

## CMX90G302 1.4 – 7.1GHz Positive Gain-Slope Amplifier +2dB

### Description

The CMX90G302 is a low-power 50  $\Omega$  cascadable MMIC gain block suitable for a wide variety of wireless applications operating in the 1.4 – 7.1 GHz frequency range.

The gain block has a positive gain-slope of +2dB across the band, eliminating the need for equalisation and compensates for increasing system losses with frequency.

CMX90G302 is highly integrated for ease of use, minimising component count and board area. RF ports are matched on-chip to 50  $\Omega$  with DC-blocking capacitors. An active bias circuit allows the device to operate over a wide supply voltage of 2.7V to 5V with typical current of 20 mA.

Using GaAs pHEMT to provide a combination of low DC power, low noise and high gain.

An alternative part, CMX90G301, is available for applications that require less gain-slope compensation.

### Applications

- Tx and Rx systems
- 4G / 5G wireless infrastructure
- TDD and FDD
- IF amplifier
- License-free bands
- General purpose gain block
- Eliminate passive equaliser

### Ordering Information

Part Number	Description
CMX90G302QF-R710	7" Reel with 1,000 pieces
CMX90G302QF-R330	13" Reel with 3,000 pieces
EV90G302	Evaluation board

3x3mm VQFN-16 Package

### Product Features

- Wide frequency range 1.4 – 7.1 GHz
- Positive gain-slope +2dB
- Small signal gain 14.8 – 16.9 dB
- Single positive DC supply 2.7 – 5 V
- Low noise figure 2 dB
- Input and output matched to 50  $\Omega$
- Output P1dB +11.5 dBm @3.5 GHz
- 1.8 V logic compatible enable
- 105°C operating temperature

### Block Diagram

## Absolute Maximum Ratings

Parameter	Rating
RF Input Power	+10dBm
Device Voltage (Vd, Ven)	+5.5V
Case Temperature (Tc)	-40 to +105 °C
Junction Temperature (Tjmax)	165 °C (MTTF = 10 <sup>6</sup> hours)
Storage Temperature	-40 to +125 °C
ESD Sensitivity	HBM >175V (Class 0B), CDM >750V (Class C2b)
MSL Level	Level 3

Exceeding the maximum ratings may result in damage or reduced device reliability.

## Thermal Characteristics

Parameter	Rating
Thermal Resistance (Rjc)	424 °C/W (Tc = 85°C) 448 °C/W (Tc = 105 °C)

Thermal resistance is junction-to-case, where case refers to the exposed die pad on the backside which is in contact with the board.

## Recommended Operating Conditions

Parameter	Min	Typ	Max	Units
Operating Frequency Range	1.4		7.1	GHz
Case Temperature (Tc)	-40		+105	°C
Device Voltage (Vd)	2.7		5	V
Enable Voltage (Ven)	0		5	V

The device will be tested under certain conditions, but performance is not guaranteed over the full range of recommended operating conditions.

## ESD Caution

CMX90G302 incorporates ESD protection circuitry however ESD precautions are strongly recommended for handling and assembly. Ensure that devices are protected from ESD in antistatic bags or carriers when being transported. Personal grounding is to be worn at all times when handling these devices.

## RoHS Compliance

All devices supplied by CML Microcircuits are compliant with RoHS directive (2011/65/EU), containing less than the permitted levels of hazardous substances

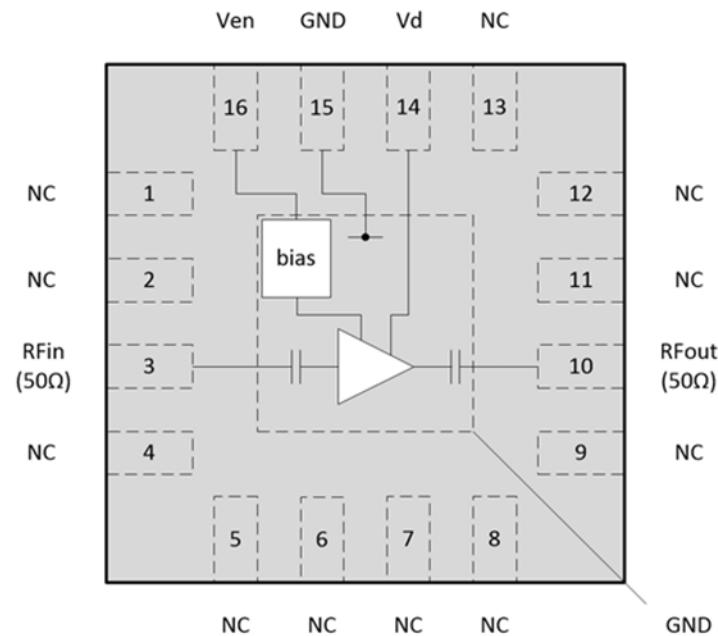

## Electrical Specification

Results taken on the EV90A302 EVB, board losses have been de-embedded using the calibration line on the EV90G302.

$Z_0 = 50 \Omega$ ,  $V_d = +5 \text{ V}$ ,  $V_{en} = +5 \text{ V}$ ,  $T_a = +25 \text{ }^\circ\text{C}$  (unless otherwise noted)

Parameter	Conditions	Min	Typ	Max	Units
<b>Frequency</b>		1.4		7.1	GHz
<b>Small Signal Gain</b>	1.4 GHz		14.8		dB
<b>Small Signal Gain</b>	3.5 GHz		15.4		dB
<b>Small Signal Gain</b>	7.1 GHz		16.9		dB
<b>Gain Slope</b>	1.4 GHz to 7.1 GHz		+2		dB
<b>Reverse Isolation</b>	1.4 GHz to 7.1 GHz		20		dB
<b>P1dB</b>	At 3.5 GHz		11.5		dBm
<b>OIP3</b>	Two-tone test $\Delta f = 10 \text{ MHz}$ , at 3.5 GHz, Pin/Tone = -20dBm	-	21	-	dBm

<b>Input Return Loss</b>	1.4 GHz to 7.1 GHz		>10		dB
<b>Output Return Loss</b>	1.4 GHz to 7.1 GHz		>10		dB
<b>Device Current (<math>I_d</math>)</b>			22		mA
<b>Ven (Logic 1 = Enabled)</b>	Amplifier normal operation	1.8		5	V
<b>Ven (Logic 0 = Standby)</b>	Amplifier in standby mode	0		0.2	V
<b><math>I_d</math></b>	Ven = 0 V		<1		uA
<b><math>I_d</math></b>	Ven = 0.2 V		9		uA
<b>S21</b>	Ven = 0 to 0.2 V		-15		dB
<b>Ven Current (<math>I_{en}</math>)</b>	Ven = 5 V		0.8		mA
<b>Turn-On Time</b>	RFin = TBC dBm		TBD		ns
<b>Turn-Off Time</b>	RFin = TBC dBm		TBD		ns

## Pin Assignments

Top View

Pin	Name	Description
1	NC	Connect to GND
2	NC	Connect to GND
3	RFin	RF input. Internally matched to 50 Ω with integrated DC-blocking capacitor.
4	NC	Connect to GND
5	NC	Connect to GND
6	NC	Connect to GND
7	NC	Connect to GND
8	NC	Connect to GND
9	NC	Connect to GND
10	RFout	RF output. Internally matched to 50 Ω with integrated DC-blocking capacitor.
11	NC	Connect to GND
12	NC	Connect to GND
13	NC	Connect to GND
14	Vd	Voltage supply to amplifier
15	GND	Connect to GND
16	Ven	Amplifier enable input
Die pad	GND	DC and RF ground. Exposed die pad must be connected to GND.

### Notes

CML recommends that all no connect (NC) pins are connected to ground.

The bottom exposed die pad must be connected to the ground plane on the board.

## Typical Performance

The following plots show typical performance characteristics of CMX90G302 measured on the evaluation board (Part Number EV90G302). Board losses have been de-embedded from the measurement results using the through line that is included on the EV90G302.

D1	DNF	SOD-523F	

### Notes

- DNF = Do not fit component

### PCB Layout

Careful layout of the printed circuit board (PCB) is essential for optimum RF and thermal performance. The recommended layout, including ground via pattern underneath the device, may be taken from the evaluation board (Part Number EV90G302).

The PCB consists of a top layer of R04350 backed by 2 layers of FR-4 with a total thickness of 1.606 mm (Figure 32) and the EV90G302 PCB (Figure 33) is 20 mm x 45 mm. The coplanar RF transmission lines have a width of 0.525 mm with a gap of 0.27 mm to ground either side. The through line length has been reduced by 3mm to account for the length of the device.

Figure 32: EV90G302 Layer Stack

Figure 33: EV90G302 PCB Top Layer View

### Thermal Design

The primary RF/DC ground and thermal path is via the exposed die pad on the backside of the package, which must be connected to the PCB ground plane. An array of plated through-hole vias directly underneath the die pad area is essential to conduct heat away and minimise ground inductance. A typical solution will have 9 grounding vias connecting the top layer to the bottom layer, with inner diameter of 0.2 mm (and 0.025 mm plating) on 0.5 mm grid pattern. The vias do not need to be filled. The PCB layout should provide a thermal radiator appropriate for the intended operation, adding as much copper to inner and outer layers as possible to avoid excessive junction temperature.

Device junction temperature ( $T_j$ ) can be calculated using  $T_j = T_c + (P_{diss} \times R_{jc})$  where  $P_{diss} = P_{dc} + P_{in} - P_{out}$  and  $T_c$  is the case temperature on the backside of the package (die pad) in contact with the PCB.

### Ven Input

The device is enabled by applying a voltage between 1.8 V and 5.0 V to pin 16 (Ven). The resulting  $I_d$  taken by the device is relatively independent of the Ven voltage applied. If the enable feature is not required, the Ven pin can be connected to the same voltage as  $V_d$ .

The device can be placed into standby mode when not in use by setting Ven low (<0.2V) to disable all circuitry.

If lower  $I_{en}$  and  $I_d$  leakage current and/or if the highest forward isolation is needed in standby mode, a diode can be used in series with the Ven pin to increase the switch-on threshold of the device. This can be particularly important at elevated temperatures. Some suggested diodes in suitable packages (SOD-523F) for the evaluation board are:

- 1N914BWT-D PN fast switching diode
- BAT43XV2-D Schottky diode

### Evaluation Board & Bias Procedure

In general, sequencing of the  $V_d$  and Ven supplies is not necessary however applying  $V_d$  before or simultaneously with Ven is recommended.

The separate through line can be used to measure the evaluation board and connector losses. These results can then be used to de-embed the device performance from evaluation board measurements.
