection of LIN self-test mode.

Configure the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

Writing $A7_H$, $58_H$, and $01_H$ successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the mode is changed to LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return "$000000_B$", and bit 7 returns an undefined value.

#### LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For exiting LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, $58_H$, and $01_H$.

### 19.3.2.5 RLN3nLMD — LIN Mode Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base>+ $08_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | LRDNFS | LIOS | LCKS[1:0] | | LMD[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.16 RLN3nLMD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | LRDNFS | LIN Reception Data Noise Filter Disable<br>0: The noise filter is enabled.<br>1: The noise filter is disabled. |
| 4 | LIOS | LIN Interrupt Output Select<br>0: RLIN3n interrupt is used.<br>1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used. |
| 3, 2 | LCKS[1:0] | LIN System Clock Select<br>b3 b2<br>0 0: fa (Clock generated by baud rate prescaler 0)<br>0 1: fb (1/2 clock generated by baud rate prescaler 0)<br>1 0: fc (1/8 clock generated by baud rate prescaler 0)<br>1 1: fd (1/2 clock generated by baud rate prescaler 1) |
| 1, 0 | LMD[1:0] | LIN/UART Mode Select<br>b1 b0<br>0 0: LIN master mode |

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

#### LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 19.4, Interrupt Sources**.

#### LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.
With $00_B$ set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).
With $01_B$ set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).
With $10_B$ set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).
With $11_B$ set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When $1_B$ is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x), and the RLN3nLMST register is $01_H$ (LIN wake-up mode), the protocol controller is supplied with fa regardless of the setting of this bit (the LCKS bit is not changed).

#### LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an LIN master, set these bits to $00_B$.

### 19.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $09_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | BDT[1:0] | | BLT[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.17 RLN3nLBFC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5, 4 | BDT[1:0] | Transmission Break Delimiter (High Level) Width Select<br>b5 b4<br>0 0: 1 Tbit<br>0 1: 2 Tbits<br>1 0: 3 Tbits<br>1 1: 4 Tbits |
| 3 to 0 | BLT[3:0] | Transmission Break (Low Level) Width Select<br>b3 b0<br>0 0 0 0: 13 Tbits<br>0 0 0 1: 14 Tbits<br>0 0 1 0: 15 Tbits<br>:<br>1 1 1 0: 27 Tbits<br>1 1 1 1: 28 Tbits |

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

Some combinations of the specified values result in a frame length exceeding the timeout time. Set the appropriate values in this register.

#### BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header.
1 Tbit to 4 Tbits can be set.

#### BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header.
13 Tbits to 28 Tbits can be set.

### 19.3.2.7 RLN3nLSC — LIN Space Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base>+ $0A_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | IBS[1:0] | | — | IBHS[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R/W | R/W | R/W |

**Table 19.18 RLN3nLSC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5, 4 | IBS[1:0] | Inter-Byte Space Select<br>b5 b4<br>0 0: 0 Tbit<br>0 1: 1 Tbit<br>1 0: 2 Tbits<br>1 1: 3 Tbits |
| 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 to 0 | IBHS[2:0] | Inter-Byte Space (Header)/Response Space Select<br>b2 b0<br>0 0 0: 0 Tbit<br>0 0 1: 1 Tbit<br>0 1 0: 2 Tbits<br>0 1 1: 3 Tbits<br>1 0 0: 4 Tbits<br>1 0 1: 5 Tbits<br>1 1 0: 6 Tbits<br>1 1 1: 7 Tbits |

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Specify the appropriate values in this register.

#### IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.
0 Tbit to 3 Tbits can be set.
These bits are enabled only during response transmission; these are disabled during response reception.

#### IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.
0 Tbit to 7 Tbits can be set.
The response space setting is enabled only during response transmission; setting is disabled during response reception.
The inter-byte space (header) is equal to the response space.

### 19.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base>+ $0B_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WUTL[3:0] | | | | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R | R |

**Table 19.19 RLN3nLWUP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | WUTL[3:0] | Wake-up Transmission Low Level Width Select<br>b7 b4<br>0 0 0 0: 1 Tbit<br>0 0 0 1: 2 Tbits<br>0 0 1 0: 3 Tbits<br>0 0 1 1: 4 Tbits<br>:<br>1 1 0 0: 13 Tbits<br>1 1 0 1: 14 Tbits<br>1 1 1 0: 15 Tbits<br>1 1 1 1: 16 Tbits |
| 3 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.
1 Tbit to 16 Tbits can be set.

With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x), fa is selected as the LIN system clock ($f_{LIN}$) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

### 19.3.2.9 RLN3nLIE — LIN Interrupt Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | SHIE | ERRIE | FRCIE | FTCIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 19.20 RLN3nLIE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | SHIE | Successful Header Transmission Interrupt Request Enable<br>0: Disables successful header transmission interrupt request.<br>1: Enables successful header transmission interrupt request. |
| 2 | ERRIE | Error Detection Interrupt Request Enable<br>0: Disables error detection interrupt request.<br>1: Enables error detection interrupt request. |
| 1 | FRCIE | Successful Frame/Wake-up Reception Interrupt Request Enable<br>0: Disables successful frame/wake-up reception interrupt request.<br>1: Enables successful frame/wake-up reception interrupt request. |
| 0 | FTCIE | Successful Frame/Wake-up Transmission Interrupt Request Enable<br>0: Disables successful frame/wake-up transmission interrupt request.<br>1: Enables successful frame/wake-up transmission interrupt request. |

Configure the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### SHIE Bit (Successful Header Transmission Interrupt Request Enable)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

#### ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.
Occurrence factors are bit errors, physical bus errors, frame/response timeout errors, framing errors, checksum errors, and response preparation errors. Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

#### FRCIE Bit (Successful Frame/Wake-up Reception Interrupt Request Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a frame or a wake-up signal (input signal low-level width count).

With 0 set, the interrupt request for RLIN3n successful reception is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for successful RLIN3n reception is generated when the FRC flag in the RLN3nLST register is set to 1.

#### FTCIE Bit (Successful Frame/Wake-up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a frame or a wake-up signal.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

### 19.3.2.10 RLN3nLEDE —LIN Error Detection Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0D_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LTES | — | — | — | FERE | FTERE | PBERE | BERE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R/W | R/W | R/W | R/W |

**Table 19.21 RLN3nLEDE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | LTES | Timeout Error Select<br>0: Frame timeout error<br>1: Response timeout error |
| 6 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | FERE | Framing Error Detection Enable *1<br>0: Disables framing error detection.<br>1: Enables framing error detection. |
| 2 | FTERE | Timeout Error Detection Enable<br>0: Disables frame/response timeout error detection.<br>1: Enables frame/response timeout error detection. |
| 1 | PBERE | Physical Bus Error Detection Enable<br>0: Disables physical bus error detection.<br>1: Enables physical bus error detection. |
| 0 | BERE | Bit Error Detection Enable *1<br>0: Disables bit error detection.<br>1: Enables bit error detection. |

Note 1. Set FERE bit and BERE bit to 1.

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 19.7.7, Error Statuses**.

#### FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
Set this bit to 1. The detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 19.7.7, Error Statuses**.

#### FTERE Bit (Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.

When this bit is set to 1, the detection result is reflected in the FTER flag of the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 19.7.7, Error Statuses**.

#### PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.
With 0 set, the physical bus error is not detected.
With 1 set, the physical bus error is detected.
When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register.
For details on the physical bus error, see **Section 19.7.7, Error Statuses**.

#### BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
Set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 19.7.7, Error Statuses**.

### 19.3.2.11 RLN3nLCUC — LIN Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0E_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | OM1 | OM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 19.22 RLN3nLCUC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | OM1 | LIN Mode Select<br>0: LIN wake-up mode<br>1: LIN operation mode |
| 0 | OM0 | LIN Reset<br>0: LIN reset mode<br>1: LIN reset mode is canceled. |

Set the RLN3nLCUC register to $01_H$ to transition to LIN wake-up mode or to $03_H$ to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN3nLCUC register to $03_H$ after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

#### OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN wake-up mode.
With 1 set, LIN operation mode.
This bit is enabled only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

#### OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN reset mode.
With 1 set, LIN reset mode is canceled.

### 19.3.2.12 RLN3nLTRC — LIN Transmission Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $10_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | RTS | FTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 19.23 RLN3nLTRC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | RTS | Response Transmission/Reception Start<br>0: Response transmission/reception is stopped in frame separate mode.<br>1: Response transmission/reception is started in frame separate mode. |
| 0 | FTS | Frame Transmission/Wake-up Transmission/Reception Start<br>0: Frame Transmission/wake-up transmission/reception is stopped.<br>1: Frame Transmission/wake-up transmission/reception is started. |

#### RTS Bit (Response Transmission/Reception Start)

In frame separate mode, set the RTS bit to 1 after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write $02_H$ to the RLN3nLTRC register using the store instruction.
Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 at the end of data group communication or transition to LIN reset mode.

#### FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)

Set the FTS bit to 1 to start frame transmission and reception.
Also set this bit to 1 to allow wake-up transmission and reception (input signal low-level width count).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

### 19.3.2.13 RLN3nLMST — LIN Mode Status Register

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RLIN3n_base> + $11_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | OMM1 | OMM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 19.24 RLN3nLMST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OMM1 | LIN Mode Status Monitor<br>0: LIN wake-up mode.<br>1: LIN operation mode. |
| 0 | OMM0 | LIN Reset Status Monitor<br>0: LIN reset mode.<br>1: Not in LIN reset mode. |

#### OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

#### OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

### 19.3.2.14 RLN3nLST — LIN Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $12_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | HTRC | D1RC | — | — | ERR | — | FRC | FTC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R/W | R/W |

**Table 19.25 RLN3nLST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | HTRC | Successful Header Transmission Flag<br>0: Header transmission has not been completed.<br>1: Header transmission has been completed. |
| 6 | D1RC | Successful Data 1 Reception Flag<br>0: Data 1 reception has not been completed.<br>1: Data 1 reception has been completed. |
| 5, 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | ERR | Error Detection Flag<br>0: No error has been detected.<br>1: Error has been detected. |
| 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | FRC | Successful Frame/Wake-up Reception Flag<br>0: Frame or wake-up reception has not been completed.<br>1: Frame or wake-up reception has been completed. |
| 0 | FTC | Successful Frame/Wake-up Transmission Flag<br>0: Frame or wake-up transmission has not been completed.<br>1: Frame or wake-up transmission has been completed. |

The RLN3nLST register is automatically cleared to $00_H$ upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains $00_H$.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value it had before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for RLN3n transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled).
To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

#### D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value it had before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. To clear the bit to 0 before the next communication is started (when the FTS bit of the

RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

### ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register while in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

### FRC Flag (Successful Frame/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for RLN3n successful reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

### FTC Flag (Successful Frame/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for RLN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

### 19.3.2.15 RLN3nLEST — LIN Error Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $13_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RPER | — | CSER | — | FER | FTER | PBER | BER |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R/W | R | R/W | R/W | R/W | R/W |

**Table 19.26 RLN3nLEST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | RPER | Response Preparation Error Flag<br>0: Response preparation error has not been detected.<br>1: Response preparation error has been detected. |
| 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | CSER | Checksum Error Flag<br>0: Checksum error has not been detected.<br>1: Checksum error has been detected. |
| 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | FER | Framing Error Flag<br>0: Framing error has not been detected.<br>1: Framing error has been detected. |
| 2 | FTER | Timeout Error Flag<br>0: Frame/response timeout error has not been detected.<br>1: Frame/response timeout error has been detected. |
| 1 | PBER | Physical Bus Error Flag<br>0: Physical bus error has not been detected.<br>1: Physical bus error has been detected. |
| 0 | BER | Bit Error Flag<br>0: Bit error has not been detected.<br>1: Bit error has been detected. |

The RLN3nLEST register is automatically cleared to $00_H$ upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains $00_H$.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/ reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value it had before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

#### CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value it had before 1 is written.
The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

#### FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the value of the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

#### FTER Flag (Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), the FTER flag is set to 1 upon frame timeout error or response timeout error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

#### PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled), the PBER flag is set to 1 upon physical bus error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

#### BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

### 19.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $14_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LSS | FSM | CSM | RFT | RFDL[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.27 RLN3nLDFC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | LSS | Transmission/Reception Continuation Select<br>0: The data group to be transmitted/received next is the last one.<br>1: The data group to be transmitted/received next is not the last one. (Checksum is not included.) |
| 6 | FSM | Frame Separate Mode Select<br>0: Frame separate mode is not set.<br>1: Frame separate mode is set. |
| 5 | CSM | Checksum Select<br>0: Classic checksum mode<br>1: Enhanced checksum mode |
| 4 | RFT | Response Field Communication Direction Select<br>0: Reception<br>1: Transmission |
| 3 to 0 | RFDL[3:0] | Response Field Length Select<br>b3 b0<br>0 0 0 0: 0 byte (+ checksum)<br>0 0 0 1: 1 byte (+ checksum)<br>0 0 1 0: 2 bytes (+ checksum)<br>:<br>0 1 1 1: 7 bytes (+ checksum)<br>1 0 0 0: 8 bytes (+ checksum)<br>Settings other than the above are prohibited. |

#### LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.
With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.
With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.
Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

#### FSM Bit (Frame Separate Mode Select)

The FSM bit selects the response communication mode.
With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without setting the RTS bit in the RLN3nLTRC register.

With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0.
When transitioning to LIN self-test mode, set this bit to 0 before transition.
For details on frame separate mode, see **Section 19.7.4.1, Transmission of LIN Frames**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

#### CSM Bit (Checksum Select)

The CSM bit selects the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error detection is enabled (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details, see **Section 19.7.7, Error Statuses**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.
During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

#### RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

#### RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the RTS bit in the RLN3nLTRC register is 0).
To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).
Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

### 19.3.2.17 RLN3nLIDB — LIN ID Buffer Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $15_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IDP1 | IDP0 | ID[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.28 RLN3nLIDB Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | IDP1 | Parity Setting (P1)<br>Sets the parity bits (P1) to be transmitted in the ID field. |
| 6 | IDP0 | Parity Setting (P0)<br>Sets the parity bits (P0) to be transmitted in the ID field. |
| 5 to 0 | ID[5:0] | ID Setting<br>Sets the 6-bit ID value to be transmitted in the ID field. |

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

In LIN self-test mode, this register operates as described below.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

#### IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.

Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

#### ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

### 19.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register

**Access:** This register is a read-only register that can be read in 8-bit units. In LIN self-test mode, this register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $16_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CKSM[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.29 RLN3nLCBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | CKSM[7:0] | Stores the checksum value transmitted or received. |

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

### 19.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN3nLDBR1: <RLIN3n_base> + $18_H$
RLN3nLDBR2: <RLIN3n_base> + $19_H$
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LDB[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.30 RLN3nLDBRb Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | LDB[7:0] | Sets the data to be transmitted or reads the received data.<br>Setting range: $00_H$ to $FF_H$ |

- For response transmission:
  These registers set the data to be transmitted in the response field.
  Use these registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 0 (not frame separate mode)
  - FTS in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped)

  or
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is stopped)
- For response reception:
  These registers store the data received in the response field.
  The received data is overwritten. If an error is detected, the data prior to reception interruption is stored in the register.
  Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)
- For transmission of response data of 9 bytes or more:
  Use these registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is stopped)
- For reception of response data of 9 bytes or more:
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as described below.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

## 19.3.3 LIN Slave Related Registers

### 19.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $01_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NSPB[3:0] | | | | LPRS[2:0] | | | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |

**Table 19.31 RLN3nLWBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | NSPB[3:0] | Bit Sampling Count Select<br>b7 b4<br>0 0 0 0: 16 samplings<br>0 0 1 1: 4 samplings<br>0 1 1 1: 8 samplings<br>1 1 1 1: 16 samplings<br>Settings other than the above are prohibited. |
| 3 to 1 | LPRS[2:0] | Prescaler Clock Select<br>b3 b1<br>0 0 0: 1/1<br>0 0 1: 1/2<br>0 1 0: 1/4<br>0 1 1: 1/8<br>1 0 0: 1/16<br>1 0 1: 1/32<br>1 1 0: 1/64<br>1 1 1: 1/128 |
| 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
When the frame communication is performed in LIN slave mode (fixed baud rate) (LMD[1:0] bits in the RLN3nLMD register = $11_B$), set these bits to "$0000_B$" or "$1111_B$" (16 samplings).
When the frame communication is performed in LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = $10_B$), set these bits to "$0011_B$" (4 samplings) or "$0111_B$" (8 samplings).

#### LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler. The LIN communication clock source is divided by this prescaler.

In LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = $10_B$), set these bits so that the prescaler clock becomes as follows according to the target baud rate.

| [Target baud rate] | [Prescaler clock] |
|---|---|
| 1 kbps to 20 kbps | : 4MHz*1 |
| 1 kbps to 2.4 kbps (excluding 2.4 kbps) | : 4MHz |
| 2.4 kbps to 20 kbps | : 8 MHz to 12 MHz |

**Note 1.** Use the clock with NSPB bits set to "$0011_B$" (4 samplings).

### 19.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register

**Access:** RLN3nLBRP01 can be read or written in 16-bit units.
RLN3nLBRP0 can be read or written in 8-bit units.
RLN3nLBRP1 can be read or written in 8-bit units.

**Address:** RLN3nLBRP01: <RLIN3n_base> + $02_H$
RLN3nLBRP0: <RLIN3n_base> + $02_H$
RLN3nLBRP1: <RLIN3n_base> + $03_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | BRP[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.32 RLN3nLBRP01 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | BRP[15:0] | Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1.<br>Setting range: $0000_H$ to $FFFF_H$ |

Configure the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units using registers RLN3nLBRP0 and RLN3nLBRP1.

**NOTE**

In LIN slave mode [auto baud rate], the system automatically sets the result of baud rate correction to the RLN3nLBRP01 register on successful reception of the sync field.

### 19.3.3.3 RLN3nLSTC — LIN Self-Test Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $04_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | LSTM |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.33 RLN3nLSTC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | - | Writing $A7_H$, $58_H$, and $01_H$ successively to the RLN3nLSTC register places the module into LIN self-test mode. |
| 0 | LSTM | LIN Self-Test Mode<br>0: The module is not in LIN self-test mode.<br>1: The module is in LIN self-test mode. |

The RLN3nLSTC register cancels protection of LIN self-test mode.

Configure the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

Writing $A7_H$, $58_H$, and $01_H$ successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the module is placed in LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return "$000000_B$", and bit 7 returns an undefined value.

#### LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For exiting LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, $58_H$, and $01_H$.

### 19.3.3.4 RLN3nLMD — LIN Mode Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $08_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | LRDNFS | LIOS | — | — | LMD[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R/W | R/W |

**Table 19.34 RLN3nLMD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | LRDNFS | LIN Reception Data Noise Filter Disable<br>0: The noise filter is enabled.<br>1: The noise filter is disabled. |
| 4 | LIOS | LIN Interrupt Output Select<br>0: RLIN3 interrupt is used.<br>1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are used. |
| 3, 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1, 0 | LMD[1:0] | LIN/UART Mode Select<br>b1 b0<br>1 0: LIN Slave mode (auto baud rate)<br>1 1: LIN Slave mode (fixed baud rate) |

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

#### LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 19.4, Interrupt Sources**.

#### LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use this module as an LIN slave, set these bits to "$10_B$" (auto baud rate) or "$11_B$" (fixed baud rate).

### 19.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $09_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | LBLT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 19.35 RLN3nLBFC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | LBLT | Reception Break (Low-Level) Detection Width Setting<br>0: A break (low-level) is detected in 9.5 or 10 Tbits<br>1: A break (low-level) is detected in 10.5 or 11 Tbits |

Configure the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### LBLT Bit (Reception Break (Low-Level) Detection Width Setting)

- When RLN3nLMD.LMD is "$10_B$" (LIN slave mode (auto baud rate))
  - 0: Low-level width of 10 Tbits or longer is detected.
  - 1: Low-level width of 11 Tbits or longer is detected.
- When RLN3nLMD.LMD is "$11_B$" (LIN slave mode (fixed baud rate))
  - 0: Low-level width of 9.5 Tbits or longer is detected.
  - 1: Low-level width of 10.5 Tbits or longer is detected.

### 19.3.3.6 RLN3nLSC — LIN Space Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0A_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | IBS[1:0] | | — | IBHS[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R/W | R/W | R/W |

**Table 19.36 RLN3nLSC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5, 4 | IBS[1:0] | Inter-Byte Space Select<br>b5 b4<br>0 0: 0 Tbit<br>0 1: 1 Tbit<br>1 0: 2 Tbits<br>1 1: 3 Tbits |
| 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 to 0 | IBHS[2:0] | Response Space Setting<br>b2 b0<br>0 0 0: 0 Tbit<br>0 0 1: 1 Tbit<br>0 1 0: 2 Tbits<br>0 1 1: 3 Tbits<br>1 0 0: 4 Tbits<br>1 0 1: 5 Tbits<br>1 1 0: 6 Tbits<br>1 1 1: 7 Tbits |

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

This register is enabled only during response transmission, and disabled during response reception.

Some combinations of the specified values result in a frame or response length exceeding the timeout time. Specify the appropriate values in this register.

#### IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the inter-byte space width of the response transmission.
0 Tbit to 3 Tbits can be set.

#### IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the transmission width of the response space.
0 Tbit to 7 Tbits can be set.

### 19.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0B_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WUTL[3:0] | | | | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R | R |

**Table 19.37 RLN3nLWUP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | WUTL[3:0] | Wake-up Transmission Low level Width Select<br>b7 b4<br>0 0 0 0: 1 Tbit<br>0 0 0 1: 2 Tbits<br>0 0 1 0: 3 Tbits<br>0 0 1 1: 4 Tbits<br>:<br>1 1 0 0: 13 Tbits<br>1 1 0 1: 14 Tbits<br>1 1 1 0: 15 Tbits<br>1 1 1 1: 16 Tbits |
| 3 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Configure the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low-level width of the wake-up frame transmission.
1 Tbit to 16 Tbits can be set.

### 19.3.3.8 RLN3nLIE — LIN Interrupt Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | SHIE | ERRIE | FRCIE | FTCIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 19.38 RLN3nLIE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | SHIE | Successful Header Reception Interrupt Request Enable<br>0: Disables successful header reception interrupt request.<br>1: Enables successful header reception interrupt request. |
| 2 | ERRIE | Error Detection Interrupt Request Enable<br>0: Disables error detection interrupt request.<br>1: Enables error detection interrupt request. |
| 1 | FRCIE | Successful Response/Wake-up Reception Interrupt Request Enable<br>0: Disables successful Response/wake-up reception interrupt request.<br>1: Enables successful Response/wake-up reception interrupt request. |
| 0 | FTCIE | Successful Response/Wake-up Transmission Interrupt Request Enable<br>0: Disables successful Response/wake-up transmission interrupt request.<br>1: Enables successful Response/wake-up transmission interrupt request. |

Configure the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### SHIE Bit (Successful Header Reception Interrupt Request Enable)

The SHIE bit enables or disables an interrupt request upon successful reception of a header.
With 0 set, the interrupt request for RLIN3n successful reception is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n successful reception is generated when the HTRC flag in the RLN3nLST register is set to 1.

#### ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.
Error types that are interrupt sources are the bit error, frame/response timeout error, framing error, sync filed error, ID parity error, checksum error, and response preparation error.
Detection of the bit error, frame/response timeout error, sync filed error, ID parity error, and framing error can be enabled or disabled using the RLN3nLEDE register.

### FRCIE Bit (Successful Response/Wake-up Reception Interrupt Request Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a response or a wake-up frame (input signal low-level width count).
With 0 set, the interrupt request for RLIN3n successful reception is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n successful reception is generated when the FRC flag in the RLN3nLST register is set to 1.

### FTCIE Bit (Successful Response/Wake-up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a response or a wake-up frame.
With 0 set, the interrupt request for RLIN3n successful transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n successful transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

### 19.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0D_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LTES | IPERE | — | SFERE | FERE | TERE | — | BERE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W |

**Table 19.39 RLN3nLEDE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | LTES | Timeout Error Select<br>0: Frame timeout error<br>1: Response timeout error |
| 6 | IPERE | ID Parity Error Detection Enable<br>0: Disables ID Parity error detection.<br>1: Enables ID Parity error detection. |
| 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | SFERE | Sync Field Error Detection Enable<br>0: Disables Sync Field error detection.<br>1: Enables Sync Field error detection. |
| 3 | FERE | Framing Error Detection Enable *1<br>0: Disables framing error detection.<br>1: Enables framing error detection. |
| 2 | TERE | Timeout Error Detection Enable<br>0: Disables frame/response timeout error detection.<br>1: Enables frame/response timeout error detection. |
| 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | BERE | Bit Error Detection Enable *1<br>0: Disables bit error detection.<br>1: Enables bit error detection. |

Note 1. Set FERE bit and BERE bit to 1

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 19.7.7, Error Statuses**.

#### IPERE Bit (ID Parity Error Detection Enable)

This bit enables or disables detection of the ID parity error.
With 0 set, the ID parity error is not detected.
With 1 set, the ID parity error is detected.
When this bit is set to 1, the detection result is reflected in the IPER flag of the RLN3nLEST register.
For details on the ID parity error, see **Section 19.7.7, Error Statuses**.

#### SFERE Bit (Sync Field Error Detection Enable)

This bit enables or disables detection of the sync field error.
With 0 set, the sync field error is not detected.
With 1 set, the sync field error is detected.
Regardless of the setting of this bit, when a sync field error is detected, this module waits for the next header.
When this bit is set to 1, the detection result is reflected in the SFER flag of the RLN3nLEST register.
For details on the sync filed error, see **Section 19.7.7, Error Statuses**.

#### FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
Set this bit to 1. The detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 19.7.7, Error Statuses**.

#### TERE Bit (Timeout Error Detection Enable)

The TERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1, the detection result is reflected in the TER flag of the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
The timeout error should not be used in LIN slave mode [auto baud rate] (when the LMD[1:0] bits in the RLN3nLMD register are "$10_B$").
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 19.7.7, Error Statuses**.

#### BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
Set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 19.7.7, Error Statuses**.

### 19.3.3.10 RLN3nLCUC — LIN Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0E_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | OM1 | OM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 19.40 RLN3nLCUC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | OM1 | LIN Mode Select<br>0: LIN wake-up mode<br>1: LIN operation mode |
| 0 | OM0 | LIN Reset<br>0: LIN reset mode<br>1: LIN reset mode is canceled. |

Set the RLN3nLCUC register to $01_H$ to transition to LIN wake-up mode or to $03_H$ to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN3nLCUC register to $03_H$ after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

#### OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific LIN operation mode (LIN wake-up mode or LIN operation mode) that is entered after exiting LIN reset mode
With 0 set, the LIN/UART interface enters LIN wake-up mode.
With 1 set, the LIN/UART interface enters LIN operation mode.
This bit is enabled only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

#### OM0 Bit (LIN Reset)

The OM0 bit selects whether to transition to or exit LIN reset mode.
With 0 set, the LIN/UART interface enters LIN reset mode.
With 1 set, the LIN/UART interface exits LIN reset mode.

### 19.3.3.11 RLN3nLTRC — LIN Transmission Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $10_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | LNRR | RTS | FTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

**Table 19.41 RLN3nLTRC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 | LNRR | No LIN Response Request<br>0: Response for the reception ID<br>1: No response for the reception ID |
| 1 | RTS | Response Transmission/Reception Start<br>0: Response transmission/reception is stopped.<br>1: Response transmission/reception is started. |
| 0 | FTS | LIN Communication Start<br>0: Header reception/wake-up transmission/reception is stopped.<br>1: Header reception/wake-up transmission/reception is started. |

#### LNRR Bit (No LIN Response Request)

Set this bit to 1 if no response is to be transmitted/received after receiving the header and checking the received ID.

Once set, this bit is automatically cleared to 0 upon detection of new sync field or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write $04_H$ using the store instruction.

Do not set this bit and the RTS bit to 1 simultaneously.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is $0_B$ (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is stopped).

When response data of 9 bytes or more is to be transmitted or received, use this bit only after the completion of the header. (Do not use this bit for the second or later data group.)

#### RTS Bit (Response Transmission/Reception Start)

Set this bit to 1 to start response transmission or reception after receiving the header and checking the received ID.

Once set, this bit is automatically cleared to 0 upon completion of response transmission or reception (including error detection) or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write $02_H$ to the RLN3nLTRC register using the store instruction.

Do not set this bit and the LNRR bit to 1 simultaneously

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is $0_B$ (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group transmission/reception or transition to LIN reset mode.

#### FTS Bit (LIN Communication Start)

Set this bit to 1 to start header reception or wake-up transmission/reception.
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is $0_B$ (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

### 19.3.3.12 RLN3nLMST — LIN Mode Status Register

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RLIN3n_base> +$11_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | OMM1 | OMM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 19.42 RLN3nLMST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OMM1 | LIN Mode Status Monitor<br>0: LIN wake-up mode.<br>1: LIN operation mode. |
| 0 | OMM0 | LIN Reset Status Monitor<br>0: LIN reset mode.<br>1: Not in LIN reset mode. |

#### OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

#### OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

### 19.3.3.13 RLN3nLST — LIN Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $12_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | HTRC | D1RC | — | — | ERR | — | FRC | FTC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R/W | R/W |

**Table 19.43 RLN3nLST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | HTRC | Successful Header Reception Flag<br>0: Header reception has not been completed.<br>1: Header reception has been completed. |
| 6 | D1RC | Successful Data 1 Reception Flag<br>0: Data 1 reception has not been completed.<br>1: Data 1 reception has been completed. |
| 5, 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | ERR | Error Detection Flag<br>0: No error has been detected.<br>1: Error has been detected. |
| 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | FRC | Successful Response/Wake-up Reception Flag<br>0: Response or wake-up reception has not been completed.<br>1: Response or wake-up reception has been completed. |
| 0 | FTC | Successful Response/Wake-up Transmission Flag<br>0: Response or wake-up transmission has not been completed.<br>1: Response or wake-up transmission has been completed. |

The RLN3nLST register is automatically cleared to $00_H$ upon transition to LIN reset mode.

In LIN reset mode, writing a value to this register is disabled. In LIN reset mode, the register retains $00_H$.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### HTRC Flag (Successful Header Reception Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value before 1 is written. The HTRC flag is set to 1 upon completion of header reception. Here, an interrupt request for RLIN3n successful reception is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if header reception is completed while this bit is 1, an interrupt is not generated. To clear this bit to 0, write 0 to the bit.
To detect a new header in the response field upon completion of header reception, clear this bit after it is set to 1.

#### D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value it had before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not

generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

### ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLIN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if an error is detected while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the RPER, IPER, CSER, SFER, FER, TER, and BER flags in the RLN3nLEST register. This clears the ERR flag to 0.

### FRC Flag (Successful Response/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FRC flag is set to 1 upon completion of response or wake-up reception. Here, an interrupt request for RLIN3n successful reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response reception or wake-up reception is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

### FTC Flag (Successful Response/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FTC flag is set to 1 upon completion of response or wake-up transmission. Here, an interrupt request for RLIN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response transmission or wake-up transmission is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

### 19.3.3.14 RLN3nLEST — LIN Error Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $13_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RPER | IPER | CSER | SFER | FER | TER | — | BER |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W |

**Table 19.44 RLN3nLEST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | RPER | Response Preparation Error Flag<br>0: Response preparation error has not been detected.<br>1: Response preparation error has been detected. |
| 6 | IPER | ID Parity Error Flag<br>0: ID parity error has not been detected.<br>1: ID parity error has been detected. |
| 5 | CSER | Checksum Error Flag<br>0: Checksum error has not been detected.<br>1: Checksum error has been detected. |
| 4 | SFER | Sync Field Error Flag<br>0: Sync field error has not been detected.<br>1: Sync field error has been detected. |
| 3 | FER | Framing Error Flag<br>0: Framing error has not been detected.<br>1: Framing error has been detected. |
| 2 | TER | Timeout Error Flag<br>0: Frame/response timeout error has not been detected.<br>1: Frame/response timeout error has been detected. |
| 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | BER | Bit Error Flag<br>0: Bit error has not been detected.<br>1: Bit error has been detected. |

The RLN3nLEST register is automatically cleared to $00_H$ upon transition to LIN reset mode.

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains $00_H$.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value it had before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. Write 0 to clear this bit.

#### IPER Flag (ID Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

When the IPERE bit of the RLN3nLEDE register is 1 (ID parity error detection enabled), this bit is set to 1 upon ID parity error detection. Write 0 to clear this bit.

### CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value it had before 1 is written.
The CSER flag is set to 1 upon checksum error detection. Write 0 to clear this bit.

### SFER Flag (Sync Field Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
When the SFERE bit of the RLN3nLEDE register is 1 (sync field error detection enabled), this bit is set to 1 upon sync field error detection. Write 0 to clear this bit.

### FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. Write 0 to clear this bit.

### TER Flag (Timeout Error Flag)

Only 0 can be written to the TER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the TERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), this flag is set to 1 upon frame timeout error or response timeout error detection. Write 0 to clear this bit.

### BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. Write 0 to clear this bit.

### 19.3.3.15 RLN3nLDFC — LIN Data Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $14_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LSS | — | LCS | RCDS | RFDL[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.45 RLN3nLDFC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | LSS | Transmission/Reception Continuation Select<br>0: The data group to be transmitted/received next is the last one.<br>1: The data group to be transmitted/received next is not the last one.<br>(Data transmission/reception continues without waiting for reception of the next header.) |
| 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | LCS | Checksum Select<br>0: Classic checksum mode<br>1: Enhanced checksum mode |
| 4 | RCDS | Response Field Communication Direction Select<br>0: Reception<br>1: Transmission |
| 3 to 0 | RFDL[3:0] | Response Field Length Select<br>b3 b0<br>0 0 0 0: 0 byte (+ checksum)<br>0 0 0 1: 1 byte (+ checksum)<br>0 0 1 0: 2 bytes (+ checksum)<br>:<br>0 1 1 1: 7 bytes (+ checksum)<br>1 0 0 0: 8 bytes (+ checksum)<br>Settings other than the above are prohibited. |

#### LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one. With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.
When multi-byte response transmission/reception function is not used, set it to “0”.
Set this bit when the RTS bit is 0 (response transmission/reception stopped).

#### LCS Bit (Checksum Select)

The LCS bit selects the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error detection is enabled (the TERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see **Section 19.7.7, Error Statuses**.
When the length of the response field data is 0 bytes (the RFDL bit is 0), do not set this bit to “1” (enhanced).

When response data of 9 bytes or more is to be transmitted or received, do not change the LCS bit setting after the first data group through the last data group.
During transmission or reception of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.
Set this bit when the RTS bit is 0 (response transmission/reception stopped).

#### RCDS Bit (Response Field Communication Direction Select)

This bit selects the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped) in LIN operation mode or when the FTS bit is 0 (header reception or wake-up transmission/reception stopped) in LIN wake-up mode).
When response data of 9 bytes or more is to be transmitted or received, do not change this bit setting after the first data group through the last data group.

#### RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
Set these bits when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped).
When response data of 9 bytes or more is to be transmitted or received, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit in the RLN3nLDFC register is 1) include the checksum.

### 19.3.3.16 RLN3nLIDB — LIN ID Buffer Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $15_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IDP1 | IDP0 | ID[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.46 RLN3nLIDB Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | IDP[1:0] | Parity Setting<br>Stores the parity bits (P0 and P1) received in the ID field. |
| 5 to 0 | ID[5:0] | ID Setting<br>Stores the 6-bit ID value received in the ID field. |

The value in the RLN3nLIDB register is enabled after the completion of header reception. In LIN mode (LIN operation mode, LIN wake-up mode), writing to this register is disabled.

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

#### IDP[1:0] Bits (Parity Setting)

The IDP bits store the parity bits (P0 and P1) received in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.

When the IPERE bit in the RLN3nLEDE register is 1 (ID parity detection enabled), the received value and the value calculated internally are compared. If they do not match, IPER (ID parity error flag) is set.

#### ID[5:0] Bits (ID Setting)

The ID bits store the 6-bit ID value received in the ID field of the LIN frame.

### 19.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register

**Access:** This register is a read-only register that can be read in 8-bit units.
However, in LIN self-test mode, this register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $16_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CKSM[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.47 RLN3nLCBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | CKSM[7:0] | Stores the checksum value transmitted or received. |

In LIN operation mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

### 19.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN3nLDBR1: <RLIN3n_base> + $18_H$
RLN3nLDBR2: <RLIN3n_base> + $19_H$
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LDB[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.48 RLN3nLDBRb Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | LDB[7:0] | Sets the data to be transmitted or holds the received data.<br>Setting range: $00_H$ to $FF_H$ |

- For response transmission:
  The RLN3nLDBRb registers set the data to be transmitted in the response field.
  These registers should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stop).
- For response reception:
  The RLN3nLDBRb registers store the data received in the response field.
  The received data is overwritten. If an error is detected, the data prior to reception interruption is stored in the register.
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started)

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

## 19.3.4 UART Related Registers

### 19.3.4.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $01_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NSPB[3:0] | | | | LPRS[2:0] | | | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |

**Table 19.49 RLN3nLWBR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | NSPB[3:0] | Bit Sampling Count Select<br>b7 b4<br>0 0 0 0: 16 samplings<br>0 1 0 1: 6 samplings<br>0 1 1 0: 7 samplings<br>0 1 1 1: 8 samplings<br>1 0 0 0: 9 samplings<br>1 0 0 1: 10 samplings<br>1 0 1 0: 11 samplings<br>1 0 1 1: 12 samplings<br>1 1 0 0: 13 samplings<br>1 1 0 1: 14 samplings<br>1 1 1 0: 15 samplings<br>1 1 1 1: 16 samplings<br>Settings other than the above are prohibited. |
| 3 to 1 | LPRS[2:0] | Prescaler Clock Select<br>b3 b1<br>0 0 0: 1/1<br>0 0 1: 1/2<br>0 1 0: 1/4<br>0 1 1: 1/8<br>1 0 0: 1/16<br>1 0 1: 1/32<br>1 1 0: 1/64<br>1 1 1: 1/128 |
| 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In UART mode, it is possible to set the NSPB bits from 6 samplings to 16 samplings.

#### LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

### 19.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register

**Access:** RLN3nLBRP01 register can be read or written in 16-bit units.
RLN3nLBRP0 register can be read or written in 8-bit units.
RLN3nLBRP1 register can be read or written in 8-bit units.

**Address:** RLN3nLBRP01: <RLIN3n_base> + $02_H$
RLN3nLBRP0: <RLIN3n_base> + $02_H$
RLN3nLBRP1: <RLIN3n_base> + $03_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | BRP[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.50 RLN3nLBRP01 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 0 | BRP[15:0] | Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1.<br>Setting range: $0000_H$ to $FFFF_H$ |

Configure the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units using the registers RLN3nLBRP0 and RLN3nLBRP1.

### 19.3.4.3 RLN3nLMD — UART Mode Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $08_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | LRDNFS | — | — | — | LMD[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R | R | R | R/W | R/W |

**Table 19.51 RLN3nLMD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | LRDNFS | UART Reception Data Noise Filter Disable<br>0: The noise filter is enabled.<br>1: The noise filter is disabled. |
| 4 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1, 0 | LMD[1:0] | LIN/UART Mode Select<br>b1 b0<br>0 1: UART mode |

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### LRDNFS Bit (UART Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

#### LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an UART, set these bits to $01_B$.

### 19.3.4.4 RLN3nLBFC — UART Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $09_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | UTPS | URPS | UPS[1:0] | | USBLS | UBOS | UBLS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.52 RLN3nLBFC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 6 | UTPS | UART Output Polarity Switch<br>0: Transmission data normal output<br>1: Transmission data with inverted output |
| 5 | URPS | UART Input Polarity Switch<br>0: Reception data normal output<br>1: Reception data with inverted output |
| 4, 3 | UPS[1:0] | UART Parity Select<br>00: Parity disabled<br>01: Even parity<br>10: 0 Parity<br>11: Odd parity |
| 2 | USBLS | UART Stop Bit length Select<br>0: Stop bit:1 bit<br>1: Stop bit: 2 bits |
| 1 | UBOS | UART Transfer Format Order Select<br>0: LSB First<br>1: MSB First |
| 0 | UBLS | UART Character Length Select<br>0: UART 8 bits communication<br>1: UART 7 bits communication |

Configure the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### UTPS Bit (UART Output Polarity Switch)

Sets the output polarity for UART communication.
With 0 set, transmit data is output without inversion.
With 1 set, inverted transmit data is output.
The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of URPS bit.

#### URPS Bit (UART Input Polarity Switch)

This bit specifies the input polarity for UART communication.
With 0 set, received data is input without inversion.
With 1 set, received data is input with inversion.
The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of UTPS bit.
When setting this bit to “1” and expansion bit reception ((with expansion bit comparison) or (with data

comparison)) is performed, set the inverse of the expected value to the UEBDL bit in the RLN3nLUOR1 register and RLN3nLIDB register to enable comparison of the inverted values of the received values.

### UPS[1:0] Bits (UART Parity Select)

Sets the UART parity.

- When these bits are set to "$00_B$", data is communicated without the parity.

  [Transmission]

  A parity bit is not added to transmit data.

  [Reception]

  Data is received without parity processing. Therefore, a parity error does not occur.

- When these bits are set to "$01_B$", data is communicated with the even parity.

  [Transmission]

  If the number of 1s in transmit data is odd, "1" is added to the parity bit. If the number of 1s in transmit data is even, "0" is added to the parity bit.

  [Reception]

  If the number of 1s in receive data including the parity bit is odd, a parity error occurs.

- When these bits are set to "$10_B$", data is communicated with 0 parity.

  [Transmission]

  Regardless of the number of 1s in transmit data, "0" is added to the parity bit.

  [Reception]

  The value of the parity bit is not evaluated. Therefore, no parity error occurs.

- When these bits are set to "$11_B$", data is communicated with the odd parity.

  [Transmission]

  If the number of 1s in transmit data is odd, "0" is added to the parity bit. If the number of 1s in transmit data is even, "1" is added to the parity bit.

  [Reception]

  If the number of 1s in receive data including the parity bit is even, a parity error occurs.

### USBLS Bit (UART Stop Bit Length Select)

Sets the stop bit length of data for UART communication.
With 0 set, stop bit length of 1 bit is selected.
With 1 set, stop bit length of 2 bits is selected.

### UBOS Bit (UART Transfer Format Select)

Sets the bit order of data for UART communication.
With 0 set, LSB first is selected.
With 1 set, MSB first is selected.

#### UBLS Bit (UART Character Length Select)

Sets the character length of one frame for UART communication.
With 0 set, the character length is 8 bits.
With 1 set, the character length is 7 bits.
When the character length of one frame is 9 bits (the UEBE bit in the RLN3nLUOR1 register is 1), the setting of this bit is ignored.

### 19.3.4.5 RLN3nLSC — UART Space Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0A_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | IBS[1:0] | | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R |

**Table 19.53 RLN3nLSC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5, 4 | IBS[1:0] | Inter-Byte Space Select<br>b5 b4<br>0 0: 0 Tbit<br>0 1: 1 Tbit<br>1 0: 2 Tbits<br>1 1: 3 Tbits |
| 3 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the space between the UART frames when transmitting data from the UART buffer. 0 to 3 Tbits can be set.

Set IBS[1:0] bits to "$00_B$" when UART buffer is not used.

When data is transferred from the UART transmission data register (RLN3nLUTDR) and the UART wait transmission data register (RLN3nLUWTDR), the setting of these bits is ignored.Set these bits to "$00_B$".

### 19.3.4.6 RLN3nLEDE —UART Error Detection Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0D_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | FERE | OERE | — | BERE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R | R/W |

**Table 19.54 RLN3nLEDE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | FERE | Framing Error Detection Enable<br>0: Disables framing error detection.<br>1: Enables framing error detection. |
| 2 | OERE | Overrun Error Detection Enable<br>0: Disables overrun error detection.<br>1: Enables overrun error detection. |
| 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | BERE | Bit Error Detection Enable<br>0: Disables bit error detection.<br>1: Enables bit error detection. |

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is $0_B$ (LIN reset mode).

#### FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is reflected in the FER flag of the RLN3nLEST register.
For details on the framing error, see **Section 19.8.5, Error Statuses**.

#### OERE Bit (Overrun Error Detection Enable)

This bit enables or disables detection of the overrun error.
With 0 set, the overrun error is not detected.
With 1 set, the overrun error is detected.
When this bit is set to 1, the detection result is reflected in the OER flag of the RLN3nLEST register.
For details on the overrun error, see **Section 19.8.5, Error Statuses**.

#### BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is reflected in the BER flag of the RLN3nLEST register.
In full-duplex communication, do not set this bit to “1”.
Do not set this register when the NSPB bits in the RLN3nLWBR register are $0101_B$ (6 samplings) and the LRDNFS bit in the RLN3nLMD register is 0 (noise filtering is enabled).

For details on the bit error, see **Section 19.8.5, Error Statuses**.

### 19.3.4.7 RLN3nLCUC — UART Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $0E_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | OM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 19.55 RLN3nLCUC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | OM0 | LIN Reset<br>0: LIN reset mode<br>1: LIN reset mode is canceled. |

After a value is written to this register, confirm that the value written is reflected in the RLN3nLMST register before writing another value.

#### OM0 Bit (LIN Reset)

The OM0 bit selects whether to transition to or exit LIN reset mode.
With 0 set, LIN reset mode.
With 1 set, LIN reset mode is canceled.

### 19.3.4.8 RLN3nLTRC — UART Transmission Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $10_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | RTS | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R |

**Table 19.56 RLN3nLTRC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | RTS | UART Buffer Transmission Start<br>0: UART Buffer transmission is stopped.<br>1: UART Buffer transmission is started. |
| 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

#### RTS Bit (UART Buffer Transmission Start)

When transmitting data from the UART buffer, set this bit to “1”.
Only 1 can be written to this bit; 0 cannot be written.
Write to this bit when the UTOE bit in the RLN3nLUOER register is 1 (transmission enable) and the UTS bit in the RLN3nLST register is 0 (transmission is not in progress).
Once set, regardless of errors, this bit is automatically cleared to 0 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register. This bit is also automatically cleared to 0 upon transition to LIN reset mode.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is $0_B$ (LIN reset mode).
When writing 1 to this bit while the UTSW bit in the RLN3nLDFC register is 1 (when UART buffer transmission is requested, the start of transmission is delayed until the reception of stop bit is completed), write only during the reception of stop bit.

### 19.3.4.9 RLN3nLMST — UART Mode Status Register

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RLIN3n_base> + $11_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | OMM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

**Table 19.57 RLN3nLMST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | OMM0 | LIN Reset Status Monitor<br>0: LIN reset mode.<br>1: Not in LIN reset mode. |

#### OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

### 19.3.4.10 RLN3nLST — UART Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $12_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | URS | UTS | ERR | — | — | FTC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 19.58 RLN3nLST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | URS | Reception Status Flag<br>0: Reception is stopped.<br>1: Reception is started. |
| 4 | UTS | Transmission Status Flag<br>0: Transmission is stopped.<br>1: Transmission is started. |
| 3 | ERR | Error Detection Flag<br>0: No error has been detected.<br>1: Error has been detected. |
| 2, 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | FTC | Successful UART Buffer Transmission Flag<br>0: UART buffer transmission has not been completed.<br>1: UART buffer transmission has been completed. |

The RLN3nLST register is automatically cleared to "$00_H$" upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains "$00_H$". To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### URS Flag (Reception Status Flag)

At the start of the reception, this flag is set to 1.
The reception is started under the following condition.

- When the start bit is detected

At the end of reception, this flag is cleared to 0. While reception is stopped, this flag retains 0.
The reception is ended under the following conditions.

- Sampling point of the first bit of the stop bits

#### UTS Flag (Transmission Status Flag)

At the start of the transmission, this flag is set to 1. During the transmission, this flag retains 1.
The transmission is started under the following conditions.

- When transmission data is specified in the RLN3nLUTDR or RLN3nLUWTDR register
- When the RTS bit in the RLN3nLTRC register is set to 1

This flag is cleared to 0 at the completion of transmission.
The transmission is ended under the following conditions.

- When transmission of data specified in the RLN3nLUTDR or RLN3nLUWTDR register is completed and next data is not specified
- When transmission from UART buffer is completed (when the RTS bit in the RLN3nLTRC register is cleared to 0)

### ERR Flag (Error Detection Flag)

This flag is set to 1 upon detection of an error, detection of an expansion bit, or when ID's match (when at least one of the flags of the RLN3nLEST register is 1). Here, an interrupt request for RLIN3n status is generated. However, if an error or expansion bit is detected or ID's match while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register.

### FTC Flag (Successful UART Buffer Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that it was before 1 was written.
Regardless of errors, this bit is set to 1 upon completion of transmission of the number of data specified by the MDL bit in the RLN3nLDFC register from the UART buffer. Here, an interrupt request for RLIN3n transmission is generated. Write 0 to clear this flag.

### 19.3.4.11 RLN3nLEST — UART Error Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $13_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | UPER | IDMT | EXBT | FER | OER | — | BER |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R | R/W |

**Table 19.59 RLN3nLEST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 6 | UPER | Parity Error Flag<br>0: Parity error has not been detected.<br>1: Parity error has been detected. |
| 5 | IDMT | ID Match Flag<br>0: The received data does not match the ID value.<br>1: The received data matches the ID value. |
| 4 | EXBT | Expansion Bit Detection Flag<br>0: Expansion bit has not been detected.<br>1: Expansion bit has been detected. |
| 3 | FER | Framing Error Flag<br>0: Framing error has not been detected.<br>1: Framing error has been detected. |
| 2 | OER | Overrun Error Flag<br>0: Overrun error has not been detected.<br>1: Overrun error has been detected. |
| 1 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 0 | BER | Bit Error Flag<br>0: Bit error has not been detected.<br>1: Bit error has been detected. |

The RLN3nLEST register is automatically cleared to $00_H$ upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to, and the value of $00_H$ is retained. To clear certain bits in this register, write 0 to those bits, and write 1 to the bits not to be cleared by using the store instruction.

#### UPER Flag (Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.
This flag is set to 1 upon parity error detection. Write 0 to clear this flag.

#### IDMT Flag (ID Match Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

The IDMT flag is set to 1 when all the following conditions are met:

- The UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enabled)
- The UECD bit in the RLN3nLUOR1 register is 0 (expansion bit comparison enabled)
- The UEBDCE bit in the RLN3nLUOR1 register is 1 (expansion bit/data comparison enabled)

– The received expansion bit and the value of the UEBDL bit of the RLN3nLUOR1 register match.
– The 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register match.

Write 0 to clear this flag.

#### EXBT Flag (Expansion Bit Detection Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
When the UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enable), if the received expansion bit matches with the UEBDL bit in the RLN3nLUOR1 register, this flag is set to 1.
Write 0 to clear this flag.

#### FER Flag (Framing Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
The FER flag is set to 1 upon framing error detection while the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled). Write 0 to clear this flag.

#### OER Flag (Overrun Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
The OER flag is set to 1 upon overrun error detection while the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). Write 0 to clear this flag.

#### BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.
The BER flag is set to 1 when the transmitted data and the data monitored by the receive pin do not match while the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled).
Write 0 to clear this flag.

### 19.3.4.12 RLN3nLDFC — UART Data Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $14_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | UTSW | — | MDL[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R | R/W | R/W | R/W | R/W |

**Table 19.60 RLN3nLDFC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | UTSW | Transmission Start Wait<br>0: When UART buffer transmission is requested, transmission is started immediately.<br>1: When UART buffer transmission is requested, transmission is not started until reception of the stop bit is completed. |
| 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 to 0 | MDL[3:0] | UART Buffer Data Length Select<br>b3 b0<br>0 0 0 0: 9 data<br>0 0 0 1: 1 data<br>0 0 1 0: 2 data<br>0 0 1 1: 3 data<br>0 1 0 0: 4 data<br>0 1 0 1: 5 data<br>0 1 1 0: 6 data<br>0 1 1 1: 7 data<br>1 0 0 0: 8 data<br>1 0 0 1: 9 data<br>Settings other than the above are prohibited. |

#### UTSW Bit (Transmission Start Wait)

This bit controls the transmission start timing of UART buffer.
With 0 set, transmission is started as soon as the start of UART buffer transmission is requested.
With 1 set, transmission is started after the completion of the stop bit reception.
Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.
This bit is enabled when the RTS bit in the RLN3nLTRC register is set to 1. In addition, writing a value to this bit is disabled when the RTS bit is 1 (UART buffer transmission started).
Set this bit to 1 only to switch from reception to transmission in half-duplex communication.

#### MDL[3:0] Bits (UART Buffer Data Length Select)

These bits specify the data length of the UART buffer.
Writing a value to these bits is disabled when the RTS bit in the RLN3nLTRC register is 1 (UART buffer transmission started).

### 19.3.4.13 RLN3nLIDB — UART ID Buffer Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $15_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ID[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.61 RLN3nLIDB Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | ID[7:0] | Specifies the ID value that is referred in expansion bit data comparison |

#### ID Bit (ID Bit)

When the UEBE bit in the RLN3nLUOR1 register is set to 1 (expansion bit enabled), the UECD bit is set to 0 (expansion bit comparison enabled), and the UEBDCE bit is set to 1 (data comparison after expansion bit is detected), set the value to be compared with the received data. Write to the RLN3nLIDB register when the URS bit in the RLN3nLST register is 0 (reception is stopped).

### 19.3.4.14 RLN3nLUDB0 — UART Data Buffer 0 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $17_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UDB[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.62 RLN3nLUDB0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | UDB[7:0] | Sets the data to be transmitted.<br>Setting range: $00_H$ to $FF_H$ |

If the data length selection corresponds to 9 data bytes (RLN3nLDFC.MDL bit is "$0_H$" or "$9_H$") for multi-byte UART transmission, then the first data value for UART communication is present in this buffer.

Write to the RLN3nLUDB0 register when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

**Table 19.63, Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format**, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 19.8.1.2, UART Buffer Transmission**, **(1) UART Buffer Transmission**.

**Table 19.63 Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format**

| | RLN3nLUDB0 | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | — | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| 7-bit; MSB first | — | Bit 0 | Bit 1 | Bit 2 | Bit 3 | Bit 4 | Bit 5 | Bit 6 |
| 8-bit; LSB first | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| 8-bit; MSB first | Bit 0 | Bit 1 | Bit 2 | Bit 3 | Bit 4 | Bit 5 | Bit 6 | Bit 7 |

### 19.3.4.15 RLN3nLDBRb — UART Data Buffer b Register (b = 1 to 8)

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN3nLDBR1: <RLIN3n_base> + $18_H$
RLN3nLDBR2: <RLIN3n_base> + $19_H$
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LDB[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.64 RLN3nLDBRb Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | LDB[7:0] | Specifies the data to be transmitted.<br>Setting range: $00_H$ to $FF_H$ |

These registers specify the data transmitted from the UART buffer.

Write to these registers when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

**Table 19.65, Bit Arrangement of the RLN3nLDBRb Register According to Each Communication Format**, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 19.8.1.2, UART Buffer Transmission**, **(1) UART Buffer Transmission**.

**Table 19.65 Bit Arrangement of the RLN3nLDBRb Register According to Each Communication Format**

| | RLN3nLDBRb | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | — | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| 7-bit; MSB first | — | Bit 0 | Bit 1 | Bit 2 | Bit 3 | Bit 4 | Bit 5 | Bit 6 |
| 8-bit; LSB first | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| 8-bit; MSB first | Bit 0 | Bit 1 | Bit 2 | Bit 3 | Bit 4 | Bit 5 | Bit 6 | Bit 7 |

### 19.3.4.16 RLN3nLUOER — UART Operation Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $20_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | UROE | UTOE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 19.66 RLN3nLUOER Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 1 | UROE | Reception Enable<br>0: Disables reception.<br>1: Enables reception. |
| 0 | UTOE | Transmission Enable<br>0: Disables transmission.<br>1: Enables transmission. |

The RLN3nLUOER register is automatically cleared to $00_H$ upon transition to LIN reset mode.
In LIN reset mode, this register cannot be written to.
In LIN reset mode, the register retains $00_H$.

#### UROE Bit (Reception Enable)

The UROE bit enables or disables reception.
With 0 set, reception is disabled.
With 1 set, reception is enabled.
Do not clear this bit during reception. If the communication is suspended during reception, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to transition to the LIN reset mode. Note that transmission is also aborted.

Do not set this bit to 1 when data transmission from the UART buffer is in progress.

#### UTOE Bit (Transmission Enable)

The UTOE bit enables or disables transmission.
With 0 set, transmission is disabled.
With 1 set, transmission is enabled.
Do not clear this bit during transmission. If the communication is suspended during transmission, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to transition to the LIN reset mode. Note that reception is also aborted.

### 19.3.4.17 RLN3nLUOR1 — UART Option Register 1

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n_base> + $21_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | UECD | UTIGTS | UEBDCE | UEBDL | UEBE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

**Table 19.67 RLN3nLUOR1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 | UECD | Expansion Bit Comparison Disable<br>0: Enables expansion bit comparison.<br>1: Disables expansion bit comparison. |
| 3 | UTIGTS | Transmission Interrupt Generation Timing Select<br>0: Transmission interrupt is generated at the start of transmission.<br>1: Transmission interrupt is generated at the completion of transmission. |
| 2 | UEBDCE | Expansion Bit Data Comparison Enable<br>0: Disables data comparison after an expansion bit is detected.<br>1: Enables data comparison after an expansion bit is detected. |
| 1 | UEBDL | Expansion Bit Detection Level Select<br>0: Selects expansion bit value 0 as the expansion bit detection level.<br>1: Selects expansion bit value 1 as the expansion bit detection level. |
| 0 | UEBE | Expansion Bit Enable<br>0: Disables expansion bit operation.<br>1: Enables expansion bit operation. |

#### UECD Bit (Expansion Bit Comparison Disable)

The UECD bit enables or disables comparison between the received expansion bit and the UEBDL bit value when the UEBE bit is 1 (expansion bit operation is enabled).
With 0 set, comparison between the received expansion bit and the UEBDL bit value is enabled when the expansion bit is received.
With 1 set, comparison between the received expansion bit and the UEBDL bit value is disabled when the expansion bit is received.
Set this bit when the OMM0 bit of the RLN3nLMST register is $0_B$ (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.
Do not set this bit to 1 when the UEBDCE bit is 1 (expansion bit/data comparison enable).

#### UTIGTS Bit (Transmission Interrupt Generation Timing Select)

The UTIGTS bit selects the generation timing of the transmission interrupt.
With 0 set, the transmission interrupt is generated at the start of transmission.
With 1 set, the transmission interrupt is generated at the completion of transmission.
When transmission from the UART buffer is performed with 0 set, the transmission interrupt is generated only at the start of the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register).
When transmission from the UART buffer is performed with 1 set, the transmission interrupt is

generated only at the completion of the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register).

### UEBDCE Bit (Expansion Bit Data Comparison Enable)

After an expansion bit is detected, this bit enables or disables the comparison between the 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register.
With 0 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is disabled.
With 1 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is $0_B$ (LIN reset mode).
Do not set this bit to 1 when the UEBE bit is 0 (expansion bit operation disabled).
Do not set this bit to 1 when the UECD bit is 1 (expansion bit comparison disabled).
Do not set this bit to 1 when the UART buffer is used.

### UEBDL Bit (Expansion Bit Detection Level Select)

The UEBDL bit selects the level to be detected as the expansion bit when the UEBE bit is 1 (expansion bit operation is enabled) and the UECD bit is 0 (expansion bit comparison enabled).
With 0 set, expansion bit value 0 is the level to be detected as the expansion bit.
With 1 set, expansion bit value 1 is the level to be detected as the expansion bit.
Set this bit when the OMM0 bit of the RLN3nLMST register is $0_B$ (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

### UEBE Bit (Expansion Bit Enable Bit)

The UEBE bit enables or disables expansion bit operation.
With 0 set, expansion bit operation is disabled.
With 1 set, expansion bit operation is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is $0_B$ (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

### 19.3.4.18 RLN3nLUTDR — UART Transmission Data Register

**Access:** RLN3nLUTDR register can be read or written in 16-bit units.
RLN3nLUTDRL register can be read or written in 8-bit units.
RLN3nLUTDRH register can be read or written in 8-bit units.

**Address:** RLN3nLUTDR: <RLIN3n_base> + $24_H$
RLN3nLUTDRL: <RLIN3n_base> + $24_H$
RLN3nLUTDRH: <RLIN3n_base> + $25_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | UTD[8:0] | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.68 RLN3nLUTDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 9 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 8 to 0 | UTD[8:0] | Specifies the data to be transmitted.<br>Setting range: $000_H$ to $1FF_H$ |

The RLN3nLUTDR register specifies the data to be transmitted from the transmission data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

This register can be accessed in 8 bits.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

Also, do not write data to this register when a transmission request is being generated due to write access to the RLN3nLUWTDR register.

When transmitting data continuously, do not set another piece of transmission data in this register before the generation of transmission interrupt.

The table below shows the bit arrangement according to the set communication format.

**Table 19.69 Bit Arrangement of the RLN3nLUTDR Register According to Each Communication Format**

| | RLN3nLUTDR | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | — | — | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 7-bit; MSB first | — | — | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 |
| 8-bit; LSB first | — | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 8-bit; MSB first | — | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 |
| 9-bit; LSB first | Bit8 | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 9-bit; MSB first | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 | Bit8 |

### 19.3.4.19 RLN3nLURDR — UART Reception Data Register

**Access:** RLN3nLURDR register is a read-only register that can be read in 16-bit units.
RLN3nLURDRL register is a read-only register that can be read in 8-bit units.
RLN3nLURDRH register is a read-only register that can be read in 8-bit units.

**Address:** RLN3nLURDR: <RLIN3n_base> + $26_H$
RLN3nLURDRL: <RLIN3n_base> + $26_H$
RLN3nLURDRH: <RLIN3n_base> + $27_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | URD [8:0] | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 19.70 RLN3nLURDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 9 | Reserved | When read, the value after reset is returned. |
| 8 to 0 | URD [8:0] | Store the received data |

The RLN3nLURDR allows the reception data to be read from the receive data register.

When the UROE bit in the RLN3nLUOER register is 1, the received data is stored in this register and can be read out.

This register is updated upon reception of stop bit in the received data.

This register is also updated even when an error is caused by the parity or stop bit.

However, the value of this register is not updated if an overrun error occurs when the OERE bit of the RLN3nLEDE register is 1 (overrun detection enabled). The value of this register is updated even if an overrun error occurs when the OERE bit is 0 (overrun detection disabled).

Read this register upon occurrence of a reception error (overrun error, framing error, parity error) when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). If the next data is received without reading this register, an overrun error occurs.

This register can be accessed in 8-bit units.

However, when expansion bit is used (UEBE bit of the RLN3nLUOR1 register is 1 (expansion bit operation enabled), do not attempt 8-bit access.

The table below shows the bit arrangement according to the set communication format.

**Table 19.71 Bit Arrangement of the RLN3nLURDR Register According to Each Communication Format**

| | RLN3nLURDR | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | — | — | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 7-bit; MSB first | — | — | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 |
| 8-bit; LSB first | — | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 8-bit; MSB first | — | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 |
| 9-bit; LSB first | Bit8 | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 9-bit; MSB first | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 | Bit8 |

### 19.3.4.20 RLN3nLUWTDR — UART Wait Transmission Data Register

**Access:** RLN3nLUWTDR register can be read or written in 16-bit units.
RLN3nLUWTDRL register can be read or written in 8-bit units.
RLN3nLUWTDRH register can be read or written in 8-bit units.

**Address:** RLN3nLUWTDR: <RLIN3n_base> + $28_H$
RLN3nLUWTDRL: <RLIN3n_base> + $28_H$
RLN3nLUWTDRH: <RLIN3n_base> + $29_H$

**Value after reset:** $0000_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | UWTD[8:0] | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 19.72 RLN3nLUWTDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 9 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 8 to 0 | UWTD[8:0] | Sets the data to be transmitted from the wait transmit data register after waiting for the stop bit reception to be completed.<br>Setting range: $000_H$ to $1FF_H$ |

The RLN3nLUWTDR register sets the data to be transmitted from the UART wait transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

Use this register only to switch from reception to transmission in half-duplex communication.

Also, write to this register only while the stop bit is being received.

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

When this register is read, the value of the RLN3nLUTDR register is actually read.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

The table below shows the bit arrangement according to the set communication format.

**Table 19.73 Bit Arrangement of the RLN3nLUWTDR Register According to Each Communication Format**

| | RLN3nLUWTDR | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | — | — | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 7-bit; MSB first | — | — | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 |
| 8-bit; LSB first | — | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 8-bit; MSB first | — | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 |
| 9-bit; LSB first | Bit8 | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 9-bit; MSB first | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 | Bit8 |

## 19.4 Interrupt Sources

The LIN/UART interface generates four types of interrupt requests.

- RLIN3n transmission interrupt
- RLIN3n successful reception interrupt
- RLIN3n status interrupt
- RLIN3n interrupt

Setting the LIOS bit in the RLN3nLMD register to 0 allows to perform logical OR operation on all of the interrupt sources, outputting the interrupt request from the RLIN3n interrupt.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, or RLIN3n status interrupt depending on the interrupt request.

**Table 19.74** lists the sources for each interrupt.

**Table 19.74 Interrupt Sources**

| | | LIOS bit in RLN3nLMD register is 0 | LIOS bit in RLN3nLMD register is 1*1 | | |
|---|---|---|---|---|---|
| | | RLIN3n Interrupt | RLIN3n Transmission Interrupt | RLIN3n Successful Reception Interrupt | RLIN3n Status Interrupt |
| LIN mode | LIN master mode | • Successful frame transmission<br>• Successful frame reception<br>• Successful wake-up transmission<br>• Successful wake-up reception<br>• Successful header transmission<br>• Bit error<br>• Physical bus error<br>• Frame/response timeout error<br>• Framing error<br>• Checksum error<br>• Response preparation error | • Successful frame transmission<br>• Successful wake-up transmission<br>• Successful header transmission | • Successful wake-up reception<br>• Successful wake-up reception | • Bit error<br>• Physical bus error<br>• Frame/response timeout error<br>• Framing error<br>• Checksum error<br>• Response preparation error |
| | LIN slave mode | • Successful response transmission<br>• Successful response reception<br>• Successful wake-up transmission<br>• Successful wake-up reception<br>• Successful header reception<br>• Bit error<br>• Frame/response timeout error<br>• Framing error<br>• Sync field error<br>• Checksum error<br>• ID parity error<br>• Response preparation error | • Successful response transmission<br>• Successful wake-up transmission | • Successful response reception<br>• Successful wake-up reception<br>• Successful header reception | • Bit error<br>• Frame/response timeout error<br>• Framing error<br>• Sync field error<br>• Checksum error<br>• ID parity error<br>• Response preparation error |
| UART mode | | — | • Transmission start/ successful transmission | • Successful reception<br>• Expansion bit mismatch | • Bit error<br>• Overrun error<br>• Framing error<br>• Expansion bit match<br>• ID match<br>• Parity error |

Note 1. The LIOS bit setting is valid in LIN Mode. In UART mode, setting the LIOS bit is not required.

In LIN mode, each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is set to 1.

## 19.5 Modes

The LIN/UART interface provides the following four modes, depending on the specific function to be performed:

- LIN reset mode
- LIN mode
  - LIN master mode
  - LIN slave mode [auto baud rate]
  - LIN slave mode [fixed baud rate]
- UART mode
- LIN self-test mode

**Figure 19.2** shows mode transitions. **Table 19.79** describes mode transition conditions. **Table 19.79** lists operations available in each mode.

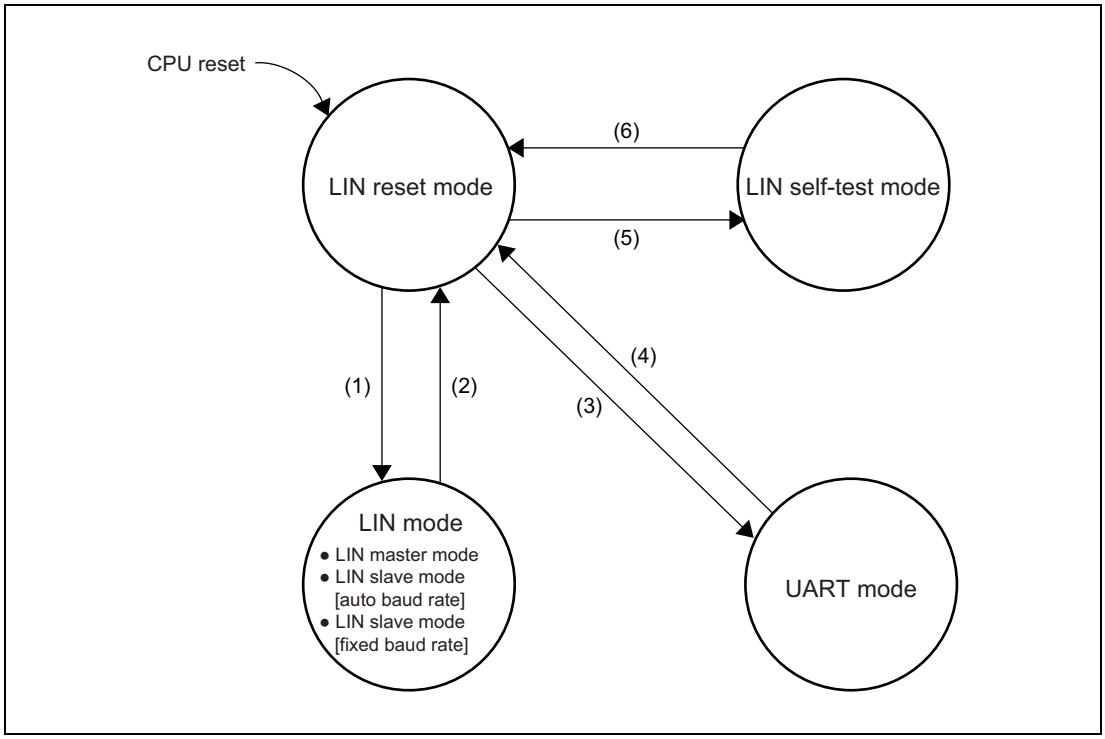


**Figure 19.2 Mode Transitions**

**Table 19.75 Transition Condition of Each Mode**

| | Mode Transition | | | Transition Condition |
|---|---|---|---|---|
| (1) | LIN reset mode | → | LIN mode | |
| | | | • LIN master mode | • LMD bits in RLN3nLMD register = $00_B$ and OM1 and OM0 bits in RLN3nLCUC register = $01_B$ or $11_B$ |
| | | | • LIN slave mode [auto baud rate] | • LMD bits in RLN3nLMD register = $11_B$ and OM1 and OM0 bits in RLN3nLCUC register = $01_B$ or $11_B$ |
| | | | • LIN slave mode [fixed baud rate] | • LMD bits in RLN3nLMD register = $10_B$ and OM1 and OM0 bits of RLN3nLCUC register = $01_B$ or $11_B$ |
| (2) | LIN mode | → | LIN reset mode | OM0 bit in RLN3nLCUC register = $0_B$ |
| (3) | LIN reset mode | → | UART mode | LMD bits in RLN3nLMD register = $01_B$ and OM0 bit in RLN3nLCUC register = $1_B$ |
| (4) | UART mode | → | LIN reset mode | OM0 bit in RLN3nLCUC register = $0_B$ |
| (5) | LIN reset mode | → | LIN self-test mode | See **Section 19.9, LIN Self-Test Mode**. |
| (6) | LIN self-test mode | → | LIN reset mode | See **Section 19.9, LIN Self-Test Mode**. |

**Table 19.76 Operations Available in Each Mode**

| LIN Mode | | | |
|---|---|---|---|
| **LIN Master Mode** | **LIN Slave Mode [auto baud rate]<br>LIN Slave Mode [fixed baud rate]** | **UART Mode** | **LIN Self-Test Mode** |
| Header transmission<br>Response transmission<br>Response reception<br>Wake-up transmission<br>Wake-up reception<br>Error detection | Header reception<br>Response transmission<br>Response reception<br>Wake-up transmission<br>Wake-up reception<br>Error detection | UART transmission<br>UART reception<br>Error detection | Self-test |

Whether mode has transitioned to LIN reset mode, the LIN mode, or the UART mode can be verified by reading the LMD bits in the RLN3nLMD register and the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

## 19.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The transition to LIN reset mode can be verified by checking that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication and the UART communication functions are halted.

From LIN reset mode, transitions to LIN mode, UART mode, and LIN self-test mode can be made.

When the mode transitions to LIN reset mode, the following registers are initialized to their reset values and they retain their initial values while in LIN reset mode:

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRb register (b = 1 to 8)
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

## 19.7 LIN Mode

LIN mode can operate in the following submodes: LIN master mode, LIN slave mode [auto baud rate], and LIN slave mode [fixed baud rate].

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to $00_B$ (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either $01_B$ or $11_B$ causes the transition to LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either $01_B$ to $11_B$.

In LIN slave mode [auto baud rate] and LIN slave mode [fixed baud rate], header reception, response transmission, response reception, wake-up transmission, wake-up reception, and error detection can be performed.

The LIN slave mode [auto baud rate] allows automatic detection of the break field and the sync field, and sets a baud rate based on the results of measurement of a sync field. The baud rate can be set to 1 kbps to 20 kbps.

Set the LPRS[2:0] bits in the RLN3nLWBR register so that the prescaler clock (the clock obtained by dividing the frequency of the LIN communication clock source by the prescaler) is configured as follows according to the target baud rate.

| [Target baud rate] | [Prescaler clock] |
|---|---|
| 1 kbps to 20 kbps | : 4MHz*1 |
| 1 kbps to 2.4 kbps (excluding 2.4 kbps) | : 4MHz |
| 2.4 kbps to 20 kbps | : 8 MHz to 12 MHz |

**Note 1.** Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to "$0011_B$" (4 samplings).

LIN slave mode [fixed baud rate] allows automatic detection of the break field, the sync field, and the ID field at a baud rate that is preset by the baud rate generator.

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to $10_B$ (LIN slave mode [auto baud rate]) and setting the OM1 and OM0 bits in the RLN3nLCUC register to $01_B$ or $11_B$ causes the transition to LIN slave mode [auto baud rate]; and setting the LMD bits in the RLN3nLMD register to $11_B$ (LIN slave mode [fixed baud rate]), and setting the OM1 and OM0 bits in the RLN3nLCUC register to $01_B$ or $11_B$ causes the transition to LIN slave mode [fixed baud rate], turning the OMM1 and OMM0 bits in the RLN3nLMST register to $01_B$ or $11_B$.

When transitioning form one submode to another submode within LIN mode, transition to LIN reset mode first and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operating modes:

- LIN operation mode
- LIN wake-up mode

**Figure 19.3** shows the transition of operating modes. **Table 19.77** describes the transition conditions of operating modes.

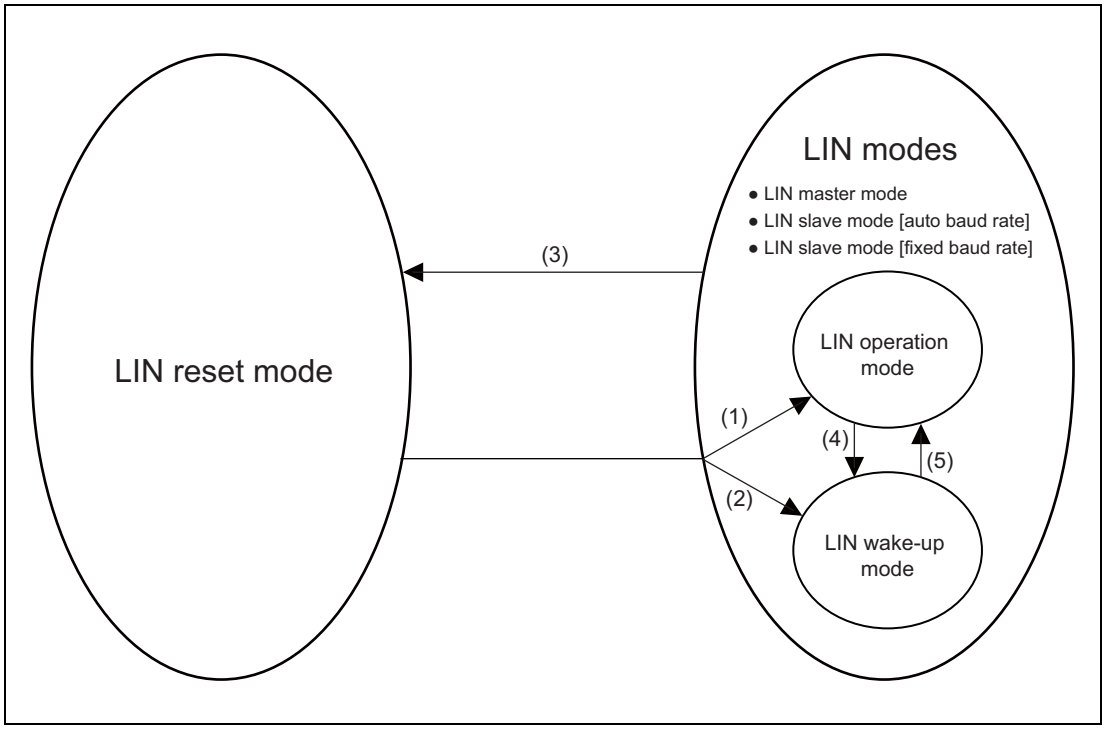

**Figure 19.3 Transition of Operating Modes**

**Table 19.77 Transition Conditions for Operating Modes**

| | Operation Mode Transition | | | Transition Condition |
|---|---|---|---|---|
| (1) | LIN reset mode | → | LIN mode<br>• LIN operation mode | LMD bits in RLN3nLMD register = $00_B$ or $10_B$ or $11_B$<br>and<br>OM1 and OM0 bits in RLN3nLCUC register = $11_B$ |
| (2) | LIN reset mode | → | LIN mode<br>• LIN wake-up mode | LMD bits in RLN3nLMD register = $00_B$ or $10_B$ or $11_B$<br>and<br>OM1 and OM0 bits in RLN3nLCUC register = $01_B$ |
| (3) | LIN mode<br>• LIN operation mode<br>• LIN wake-up mode | → | LIN reset mode | OM0 bit in RLN3nLCUC register = $0_B$ |
| (4) *1 | LIN mode<br>• LIN operation mode | → | LIN mode<br>• LIN wake-up mode | OM1 and OM0 bits in RLN3nLCUC register = $01_B$ |
| (5) *1 | LIN mode<br>• LIN wake-up mode | → | LIN mode<br>• LIN operation mode | OM1 and OM0 bits in RLN3nLCUC register = $11_B$ |

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is in progress (when the FTS bit in the RLN3nLTRC register is 1).

### (1) LIN Operation Mode

While in LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to $11_B$ switches the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to $11_B$. Communication settings should be configured after the OMM1 and OMM0 bits have become $11_B$.

### (2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to $01_B$ switches the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to $01_B$. Communication settings should be configured after the OMM1 and OMM0 bits have become $01_B$.

## 19.7.1 LIN Master Mode

### 19.7.1.1 Header Transmission

**Figure 19.4** shows the operation of the LIN/UART interface (LIN master mode) in header transmission. **Table 19.78** provides processing in header transmission.

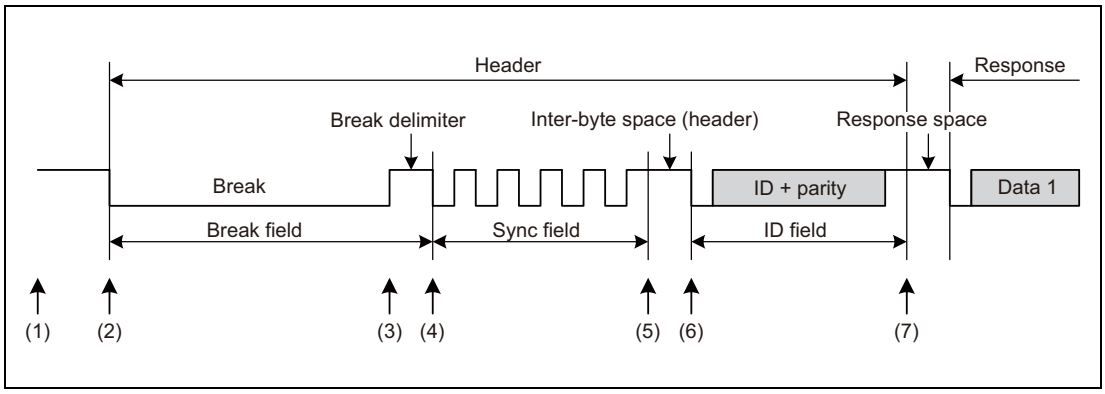

**Figure 19.4 Operation in Header Transmission**

**Table 19.78 Processing in Header Transmission**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (1) | • Sets a baud rate<br>• Sets noise filter ON/OFF<br>• Enables interrupt<br>• Enables error detection<br>• Sets frame configuration parameters<br>• Transitions to LIN master mode: LIN operation mode<br>• Configures frame information to be transmitted (ID, parity, data length, response direction, Checksum method, and transmission data) | Waits for the FTS bit in the RLN3nLTRC register to be set by software (idle) |
| (2) | Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started) | Transmits a break. |
| (3) | Waits for an interrupt request | Transmits a break delimiter. |
| (4) | | Transmits a sync field ($55_H$). |
| (5) | | Transmits an inter-byte space (header). |
| (6) | | Transmits an ID field. |
| (7) | | Sets the successful header transmission flag. |

**NOTE**

For information about error detection conditions, see **Section 19.7.7, Error Statuses**.

### 19.7.1.2 Response Transmission

**Figure 19.5** shows the operation of the LIN/UART interface (LIN master mode) in response transmission. **Table 19.79** provides processing in response transmission.

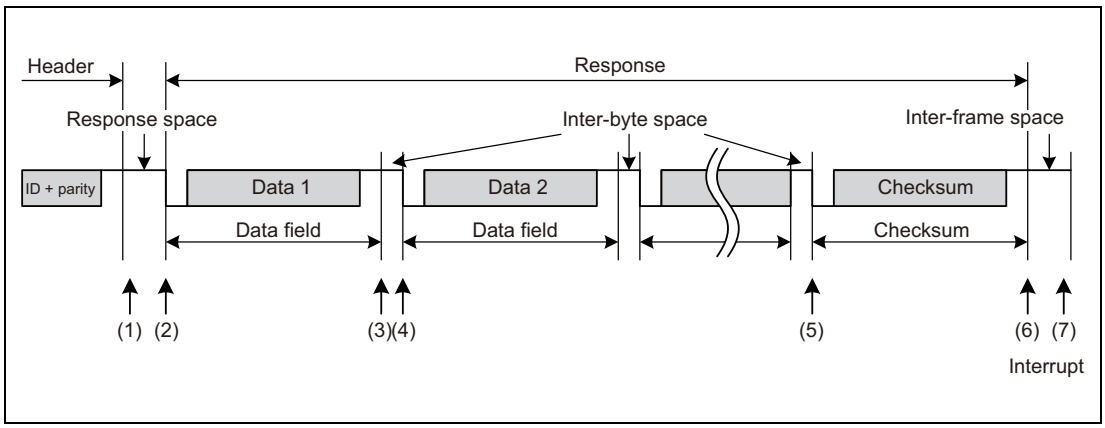

**Figure 19.5 Operation in Response Transmission**

**Table 19.79 Processing in Response Transmission**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (1) | [When in frame separate mode]<br>• Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started)<br>[When not in frame separate mode]<br>• Waits for an interrupt request | [When in frame separate mode]<br>• Waits for the RTS bit in the RLN3nLTRC register to be set to 1 by software.<br>• When the bit is set to 1, transmits a response space.<br>[When not in frame separate mode]<br>• Transmits a response space. |
| (2) | Waits for an interrupt request | Transmits data 1. |
| (3) | | Transmits an inter-byte space. |
| (4) | | • Transmits data 2.<br>• Transmits an inter-byte space<br>• Transmits data 3.<br>• Transmits an inter-byte space<br>(Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register).<br>:<br>: |
| (5) | | Transmits the checksum. |
| (6) | | • Sets the successful frame/wake-up transmission flag.<br>• Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped)<br>[When in frame separate mode]<br>• Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception is stopped). |
| (7) | • Processing after communication Checks the RLN3nLST register, and clears flags. | Idle |

**NOTE**

For information about error detection conditions, see **Section 19.7.7, Error Statuses**.

### 19.7.1.3 Response Reception

**Figure 19.6** shows the operation of the LIN/UART interface (LIN master mode) in response reception. **Table 19.80** provides processing in response reception.

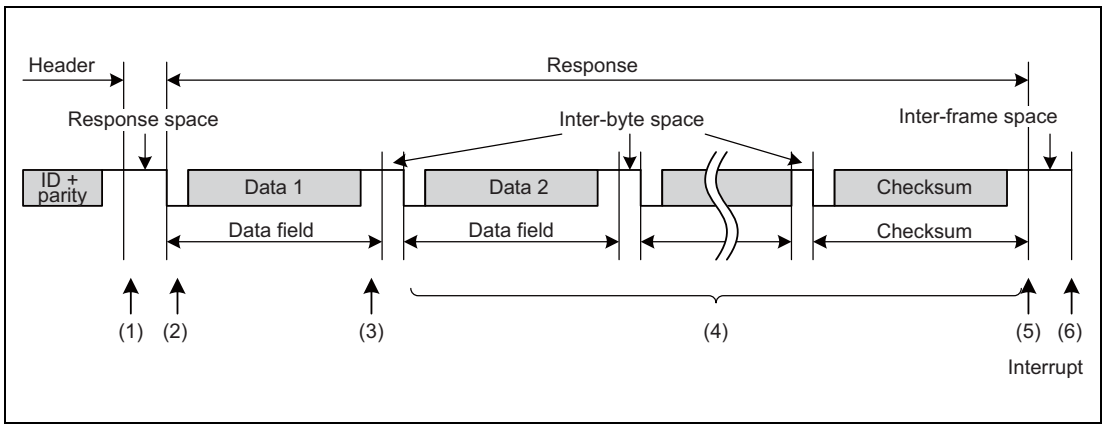

**Figure 19.6 Operation in Response Reception**

**Table 19.80 Processing in Response Reception**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (1) | Waits for an interrupt request (no processing) | Waits for detection of a start bit. |
| (2) | | Receives data 1 when the start bit is detected. |
| (3) | | Sets the successful data 1 reception flag. |
| (4) | | • Receives data 2 when the start bit is detected.<br>• Receives data 3 when the start bit is detected.<br>Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register).<br>:<br>:<br>• Receives the checksum when the start bit is detected. |
| (5) | | • Determines the checksum.<br>• Sets the successful frame/wake-up reception flag.<br>• Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped). |
| (6) | • Processing after communication<br>Reads the received data.<br>Checks the RLN3nLST register, and clears flags. | Idle |

**NOTE**

For information about error detection, see **Section 19.7.7, Error Statuses**.

## 19.7.2 LIN Slave Mode

### 19.7.2.1 Header Reception

**Figure 19.7** shows the operation of the LIN/UART interface (LIN slave mode) in header reception.
**Table 19.81** provides processing in header reception.

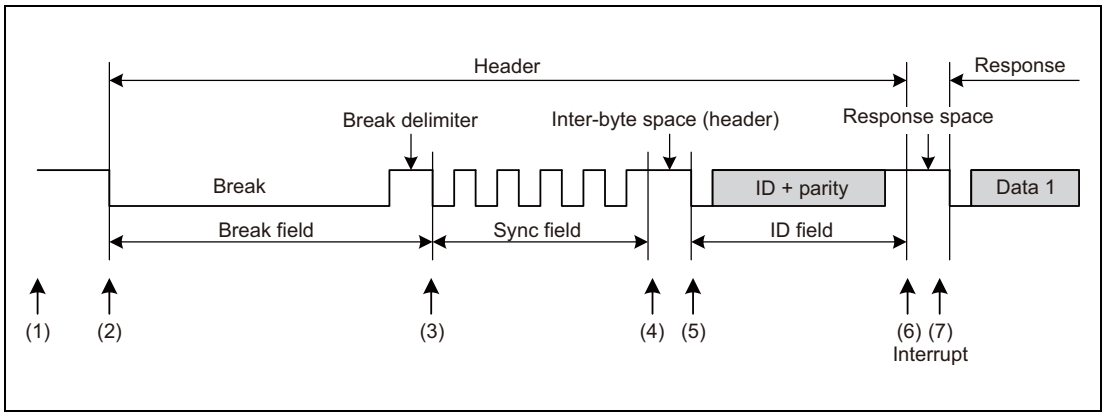

**Figure 19.7 Operation in Header Reception**

**Table 19.81 Processing in Header Reception**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (1) | • Sets a baud rate<br>• Sets noise filter ON/OFF<br>• Enables interrupt<br>• Enables error detection<br>• Sets frame configuration parameters<br>• Transitions to the LIN slave mode: LIN operation mode<br>• Sets the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/ reception started) | Waits for the FTS bit in the RLN3nLTRC register to be set by software. |
| (2) | Waits for an interrupt request. | Waits for detection of break field |
| (3) | | Detects a break field (LIN slave mode [fixed baud rate]). For details about the break field detection timing in the case of LIN slave mode [auto baud rate], see [Auto Baud Rate Correction Function].) |
| (4) | | • Detects a sync field ($55_H$)<br>• Sets the baud rate generator (in the case of LIN slave mode [auto baud rate])<br>• Clears the no-response request bit (LNRR bit). |
| (5) | | • Receives an ID field.<br>• Checks the ID parity bit |
| (6) | | Sets the header reception complete flag. |
| (7) | • Checks the RLN3nLST register, and clears flags.<br>• Checks the RLN3nLIDB register, and prepares a response. | • Completes a header reception process.<br>• Waits for a response request. |

**NOTE**

The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred. For information about error detection conditions, see **Section 19.7.7, Error Statuses**.

### [Auto Baud Rate Correction Function]

In LIN slave mode [auto baud rate], the system always measures the low-level widths that are received. If the first "Low level" width is 10 times (if the BLT bit of the RLN3nLBFC register is "0") or 11 times (if the BLT bit of the RLN3nLBFC register is "1") or greater than the bit width calculated from the average of the starting 2 bits (the period of the consecutive falling edges from the beginning of the sync field) of the sync field, the system concludes that the detection of break field was successful and verifies that the data in the sync field is $55_H$. If the data in the sync field is indeed $55_H$ and the system determines that sync field reception was successful, the system automatically sets the baud rate correction result to the RLN3nLBRP01 register.

If data is received up to the ID field without error, a successful header reception interrupt is generated at the stop bit position.

On the other hand, if the data in the sync field is not $55_H$ and the system determines that sync field reception failed, the system sets the sync field error flag and an error interrupt is generated. In that case, baud rate correction is not performed and the LIN/UART interface waits for the detection of the next break field (low level).

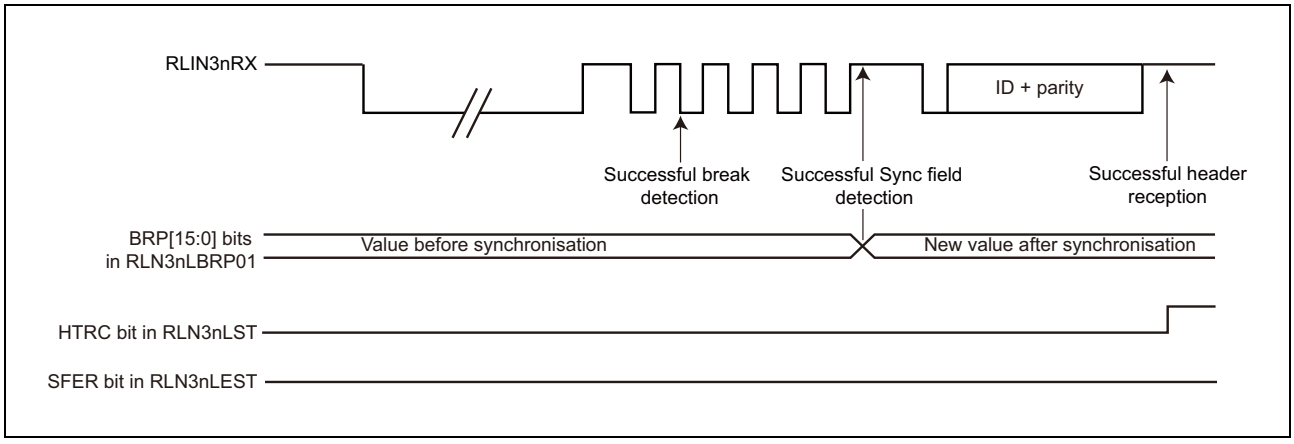

**Figure 19.8 Header Reception in LIN Slave Mode [Auto Baud Rate] (in Normal Operation)**

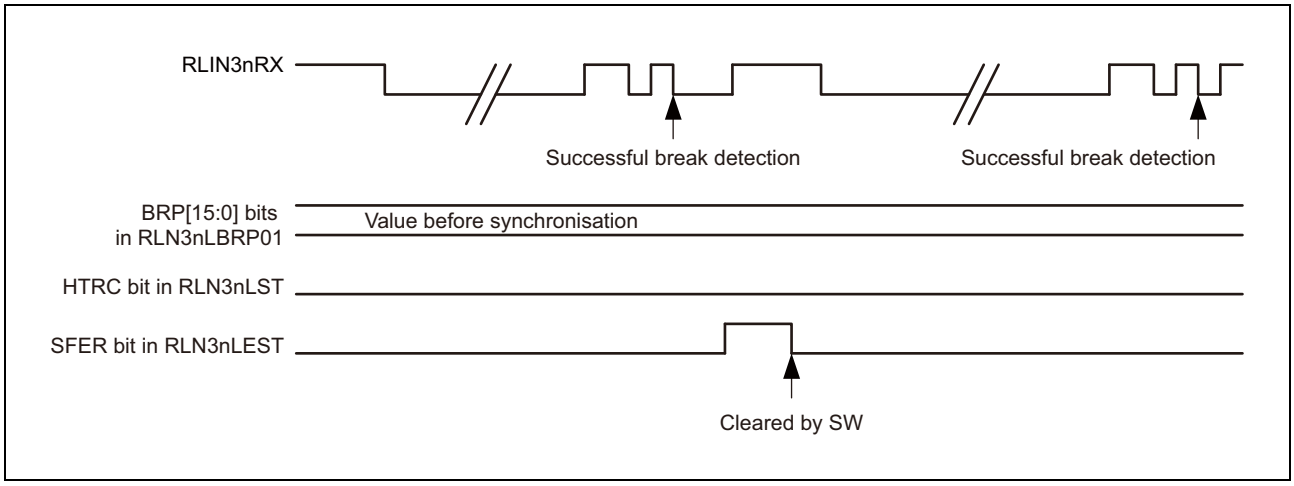

**Figure 19.9 Header Reception in LIN Slave Mode [Auto Baud Rate] (Sync Field Error)**

### 19.7.2.2 Response Transmission

**Figure 19.10** shows the operation of the LIN/UART interface (LIN slave mode) in response transmission. **Table 19.82** provides processing in response transmission.

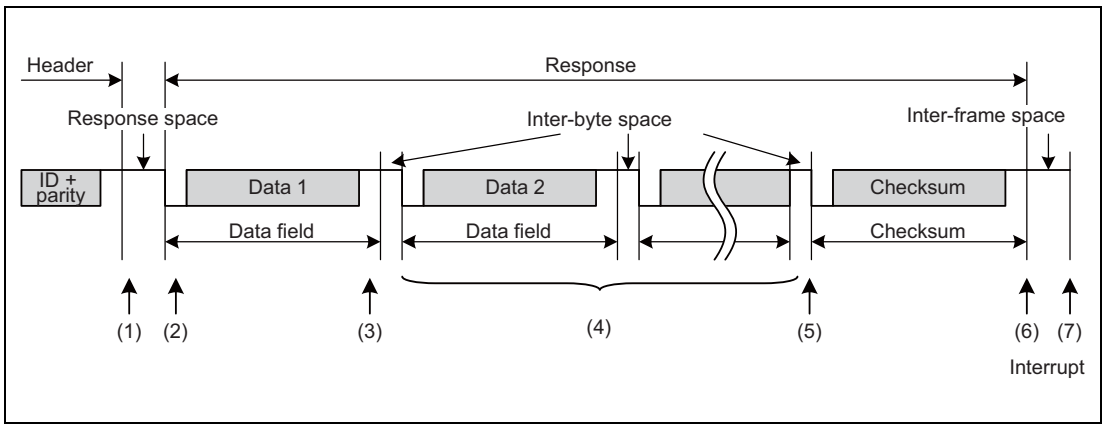

**Figure 19.10 Operation in Response Transmission**

**Table 19.82 Processing in Response Transmission**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (1) | • Configures the RLN3nLDFC register.<br>• Configures the RLN3nLDBRb registers.(b = 1 to 8)<br>• Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started) | • Waits for the RTS or LNRR bit in the RLN3nLTRC register to be set by software<br>• Transmits the response space after the RTS bit of the RLN3nLTRC register is set to 1 |
| (2) | Waits for an interrupt request. | Transmits data 1. |
| (3) | | Transmits an inter-byte space. |
| (4) | | • Transmits data 2.<br>• Transmits an inter-byte space<br>• Transmits data 3.<br>• Transmits an inter-byte space<br>(Repeats as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register).<br>:<br>: |
| (5) | | Transmits the checksum. |
| (6) | | • Sets the successful response/wake-up transmission flag.<br>• Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped). |
| (7) | • Processing after communication Checks the RLN3nLST register, and clears flags. | • Completes the response transmission process.<br>• Waits for a new break. |

**NOTE**

- For information about error detection, see **Section 19.7.7, Error Statuses**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred.

### 19.7.2.3 Response Reception

**Figure 19.11** shows the operation of the LIN/UART interface (LIN slave mode) in response reception. **Table 19.83** provides processing in response reception.

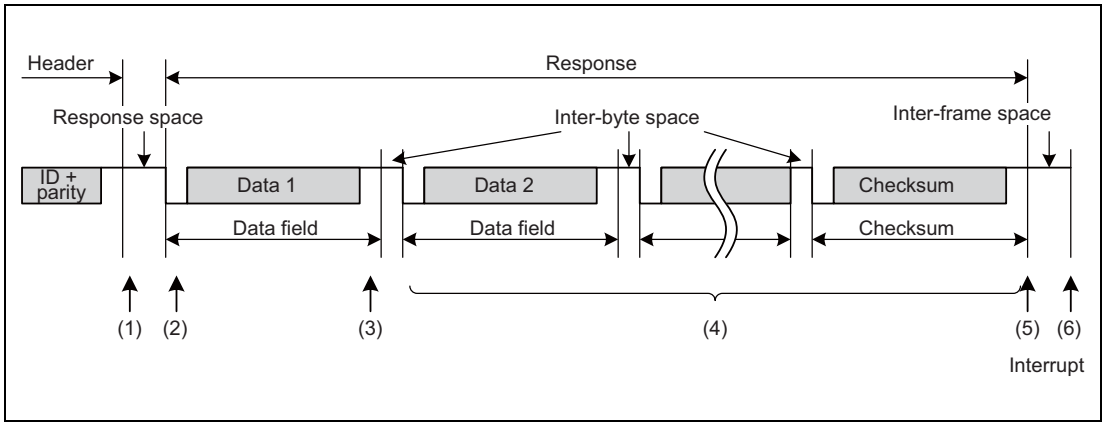

**Figure 19.11 Operation in Response Reception**

**Table 19.83 Processing in Response Reception**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (1) | • Sets the RLN3nLDFC register.<br>• Sets the response transmission/reception start bit (RTS bit) to 1. | • Waits for the RTS (response transmission/reception start) or LNRR (no-response request) bit to be set by software.<br>• Waits for detection of the start bit. |
| (2) | Waits for an interrupt request. | Receives data 1 when the start bit is detected. |
| (3) | | Sets the successful data 1 reception flag. |
| (4) | | • Receives data 2 when the start bit is detected.<br>• Receives data 3 when the start bit is detected.<br>Repeats as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register).<br>⋮<br>⋮<br>• Receives the checksum when the start bit is detected. |
| (5) | | • Determines the checksum.<br>• Sets the successful response/wake-up reception flag or error flag.<br>• Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped). |
| (6) | • Processing after communication<br>Reads the received data.<br>Checks the RLN3nLST register, and clears flags. | • Completes the response process.<br>• Waits for a new break. |

**NOTE**

- For information about error detection conditions, see **Section 19.7.7, Error Statuses**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred.

### 19.7.2.4 No-response Request

**Figure 19.12** shows the operation of the LIN/UART interface (LIN slave mode) when no response is requested. **Table 19.84** shows the processing that occurs when no response is requested.

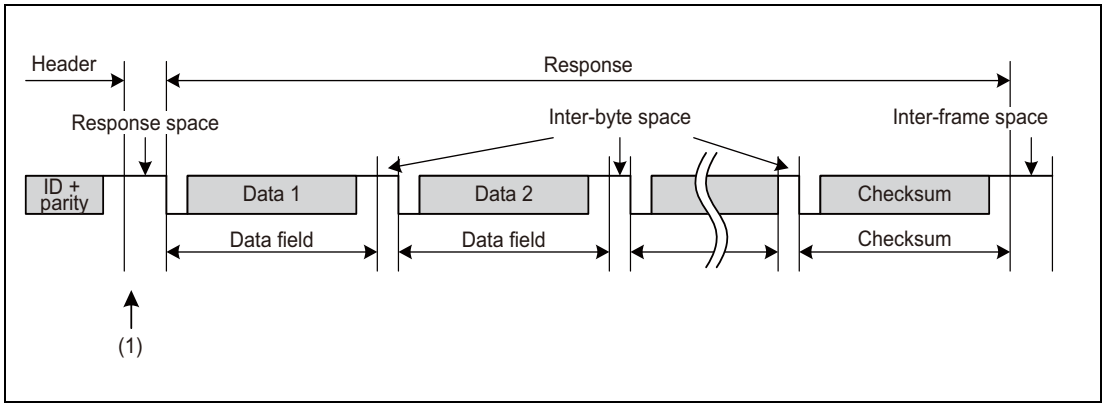

**Figure 19.12 Operation when No Response is Requested**

**Table 19.84 Processing when No Response is Requested**

| Software Processing | LIN/UART Interface Processing |
|---|---|
| (1) | • Waits for the LNRR (no-response request) bit to be set by software |
| • Sets the no-response request bit (LNRR bit) to 1. | • Completes the frame reception process |
| | • Waits for a new break |

## 19.7.3 Data Transmission/Reception

### 19.7.3.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag of the RLN3nLEST register (see **Section 19.7.7, Error Statuses**).

In LIN master mode and LIN slave mode [fixed baud rate], 1 Tbit is generated to be $16f_{LIN}$, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

In LIN slave mode [auto baud rate], if 1 Tbit is generated to be $4f_{LIN}$, the sampling point for received data is at the third clock cycle (75% position). If 1 Tbit is generated to be $8f_{LIN}$, the sampling point for received data is at the 7th clock cycle (87.5% position).

**Figure 19.13** shows an example of data transmission timing.

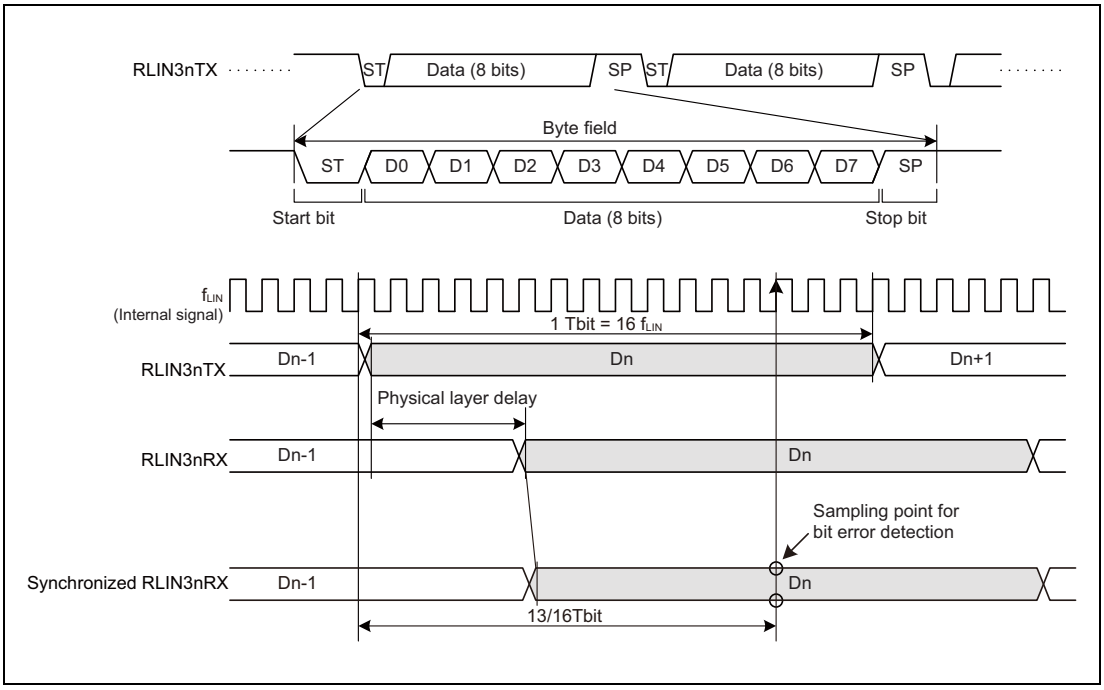

**Figure 19.13 Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])**

### 19.7.3.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN/UART interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN/UART interface uses a noise filter, and the value determined by a 3-sampling majority rule on prescaler clocks is used as the sampling value. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN/UART interface does not use a noise filter, and the value of the synchronized RLIN3nRX value at the sampling position is used as the sampling value.

**Figure 19.14** shows an example of data reception timing.

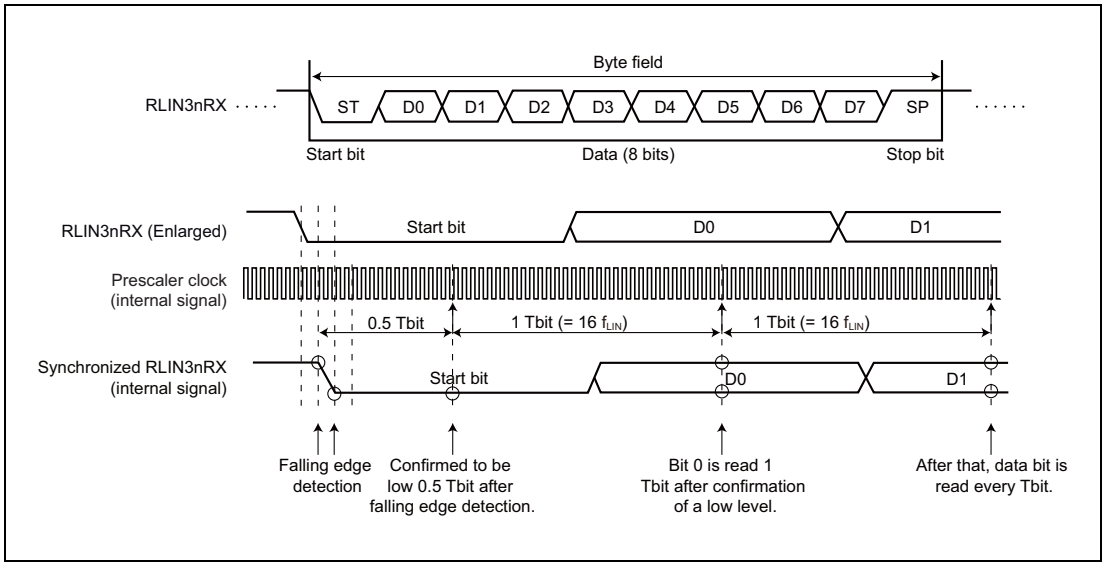

**Figure 19.14 Example of Data Reception Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])**

## 19.7.4 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN/UART interface transmits or receives data continuously.

### 19.7.4.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data regions 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data regions 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

**Figure 19.15** shows the LIN transmission processing and the corresponding buffers.

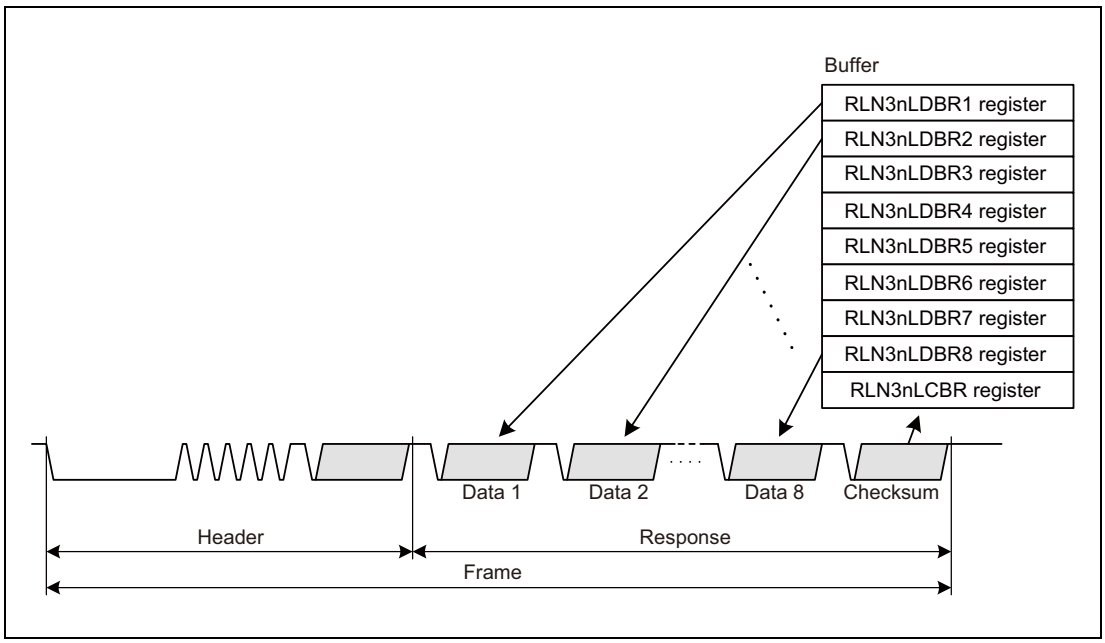

**Figure 19.15 LIN Transmission Processing and Corresponding Buffers**

**[Frame Separate Mode]**

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, the header and response are separately transmitted when prompted by respective transmission start requests.

When the transmission of the header is completed, the HTRC flag in the RLN3nLST register is set to 1 (successful header transmission).

Use frame separate mode when transmitting or receiving response data of 9 bytes or greater in LIN master mode.

### 19.7.4.2 Reception of LIN Frames

For an 8-byte reception, the contents of data regions 1 to 8 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data regions 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

**Figure 19.16** depicts the LIN reception processing and the corresponding buffers.

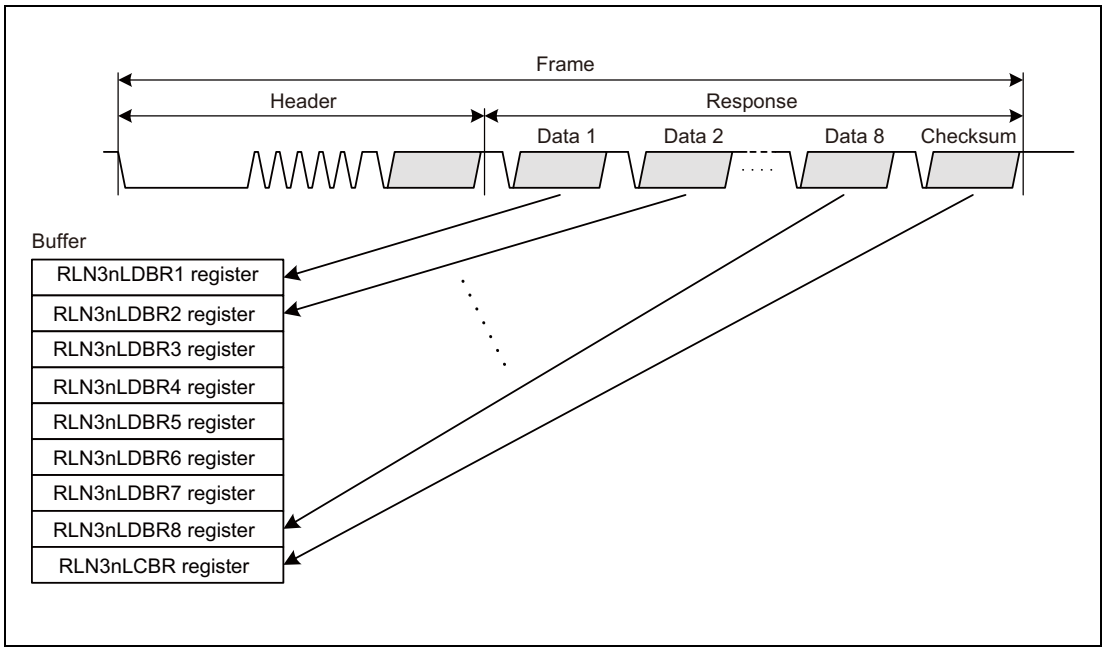

**Figure 19.16 LIN Reception Processing and Corresponding Buffers**

**[Reception of Data 1]**

When the reception of the first byte of data is completed, the D1RC flag in the RLN3nLST register is set to 1 (successful data 1 reception).

#### 19.7.4.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses of 10 bytes or greater can also be transmitted and received.

In such case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be transmitted or received is not the final data group) in the first data group (variable from 0 to 8 bytes) before transmitting or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit in the RLN3nLDFC register should be set to 0 (indicating that the next data group to be transmitted or received is the final data group) before transmitting or receiving the data group, and a checksum should be appended to the final data group.

By changing the RFDL bit setting in RLN3nLDFC register when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register to 1 (frame separate mode).

**NOTE**

In LIN slave mode, the LIN/UART interface can detect a new break field during the transmission or reception of a response.

### 19.7.5 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

#### 19.7.5.1 Wake-up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN3nLDFC register to 1 (LIN master mode: response transmission), or setting the RCDS bit in the RLN3nLDFC register to 1 (LIN slave mode: response transmission), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission, header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal is set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register in LIN master mode is 1 (LIN2.x), the LIN system clock ($f_{LIN}$) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register. By setting the WUTL[3:0] bits of the RLN3nLWUP register to $0100_B$ (5 Tbits), 260 µs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low-level width is output without any bit error, the FTC flag in the RLN3nLST register is set to 1 (successful frame response or wake-up transmission) and when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wake-up transmission interrupt enabled), an interrupt request for RLIN3n transmission is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is aborted and the BER flag of the RLN3nLEST register is set to 1 (bit error detected).
When RLN3nLEDE.PBERE is set in LIN master mode, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

**Figure 19.17** shows the wake-up transmission timing.

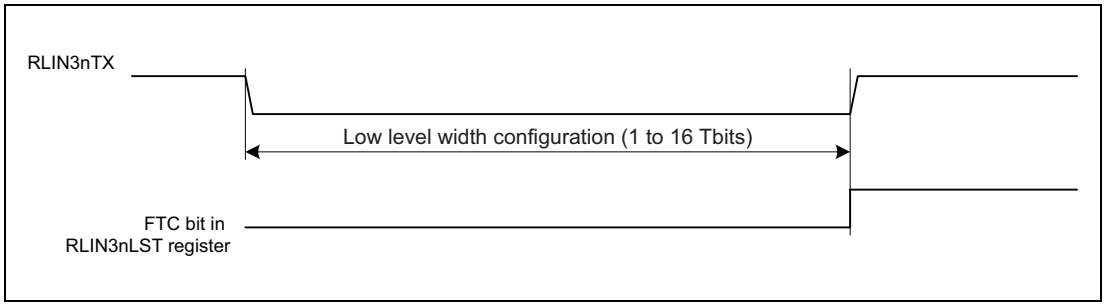

**Figure 19.17 Wake-up Transmission Timing**

### 19.7.5.2 Wake-up Reception

To detect a wake-up signal, use the input signal low-level width count function. The input signal low level width count function measures the low level width of the input signal to the RLIN3nRX pin, using the same sampling point as data reception. This allows the 2.5-Tbit or longer low-level width of the input signal of $f_{LIN}$ to be measured.

In LIN master mode, by setting the LWBR0 bit in the RLN3nLWBR register, operation is executed without changing the baud rate generator setting at a transition between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock ($f_{LIN}$) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200bps while fa is selected, an input signal with a low-level width of 130 us or longer regardless of the setting of the LCKS bit in the RLN3nLMD register.

To used the wake-up reception function, in LIN wake-up mode, set the RFT bit in the RLN3nLDFC register to 0 (LIN master mode: response reception) or the RCDS bit in the RLN3nLDFC register to 0 (LIN slave mode: response reception), and then set the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register is set to 1 (successful frame response/wake-up reception) and if the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wake-up reception interrupt enabled), an interrupt request for RLIN3n successful reception is generated.

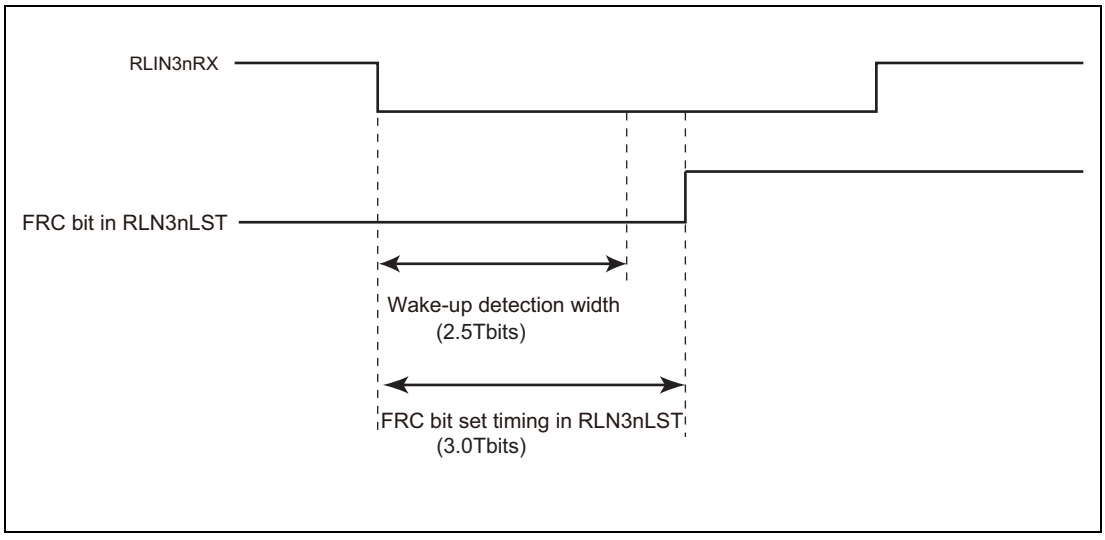

**Figure 19.18 Input Signal Low level Count Function**

### 19.7.5.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, however the collision of wakeup signals is not detected in the LIN/UART interface.

### 19.7.6 Statuses

During LIN mode operation, the LIN/UART interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/reception, can generate interrupt requests.

**Table 19.85** shows the types of statuses available in LIN master mode. **Table 19.86** lists the types of statuses available in LIN slave mode [auto baud rate] and in LIN slave mode [fixed baud rate].

**Table 19.85 Types of Statuses in LIN Master Mode**

| Status | Status Set Condition | Status Clear Condition | Operating Mode Capable of Status Detection | Corresponding Bit | Interrupt |
|---|---|---|---|---|---|
| Reset | After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode. | After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode. | All modes | OMM0 bit in RLN3nLMST register | — |
| Operation mode | After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if the LIN/UART interface actually enters LIN operation mode. | After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if the LIN/UART interface actually enters LIN wake-up mode. | • LIN operation mode<br>• LIN wake-up mode | OMM1 bit in RLN3nLMST register | — |
| Successful frame/wake-up transmission | When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully. | • When the next communication is started (When the FTS bit in the RLN3nLTRC register is set)<br>• When cleared by software<br>• After transition to LIN reset mode | • LIN operation mode<br>• LIN wake-up mode | FTC flag in RLN3nLST register | √ |
| Successful frame/wake-up reception | When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully. | • When the next communication is started (When the FTS bit in the RLN3nLTRC register is set)<br>• When cleared by software<br>• After transition to LIN reset mode | • LIN operation mode<br>• LIN wake-up mode | FRC flag in RLN3nLST register | √ |
| Error detection | If any of the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected). | • When the next communication is started (When the FTS bit in the RLN3nLTRC register is set)<br>• When cleared by software*1<br>• After transition to LIN reset mode | • LIN operation mode<br>• LIN wake-up mode | ERR flag in RLN3nLST register | √ |
| Successful data 1 reception | When the RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received successfully.*2 | • When the next communication is started (When the FTS bit in the RLN3nLTRC register is set)<br>• When cleared by software<br>• After transition to LIN reset mode | LIN operation mode | D1RC flag in RLN3nLST register | — |
| Successful header transmission | When a header field is transmitted successfully. | • When the next communication is started (When the FTS bit in the RLN3nLTRC register is set)<br>• When cleared by software<br>• After transition to LIN reset mode | LIN operation mode | HTRC flag in RLN3nLST register | √ |

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are $0000_B$ (0-byte + checksum).

**Table 19.86 Types of Statuses in LIN Slave Mode**

| Status | Status Set Condition | Status Clear Condition | Operating Mode Capable of Status Detection | Corresponding Bit | Interrupt |
|---|---|---|---|---|---|
| Reset | After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode. | After the OM0 bit of the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode. | All modes | OMM0 bit in RLN3nLMST register | — |
| Operation mode | After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if the LIN/UART interface actually enters LIN operation mode. | • After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if the LIN/UART interface actually enters LIN wake-up mode. | • LIN operation mode<br>• LIN wake-up mode | OMM1 bit in RLN3nLMST register | — |
| Successful response/wake-up transmission | When a response field, a wake-up signal, or a data group is transmitted successfully. | • When cleared by software<br>• After transition to LIN reset mode | • LIN operation mode<br>• LIN wake-up mode | FTC flag in RLN3nLST register | √ |
| Successful response/wake-up reception | When a response field, a wake-up signal, or a data group is received successfully. | • When cleared by software<br>• After transition to LIN reset mode | • LIN operation mode<br>• LIN wake-up mode | FRC flag in RLN3nLST register | √ |
| Error detection | If any of the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, and BER flag of the RLN3nLEST register is set to 1 (error detected). | • When cleared by software*1<br>• After transition to LIN reset mode | • LIN operation mode<br>• LIN wake-up mode | ERR flag in RLN3nLST register | √ |
| Successful data 1 reception | When the RCDS bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte for each data group is received successfully.*2 | • When cleared by software<br>• After transition to LIN reset mode | LIN operation mode | D1RC flag in RLN3nLST register | — |
| Successful header reception | When a header field is received successfully. | • When cleared by software<br>• After transition to LIN reset mode | LIN operation mode | HTRC flag in RLN3nLST register | √ |

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, or BER flag of the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are $0000_B$ (0-byte + checksum).

## 19.7.7 Error Statuses

### 19.7.7.1 LIN Master Mode

#### (1) Types of Error Statuses

The LIN/UART interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

**Table 19.87** shows the types of error statuses.

**Table 19.87 Types of Error Statuses in LIN Master Mode**

| Status | Error Detection Condition | Operating Mode Capable of Error Detection | Communication | Enable/ Disable Detection | Corresponding Bit |
|---|---|---|---|---|---|
| Bit error | The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1*2 | • LIN operation mode<br>• LIN wake-up mode | Aborted | Enabled | BER flag in RLN3nLEST register |
| Physical bus error | • LIN bus is detected to be high level when transmitting a break<br>• LIN bus is detected to be low level when transmitting a break delimiter<br>• LIN bus is detected to be high level when transmitting a wake-up | • LIN operation mode<br>• LIN wake-up mode | Aborted | Enabled | PBER flag in RLN3nLEST register |
| Timeout error | A frame or response transmission/reception does not terminate within a given time*3 | LIN operation mode | Aborted | Enabled | FTER flag in RLN3nLEST register |
| Framing error | In response field reception, the stop bit of each data byte is low level | LIN operation mode | Aborted | Enabled | FER flag in RLN3nLEST register |
| Checksum error | In response field reception, checksum test results in an error | LIN operation mode | — | Disabled | CSER flag in RLN3nLEST register |
| Response preparation error | One of the following conditions occurs in frame separate mode during a multi-byte response reception:<br>• The first reception data byte is received after completion of header transmission but before a response transmission/reception request is specified<br>• The first reception data byte is received after the completion of previous data group reception but before a transmission/ reception request for the next data group is specified. | LIN operation mode | Aborted | Disabled | RPER flag in RLN3nLEST register |

Note 1. If a bit error is detected, processing is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately after the bit that caused the error is transmitted. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and can be calculated using the following formula.
When the FSM bit in the RLN3nLDFC register is set to 1 (frame separate mode), the timeout time is that of the 8 data bytes until the RTS bit of the RLN3nLTRC register is set. Once the RTS bit is set, the timeout time is changed to the time based on the response field data length (the RFDL[3:0] bits in the RLN3nLDFC register).

**[Frame timeout]**
When classic checksum is selected (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced checksum is selected (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]
The aforementioned timeout time is longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.
**[Response timeout]**
Timeout time = (number of data bytes + 1) × 14 [Tbit]

When an error is detected, time-out error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), when it is cleared by software, or at a transition to LIN reset mode.

### (2) Target Time Domain for LIN Error Detection

**Figure 19.19** shows the time domain in which the LIN/UART interface in LIN master mode performs monitoring for error detection.

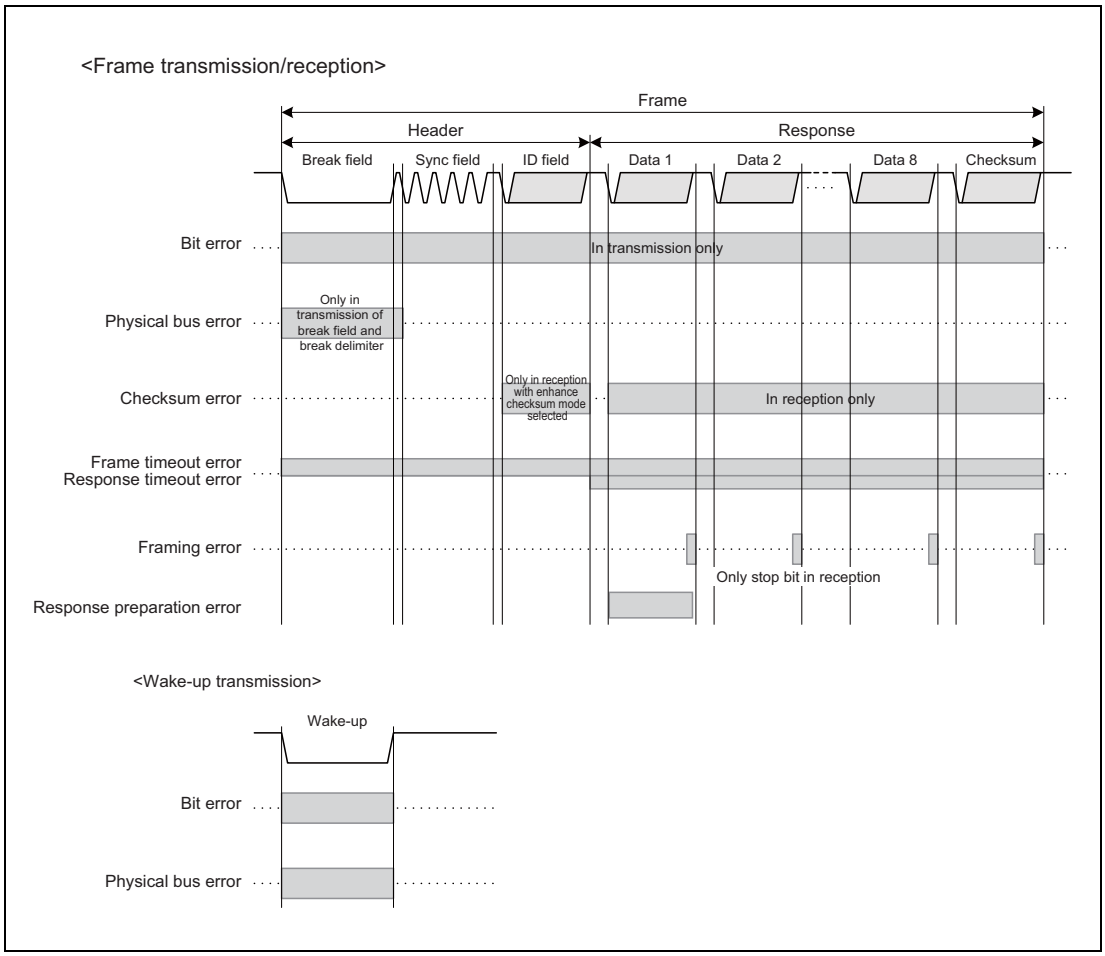

**Figure 19.19 Target Time Domain for LIN Error Detection (LIN Master Mode)**

### 19.7.7.2 LIN Slave Mode

#### (1) Types of Error Statuses

The LIN/UART interface can detect seven types of error statuses in LIN slave mode [auto baud rate] or in LIN slave mode [fixed baud rate]. These error statuses can be verified by checking the corresponding bits in the RLN3nLEST register.

**Table 19.88** shows the types of error statuses.

**Table 19.88 Types of Error Statuses in LIN Slave Mode**

| Status | Error Detection Condition | Operating Mode Capable of Error Detection | Communication | Enable/ Disable Detection | Corresponding Bit |
|---|---|---|---|---|---|
| Bit error | The transmitted data and the data on the LIN bus monitored by the receive pin do not match*1 *2 | • LIN operation mode<br>• LIN wake-up mode | Aborted | Enabled | BER flag in RLN3nLEST register |
| Timeout error | A frame or response transmission/reception does not terminate within a given time*3 | LIN operation mode | Aborted | Enabled | TER flag in RLN3nLEST register |
| Framing error | In frame reception, the stop bit of each data byte is low level | LIN operation mode | Aborted | Enabled | FER flag in RLN3nLEST register |
| Sync field error | If the width of the break low level is greater than the width set by the LBLT bit in the RLN3nLBFC register and the sync field is not $55_H$ | LIN operation mode | Aborted | Enabled*4 | SFER flag in RLN3nLEST register |
| Checksum error | In response field reception, the checksum test results in an error | LIN operation mode | —*5 | Disabled | CSER flag in RLN3nLEST register |
| ID parity error | If the received ID parity bit does not match the value that is automatically calculated by the LIN/ UART interface | LIN operation mode | Aborted | Enabled | IPER flag in RLN3nLEST register |
| Response preparation error | • After the reception of a header, if the response is not prepared before the first reception data byte is received<br>• In a multi-byte response reception, if the preparation for the reception of next data group does not complete before the first reception data byte for the next data group is received | LIN operation mode | Aborted | Disabled | RPER flag in RLN3nLEST register |

Note 1. If a bit error is detected, processing is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately after the bit that caused the error is transmitted. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the LCS bit in the RLN3nLDFC register), and this can be calculated according to the following formula. The timeout time is that of 8 data bytes until the RTS bit or the LNRR bit of the RLN3nLTRC register is set. When the RTS bit is set, the timeout time is changed to the time based on the response field data length (RFDL[3:0] bit of the RLN3nLDFC register). When the LNRR bit is set, the timeout function stops.

**[Frame timeout]**
When classic checksum is selected (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced checksum is selected (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.

**[Response timeout]**
Timeout time = (number of data bytes + 1) × 14 [Tbit]
When en error is detected, time-out error detection function stops.

Note 4. Only reflection of the result to the SFER flag can be enabled/disabled. Error detection cannot be enabled/disabled.

Note 5. Checksum determination is performed upon completion of response frame reception. In case of an error, the successful reception flag is not set to 1.

The error status is cleared by software or at a transition to LIN reset mode.

### (2) Target Time Domain for LIN Error Detection

**Figure 19.20** shows the time domain in which the LIN/UART interface in slave mode performs monitoring for error detection.

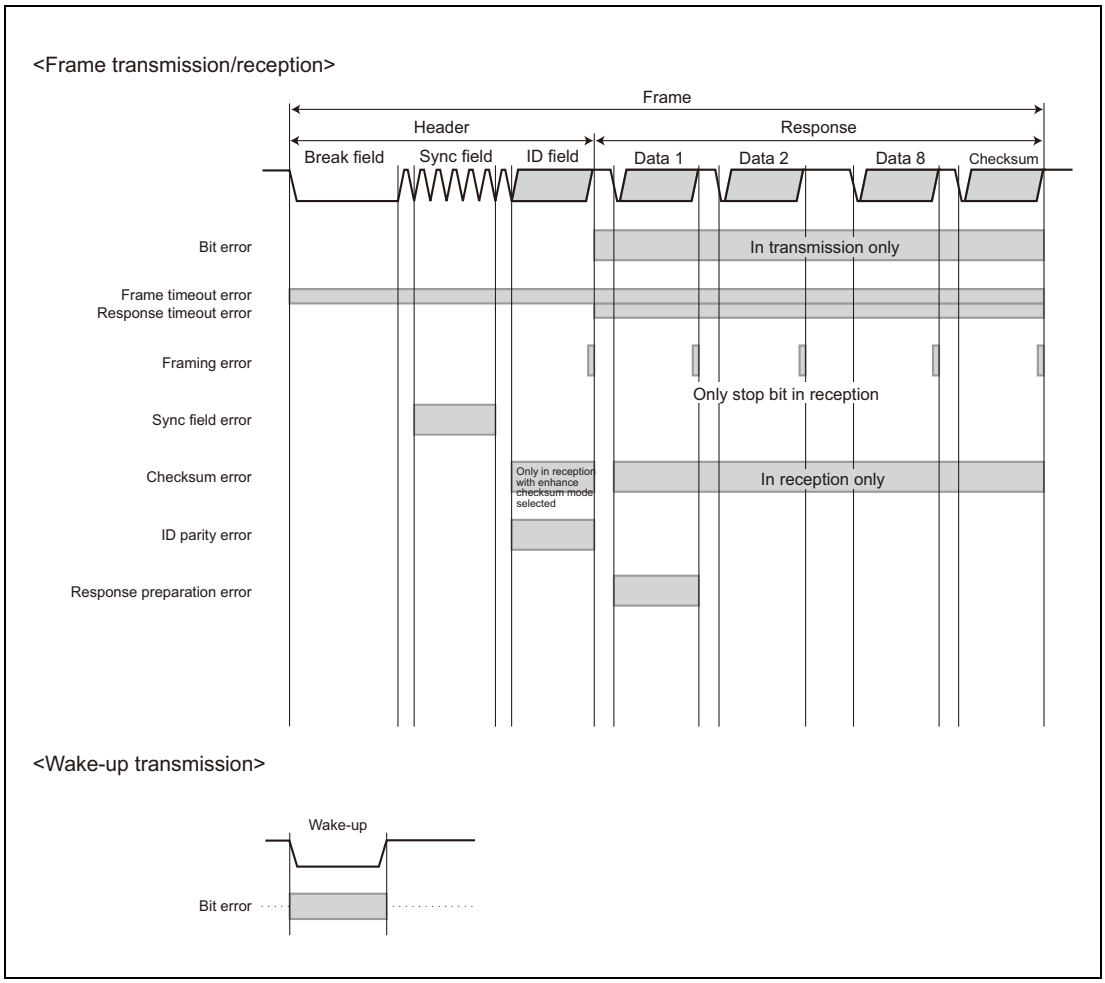

**Figure 19.20 Target Time Domain for LIN Error Detection (LIN Slave Mode)**

## 19.8 UART Mode

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to $01_B$ (UART mode) and the OM0 bit in the RLN3nLCUC register to 1 changes the mode to UART mode, turning the OMM0 bit in the RLN3nLMST register to 1.

### 19.8.1 Transmission

**Figure 19.21** shows the operation of the LIN/UART interface (in UART mode) during transmission. **Table 19.89** provides processing of the LIN/UART interface (in UART mode) during transmission.

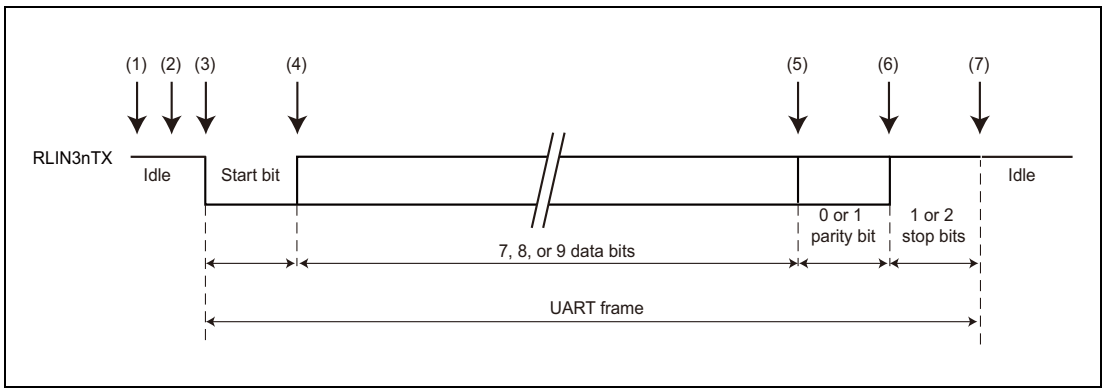

**Figure 19.21 LIN/UART Interface (in UART Mode) Transmission Operation**

**Table 19.89 LIN/UART Interface (UART Mode) Transmission Processing (1/2)**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (1) | • Sets a baud rate.<br>• Sets noise filter ON/OFF.<br>• Enables error detection.<br>• Configures data format.<br>• Sets an interrupt generation timing.<br>• Exits from LIN reset mode.<br>• Sets the transmission enable bit (UTOE bit) to 1. | • Waits for a transmission trigger (RLN3nLUTDR register) by software. |
| (2) | • Specifies the data to be transmitted in the UART transmit data register (RLN3nLUTDR) or UART wait transmit data register (RLN3nLUWTDR). | • Sets the transmission status flag. |
| (3) | • Waits for an interrupt request.<br>[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] | • Transmits a start bit (for switching from reception to transmission in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see **Section 19.8.1.4, Transmission Start Wait Function**.<br>[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)]<br>• Outputs a transmission interrupt. |
| (4) | • When transmitting data continuously, specifies the next data to be transmitted in the UART transmission data register (RLN3nLUTDR) and waits for the generation of an interrupt request. | Transmits the data specified in the UART (wait) transmission data register. |
| (5) | | Transmits a parity bit when parity is used. |
| (6) | | Transmits 1 or 2 stop bits. |

**Table 19.89 LIN/UART Interface (UART Mode) Transmission Processing (2/2)**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (7) | [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)]<br>• If another item of transmission data is set, goes to step (3). | [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)]<br>• If another piece of transmission data is set, goes to step (3).<br>• If the next data to be transmitted is not specified, clears the transmission status flag. |
| | [When the UTIGTS bit is 1 (a transmission interrupt is output upon completion of transmission)]<br>• When transmitting data continuously, goes to step (2). | [When the UTIGTS bit is 1 (a transmission interrupt is output upon completion of transmission)]<br>• Generates RLIN3n transmission interrupt request.<br>• Clears the transmission status flag. |

### 19.8.1.1 Continuous Transmission

The LIN/UART interface (in UART mode) can transmit multiple sets of data continuously by using the RLN3nLUTDR register. **Figure 19.22** shows an operation example where the transmission interrupt generation timing is the start of transmission and an operation example where the transmission interrupt generation timing is the completion of transmission.

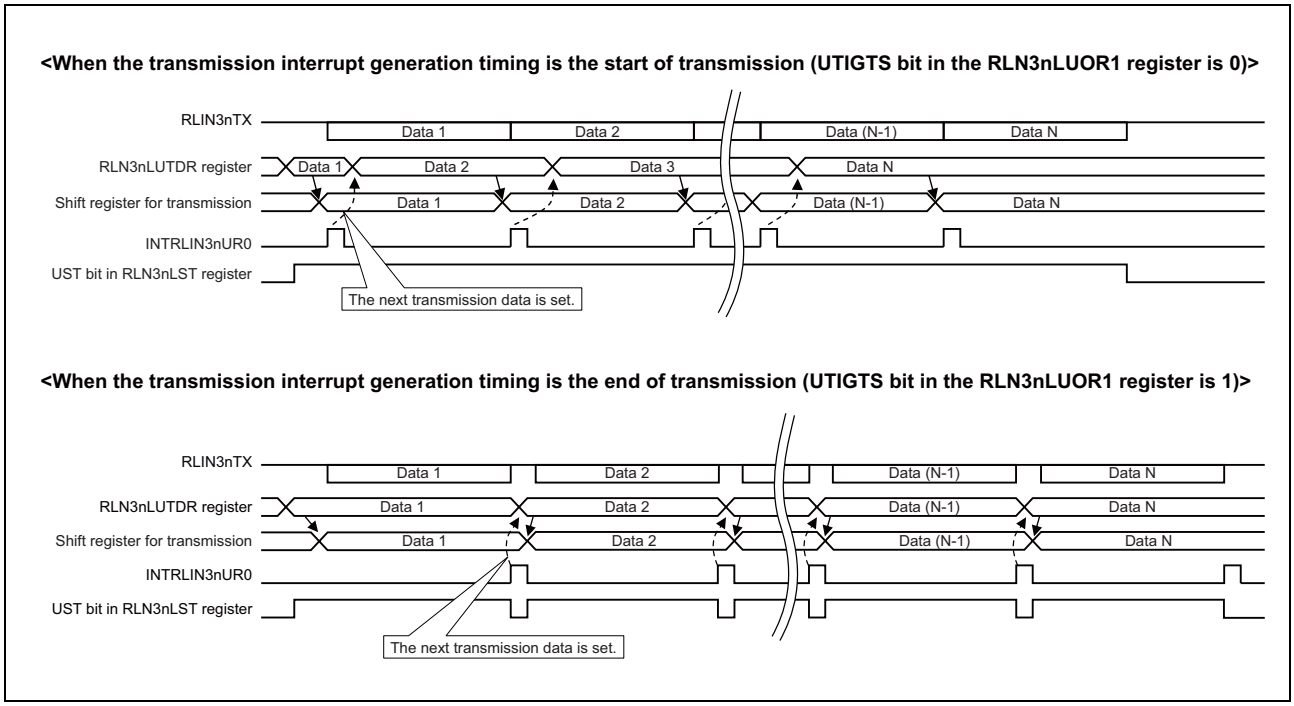

**Figure 19.22 Operation Examples of LIN/UART Interface (UART Mode) Continuous Transmission**

An interrupt can be generated at the completion of a transmission by changing the UTIGTS bit in the RLN3nLUOR1 register from 0 to 1 after the start of transmission of final data, provided that the transmission interrupt generation timing is the start of transmission and the completion of transmission of final data needs to be known.

### 19.8.1.2 UART Buffer Transmission

The LIN/UART interface (in UART mode) has a maximum of nine bytes of UART buffers and it is capable of performing continuous transmissions through the use of UART buffers.

**Figure 19.23** shows the UART buffer transmission operation of the LIN/UART interface (in UART mode). **Table 19.90** shows the UART buffer transmission processing.

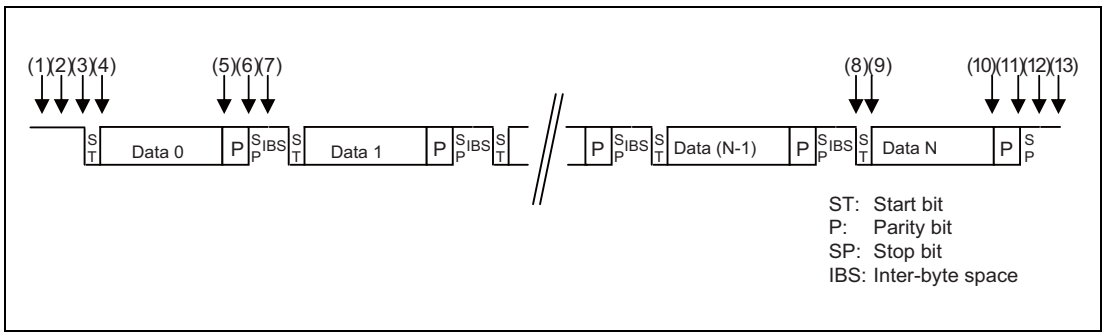

**Figure 19.23 UART Buffer Transmission in LIN/UART Interface (in UART Mode)**

**Table 19.90 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode) (1/2)**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (1) | • Sets a baud rate<br>• Sets noise filter ON/OFF<br>• Enables error detection<br>• Configures data format<br>• Sets the interrupt generation timing to the completion of transmission.<br>• Exits from LIN reset mode.<br>• Sets the transmission enable bit (UTOE bit) to 1 | • Waits for a transmission trigger (RTS bit) by software |
| (2) | • Sets the UART buffer data length and whether the start of transmission must be waited.<br>• Specifies the data to be transmitted in the UART data 0 buffer register (RLN3nLUDB0) and the LIN data buffer b register (RLN3nLDBRb). (b =1 to 8)<br>• Sets the UART buffer transmission start bit (RTS). | • Sets the transmission status flag. |
| (3) | Waits for an interrupt request. | Transmits a start bit.<br>(For switching from reception to transmission in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see **Section 19.8.1.4, Transmission Start Wait Function**.) |
| (4) | | Transmits the data specified in the UART data buffer 0 register (RLN3nLUDB0) or the LIN/UART data buffer b register (RLN3nLDBRb). |
| (5) | | Transmits a parity bit when parity is used. |
| (6) | | Transmits 1 or 2 stop bits<br>(When the number of data set in UART buffer data length select bits is 1, proceeds to (12).) |
| (7) | | Transmits an inter-byte space (idle). |
| | | Repeats steps (3) to (7) until the number of data set in the UART buffer data length select bits -1 is reached. |

**Table 19.90 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode) (2/2)**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (8) | | Transmits a start bit. |
| (9) | | Transmits the data specified in the LIN/UART data buffer b register (RLN3nLDBRb). |
| (10) | | Transmits a parity bit when parity is used. |
| (11) | | Transmits 1 or 2 stop bits. |
| (12) | | • Sets the successful buffer transmission flag.<br>• Clears the UART buffer transmission start bit (RTS).<br>• Generates a transmission interrupt request signal.<br>• Clears the transmission status flag. |
| (13) | • Checks the RLN3nLST register, and clears flags<br>• When continuously transmitting data, goes to step (2). | |

### (1) UART Buffer Transmission

For a 9-byte transmission, the contents stored in the RLN3nLUDB0 and RLN3nLDBR1 to RLN3nLDBR8 registers are transmitted to data regions 0 to 8. The RLN3nLUDB0 register is used only if 9-byte transmission is specified. In other cases, the RLN3nLDBR1 to RLN3nLDBR8 registers are selected depending on the data length. For a 4-byte transmission, the contents stored in the RLN3nLDBR1 to RLN3nLDBR4 registers are transmitted to data regions 1 to 4, but the contents of the RLN3nLDBR5 to RLN3nLDBR8 registers are not transmitted. An RLIN3n transmission interrupt is generated after the number of data specified in the MDL [3:0] bits of the RLN3nLDFC register is transmitted. The spaces between each transmitted data can be specified in the IBS bit of the RLN3nLSC register.

**Figure 19.24** shows a 9-byte UART buffer and the transmission processing.

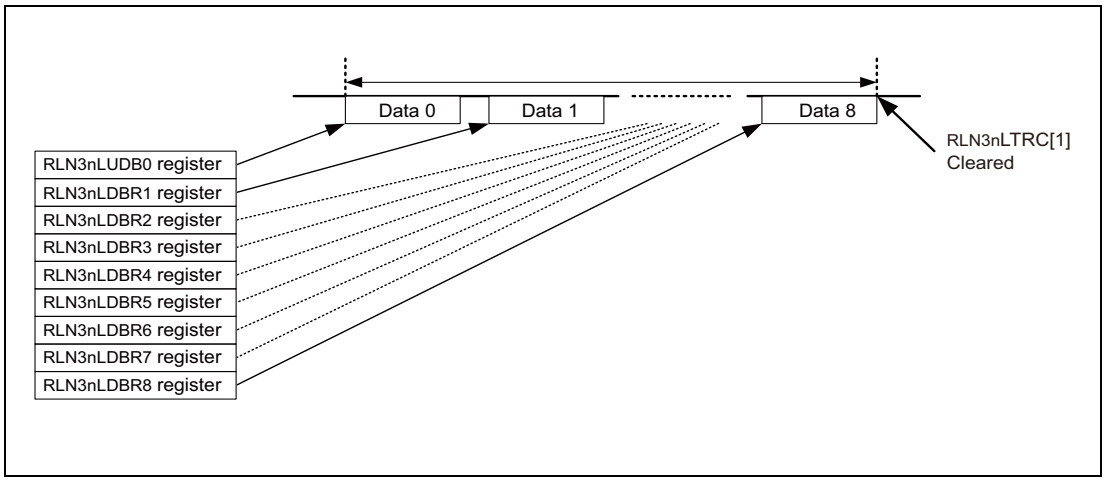

**Figure 19.24 UART Buffer and Transmission Processing (for 9-Byte Transmission)**

### 19.8.1.3 Data Transmission

One bit of data is transmitted per Tbit.

In half-duplex communication, if the BERE bit in the RLN3nLEDE register is 1 (bit error detection enabled), the transmission data and the input pin level are compared bit by bit during data transmission, and the results are stored in the BER flag of the RLN3nLEST register (see **Section 19.7.7, Error Statuses**). The timing at which the input pin is sampled during data transmission can vary depending on the settings of the LPRS[2:0] and NSPB[3:0] bits in the RLN3nLWBR register.

The bit error detection timing in UART mode is shown in **Table 19.91**.

**Table 19.91 Error Detection Timing in UART Mode**

| Sampling Count Per Bit | Bit Error Detection Timing |
|---|---|
| 6 samples | 3rd clock cycle + 1 prescaler clock |
| 7 samples | 4th clock cycle + 1 prescaler clock |
| 8 samples | 4th clock cycle + 1 prescaler clock |
| 9 samples | 5th clock cycle + 1 prescaler clock |
| 10 samples | 5th clock cycle + 1 prescaler clock |
| 11 samples | 6th clock cycle + 1 prescaler clock |
| 12 samples | 6th clock cycle + 1 prescaler clock |
| 13 samples | 7th clock cycle + 1 prescaler clock |
| 14 samples | 7th clock cycle + 1 prescaler clock |
| 15 samples | 8th clock cycle + 1 prescaler clock |
| 16 samples | 8th clock cycle + 1 prescaler clock |

Example of Data Transmission Timing (when 1 Tbit = 16 samplings) is shown in **Figure 19.25**

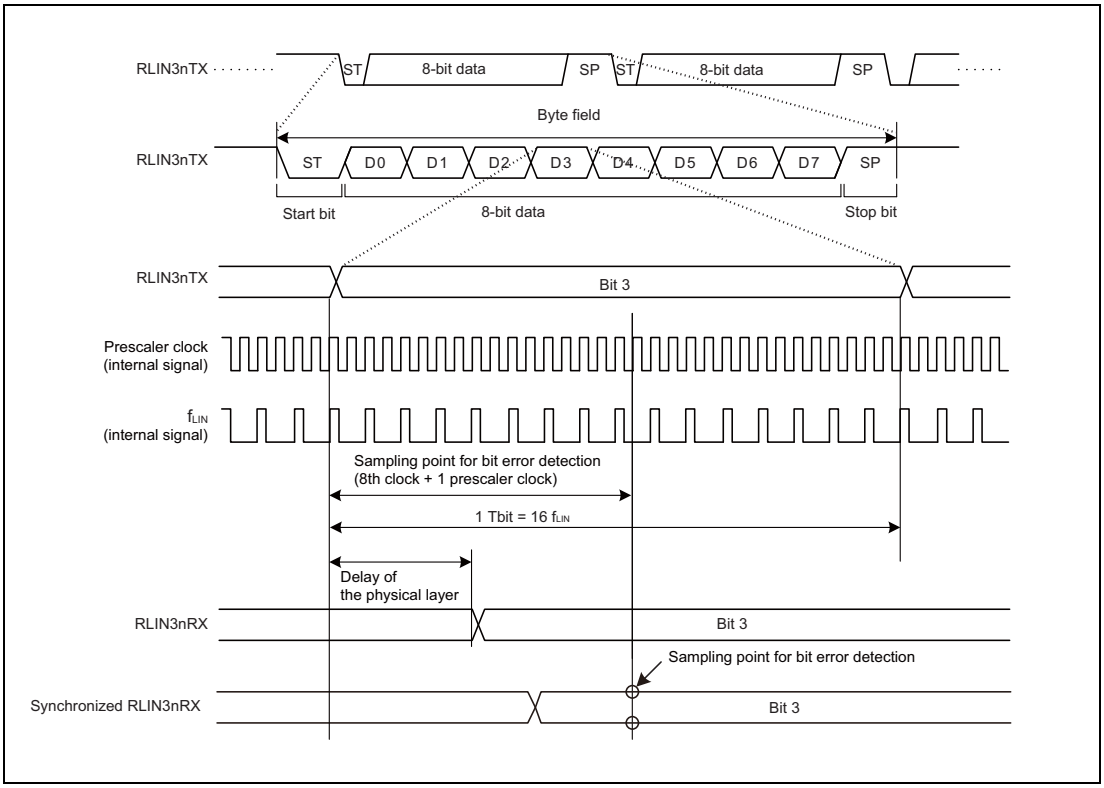

**Figure 19.25 Example of Data Transmission Timing (When 1 Tbit = 16 samplings)**

### 19.8.1.4 Transmission Start Wait Function

For performing half-duplex communication, the LIN/UART interface (in UART mode) has the function of securing the reception stop bit length when switching from reception to transmission.

If it is desired to delay the start of transmission until the stop bits for the reception are completed, specify the transmission data in the RLN3nLUWTDR register, which is used only for the wait function, instead of specifying it in the RLN3nLUTDR register as a transmission start request. When transmitting from the UART buffer, set the RTS bit in the RLN3nLTRC register to 1 (UART buffer transmission start) while the UTSW bit in the RLN3nLDFC register is set to 1.

In this case, the LIN/UART interface delays the start of transmission until the stop bits of reception data are completed.

It should be noted that even if the UART stop bit length select bit (USBLS) in RLN3nLBFC register is 1 (stop bits = 2 bits), there is only a 1-bit delay.

**Figure 19.26** shows the operation of transmission wait function.

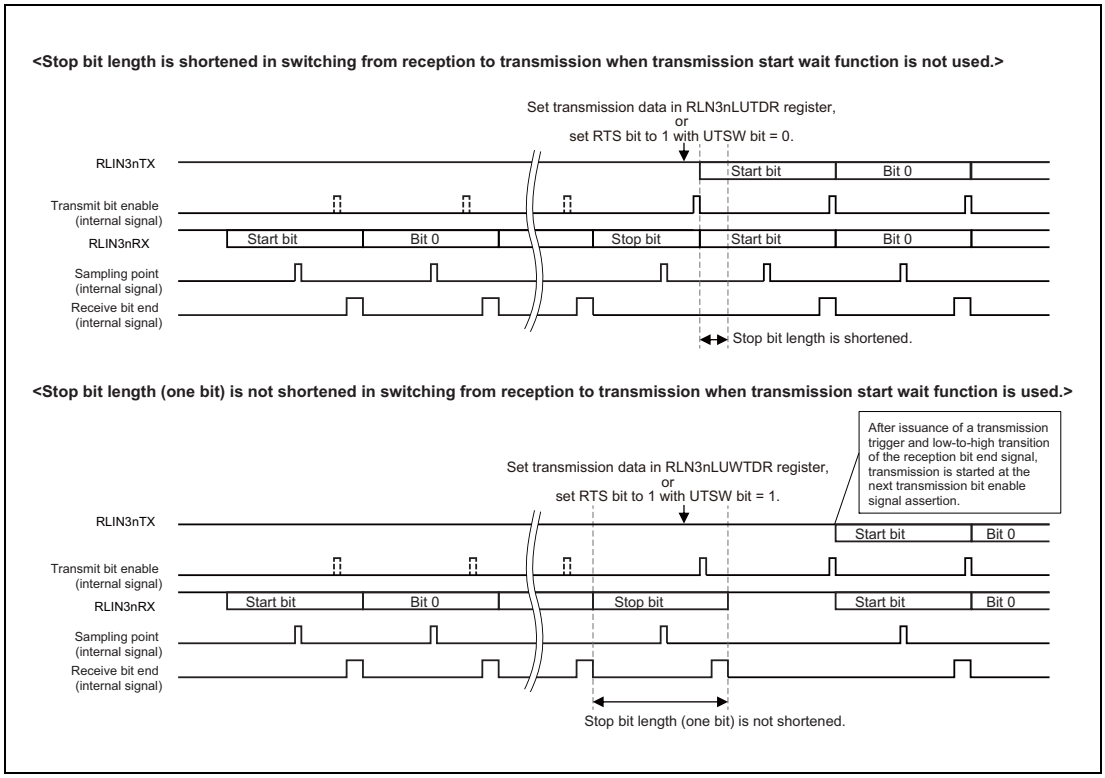

**Figure 19.26 Transmission Wait Function (Case When Transmit Data Is Set While Stop Bits Are Being Received)**

### 19.8.2 Reception

**Figure 19.27** shows the LIN/UART interface (in UART mode) reception operation.**Table 19.92** shows the LIN/UART interface (in UART mode) reception processing.

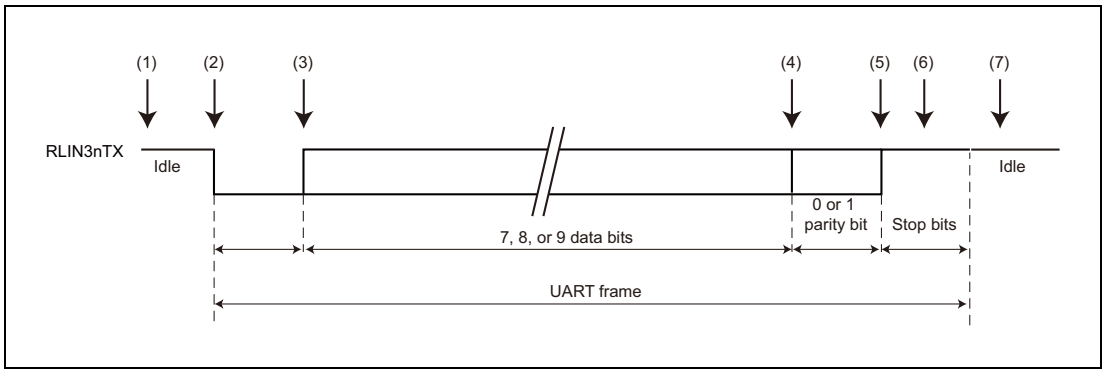

**Figure 19.27 LIN/UART Interface (in UART Mode) Reception Operation**

**Table 19.92 LIN/UART Interface (in UART Mode) Reception Processing**

| | Software Processing | LIN/UART Interface Processing |
|---|---|---|
| (1) | • Sets a baud rate.<br>• Sets noise filter ON/OFF.<br>• Enables error detection.<br>• Configures data format.<br>• Exits from LIN reset mode.<br>• Sets the reception enable bit (UROE bit) to 1. | • Waits for the reception to be enabled by software.<br>• Waits for detection of a start bit. |
| (2) | Waits for an interrupt request. | • Waits for a falling edge from the reception pin, and detects a start bit.<br>• Sets the reception status flag. |
| (3) | | Receives data. |
| (4) | | Receives a parity bit when parity is used. |
| (5) | | Receives only 1 stop bit. |
| (6) | | • Generates a RLIN3n successful reception interrupt request.<br>• Clears the reception status flag. |
| (7) | Checks the RLN3nLST register, and clears flags | Waits for a falling edge from the reception pin. |

### 19.8.2.1 Data Reception

Data reception is performed by using the synchronized RLIN3nRX (an internal signal) that is the input from the RLIN3nRX pin synchronized with the prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, resampling is performed 0.5 Tbits later when the number of sampling per 1 Tbit is even and {(the number of sampling + 1) / 2} / (the number of sampling) Tbits later when the number is odd. If the synchronized RLIN3nRX signal is low level, the bit is recognized as a start bit. The bit is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected during the resampling.

After the start bit is detected, 1 bit is sampled per Tbit.

However, when the BERE bit in the RLN3nLEDE register is 1, the sampling point is the same as the bit error detection timing.

The LIN/UART interface has a noise filter function for received data. If the LRDNFS bit in the RLN3nLMD register is 0, the noise filter is used. For a sampling value, the value determined by a 3-sampling majority rule by the prescaler clock is used. If the LRDNFS bit in the RLN3nLMD register is 1, the noise filter is not used. In this case, for a sampling value, the synchronized RLIN3nRX value at the sampling position is used as is.

**Figure 19.28** shows an example of data reception timing.

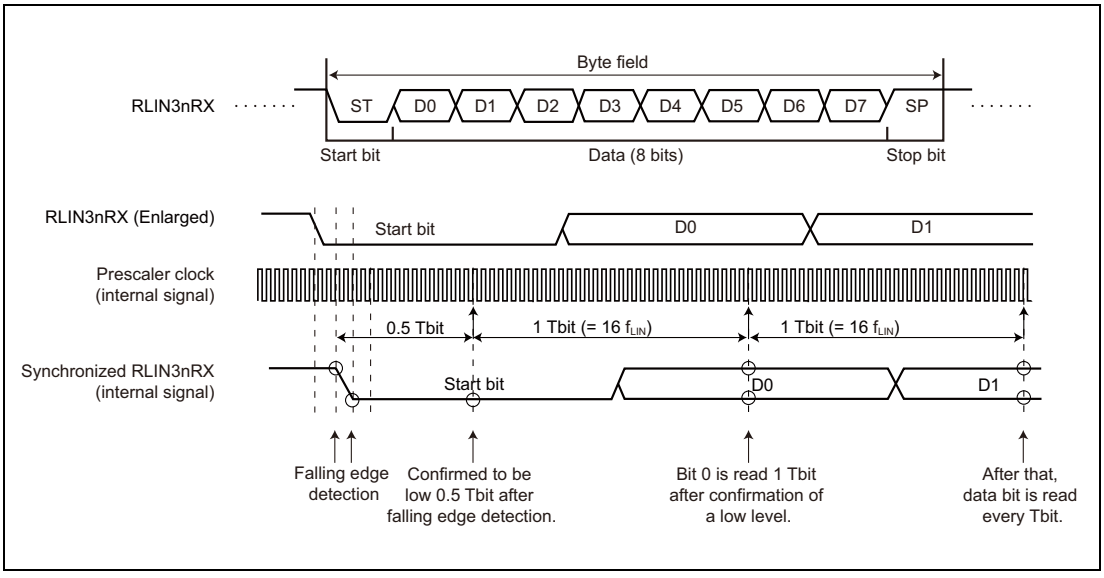

**Figure 19.28 Example of Data Reception Timing (When 1 Tbit = 16 samplings)**

## 19.8.3 Expansion Bits

The LIN/UART interface (in UART mode) can transmit and receive 9-bit long data by setting the UEBE bit in the RLN3nLUOR1 register to 1.

### 19.8.3.1 Expansion Bit Transmission

The LIN/UART interface (in UART mode) can transmit 9-bit long data by writing the 9-bit data to either the UART transmission data register (RLN3nLUTDR) or the UART wait transmission data register (RLN3nLUWTDR) when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1.

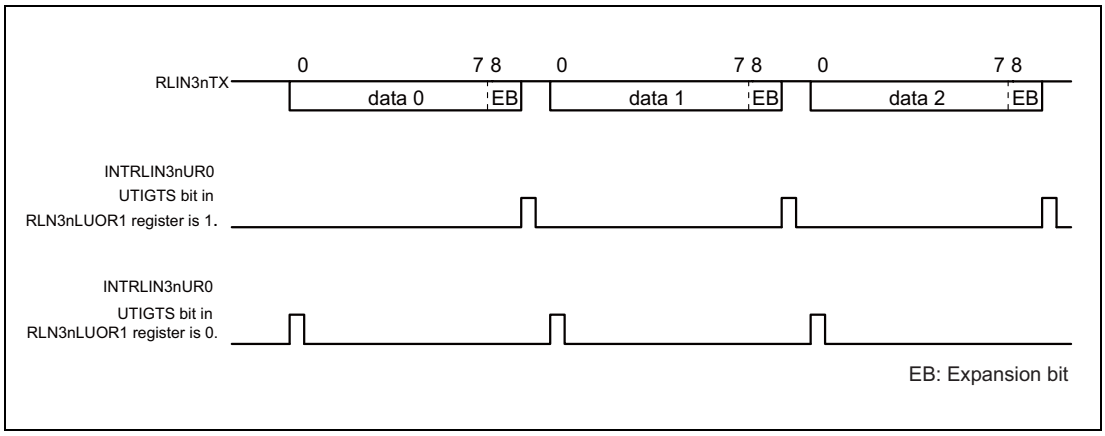

**Figure 19.29 Transmission Example When Expansion Bit is Enabled (LSB First)**

### 19.8.3.2 Expansion Bit Reception

The LIN/UART interface (in UART mode) can always receive 9-bit data without comparing the expansion bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 1, and the expansion bit data comparison enable bit (UEBDCE) is 0. Regardless of the expansion bit detection level select bit (UEBDL) setting in the UART option register 1 (RLN3nLUOR1), a RLIN3n successful reception interrupt is generated when 9-bit data is received.

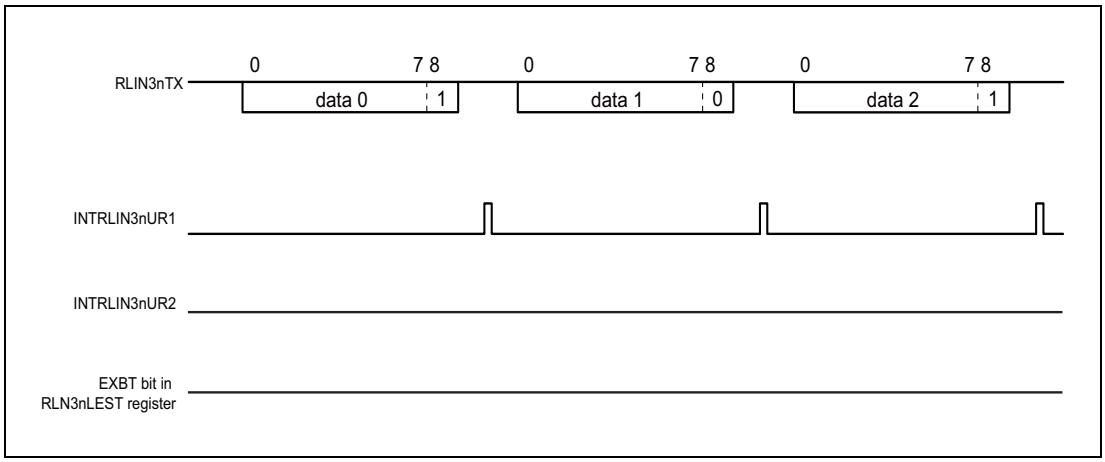

**Figure 19.30 Expansion Bit Reception Example (LSB First)**

### 19.8.3.3 Expansion Bit Reception (with Expansion Bit Comparison)

The LIN/UART interface (in UART mode) can compare received expansion bits and the UEBDL bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 0.

If the level that was set in the expansion bit detection level select bit (UEBDL) is detected, an RLIN3n status interrupt request is generated upon completion of data reception, and the expansion bit detection flag (EXBT) in the LIN error status register (RLN3nLEST) is set. If the reversed value of an expansion bit detection level is detected, RLIN3n successful reception interrupt request is generated. In either case, the received data is stored in the UART reception data register (RLN3nLURDR), unless there was an overrun error.

**Figure 19.31** shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

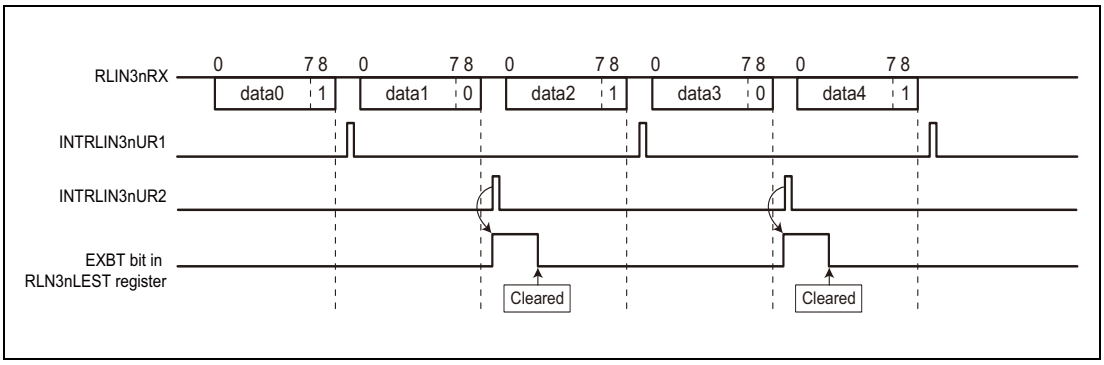

**Figure 19.31 Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL = 0)**

**NOTE**

- If a reception error (parity error, framing error, or overrun error) occurs in received data 0, 2, or 4 (if a reversed value of an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. In this case, a RLIN3n successful reception interrupt is not generated.
- If a reception error (parity error, framing error, or overrun error) occurs in received data 1 or 3 (if an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs, the expansion bit detection flag (EXBT) is also set.

### 19.8.3.4 Expansion Bit Reception (with Data Comparison)

If the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 1, when the level that was set by the expansion bit detection level select bit (UEBDL) is detected, the LIN/UART interface (in UART mode) compares the 8 bits of the received data excluding the expansion bit, with the a preset RLN3nLIDB register value.

If the result of the comparison is a match, the LIN/UART interface performs the following operations:

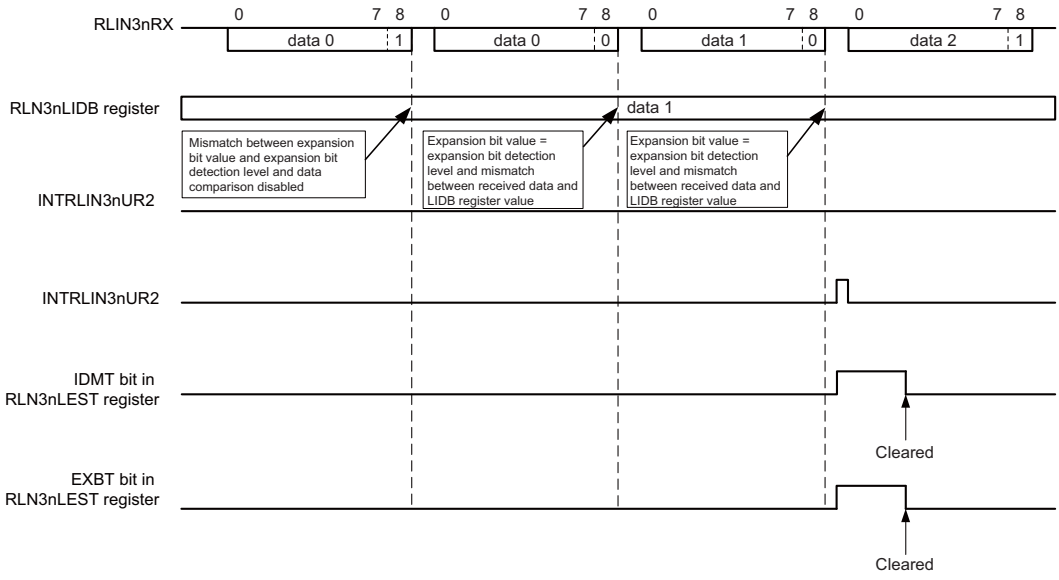
- Generates an RLIN3n status interrupt
- Sets the expansion bit detection flag (EXBT)
- Sets the ID match flag (IDMT)
- Stores the received data in the UART reception data register (RLN3nLURDR)

Even when the result of the comparison is a match, successful RLIN3n successful reception interrupt is not generated.

If the result of the comparison is not a match, no RLIN3n successful reception interrupt or RLIN3n status interrupt is generated, and the EXBT and IDMT flags are not set to 1. The received data is not stored in the UART reception data register (RLN3nLURDR).

When changing the UEBDCE bit to 0, make the change before the reception of the next data is completed.

**Figure 19.32** shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.



**Note:** If a reception error (parity error, framing error, or overrun error) occurs, an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs and the result of comparison is a match, the EXBT and IDMT are also set to 1.

**Figure 19.32 Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0)**

### 19.8.4 Statuses

In UART mode, the LIN/UART interface can detect five types of statuses.

Two statuses, successful UART buffer transmission and error detection, can generate interrupt requests.

**Table 19.93** shows the types of statuses available in UART mode.

**Table 19.93 Types of Statuses in UART Mode**

| Status | Status Set Condition | Status Clear Condition | Corresponding Bit | Interrupt |
|---|---|---|---|---|
| Reset | After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode. | After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode. | OMM0 bit in RLN3nLMST register | — |
| Successful UART buffer transmission | • When the UTIGTS bit in the RLN3nLUOR1 register is 0 (transmission interrupt request is generated upon start of transmission), if the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register) is started.<br>• When the UTIGTS bit in the RLN3nLUOR1 register is 1 (transmission interrupt request is generated upon completion of transmission), if the transmission of the data length specified by the MDL bit in the RLN3nLDFC register is completed. | • When cleared by software<br>• After transition to LIN reset mode | FTC flag in RLN3nLST register | √ |
| Error detection | If any of the UPER flag, IDMT flag, EXBT flag, FER flag, OER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected). | • When cleared by software*1<br>• After transition to LIN reset mode | ERR flag in RLN3nLST register | √ |
| Transmission status | • When data is written to the RLN3nLUTDR or RLN3nLUWTDR register.<br>• When 1 is written to the RTS bit in the RLN3nLTRC register. | • When the transmission of the data specified in the RLN3nLUTDR or RLN3nLUWTDR register is completed, but the next transmission data is not specified.<br>• When the transmission of the data in the UART buffer is completed and the RTS bit in the RLN3nLTRC register is cleared.<br>• After transition to LIN reset mode | UTS flag in RLN3nLST register | — |
| Reception status | • When a start bit is detected. | • When a sampling point for stop bits is detected<br>• After transition to LIN reset mode | URS flag in RLN3nLST register | — |

Note 1. Writing a 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register when not in the LIN reset mode sets the ERR flag in the RLN3nLST register to 0.

## 19.8.5 Error Statuses

### Types of Error Statuses

In UART mode, the LIN/UART interface can detect four types of errors and two types of statuses. The condition of these statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

**Table 19.94** lists applicable status types.

**Table 19.94 Types of Statuses in UART Mode**

| Status | Error Detection Condition | Communication | Enable/ Disable Detection | Corresponding Bit |
|---|---|---|---|---|
| Bit error | The transmitted data and the data monitored on the reception pin do not match*1 | Continues until the transmission of the specified transmission data is completed. | Enabled | BER flag in RLN3nLEST register |
| Overrun error | After received data is stored in the RLN3nLURDR register, the next data is received before the previous data is read. (In this case, no data is stored in the RLN3nLURDR register). | — (Reception is completed by the time this error is detected) | Enabled | OER flag in RLN3nLEST register |
| Framing error | When the first stop bit is low level in the reception processing. | — (Reception is completed by the time this error is detected) | Enabled | FER flag in RLN3nLEST register |
| Parity error | The received parity value fails to match the parity value calculated from the received data | Continues until the data reception is completed. | Disabled *2 | UPER flag in RLN3nLEST register |
| Expansion bit detection | The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register. | — | Enabled | EXBT flag in RLN3nLEST register |
| ID match detection | The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register and the 8-bit received data excluding the expansion bit matches the value of the RLN3nLIDB register. | — | Enabled | IDMT flag in RLN3nLEST register |

Note 1. In the case of transmission from the UART buffer, bit errors are detected even in the space between UART frames (inter-byte space).

Note 2. Setting the UPS[1:0] bits in the RLN3nLBFC register to $10_B$ (0 parity) disables the checking of parity bit values. In this case, no parity error is generated.

The error status is cleared by software or at a transition to LIN reset mode.

## 19.9 LIN Self-Test Mode

The LIN/UART interface provides a LIN self-test mode. When the LIN/UART interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and they are internally connected within the LIN/UART interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX. The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following four modes:

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception
- LIN slave self-test mode (transmission): Header reception and response transmission
- LIN slave self-test mode (reception): Header reception and response reception

In LIN self-test mode, the operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator.

Regardless of the setting of the baud rate related registers, the baud rate setting is the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to $0000_B$ or $1111_B$.)

In addition, in LIN self-test mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- LIN slave mode (Auto baud rate)
- Frame/response timeout error

Do not use these functions.

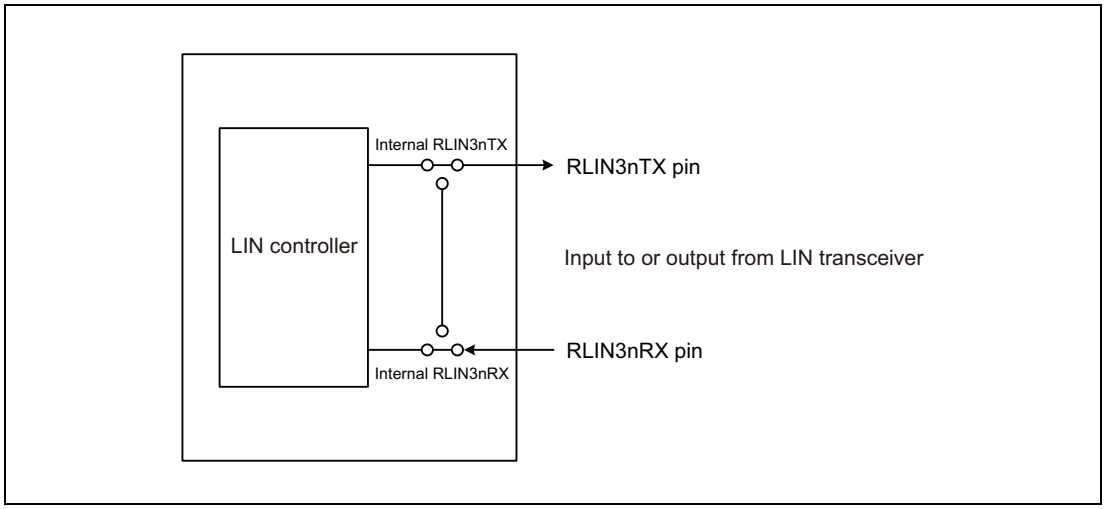


**Figure 19.33 Connection in LIN Reset Mode, LIN Mode, and UART Mode**

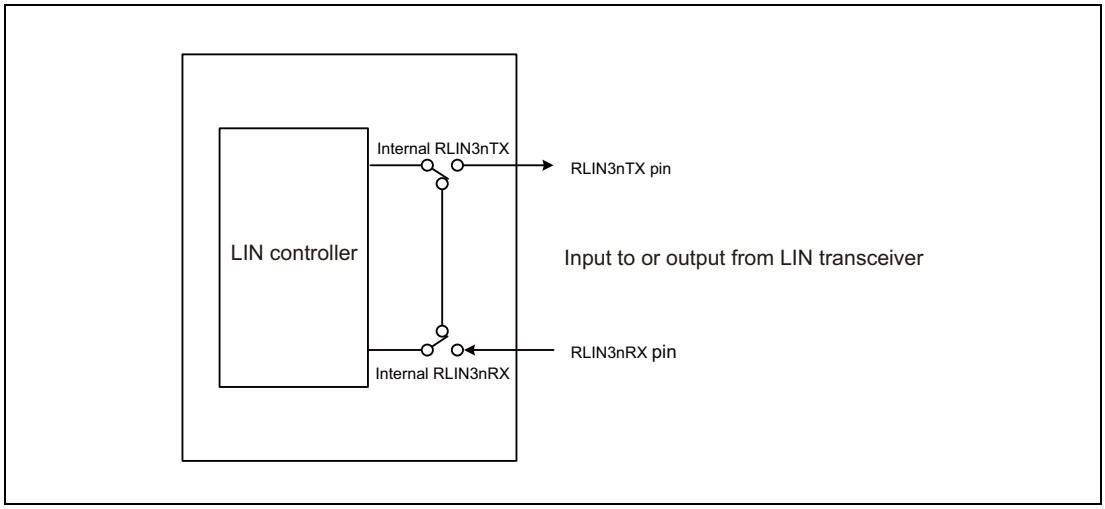

**Figure 19.34 Connection in LIN Self-Test Mode**

### 19.9.1 Transition to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.
The LSTM bit in the RLN3nLSTC register set to 1 indicates that the mode has transitioned to the LIN self-test mode.

When transitioning to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be consecutively written three times to the LIN self-test control register, as follows:

- Transition to LIN reset mode
  Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
  LMD bits in RLN3nLMD = $00_B$ (LIN master mode) or $11_B$ (LIN slave mode [fixed baud rate])
- 1st write: RLN3nLSTC register = $1010\ 0111_B$ ($A7_H$)
- 2nd write: RLN3nLSTC register = $0101\ 1000_B$ ($58_H$)
- 3rd write: RLN3nLSTC register = $0000\ 0001_B$ ($01_H$)
- Verify the transition to LIN self-test mode
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the 1st write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is aborted. The above sequence should be retried from the 1st write step. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also aborted.

### 19.9.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxxx_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx $xx00_B$*1
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = x000 $x0xx_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 00xx $xxxx_B$
  RLN3nLSC register = 00xx $0xxx_B$
- Exit the LIN reset mode.
  Write $11_B$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to $11_B$.
- Configure the transmission frame related registers.
  RLN3nLDFC register = 00x1 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx $xxxx_B$
- Start header transmission → response transmission
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (transmission) is executed, interrupt is generated, and status and error status are also updated. The checksum is automatically calculated by the LIN/UART interface. To abort the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

**Note:** x: Arbitrary value can be specified.

**Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register and the LCKS bit in the RLN3nLMD register. Therefore, configuration of these registers is not necessary.

**Note 2.** If necessary, configure the related registers described in **Section 7, Exception/Interrupts**.

**Note 3.** When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).

The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

### 19.9.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxxx_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx $xx00_B$*1
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = x000 $x0xx_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 00xx $xxxx_B$
  RLN3nLSC register = 00xx $0xxx_B$*1
- Exit the LIN reset mode.
  Write $11_B$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to $11_B$.
- Configure the reception frame related registers.
  RLN3nLDFC register = 00x0 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx $xxxx_B$
  RLN3nCBR register = xxxx $xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, perform the calculation and specify the calculated value in the RLN3nLCBR register.
- Start header transmission → response reception
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (reception) is executed, interrupt is generated, and status and error status are also updated. To abort the LIN master self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the specified value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

**Note:** x: Arbitrary value can be specified.

**Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, configuration of these registers is not necessary.

**Note 2.** If necessary, configure the related registers described in **Section 7, Exception/Interrupts**.

**Note 3.** When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).
The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

### 19.9.4 Transmission in LIN Slave Self-Test Mode

To execute a self-test on LIN slave transmission, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxx0_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00x $x0011_B$
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = xx0x $x00x_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 0000 $000x_B$*3
  RLN3nLSC register = 00xx $0001_B$
- Exit the LIN reset mode.
  Write $11_B$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to $11_B$.
- Configure the transmission frame related registers.
  RLN3nLDFC register = 00x1 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = xxxx $xxxx_B$
- Header reception → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/ reception started).
  (The header reception and the response transmission are executed in this order, without manipulating the RTS bit in the RLN3nLTRC register.)
  The LIN slave self-test mode (transmission) is executed, interrupt is generated, and status and error status are also updated.
  The checksum is automatically calculated by the LIN/UART interface. To abort the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.

- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

**Note:** x: Arbitrary value can be specified.

**Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, and the RLN3nLBRP1 register. Therefore, configuration of these registers is not necessary.

**Note 2.** If necessary, configure the related registers described in **Section 7, Exception/Interrupts**

**Note 3.** According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

**Note 4.** When the successful header reception interrupt and the successful response transmission interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).
The time from setting of the successful header reception flag to setting of the successful response/wake-up transmission flag is calculated by using the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

### 19.9.5 Reception in LIN Slave Self-Test Mode

To execute a self-test on LIN slave reception, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxx0_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx $0011_B$
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = xx0x $x00x_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 0000 $000x_B$*3
  RLN3nLSC register = 00xx $0001_B$*1
- Exit the LIN reset mode.
  Write $11_B$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to $11_B$.
- Configure the reception frame related registers.
  RLN3nLDFC register = 00x0 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = xxxx $xxxx_B$
  RLN3nCBR register = xxxx $xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, users must calculate it and set it to the RLN3nLCBR register. A checksum test can be performed by setting an incorrect checksum value here.
- Header reception → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/ reception started).
  (Without any setting of the RTS bit in the RLN3nLTRC register, the header reception and the response reception are executed in this order.)
  The LIN slave self-test mode (reception) is executed, interrupt is generated, and status and error status are also updated. To abort the LIN slave self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the specified value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

**Note:** x: Arbitrary value can be specified.

**Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, and the IBS bit in the RLN3nLSC register.
Therefore, configuration of these registers is not necessary.

**Note 2.** If necessary, configure the related registers described in **Section 7, Exception/Interrupts**.

**Note 3.** According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

**Note 4.** When the successful header reception interrupt and the successful response reception interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).
The time required from the set of the successful header reception flag to the set of the successful response/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

### 19.9.6 Exiting LIN Self-Test Mode

To exit LIN self-test mode, perform the following procedure:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
  If the OMM1 and OMM0 bits in the RLN3nLMST register are not $11_B$, write $11_B$ to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register are set to $11_B$, transition to LIN reset mode.
- Verify that LIN/UART interface has exited LIN self-test mode.
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 0 (not in LIN self-test mode)
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

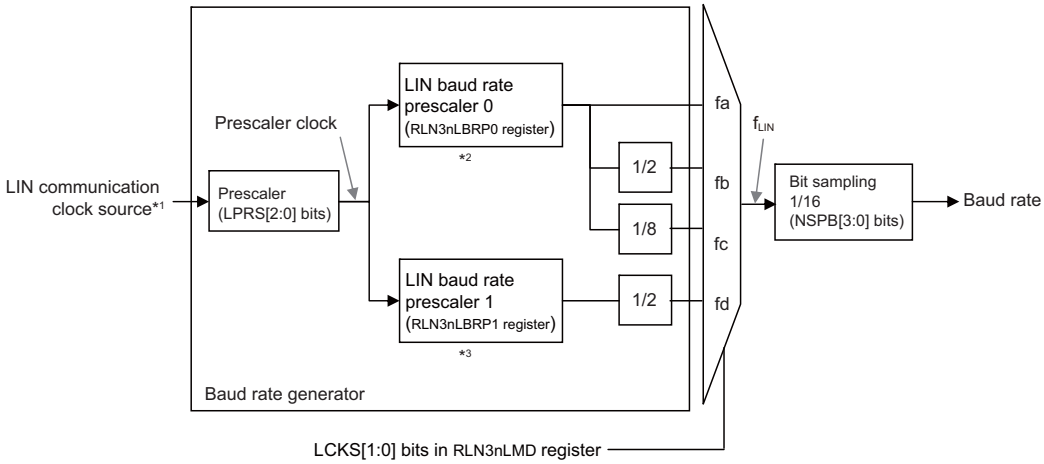
## 19.10 Baud Rate Generator

The prescaler clock is obtained by dividing the LIN communication clock source frequency by the prescaler, and the LIN system clock ($f_{LIN}$) is obtained by dividing the prescaler clock frequency by the baud rate generator. The clock obtained by dividing the LIN system clock frequency ($f_{LIN}$) by the number of samples is the baud rate. The inverse of this baud rate is called the bit time (Tbit).

The LIN/UART interface has two types of baud rate generators. The baud rate generators are switched according to the mode used.

### 19.10.1 LIN Master Mode

**Figure 19.35** shows a block diagram of baud rate generation in LIN master mode.



Note 1. For the LIN communication clock source, see **Section 12.5.3, Clock Domain Settings**.
Note 2. When the value in RLN3nLBRP0 register is N (N = 0 to 255), the clock frequency is divided by N + 1.
Note 3. When the value in RLN3nLBRP1 register is M (M = 0 to 255), the clock frequency is divided by M + 1.

**Figure 19.35 Block Diagram of Baud Rate Generation in LIN Master Mode**

By setting the RLN3nLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting bit rates are fa = 19200 × 16, fb = 9600 × 16, and fc = 2400 × 16. These bit rates are frequency-divided by 16 in the bit timing generator, enabling baud rates of 19200 bps, 9600 bps and 2400 bps, to be generated. Also, by configuring the RLN3nLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting bit rate is fd = 10417 × 16. This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

Baud rate of LIN master

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP0+ 1) ÷ 16 [bps] (When fa is selected for $f_{LIN}$)

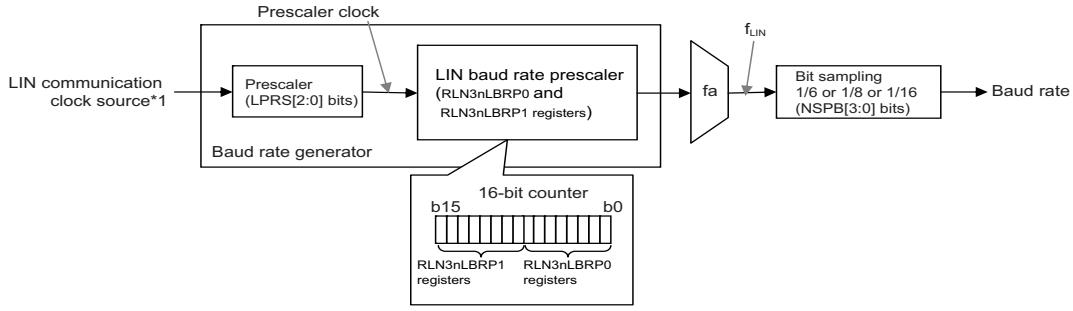
= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP0 + 1) ÷ 2 ÷ 16 [bps] (When fb is selected for $f_{LIN}$)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP0 + 1) ÷ 8 ÷ 16 [bps] (When fc is selected for $f_{LIN}$)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP1 + 1) ÷ 2 ÷ 16 [bps] (When fd is selected for $f_{LIN}$)

### 19.10.2 LIN Slave Mode

**Figure 19.36** shows a block diagram of baud rate generation in LIN slave mode.



Note 1. For the LIN communication clock source, see **Section 12.5.3, Clock Domain Settings**.

**Figure 19.36 Block Diagram of Baud Rate Generation in LIN Slave Mode**

In LIN slave mode (auto baud rate), the baud rate can be specified in the range of 1 kbps to 20 kbps. Configure the prescaler clock as follows according to the target baud rate:

| [Target baud rate] | [Prescaler clock] |
|---|---|
| 1 kbps to 20 kbps | : 4MHz *1 |
| 1 kbps to 2.4 kbps (excluding 2.4 kbps) | : 4MHz |
| 2.4 kbps to 20 kbps | : 8 MHz to 12 MHz |

**Note 1.** Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to "$0011_B$" (4 samplings).

The formula for baud rate is described below.

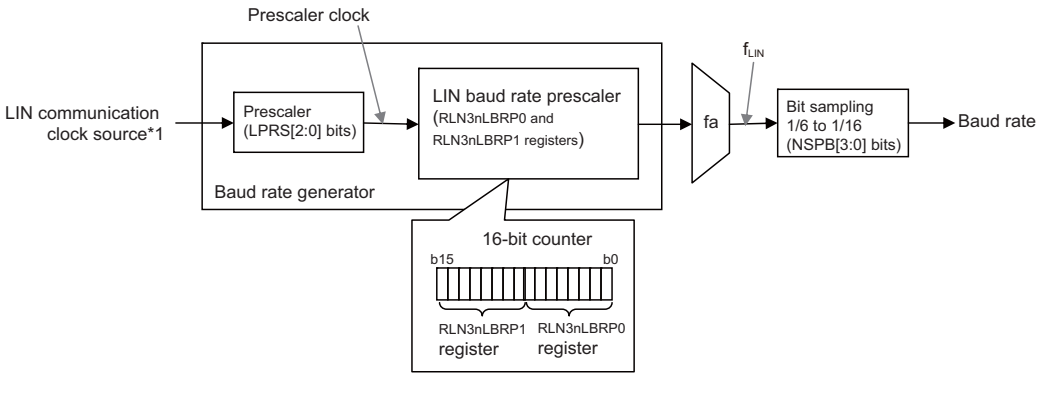
Baud rate of LIN slave
= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP01 + 1) ÷ 16 [bps] ([Fixed baud rate])
= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP01 + 1) ÷ 4 or 8 [bps] ([Auto baud rate])

**NOTE**

For a LIN slave with fixed baud rate, set the NSPB[3:0] bit to "$0000_B$" (16 samplings) or "$1111_B$" (16 samplings). For a LIN slave with auto baud rate, set the NSPB[3:0] bits to "$0011_B$" (4 samplings) or "$0100_B$" (8 samplings).

### 19.10.3 UART Mode

**Figure 19.37** shows a block diagram of baud rate generation in UART mode.



Note 1. For the LIN communication clock source, see **Section 12.5.3, Clock Domain Settings**.

**Figure 19.37 Block Diagram of Baud Rate Generation in UART Mode**

UART baud rate is calculated with the following formula:

UART baud rate
= {LIN communication clock source frequency} × (RLN3nLWBR.LPRS[2:0] selected clock) ÷ (RLN3nLBRP01 + 1) ÷ {RLN3nLWBR.NSPB[3:0] selected count} [bps]

## 19.11 Noise Filter

The LIN/UART interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (use the noise filter), the noise filter is activated. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

**Figure 19.38** shows the configuration of the noise filter, **Figure 19.39** shows an example of a noise filter circuit, and **Figure 19.40** shows the determination of the received data when the noise filter is used.

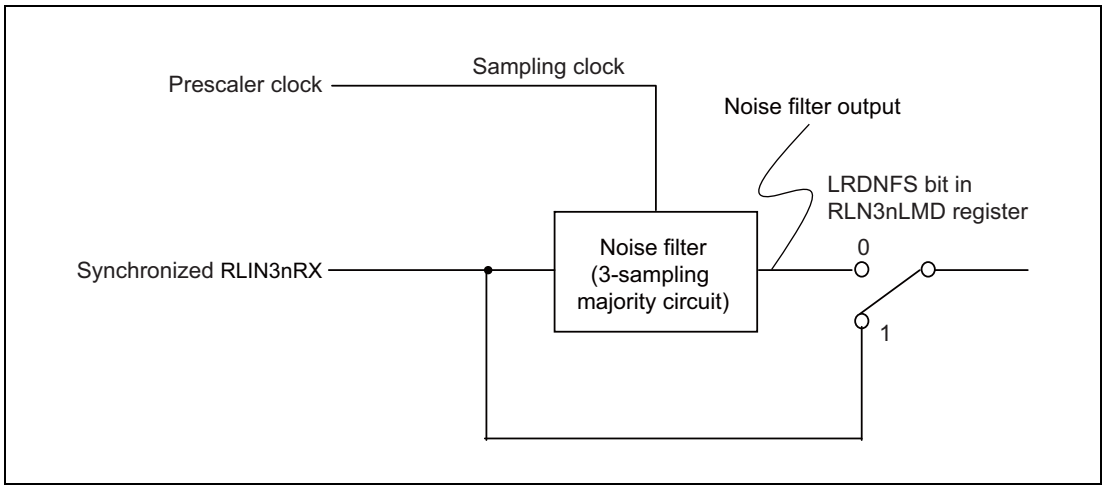


**Figure 19.38 Configuration of Noise Filter**

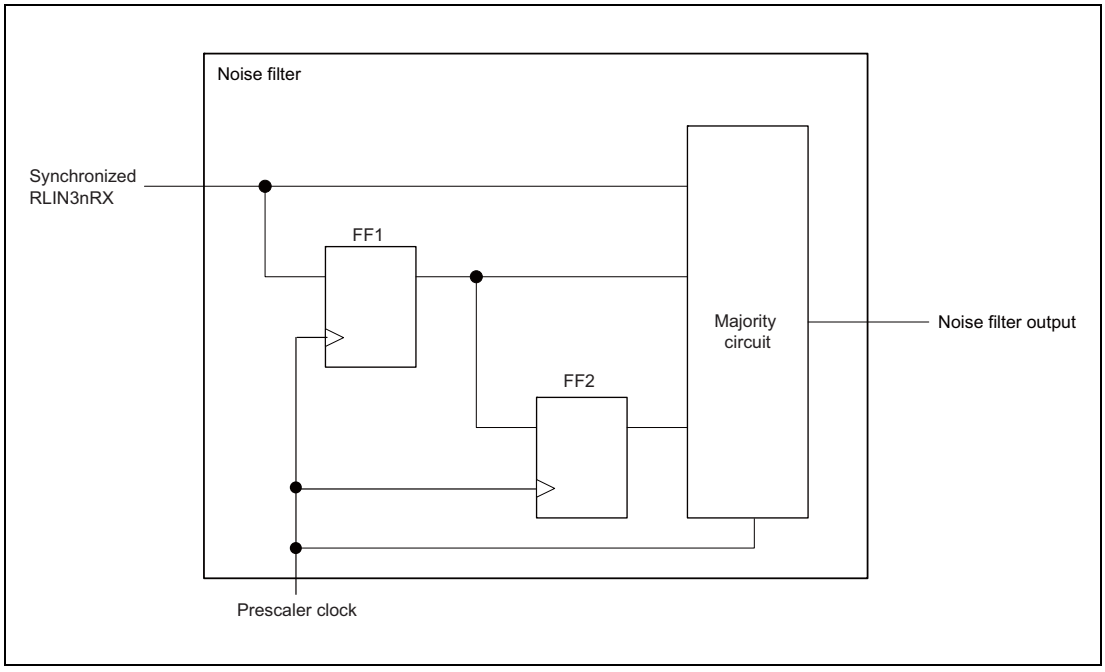

**Figure 19.39 Example of Noise Filter Circuit**

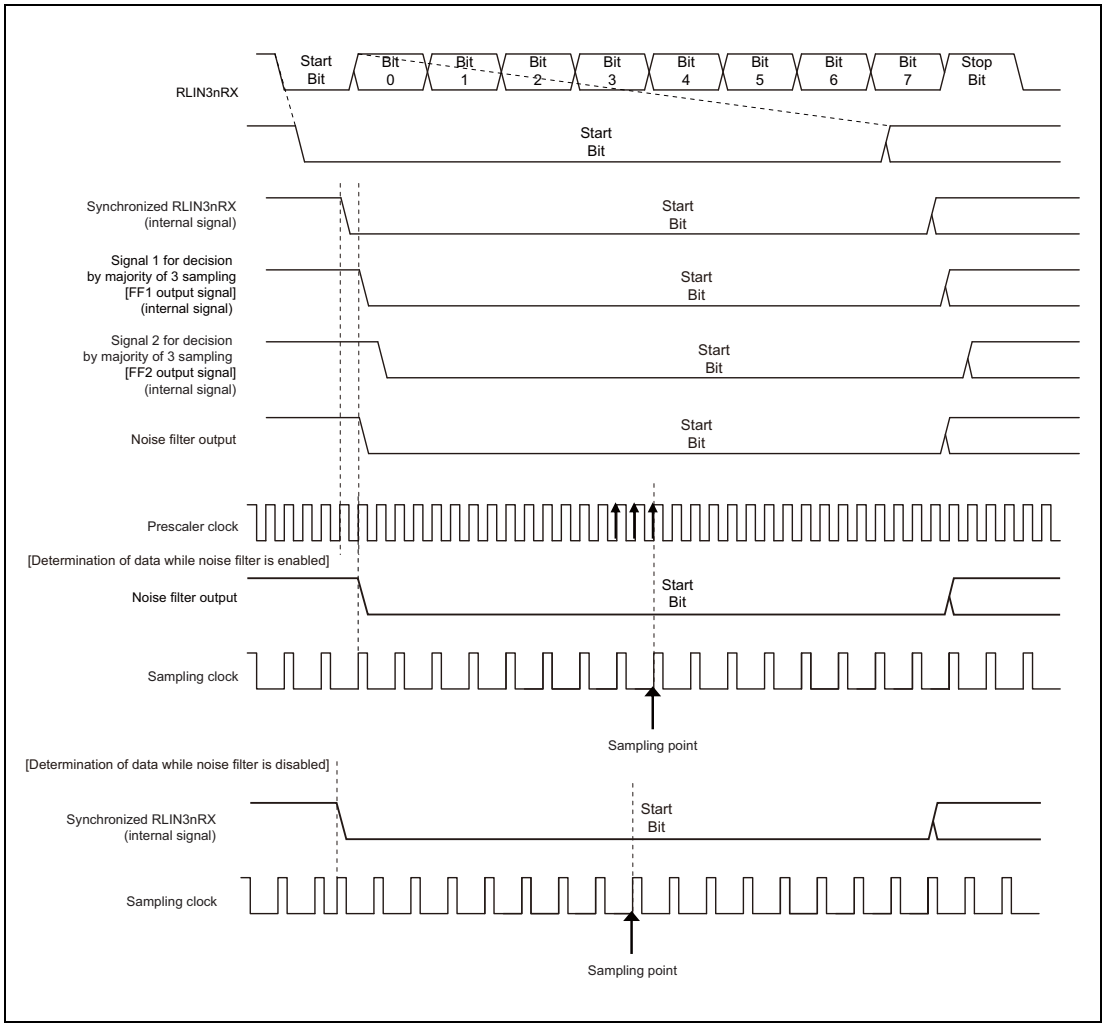

**Figure 19.40 Determination of Received Data when Noise Filter is Used**

# Section 20 I2C Bus Interface (RIIC)

This section contains a generic description of the I2C Bus Interface (RIIC).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RIIC.

## 20.1 Features of RH850/F1K RIIC

### 20.1.1 Number of Units and Channels

This microcontroller has the following number of RIIC units.

Each RIIC unit has one channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

**Table 20.1 Number of Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | | |
| Name | RIICn (n = 0) | | |

**Table 20.2 Index**

| Index | Description |
|---|---|
| n | Throughout this section, the individual RIIC units are identified by the index “n” (n = 0): for example, RIICnCR1 is the I2C bus control register1. |

### 20.1.2 Register Base Address

RIIC base addresses are listed in the following table.

RIIC register addresses are given as offsets from the base addresses.

**Table 20.3 Register Base Address**

| Base Address Name | Base Address |
|---|---|
| <RIIC0_base> | FFCA 0000H |

### 20.1.3 Clock Supply

The RIIC clock supply is shown in the following table.

**Table 20.4 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| RIICn | PCLK*1 | CKSCLK_IIIC | Communication clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_IIIC | |

Note 1. Set the period of PCLK no greater than 1/2 of the width at high level of the SCL clock.

### 20.1.4 Interrupt Requests

RIIC interrupt requests are listed in the following table.

**Table 20.5 Interrupt Requests**

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|---|---|---|---|
| **RIIC0** | | | |
| INTRIICnEE | RIIC communication error / event generation interrupt | 77 | — |
| INTRIICnRI | RIIC receive end interrupt | 78 | 20 |
| INTRIICnTI | RIIC transmit data empty interrupt | 76 | 19 |
| INTRIICnTEI | RIIC transmit end interrupt | 79 | — |

### 20.1.5 Reset Sources

RIIC reset sources are listed in the following table. RIIC is initialized by these reset sources.

**Table 20.6 Reset Sources**

| Unit Name | Reset Source |
|---|---|
| RIIC0 | All reset sources (ISORES) |

### 20.1.6 External Input/Output Signals

External input/output signals of RIIC are listed below.

**Table 20.7 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **RIIC0** | | |
| RIICnSCL | Serial clock I/O pin | RIIC0SCL |
| RIICnSDA | Serial data I/O pin | RIIC0SDA |

When using these ports, the PBDCn register for the corresponding port and the corresponding bit in the PODCn register must be set to 1.

# 20.2 Overview

## 20.2.1 Functional Overview

### Communications format

- I2C bus format
- Master mode or slave mode selectable
- Automatic securing of the various set-up times, hold times, and bus-free times according to the specified transfer rate

### Transfer rate

Up to 400 kbps

### SCL clock

- For master operation, the duty cycle of the SCL clock is selectable in the following range:
  - 0% < Duty < 100%

### Issuing and detecting conditions

Start, restart, and stop conditions are automatically generated. Start conditions (including restart conditions) and stop conditions are detectable.

### Slave address

- Up to three slave-address settings can be made.
- Seven- and ten-bit address formats are supported (along with the use of both at once).
- General call addresses and device ID addresses are detectable.

### Acknowledgement

- For transmission, the acknowledge bit is automatically loaded
  - Transfer of the next data for transmission can be automatically suspended on detection of a not-acknowledge bit.
- For reception, the acknowledge bit is automatically transmitted
  - If a wait between the eighth and ninth clock cycles has been selected, software control of the value in the acknowledge field in response to the received value is possible.

### Wait function

- In reception, the following periods of waiting can be obtained by holding the clock signal (SCL) at the low level:
  - Waiting between the eighth and ninth clock cycles
  - Waiting between the ninth clock cycle and the first clock cycle of the next transfer (WAIT function)

### SDA output delay function

Timing of the output of transmitted data, including the acknowledge bit, can be delayed.

### Arbitration

- For multi-master operation
  - Operation to synchronize the SCL (clock) signal in cases of conflict with the SCL signal from another master is possible.
  - When issuing the start condition would create conflict on the bus, loss of arbitration is detected by testing for non-matching between the internal signal for the SDA line and the level on the SDA line.
  - In master operation, loss of arbitration is detected by testing for non-matching of internal and line levels for transmit data.
- Loss of arbitration due to detection of the start condition while the bus is busy can be detected (to prevent the issuing of double start conditions).
- Loss of arbitration in transfer of a not-acknowledge bit due to the internal signal for the SDA line and the level on the SDA line not matching can be detected.
- Loss of arbitration due to non-matching of internal and line levels for data can be detected in slave transmission.

### Timeout function

The internal time-out function is capable of detecting long-interval stop of the SCL (clock signal).

### Noise removal

The interface incorporates digital noise filters for both the SCL and SDA signals, and the width for noise cancellation by the filters is adjustable by software.

### Interrupt sources

- Four sources:
  - Error in transfer or occurrence of events (detection of arbitration loss, NACK, time-out, a start condition including a restart condition, or a stop condition)
  - Reception complete (including matching with a slave address)
  - Transmit-data-empty (including matching with a slave address)
  - Transmission complete

## 20.2.2 Block Diagram

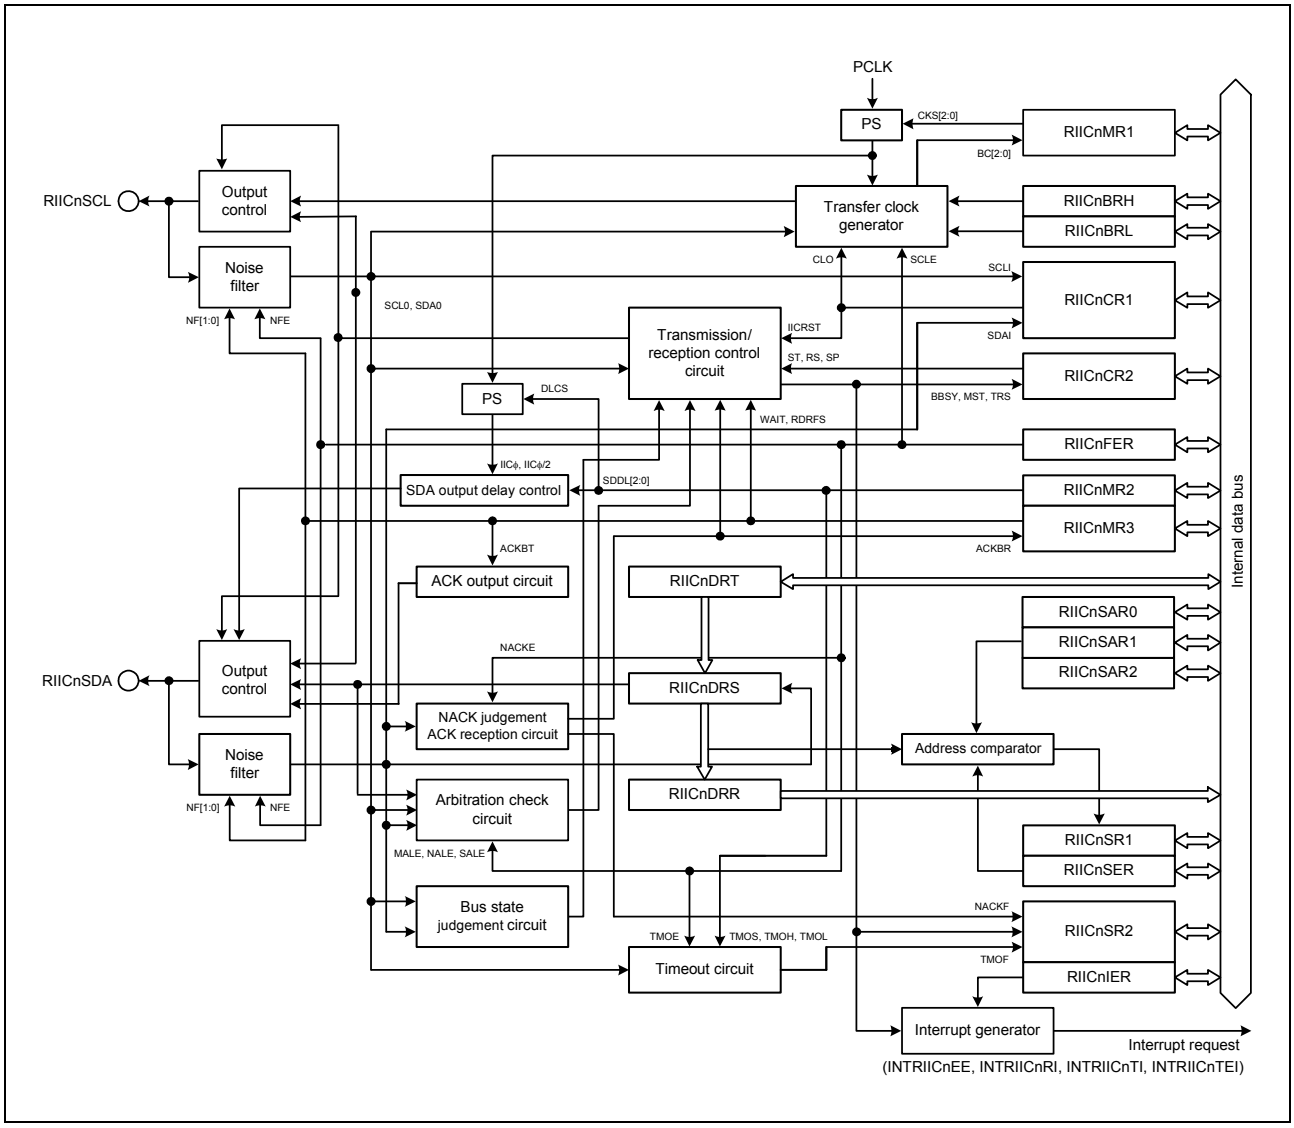

**Figure 20.1 Block Diagram of RIIC**

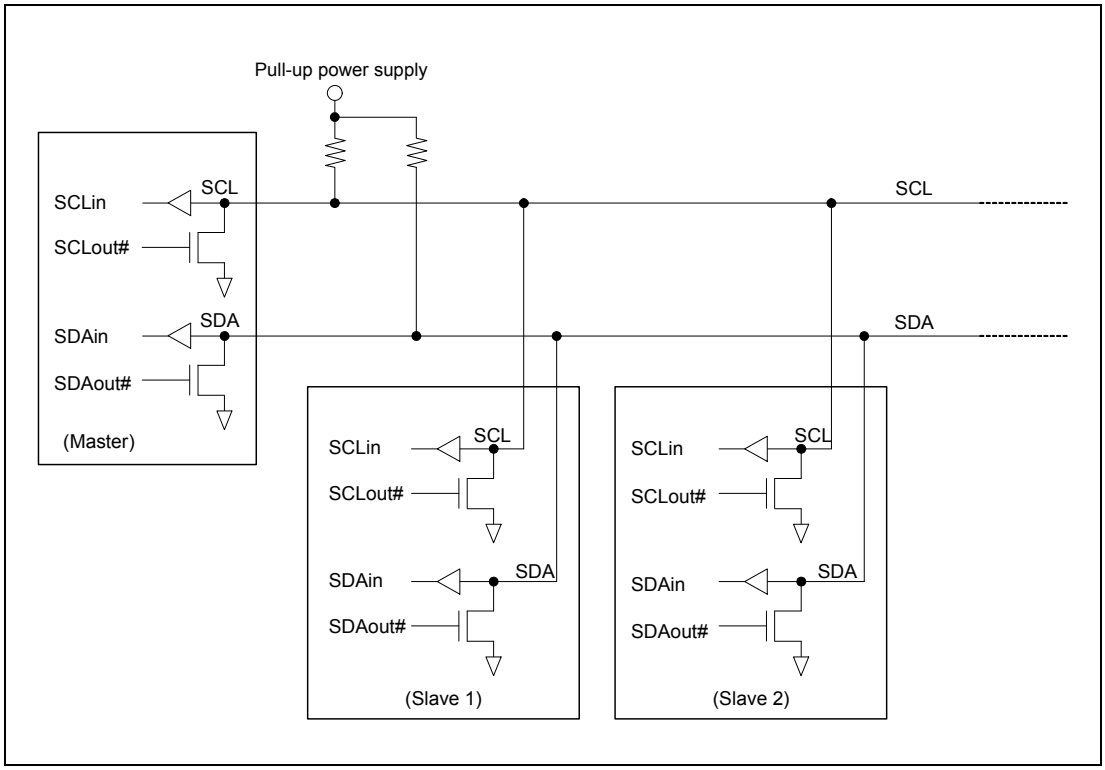

**Figure 20.2 Connections to the External Circuit by the I/O Pins (I2C Bus Configuration Example)**

# 20.3 Registers

## 20.3.1 List of Registers

RIIC registers are listed in the table below.

For details about <RIICn_base>, see **Section 20.1.2, Register Base Address**.

**Table 20.8 List of Registers**

| Module Name | Register Name | Symbol | Address |
|---|---|---|---|
| RIICn | I2C Bus Control Register 1 | RIICnCR1 | <RIICn_base> + $0000_H$ |
| | I2C Bus Control Register 2 | RIICnCR2 | <RIICn_base> + $0004_H$ |
| | I2C Bus Mode Register 1 | RIICnMR1 | <RIICn_base> + $0008_H$ |
| | I2C Bus Mode Register 2 | RIICnMR2 | <RIICn_base> + $000C_H$ |
| | I2C Bus Mode Register 3 | RIICnMR3 | <RIICn_base> + $0010_H$ |
| | I2C Bus Function Enable Register | RIICnFER | <RIICn_base> + $0014_H$ |
| | I2C Bus Status Enable Register | RIICnSER | <RIICn_base> + $0018_H$ |
| | I2C Bus Interrupt Enable Register | RIICnIER | <RIICn_base> + $001C_H$ |
| | I2C Bus Status Register 1 | RIICnSR1 | <RIICn_base> + $0020_H$ |
| | I2C Bus Status Register 2 | RIICnSR2 | <RIICn_base> + $0024_H$ |
| | I2C Slave Address Register 0 | RIICnSAR0 | <RIICn_base> + $0028_H$ |
| | I2C Slave Address Register 1 | RIICnSAR1 | <RIICn_base> + $002C_H$ |
| | I2C Slave Address Register 2 | RIICnSAR2 | <RIICn_base> + $0030_H$ |
| | I2C Bus Bit Rate Low-Level Register | RIICnBRL | <RIICn_base> + $0034_H$ |
| | I2C Bus Bit Rate High-Level Register | RIICnBRH | <RIICn_base> + $0038_H$ |
| | I2C Bus Transmit Data Register | RIICnDRT | <RIICn_base> + $003C_H$ |
| | I2C Bus Receive Data Register | RIICnDRR | <RIICn_base> + $0040_H$ |
| | I2C Bus Shift Register | RIICnDRS | — |

## 20.3.2 RIICnCR1 — I2C Bus Control Register 1

**Access:** RIICnCR1 register can be read or written in 32-bit units.
RIICnCR1L register can be read or written in 16-bit units.
RIICnCR1LL register can be read or written in 8-bit units.

**Address:** RIICnCR1: <RIICn_base> + $0000_H$

RIICnCR1L: <RIICn_base> + $0000_H$

RIICnCR1LL: <RIICn_base> + $0000_H$

**Value after reset:** 0000 $001F_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | ICE | IICRST | CLO | SOWP | SCLO | SDAO | SCLI | SDAI |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | W | R/W | R/W | R | R |

**Table 20.9 RIICnCR1 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 7 | ICE | I2C Bus Interface Enable<br>0: Disabled (the RIICnSCL and RIICnSDA pins are not driven).<br>1: Enabled (the RIICnSCL and RIICnSDA pins are driven).<br>(This bit selects an RIIC reset or internal reset in combination with the IICRST bit.) |
| 6 | IICRST | I2C Bus Interface Internal Reset<br>0: Clears the RIIC reset or internal reset.<br>1: Initiates the RIIC reset or internal reset.<br>(Clears the bit counter and the SCL/SDA output latch) |
| 5 | CLO | Extra SCL Clock Cycle Output<br>0: Does not output an extra SCL clock cycle (default).<br>1: Outputs an extra SCL clock cycle.<br>(The CLO bit is cleared automatically after one clock cycle is output.) |
| 4 | SOWP | SCLO/SDAO Write Protect<br>0: Bits SCLO and SDAO can be written.<br>1: Bits SCLO and SDAO are protected.<br>(This bit is read as 1.) |
| 3 | SCLO | SCL Output Control/Monitor<br>• Read:<br>0: The RIIC has driven the RIICnSCL pin low.<br>1: The RIIC has released the RIICnSCL pin.<br>• Write:<br>0: The RIIC drives the RIICnSCL pin low.<br>1: The RIIC releases the RIICnSCL pin. |

Table 20.9 RIICnCR1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 2 | SDAO | SDA Output Control/Monitor<br>• Read:<br>0: The RIIC has driven the RIICnSDA pin low.<br>1: The RIIC has released the RIICnSDA pin.<br>• Write:<br>0: The RIIC drives the RIICnSDA pin low.<br>1: The RIIC releases the RIICnSDA pin. |
| 1 | SCLI | SCL Line Monitor<br>0: RIICnSCL line is low.<br>1: RIICnSCL line is high. |
| 0 | SDAI | SDA Line Monitor<br>0: RIICnSDA line is low.<br>1: RIICnSDA line is high. |

### SDAO Bit (SDA Output Control/Monitor) and SCLO Bit (SCL Output Control/Monitor)

These bits are used to directly control the RIICnSDA and RIICnSCL signals output from the RIIC.

When writing to these bits, also write 0 to the SOWP bit.

The result of setting these bits is input to the RIIC via the input buffer. When slave mode is selected, a START condition may be detected and the bus may be released depending on the bit settings.

Do not rewrite these bits during a START condition, STOP condition, repeated START condition, or during transmission or reception. Operation after rewriting under the above conditions is not guaranteed.

When reading these bits, the state of signals output from the RIIC can be read.

### CLO Bit (Extra SCL Clock Cycle Output)

This bit is used to output an extra SCL clock cycle for debugging or error processing.

Normally, set the bit to 0. Setting the bit to 1 in a normal communication state causes a communication error.

For details on this function, see **Section 20.13.2, Extra SCL Clock Cycle Output Function**.

### IICRST Bit (I2C Bus Interface Internal Reset)

This bit is used to reset the internal states of the RIIC.

Setting this bit to 1 initiates an RIIC reset or internal reset.

Whether an RIIC reset or internal reset is initiated is determined according to the combination with the ICE bit. **Table 20.10** lists the types of RIIC reset.

The RIIC reset resets all registers (except ICE and IICRST) including the RIICnCR2.BBSY flag and internal states of the RIIC, and the internal reset resets the bit counter (RIICnMR1.BC[2:0] bits), the I2C bus shift register (RIICnDRS), and the I2C bus status registers (RIICnSR1 and RIICnSR2) as well as the internal states of the RIIC. For the reset conditions for each register, see **Section 20.14, Reset Function of RIIC**.

An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the RIIC without initializing the port settings and the control and setting registers of the RIIC when the bus or RIIC hangs up due to a communication errorr, etc.

If the RIIC hangs up in a low level output state, resetting the internal states cancels the low level output state and releases the bus with the RIICnSCL pin and RIICnSDA pin at a high impedance.

**CAUTION**

If an internal reset is initiated using the IICRST bit for a bus hang-up occurred during communication with the master device in slave mode, the states may become different between the slave device and the master device (due to the difference in the bit counter information). For this reason, do not initiate an internal reset in slave mode, but initiate restoration processing from the master device. If an internal reset is necessary because the RIIC hangs up with the SCL line in a low level output state in slave mode, initiate an internal reset and then issue a restart condition from the master device or resume communication from the start condition issuance after issuing a stop condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start condition or restart condition from the master device, synchronization will be lost because the master and slave devices operate asynchronously.

**Table 20.10 RIIC Resets**

| IICRST | ICE | State | Specifications |
|---|---|---|---|
| 1 | 0 | RIIC reset | Resets all registers (except ICE and IICRST) and internal states of the RIIC. |
| | 1 | Internal reset | Reset the RIICnMR1.BC[2:0] bits, and the RIICnSR1, RIICnSR2, RIICnDRS registers and the internal states of the RIIC. |

### ICE Bit (I2C Bus Interface Enable)

The ICE bit selects driving or non-driving of the RIICnSCL and RIICnSDA pins. Moreover, this bit can perform two types of reset in combination with the IICRST bit. For the types of reset, see **Table 20.10, RIIC Resets**.

Set the ICE bit to 1 when using RIIC. Setting the ICE bit to 1 selects driving of the RIICnSCL and RIICnSDA pins.

Set the ICE bit to 0 when RIIC is not to be used. Clearing the ICE bit to 0 stops driving of the RIICnSCL and RIICnSDA pins.

**CAUTION**

Though the output from RIICnSDA or RIICnSCL is disabled while the ICE bit is 0, the input to RIICnSDA or RIICnSCL is enabled. The RIICnSCL and RIICnSDA pin functions should not be assigned to the RIIC. If assigned, it causes the slave addresses to be compared.

## 20.3.3 RIICnCR2 — I2C Bus Control Register 2

**Access:** RIICnCR2 register can be read or written in 32-bit units.
RIICnCR2L register can be read or written in 16-bit units.
RIICnCR2LL register can be read or written in 8-bit units.

**Address:** RIICnCR2: <RIICn_base> + $0004_H$

RIICnCR2L: <RIICn_base> + $0004_H$

RIICnCR2LL: <RIICn_base> + $0004_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | BBSY | MST | TRS | — | SP | RS | ST | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R | R/W | R/W | R/W | R |

**Table 20.11 RIICnCR2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 7 | BBSY | Bus Busy Detection Flag<br>0: The I2C bus is released (the bus is free).<br>1: The I2C bus is occupied (the bus is busy). |
| 6 | MST*1 | Master/Slave Mode<br>0: Slave mode<br>1: Master mode |
| 5 | TRS*1 | Transmit/Receive Mode<br>0: Receive mode<br>1: Transmit mode |
| 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | SP | Stop Condition Issuance Request<br>0: Does not request to issue a stop condition.<br>1: Requests to issue a stop condition. |
| 2 | RS | Restart Condition Issuance Request<br>0: Does not request to issue a restart condition.<br>1: Requests to issue a restart condition. |
| 1 | ST | Start Condition Issuance Request<br>0: Does not request to issue a start condition.<br>1: Requests to issue a start condition. |
| 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Note 1. When the RIICnMR1.MTWP bit is set to 1, the MST and TRS bits can be written to.

### ST Bit (Start Condition Issuance Request)

This bit is used to request transition to master mode and issuance of a start condition.

When this bit is set to 1 to request to issue a start condition, a start condition is issued when the BBSY flag is set to 0 (bus free).

For details on the start condition issuance, see **Section 20.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the ST bit

[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition has been issued
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTION**

Set the ST bit to 1 (start condition issuance request) when the BBSY flag is set to 0 (bus free).
Note that arbitration may be lost as the start condition issuance error if the ST bit is set to 1 (start condition issuance request) when the BBSY flag is set to 1 (bus busy).

### RS Bit (Restart Condition Issuance Request)

This bit is used to request that a restart condition be issued in master mode.

When this bit is set to 1 to request to issue a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the restart condition issuance, see **Section 20.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the RS bit with the RIICnCR2.BBSY flag set to 1

[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition has been issued or a start condition is detected
- When a stop condition is detected
- When the RIICnCR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTIONS**

1. Do not set the RS bit to 1 while issuing a stop condition.
2. It is commended to issue a restart condition in master transmit mode. If the RS bit is set to 1 (restart condition issuance request) in mode other than master mode, the restart condition is not issued in this mode but the RS bit remains set. If the operating mode changes to master mode with the bit not being cleared, the restart condition may be issued.

### SP Bit (Stop Condition Issuance Request)

This bit is used to request that a stop condition be issued in master mode.

When this bit is set to 1 to request to issue a stop condition, a stop condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the stop condition issuance, see **Section 20.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the SP bit with both the RIICnCR2.BBSY flag and the RIICnCR2.MST bit set to 1

[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition has been issued or a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When a start condition and a restart condition are detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTIONS**

1. Writing to the SP bit is not possible while the setting of the BBSY flag is 0 (bus free).
2. Do not set the SP bit to 1 while a restart condition is being issued.

### TRS Bit (Transmit/Receive Mode)

This bit indicates transmit or receive mode.

The RIIC is in receive mode when the TRS bit is set to 0 and is in transmit mode when the bit is set to 1. Combination of this bit and the MST bit indicates the operating mode of the RIIC.

The value of the TRS bit is automatically changed to the value for transmission mode or reception mode (1 or 0) by detection or issuing of a start condition, setting or clearing of the R/W# bit, etc. Although writing to the TRS bit is possible when the RIICnMR1.MTWP bit is set to 1, writing to this bit is not necessary during normal usage.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When the address received in slave mode matches the address enabled in RIICnSER, with the R/W# bit set to 1
- When 1 is written to the TRS bit with the RIICnMR1.MTWP bit set to 1

[Clearing conditions]

- When a stop condition is detected
- The RIICnSR2.AL (arbitration-lost) flag being set to 1
- In master mode, reception of a slave address to which an R/W# bit with the value 1 is appended
- In slave transmit mode, a restart condition is detected (a restart condition is detected with RIICnCR2.BBSY = 1 and RIICnCR2.MST = 0)

- When 0 is written to the TRS bit with the RIICnMR1.MTWP bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### MST Bit (Master/Slave Mode)

This bit indicates master or slave mode.

The RIIC is in slave mode when the MST bit is set to 0 and is in master mode when the bit is set to 1. Combination of this bit and the TRS bit indicates the operating mode of the RIIC.

The value of the MST bit is automatically changed to the value for master mode or slave mode (1 or 0) by detection or issuing of a start condition, etc. Although writing to the MST bit is possible when the RIICnMR1.MTWP bit is set to 1, writing to this bit is not necessary during normal usage.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When 1 is written to the MST bit with the RIICnMR1.MTWP bit set to 1

[Clearing conditions]

- When a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 0 is written to the MST bit with the RIICnMR1.MTWP bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### BBSY Flag (Bus Busy Detection)

The BBSY flag indicates whether the I2C bus is occupied (bus busy) or released (bus free).

This bit is set to 1 when the SDA line changes from high to low under the condition of SCL = high, assuming that a start condition has been issued.

When the SDA line changes from low to high under the condition of SCL = high, this bit is cleared to 0 after the bus free time (specified in RIICnBRL) start condition is not detected, assuming that a stop condition has been issued.

[Setting condition]

When a start condition is detected

[Clearing conditions]

- When the bus free time (specified in RIICnBRL) start condition is not detected after detecting a stop condition
- When 1 is written to the RIICnCR1.IICRST bit with the RIICnCR1.ICE bit set to 0 (RIIC reset)

**CAUTION**

- When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
- When an internal reset is applied while the bus is not free, the BBSY flag is not cleared.

## 20.3.4 RIICnMR1 — I2C Bus Mode Register 1

**Access:** RIICnMR1 register can be read or written in 32-bit units.
RIICnMR1L register can be read or written in 16-bit units.
RIICnMR1LL register can be read or written in 8-bit units.

**Address:** RIICnMR1: <RIICn_base> + $0008_H$

RIICnMR1L: <RIICn_base> + $0008_H$

RIICnMR1LL: <RIICn_base> + $0008_H$

**Value after reset:** $0000\ 0008_H$

Note 1. When rewriting the BC[2:0] bits, write 0 to the BCWP bit simultaneously.

### BC[2:0] Bits (Bit Counter)

These bits function as a counter that indicates the number of bits remaining to be transferred at the detection of a rising edge on the SCL line. Although these bits are writable and readable, it is not necessary to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one (data is transferred with an additional acknowledge bit) between transferred frames. When setting any value other than $000_B$, set the value while the SCL line is at a low level.

[Clearing conditions]

- When 1 is written to the RIICnCR1.IICRST bit and a RIIC reset or internal reset is initiated.
- Data transfer including the acknowledge bit being completed.
- A start condition including a restart condition being detected.

## 20.3.5 RIICnMR2 — I2C Bus Mode Register 2

**Access:** RIICnMR2 register can be read or written in 32-bit units.
RIICnMR2L register can be read or written in 16-bit units.
RIICnMR2LL register can be read or written in 8-bit units.

**Address:** RIICnMR2: <RIICn_base> + $000C_H$

RIICnMR2L: <RIICn_base> + $000C_H$

RIICnMR2LL: <RIICn_base> + $000C_H$

**Value after reset:** $0000\ 0006_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.13 RIICnMR2 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 7 | DLCS | SDA Output Delay Clock Source Selection<br>0: The internal reference clock (IICϕ) is selected as the clock source of the SDA output delay counter.<br>1: The internal reference clock divided by 2 (IICϕ/2) is selected as the clock source of the SDA output delay counter.*1 |
| 6 to 4 | SDDL[2:0] | SDA Output Delay Counter<br>• When RIICnMR2.DLCS = 0 (IICϕ)<br>b6 b4<br>0 0 0: No output delay<br>0 0 1: 1 IICϕ cycle<br>0 1 0: 2 IICϕ cycles<br>0 1 1: 3 IICϕ cycles<br>1 0 0: 4 IICϕ cycles<br>1 0 1: 5 IICϕ cycles<br>1 1 0: 6 IICϕ cycles<br>1 1 1: 7 IICϕ cycles<br>• When RIICnMR2.DLCS = 1 (IICϕ/2)<br>b6 b4<br>0 0 0: No output delay<br>0 0 1: 1 or 2 IICϕ cycles<br>0 1 0: 3 or 4 IICϕ cycles<br>0 1 1: 5 or 6 IICϕ cycles<br>1 0 0: 7 or 8 IICϕ cycles<br>1 0 1: 9 or 10 IICϕ cycles<br>1 1 0: 11 or 12 IICϕ cycles<br>1 1 1: 13 or 14 IICϕ cycles |
| 3 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 2 | TMOH | Timeout H Count Control<br>0: Disables counting while the SCL line is at a high level.<br>1: Enables counting while the SCL line is at a high level. |

Table 20.13 RIICnMR2 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 1 | TMOL | Timeout L Count Control<br>0: Disables counting while the SCL line is at a low level.<br>1: Enables counting while the SCL line is at a low level. |
| 0 | TMOS | Timeout Detection Time Selection<br>0: Long mode is selected.<br>1: Short mode is selected. |

Note 1. The setting DLCS = 1 (IICϕ/2) only becomes valid when SCL is at the low level. When SCL is at the high level, the setting DLCS = 1 becomes invalid and the clock source becomes the internal reference clock (IICϕ).

### TMOS Bit (Timeout Detection Time Selection)

This bit is used to select long mode or short mode for the timeout detection time when the timeout function is enabled (RIICnFER.TMOE bit = 1). When this bit is set to 0, long mode is selected. When this bit is set to 1, short mode is selected. In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14 bit-counter. While the SCL line is in the state that enables this counter as specified by bits TMOH and TMOL, the counter counts up in synchronization with the internal reference clock (IICϕ) as a count source.

For details on the timeout function, see **Section 20.13.1, Timeout Function**.

### TMOL Bit (Timeout L Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held low when the timeout function is enabled (RIICnFER.TMOE bit = 1).

### TMOH Bit (Timeout H Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held high when the timeout function is enabled (RIICnFER.TMOE bit = 1).

### SDDL[2:0] Bits (SDA Output Delay Setup Counter)

The SDA output can be delayed by the SDDL[2:0] setting. This counter works with the clock source selected by the DLCS bit. The setting of this function can be used for all types of SDA output, including the transmission of the acknowledge bit.

For details on this function, see **Section 20.7, Facility for Delaying SDA Output**.

**CAUTION**

Set the SDA output delay time to meet the I2C bus standard (within the data enable time/acknowledge enable time*1). Note that, if a value outside the standard is set, communication with communication devices may malfunction or it may seemingly become a start condition or stop condition depending on the bus state.

Note 1. Data enable time/acknowledge enable time
3,450 ns (up to 100 kbps: standard mode [Sm])
900 ns (up to 400 kbps: fast mode [Fm])

## 20.3.6 RIICnMR3 — I2C Bus Mode Register 3

**Access:** RIICnMR3 register can be read or written in 32-bit units.
RIICnMR3L register can be read or written in 16-bit units.
RIICnMR3LL register can be read or written in 8-bit units.

**Address:** RIICnMR3: <RIICn_base> + $0010_H$

RIICnMR3L: <RIICn_base> + $0010_H$

RIICnMR3LL: <RIICn_base> + $0010_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | WAIT | RDRFS | ACKWP | ACKBT | ACKBR | NF[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R | R/W | R/W |

**Table 20.14 RIICnMR3 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 7 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 6 | WAIT*2 | WAIT<br>0: No WAIT<br>(The period between ninth clock cycle and first clock cycle is not held low.)<br>1: WAIT<br>(The period between ninth clock cycle and first clock cycle is held low.)<br>Low-hold is released by reading RIICnDRR. |
| 5 | RDRFS*2 | RDRF Flag Set Timing Selection<br>0: The RDRF flag is set at the rising edge of the ninth SCL clock cycle.<br>(The SCL line is not held low at the falling edge of the eighth clock cycle.)<br>1: The RDRF flag is set at the rising edge of the eighth SCL clock cycle.<br>(The SCL line is held low at the falling edge of the eighth clock cycle.) Low-hold is released by writing a value to the ACKBT bit. |
| 4 | ACKWP*1 | ACKBT Write Protect<br>0: Modification of the ACKBT bit is disabled.<br>1: Modification of the ACKBT bit is enabled. |
| 3 | ACKBT*1 | Transmit Acknowledge<br>0: A 0 is sent as the acknowledge bit (ACK transmission).<br>1: A 1 is sent as the acknowledge bit (NACK transmission). |
| 2 | ACKBR | Receive Acknowledge<br>0: A 0 is received as the acknowledge bit (ACK reception).<br>1: A 1 is received as the acknowledge bit (NACK reception). |
| 1, 0 | NF[1:0] | Digital noise Filter Stage Selection<br>b1 b0<br>0 0: Noise of up to one IICϕ cycle is filtered out (single-stage filter).<br>0 1: Noise of up to two IICϕ cycles is filtered out (2-stage filter).<br>1 0: Noise of up to three IICϕ cycles is filtered out (3-stage filter).<br>1 1: Noise of up to four IICϕ cycles is filtered out (4-stage filter). |

Note 1. If it is attempted to write 1 to both ACKWP and ACKBT bits, the ACKBT bit cannot be set to 1.

Note 2. The WAIT and RDRFS bits are valid only in receive mode (invalid in transmit mode).

### NF[1:0] Bits (Digital noise Filter Stage Selection)

These bits are used to select the number of stages of the digital noise filter.

**CAUTION**

Set the noise range to be filtered out by the noise filter within a range less than the SCL line high-level period or low-level period. If the noise range is set to a value of (SCL clock width: high-level period or low-level period, whichever is shorter) - [1.5 internal reference clock synchronized (IICϕ) cycles] or more, the SCL clock is regarded as noise by the noise filter function of the RIIC, which may prevent the RIIC from operating normally.

### ACKBR Bit (Receive Acknowledge)

This bit is used to store the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

When 1 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When 0 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

### ACKBT Bit (Transmit Acknowledge)

This bit is used to set the bit to be sent at the acknowledge timing in receive mode.

[Setting condition]

When 1 is written to this bit with the ACKWP bit set to 1

[Clearing conditions]

- When 0 is written to this bit after ACKWP reading while the ACKWP bit is set to 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

**CAUTION**

The ACKBT bit must be written to while the ACKWP bit is 1. If the ACKBT bit is written to with the ACKWP bit cleared to 0, writing to the ACKBT bit is disabled.

### ACKWP Bit (ACKBT Write Protect)

This bit is used to control the modification of the ACKBT bit.

### RDRFS Bit (RDRF Flag Set Timing Selection)

This bit is used to select the RDRF flag set timing in receive mode and also to select whether to hold the SCL line low at the falling edge of the eighth SCL clock cycle.

When the RDRFS bit is 0, the SCL line is not held low at the falling edge of the eighth SCL clock cycle, and the RDRF flag is set to 1 at the rising edge of the ninth SCL clock cycle.

When the RDRFS bit is 1, the RDRF flag is set to 1 at the rising edge of the eighth SCL clock cycle and the SCL line is held low at the falling edge of the eighth SCL clock cycle. The low-hold of the SCL line is released by writing a value to the ACKBT bit.

After data is received with this setting, the SCL line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1) according to receive data.

### WAIT Bit (WAIT)

This bit is used to control whether to hold the period between the ninth SCL clock cycle and the first SCL clock cycle low until the receive data buffer (RIICnDRR) is completely read each time single-byte data is received in receive mode.

When the WAIT bit is 0, the receive operation is continued without holding the period between the ninth and the first SCL clock cycle low. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCL line is held low from the falling edge of the ninth clock cycle until the RIICnDRR value is read each time single-byte data is received. This enables receive operation in byte units.

**CAUTION**

When the value of the WAIT bit is cleared to 0, be sure to read the RIICnDRR beforehand.

## 20.3.7 RIICnFER — I2C Bus Function Enable Register

**Access:** RIICnFER register can be read or written in 32-bit units.
RIICnFERL register can be read or written in 16-bit units.
RIICnFERLL register can be read or written in 8-bit units.

**Address:** RIICnFER: <RIICn_base> + $0014_H$

RIICnFERL: <RIICn_base> + $0014_H$

RIICnFERLL: <RIICn_base> + $0014_H$

**Value after reset:** $0000\ 0072_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 20.15 RIICnFER Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 7 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 6 | SCLE | SCL Synchronous Circuit Enable<br>0: No SCL synchronous circuit is used.<br>1: An SCL synchronous circuit is used. |
| 5 | NFE | Digital Noise Filter Circuit Enable<br>0: No digital noise filter circuit is used.<br>1: A digital noise filter circuit is used. |
| 4 | NACKE | NACK Reception Transfer Suspension Enable<br>0: Transfer operation is not suspended during NACK reception (transfer suspension disabled).<br>1: Transfer operation is suspended during NACK reception (transfer suspension enabled). |
| 3 | SALE | Slave Arbitration-Lost Detection Enable<br>0: Slave arbitration-lost detection is disabled.<br>1: Slave arbitration-lost detection is enabled. |
| 2 | NALE | NACK Transmission Arbitration-Lost Detection Enable<br>0: NACK transmission arbitration-lost detection is disabled.<br>1: NACK transmission arbitration-lost detection is enabled. |
| 1 | MALE | Master Arbitration-Lost Detection Enable<br>0: Master arbitration-lost detection is disabled.<br>(Disables the arbitration-lost detection function and does not clear the RIICnCR2.MST and TRS bits automatically when arbitration is lost.)<br>1: Master arbitration-lost detection is enabled.<br>(Enables the arbitration-lost detection function and clears the RIICnCR2.MST and TRS bits automatically when arbitration is lost.)<br><br>If 1 is written to the ST bit while the BBSY flag is 1 in slave transmit mode, the TRS bit is not cleared. |
| 0 | TMOE | Timeout Function Enable<br>0: The timeout function is disabled.<br>1: The timeout function is enabled. |

#### TMOE Bit (Timeout Function Enable)

This bit is used to enable or disable the timeout function.

For details on the timeout function, see **Section 20.13.1, Timeout Function**.

#### MALE Bit (Master Arbitration-Lost Detection Enable)

This bit is used to select enabling or disabling of the arbitration-lost detection function. Normally, set this bit to 1.

#### NALE Bit (NACK Transmission Arbitration-Lost Detection Enable)

This bit is used to specify whether the detection of ACK during transmission of NACK in reception (such as when slaves with the same address are present on the bus and each is transmitting different data, or when two or more masters select the same slave device simultaneously with different numbers of bytes for reception) is judged to represent a loss in arbitration.

#### SALE Bit (Slave Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode (such as when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs due to noise).

#### NACKE Bit (NACK Reception Transfer Suspension Enable)

This bit is used to specify whether to continue or discontinue the transfer operation when NACK is received in transmit mode. Normally, set this bit to 1.

When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended.

When the NACKE bit is 0, the next transfer operation is continued regardless of the received acknowledge content.

#### SCLE Bit (SCL Synchronous Circuit Enable)

This bit is used to specify whether to synchronize the SCL clock with a rising or falling edge on the SCL line. Normally, set this bit to 1.

When the SCLE bit is cleared to 0 (SCL synchronous circuit not used), the RIIC does not synchronize the SCL clock with the SCL input clock. In this setting, the RIIC outputs the SCL clock with the transfer rate set in RIICnBRH and RIICnBRL regardless of the SCL line state. For this reason, if the bus load of the I2C bus line is much larger than the specification value or if the SCL clock output overlaps in multiple masters, the short-cycle SCL clock that does not meet the specification may be output. When no SCL synchronous circuit is used, it also affects the issuance of a start condition, restart condition, and stop condition, and the continuous output of extra SCL clock cycles.

This bit must not be cleared to 0 except for checking the output of the transfer rate.

## 20.3.8 RIICnSER — I2C Bus Status Enable Register

**Access:** RIICnSER register can be read or written in 32-bit units.
RIICnSERL register can be read or written in 16-bit units.
RIICnSERLL register can be read or written in 8-bit units.

**Address:** RIICnSER: <RIICn_base> + $0018_H$

RIICnSERL: <RIICn_base> + $0018_H$

RIICnSERLL: <RIICn_base> + $0018_H$

**Value after reset:** $0000\ 0009_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W | R/W | R/W | R/W |

**Table 20.16 RIICnSER Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | DIDE | Device-ID Address Detection Enable<br>0: Device-ID address detection is disabled.<br>1: Device-ID address detection is enabled. |
| 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | GCE | General Call Address Enable<br>0: General call address detection is disabled.<br>1: General call address detection is enabled. |
| 2 | SAR2 | Slave Address Register 2 Enable<br>0: Slave address in RIICnSAR2 is disabled.<br>1: Slave address in RIICnSAR2 is enabled. |
| 1 | SAR1 | Slave Address Register 1 Enable<br>0: Slave address in RIICnSAR1 is disabled.<br>1: Slave address in RIICnSAR1 is enabled. |
| 0 | SAR0 | Slave Address Register 0 Enable<br>0: Slave address in RIICnSAR0 is disabled.<br>1: Slave address in RIICnSAR0 is enabled. |

#### SARy Bit (Slave Address Register y Enable) (y = 0 to 2)

This bit is used to enable or disable the slave address set in RIICnSARy.

When this bit is set to 1, the slave address set in RIICnSARy is enabled and is compared with the received slave address.

When this bit is cleared to 0, the slave address set in RIICnSARy is disabled and is ignored even if it matches the received slave address.

#### GCAE Bit (General Call Address Enable)

This bit is used to specify whether to ignore the general call address ($0000\ 000_B$ + 0 [W]: All 0) when it is received.

When this bit is set to 1, if the received slave address matches the general call address, the RIIC recognizes the received slave address as the general call address independently of the slave addresses set in RIICnSARy (y = 0 to 2) and performs data receive operation.

When this bit is cleared to 0, the received slave address is ignored even if it matches the general call address.

#### DIDE Bit (Device-ID Address Detection Enable)

This bit is used to specify whether to recognize and execute the Device-ID address when a device ID ($1111\ 100_B$) is received in the first frame after a start condition or restart condition is detected.

When this bit is set to 1, if the received first frame matches the device ID, the RIIC recognizes that the Device-ID address has been received. When the following R/W# bit is 0 [W], the RIIC recognizes the second and the following frames as slave addresses and continues the receive operation.

When this bit is cleared to 0, the RIIC ignores the received first frame even if it matches the device ID address and recognizes the first frame as a normal slave address.

For details on the device-ID address detection, see **Section 20.9.3, Device-ID Address Detection**.

## 20.3.9 RIICnIER — I2C Bus Interrupt Enable Register

**Access:** RIICnIER register can be read or written in 32-bit units.
RIICnIERL register can be read or written in 16-bit units.
RIICnIERLL register can be read or written in 8-bit units.

**Address:** RIICnIER: <RIICn_base> + $001C_H$

RIICnIERL: <RIICn_base> + $001C_H$

RIICnIERLL: <RIICn_base> + $001C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.17 RIICnIER Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 7 | TIE | Transmit Data Empty Interrupt Enable<br>0: Transmit data empty interrupt request (INTRIICnTI) is disabled.<br>1: Transmit data empty interrupt request (INTRIICnTI) is enabled. |
| 6 | TEIE | Transmit End Interrupt Enable<br>0: Transmit end interrupt request (INTRIICnTEI) is disabled.<br>1: Transmit end interrupt request (INTRIICnTEI) is enabled. |
| 5 | RIE | Receive Complete Interrupt Enable<br>0: Receive complete interrupt request (INTRIICnRI) is disabled.<br>1: Receive complete interrupt request (INTRIICnRI) is enabled. |
| 4 | NAKIE | NACK Reception Interrupt Enable<br>0: NACK reception interrupt request (NAKI) is disabled.<br>1: NACK reception interrupt request (NAKI) is enabled. |
| 3 | SPIE | Stop Condition Detection Interrupt Enable<br>0: Stop condition detection interrupt request (SPI) is disabled.<br>1: Stop condition detection interrupt request (SPI) is enabled. |
| 2 | STIE | Start Condition Detection Interrupt Enable<br>0: Start condition detection interrupt request (STI) is disabled.<br>1: Start condition detection interrupt request (STI) is enabled. |
| 1 | ALIE | Arbitration-Lost Interrupt Enable<br>0: Arbitration-lost interrupt request (ALI) is disabled.<br>1: Arbitration-lost interrupt request (ALI) is enabled. |
| 0 | TMOIE | Timeout Interrupt Enable<br>0: Timeout interrupt request (TMOI) is disabled.<br>1: Timeout interrupt request (TMOI) is enabled. |

### TMOIE Bit (Timeout Interrupt Enable)

This bit is used to enable or disable timeout interrupt requests (TMOI) when the RIICnSR2.TMOF flag is set to 1. A TMOI interrupt request is canceled by clearing the TMOF flag or the TMOIE bit to 0.

#### ALIE Bit (Arbitration-Lost Interrupt Enable)

This bit is used to enable or disable arbitration-lost interrupt requests (ALI) when the RIICnSR2.AL flag is set to 1. An ALI interrupt request is canceled by clearing the AL flag or the ALIE bit to 0.

#### STIE Bit (Start Condition Detection Interrupt Enable)

This bit is used to enable or disable start condition detection interrupt requests (STI) when the RIICnSR2.START flag is set to 1. An STI interrupt request is canceled by clearing the START flag or the STIE bit to 0.

#### SPIE Bit (Stop Condition Detection Interrupt Enable)

This bit is used to enable or disable stop condition detection interrupt requests (SPI) when the RIICnSR2.STOP flag is set to 1. An SPI interrupt request is canceled by clearing the STOP flag or the SPIE bit to 0.

#### NAKIE Bit (NACK Reception Interrupt Enable)

This bit is used to enable or disable NACK reception interrupt requests (NAKI) when the RIICnSR2.NACKF flag is set to 1. An NAKI interrupt request is canceled by clearing the NACKF flag or the NAKIE bit to 0.

#### RIE Bit (Receive Complete Interrupt Enable)

This bit is used to enable or disable receive complete interrupt requests (INTRIICnRI) when the RIICnSR2.RDRF flag is set to 1.

#### TEIE Bit (Transmit End Interrupt Enable)

This bit is used to enable or disable transmit end interrupts (INTRIICnTEI) when the RIICnSR2.TEND flag is set to 1. An INTIICnTEI interrupt request is canceled by clearing the TEND flag or the TEIE bit to 0.

#### TIE Bit (Transmit Data Empty Interrupt Enable)

This bit is used to enable or disable transmit data empty interrupts (INTRIICnTI) when the RIICnSR2.TDRE flag is set to 1.

## 20.3.10 RIICnSR1 — I2C Bus Status Register 1

**Access:** RIICnSR1 register can be read or written in 32-bit units.
RIICnSR1L register can be read or written in 16-bit units.
RIICnSR1LL register can be read or written in 8-bit units.

**Address:** RIICnSR1: <RIICn_base> + $0020_H$

RIICnSR1L: <RIICn_base> + $0020_H$

RIICnSR1LL: <RIICn_base> + $0020_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R(/W) *1 | R | R(/W) *1 | R(/W) *1 | R(/W) *1 | R(/W) *1 |

Note 1. Only 0 can be written to this bit.

**Table 20.18 RIICnSR1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 5 | DID | Device-ID Address Detection Flag<br>0: Device-ID address is not detected.<br>1: Device-ID address is detected. |
| 4 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 3 | GCA | General Call Address Detection Flag<br>0: General call address is not detected.<br>1: General call address is detected. |
| 2 | AAS2 | Slave Address 2 Detection Flag<br>0: Slave address 2 is not detected.<br>1: Slave address 2 is detected. |
| 1 | AAS1 | Slave Address 1 Detection Flag<br>0: Slave address 1 is not detected.<br>1: Slave address 1 is detected. |
| 0 | AAS0 | Slave Address 0 Detection Flag<br>0: Slave address 0 is not detected.<br>1: Slave address 0 is detected. |

### AASy Flag (Slave Address y Detection) (y = 0 to 2)

[Setting conditions]

<For 7-bit address format: RIICnSARy.FSy = 0>

When the received slave address matches the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

When the received slave address matches a value of (1111 $0_B$ + RIICnSARy.SVA[9:8]) and the following address matches the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy bit after reading AASy = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

<For 7-bit address format: RIICnSARy.FSy = 0>

- When the received slave address does not match the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

- When the received slave address does not match a value of (1111 $0_B$ + RIICnSARy.SVA[9:8]) with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the received slave address matches a value of (1111 $0_B$ + RIICnSARy.SVA[9:8]) and the following address does not match the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

### GCA Flag (General Call Address Detection)

[Setting condition]

- When the received slave address matches the general call address (0000 $000_B$ + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
  This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA bit after reading GCA = 1
- When a stop condition is detected
- When the received slave address does not match the general call address (0000 $000_B$ + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### DID Flag (Device-ID Address Detection)

[Setting condition]

- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID ($1111\ 100_B$) + 0 [W]) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled). This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.
- When a restart condition is detected after a match with the device ID address and the device ID address ($1111\ 100_B$) plus 1[R] has matched while the setting of the RIICnSER.DIDE bit is 1 (device ID address detection enabled). This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID bit after reading DID = 1
- When a stop condition is detected
- When the first frame received immediately after a start condition or restart condition is detected does not match a value of (device ID ($1111\ 100_B$)) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID ($1111\ 100_B$) + 0 [W]) and the second frame does not match any of slave addresses 0 to 2 with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

## 20.3.11 RIICnSR2 — I2C Bus Status Register 2

**Access:** RIICnSR2 register can be read or written in 32-bit units.
RIICnSR2L register can be read or written in 16-bit units.
RIICnSR2LL register can be read or written in 8-bit units.

**Address:** RIICnSR2: <RIICn_base> + $0024_H$

RIICnSR2L: <RIICn_base> + $0024_H$

RIICnSR2LL: <RIICn_base> + $0024_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TDRE | TEND | RDRF | NACKF | STOP | START | AL | TMOF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R(/W) *1 | R(/W) *1 | R(/W) *1 | R(/W) *1 | R(/W) *1 | R(/W) *1 | R(/W) *1 |

Note 1. Only 0 can be written to this bit.

**Table 20.19 RIICnSR2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 7 | TDRE | Transmit Data Empty Flag<br>0: RIICnDRT contains transmit data.<br>1: RIICnDRT contains no transmit data. |
| 6 | TEND | Transmit End Flag<br>0: Data is being transmitted.<br>1: Data has been transmitted. |
| 5 | RDRF | Receive Complete Flag<br>0: RIICnDRR contains no receive data.<br>1: RIICnDRR contains receive data. |
| 4 | NACKF | NACK Detection Flag<br>0: NACK is not detected.<br>1: NACK is detected. |
| 3 | STOP | Stop Condition Detection Flag<br>0: Stop condition is not detected.<br>1: Stop condition is detected. |
| 2 | START | Start Condition Detection Flag<br>0: Start condition is not detected.<br>1: Start condition is detected. |
| 1 | AL | Arbitration-Lost Flag<br>0: Arbitration is not lost.<br>1: Arbitration is lost. |
| 0 | TMOF | Timeout Detection Flag<br>0: Timeout is not detected.<br>1: Timeout is detected. |

### TMOF Flag (Timeout Detection)

This flag is set to 1 when the RIIC recognizes timeout after the SCL line state remains unchanged for a certain period.

[Setting condition]

The timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is stuck low or high during the following conditions:

- The bus is busy (the RIICnCR2.BBSY flag is 1) in master mode (the RIICnCR2.MST bit is 1).
- The RIIC's own slave address matches (the RIICnSR1 register is not $00_H$) and the bus is busy (the RIICnCR2.BBSY bit is 1) in slave mode (the RIICnCR2.MST bit is 0).
- The bus is free (the RIICnCR2.BBSY flag is 0) while generation of a start condition is requested (the RIICnCR2.ST bit is 1).

[Clearing conditions]

- When 0 is written to the TMOF bit after reading TMOF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### AL Flag (Arbitration-Lost)

This flag shows that bus mastership has been lost (loss in arbitration) due to a bus conflict or some other reason when a start condition is issued or an address and data are transmitted. The RIIC monitors the level on the SDA line during transmission and, if the level on the line does not match the value of the bit being output, sets the value of the AL bit to 1 to indicate that the bus is occupied by another device.

The RIIC can also set the flag to indicate the detection of loss of arbitration during NACK transmission in receive mode or during data transmission in slave mode.

[Setting conditions]

<When master arbitration-lost detection is enabled: RIICnFER.MALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data (including slave address) transmission in master transmit mode (when the SDA line is driven low while the internal SDA output is at a high level (the SDA pin is in the high-impedance state))
- When a start condition is detected while the RIICnCR2.ST bit is 1 (start condition issuance request) or the internal SDA output state does not match the SDA line level
- When the RIICnCR2.ST bit is set to 1 (start condition issuance request) with the RIICnCR2.BBSY flag set to 1.

<When NACK arbitration-lost detection is enabled: RIICnFER.NALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock in the ACK period during NACK transmission in receive mode

<When slave arbitration-lost detection is enabled: RIICnFER.SALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data transmission in slave transmit mode

[Clearing conditions]

- When 0 is written to the AL bit after reading AL = 1

- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**Table 20.20 Relationship between Arbitration-Lost Generation Sources and Arbitration-Lost Enable Functions**

| RIICnFER | | | RIICnSR2 | | |
|---|---|---|---|---|---|
| MALE | NALE | SALE | AL | Error | Arbitration-Lost Generation Source |
| 1 | — | — | 1 | Start condition issuance error | When internal SDA output state does not match SDA line level when a start condition is detected while the RIICnCR2.ST bit is 1 |
| | | | | | When RIICnCR2.ST is set to 1 with RIICnCR2.BBSY set to 1 |
| | | | 1 | Transmit data mismatch | When transmit data (including slave address) does not match the bus state in master transmit mode |
| — | 1 | — | 1 | NACK transmission mismatch | When ACK is detected during transmission of NACK in master receive mode or slave receive mode |
| — | — | 1 | 1 | Transmit data mismatch | When transmit data does not match the bus state in slave transmit mode |

—: Don't care

### START Flag (Start Condition Detection)

[Setting condition]

When a start condition (or a restart condition) is detected

[Clearing conditions]

- When 0 is written to the START bit after reading START = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### STOP Flag (Stop Condition Detection)

[Setting condition]

When a stop condition is detected

[Clearing conditions]

- When 0 is written to the STOP bit after reading STOP = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### NACKF Flag (NACK Detection)

[Setting condition]

When acknowledge is not received (NACK is received) from the receive device in transmit mode with the RIICnFER.NACKE bit set to 1 (transfer suspension enabled)

[Clearing conditions]

- When 0 is written to the NACKF bit after reading NACKF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTION**

When the NACKF flag is set to 1, the RIIC suspends data transmission/reception. Writing to RIICnDRT in transmit mode or reading from RIICnDRR in receive mode with the NACKF flag set to 1 does not enable data transmit/receive operation. To restart data transmission/reception, clear the NACKF flag to 0.

### RDRF Flag (Receive Complete)

[Setting conditions]

- When receive data has been transferred from RIICnDRS to RIICnDRR
  At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit)
- When the received slave address matches the address enabled in RIICnSER after a start condition (or a restart condition) is detected with the RIICnCR2.TRS bit cleared to 0
- In master mode, transition to master reception while the R/W# bit appended to the slave address is set to 1

[Clearing conditions]

- When 0 is written to the RDRF bit after reading RDRF = 1
- When data is read from RIICnDRR
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### TEND Flag (Transmit End)

[Setting condition]

At the rising edge of the ninth SCL clock cycle while the TDRE flag is 1

[Clearing conditions]

- When 0 is written to the TEND bit after reading TEND = 1
- When data is written to RIICnDRT
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### TDRE Flag (Transmit Data Empty)

[Setting conditions]

- When data has been transferred from RIICnDRT to RIICnDRS and RIICnDRT becomes empty
- When the RIICnCR2.TRS bit is set to 1
  - When the RIICnCR2.MST bit is set to 1 after a start condition is detected
  - When 1 is written to the RIICnCR2.TRS bit while the RIICnMR1.MTWP bit is 1
- When the received slave address matches the address enabled in RIICnSER after a start condition including a restart condition is detected with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When data is written to RIICnDRT
- When the RIICnCR2.TRS bit is cleared to 0
  - When a stop condition is detected
  - When the RIIC enters receive mode from transmit mode
  - When 0 is written to the RIICnCR2.TRS bit while the RIICnMR1.MTWP bit is 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTION**

When the NACKF flag is set to 1 while the RIICnFER.NACKE bit is 1, the RIIC suspends data transmission/reception. Here, if the TDRE flag is 0 (next transmit data has been written), data is transferred to the RIICnDRS register and the RIICnDRT register becomes empty at the rising edge of the ninth clock cycle, but the TDRE flag is not set to 1.

## 20.3.12 RIICnSARy — I2C Slave Address Register y (y = 0 to 2)

**Access:** RIICnSARy register can be read or written in 32-bit units.
RIICnSARyL register can be read or written in 16-bit units.
RIICnSARyLL and RIICnSARyLH registers can be read or written in 8-bit units.

**Address:** RIICnSAR0: <RIICn_base> + $0028_H$

RIICnSAR0L: <RIICn_base> + $0028_H$

RIICnSAR0LL: <RIICn_base> + $0028_H$,
RIICnSAR0LH: <RIICn_base> + $0029_H$

RIICnSAR1: <RIICn_base> + $002C_H$

RIICnSAR1L: <RIICn_base> + $002C_H$

RIICnSAR1LL: <RIICn_base> + $002C_H$,
RIICnSAR1LH: <RIICn_base> + $002D_H$

RIICnSAR2: <RIICn_base> + $0030_H$

RIICnSAR2L: <RIICn_base> + $0030_H$

RIICnSAR2LL: <RIICn_base> + $0030_H$,
RIICnSAR2LH: <RIICn_base> + $0031_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 15 | FSy | 7-Bit/10-Bit Address Format Selection<br>0: The 7-bit address format is selected.<br>1: The 10-bit address format is selected. |
| 14 to 10 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 9 to 1 | SVA[9:1] | 7-Bit Address/10-Bit Address Upper Bits<br>A slave address is set.<br>• When the FSy bit is 0 (7-bit address format), the SVA[7:1] bits are valid and form a 7-bit slave address.<br>• When the FSy bit is 1 (10-bit address format), SVA[9:1] bits form a 10-bit slave address (combined with the SVA0 bit). |
| 0 | SVA0 | 10-Bit Address LSB<br>The least significant bit (LSB) of a 10-bit slave address is set.<br>• When the FSy bit is 0 (7-bit address format), this bit is invalid.<br>• When the FSy bit is 1 (10-bit address format), this bit is a 10-bit slave address (combined with the SVA[9:1] bits). |

#### SVA0 Bit (10-Bit Address LSB)

When the 10-bit address format is selected (RIICnSARy.FSy = 1), this bit functions as the LSB of a 10-bit address and forms a 10-bit address in combination with the SVA[9:1] bits.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, this bit is valid. While the RIICnSARy.FSy bit or SARy bit is 0, the setting of this bit is ignored.

#### SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits)

When the 7-bit address format is selected (RIICnSARy.FSy = 0), these bits function as a 7-bit address. When the 10-bit address format is selected (RIICnSARy.FSy = 1), these bits function as a 10-bit address in combination with the SVA0 bit.

While the RIICnSER.SARy bit is 0, the setting of these bits is ignored.

#### FSy Bit (7-Bit/10-Bit Address Format Selection)

This bit is used to select 7-bit address or 10-bit address for slave address y (in RIICnSARy).

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 0, the 7-bit address format is selected for slave address y, the RIICnSARy.SVA[7:1] setting is valid, and the settings of the SVA[9:8] bits and the RIICnSARy.SVA0 bit are ignored.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, the 10-bit address format is selected for slave address y and the settings of the SVA[9:1] bits and the SVA0 bit are valid.

While the RIICnSER.SARy bit is 0 (RIICnSARy disabled), the setting of the RIICnSARy.FSy bit is invalid.

## 20.3.13 RIICnBRL — I2C Bus Bit Rate Low-Level Register

**Access:** RIICnBRL register can be read or written in 32-bit units.
RIICnBRLL register can be read or written in 16-bit units.
RIICnBRLLL register can be read or written in 8-bit units.

**Address:** RIICnBRL: <RIICn_base> + $0034_H$

RIICnBRLL: <RIICn_base> + $0034_H$

RIICnBRLLL: <RIICn_base> + $0034_H$

**Value after reset:** $0000\ 00FF_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.22 RIICnBRL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 to 0 | BRL[4:0] | Bit Rate Low-Level Period<br>Low-level period of SCL clock |

The RIICnBRL register is a 5-bit register that is used to set the width at low level for the SCL clock.

It also works to generate the data setup time for automatic SCL low-hold operation (see **Section 20.10, Automatic Low-Hold Function for SCL**); when the RIIC is used only in slave mode, this register needs to be set to a value longer than the data setup time*1.

RIICnBRL counts the low-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits.

Note 1. Data setup time ($t_{SU}$: DAT)
250 ns (up to 100 kbps: standard mode [Sm])
100 ns (up to 400 kbps: fast mode [Fm])

## 20.3.14 RIICnBRH — I2C Bus Bit Rate High-Level Register

**Access:** RIICnBRH register can be read or written in 32-bit units.
RIICnBRHL register can be read or written in 16-bit units.
RIICnBRHLL register can be read or written in 8-bit units.

**Address:** RIICnBRH: <RIICn_base> + $0038_H$

RIICnBRHL: <RIICn_base> + $0038_H$

RIICnBRHLL: <RIICn_base> + $0038_H$

**Value after reset:** $0000\ 00FF_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

**Table 20.23 RIICnBRH Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 to 0 | BRH[4:0] | Bit Rate High-Level Period<br>High-level period of SCL clock |

RIICnBRH is a 5-bit register to set the high-level period of SCL clock. RIICnICBRH is valid in master mode. If the RIIC is used only in slave mode, this register need not to set the high-level period.

RIICnBRH counts the high-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits.

The I2C transfer rate and the SCL clock duty are calculated using the following expression.

(1) When RIICnFER.SCLE = 0
Transfer rate = 1 / {[ (RIICnBRH+1) + (RIICnBRL+1) ] / IICφ*1 + tr + tf}
Duty cycle = {tr+[(RIICnBRH+1)/ IICφ]}/{ tr + tf + [(RIICnBRH+1) + (RIICnBRL+1)]/IICφ}

(2) When RIICnFER.SCLE=1, RIICnFER.NFE=0, IICφ = PCLK
Transfer rate = 1 / {[ (RIICnBRH+3) + (RIICnBRL+3) ] / IICφ*1 + tr + tf}
Duty cycle = {tr +[(RIICnBRH+3)/ IICφ]}/{ tr + tf + [(RIICnBRH+3) + (RIICnBRL+3)]/IICφ}

(3) When RIICnFER.SCLE=1, RIICnFER.NFE=1, IICφ = PCLK
Transfer rate =1 / {[ (RIICnBRH+3+nf) + (RIICnBRL+3+nf) ] / IICφ*1 + tr + tf}
Duty cycle = {tr +[(RIICnBRH+3+nf)/ IICφ]}/{ tr + tf + [(RIICnBRH+3+nf) + (RIICnBRL+3+nf)]/ IICφ}

(4) RIICnFER.SCLE=1, RIICnFER.NFE=0, IICφ < PCLK
Transfer rate =1 / {[ (RIICnBRH+2) + (RIICnBRL+2) ] / IICφ*1+ tr + tf}
Duty cycle = {tr +[(RIICnBRH+2)/ IICφ]}/{ tr + tf + [(RIICnBRH+2) + (RIICnBRL+2)]/IICφ}

(5) When RIICnFER.SCLE=1, RIICnFER.NFE=1, IICφ < PCLK
Transfer rate =1 / {[ (RIICnBRH+2+nf) + (RIICnBRL+2+nf) ] / IICφ*1+ tr + tf}
Duty cycle = {tr +[(RIICnBRH+2+nf)/ IICφ]}/{ tr + tf + [(RIICnBRH+2+nf) + (RIICnBRL+2+nf)]/ IICφ}

tf: SCL line falling time [ns]*2
tr: SCL line rising time [ns]*2
nf: Digital noise filter stage
Duty cycle: 0% < Duty < 100%

**Note 1.** As for IICφ, see CKS[2:0] in **Section 20.3.4, RIICnMR1 — I2C Bus Mode Register 1**.

**Note 2.** The SCL line rising time [tr] and SCL line falling time [tf] depend on the total bus line capacitance [Cb] and the pull-up resistor [Rp]. For details, see the I2C bus standard from NXP Semiconductors.

**Table 20.24** lists examples of the RIICnBRH and RIICnBRL register settings when the SCL synchronization circuit is not used.

**Table 20.24 Examples of RIICnBRH/RIICnBRLSettings for Transfer Rate**

| Transfer Rate (kbps) | PCLK Frequency (MHz) | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 8 | | | | | 10 | | | | | 12.5 | | | | |

| 100 | $011_B$ | 14 | $EE_H$ | 17 | $F1_H$ | $011_B$ | 16 | $F0_H$ | 19 | $F3_H$ |
| 400 | $001_B$ | 8 | $E8_H$ | 19 | $F3_H$ | $001_B$ | 9 | $E9_H$ | 21 | $F5_H$ |

**CAUTION**

CBRH/ICBRL settings in these tables are calculated using the following values:
SCL line rising time (tr): 100 kbps or less, [Sm]: 1000 ns, 400 kbps or less, [Fm]: 300 ns
SCL line falling time (tf): 400 kbps or less, [Sm/Fm]: 300 ns
For the specified values of SCL line rising time (tr) and SCL line falling time (tf), see the I2C bus standard from NXP Semiconductors.

## 20.3.15 RIICnDRT — I2C Bus Transmit Data Register

**Access:** RIICnDRT register can be read or written in 32-bit units.
RIICnDRTL register can be read or written in 16-bit units.
RIICnDRTLL register can be read or written in 8-bit units.

**Address:** RIICnDRT: <RIICn_base> + $003C_H$

RIICnDRTL: <RIICn_base> + $003C_H$

RIICnDRTLL: <RIICn_base> + $003C_H$

**Value after reset:** $0000\ 00FF_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | DRT[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

When RIICnDRT detects a space in the I2C bus shift register (RIICnDRS), it transfers the transmit data that has been written to RIICnDRT to RIICnDRS and starts transmitting data in transmit mode.

The double-buffer structure of RIICnDRT and RIICnDRS allows continuous transmit operation if the next transmit data has been written to RIICnDRT while the RIICnDRS data is being transmitted.

RIICnDRT can always be read and written. Write transmit data to RIICnDRT once when a transmit data empty interrupt (INTRIICnTI) request is generated. When writing to bit 31 to 8, write the value after reset.

## 20.3.16 RIICnDRR — I2C Bus Receive Data Register

**Access:** RIICnDRR register is a read-only register that can be read in 32-bit units.
RIICnDRRL register is a read-only registers that can be read in 16-bit units.
RIICnDRRLL register is a read-only registers that can be read in 8-bit units.

**Address:** RIICnDRR: <RIICn_base> + $0040_H$

RIICnDRRL: <RIICn_base> + $0040_H$

RIICnDRRLL: <RIICn_base> + $0040_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | DRR[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

When 1 byte of data has been received, the received data is transferred from the I2C bus shift register (RIICnDRS) to RIICnDRR to enable the next data to be received.

The double-buffer structure of RIICnDRS and RIICnDRR allows continuous receive operation if the received data has been read from RIICnDRR while RIICnDRS is receiving data.

RIICnDRR cannot be written. Read data from RIICnDRR once when a receive complete interrupt (INTRIICnRI) request is generated.

If RIIC receives the next receive data before the current data is read from RIICnDRR (while the RIICnSR2.RDRF flag is 1), the RIIC automatically holds the SCL clock low one cycle before the RDRF flag is set to 1 next.

## 20.3.17 RIICnDRS — I2C Bus Shift Register

**Access:** This register is not accessible.

**Address:** —

**Value after reset:** 0000 00FF$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

RIICnDRS is a shift register to transmit and receive data.

During transmission, transmit data is transferred from RIICnDRT to RIICnDRS and is sent from the SDA pin. During reception, data is transferred from RIICnDRS to RIICnDRR after 1 byte of data has been received.

RIICnDRS cannot be accessed directly.

## 20.4 Interrupt Sources

The RIIC issues four types of interrupt request: transfer error or event generation (arbitration-lost detection, NACK detection, timeout detection, start condition detection, and stop condition detection), receive complete, transmit data empty, and transmit end.

**Table 20.25** lists details of the several interrupt requests. The receive complete and transmit data empty interrupt request are both capable of launching data transfer by the DMAC.

**Table 20.25 Interrupt Sources**

| Symbol | Interrupt Source | Interrupt Flag | DMACA Launching | Interrupt Condition |
|---|---|---|---|---|
| INTRIICnTI | Transmit Data Empty | TDRE | Possible | TDRE = 1 and TIE = 1 |
| INTRIICnTEI | Transmit End | TEND | Not possible | TEND = 1 and TEIE = 1 |
| INTRIICnRI | Receive Complete | RDRF | Possible | RDRF = 1 and RIE = 1 |
| INTRIICnEE | Transfer Error/ Event Generation | AL | Not possible | AL = 1 and ALIE = 1 |
| | | NACKF | | NACKF = 1 and NAKIE = 1 |
| | | TMOF | | TMOF = 1 and TMOIE = 1 |
| | | START | | START = 1 and STIE = 1 |
| | | STOP | | STOP = 1 and SPIE = 1 |

Clear or mask the each flag during interrupt handling.

**CAUTIONS**

1. **There is a latency (delay) between the execution of a write instruction for a peripheral module by the CPU and actual writing to the module. Thus, when an interrupt flag has been cleared or masked, read the relevant flag again to check whether clearing or masking has been completed, and then return from interrupt processing. Returning from interrupt processing without checking that writing to the module has been completed creates a possibility of repeated processing of the same interrupt.**
2. **Since INTRIICnTI is an edge-detected interrupt, it does not require clearing. Furthermore, the RIICnSR2.TDRE flag (a condition for INTRIICnTI) is automatically cleared to 0 when data for transmission are written to RIICnDRT or a stop condition is detected (RIICnSR2.STOP flag = 1).**
3. **Since INTRIICnRI is an edge-detected interrupt, it does not require clearing. Furthermore, the RIICnSR2.RDRF flag (a condition for INTRIICnRI) is automatically cleared to 0 when data are read from RIICnDRR.**
4. **When using the INTRIICnTEI interrupt, clear the RIICnSR2.TEND flag in the INTRIICnTEI interrupt processing.**
   **Note that the RIICnSR2.TEND flag is automatically cleared to 0 when data for transmission are written to RIICnDRT or a stop condition is detected (RIICnSR2.STOP flag = 1).**

# 20.5 Operation

## 20.5.1 Communication Data Format

The I2C bus format consists of 8-bit data and 1-bit acknowledge. The frame following a start condition or restart condition is an address frame used to specify a slave device with which the master device communicates. The specified slave is valid until a new slave is specified or a stop condition is issued.

**Figure 20.3** shows the I2C bus format, and **Figure 20.4** shows the I2C bus timing.

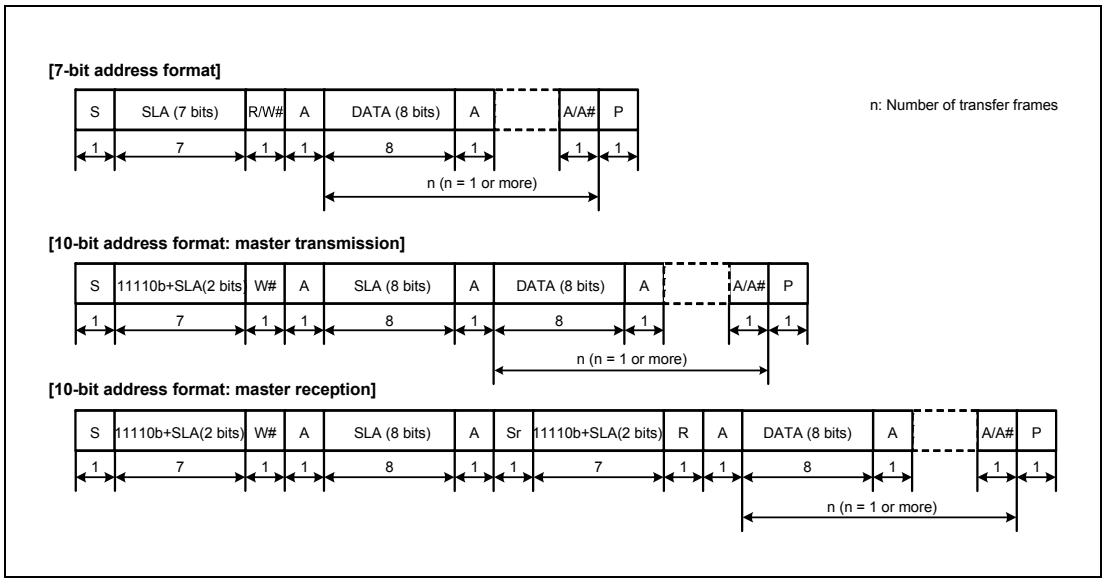

Figure 20.3 I2C Bus Format

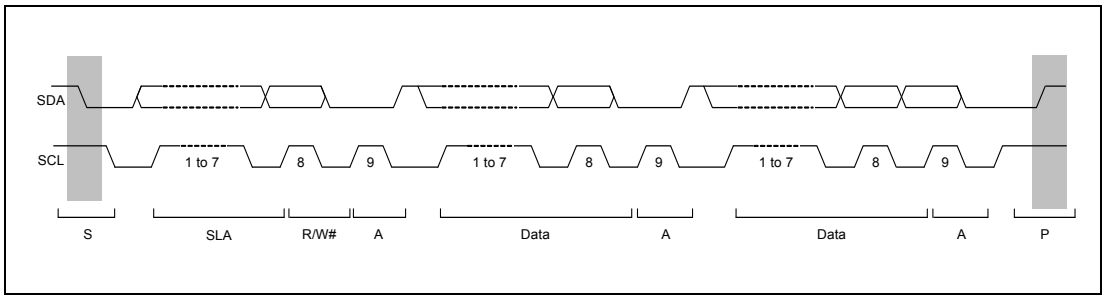

Figure 20.4 I2C Bus Timing (SLA = 7 Bits)

S: Start condition. The master device drives the SDA line low from high level while the SCL line is at a high level.

SLA: Slave address, by which the master device selects a slave device.

R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W is 1, or from the master device to the slave device when R/W is 0.

A: Acknowledge. The receive device drives the SDA line low. (In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.)

A#: Not-acknowledge. The receiving device has not returned a response or is not present so the SDA line has remained at the high level.

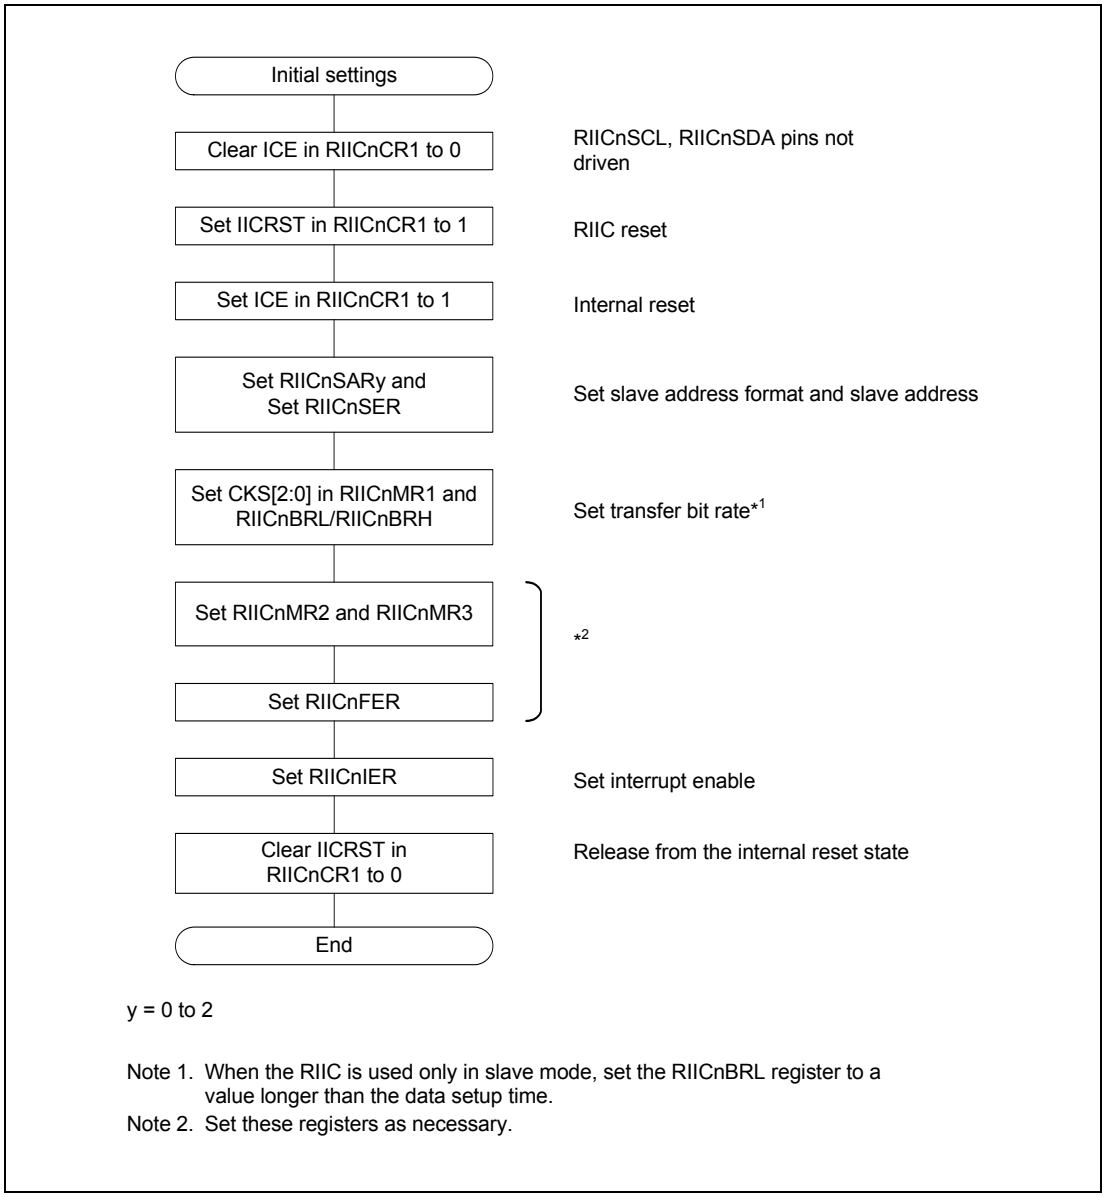
Sr: Restart condition. The master device drives the SDA line low from the high level after the setup time has elapsed with the SCL line at the high level.

DATA: Transmitted or received data

P: Stop condition. The master device drives the SDA line high from low level while the SCL line is at a high level.

## 20.5.2 Initial Settings

Before starting data transmission and reception, initialize the RIIC according to the procedure in **Figure 20.5**. Make initial settings for the RIIC once when starting the RIIC.



Note 1. When the RIIC is used only in slave mode, set the RIICnBRL register to a value longer than the data setup time.

Note 2. Set these registers as necessary.

**Figure 20.5 Example of RIIC Initialization Flowchart**

### 20.5.3 Master Transmit Operation

In master transmit operation, the RIIC outputs the SCL (clock) and transmitted data signals as the master device, and the slave device returns acknowledgements. **Figure 20.6** shows an example of usage of master transmission and **Figure 20.7** to **Figure 20.9** show the timing of operations in master transmission.

The following describes the procedure and operations for master transmission.

(1) Set the RIICnCR1.IICRST bit 1 to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 20.5**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. At the same time, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS and MST bits to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the slave address including the R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the RIIC continues in master transmit mode.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that the slave address has not been recognized or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For data transmission with an address in the 10-bit format, start by writing 1111 $0_B$, the two higher-order bits of the slave address, and W# to RIICnDRT as the first address transmission. Then, as the second address transmission, write the eight lower-order bits of the slave address to RIICnDRT.

(4) After confirming that the RIICnSR2.TDRE flag is 1, write the data for transmission to the RIICnDRT register. The RIIC automatically holds the SCL line low until the data for transmission are ready or a stop condition is issued.

(5) After all bytes of data for transmission have been written to the RIICnDRT register, wait until the value of the RIICnSR2.TEND flag returns to 1, and then set the RIICnCR2.SP bit to 1 (stop condition issuance request). Upon receiving a stop condition issuance request, the RIIC issues the stop condition.

(6) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to $00_B$ and enters slave receive mode. Furthermore, it automatically clears the RIICnSR2.TDRE and TEND flags to 0, and sets the RIICnSR2.STOP flag in to 1.

(7) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

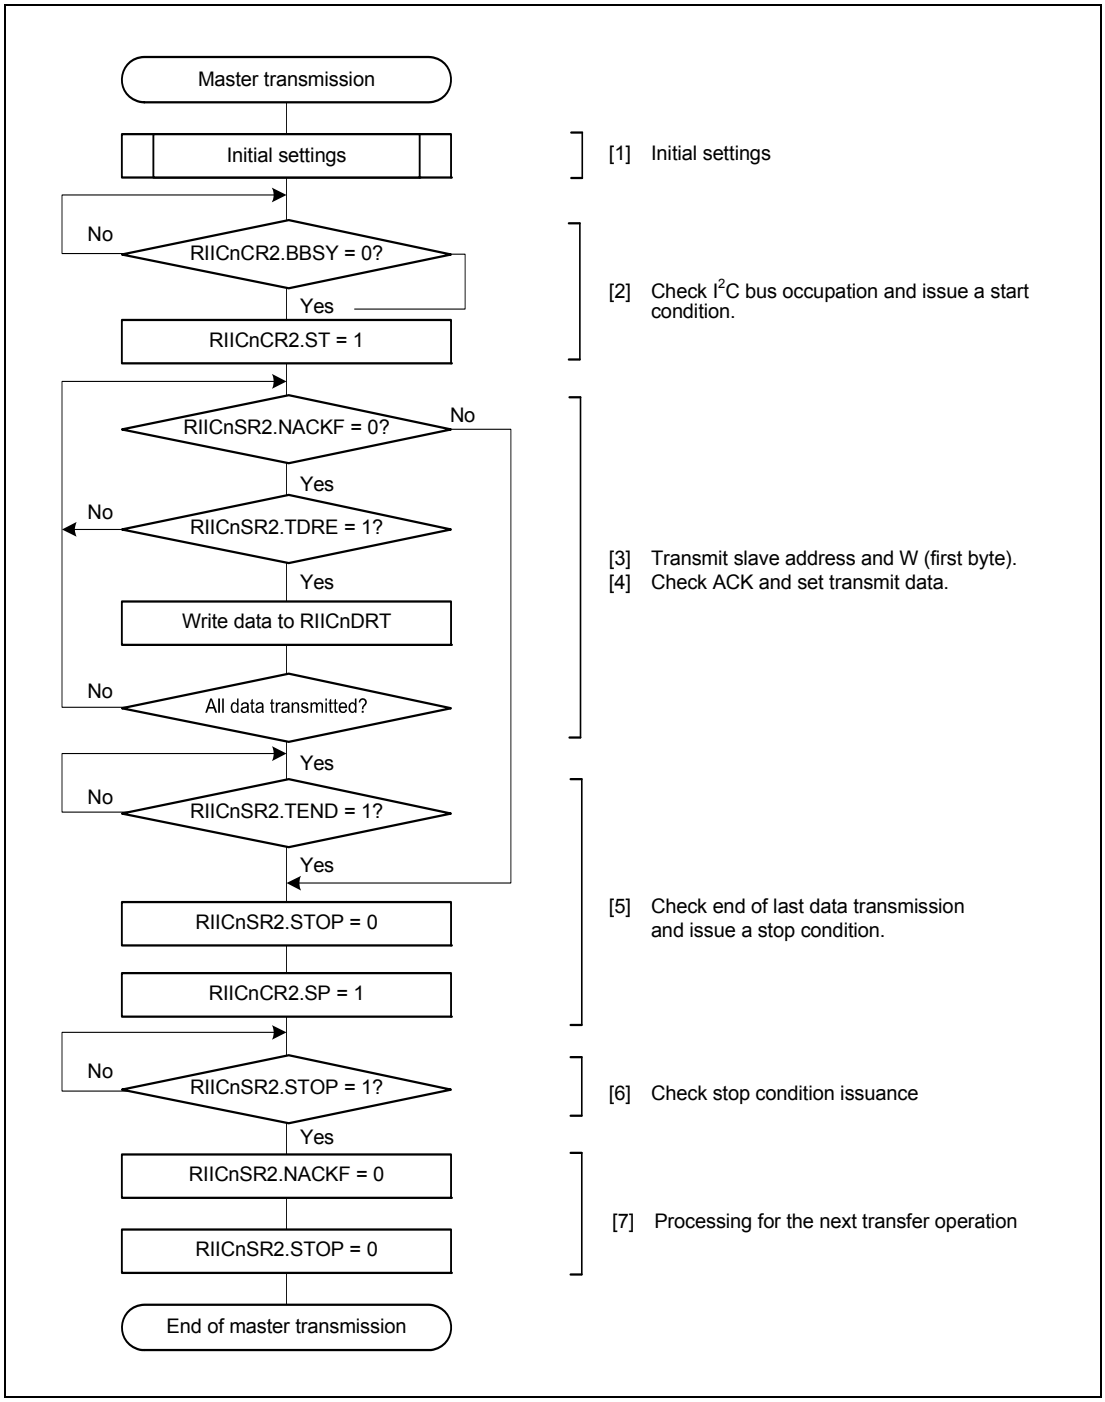


**Figure 20.6 Example of Master Transmission Flowchart**

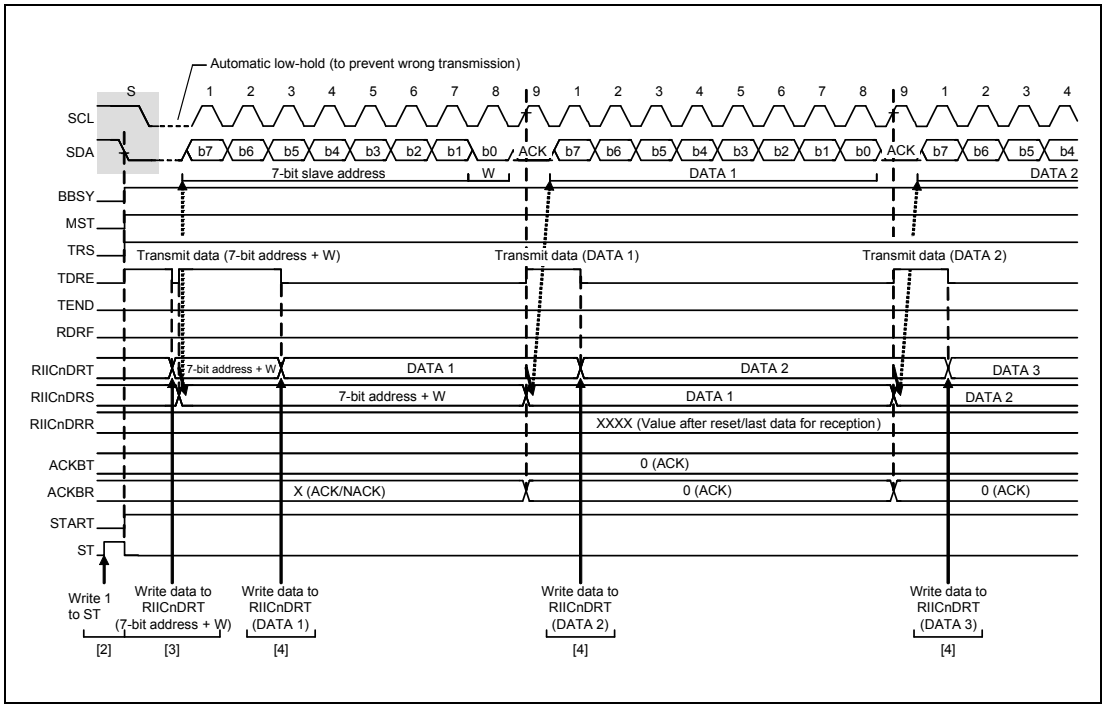

**Figure 20.7 Master Transmit Operation Timing (1) (7-Bit Address Format)**

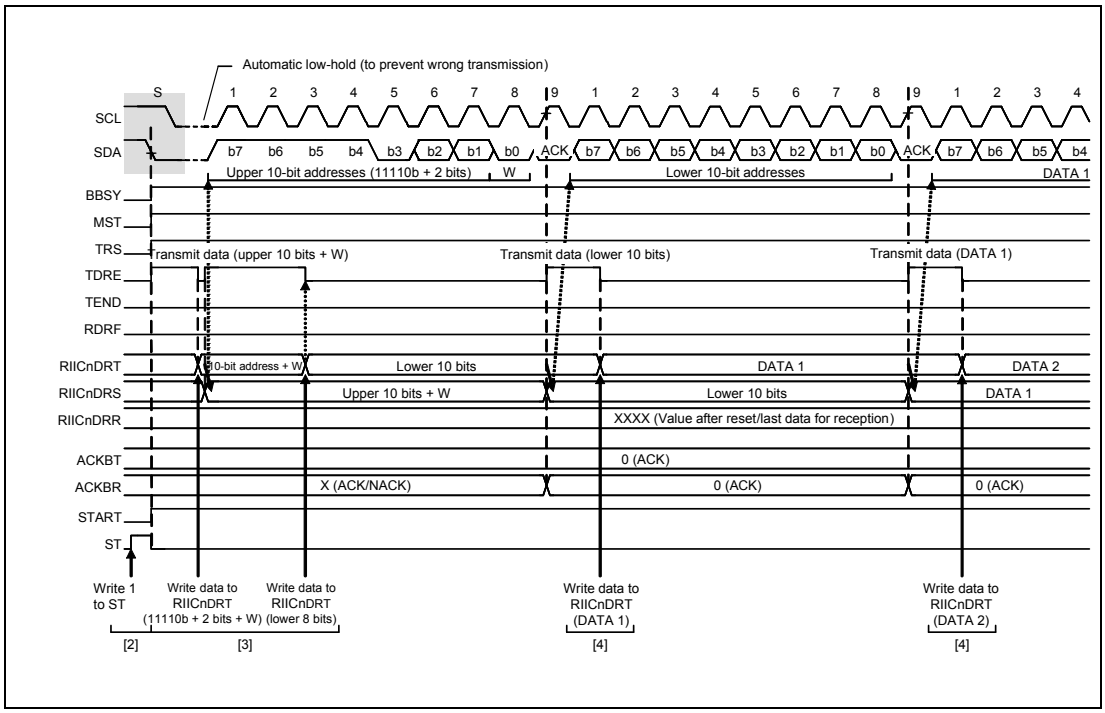

**Figure 20.8 Master Transmit Operation Timing (2) (10-Bit Address Format)**

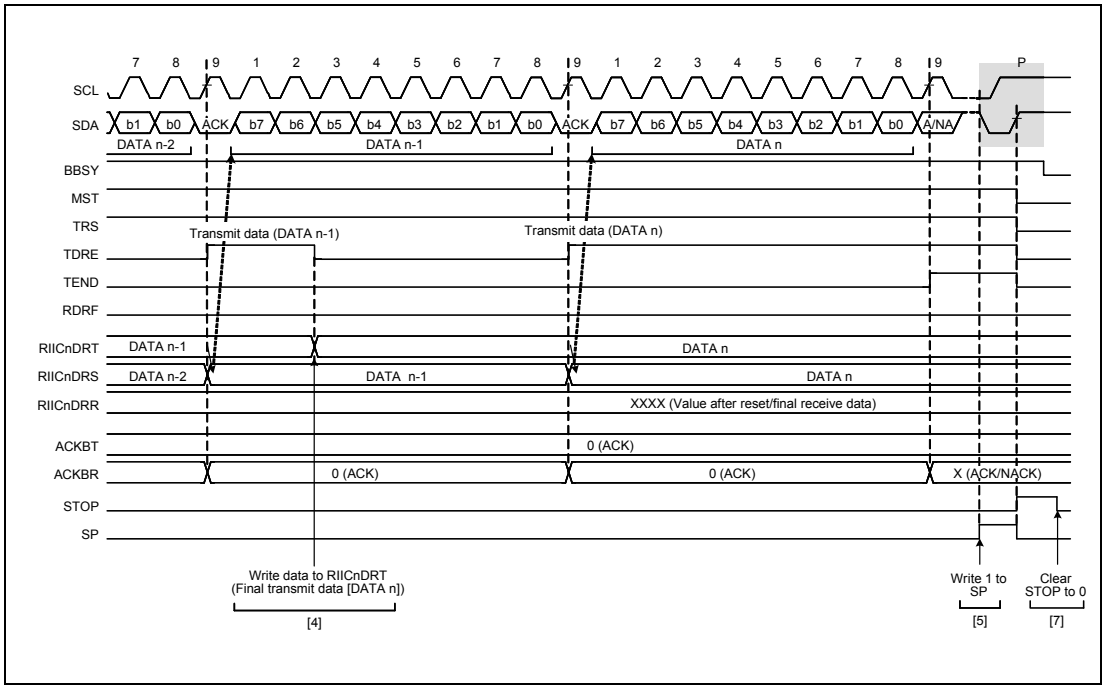

**Figure 20.9 Master Transmit Operation Timing (3)**

### 20.5.4 Master Receive Operation

In master receive operation, the RIIC as a master device outputs the SCL (clock) signal, receives data from the slave device, and returns acknowledgements. Since the RIIC must start by sending a slave address to the corresponding slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

**Figure 20.10** shows an example of master reception flowchart (7-bit address format, 1 or 2 bytes), **Figure 20.11** shows an example of master reception flowchart (7-bit address format, 3 bytes or more), and **Figure 20.12** to **Figure 20.14** show the timing of operations in master reception.

The following describes the procedure and operations for master reception.

(1) Set the RIICnCR1.IICRST bit to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 20.5**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. When the RIIC detects the start condition, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the levels for the SDA output and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and value of the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the slave address including the R/W# bit has been transmitted, the value of the RIICnCR2.TRS bit is automatically updated to select transmit or receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 1, the RIICnCR2.TRS bit is cleared to 0 on the rising edge of the ninth cycle of SCL (the clock signal), placing the RIIC in master receive mode. At this time, the TDRE flag is automatically cleared to 0 and the RIICnSR2.RDRF flag is automatically set to 1.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that the slave address has not been recognized or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For master reception from a device with a 10-bit address, start by using master transmission to transmit the two higher-order bits of the slave address and then the eight lower-order bits of the slave address, and issue a restart condition following generation of the transmission end interrupt (or after TEND = 1) (see **Figure 20.13** for operation timing). After that, transmitting 1111 $0_B$ plus the two higher-order bits of the slave address, and the R bit places the RIIC in master receive mode.

(4) Dummy read RIICnDRR after confirming that the RIICnSR2.RDRF flag is 1; this makes the RIIC start output of the SCL (clock) signal and start data reception.

(5) After 1 byte of data has been received, the RIICnSR2.RDRF flag is set to 1 on the rising edge of the eighth or ninth cycle of SCL clock (the clock signal) as selected by the RIICnMR3.RDRFS bit. Reading out RIICnDRR at this time will produce the received data, and the RDRF flag is automatically cleared to 0 at the same time. Furthermore, the value of the acknowledgement field received during the ninth cycle of SCL clock is returned as the value set in the RIICnMR3.ACKBT bit. Furthermore, if the next byte to be received is the next to last byte, set the RIICnMR3.WAIT bit to 1 (for wait insertion) before reading the RIICnDRR (containing the second byte from last). As well as enabling NACK output even in the case of delays in processing to set the RIICnMR3.ACKBT bit to 1 (NACK) in step (6), due to other interrupts, etc., this fixes the SCL line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, so the state is such that issuing a stop condition is possible.

(6) When the RIICnMR3.RDRFS bit is 0 and the slave device must be notified that it is to end transfer for data reception after transfer of the next (final) byte, set the RIICnMR3.ACKBT bit to 1 (NACK).

(7) After reading out the byte before last from the RIICnDRR register, if the value of the RIICnSR2.RDRF flag is confirmed to be 1, write 1 to the RIICnCR2.SP bit (stop condition issuance request) and then read the last byte from RIICnDRR. When RIICnDRR is read, the RIIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is completed or the SCL line is released from the low-hold state.

(8) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to $00_B$ and enters slave receive mode. Furthermore, detection of the stop condition leads to setting of the RIICnSR2.STOP flag to 1.

(9) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

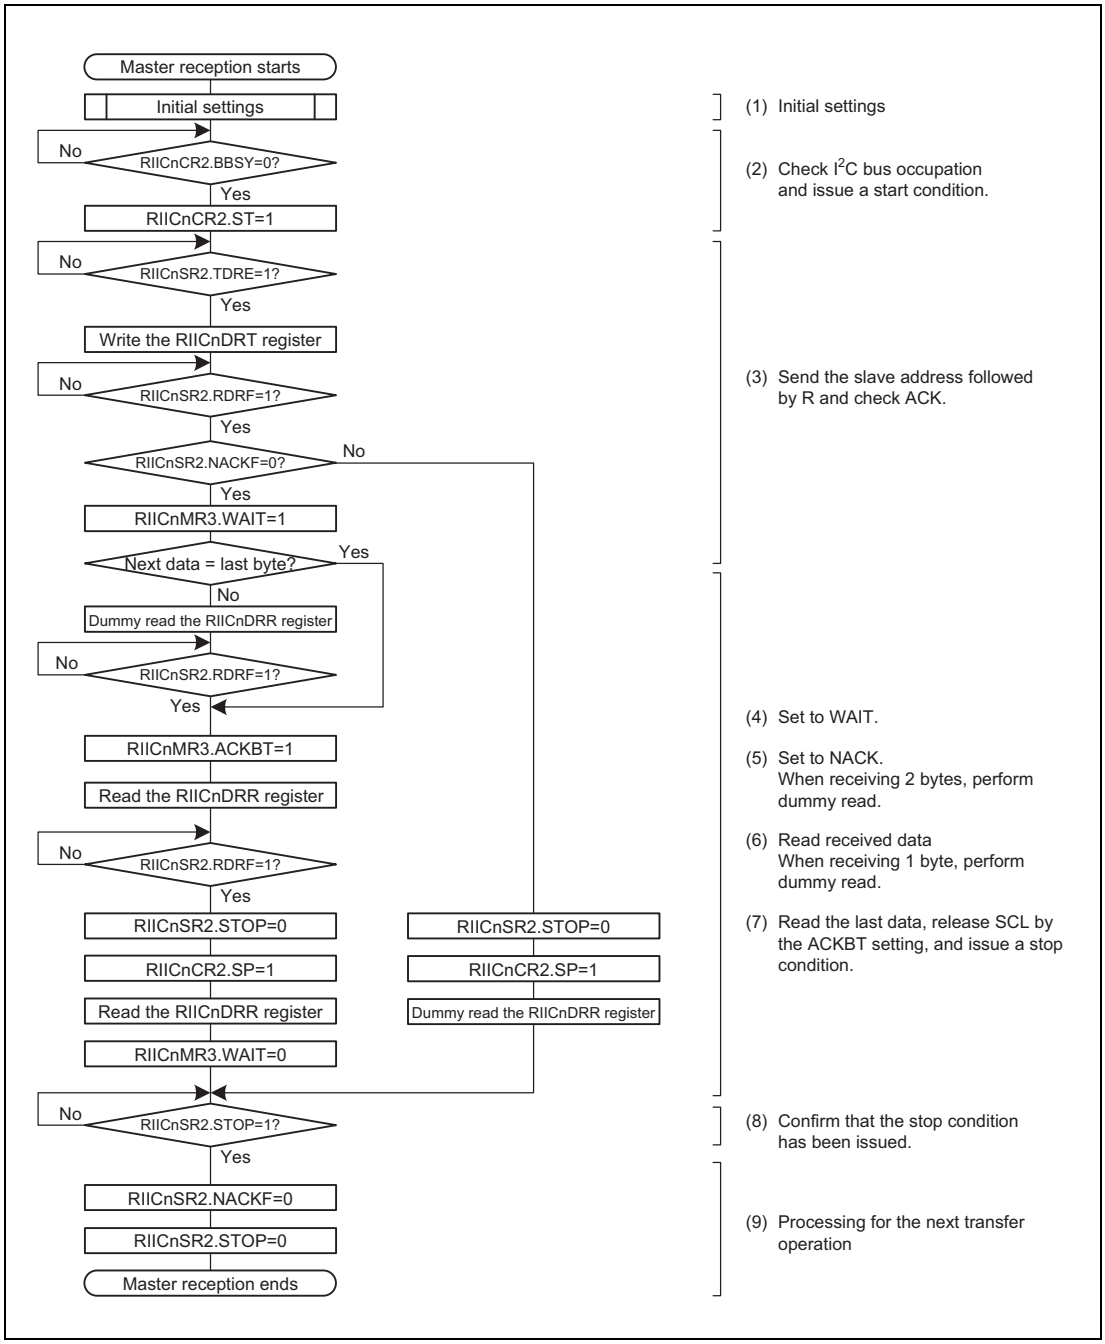

**Figure 20.10 Example of Master Reception Flowchart (7-Bit Address Format, 1 or 2 Bytes)**

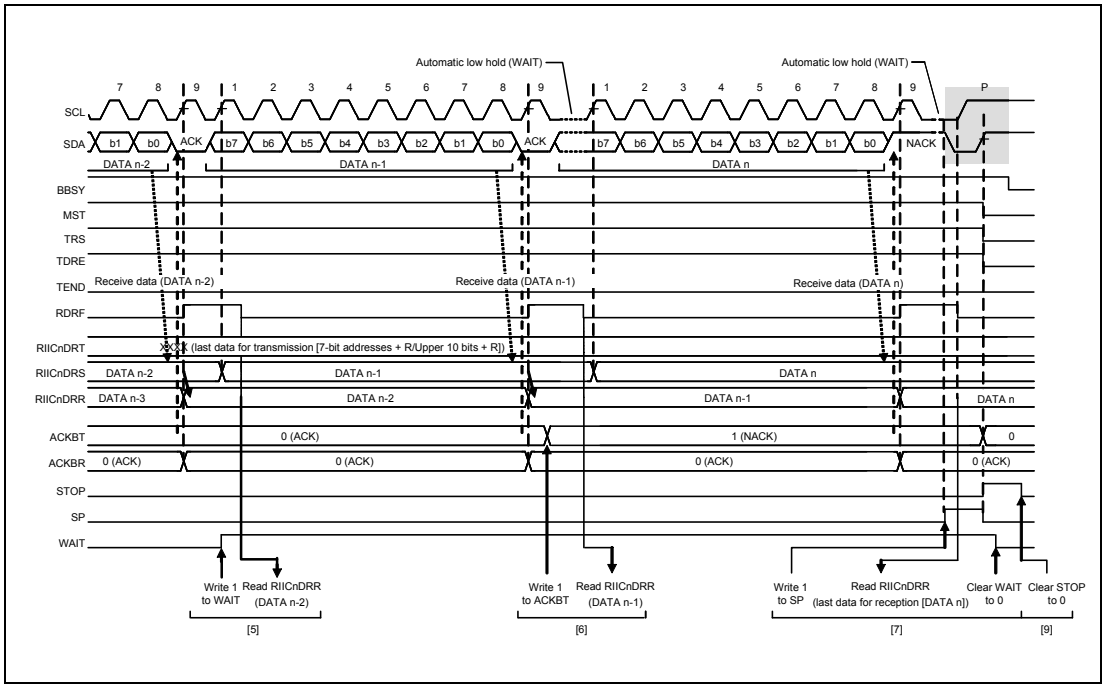

**Figure 20.14 Master Receive Operation Timing (3) (when RDRFS = 0)**

### 20.5.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL (clock) signal, the RIIC transmits data as a slave device, and the master device returns acknowledgements.

**Figure 20.5** shows an example of usage of slave transmission and **Figure 20.16** and **Figure 20.17** show the timing of operations in slave transmission.

The following describes the procedure and operations for slave transmission.

(1) Follow the procedure in **Figure 20.5** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC automatically sets the BBSY and RIICnSR2.START flags to 1 and automatically clears the ST bit to 0 on detection of a start condition.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 1, the RIIC automatically places itself in slave transmit mode by setting both the RIICnCR2.TRS bit and the RIICnSR2.TDRE flag to 1.

(3) After the RIICnSR2.TDRE flag is confirmed to be 1, write the data for transmission to the RIICnDRT register. At this time, if the RIIC receives no acknowledge from the master device (receives an NACK signal) while the RIICnFER.NACKE bit is 1, the RIIC suspends transfer of the next data.

(4) Wait until the RIICnSR2.TEND flag is set to 1 while the RIICnSR2.TDRE flag is 1, after the RIICnSR2.NACKF flag is set to 1 or the last byte for transmission is written to the RIICnDRT register. When the RIICnSR2.NACKF flag or the TEND flag is 1, the RIIC drives the SCL line low on the ninth falling edge of SCL clock.

(5) When the RIICnSR2.NACKF flag or the RIICnSR2.TEND flag is 1, dummy read RIICnDRR to complete the processing. This releases the SCL line.

(6) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.GCA, and AASy (y = 0 to 2), flags RIICnSR2.TDRE and TEND, and the RIICnCR2.TRS bit to 0, and enters slave receive mode. Furthermore, it automatically sets the RIICnSR2.STOP flag to 1.

(7) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

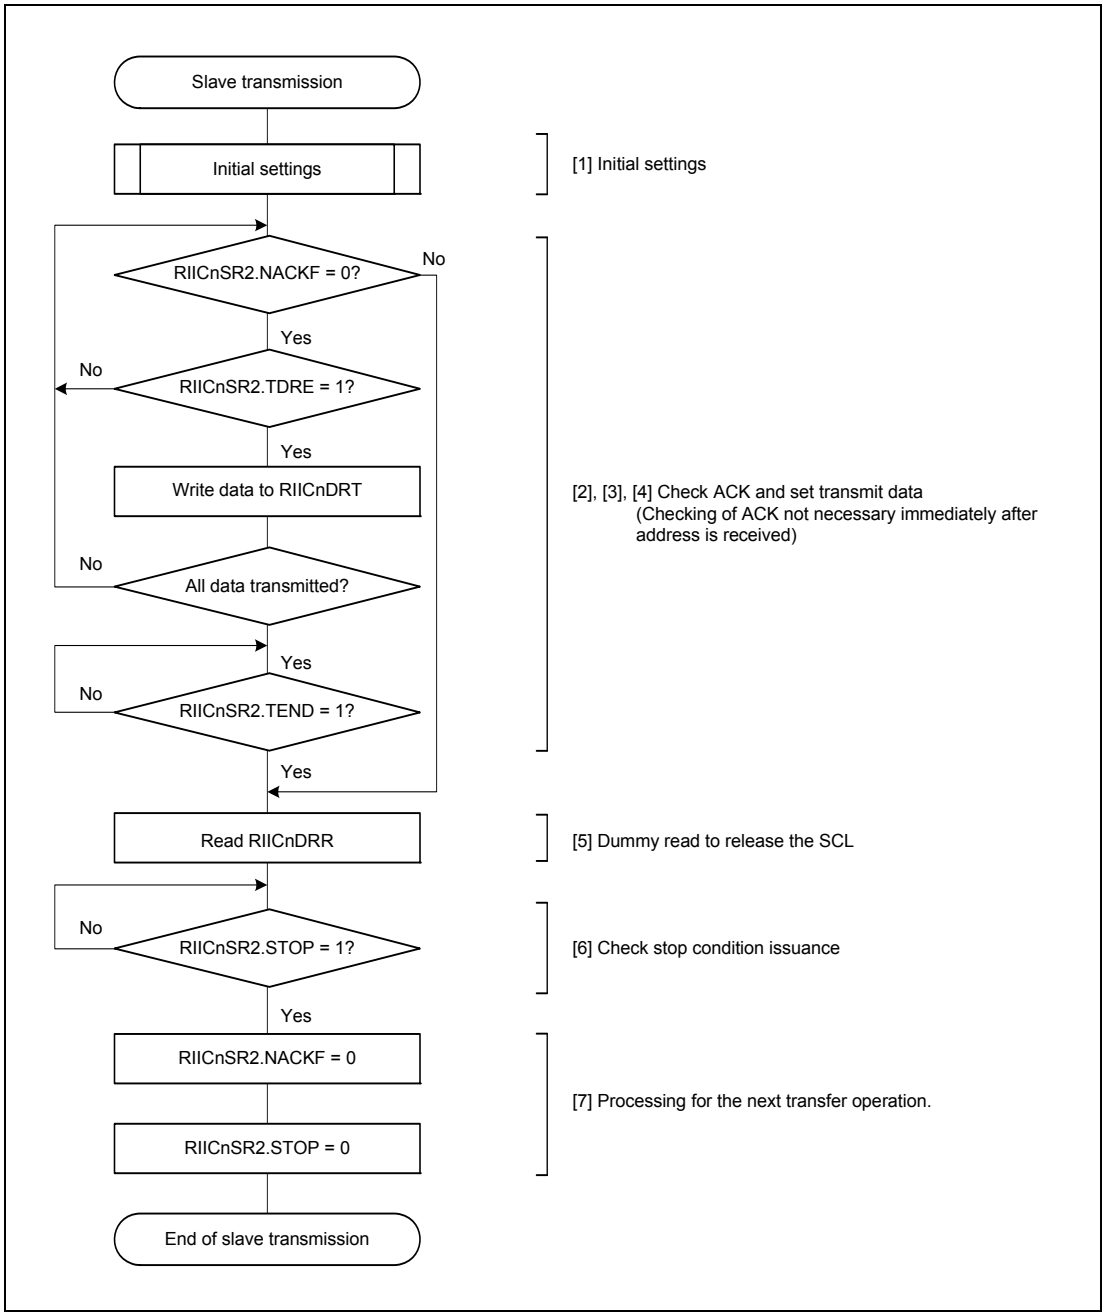

**Figure 20.15 Example of Slave Transmission Flowchart**

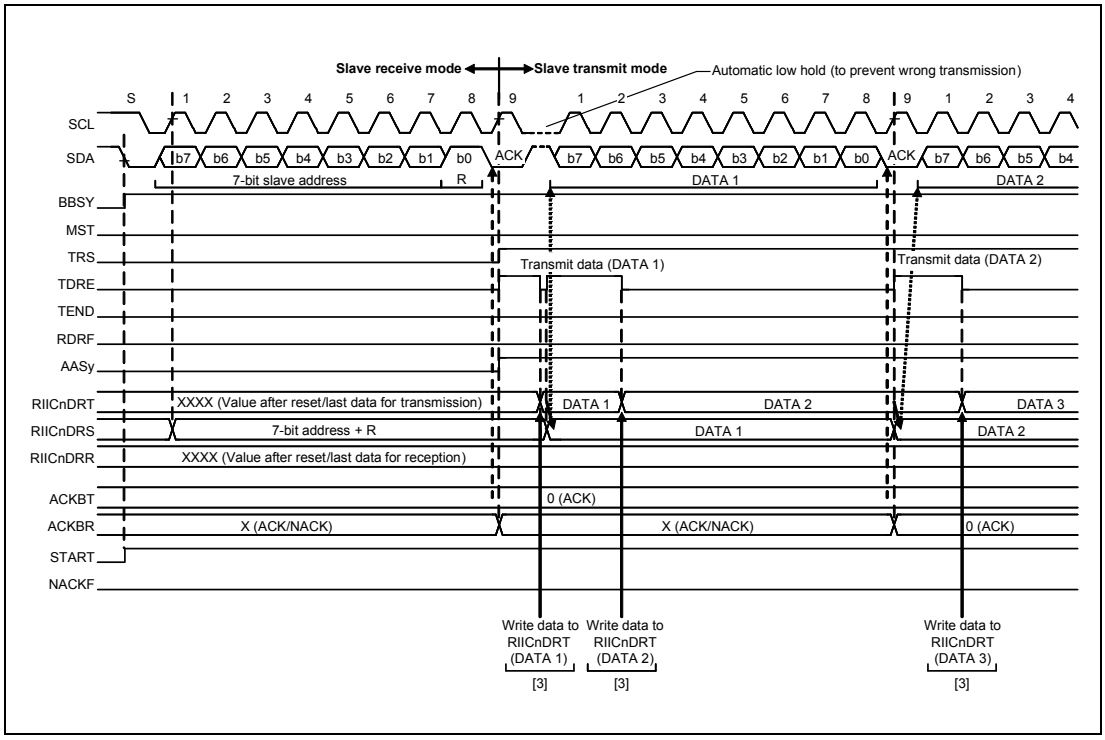

**Figure 20.16 Slave Transmit Operation Timing (1) (7-Bit Address Format)**

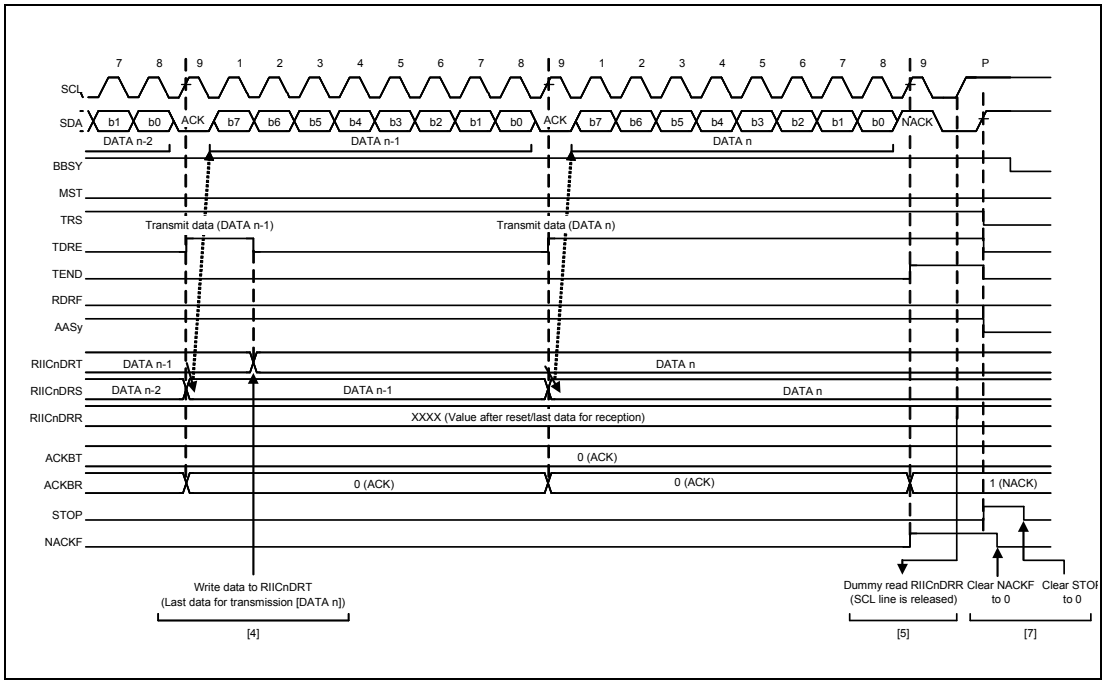

**Figure 20.17 Slave Transmit Operation Timing (2)**

### 20.5.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the RIIC returns acknowledgements as a slave device.

**Figure 20.18** shows an example of usage of slave reception and **Figure 20.19** and **Figure 20.20** show the timing of operations in slave reception.

The following describes the procedure and operations for slave reception.

(1) Follow the procedure in **Figure 20.5** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC automatically sets the BBSY and RIICnSR2.START flags to 1 and automatically clears the ST bit to 0 on detection of a start condition.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 0, the RIIC continues to place itself in slave receive mode and sets the RIICnSR2.RDRF flag to 1.

(3) After the RIICnSR2.STOP flag is confirmed to be 0 and the RIICnSR2.RDRF flag to be 1, dummy read RIICnDRR as the first read operation (the dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower eight bits when the 10-bit address format is selected).

(4) When RIICnDRR is read, the RIIC automatically clears the RIICnSR2.RDRF flag to 0. If reading of RIICnDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the RIIC holds the SCL line low from one SCL cycle before the timing with which RDRF should be set. In this case, reading RIICnDRR releases the SCL line from being held at the low level.
When the RIICnSR2.STOP flag is 1 and the RIICnSR2.RDRF flag is also 1, read RIICnDRR until all the data is completely received.

(5) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 0. Furthermore, it automatically sets the RIICnSR2.STOP flag to 1.

(6) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.STOP flag to 0 for the next transfer operation.

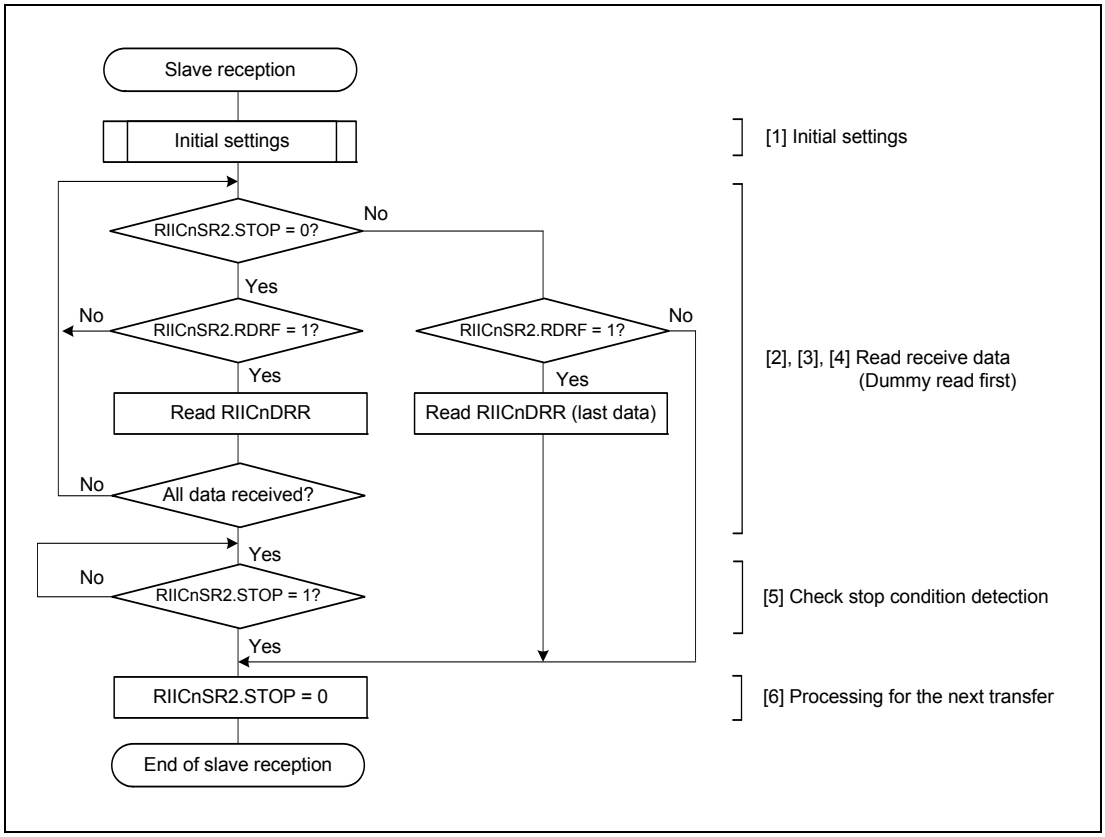

**Figure 20.18 Example of Slave Reception Flowchart**

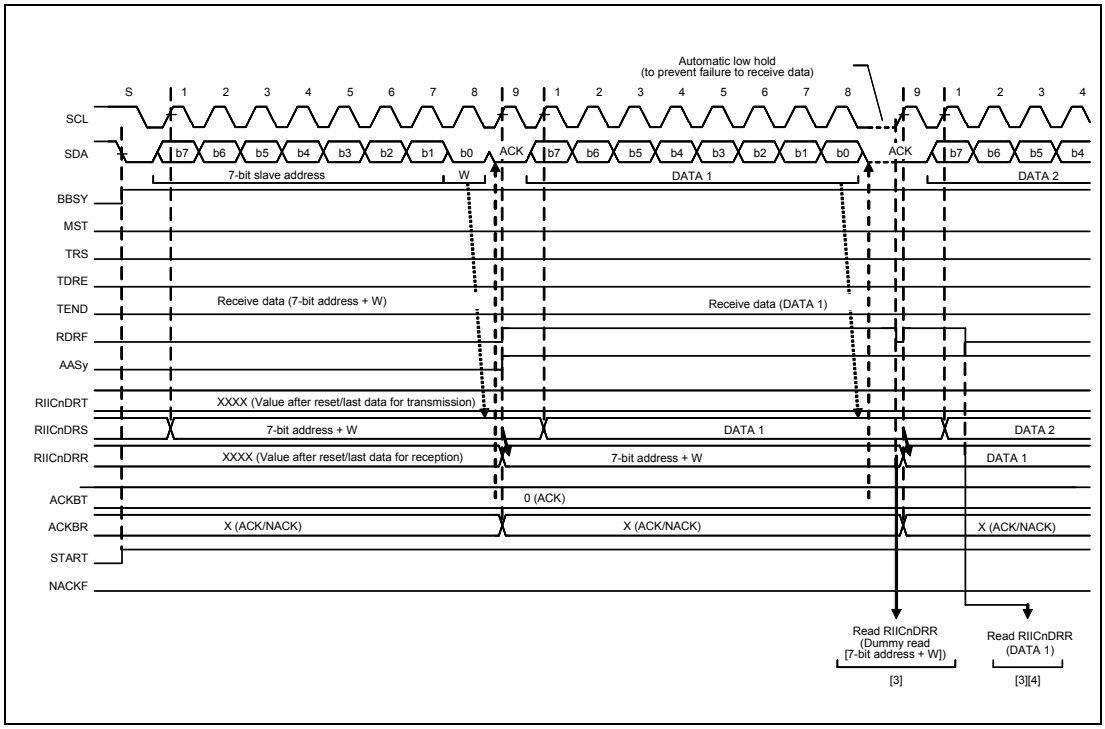

**Figure 20.19 Slave Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)**

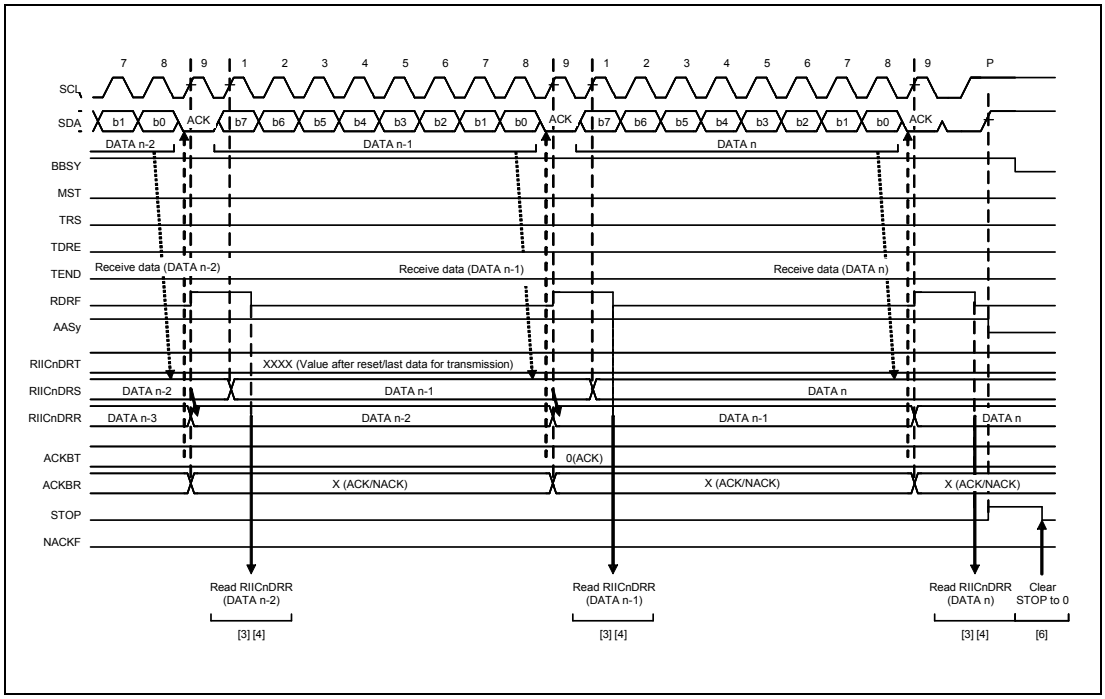

**Figure 20.20 Slave Receive Operation Timing (2) (when RDRFS = 0)**

## 20.6 SCL Synchronization Circuit

In generation of the SCL (clock) signal, the RIIC starts counting out the value for width at high level specified in RIICnBRH when it detects a rising edge on the SCL line and drives the SCL line low once counting of the width at high level is complete. When the RIIC detects the falling edge of the SCL line, it starts counting out the width at low level period specified in RIICnBRL, and then stops driving the SCL line (releases the line) once counting of the width at low level is complete. The SCL (clock) signal is thus generated.

If multiple master devices are connected to the I2C bus, a collision of SCL signals may arise due to contention with another master device. In such cases, the master devices have to synchronize their SCL signals. Since this synchronization of SCL signals must be bit by bit, the RIIC is equipped with a facility (the SCL synchronization circuit) to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCL line during communication.

When the RIIC has detected a rising edge on the SCL line and thus started counting out the width at high level specified in RIICnBRH, and the level on the SCL line falls because an SCL signal is being generated by another master device, the RIIC stops counting when it detects the falling edge, drives the level on the SCL line low, and starts counting out the width at low level specified in RIICnBRL. When the RIIC finishes counting out the width at low level, it stops driving the SCL line to the low level (i.e. releases the line). At this time, if the width at low level of the SCL clock signal from the other master device is longer than the width at low level set in the RIIC, the width at low level of the SCL signal will be extended. Once the width at low level for the other master device has ended, the SCL signal rises because the SCL line has been released. That is, in cases of contention of SCL signals from more than one master, the width at high level of the SCL signal is synchronized with that of the clock having the narrower width, and the width at low level of the SCL signal is synchronized with that of the clock having the broader width. However, such synchronization of the SCL signal is only enabled when the RIICnFER.SCLE bit is set to 1.

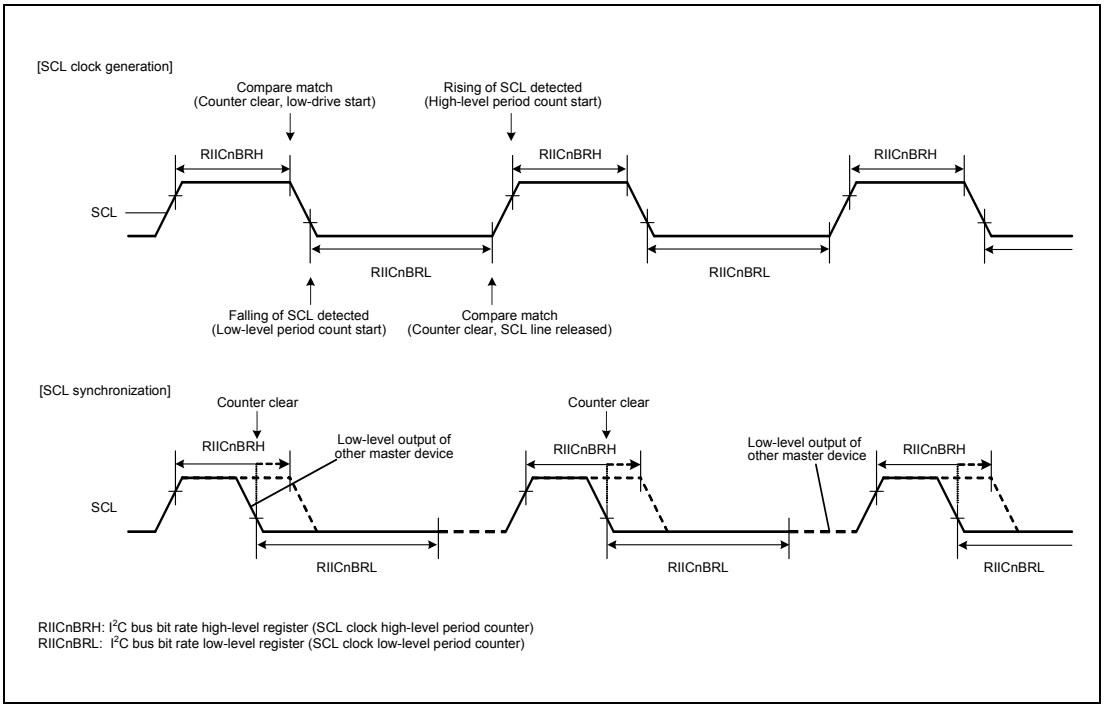

**Figure 20.21 Generation and Synchronization of the SCL Signal from the RIIC**

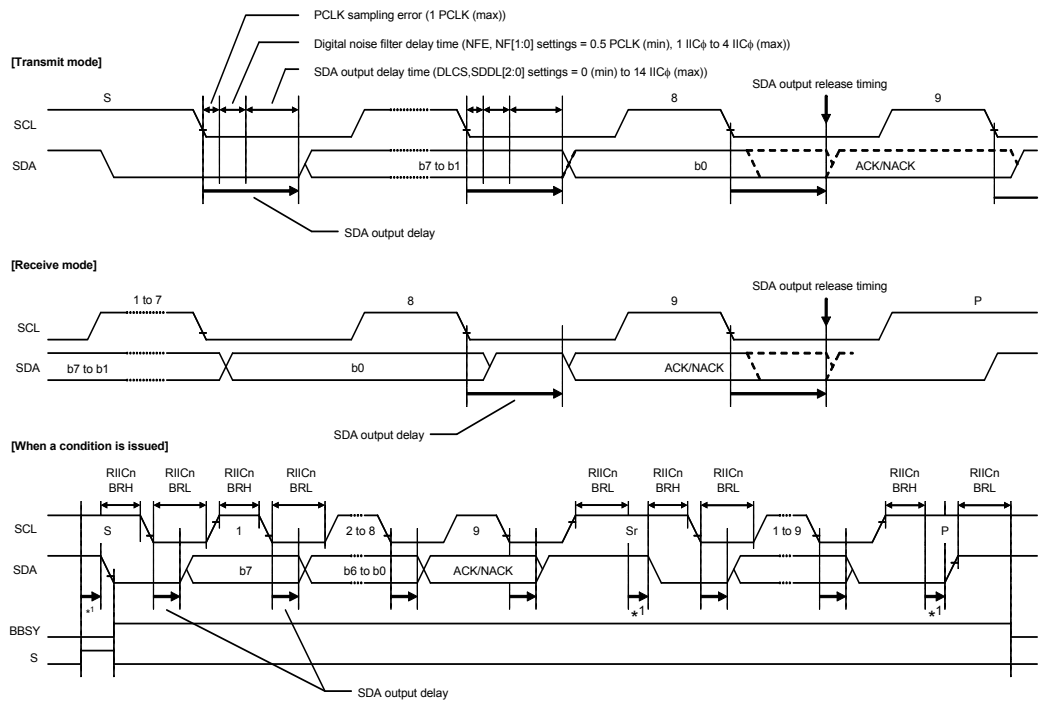
## 20.7 Facility for Delaying SDA Output

The RIIC module incorporates a facility for delaying output on the SDA line. The delay can be applied to all output (issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals) on the SDA line.

With the SDA output delay facility, SDA output is delayed from detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval over which the SCL (clock) signal is at the low level. Doing this leads to usage with the aim of preventing erroneous operation of communications devices.

The output delay facility is enabled by setting the RIICnMR2.SDDL[2:0] bits to any value other than $000_B$, and disabled by setting the same bits to $000_B$.

While the SDA output delay facility is enabled (i.e. while the SDDL[2:0] bits are set to any value other than $000_B$), the RIICnMR2.DLCS bit selects the clock source for counting by the SDA output delay counter as the internal base clock (IICϕ) for the RIIC module or as a clock signal derived by dividing the frequency of the internal base clock by two (IICϕ/2). The counter counts the number of cycles set in the SDDL[2:0] bits. After counting of the set number of cycles of delay is completed, the RIIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.



Note 1. The output delay facility is set by the SDDL[2:0] bits when a start (S), restart (Sr), or stop (P) condition is issued.

**Figure 20.22 SDA Output Delay Facility**

## 20.8 Digital Noise-Filter Circuits

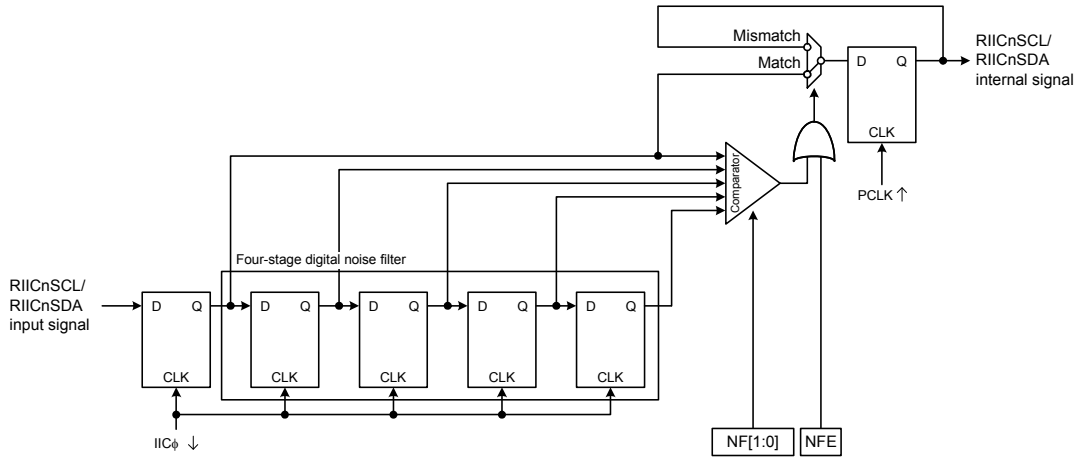
The states of the RIICnSCL and RIICnSDA pins are conveyed to the internal circuitry through the digital noise-filter circuit. **Figure 20.23** is a block diagram of the digital noise-filter circuit.

The on-chip digital noise-filter circuit of the RIIC consists of four flip-flop circuit stages connected in series and a match-detection circuit.

The number of effective stages in the digital noise filter is selected by the RIICnMR3.NF[1:0] bits. The selected number of effective stages determines the noise-filtering capability as a period from one to four IICϕ cycles.

The input signal to the RIICnSCL pin (or RIICnSDA pin) is sampled on falling edges of the IICϕ signal. When the input signal level matches the output level of the number of effective flip-flop circuit stages as selected by the RIICnMR3.NF[1:0] bits, the signal level is conveyed as an internal signal. If the signal levels do not match, the previous value is retained.

If the ratio between the frequency of the internal operating clock (PCLK) and the transfer rate is small, the characteristics of the digital noise filter may lead to the elimination of needed signals as noise. In such cases, it is possible to disable the digital noise-filter circuit (by clearing the RIICnFER.NFE bit to 0).



**Note:** NFE: Digital noise filter circuit enable bit
NF[1:0]: Digital noise filter stage selection bit

**Figure 20.23 Block Diagram of Digital Noise Filter Circuit**

## 20.9 Address Match Detection

The RIIC can set three unique slave addresses in addition to the general call address and device ID address, and also can set 7-bit or 10-bit slave addresses.

### 20.9.1 Slave-Address Match Detection

The RIIC can set three unique slave addresses, and has a slave address detection function for each unique slave address. When the RIICnSER.SARy bit (y = 0 to 2) is set to 1, the slave addresses set in RIICnSARy (y = 0 to 2) can be detected.

When the RIIC detects a match of the set slave address, the corresponding RIICnSR1.AASy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. The RIICnSR2.RDRF flag or the RIICnSR2.TDRE flag is set to 1 by the following R/W# bit. This causes a receive complete interrupt (INTRIICnRI) or transmit data empty interrupt (INTRIICnTI) to be generated. The AASy flag is used to identify which slave address has been specified.

**Figure 20.24** to **Figure 20.26** show the AASy flag set timing in three cases.

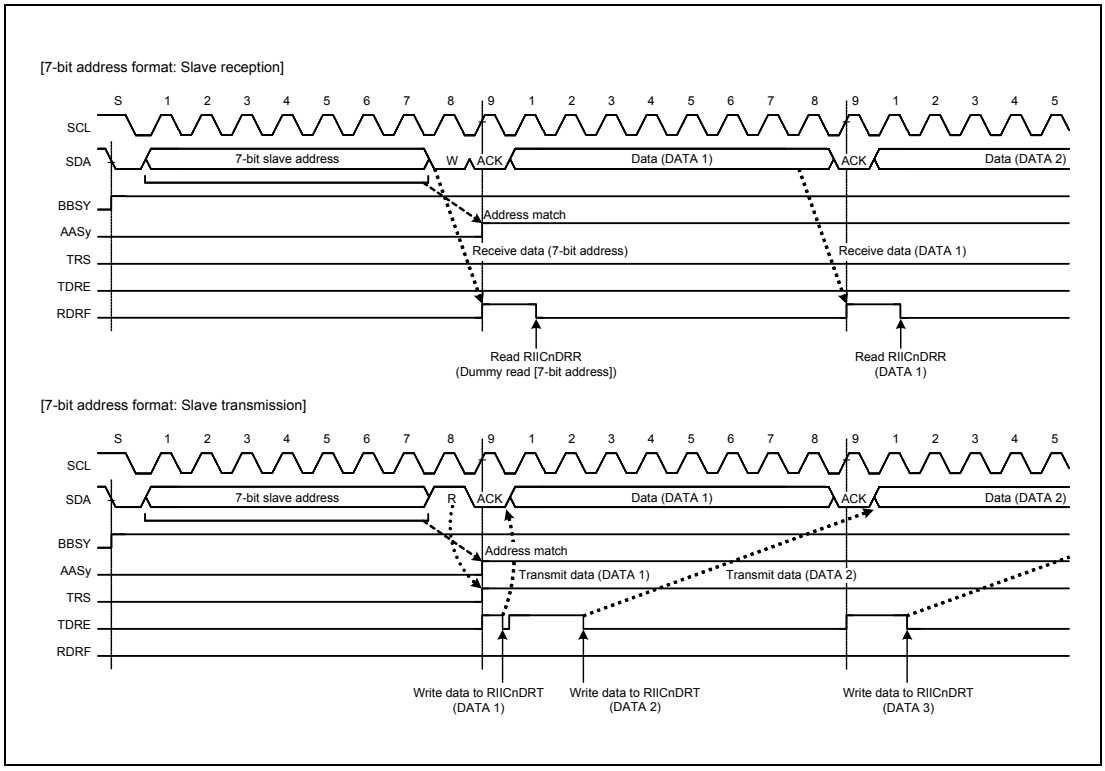


**Figure 20.24 AASy Flag Set Timing with 7-Bit Address Format Selected**

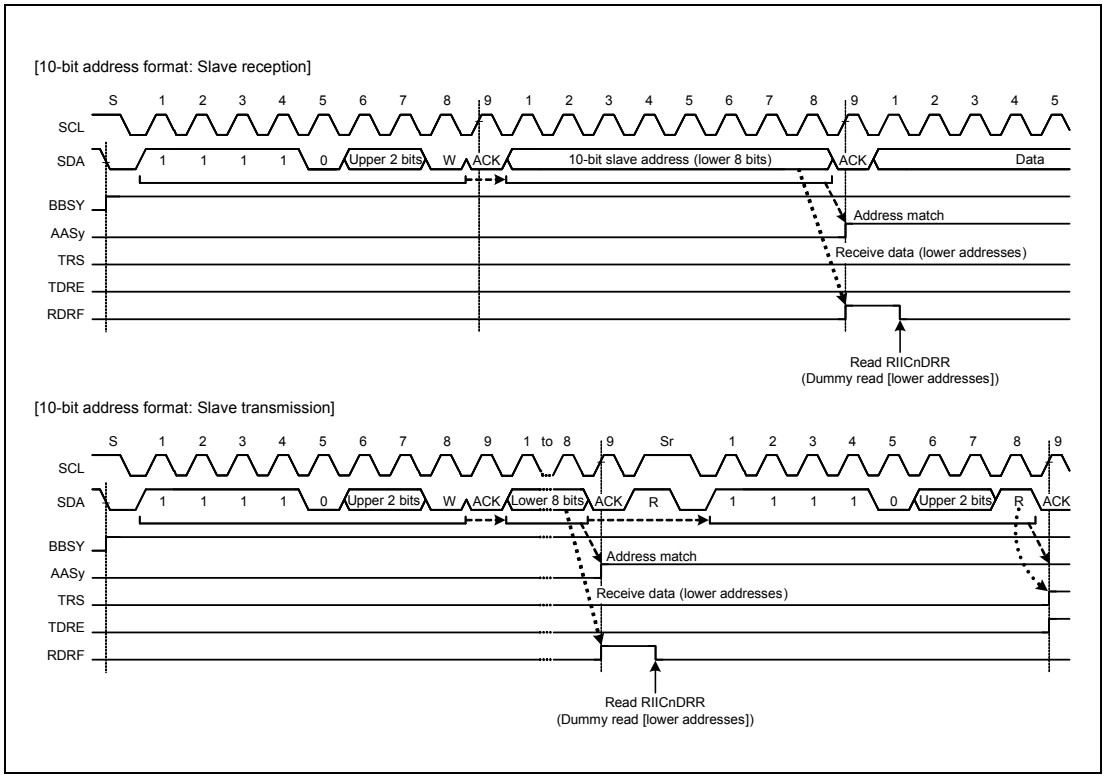

**Figure 20.25 AASy Flag Set Timing with 10-Bit Address Format Selected**

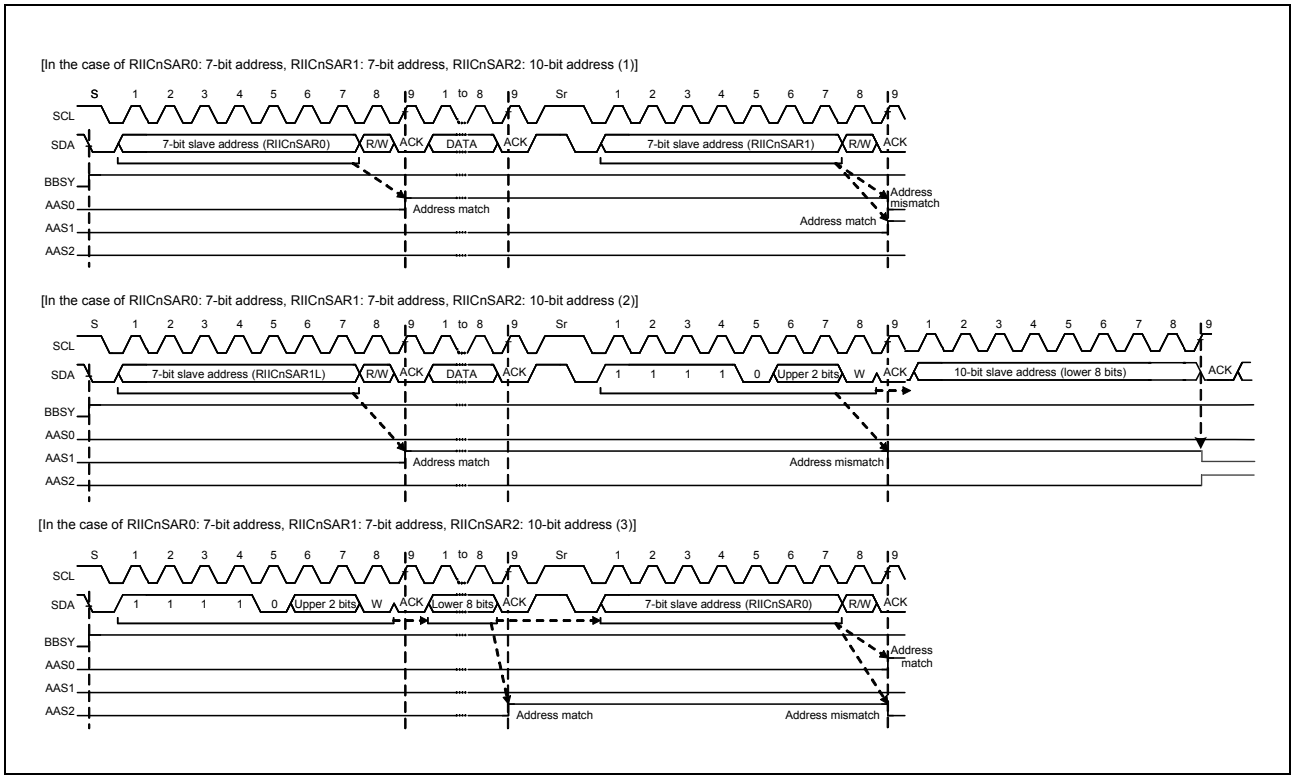

**Figure 20.26 AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed**

### 20.9.2 Detection of the General Call Address

The RIIC has a facility for detecting the general call address (0000 $000_B$ + 0 [W]). This is enabled by setting the RIICnSER.GCAE bit to 1.

If the address received after a start or restart condition is issued is 0000 $000_B$ + 1[R] (start byte), the RIIC recognizes this as the address of a slave device with an “all-zero” address but not as the general call address.

When the RIIC detects the general call address, both the RIICnSR1.GCA flag and the RIICnSR2.RDRF flag are set to 1 on the rising edge of the ninth cycle of SCL clock. This leads to the generation of a receive complete interrupt (INTRIICnRI). The value of the GCA flag can be confirmed to recognize that the general call address has been transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

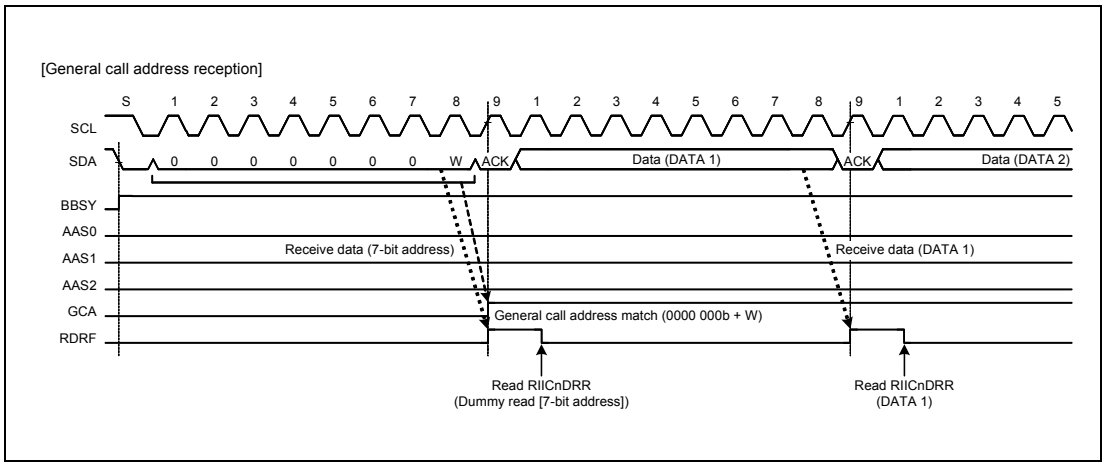

**Figure 20.27 Timing of GCA Flag Setting during Reception of General Call Address**

### 20.9.3 Device-ID Address Detection

The RIIC module has a facility for detecting device-ID addresses conforming with the I2C bus specification (Rev. 03). When the RIIC receives 1111 $100_B$ as the first byte after a start condition or restart condition was issued with the RIICnSER.DIDE bit set to 1, the RIIC recognizes the address as a device ID, sets the RIICnSR1.DID flag to 1 on the rising edge of the ninth SCL clock cycle when the following R/W# bit is 0, and then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the RIIC sets the corresponding RIICnSR1.AASy flag (y = 0 to 2) to 1.

After that, when the first byte received after a start or restart condition is issued matches the device ID address (1111 $100_B$) again and the following R/W# bit is 1, the RIIC does not compare the second and subsequent bytes and sets the RIICnSR2.TDRE flag to 1.

In the device-ID address detection function, the RIIC clears the DID flag to 0 if a match with the RIIC's own slave address is not obtained or a match with the device ID address is not obtained after a match with the RIIC's own slave address and the detection of a restart condition. If the first byte after detection of a start or restart condition matches the device ID address (1111 $100_B$) and the R/W# bit is 0, the RIIC sets the DID flag to 1 and compares the second and subsequent bytes with the RIIC's slave address. If the R/W# bit is 1, the DID flag holds the previous value and the RIIC does not compare the second and subsequent bytes. Therefore, the reception of a device-ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Furthermore, prepare the device-ID fields (three bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal data for transmission. For details, see I2C Bus Standard from NXP Semiconductors.

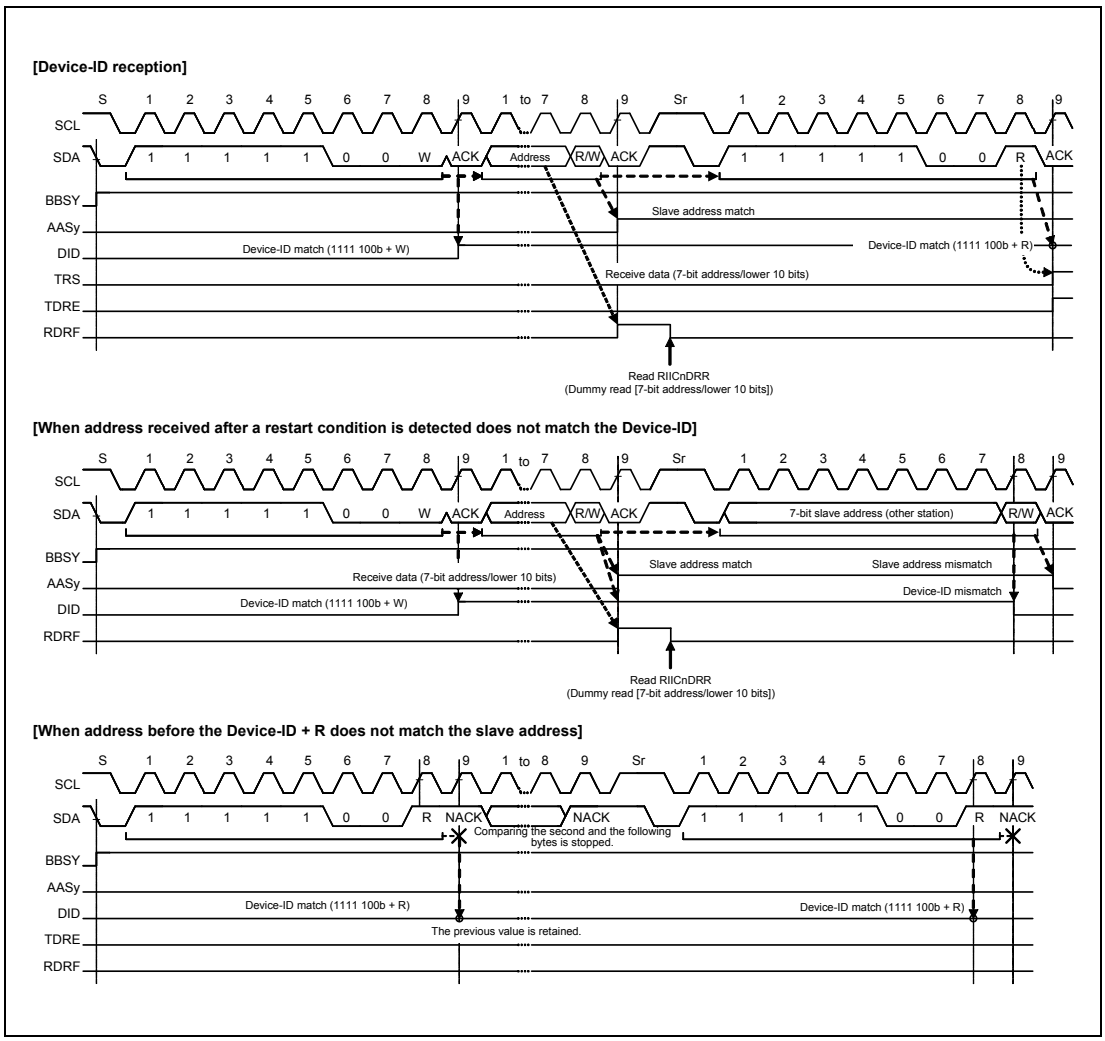

**Figure 20.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID**

# 20.10 Automatic Low-Hold Function for SCL

## 20.10.1 Function to Prevent Wrong Transmission of Transmit Data

To prevent the unintended transmission of erroneous data, this low-hold period is extended until data for transmission have been written. In addition, the RIIC holds the SCL line low over the period until a stop condition is issued and also over the period until the RIICnDRR register is dummy read.

**<Master transmit mode>**

- Low-level interval after a start condition or restart condition is issued
- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next
- Low-level interval from the ninth clock cycle until a stop condition is issued

**<Slave transmit mode>**

- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next
- Low-level interval from the ninth clock cycle and the RIICnDRR register is dummy read

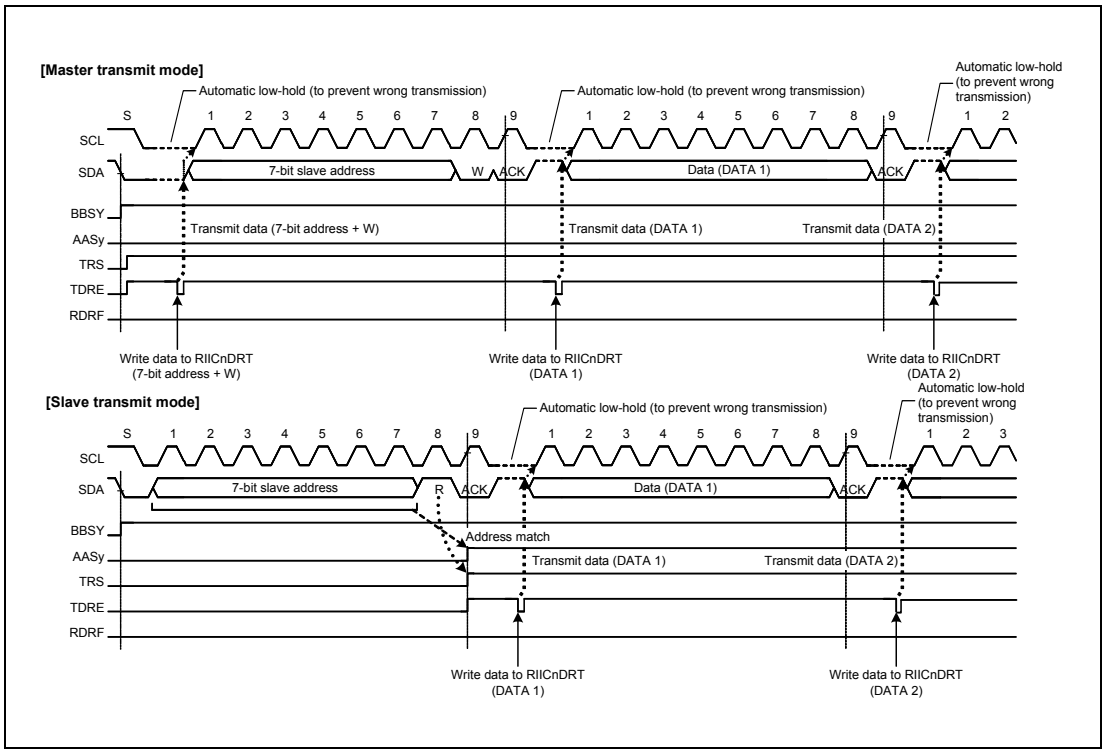

**Figure 20.29 Automatic Low-Hold Operation in Transmit Mode**

## 20.10.2 NACK Reception Transfer Suspension Function

The RIIC has a function to suspend transfer operation when NACK is received in transmit mode (RIICnCR2.TRS bit = 1). This function is enabled when the RIICnFER.NACKE bit is set to 1 (transfer suspension enabled). If the next transmit data has already been written (RIICnSR2.TDRE flag = 0) when NACK is received, next data transmission at the falling edge of the ninth SCL clock cycle is automatically suspended. This prevents the SDA line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (RIICnSR2.NACKF flag = 1), transmit operation and receive operation are discontinued. To restore transmit/receive operation, be sure to clear the NACKF flag to 0. In master transmit mode, clear the NACKF flag to 0, issue a restart or stop condition, and then issue a start condition again.

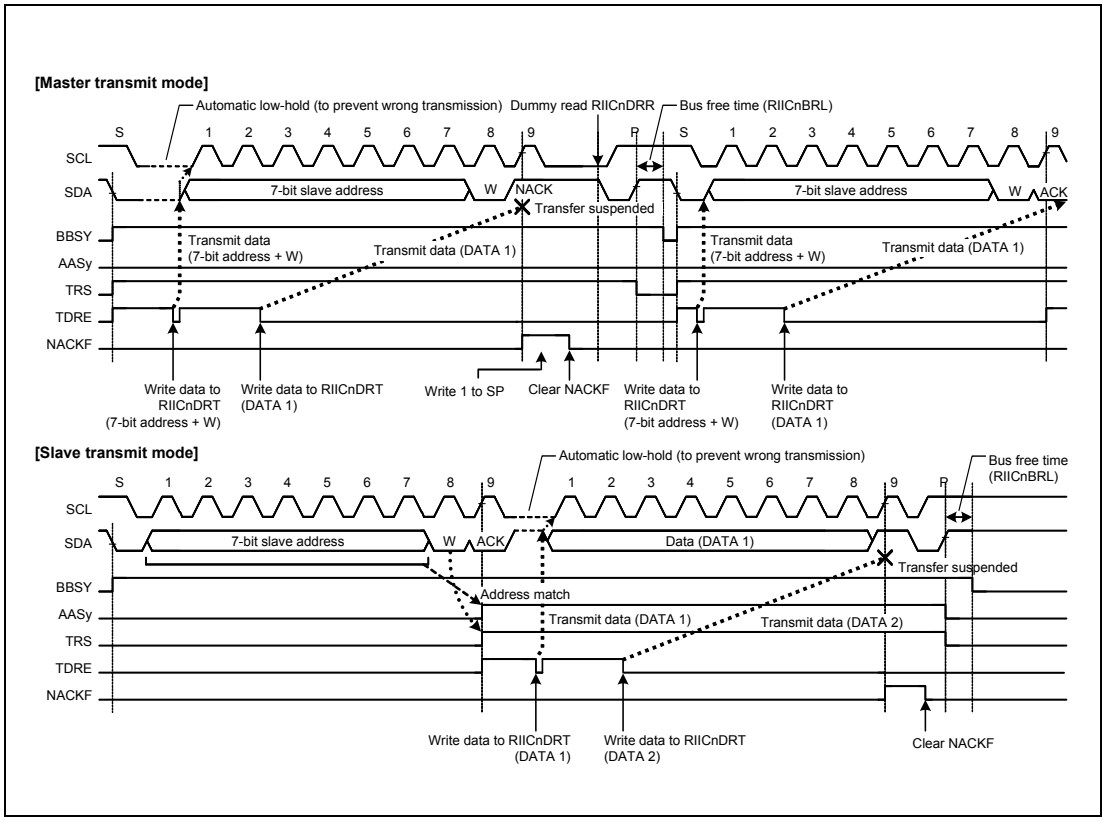

**Figure 20.30 Suspension of Data Transfer when NACK is Received (NACKE = 1)**

### 20.10.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (RIICnDRR) read is delayed for a period of one transfer frame or more with receive complete (RIICnSR2.RDRF flag = 1) in receive mode (RIICnCR2.TRS = 0), the RIIC holds the SCL line low automatically immediately before the next data is received to prevent failure to receive data.

This function to prevent failure to receive data using the automatic low-hold function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, the RIIC's own slave address is designated after a stop condition is issued. This function does not disturb other communication because the RIIC does not hold the SCL line low when a mismatch with its own slave address occurs after a stop condition is issued.

Sections in which the SCL line is held low can be selected with a combination of the RIICnMR3.WAIT and RDRFS bits.

#### (1) One-Byte Receive Operation and Automatic Low-Hold Function Using the WAIT Bit

When the RIICnMR3.WAIT bit is set to 1, the RIIC performs one-byte receive operation using the WAIT bit function.
Furthermore, when the RIICnMR3.RDRFS bit is 0, the RIIC automatically sends the RIICnMR3.ACKBT bit value for the acknowledge bit in the period from the falling edge of the eighth SCL clock cycle to the falling edge of the ninth SCL clock cycle, and automatically holds the SCL line low at the falling edge of the ninth SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from RIICnDRR, which enables bytewise receive operation.

The WAIT bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and device ID address) is obtained in master receive mode or slave receive mode.

#### (2) One-Byte Receive Operation (ACK/NACK Transmission Control) and Automatic Low-Hold Function Using the RDRFS Bit

When the RIICnMR3.RDRFS bit is set to 1, the RIIC performs one-byte receive operation using the RDRFS bit function.
When the RIICnSR2.RDRFS bit is set to 1, the RDRF flag (receive complete) in RIICnSR2 is set to 1 at the rising edge of the eighth SCL clock cycle, and the SCL line is automatically held low at the falling edge of the eighth SCL clock cycle. This lowhold is released by writing a value to the RIICnMR3.ACKBT bit, but cannot be released by reading data from RIICnDRR, which enables receive operation by the ACK/NACK transmission control according to the data received in byte units.

The RDRFS bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and device ID address) is obtained in master receive mode or slave receive mode.

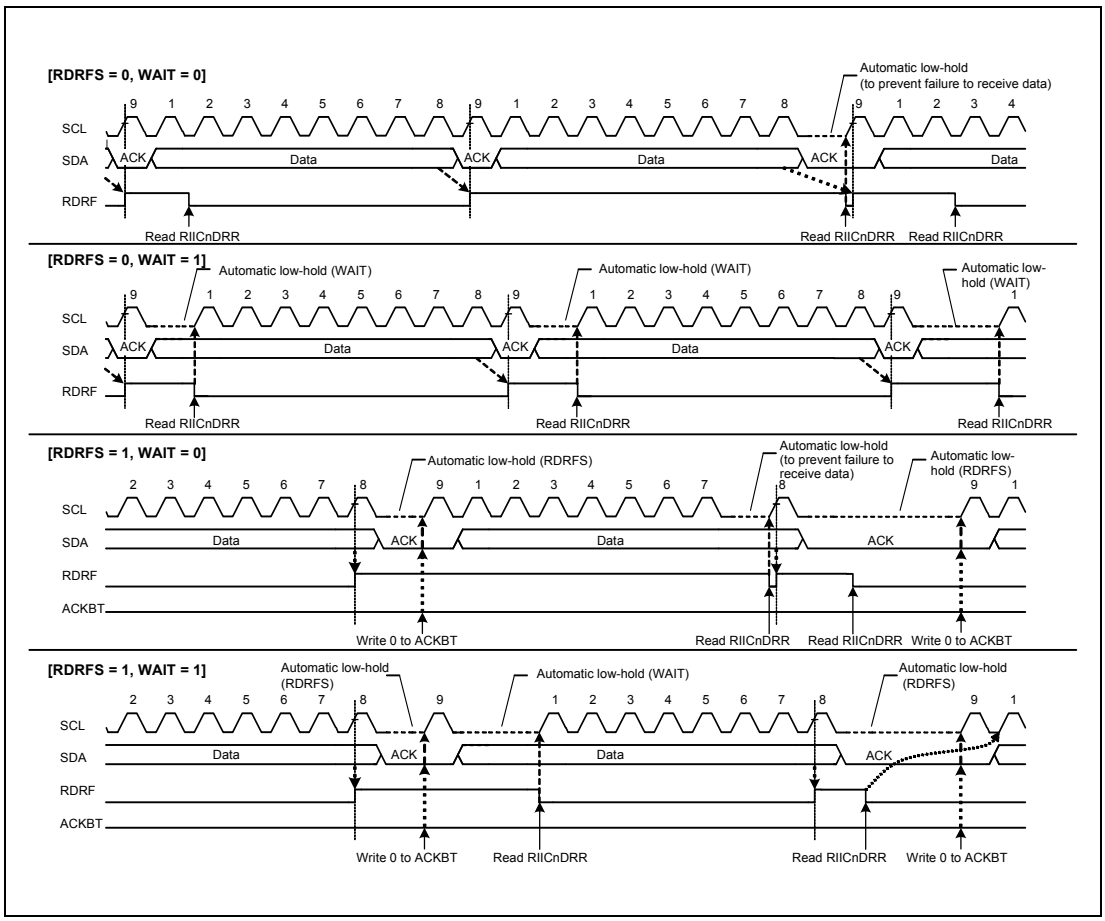

**Figure 20.31 Automatic Low-Hold Operation in Receive Mode (Using RDRFS and WAIT Bits)**

## 20.11 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I2C bus standard, the RIIC has functions to prevent double-issue of a start condition, to detect arbitration-lost during transmission of NACK, and to detect arbitration-lost in slave transmit mode.

### 20.11.1 Master Arbitration-Lost Detection (MALE Bit)

The RIIC drives the SDA line low to issue a start condition. However, if the SDA line has already been driven low by another master device issuing a start condition, the RIIC considers this a loss in arbitration, so priority is given to transfer by the other master device. Similarly, if the RIICnCR2.ST bit is set to 1 while the bus is busy (RIICnCR2.BBSY flag = 1), the RIIC considers itself to have lost in arbitration, so priority is given to transfer by the other master device and no start condition is generated.

When a start condition is issued successfully, if the data for transmission including the address bits (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state, and the low level is detected on the SDA line), the RIIC loses in arbitration.

After a loss in arbitration of mastership, the RIIC immediately enters slave receive mode. If a slave address (including the general call address) matches its own address at this time, the RIIC continues in slave operation.

A loss in arbitration of mastership is detected when the following conditions are met while the RIICnFER.MALE bit is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Non-matching of the internal level for output on SDA and the level on the SDA line after a start condition was issued by setting the RIICnCR2.ST bit to 1 while the RIICnCR2.BBSY flag was cleared to 0 (erroneous issuing of a start condition)
- Setting of the RIICnCR2.ST bit to 1 (start condition double-issue error) while the RIICnCR2.BBSY flag is set to 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDA line in master transmit mode (RIICnCR2.MST and TRS bits = $11_B$)

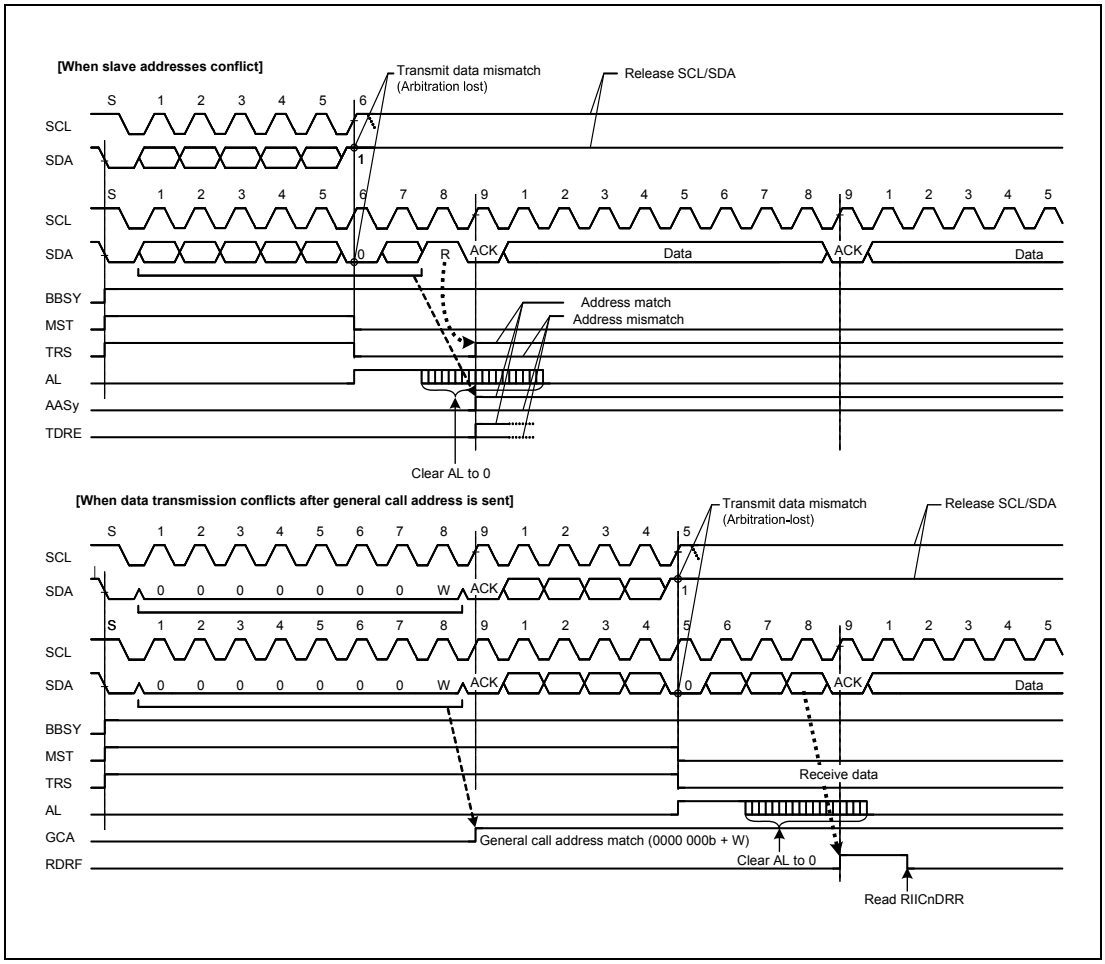

**Figure 20.32 Examples of Master Arbitration-Lost Detection (MALE = 1)**

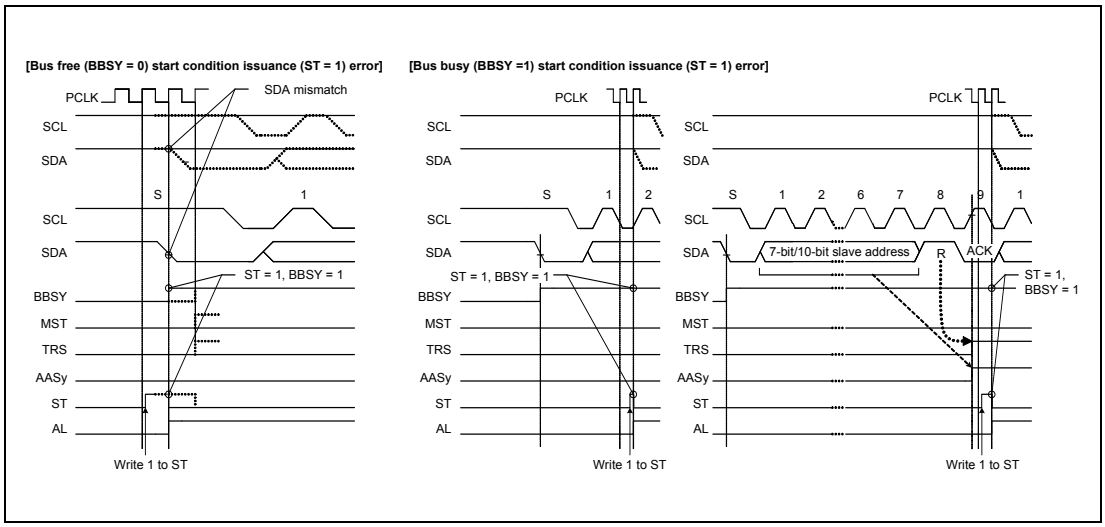

**Figure 20.33 Arbitration-Lost when a Start Condition is Issued (MALE = 1)**

The TRS bit is not cleared if 1 is written to the ST bit while the BBSY flag is 1 in slave transmit mode.

### 20.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

The RIIC has a function to cause arbitration to be lost if the internal SDA output level does not match the level on the SDA line (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state, and the low level is detected on the SDA line) during transmission of NACK in receive mode. Arbitration is lost due to a conflict of NACK transmission and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send/receive the same information through a single slave device. **Figure 20.34** shows an example of arbitration-lost detection during transmission of NACK.

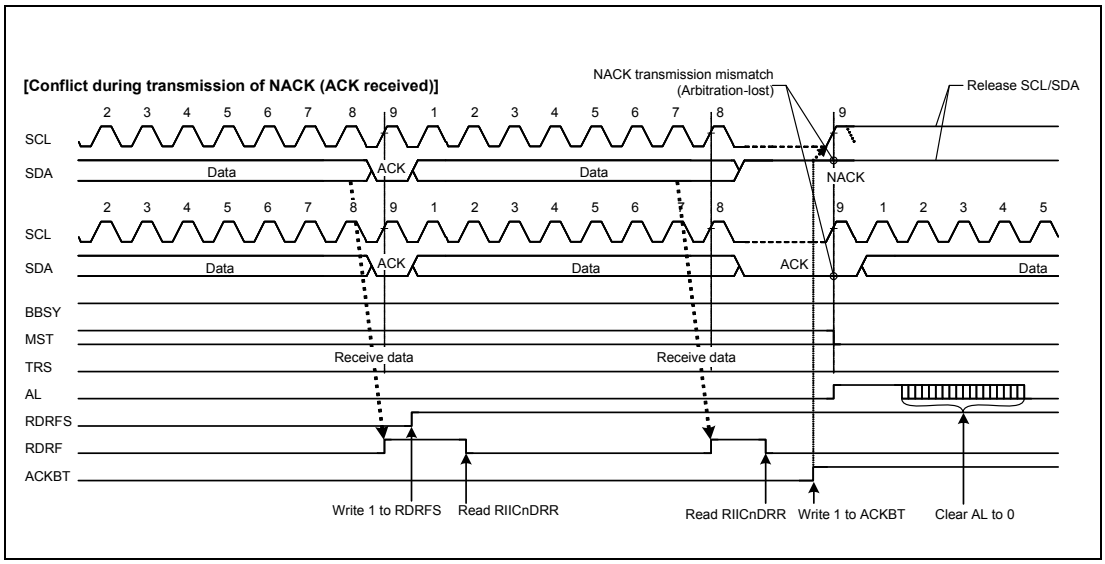

**Figure 20.34 Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)**

The following explains arbitration-lost detection using an example where two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives two bytes of data from the slave device, and master B receives four bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in both master A and master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Here, master A sends NACK when it has received two final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received necessary four bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect ACK transmitted by master B and issues a stop condition.

Therefore, the issuance of the stop condition conflicts with the SCL clock output of master B, which disturbs communication.

When the RIIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost.

If arbitration is lost during transmission of NACK, the RIIC enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

The RIIC detects arbitration-lost during transmission of NACK when the following condition is met with the RIICnFER.NALE bit set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

When the internal SDA output level does not match the SDA line (ACK is received) during transmission of NACK (RIICnMR3.ACKBT bit = 1)

### 20.11.3 Slave Arbitration-Lost Detection (SALE Bit)

The RIIC has a function to cause arbitration to be lost if the data for transmission (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the highimpedance state, and the low level is detected on the SDA line) in slave transmit mode.

When it loses slave arbitration, the RIIC enters slave receive mode.

The RIIC detects slave arbitration-lost when the following condition is met with the RIICnFER.SALE bit set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

When transmit data excluding acknowledge (internal SDA output level) does not match the SDA line in slave transmit mode (RIICnCR2.MST and TRS bits = $01_B$)

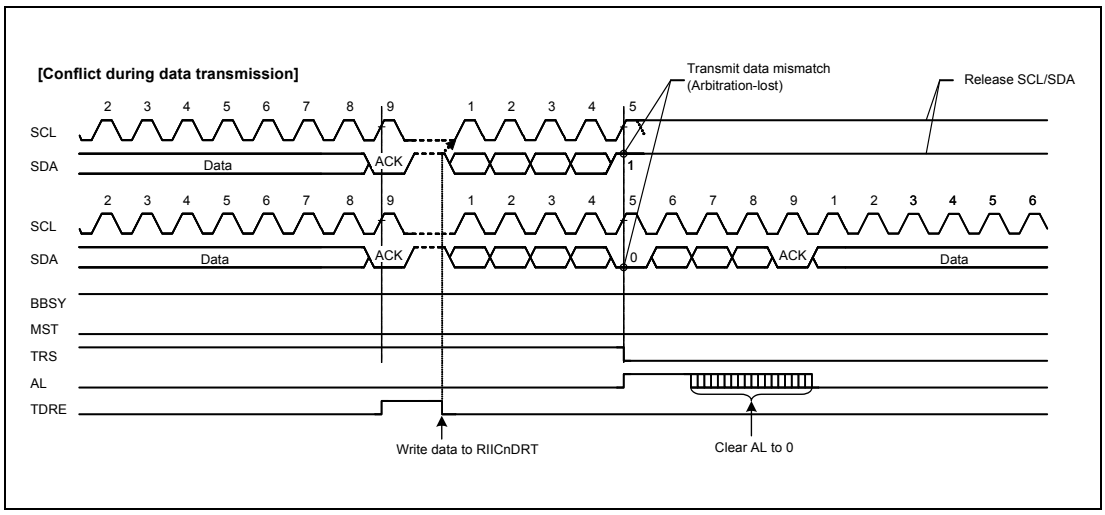

**Figure 20.35 Example of Slave Arbitration-Lost Detection (SALE = 1)**

# 20.12 Start Condition/Restart Condition/Stop Condition Issuing Function

## 20.12.1 Issuing a Start Condition

The RIIC issues a start condition when the RIICnCR2.ST bit is set to 1.

When the ST bit is set to 1, a start condition issuance request is made and the RIIC issues a start condition when the RIICnCR2.BBSY flag is 0 (bus free). When a start condition is issued normally, the RIIC automatically shifts to the master transmit mode.

A start condition is issued in the following sequence.

[Start condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the start condition hold time.
- Drive the SCL line low (high level to low level).
- Detect low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

## 20.12.2 Issuing a Restart Condition

The RIIC issues a restart condition when the RIICnCR2.RS bit is set to 1.

When the RS bit is set to 1, a restart condition issuance request is made even during communication and the RIIC issues a restart condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

(To detect the issuance of a restart condition, clear the RIICnSR2.START flag before a restart condition is issued.)

A restart condition is issued in the following sequence.

[Restart condition issuance]

- Release the SDA line.
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRL and the restart condition setup time.
- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the restart condition hold time.
- Drive the SCL line low (high level to low level).
- Detect a low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

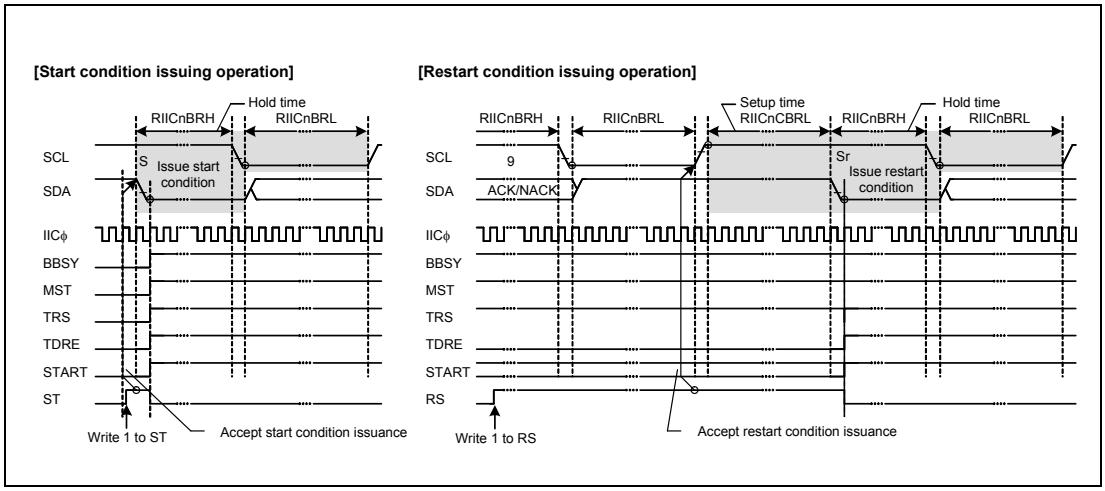

**Figure 20.36 Start Condition/Restart Condition Issue Timing (ST and RS Bits)**

### 20.12.3 Issuing a Stop Condition

The RIIC issues a stop condition when the RIICnCR2.SP bit is set to 1.

When the SP bit is set to 1, a stop condition issuance request is made and the RIIC issues a stop condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A stop condition is issued in the following sequence.

[Stop condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRH and the stop condition setup time.
- Release the SDA line (low level to high level).
- Ensure the time set in RIICnBRL and the bus free time.
- Clear the BBSY flag to 0 (to release the bus mastership).

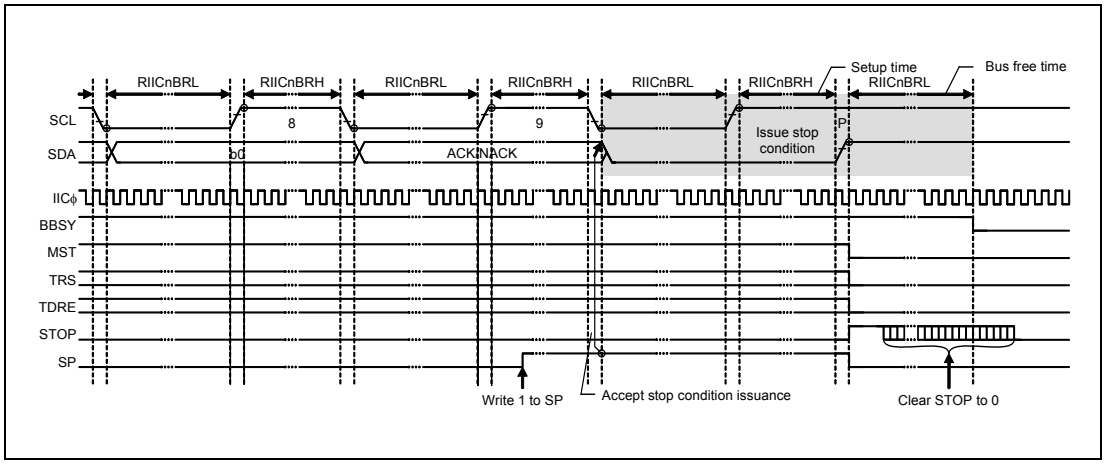

**Figure 20.37 Stop Condition Issue Timing (SP Bit)**

## 20.13 Bus Hanging

If the clock signals from the master and slave devices go out of synchronization due to noise or other factors, the I2C bus might hang with a fixed level on the SCL line and/or SDA line.

As measures against the bus hanging, the RIIC has a timeout function to detect hanging by monitoring the SCL line, a function for the output of an extra SCL clock cycle to release the bus from a hung state due to clock signals being out of synchronization, and the RIIC/internal reset function.

By checking the RIICnCR1.SCLO, SDAO, SCLI, and SDAI bits, it is possible to see whether the RIIC or its partner in communications is placing the low level on the SCL or SDA lines.

### 20.13.1 Timeout Function

The RIIC has the timeout function to detect an abnormality that the SCL line is held for a certain period of time. The RIIC can detect an abnormal bus state by monitoring that the SCL line is held low or high for a predetermined time.

The timeout function monitors the SCL line state and counts the low-level period or high-level period using the internal counter. The timeout function resets the internal counter each time the SCL line changes (rising or falling), but continues to count unless the SCL line changes. If the internal counter overflows due to no SCL line change, the RIIC can detect the timeout and report the bus abnormality.

The internal counter is cleared when one of the conditions is met.

(1) When RIICnMR2.TMOH=0, and RIICnMR2.TMOL=1:
The internal counter is cleared by SCL rising

(2) When RIICnMR2.TMOH=1, and RIICnMR2.TMOL=0:
The internal counter is cleared by SCL falling

(3) When RIICnMR2.TMOH=RIICnMR2.TMOL=1:
The internal counter is cleared by SCL rising or falling

This timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is stuck low or high during the following conditions:

- The bus is busy (RIICnCR2.BBSY flag is 1) in master mode (RIICnCR2.MST bit is 1).
- The RIIC's own slave address matches (RIICnSR1 register is not $00_H$) and the bus is busy (RIICnCR2.BBSY flag is 1) in slave mode (RIICnCR2.MST bit is 0).
- The bus is free (RIICnCR2.BBSY flag is 0) while generation of a START condition is requested (RIICnCR2.ST bit is 1).

The internal counter of the timeout function works using the internal reference clock (IICϕ) set by the RIICnMR1.CKS[2:0] bits as a count source. It functions as a 16-bit counter when long mode is selected (RIICnMR2.TMOS bit = 0) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCL line level (low/high or both levels) during which this counter is activated can be selected by the setting of the RIICnMR2.TMOH and TMOL bits. If both TMOL and TMOH bits are cleared to 0, the internal counter does not work.

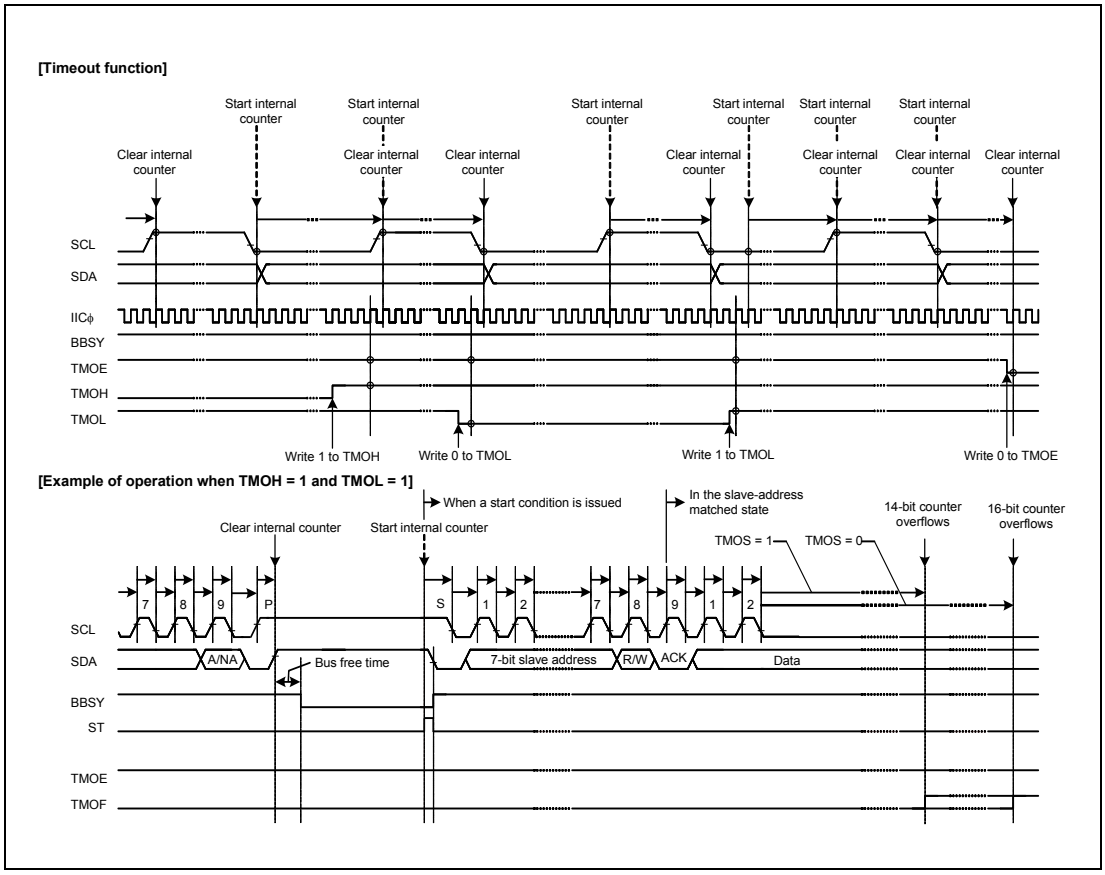

**Figure 20.38 Timeout Function (TMOE, TMOS, TMOH, and TMOL Bits)**

### 20.13.2 Extra SCL Clock Cycle Output Function

In master mode, the RIIC module has a facility for the output of extra SCL (clock) cycles to release the SDA line of the slave device from being held at the low level due to the master being out of synchronization with the slave device.

This function is mainly used in master mode to release the SDA line of the slave device from the state of being fixed to the low level by including extra cycles of SCL output from the RIIC with single cycles of the SCL (clock) signal as the unit in the case of a bus error where the RIIC cannot issue a stop condition because the slave device is holding the SDA line at the low level. Do not use this facility in normal situations. Using it when communications are proceeding correctly will lead to malfunctions.

When the RIICnCR1.CLO bit is set to 1 in master mode, a single cycle of the SCL clock at the frequency corresponding to the transfer rate settings (settings of the RIICnMR1.CKS[2:0] bits, and of the RIICnBRH and RIICnBRL registers) is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit is automatically cleared to 0. Therefore, further extra clock cycles can be output consecutively by the software program writing 1 to the CLO bit after having read CLO = 0.

When the RIIC module is in master mode and the slave device is holding the SDA line at the low level because synchronization with the slave device has been lost due to the effects of noise, etc., the output of a stop condition is not possible. The facility for output of an extra cycle of the SCL (clock) signal can be used to output extra cycles of SCL one by one to make the slave device release the SDA line from being held at the low level, thus recovering the bus from an unusable state. Release of the SDA line by the slave device can be monitored by reading the RIICnCR1.SDAI bit. After confirming release of the SDA line by the slave device, complete communications by reissuing the stop condition.

Use this facility with the RIICnFER.MALE bit (master arbitration-lost detection disabled) cleared to 0. If the MALE bit is set to 1 (master arbitration-lost detection enabled), arbitration is lost when the value of the RIICnCR1.SDAO bit does not match the state of the SDA line, so take care on this point.

[Additional output conditions for the SCL clock]

- In master mode and when the bus is free
- In master mode and the SCL line is not held low (the bus is busy)

**Figure 20.39** shows the operation timing of the extra SCL clock cycle output function (CLO bit).

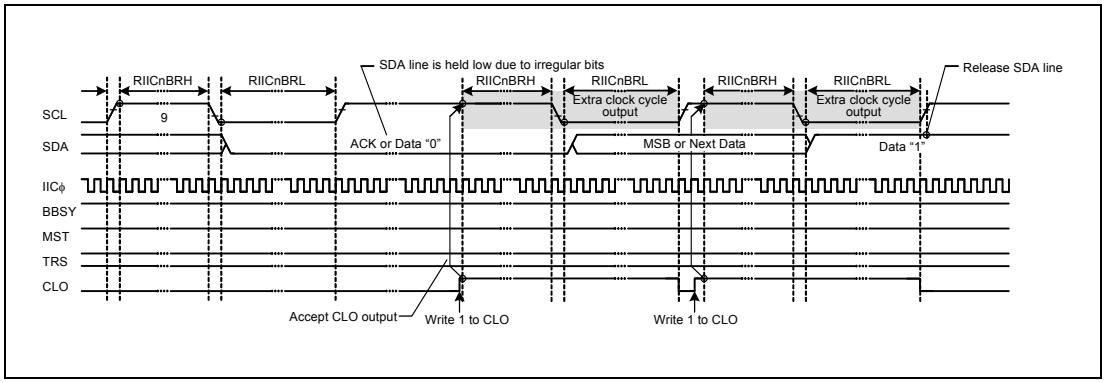

**Figure 20.39 Extra SCL Clock Cycle Output Function (CLO Bit)**

### 20.13.3 RIIC Reset and Internal Reset

The RIIC module incorporates a function for resetting itself. There are two types of reset. One is referred to as an RIIC reset; this initializes all registers including the RIICnCR2.BBSY flag. The other is referred to as an internal reset; this releases the RIIC from the slave-address matched state and initializes the internal counter while retaining other settings.

After issuing a reset, be sure to clear the RIICnCR1.IICRST bit to 0.

Both types of reset are effective for release from bus-hung states since both restore the output state of the SCL and SDA pins to the high impedance state.

Issuing a reset during slave operation may lead to a loss of synchronization between the master device clock and the slave device clock, so avoid this where possible. Note that monitoring of the bus state, such as for the presence of a start condition, is not possible during an RIIC reset (RIICnCR1.ICE and IICRST bits = $01_B$).

For a detailed description of the RIIC and internal resets, see **Section 20.14, Reset Function of RIIC**.

## 20.14 Reset Function of RIIC

The RIIC has RIIC reset, and internal reset functions. In addition RIIC is cleared by ISORES. **Table 20.26** lists the scope of each reset and reset conditions.

**Table 20.26 RIIC Reset Functions (1/2)**

| UM | | ISORES | RIIC Reset (ICE = 0, IICRST = 1) | Internal Reset (ICE = 1, IICRST = 1) | Start/Restart Condition Detection | Stop Condition Detection |

Note 1. When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
When an internal reset is applied while the bus is not free, the BBSY flag is not cleared to 0.

# Section 21 CAN Interface (RS-CAN)

This section contains a generic description of the CAN Interface (RS-CAN).

A CAN FD interface is also available, but only in PREMIUM models. In ECO and ADVANCED models, the CAN FD channels can be used as classic (non-FD) CAN channels.

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD and RS-CAN.

## 21.1 Features of RH850/F1K RS-CANFD

### 21.1.1 Number of Units and Channels

This product supports a CAN FD interface that complies with the new ISO/CD 11898-1 standard that revises the CRC field definition to include the stuff bit count. This product can also support the CRC field definition that complies with the ISO/CD 11898-1 standard issued on August 12, 2014 by setting OPBT0.CANFDCRC = 0. For details about OPBT0, see **Section 37, Flash Memory**.

This microcontroller has the following number of RS-CANFD and RS-CAN units.

**Table 21.1 Number of RS-CANFD Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | 1 | | |
| Name | RSCAN0 | | |

**Table 21.2 Number of RS-CAN Units**

| Product Name | RH850/F1K 100 pins | RH850/F1K 144 pins | RH850/F1K 176 pins |
|---|---|---|---|
| Number of Units | — | — | 1 |
| Name | — | — | RSCAN1 |

Each unit has the following number of CAN FD interface channels.

**Table 21.3 Unit Configurations and Channels**

| Unit Name | Channel Name | CAN FD Support*1 | RH850/F1K 100 pins (6 ch) | RH850/F1K 144 pins (6 ch) | RH850/F1K 176 pins (7 ch) |
|---|---|---|---|---|---|
| RSCAN0 | CAN0 | Yes | √ | √ | √ |
| | CAN1 | Yes | √ | √ | √ |
| | CAN2 | Yes | √ | √ | √ |
| | CAN3 | Yes | √ | √ | √ |
| | CAN4 | Yes | √ | √ | √ |
| | CAN5 | Yes | √ | √ | √ |
| RSCAN1 | CAN6 | No | — | — | √ |

Note 1. The CAN FD interface is only available in PREMIUM models. In ECO and ADVANCED models, the CAN FD channels can be used as classic (non-FD) CAN channels.

For details about the functions and registers of CAN0 to CAN5 (RS-CANFD), see **Section 21.2, RS-CANFD**.

For details about the functions and registers of CAN6 (RS-CAN), see **Section 21.14, RS-CAN**.

## 21.2 RS-CANFD

This section describes the functions and registers of RS-CANFD.

The RS-CANFD has two interface modes (classical CAN mode and CAN FD mode) and uses different registers for each mode. There are two types of register names RSCANnXXX and RSCFDnCFDXXX (XXX: arbitrary) depending on the interface mode. When explaining specifications common to two registers, register names are described as RSCANn(CFD)XXX.

**Table 21.4 Indices**

| Index | Description |
|---|---|
| n | Throughout this section, the individual RS-CANFD units are generically indicated by the index “n” (n = 0); for example, RSCANn(CFD)GCTR is the global control register of the RSCANn unit. |
| m | Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “m” (m = 0 to 5); for example, RSCANn(CFD)CmSTS is the channel m status register. |
| j | The individual registers associated with receive rule table are generically indicated by the index “j” (j = 0 to 15); for example, RSCANn(CFD)GAFLIDj is the receive rule ID register. |
| k | The individual transmit/receive FIFO buffers are generically indicated by the index “k” (k = 0 to [channel m × 3 + 2]); for example, RSCANn(CFD)CFCCk is the transmit/receive FIFO buffer configuration/control register. |
| x | The individual receive FIFO buffers are generically identified by the index “x” (x = 0 to 7); for example, RSCANn(CFD)RFSTSx is the receive FIFO buffer status register. |
| d | Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by “d” (classical CAN mode: d = 0 to 1, CAN FD mode: d = 0 to 15). For example, the transmit/receive FIFO buffer data field register is described as RSCANn(CFD)CFDFdk. |
| q | The individual receive buffers are generically indicated by the index “q” (q = 0 to [channel m × 16 + 15]); for example, RSCANn(CFD)RMIDq is the receive buffer ID register. |
| p | The individual transmit buffers are generically indicated by the index “p” (p = 0 to [channel m × 16 + 15]; for example, RSCANn(CFD)TMCp is the transmit buffer control register. |
| b | Data field registers of receive buffers and transmit buffers are identified by “b” (classical CAN mode: b = 0 to 1, CAN FD mode: b = 0 to 4). For example, the receive buffer data field register is described as RSCANn(CFD)RMDFbq. |
| r | The individual RAM tests for CAN are generically indicated by the index “r” (r = 0 to 63); for example, RSCANn(CFD)RPGACCr is the RAM test page access register. |
| y | The registers not covered above are indicated by the index “y” (y = 0 to 2); for example, RSCANn(CFD)RMNDy is a receive buffer new data register. |

**Note:** The functions and descriptions of registers in this section are for a 6-channel RS-CANFD (m = 0 to 5). When referring to information with indices, regard the index values as the ones corresponding to your product. Also, note that, if the value of an index exceeds the range described in this section due to your product, write the value after reset when writing to bits outside the index range.

The following table lists the values of indices for individual products.

**Table 21.5 Indices for Individual Products**

| Indices for Individual Products |
|---|
| **100, 144, 176 pins (6 ch)** |
| j = 0 to 15 |
| k = 0 to 17 |
| x = 0 to 7 |
| q = 0 to 95 |
| p = 0 to 95 |
| r = 0 to 63 |
| y = 0 to 2 |

### 21.2.1 Register Base Address

RSCAN0 base addresses are listed in the following table.

RSCAN0 register addresses are given as offsets from the base addresses.

**Table 21.6 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <RSCAN0_base> | FFD0 $0000_H$ |
| <ECCCAN0_base> for MB RAM | FFC7 $1300_H$ |
| <ECCCANFD0_base> for AFL RAM | FFC7 $1400_H$ |

### 21.2.2 Clock Supply

The RSCANn clock supply is shown in the following table.

**Table 21.7 Clock Supply**

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
|---|---|---|---|
| RSCANn (n =0) | clk_xincan | CKSCLK_ICANOSC | Communicatiaon clock from OSC clock |
| | clkc | CKSCLK_IPERI2 | Communication clock |
| | pclk | CKSCLK_ICAN | Module clock |
| | Register access clock | CPUCLK2 | Bus clock |
| | | CKSCLK_ICAN | |

The operating frequency of the RSCANn depends on the transfer rate and the number of channels in use. Use the RSCANn within the frequency range shown in **Table 21.8**.

**Table 21.8 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K (1/2)**

| Condition | | Range of Operating Frequency | | |
|---|---|---|---|---|
| Transfer Rate | No. of Channels in Use | pclk | clk_xincan*1 | clkc*1, *2 |
| 1 Mbps | 6ch | pclk ≥ 53MHz | 8 MHz ≤ clk_xincan ≤ pclk/2 | 12.5 MHz ≤ clkc ≤ pclk/2 |
| | 5ch | pclk ≥ 46MHz | | |
| | 4ch | pclk ≥ 40MHz | | |
| | 3ch | pclk ≥ 32MHz | | |
| | 2ch | pclk ≥ 26MHz | | |
| | 1ch | pclk ≥ 18MHz | | |
| 500 kbps | 6ch | pclk ≥ 27MHz | 4 MHz ≤ clk_xincan ≤ pclk/2 | 12.5 MHz ≤ clkc ≤ pclk/2 |
| | 5ch | pclk ≥ 23MHz | | |
| | 4ch | pclk ≥ 20MHz | | |
| | 3ch | pclk ≥ 16MHz | | |
| | 2ch | pclk ≥ 13MHz | | |
| | 1ch | pclk ≥ 8MHz | | |

Table 21.8 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K (2/2)

| Condition | | Range of Operating Frequency | | |
|---|---|---|---|---|
| Transfer Rate | No. of Channels in Use | pclk | clk_xincan*1 | clkc*1, *2 |
| 125 kbps | 6ch | pclk ≥ 8MHz | 4 MHz ≤ clk_xincan ≤ pclk/2 | 12.5 MHz ≤ clkc ≤ pclk/2 |
| | 5ch | | | |
| | 4ch | | | |
| | 3ch | | | |
| | 2ch | | | |
| | 1ch | | | |

Note 1. Setting the DCS bit in the RSCANn(CFD)GCFG register enables to select either clk_xincan or clkc. Set clocks less than or equal to pclk/2 (up to 40 MHz).

Note 2. When pclk ≤ 25 MHz, select clk_xincan.

**CAUTION**

**When the RS-CANFD module is used in STOP mode, set the MainOSC as the clock source of the RS-CANFD module. For details about how to set the clock source, see Section 12.4.3.10, RS-CAN Clock Domains C_ISO_CAN and C_ISO_CANOSC.**

## 21.2.3 Interrupt Requests

RSCANn interrupt requests are listed in the following table.

Table 21.9 Interrupt Requests (1/2)

| Unit Interrupt Signal | | Description | Interrupt Number | DMA Trigger Number (Only in CAN FD Mode) |
|---|---|---|---|---|
| **RSCANn (n = 0)** | | | | |
| Global | INTRCANGERR0 | CAN global error interrupt | 22 | — |
| | INTRCANGRECC0 | CAN receive FIFO interrupt | 23 | — |
| | RSCANFDRF0 | Reception FIFO Access Message Buffers0 | — | 60 |
| | RSCANFDRF1 | Reception FIFO Access Message Buffers1 | — | 61 |
| | RSCANFDRF2 | Reception FIFO Access Message Buffers2 | — | 62 |
| | RSCANFDRF3 | Reception FIFO Access Message Buffers3 | — | 63 |
| | RSCANFDRF4 | Reception FIFO Access Message Buffers4 | — | 68 |
| | RSCANFDRF5 | Reception FIFO Access Message Buffers5 | — | 69 |
| | RSCANFDRF6 | Reception FIFO Access Message Buffers6 | — | 82 |
| | RSCANFDRF7 | Reception FIFO Access Message Buffers7 | — | 83 |
| CAN0 | INTRCAN0ERR | CAN0 error interrupt | 24 | — |
| | INTRCAN0REC | CAN0 transmit/receive FIFO receive complete interrupt | 25 | — |
| | INTRCAN0TRX | CAN0 transmit interrupt | 26 | — |
| | RSCANFDCF0 | CAN0 Common FIFO Access Message Buffers | — | 23 |
| CAN1 | INTRCAN1ERR | CAN1 error interrupt | 113 | — |
| | INTRCAN1REC | CAN1 transmit/receive FIFO receive complete interrupt | 114 | — |
| | INTRCAN1TRX | CAN1 transmit interrupt | 115 | — |

Table 21.9 Interrupt Requests (2/2)

| Unit Interrupt Signal | | Description | Interrupt Number | DMA Trigger Number (Only in CAN FD Mode) |
|---|---|---|---|---|
| CAN1 | RSCANFDCF1 | CAN1 Common FIFO Access Message Buffers | — | 24 |
| CAN2 | INTRCAN2ERR | CAN2 error interrupt | 217 | — |
| | INTRCAN2REC | CAN2 transmit/receive FIFO receive complete interrupt | 218 | — |
| | INTRCAN2TRX | CAN2 transmit interrupt | 219 | — |
| | RSCANFDCF2 | CAN2 Common FIFO Access Message Buffers | — | 26 |
| CAN3 | INTRCAN3ERR | CAN3 error interrupt | 220 | — |
| | INTRCAN3REC | CAN3 transmit/receive FIFO receive complete interrupt | 221 | — |
| | INTRCAN3TRX | CAN3 transmit interrupt | 222 | — |
| | RSCANFDCF3 | CAN3 Common FIFO Access Message Buffers | — | 27 |
| CAN4 | INTRCAN4ERR | CAN4 error interrupt | 272 | — |
| | INTRCAN4REC | CAN4 transmit/receive FIFO receive complete interrupt | 273 | — |
| | INTRCAN4TRX | CAN4 transmit interrupt | 274 | — |
| | RSCANFDCF4 | CAN4 Common FIFO Access Message Buffers | — | 48 |
| CAN5 | INTRCAN5ERR | CAN5 error interrupt | 287 | — |
| | INTRCAN5REC | CAN5 transmit/receive FIFO receive complete interrupt | 288 | — |
| | INTRCAN5TRX | CAN5 transmit interrupt | 289 | — |
| | RSCANFDCF5 | CAN5 Common FIFO Access Message Buffers | | 49 |

**NOTE**

For the wake-up factors from standby mode, see **Section 14.1.2.1, Wake-Up Factors for Stand-By Modes**.

### 21.2.4 Reset Factors

RSCANn reset factors are listed in the following table. RSCANn is initialized by these reset factors.

**Table 21.10 Reset Factors**

| Unit Name | Reset Factor |
|---|---|
| RSCANn (n = 0) | All reset factors (ISORES) |

### 21.2.5 External Input/Output Signals

External input/output signals of RSCANn are listed below.

**Table 21.11 External Input/Output Signals**

| Unit Signal Name | Description | Alternative Port Pin Signal |
|---|---|---|
| **RSCANn (n = 0)** | | |
| CANmRX (m = 0 to 5) | CANm receive data input | CANmRX (m = 0 to 5) |
| CANmTX (m = 0 to 5) | CANm transmit data output | CANmTX (m = 0 to 5) |

# 21.3 Overview

## 21.3.1 Functional Overview

The RH850/F1K incorporates one CAN interface unit (RS-CAN) which consists of six channels (CAN0 to CAN 5) of CAN controllers conforming to the ISO11898-1 specification.

**Table 21.12** shows the RS-CANFD module specifications. **Figure 21.1** shows the RS-CANFD module block diagram.

**Table 21.12 RS-CANFD Module Specifications (1/3)**

| Item | Specification |
|---|---|
| Number of channels | 6 |
| Protocol | ISO11898-1 compliant<br>Using CAN FD frames is selectable by switching interface modes. |
| Communication speed | Classical CAN mode:<br>• Maximum 1 Mbps<br>$\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$<br>CANm bit time = CANmTq × Tq count per bit<br>$\text{CANmTq} = \frac{\text{(BRP[9:0] bits in the RSCANnCmCFG register + 1)}}{\text{fCAN}}$<br>fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCANnGCFG register)<br>CAN FD mode:<br>• Nominal bit rate: max.1 Mbps, data bit rate: max. 5 Mbps<br>$\text{Transmission rate (CANm nominal bit time clock)} = \frac{1}{\text{CANm nominal bit time}}$<br>$\text{Transmission rate (CANm data bit time clock)} = \frac{1}{\text{CANm data bit time}}$<br>CANm nominal bit time = CANmTq(N) × Tq count per nominal bit<br>CANm data bit time = CANmTq(D) × Tq count per data bit<br>$\text{CANmTq(N)} = \frac{\text{(NBRP[9:0] bits in the RSCFDnCFDCmNCFG register + 1)}}{\text{fCAN}}$<br>$\text{CANmTq(D)} = \frac{\text{(DBRP[7:0] bits in the RSCFDnCFDCmDCFG register + 1)}}{\text{fCAN}}$<br>fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFG register)<br>m = 0 to 5<br>Tq: Time quantum |
| Buffer | 480 buffers in total<br>• Channel-dedicated: 96 buffers (16 buffers × 6 channels)<br>Transmit buffer: 16 buffers per channel<br>Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable)<br>• Shared between channels: 384 buffers for all channels<br>Receive buffer: 0 to 96 buffers<br>Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each)<br>Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each)<br>• ECC included |

Table 21.12 RS-CANFD Module Specifications (2/3)

| Item | Specification |
|---|---|
| Reception function | • Receives data frames and remote frames.<br>• Selects ID format (standard ID, extended ID, or both IDs) to be received.<br>• Sets interrupt enable/disable for each FIFO.<br>• Mirror function (reception of messages transmitted from the own CAN node)<br>• Timestamp function (to record message reception time as a 16-bit timer value) |
| Reception filter function | • Selects receive messages according to 384 receive rules.<br>• Sets the number of receive rules (0 to 128) for each channel.<br>• Acceptance filter processing: Sets ID and mask for each receive rule.<br>• DLC filter processing: Enables DLC filter check for each acceptance rule. |
| Receive message transfer function | • Routing function<br>Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers)<br>Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer<br>• Labeling function<br>Stores label information together with a message in a receive buffer and FIFO buffer. |
| Transmission function | • Transmits data frames and remote frames.<br>• Selects ID format (standard ID, extended ID, or both IDs) to be transmitted.<br>• Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer.<br>• Selects ID priority transmission or transmit buffer number priority transmission.<br>• Transmission can be aborted (possible to confirm with a flag)<br>• One-shot transmission function |
| Interval transmission function | Transmits messages at configurable intervals<br>(transmit mode or gateway mode of transmit/receive FIFO buffers) |
| Transmit queue function | Transmits all stored messages according to the ID priority. |
| Transmit history function | Stores the history information of transmission-completed messages<br>Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information. |
| Gateway function | Transmits a received message automatically. |
| Bus off recovery mode selection | Selects the method for returning from bus off state.<br>• ISO11898-1 compliant<br>• Automatic entry to channel halt mode at bus-off entry<br>• Automatic entry to channel halt mode at bus-off end<br>• Transition to channel halt mode by program request<br>• Transition to the error-active state by program request (forcible return from the bus off state) |
| Error status monitoring | • Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock).<br>• Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery)<br>• Reads the error counter.<br>• Monitors DLC errors. |
| Interrupt factor | 20 factors<br>• Global Interrupts (2 factors)<br>Receive FIFO interrupt<br>Global error interrupt<br>• Channel interrupts (3 factors/channel)<br>CANm transmit interrupt (m = 0 to 5)<br>– CANm transmit complete interrupt<br>– CANm transmit abort interrupt<br>– CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)<br>– CANm transmit history interrupt<br>– CANm transmit queue interrupt<br>CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)<br>CANm error interrupt |
| CAN stop mode | Reduces power consumption by stopping clock supply to the RS-CANFD module. |

Table 21.12 RS-CANFD Module Specifications (3/3)

| Item | Specification |
|---|---|
| CAN clock source | Selects the clkc or the clk_xincan.<br>For the operating frequency range, see **Table 21.8**. |
| Test function | Test function for user evaluation<br>• Listen-only mode<br>• Self-test mode 0 (external loopback)<br>• Self-test mode 1 (internal loopback)<br>• Restricted operation mode<br>• RAM test (read/write test)<br>• Inter-channel communication test [CRC error test enabled] |

## 21.3.2 Interface Modes

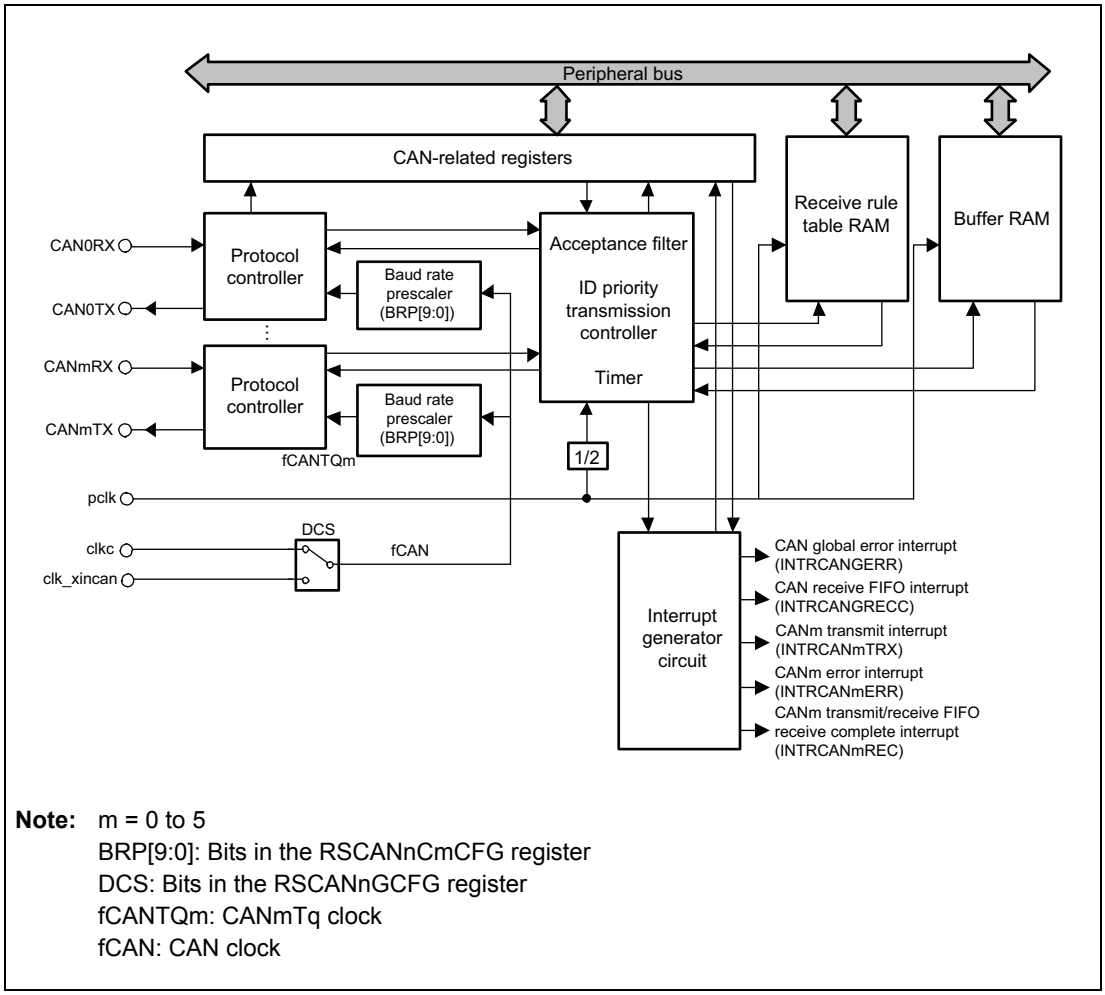
The RS-CANFD has two interface modes.

- Classical CAN mode: Handles only classical CAN frames.
- CAN FD mode: Handles classical CAN frames and CAN FD frames.

These two modes use different register maps with the same base address. Register maps change by switching interface modes.

Interface modes are switched by the RCMC bit in the RSCFDnCFDGRMCFG register.

### 21.3.3 Block Diagram



**Note:** m = 0 to 5
BRP[9:0]: Bits in the RSCANnCmCFG register
DCS: Bits in the RSCANnGCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

**Figure 21.1 RS-CANFD Module Block Diagram (Classical CAN Mode)**

In CAN FD mode, different clock signals are input to the baud rate prescaler and the protocol controller respectively. See **Section 21.11.1.3, Communication Speed Setting**.

# 21.4 Registers (Classical CAN Mode)

## 21.4.1 List of Registers

The following tables list RS-CANFD registers to be used in classical CAN mode.

For details about <RSCANn_base>, see **Section 21.2.1, Register Base Address**.

**Table 21.13 Registers (1/2)**

| Module | Register | Symbol | Address | Guard Group |
|---|---|---|---|---|
| **Channel-related registers** | | | | |
| RSCANn | Channel m Configuration register | RSCANnCmCFG | <RSCANn_base> + $0000_H$ + ($10_H$ × m) | RSCANn Chm |
| | Channel m control register | RSCANnCmCTR | <RSCANn_base> + $0004_H$ + ($10_H$ × m) | RSCANn Chm |
| | Channel m status register | RSCANnCmSTS | <RSCANn_base> + $0008_H$ + ($10_H$ × m) | RSCANn Chm |
| | Channel m error flag register | RSCANnCmERFL | <RSCANn_base> + $000C_H$ + ($10_H$ × m) | RSCANn Chm |
| **Global-related registers** | | | | |
| RSCANn | Global configuration register | RSCANnGCFG | <RSCANn_base> + $0084_H$ | RSCANn global |
| | Global control register | RSCANnGCTR | <RSCANn_base> + $0088_H$ | RSCANn global |
| | Global status register | RSCANnGSTS | <RSCANn_base> + $008C_H$ | RSCANn global |
| | Global error flag register | RSCANnGERFL | <RSCANn_base> + $0090_H$ | RSCANn global |
| | Global timestamp counter register | RSCANnGTSC | <RSCANn_base> + $0094_H$ | RSCANn global |
| | Global TX Interrupt Status register 0 | RSCANnGTINTSTS0 | <RSCANn_base> + $0460_H$ | RSCANn global |
| | Global TX Interrupt Status register 1 | RSCANnGTINTSTS1 | <RSCANn_base> + $0464_H$ | RSCANn global |
| | Global FD configuration register | RSCANnGFDCFG | <RSCANn_base> + $0474_H$ | RSCANn global |
| **Receive rule-related registers** | | | | |
| RSCANn | Receive Rule Entry Control register | RSCANnGAFLECTR | <RSCANn_base> + $0098_H$ | RSCANn global |
| | Receive Rule Configuration register 0 | RSCANnGAFLCFG0 | <RSCANn_base> + $009C_H$ | RSCANn global |
| | Receive Rule Configuration register 1 | RSCANnGAFLCFG1 | <RSCANn_base> + $00A0_H$ | RSCANn global |
| | Receive Rule ID register j | RSCANnGAFLIDj | <RSCANn_base> + $0500_H$ + ($10_H$ × j) | RSCANn global |
| | Receive Rule Mask register j | RSCANnGAFLMj | <RSCANn_base> + $0504_H$ + ($10_H$ × j) | RSCANn global |
| | Receive Rule Pointer 0 register j | RSCANnGAFLP0j | <RSCANn_base> + $0508_H$ + ($10_H$ × j) | RSCANn global |
| | Receive Rule Pointer 1 register j | RSCANnGAFLP1j | <RSCANn_base> + $050C_H$ + ($10_H$ × j) | RSCANn global |
| **Receive buffer-related registers** | | | | |
| RSCANn | Receive Buffer Number register | RSCANnRMNB | <RSCANn_base> + $00A4_H$ | RSCANn global |
| | Receive Buffer New Data register y | RSCANnRMNDy | <RSCANn_base> + $00A8_H$ + ($04_H$ × y) | RSCANn global |
| | Receive Buffer ID register q | RSCANnRMIDq | <RSCANn_base> + $0600_H$ + ($10_H$ × q) | RSCANn global |
| | Receive Buffer Pointer register q | RSCANnRMPTRq | <RSCANn_base> + $0604_H$ + ($10_H$ × q) | RSCANn global |
| | Receive Buffer Data Field 0 register q | RSCANnRMDF0q | <RSCANn_base> + $0608_H$ + ($10_H$ × q) | RSCANn global |
| | Receive Buffer Data Field 1 register q | RSCANnRMDF1q | <RSCANn_base> + $060C_H$ + ($10_H$ × q) | RSCANn global |
| **Receive FIFO buffer-related registers** | | | | |
| RSCANn | Receive FIFO Buffer Configuration and Control register x | RSCANnRFCCx | <RSCANn_base> + $00B8_H$ + ($04_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Status register x | RSCANnRFSTSx | <RSCANn_base> + $00D8_H$ + ($04_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Pointer Control register x | RSCANnRFPCTRx | <RSCANn_base> + $00F8_H$ + ($04_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Access ID register x | RSCANnRFIDx | <RSCANn_base> + $0E00_H$ + ($10_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Access Pointer register x | RSCANnRFPTRx | <RSCANn_base> + $0E04_H$ + ($10_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Access Data Field 0 register x | RSCANnRFDF0x | <RSCANn_base> + $0E08_H$ + ($10_H$ × x) | RSCANn global |
| | Receive FIFO Buffer Access Data Field 1 register x | RSCANnRFDF1x | <RSCANn_base> + $0E0C_H$ + ($10_H$ × x) | RSCANn global |
| **Transmit/Receive FIFO buffer related registers** | | | | |

Table 21.13 Registers (2/2)

| Module | Register | Symbol | Address | Guard Group |
|---|---|---|---|---|
| RSCANn | Transmit/receive FIFO Buffer Configuration and Control register k | RSCANnCFCCk | <RSCANn_base> + $0118_H$ + ($04_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Status register k | RSCANnCFSTSk | <RSCANn_base> + $0178_H$ + ($04_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Pointer Control register k | RSCANnCFPCTRk | <RSCANn_base> + $01D8_H$ + ($04_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Access ID register k | RSCANnCFIDk | <RSCANn_base> + $0E80_H$ + ($10_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Access Pointer register k | RSCANnCFPTRk | <RSCANn_base> + $0E84_H$ + ($10_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Access Data Field 0 register k | RSCANnCFDF0k | <RSCANn_base> + $0E88_H$ + ($10_H$ × k) | RSCANn global |
| | Transmit/receive FIFO Buffer Access Data Field 1 register k | RSCANnCFDF1k | <RSCANn_base> + $0E8C_H$ + ($10_H$ × k) | RSCANn global |
| **FIFO status-related registers** | | | | |
| RSCANn | FIFO Empty Status register | RSCANnFESTS | <RSCANn_base> + $0238_H$ | RSCANn global |
| | FIFO Full Status register | RSCANnFFSTS | <RSCANn_base> + $023C_H$ | RSCANn global |
| | FIFO Message Lost Status register | RSCANnFMSTS | <RSCANn_base> + $0240_H$ | RSCANn global |
| | Receive FIFO Buffer Interrupt Flag Status register | RSCANnRFISTS | <RSCANn_base> + $0244_H$ | RSCANn global |
| | Transmit/receive FIFO Buffer Receive Interrupt Flag Status register | RSCANnCFRISTS | <RSCANn_base> + $0248_H$ | RSCANn global |
| | Transmit/receive FIFO Buffer Transmit Interrupt Flag Status register | RSCANnCFTISTS | <RSCANn_base> + $024C_H$ | RSCANn global |
| **Transmit buffer-related registers** | | | | |
| RSCANn | Transmit Buffer Control register p | RSCANnTMCp | <RSCANn_base> + $0250_H$ + ($01_H$ × p) | RSCANn global |
| | Transmit Buffer Status register p | RSCANnTMSTSp | <RSCANn_base> + $02D0_H$ + ($01_H$ × p) | RSCANn global |
| | Transmit Buffer ID register p | RSCANnTMIDp | <RSCANn_base> + $1000_H$ + ($10_H$ × p) | RSCANn global |
| | Transmit Buffer Pointer register p | RSCANnTMPTRp | <RSCANn_base> + $1004_H$ + ($10_H$ × p) | RSCANn global |
| | Transmit Buffer Data Field 0 register p | RSCANnTMDF0p | <RSCANn_base> + $1008_H$ + ($10_H$ × p) | RSCANn global |
| | Transmit Buffer Data Field 1 register p | RSCANnTMDF1p | <RSCANn_base> + $100C_H$ + ($10_H$ × p) | RSCANn global |
| | Transmit Buffer Interrupt Enable Configuration register y | RSCANnTMIECy | <RSCANn_base> + $0390_H$ + ($04_H$ × y) | RSCANn global |
| **Transmit buffer status-related registers** | | | | |
| RSCANn | Transmit Buffer Transmit Request Status register y | RSCANnTMTRSTSy | <RSCANn_base> + $0350_H$ + ($04_H$ × y) | RSCANn global |
| | Transmit Buffer Transmit Abort Request Status register y | RSCANnTMTARSTSy | <RSCANn_base> + $0360_H$ + ($04_H$ × y) | RSCANn global |
| | Transmit Buffer Transmit Complete Status register y | RSCANnTMTCSTSy | <RSCANn_base> + $0370_H$ + ($04_H$ × y) | RSCANn global |
| | Transmit Buffer Transmit Abort Status register y | RSCANnTMTASTSy | <RSCANn_base> + $0380_H$ + ($04_H$ × y) | RSCANn global |
| **Transmit queue-related registers** | | | | |
| RSCANn | Transmit Queue Configuration and Control register m | RSCANnTXQCCm | <RSCANn_base> + $03A0_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit Queue Status register m | RSCANnTXQSTSm | <RSCANn_base> + $03C0_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit Queue Pointer Control register m | RSCANnTXQPCTRm | <RSCANn_base> + $03E0_H$ + ($04_H$ × m) | RSCANn Chm |
| **Transmit history-related registers** | | | | |
| RSCANn | Transmit History Configuration and Control register m | RSCANnTHLCCm | <RSCANn_base> + $0400_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit History Status register m | RSCANnTHLSTSm | <RSCANn_base> + $0420_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit History Pointer Control register m | RSCANnTHLPCTRm | <RSCANn_base> + $0440_H$ + ($04_H$ × m) | RSCANn Chm |
| | Transmit History Access register m | RSCANnTHLACCm | <RSCANn_base> + $1800_H$ + ($04_H$ × m) | RSCANn Chm |
| **Test-related registers** | | | | |
| RSCANn | Global Test Configuration register | RSCANnGTSTCFG | <RSCANn_base> + $0468_H$ | RSCANn global |
| RSCANn | Global Test Control register | RSCANnGTSTCTR | <RSCANn_base> + $046C_H$ | RSCANn global |
| | Global Lock Key register | RSCANnGLOCKK | <RSCANn_base> + $047C_H$ | RSCANn global |
| | RAM Test Page Access register r | RSCANnRPGACCr | <RSCANn_base> + $1900_H$ + ($04_H$ × r) | RSCANn global |

**Note:** For details about Guard Group, see **Section 33, Functional Safety**.

**Table 21.14 Transmit Buffer p Allocated to Each Channel**

| | CANm |
|---|---|
| Transmit buffer p | Transmit buffer 16 × m + 0 |
| | Transmit buffer 16 × m + 1 |
| | Transmit buffer 16 × m + 2 |
| | Transmit buffer 16 × m + 3 |
| | Transmit buffer 16 × m + 4 |
| | Transmit buffer 16 × m + 5 |
| | Transmit buffer 16 × m + 6 |
| | Transmit buffer 16 × m + 7 |
| | Transmit buffer 16 × m + 8 |
| | Transmit buffer 16 × m + 9 |
| | Transmit buffer 16 × m + 10 |
| | Transmit buffer 16 × m + 11 |
| | Transmit buffer 16 × m + 12 |
| | Transmit buffer 16 × m + 13 |
| | Transmit buffer 16 × m + 14 |
| | Transmit buffer 16 × m + 15 |

**Table 21.15 Transmit/Receive FIFO Buffer k Allocated to Each Channel**

| | CANm |

## 21.4.2 Details of Channel-Related Registers

### 21.4.2.1 RSCANnCmCFG — Channel Configuration Register (m = 0 to 5)

**Access:** RSCANnCmCFG register can be read or written in 32-bit units
RSCANnCmCFGL, RSCANnCmCFGH registers can be read or written in 16-bit units
RSCANnCmCFGLL, RSCANnCmCFGLH, RSCANnCmCFGHL, RSCANnCmCFGHH registers can be read or written in 8-bit units

**Address:** RSCANnCmCFG: <RSCANn_base> + $0000_H$ + ($10_H$ × m)

RSCANnCmCFGL: <RSCANn_base> + $0000_H$ + ($10_H$ × m),
RSCANnCmCFGH: <RSCANn_base> + $0002_H$ + ($10_H$ × m)

RSCANnCmCFGLL: <RSCANn_base> + $0000_H$ + ($10_H$ × m),
RSCANnCmCFGLH: <RSCANn_base> + $0001_H$ + ($10_H$ × m),
RSCANnCmCFGHL: <RSCANn_base> + $0002_H$ + ($10_H$ × m),
RSCANnCmCFGHH: <RSCANn_base> + $0003_H$ + ($10_H$ × m)

**Value after reset:** $0000\ 0000_H$

| 9 to 0 | BRP[9:0] | Prescaler Division Ratio Set<br>When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1. |

Modify the RSCANnCmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before transitioning to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see **Section 21.11.1, Initial Settings**.

#### SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq, inclusive.
Set a value less than or equal to the value of the TSEG2 bits.

#### TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).
Allowed values are 2 Tq to 8 Tq, inclusive.
Set a value smaller than the value of the TSEG1 bits.

#### TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).
Allowed values are 4 Tq to 16 Tq, inclusive.

#### BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

### 21.4.2.2 RSCANnCmCTR — Channel Control Register (m = 0 to 5)

**Access:** RSCANnCmCTR register can be read or written in 32-bit units
RSCANnCmCTRL, RSCANnCmCTRH registers can be read or written in 16-bit units
RSCANnCmCTRLL, RSCANnCmCTRLH, RSCANnCmCTRHL, RSCANnCmCTRHH registers can be read or written in 8-bit units

**Address:** RSCANnCmCTR: <RSCANn_base> + $0004_H$ + ($10_H$ × m)

RSCANnCmCTRL: <RSCANn_base> + $0004_H$ + ($10_H$ × m),
RSCANnCmCTRH: <RSCANn_base> + $0006_H$ + ($10_H$ × m)

RSCANnCmCTRLL: <RSCANn_base> + $0004_H$ + ($10_H$ × m),
RSCANnCmCTRLH: <RSCANn_base> + $0005_H$ + ($10_H$ × m),
RSCANnCmCTRHL: <RSCANn_base> + $0006_H$ + ($10_H$ × m),
RSCANnCmCTRHH: <RSCANn_base> + $0007_H$ + ($10_H$ × m)

**Value after reset:** $0000\ 0005_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCANnCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCANnCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCANnGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

#### CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

#### CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

#### ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCANnCmERFL register.
When this bit is clear to 0, if any error is detected while the flags of bits 14 to 8 in the RSCANnCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

#### BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to $00_B$, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to $10_B$ (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to $01_B$, the CHMDC[1:0] bits in the RSCANnCmCTR register (m = 0 to 5) are set to $10_B$ and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register are cleared to $00_H$.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to $10_B$, the CHMDC[1:0] bits are set to $10_B$ and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_H$.

When the BOM[1:0] bits are set to $11_B$ and the CHMDC[1:0] bits are set to $10_B$ while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_H$. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to $10_B$, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bits at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are $01_B$ or at bus off end when the BOM[1:0] bits are $10_B$), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

#### TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

#### ALIE Bit

When the ALF flag in the RSCANnCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BLIE Bit

When the BLF flag in the RSCANnCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### OLIE Bit

When the OVLF flag in the RSCANnCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BORIE Bit

When the BORF flag in the RSCANnCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BOEIE Bit

When the BOEF flag in the RSCANnCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EPIE Bit

When the EPF flag in the RSCANnCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EWIE Bit

When the EWF flag in the RSCANnCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BEIE Bit

When the BEF flag in the RSCANnCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register to $00_H$ and also clears the BOSTS flag in the RSCANnCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCANnCmCTR register are $00_B$ (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

#### CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

#### CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 21.7.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to $11_B$. When the RS-CANFD module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become $10_B$.

### 21.4.2.3 RSCANnCmSTS — Channel Status Register (m = 0 to 5)

**Access:** RSCANnCmSTS register is a read-only register that can be read in 32-bit units
RSCANnCmSTSL, RSCANnCmSTSH registers are read-only registers that can be read in 16-bit units
RSCANnCmSTSLL, RSCANnCmSTSHL, RSCANnCmSTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnCmSTS: <RSCANn_base> + $0008_H$ + ($10_H$ × m)

RSCANnCmSTSL: <RSCANn_base> + $0008_H$ + ($10_H$ × m),
RSCANnCmSTSH: <RSCANn_base> + $000A_H$ + ($10_H$ × m)

RSCANnCmSTSLL: <RSCANn_base> + $0008_H$ + ($10_H$ × m),
RSCANnCmSTSHL: <RSCANn_base> + $000A_H$ + ($10_H$ × m),
RSCANnCmSTSHH: <RSCANn_base> + $000B_H$ + ($10_H$ × m)

**Value after reset:** $0000\ 0005_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.20 RSCANnCmSTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | TEC[7:0] | The transmit error counter (TEC) can be read. |
| 23 to 16 | REC[7:0] | The receive error counter (REC) can be read. |
| 15 to 8 | Reserved | When read, the value after reset is returned. |
| 7 | COMSTS | Communication Status Flag<br>0: Communication is not ready.<br>1: Communication is ready. |
| 6 | RECSTS | Receive Status Flag<br>0: Bus idle, in transmission or bus off state<br>1: In reception |
| 5 | TRMSTS | Transmit Status Flag<br>0: Bus idle or in reception<br>1: In transmission or bus off state |
| 4 | BOSTS | Bus Off Status Flag<br>0: Not in bus off state<br>1: In bus off state |
| 3 | EPSTS | Error Passive Status Flag<br>0: Not in error passive state<br>1: In error passive state |
| 2 | CSLPSTS | Channel Stop Status Flag<br>0: Not in channel stop mode<br>1: In channel stop mode |
| 1 | CHLTSTS | Channel Halt Status Flag<br>0: Not in channel halt mode<br>1: In channel halt mode |
| 0 | CRSTSTS | Channel Reset Status Flag<br>0: Not in channel reset mode<br>1: In channel reset mode |

#### TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

#### REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

#### COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the RS-CANFD module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

#### RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

#### TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

#### BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the RS-CANFD module has exited the bus off state.

#### EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])). It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

#### CSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel stop mode, and is cleared to 0 when the RS-CANFD module has returned from channel stop mode.

#### CHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel halt mode, and is cleared to 0 when the RS-CANFD module has returned from channel halt mode.

**CRSTSTS Flag**

This flag is set to 1 when the RS-CANFD module has transitioned to channel reset mode, and is cleared to 0 when the RS-CANFD module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the RS-CANFD module transitions from channel reset mode to channel stop mode.

### 21.4.2.4 RSCANnCmERFL — Channel Error Flag Register (m = 0 to 5)

**Access:** RSCANnCmERFL register can be read or written in 32-bit units
RSCANnCmERFLL register can be read or written in 16-bit units
RSCANnCmERFLH register is a read-only register that can be read in 16-bit units
RSCANnCmERFLLL, RSCANnCmERFLLH registers can be read or written in 8-bit units
RSCANnCmERFLHL, RSCANnCmERFLHH registers are the read-only registers that can be read in 8-bit units

**Address:** RSCANnCmERFL: <RSCANn_base> + $000C_H$ + ($10_H$ × m)

RSCANnCmERFLL: <RSCANn_base> + $000C_H$ + ($10_H$ × m),
RSCANnCmERFLH: <RSCANn_base> + $000E_H$ + ($10_H$ × m)

RSCANnCmERFLLL: <RSCANn_base> + $000C_H$ + ($10_H$ × m),
RSCANnCmERFLLH: <RSCANn_base> + $000D_H$ + ($10_H$ × m),
RSCANnCmERFLHL: <RSCANn_base> + $000E_H$ + ($10_H$ × m),
RSCANnCmERFLHH: <RSCANn_base> + $000F_H$ + ($10_H$ × m)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.21 RSCANnCmERFL Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 30 to 16 | CRCREG[14:0] | CRC Calculation Data<br>A CRC value calculated based on the transmit message or receive message is indicated. |
| 15 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 | ADERR | ACK Delimiter Error Flag<br>0: No ACK delimiter error is detected.<br>1: ACK delimiter error is detected. |
| 13 | B0ERR | Dominant Bit Error Flag<br>0: No dominant bit error is detected.<br>1: Dominant bit error is detected. |
| 12 | B1ERR | Recessive Bit Error Flag<br>0: No recessive bit error is detected.<br>1: Recessive bit error is detected. |
| 11 | CERR | CRC Error Flag<br>0: No CRC error is detected.<br>1: CRC error is detected. |
| 10 | AERR | ACK Error Flag<br>0: No ACK error is detected.<br>1: ACK error is detected. |
| 9 | FERR | Form Error Flag<br>0: No form error is detected.<br>1: Form error is detected. |

Table 21.21 RSCANnCmERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 8 | SERR | Stuff Error Flag<br>0: No stuff error is detected.<br>1: Stuff error is detected. |
| 7 | ALF | Arbitration-lost Flag<br>0: No arbitration-lost is detected.<br>1: Arbitration-lost is detected. |
| 6 | BLF | Bus Lock Flag<br>0: No channel bus lock is detected.<br>1: Channel bus lock is detected. |
| 5 | OVLF | Overload Flag<br>0: No overload is detected.<br>1: Overload is detected. |
| 4 | BORF | Bus Off Recovery Flag<br>0: No bus off recovery is detected.<br>1: Bus off recovery is detected. |
| 3 | BOEF | Bus Off Entry Flag<br>0: No bus off entry is detected.<br>1: Bus off entry is detected. |
| 2 | EPF | Error Passive Flag<br>0: No error passive is detected.<br>1: Error passive is detected. |
| 1 | EWF | Error Warning Flag<br>0: No error warning is detected.<br>1: Error warning is detected. |
| 0 | BEF | Bus Error Flag<br>0: No channel bus error is detected.<br>1: Channel bus error is detected. |

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCANnCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCANnCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

### CRCREG[14:0] Flag

When the CTME bit in the RSCANnCmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

### ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

### B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

### B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

#### CERR Flag

This flag is set to 1 when a CRC error has been detected.

#### AERR Flag

This flag is set to 1 when an ACK error has been detected.

#### FERR Flag

This flag is set to 1 when a form error has been detected.

#### SERR Flag

This flag is set to 1 when a stuff error has been detected.

#### ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

#### BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The RS-CANFD module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

#### OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

#### BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the RS-CANFD module returns from the bus off state. However, this flag is not set to 1 if the RS-CANFD module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to $01_B$ (channel reset mode).
- The RTBO bit in the RSCANnCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCANnCmCTR register are set to $01_B$ (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to $10_B$ (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to $11_B$ (transition to channel halt mode upon a request from the program during bus off).

### BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCANnCmCTR register (m = 0 to 5) are set to $01_B$ (transition to channel halt mode at bus off entry).

### EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

### EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

### BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCANnCmERFL register is set to 1.

**NOTE**

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

## 21.4.3 Details of Global-Related Registers

### 21.4.3.1 RSCANnGCFG — Global Configuration Register

**Access:** RSCANnGCFG register can be read or written in 32-bit units
RSCANnGCFGL, RSCANnGCFGH registers can be read or written in 16-bit units
RSCANnGCFGLL, RSCANnGCFGLH, RSCANnGCFGHL, RSCANnGCFGHH registers can be read or written in 8-bit units

**Address:** RSCANnGCFG: <RSCANn_base> + $0084_H$

RSCANnGCFGL: <RSCANn_base> + $0084_H$,
RSCANnGCFGH: <RSCANn_base> + $0086_H$

RSCANnGCFGLL: <RSCANn_base> + $0084_H$,
RSCANnGCFGLH: <RSCANn_base> + $0085_H$,
RSCANnGCFGHL: <RSCANn_base> + $0086_H$,
RSCANnGCFGHH: <RSCANn_base> + $0087_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 3 | MME | Mirror Function Enable<br>0: Mirror function is disabled.<br>1: Mirror function is enabled. |
| 2 | DRE | DLC Replacement Enable<br>0: DLC replacement is disabled.<br>1: DLC replacement is enabled. |
| 1 | DCE | DLC Check Enable<br>0: DLC check is disabled.<br>1: DLC check is enabled. |
| 0 | TPRI | Transmit Priority Select<br>0: ID priority<br>1: Transmit buffer number priority |

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to $000_B$.

Note 2. For the CAN clock frequency settings, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

Modify the RSCANnGCFG register only in global reset mode.

### ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 21.9.3.1, Interval Transmission Function**.

### TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

#### TSSS Bit

This bit is used to select a clock source of the timestamp counter.

#### TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

#### TMTSCE Bit

Setting this bit to 1 makes it possible to store the timestamp of a transmitted message in the transmit history buffer. The timestamp is stored in TMTS[15:0] bits in the RSCANnTHLACCm register.

#### EEFE Bit

Setting this bit to 1 sets the EEFm bit in the RSCANnGERFL register to 1 when a 2-bit ECC error is detected during the transmission priority determination. At this time, the message in which a 2-bit ECC error was detected is not transmitted.

#### DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

#### MME Bit

Setting this bit to 1 makes the mirror function available.

#### DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of $00_H$ is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

#### DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCANnGAFLP0j register to $0000_B$ before clearing the DCE bit in the RSCANnGCFG register to 0.

#### TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

### 21.4.3.2 RSCANnGCTR — Global Control Register

**Access:** RSCANnGCTR register can be read or written in 32-bit units
RSCANnGCTRL, RSCANnGCTRH registers can be read or written in 16-bit units
RSCANnGCTRLL, RSCANnGCTRLH, RSCANnGCTRHL registers can be read or written in 8-bit units

**Address:** RSCANnGCTR: <RSCANn_base> + $0088_H$

RSCANnGCTRL: <RSCANn_base> + $0088_H$,
RSCANnGCTRH: <RSCANn_base> + $008A_H$

RSCANnGCTRLL: <RSCANn_base> + $0088_H$,
RSCANnGCTRLH: <RSCANn_base> + $0089_H$,
RSCANnGCTRHL: <RSCANn_base> + $008A_H$

**Value after reset:** $0000\ 0005_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R | R | R | R | R | R/W | R/W | R/W |

**Table 21.23 RSCANnGCTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 17 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TSRST | Timestamp Counter Reset<br>Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0. |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | THLEIE | Transmit History Buffer Overflow Interrupt Enable<br>0: Transmit history buffer overflow interrupt is disabled.<br>1: Transmit history buffer overflow interrupt is enabled. |
| 9 | MEIE | FIFO Message Lost Interrupt Enable<br>0: FIFO message lost interrupt is disabled.<br>1: FIFO message lost interrupt is enabled. |
| 8 | DEIE | DLC Error Interrupt Enable<br>0: DLC error interrupt is disabled.<br>1: DLC error interrupt is enabled. |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | GSLPR | Global Stop Mode<br>0: Other than global stop mode<br>1: Global stop mode |
| 1, 0 | GMDC[1:0] | Global Mode Select<br>b1 b0<br>0 0: Global operating mode<br>0 1: Global reset mode<br>1 0: Global test mode<br>1 1: Setting prohibited |

#### TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCANnGTSC register is cleared to $0000_H$.

#### THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.
Clearing this bit to 0 makes the RS-CANFD module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

#### GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 21.7.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

### 21.4.3.3 RSCANnGSTS — Global Status Register

**Access:** RSCANnGSTS register is a read-only register that can be read in 32-bit units
RSCANnGSTSL register is a read-only register that can be read in 16-bit units
RSCANnGSTSLL register is a read-only register that can be read in 8-bit units

**Address:** RSCANnGSTS: <RSCANn_base> + $008C_H$

RSCANnGSTSL: <RSCANn_base> + $008C_H$

RSCANnGSTSLL: <RSCANn_base> + $008C_H$

**Value after reset:** $0000\ 000D_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | GRAMINIT | GSLPSTS | GHLTSTS | GRSTSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.24 RSCANnGSTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is returned. |
| 3 | GRAMINIT | CAN RAM Initialization Status Flag<br>0: CAN RAM initialization is completed.<br>1: CAN RAM initialization is ongoing. |
| 2 | GSLPSTS | Global Stop Status Flag<br>0: Not in global stop mode<br>1: In global stop mode |
| 1 | GHLTSTS | Global Test Status Flag<br>0: Not in global test mode<br>1: In global test mode |
| 0 | GRSTSTS | Global Reset Status Flag<br>0: Not in global reset mode<br>1: In global reset mode |

#### GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

#### GSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global stop mode, and is cleared to 0 when the RS-CANFD module has returned from global stop mode.

#### GHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global test mode, and is cleared to 0 when the RS-CANFD module has exited global test mode.

**GRSTSTS Flag**

This flag is set to 1 when the RS-CANFD module has transitioned to global reset mode, and is cleared to 0 when the RS-CANFD module has exited global reset mode. This flag remains 1 even when the RS-CANFD module has transitioned from global reset mode to global stop mode.

### 21.4.3.4 RSCANnGERFL — Global Error Flag Register

**Access:** RSCANnGERFL register can be read or written in 32-bit units
RSCANnGERFLL, RSCANnGERFLH registers can be read or written in 16-bit units
RSCANnGERFLLL, RSCANnGERFLHL registers can be read or written in 8-bit units

**Address:** RSCANnGERFL: <RSCANn_base> + $0090_H$

RSCANnGERFLL: <RSCANn_base> + $0090_H$,
RSCANnGERFLH: <RSCANn_base> + $0092_H$

RSCANnGERFLLL: <RSCANn_base> + $0090_H$,
RSCANnGERFLHL: <RSCANn_base> + $0092_H$

**Value after reset:** 0000 $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | EEF5 | EEF4 | EEF3 | EEF2 | EEF1 | EEF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | THLES | MES | DEF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

**Table 21.25 RSCANnGERFL Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22, 15, 14, 7, 6, 4, 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 | EEF5 | ECC Error Flag for Channel 5<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 20 | EEF4 | ECC Error Flag for Channel 4<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 19 | EEF3 | ECC Error Flag for Channel 3<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 18 | EEF2 | ECC Error Flag for Channel 2<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 17 | EEF1 | ECC Error Flag for Channel 1<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 16 | EEF0 | ECC Error Flag for Channel 0<br>0: No 2-bit ECC error when deciding transmission priority<br>1: A 2-bit ECC error when deciding transmission priority |
| 13 to 8, 5 | Reserved | When read, the undefined value is returned. When writing, write the value after reset. |
| 2 | THLES | Transmit History Buffer Overflow Status Flag<br>0: No transmit history buffer overflow has occurred.<br>1: A transmit history buffer overflow has occurred. |
| 1 | MES | FIFO Message Lost Status Flag<br>0: No FIFO message lost error has occurred.<br>1: A FIFO message lost error has occurred. |

Table 21.25 RSCANnGERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | DEF | DLC Error Flag<br>0: No DLC error has occurred.<br>1: A DLC error has occurred. |

All flags in the RSCANnGERFL register are cleared to 0 in global reset mode.

### EEFm Flag

While the EEFE bit in the RSCANnGCFG register is 1, when a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 5), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

### THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCANnTHLSTSm register (m = 0 to 5) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

### MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCANnRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCANnCFSTSk register (k = 0 to 17) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

### DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

**NOTE**

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### 21.4.3.5 RSCANnGTSC — Global Timestamp Counter Register

**Access:** RSCANnGTSC register is a read-only register that can be read in 32-bit units.
RSCANnGTSCL register is a read-only register that can be read in 16-bit units.

**Address:** RSCANnGTSC: <RSCANn_base> + $0094_H$

RSCANnGTSCL: <RSCANn_base> + $0094_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TS[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.26 RSCANnGTSC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 0 | TS[15:0] | Timestamp Value<br>The timestamp counter value can be read.<br>Counter Value: $0000_H$ to $FFFF_H$ |

#### TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer.

Furthermore, while the TMTSCE bit in the RSCANnGCFG register is 1, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter start timing and stop timing depend on the count source.

- When the TSSS bit in the RSCANnGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RS-CANFD module has transitioned to global operating mode.
  This counter stops counting when the RS-CANFD module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

### 21.4.3.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0

**Access:** RSCANnGTINTSTS0 register is a read-only register that can be read in 32-bit units
RSCANnGTINTSTS0L, RSCANnGTINTSTS0H registers are read-only registers that can be read in 16-bit units
RSCANnGTINTSTS0LL, RSCANnGTINTSTS0LH, RSCANnGTINTSTS0HL, RSCANnGTINTSTS0HH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnGTINTSTS0: <RSCANn_base> + $0460_H$

RSCANnGTINTSTS0L: <RSCANn_base> + $0460_H$,
RSCANnGTINTSTS0H: <RSCANn_base> + $0462_H$

RSCANnGTINTSTS0LL: <RSCANn_base> + $0460_H$,
RSCANnGTINTSTS0LH: <RSCANn_base> + $0461_H$,
RSCANnGTINTSTS0HL: <RSCANn_base> + $0462_H$,
RSCANnGTINTSTS0HH: <RSCANn_base> + $0463_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | THIF3 | CFTIF3 | TQIF3 | TAIF3 | TSIF3 | — | — | — | THIF2 | CFTIF2 | TQIF2 | TAIF2 | TSIF2 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 |

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

**Table 21.27 RSCANnGTINTSTS0 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 29 | Reserved | When read, the value after reset is returned. |
| 28 | THIF3 | Channel 3 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 27 | CFTIF3 | Channel 3 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 26 | TQIF3 | Channel 3 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 25 | TAIF3 | Channel 3 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested |
| 24 | TSIF3 | Channel 3 Transmit Buffer Transmit Complete Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |
| 23 to 21 | Reserved | When read, the value after reset is returned. |
| 20 | THIF2 | Channel 2 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 19 | CFTIF2 | Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 18 | TQIF2 | Channel 2 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |

Table 21.27 RSCANnGTINTSTS0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 17 | TAIF2 | Channel 2 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 16 | TSIF2 | Channel 2 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | THIF1 | Channel 1 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 11 | CFTIF1 | Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 10 | TQIF1 | Channel 1 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 9 | TAIF1 | Channel 1 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 8 | TSIF1 | Channel 1 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |
| 7 to 5 | Reserved | When read, the value after reset is returned. |
| 4 | THIF0 | Channel 0 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 3 | CFTIF0 | Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF0 | Channel 0 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 1 | TAIF0 | Channel 0 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 0 | TSIF0 | Channel 0 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |

### TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the corresponding TMTRF[1:0] flags in the RSCAN0TMSTSp register are set to $10_B$ (transmit completed without abort request) or $11_B$ (transmit completed with abort request).

When all TMTRF[1:0] flags that meet the condition to set the TSIFm bit to 1 are cleared to $00_B$, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

### TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCAN0TMSTSp register are set to $01_B$ (transmit abort completed).

This flag is cleared to 0 when all TMTRF[1:0] flags that completed transmit abort are cleared to $00_B$.

### TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

### CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When all CFTXIF bits that meet the condition to set the CFTIFm bit to 1 are cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

### THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

### 21.4.3.7 RSCANnGTINTSTS1 — Global TX Interrupt Status Register 1

**Access:** RSCANnGTINTSTS1 register is a read-only register that can be read in 32-bit units
RSCANnGTINTSTS1L register is a read-only register that can be read in 16-bit units
RSCANnGTINTSTS1LL, RSCANnGTINTSTS1LH registers are read-only registers that can be read in 8-bit units

**Address:** RSCANnGTINTSTS1: <RSCANn_base> + $0464_H$

RSCANnGTINTSTS1L: <RSCANn_base> + $0464_H$

RSCANnGTINTSTS1LL: <RSCANn_base> + $0464_H$,
RSCANnGTINTSTS1LH: <RSCANn_base> + $0465_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | THIF5 | CFTIF5 | TQIF5 | TAIF5 | TSIF5 | — | — | — | THIF4 | CFTIF4 | TQIF4 | TAIF4 | TSIF4 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 | R | R | R | R*1 | R*1 | R*1 | R*1 | R*1 |

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

**Table 21.28 RSCANnGTINTSTS1 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | THIF5 | Channel 5 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 11 | CFTIF5 | Channel 5 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 10 | TQIF5 | Channel 5 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 9 | TAIF5 | Channel 5 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 8 | TSIF5 | Channel 5 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |
| 7 to 5 | Reserved | When read, the value after reset is returned. |
| 4 | THIF4 | Channel 4 Transmit History Interrupt Status Flag<br>0: Transmit history interrupt is not requested.<br>1: Transmit history interrupt is requested. |
| 3 | CFTIF4 | Channel 4 Transmit/receive FIFO Transmit Interrupt Status Flag<br>0: Transmit/receive FIFO transmit interrupt is not requested.<br>1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF4 | Channel 4 Transmit Queue Interrupt Status Flag<br>0: Transmit queue interrupt is not requested.<br>1: Transmit queue interrupt is requested. |
| 1 | TAIF4 | Channel 4 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |

Table 21.28 RSCANnGTINTSTS1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | TSIF4 | Channel 4 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |

### TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the corresponding TMTRF[1:0] flags in the RSCAN0TMSTSp register are set to $10_B$ (transmit completed without abort request) or $11_B$ (transmit completed with abort request).

When all TMTRF[1:0] flags that meet the condition to set the TSIFm bit to 1 are cleared to $00_B$, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

### TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is set to 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to $01_B$ (transmit abort completed).

This flag is cleared to 0 when all TMTRF[1:0] flags that completed transmit abort are cleared to $00_B$.

### TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. Clearing the TXQIE bit to 0 also clears this flag to 0.

### CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When all CFTXIF bits that meet the condition to set the CFTIFm bit to 1 are cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

### THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0.

This flag is also cleared to 0 when the THLIE bit is cleared to 0.

### 21.4.3.8 RSCANnGFDCFG — Global FD Configuration Register

**Access:** RSCANnGFDCFG register can be read or written in 32-bit unit.
RSCANnGFDCFGL register can be read or written in 16-bit unit.
RSCANnGFDCFGLH register can be read or written in 8-bit unit.

**Address:** RSCANnGFDCFG: <RSCANn_base> + $0474_H$

RSCANnGFDCFGL: <RSCANn_base> + $0474_H$

RSCANnGFDCFGLH: <RSCANn_base> + $0475_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 21.29 RSCANnGFDCFG Register Content**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 10 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 9, 8 | TSCCFG[1:0] | Timestamp Capture Setting<br>b9 b8<br>0 0: Captured at a sample point in the SOF bit.<br>0 1: Captured when a valid frame has been transmitted/received.<br>1 0: Setting prohibited<br>1 1: Setting prohibited |
| 7 to 1 | Reserved | These bits are read as the value after reset.<br>The write value should be the value after reset. |
| 0 | Reserved | When read, an undefined value is returned.<br>The write value should be the value after reset. |

#### TSCCFG[1:0] Bit

Select a point where a timestamp value is captured. Modify this bit only in global reset mode.

## 21.4.4 Details of Receive Rule-related Registers

### 21.4.4.1 RSCANnGAFLECTR — Receive Rule Entry Control Register

**Access:** RSCANnGAFLECTR register can be read or written in 32-bit units
RSCANnGAFLECTRL register can be read or written in 16-bit units
RSCANnGAFLECTRLL, RSCANnGAFLECTRLH registers can be read or written in 8-bit units

**Address:** RSCANnGAFLECTR: <RSCANn_base> + $0098_H$

RSCANnGAFLECTRL: <RSCANn_base> + $0098_H$

RSCANnGAFLECTRLL: <RSCANn_base> + $0098_H$,
RSCANnGAFLECTRLH: <RSCANn_base> + $0099_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | AFLDAE | — | — | — | AFLPN[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

**Table 21.30 RSCANnGAFLECTR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 9 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 8 | AFLDAE | Receive Rule Table Write Enable<br>0: Receive rule table write is disabled.<br>1: Receive rule table write is enabled. |
| 7 to 5 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 4 to 0 | AFLPN[4:0] | Receive Rule Table Page Number Configuration<br>A page number can be selected in the range of page 0 ($00000_B$) to page 23 ($10111_B$). |

#### AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

#### AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of $00000_B$ to $10111_B$.

### 21.4.4.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0

**Access:** RSCANnGAFLCFG0 register can be read or written in 32-bit units
RSCANnGAFLCFG0L, RSCANnGAFLCFG0H registers can be read or written in 16-bit units
RSCANnGAFLCFG0LL, RSCANnGAFLCFG0LH, RSCANnGAFLCFG0HL, RSCANnGAFLCFG0HH registers can be read or written in 8-bit units

**Address:** RSCANnGAFLCFG0: <RSCANn_base> + $009C_H$

RSCANnGAFLCFG0L: <RSCANn_base> + $009C_H$,
RSCANnGAFLCFG0H: <RSCANn_base> + $009E_H$

RSCANnGAFLCFG0LL: <RSCANn_base> + $009C_H$,
RSCANnGAFLCFG0LH: <RSCANn_base> + $009D_H$,
RSCANnGAFLCFG0HL: <RSCANn_base> + $009E_H$,
RSCANnGAFLCFG0HH: <RSCANn_base> + $009F_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RNC0[7:0] | | | | | | | | RNC1[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RNC2[7:0] | | | | | | | | RNC3[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.31 RSCANnGAFLCFG0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RNC0[7:0] | Number of Rules for Channel 0<br>Set the number of receive rules exclusively used for channel 0. |
| 23 to 16 | RNC1[7:0] | Number of Rules for Channel 1<br>Set the number of receive rules exclusively used for channel 1. |
| 15 to 8 | RNC2[7:0] | Number of Rules for Channel 2<br>Set the number of receive rules exclusively used for channel 2. |
| 7 to 0 | RNC3[7:0] | Number of Rules for Channel 3<br>Set the number of receive rules exclusively used for channel 3. |

Modify the RSCANnGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

#### RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

#### RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

**RNC2[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

**RNC3[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 3 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

### 21.4.4.3 RSCANnGAFLCFG1 — Receive Rule Configuration Register 1

**Access:** RSCANnGAFLCFG1 register can be read or written in 32-bit units
RSCANnGAFLCFG1H register can be read or written in 16-bit units
RSCANnGAFLCFG1HL, RSCANnGAFLCFG1HH registers can be read or written in 8-bit units

**Address:** RSCANnGAFLCFG1: <RSCANn_base> + $00A0_H$

RSCANnGAFLCFG1H: <RSCANn_base> + $00A2_H$

RSCANnGAFLCFG1HL: <RSCANn_base> + $00A2_H$,
RSCANnGAFLCFG1HH: <RSCANn_base> + $00A3_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RNC4[7:0] | | | | | | | | RNC5[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.32 RSCANnGAFLCFG1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | RNC4[7:0] | Number of Rules for Channel 4<br>Set the number of receive rules exclusively used for channel 4. |
| 23 to 16 | RNC5[7:0] | Number of Rules for Channel 5<br>Set the number of receive rules exclusively used for channel 5. |
| 15 to 0 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |

Modify the RSCANnGAFLCFG1 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

#### RNC4[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 4 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

#### RNC5[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 5 receive rule table.

Set these bits to a value within the range of $00_H$ to $80_H$.

### 21.4.4.4 RSCANnGAFLIDj — Receive Rule ID Register (j = 0 to 15)

**Access:** RSCANnGAFLIDj register can be read or written in 32-bit units
RSCANnGAFLIDjL, RSCANnGAFLIDjH registers can be read or written in 16-bit units
RSCANnGAFLIDjLL, RSCANnGAFLIDjLH, RSCANnGAFLIDjHL, RSCANnGAFLIDjHH registers can be read or written in 8-bit units

**Address:** RSCANnGAFLIDj: <RSCANn_base> + $0500_H$ + ($10_H$ × j)

RSCANnGAFLIDjL: <RSCANn_base> + $0500_H$ + ($10_H$ × j),
RSCANnGAFLIDjH: <RSCANn_base> + $0502_H$ + ($10_H$ × j)

RSCANnGAFLIDjLL: <RSCANn_base> + $0500_H$ + ($10_H$ × j),
RSCANnGAFLIDjLH: <RSCANn_base> + $0501_H$ + ($10_H$ × j),
RSCANnGAFLIDjHL: <RSCANn_base> + $0502_H$ + ($10_H$ × j),
RSCANnGAFLIDjHH: <RSCANn_base> + $0503_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDE | GAFLRTR | GAFLLB | GAFLID[28:16] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLID[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.33 RSCANnGAFLIDj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | GAFLIDE | IDE Select<br>0: Standard ID<br>1: Extended ID |
| 30 | GAFLRTR | RTR Select<br>0: Data frame<br>1: Remote frame |
| 29 | GAFLLB | Receive Rule Target Message Select<br>0: When a message transmitted from another CAN node is received<br>1: When the own transmitted message is received |
| 28 to 0 | GAFLID[28:0] | ID<br>Set the ID of the receive rule.<br>For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0. |

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

#### GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

#### GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

#### GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

### 21.4.4.5 RSCANnGAFLMj — Receive Rule Mask Register (j = 0 to 15)

**Access:** RSCANnGAFLMj register can be read or written in 32-bit units
RSCANnGAFLMjL, RSCANnGAFLMjH registers can be read or written in 16-bit units
RSCANnGAFLMjLL, RSCANnGAFLMjLH, RSCANnGAFLMjHL, RSCANnGAFLMjHH registers can be read or written in 8-bit units

**Address:** RSCANnGAFLMj: <RSCANn_base> + $0504_H$ + ($10_H$ × j)

RSCANnGAFLMjL: <RSCANn_base> + $0504_H$ + ($10_H$ × j),
RSCANnGAFLMjH: <RSCANn_base> + $0506_H$ + ($10_H$ × j)

RSCANnGAFLMjLL: <RSCANn_base> + $0504_H$ + ($10_H$ × j),
RSCANnGAFLMjLH: <RSCANn_base> + $0505_H$ + ($10_H$ × j),
RSCANnGAFLMjHL: <RSCANn_base> + $0506_H$ + ($10_H$ × j),
RSCANnGAFLMjHH: <RSCANn_base> + $0507_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDEM | GAFLRTRM | — | GAFLIDM[28:16] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDM[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.34 RSCANnGAFLMj Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | GAFLIDEM | IDE Mask<br>0: The IDE bit is not compared.<br>1: The IDE bit is compared. |
| 30 | GAFLRTRM | RTR Mask<br>0: The RTR bit is not compared.<br>1: The RTR bit is compared |
| 29 | Reserved | When read, the value after reset is returned.<br>When writing, write the value after reset. |
| 28 to 0 | GAFLIDM[28:0] | ID Mask<br>0: The corresponding ID bit is not compared.<br>1: The corresponding ID bit is compared. |

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

#### GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

#### GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

### 21.4.4.6 RSCANnGAFLP0j — Receive Rule Pointer 0 Register (j = 0 to 15)

**Access:** RSCANnGAFLP0j register can be read or written in 32-bit units
RSCANnGAFLP0jL, RSCANnGAFLP0jH registers can be read or written in 16-bit units
RSCANnGAFLP0jLH, RSCANnGAFLP0jHL, RSCANnGAFLP0jHH registers can be read or written in 8-bit units

**Address:** RSCANnGAFLP0j: <RSCANn_base> + $0508_H$ + ($10_H$ × j)

RSCANnGAFLP0jL: <RSCANn_base> + $0508_H$ + ($10_H$ × j),
RSCANnGAFLP0jH: <RSCANn_base> + $050A_H$ + ($10_H$ × j)

RSCANnGAFLP0jLH: <RSCANn_base> + $0509_H$ + ($10_H$ × j),
RSCANnGAFLP0jHL: <RSCANn_base> + $050A_H$ + ($10_H$ × j),
RSCANnGAFLP0jHH: <RSCANn_base> + $050B_H$ + ($10_H$ × j)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLDLC[3:0] | | | | GAFLPTR[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
