

3.3V CMOS PRESETTABLE SYNCHRONOUS 4-BIT UP/DOWN BINARY COUNTER WITH 5 VOLT TOLERANT I/O

IDT74LVC169A

FEATURES:

- 0.5 MICRON CMOS Technology
- ESD > 2000V per MIL-STD-883, Method 3015;
> 200V using machine model (C = 200pF, R = 0)
- 1.27mm pitch SOIC, 0.635mm pitch QSOP,
0.65mm pitch SSOP, 0.65mm pitch TSSOP packages
- Extended commercial range of -40°C to +85°C
- V_{CC} = 3.3V ±0.3V, Normal Range
- V_{CC} = 2.3V to 3.6V, Extended Range
- CMOS power levels (0.4μW typ. static)
- Rail-to-Rail output swing for increased noise margin
- All inputs, outputs and I/O are 5 Volt tolerant
- Supports hot insertion

Drive Features for LVC169A:

- High Output Drivers: ±24mA
- Reduced system switching noise

APPLICATIONS:

- 5V and 3.3V mixed voltage systems
- Data communication and telecommunication systems

DESCRIPTION:

The LVC169A is a high-performance, low-power, low-voltage, Si-gate CMOS device, superior to most advanced CMOS-compatible TTL families.

The LVC169A is a presettable synchronous binary counter which features an internal look-ahead carry and can be used for high-speed counting. Synchronous operation is provided by having all flip-flops clocked simultaneously on the positive-going edge of the clock (CP). Outputs (Q₀ to Q₃) of the counters may be preset to a high or low level. A low level at the parallel enable input ($\overline{PE}$) disables the counting action and causes the data at inputs (D₀ to D₃) to be loaded into the counter on the positive-going edge of the clock (provided that the set-up and hold time requirements for $\overline{PE}$ are met). Preset takes place regardless of the levels at the count enable inputs ($\overline{CEP}$ and $\overline{CET}$).

The look-ahead carry simplifies serial cascading of the counters. Both count enable inputs ($\overline{CEP}$ and $\overline{CET}$) must be high to count. The $\overline{CET}$ input is fed forward to enable the terminal count output ($\overline{TC}$). The $\overline{TC}$ output thus enabled will produce a high output pulse of a duration approximately equal to the next cascaded stage. The maximum clock frequency for the cascaded counters is determined by the CP to $\overline{TC}$ propagation delay and $\overline{CEP}$ to CP set-up time, according to the following formula:

$$f_{\max} = \frac{1}{t_{p(\max)}(\text{CP to } \overline{TC}) + t_{su}(\overline{CEP} \text{ to } \overline{CP})}$$

Inputs can be driven from either 3.3V or 5V devices. This feature allows the use of this device as a translator in a mixed 3.3V/5V supply system.

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
