Preface

Scope and purpose

This document provides information about the OPTIREG™ linear voltage regulator TLS850B0TxVxx demoboard for the ultra low quiescent current linear voltage regulator family TLS850B0TxVxx from Infineon Technologies AG. Please also refer to the corresponding [datasheet](#).

Intended audience

This document is intended for engineers who develop applications.

1 Introduction

1 Introduction

This document describes the OPTIREG™ linear voltage regulator TLS850B0TxVxx demoboard and its functionality. It includes a brief summary of the used passive components, as well as a short explanation for the correct usage of the board. For specifications and parameters please refer to the datasheet.

1.1 General description

The TLS850B0TxVxx is a linear voltage regulator which can be connected directly to the battery board net of a car. It is optimized for low drop out and low current consumption in off mode and thus also suitable for standby operation. Additionally it can withstand high voltage transients such as a load dump scenario in a vehicle.

1.2 TLS850B0TxVxx features

To meet the automotive standards, the TLS850B0TxVxx comes with a feature set that includes:

- Output voltage accuracy $\pm 2\%$
- Enable feature to reduce the current consumption to a minimum while the application is not used
- Protection features:
 - Output current limitation
 - Overtemperature shutdown
- Robustness against high input transients up to 45 V
- Green Product (RoHS compliant)

1.3 Block diagram

[Figure 1](#) shows the device's basic features and their interaction.

1 Introduction

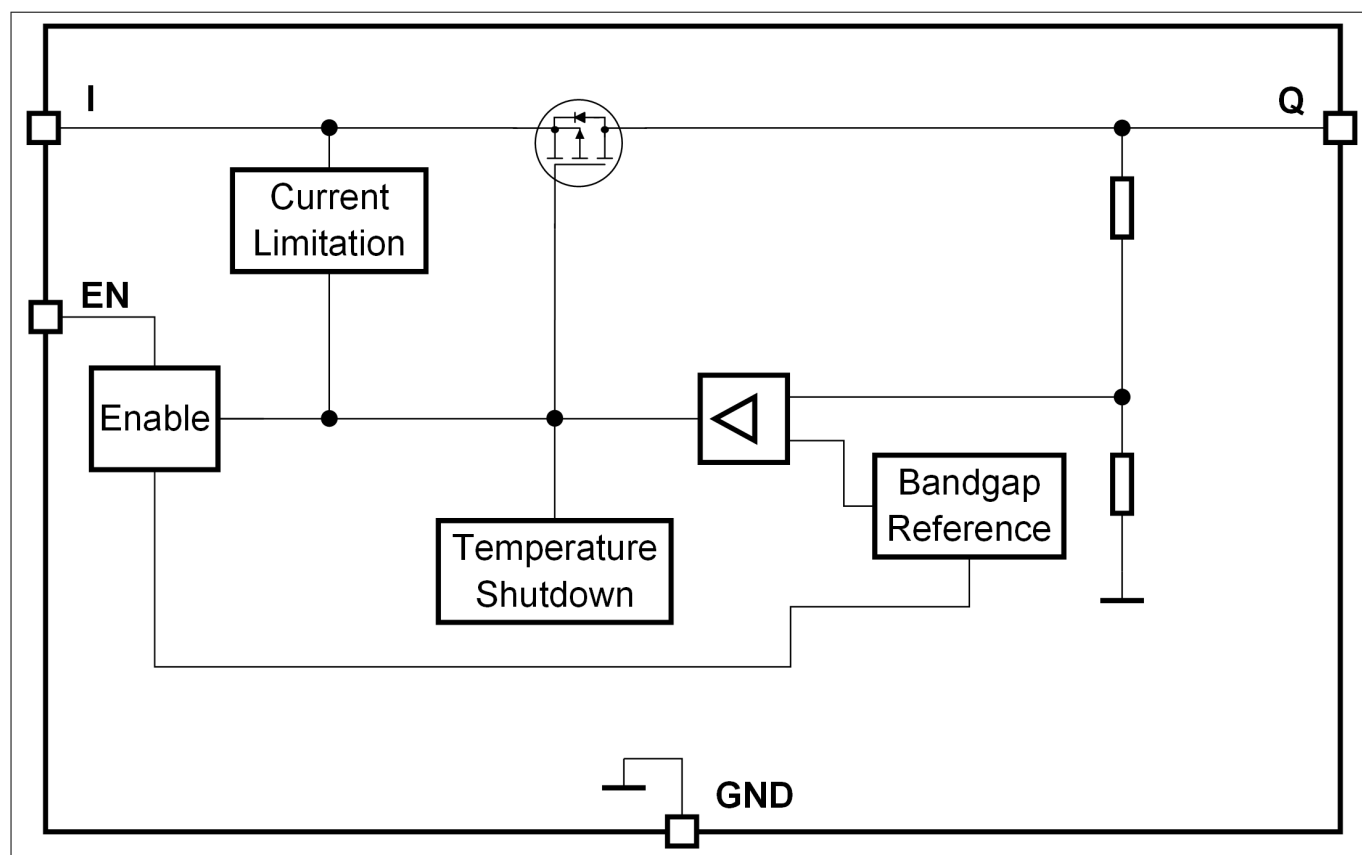

Figure 1 **Block diagram TLS850B0TxVxx**

2 Demoboard

2 Demoboard

The device is available in a PG-TO263-5 and PG-TO252-5 package. Basic functions of the device can be evaluated with it, as well as identifying the proper configuration. Apart from that it may serve as help to assess the device behavior outside of the application and under isolated conditions of stress.

Figure 2 and Figure 3 show the demoboards.

2 Demoboard

2.1 Operating conditions

To avoid electrical damage of the demoboard, the operating range defined in [Table 1](#) must be followed.

Table 1 Operating range¹⁾

Parameter	Symbol	Limit values		Unit	Note
		Min.	Max.		
Board supply	VIN	0	45	V	²⁾ Power supply
Regulator output	VOUT	0	7	V	Regulated output voltage
Enable input signal	EN	0	³⁾ 45	V	Enable signal to switch on the regulator

1) The Demoboard operates at an ambient temperature of 25°C.

2) Functional input voltage range: 3 V to 40 V.

3) Absolute maximum rating.

2.2 Demoboard configuration

The demoboard enables the operator to use and test the basic function set of the TLS850B0TxVxx. This includes the following features:

- Connecting the enable input signal to the supply voltage VIN via jumper JP1
- Delay the enable by adding an additional capacitor at EN (C5)
- Placeholder for additional output capacitor (C1)
- Several test points to conveniently attach probes to the respective signals

2.2.1 Enable function

The jumper JP1 can be used to connect the EN signal to the supply voltage VIN or to pull it to GND. Furthermore an external enable signal can be applied by using the banana jack EN.

Table 2 Jumper JP1 setting for enable function

JP1	Enable function
Pin 3 to pin 2	EN is connected to the supply voltage VIN; the regulator is enabled while it is supplied
Pin 2 to pin 1	EN is pulled to GND
Open	EN is floating; An external enable signal can be applied via the banana jack EN

5 Restrictions

5 Restrictions

This demoboard offers limited features only to evaluate and test Infineon products. The demoboard is neither an end product, nor it is intended or authorized by Infineon to be used as a reference design. It must not be used for any field production.
