

# **MX25L6433F**

**3V, 64M-BIT [x 1/x 2/x 4]  
CMOS MXSMIO<sup>®</sup> (SERIAL MULTI I/O)  
FLASH MEMORY**

## ***Key Features***

- *Hold Feature*
- *Multi I/O Support - Single I/O, Dual I/O and Quad I/O*
- *Auto Erase and Auto Program Algorithms*
- *Program Suspend/Resume & Erase Suspend/Resume*

**64M-BIT [x 1 / x 2 / x 4] CMOS MXSMIO® (SERIAL MULTI I/O)  
FLASH MEMORY****1. FEATURES****GENERAL**

- Supports Serial Peripheral Interface -- Mode 0 and Mode 3
- 67,108,864 x 1 bit structure  
or 33,554,432 x 2 bits (two I/O read mode) structure  
or 16,777,216 x 4 bits (four I/O mode) structure
- 2048 Equal Sectors with 4K bytes each
  - Any Sector can be erased individually
- 256 Equal Blocks with 32K bytes each
  - Any Block can be erased individually
- 128 Equal Blocks with 64K bytes each
  - Any Block can be erased individually
- Power Supply Operation
  - 2.65-3.6 volts for read, erase, and program operations
- Latch-up protected to 100mA from -1V to Vcc +1V
- Supports Performance Enhance Mode - XIP (execute-in-place)
- Additional 8K-bit bit secured OTP
  - Features unique identifier
  - Factory locked identifiable, and customer lockable
- Auto Erase and Auto Program Algorithms
  - Automatically erases and verifies data at selected sector
  - Automatically programs and verifies data at selected page by an internal algorithm that automatically times the program pulse width (Any page to be programmed should have page in the erased state first.)
- Status Register Feature
- Command Reset
- Program/Erase Suspend
- Program/Erase Resume
- Electronic Identification
  - JEDEC 1-byte Manufacturer ID and 2-byte Device ID
  - RES command for 1-byte Device ID
- Supports Serial Flash Discoverable Parameters (SFDP) mode

**PERFORMANCE**

- High Performance  
VCC = 2.65-3.6V
  - Normal read
    - 50MHz
  - Fast read
    - FAST\_READ, DREAD, QREAD:  
133MHz with 8 dummy cycles
    - 2READ: 80MHz with 4 dummy cycles,  
133MHz with 8 dummy cycles
    - 4READ: 80MHz with 6 dummy cycles,  
133MHz with 10 dummy cycles
    - Configurable dummy cycle number for 2READ and 4READ operation
  - 8/16/32/64 byte Wrap-Around Burst Read Mode
- Low Power Consumption
- Typical 100,000 erase/program cycles
- 20 years data retention

**SOFTWARE FEATURES**

- Input Data Format
  - 1-byte Command code
- Advanced Security Features
  - Block lock protection

The BP0-BP3 and T/B status bits define the size of the area to be protected against program and erase instructions

**HARDWARE FEATURES**

- SCLK Input
  - Serial clock input
- SI/SIO0
  - Serial Data Input or Serial Data Input/Output for 2 x I/O mode or Serial Data Input/Output for 4 x I/O mode
- SO/SIO1
  - Serial Data Output or Serial Data Input/Output for 2 x I/O mode or Serial Data Input/Output for 4 x I/O mode
- WP#/SIO2
  - Hardware write protection or Serial Data Input/Output for 4 x I/O mode
- HOLD#/SIO3
  - To pause the device without deselecting the device or Serial Data Input/Output for 4 x I/O mode
- PACKAGE
  - 8-pin SOP (200mil)
  - 16-pin SOP (300mil)
  - 8-WSON (6x5mm)
  - 8-WSON (8x6mm)
  - 8-land XSON(4x4mm)
  - 24 ball TFBGA (6x8mm)

**- All devices are RoHS Compliant and Halogen-free**

## 2. GENERAL DESCRIPTION

MX25L6433F is 64Mb bits Serial NOR Flash memory, which is configured as 8,388,608 x 8 internally. When it is in four I/O mode, the structure becomes 16,777,216 bits x 4. When it is in two I/O mode, the structure becomes 33,554,432 bits x 2. MX25L6433F features a serial peripheral interface and software protocol allowing operation on a simple 3-wire bus while it is in single I/O mode. The three bus signals are a clock input (SCLK), a serial data input (SI), and a serial data output (SO). Serial access to the device is enabled by CS# input.

MX25L6433F, MXSMIO® (Serial Multi I/O) flash memory, provides sequential read operation on the whole chip and multi-I/O features.

When it is in quad I/O mode, the SI pin, SO pin, WP# pin and HOLD# pin become SIO0 pin, SIO1 pin, SIO2 pin and SIO3 pin for address/dummy bits input and data Input/Output.

After program/erase command is issued, auto program/erase algorithms which program/erase and verify the specified page or sector/block locations will be executed. Program command is executed on byte basis, or page (256 bytes) basis. Erase command is executed on 4K-byte sector, 32K-byte/64K-byte block, or whole chip basis.

To provide user with ease of interface, a status register is included to indicate the status of the chip. The status read command can be issued to detect completion status of a program or erase operation via WIP bit.

When the device is not in operation and CS# is high, it will remain in standby mode.

The MX25L6433F utilizes Macronix's proprietary memory cell, which reliably stores memory contents even after 100,000 program and erase cycles.

### 3. PIN CONFIGURATION

#### 8-PIN SOP (200mil)

#### 16-PIN SOP (300mil)

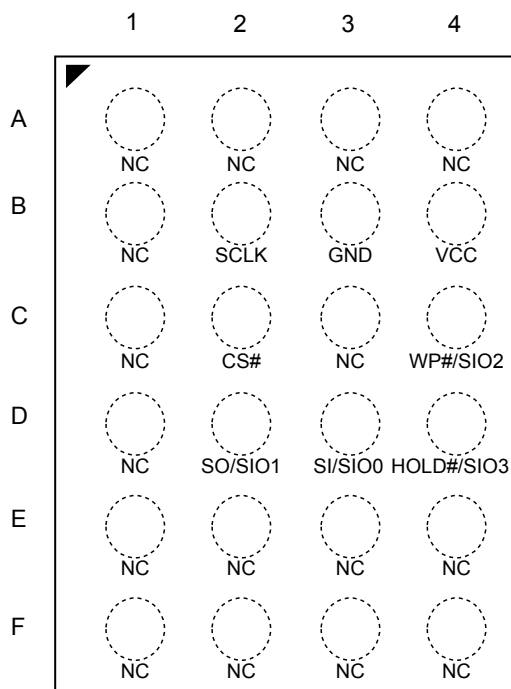

#### 8-WSON (6x5mm, 8x6mm)

#### 8-LAND XSON(4x4mm)

#### 24-Ball TFBGA (6x8 mm) TOP View

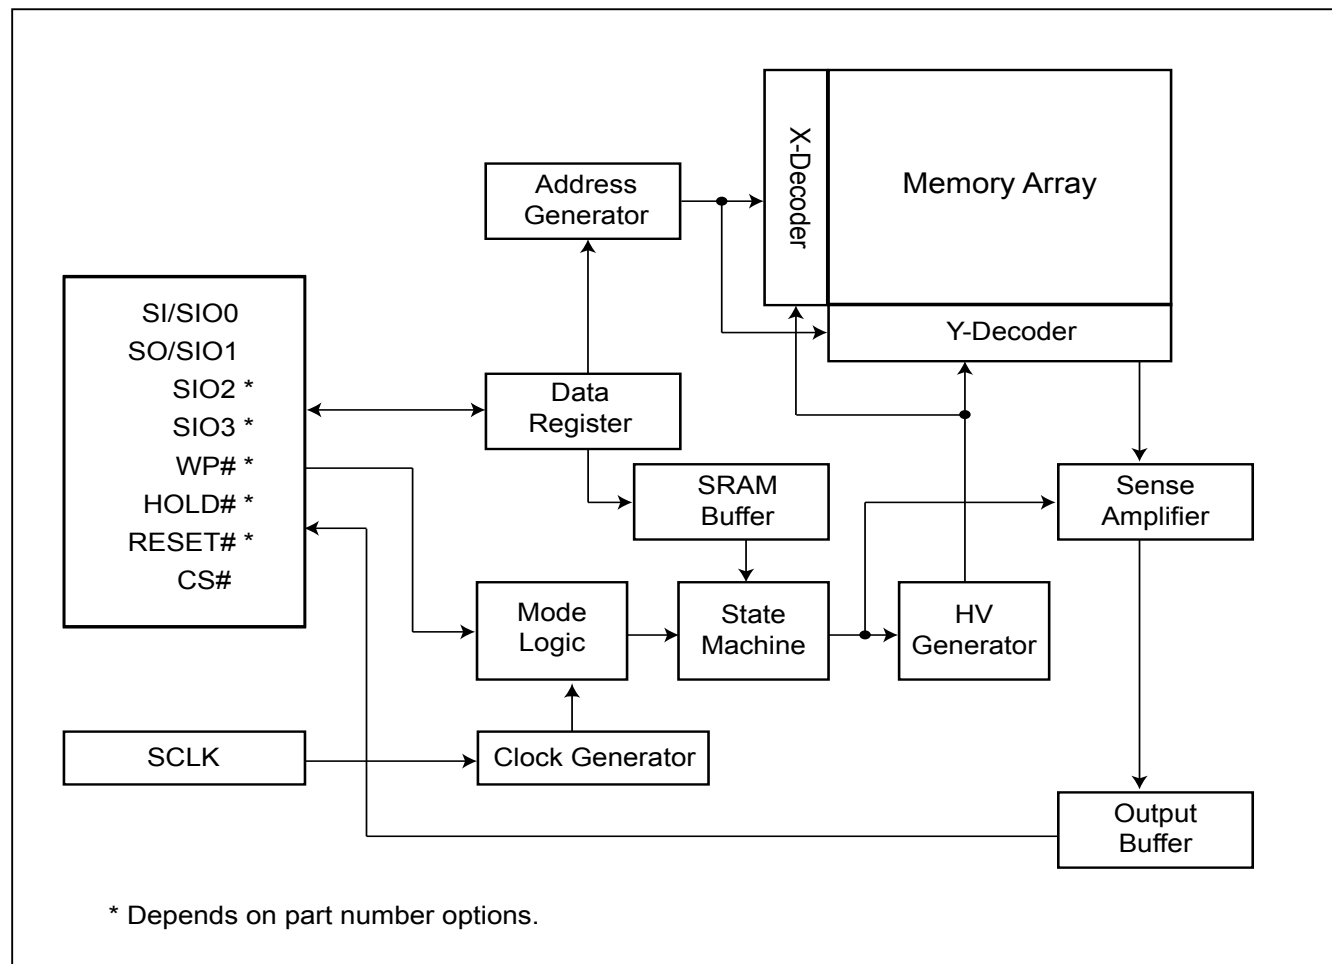

### 4. PIN DESCRIPTION

SYMBOL	DESCRIPTION
CS#	Chip Select
SI/SIO0	Serial Data Input (for 1xI/O) / Serial Data Input & Output (for 2xI/O mode and 4xI/O mode)
SO/SIO1	Serial Data Output (for 1xI/O) / Serial Data Input & Output (for 2xI/O mode and 4xI/O mode)
SCLK	Clock Input
WP#/SIO2	Write protection Active Low or Serial Data Input & Output (for 4xI/O mode)
HOLD#/SIO3	To pause the device without deselecting the device or Serial Data Input & Output (for 4xI/O mode)
VCC	+ 3.0V Power Supply
GND	Ground
NC	No Connection

**Note:** The pin of HOLD#/SIO3 or WP#/SIO2 will remain internal pull up function while this pin is not physically connected in system configuration. However, the internal pull up function will be disabled if the system has physical connection to HOLD#/SIO3 or WP#/SIO2 pin.

## 5. BLOCK DIAGRAM

## 6. DATA PROTECTION

During power transition, there may be some false system level signals which result in inadvertent erasure or programming. The device is designed to protect itself from these accidental write cycles.

The state machine will be reset as standby mode automatically during power up. In addition, the control register architecture of the device constrains that the memory contents can only be changed after specific command sequences have completed successfully.

In the following, there are several features to protect the system from the accidental write cycles during VCC power-up and power-down or from system noise.

- Valid command length checking: The command length will be checked whether it is at byte base and completed on byte boundary.
- Write Enable (WREN) command: WREN command is required to set the Write Enable Latch bit (WEL) before other commands to change data.
- Deep Power Down Mode: By entering deep power down mode, the flash device also is under protected from writing all commands except Release from Deep Power Down mode command (RDP) and Read Electronic Signature command (RES).

### I. Block lock protection

- The Software Protected Mode (SPM) uses (TB, BP3, BP2, BP1, BP0) bits to allow part of memory to be protected as read only. The protected area definition is shown as table of ["Table 1. Protected Area Sizes"](#), the protected areas are more flexible which may protect various areas by setting value of TB, BP0-BP3 bits.
- The Hardware Protected Mode (HPM) uses WP#/SIO2 to protect the (BP3, BP2, BP1, BP0, TB) bits and SRWD bit.

**Table 1. Protected Area Sizes**

**Protected Area Sizes (T/B bit = 0)**

Status bit				Protect Level
BP3	BP2	BP1	BP0	64Mb
0	0	0	0	0 (none)
0	0	0	1	1 (1block, block 127 <sup>th</sup> )
0	0	1	0	2 (2blocks, block 126 <sup>th</sup> -127 <sup>th</sup> )
0	0	1	1	3 (4blocks, block 124 <sup>th</sup> -127 <sup>th</sup> )
0	1	0	0	4 (8blocks, block 120 <sup>th</sup> -127 <sup>th</sup> )
0	1	0	1	5 (16blocks, block 112 <sup>th</sup> -127 <sup>th</sup> )
0	1	1	0	6 (32blocks, block 96 <sup>th</sup> -127 <sup>th</sup> )
0	1	1	1	7 (64blocks, block 64 <sup>th</sup> -127 <sup>th</sup> )
1	0	0	0	8 (128blocks, protect all)
1	0	0	1	9 (128blocks, protect all)
1	0	1	0	10 (128blocks, protect all)
1	0	1	1	11 (128blocks, protect all)
1	1	0	0	12 (128blocks, protect all)
1	1	0	1	13 (128blocks, protect all)
1	1	1	0	14 (128blocks, protect all)
1	1	1	1	15 (128blocks, protect all)

**Protected Area Sizes (T/B bit = 1)**

Status bit				Protect Level
BP3	BP2	BP1	BP0	64Mb
0	0	0	0	0 (none)
0	0	0	1	1 (1block, block 0 <sup>th</sup> )
0	0	1	0	2 (2blocks, block 0 <sup>th</sup> -1 <sup>st</sup> )
0	0	1	1	3 (4blocks, block 0 <sup>th</sup> -3 <sup>rd</sup> )
0	1	0	0	4 (8blocks, block 0 <sup>th</sup> -7 <sup>th</sup> )
0	1	0	1	5 (16blocks, block 0 <sup>th</sup> -15 <sup>th</sup> )
0	1	1	0	6 (32blocks, block 0 <sup>th</sup> -31 <sup>st</sup> )
0	1	1	1	7 (64blocks, block 0 <sup>th</sup> -63 <sup>rd</sup> )
1	0	0	0	8 (128blocks, protect all)
1	0	0	1	9 (128blocks, protect all)
1	0	1	0	10 (128blocks, protect all)
1	0	1	1	11 (128blocks, protect all)
1	1	0	0	12 (128blocks, protect all)
1	1	0	1	13 (128blocks, protect all)
1	1	1	0	14 (128blocks, protect all)
1	1	1	1	15 (128blocks, protect all)

**Note:** The device is ready to accept a Chip Erase instruction if, and only if, all Block Protect (BP3, BP2, BP1, BP0) are 0.

**II. Additional 8K-bit secured OTP** for an unique identifier to provide an 8K-bit one-time program area for setting a device unique serial number. This may be accomplished in the factory or by an end systems customer.

The 8K-bit secured OTP area is composed of two rows of 4K-bit. Customer could lock the first 4K-bit OTP area and factory could lock the other.

- Security register bit 0 indicates whether the 2<sup>nd</sup> 4K-bit is locked by factory or not.
- Customer may lock-down the customer lockable secured OTP by writing WRSCUR(write security register) command to set customer lock-down bit1 as "1". Please refer to table of "[Table 10. Security Register Definition](#)" for security register bit definition and table of "[Table 2. 8K-bit Secured OTP Definition](#)" for address range definition.
- The 8K-bit secured OTP area is programmed by entering secured OTP mode (with the Enter Security OTP command), and going through a normal program procedure. Exiting secured OTP mode is done by issuing the Exit Security OTP command.

**Note:** Once lock-down whatever by factory or customer, the corresponding secured area cannot be changed any more. While in 8K-bit Secured OTP mode, array access is not allowed.

**Table 2. 8K-bit Secured OTP Definition**

Address range	Size	Lock-down
xxx000-xxx1FF	4096-bit	Determined by Customer
xxx200-xxx3FF	4096-bit	Determined by Factory

## 7. MEMORY ORGANIZATION

**Table 3. Memory Organization**

Block(64K-byte)	Block(32K-byte)	Sector (4K-byte)	Address Range	
127	255	2047	7FF000h	7FFFFFFh
		⋮	⋮	⋮
		2040	7F8000h	7F8FFFh
	254	2039	7F7000h	7F7FFFh
		⋮	⋮	⋮
		2032	7F0000h	7F0FFFh

	0	7	007000h	007FFFh
		⋮	⋮	⋮
		0	000000h	000FFFh

## 8. DEVICE OPERATION

1. Before a command is issued, status register should be checked to ensure device is ready for the intended operation.
2. When an incorrect command is written to this device, it enters standby mode and stays in standby mode until the next CS# falling edge. In standby mode, This device's SO pin should be High-Z.
3. When a correct command is written to this device, it enters active mode and stays in active mode until the next CS# rising edge.
4. For standard single data rate serial mode, input data is latched on the rising edge of Serial Clock(SCLK) and data is shifted out on the falling edge of SCLK. The difference of Serial mode 0 and mode 3 is shown as "[Figure 1. Serial Modes Supported \(for Normal Serial mode\)](#)".
5. For the following instructions: RDID, RDSR, RDSCUR, READ, FAST\_READ, RDSFDP, 4READ, QREAD, 2READ, DREAD, RDCR, RES, and REMS the shifted-in instruction sequence is followed by a data-out sequence. After any bit of data being shifted out, the CS# can be high. For the following instructions: WREN, WRDI, WRSR, SE, BE, BE32K, CE, PP, 4PP, Suspend, Resume, NOP, RSTEN, RST, ENSO, EXSO, and WRSCUR, the CS# must go high exactly at the byte boundary; otherwise, the instruction will be rejected and not executed.
6. While a Write Status Register, Program, or Erase operation is in progress, access to the memory array is ignored and will not affect the current operation of Write Status Register, Program, or Erase.

**Figure 1. Serial Modes Supported (for Normal Serial mode)**

**Note:**

CPOL indicates clock polarity of Serial master, CPOL=1 for SCLK high while idle, CPOL=0 for SCLK low while not transmitting. CPHA indicates clock phase. The combination of CPOL bit and CPHA bit decides which Serial mode is supported.

## 9. HOLD FEATURE

HOLD# pin signal goes low to hold any serial communications with the device. The HOLD feature will not stop the operation of write status register, programming, or erasing in progress.

The operation of HOLD requires Chip Select (CS#) keeping low and starts on falling edge of HOLD# pin signal while Serial Clock (SCLK) signal is being low (if Serial Clock signal is not being low, HOLD operation will not start until Serial Clock signal being low). The HOLD condition ends on the rising edge of HOLD# pin signal while Serial Clock(SCLK) signal is being low (if Serial Clock signal is not being low, HOLD operation will not end until Serial Clock being low).

**Figure 2. Hold Condition Operation**

During the HOLD operation, the Serial Data Output (SO) is high impedance when Hold# pin goes low and will keep high impedance until Hold# pin goes high. The Serial Data Input (SI) is don't care if both Serial Clock (SCLK) and Hold# pin goes low and will keep the state until SCLK goes low and Hold# pin goes high. If Chip Select (CS#) drives high during HOLD operation, it will reset the internal logic of the device. To re-start communication with chip, the HOLD# must be at high and CS# must be at low.

**Note:** The HOLD feature is disabled during Quad I/O mode.

## 10. COMMAND DESCRIPTION

**Table 4. Command Sets**

### Read Commands

I/O	1	1	2	2	4	4
Command	READ (normal read)	FAST READ (fast read data)	2READ (2 x I/O read command)	DREAD (1I / 2O read command)	4READ (4 x I/O read command)	QREAD (1I/4O read command)
1 <sup>st</sup> byte	03 (hex)	0B (hex)	BB (hex)	3B (hex)	EB (hex)	6B (hex)
2 <sup>nd</sup> byte	A[23:16]	A[23:16]	A[23:16]	A[23:16]	A[23:16]	A[23:16]
3 <sup>rd</sup> byte	A[15:8]	A[15:8]	A[15:8]	A[15:8]	A[15:8]	A[15:8]
4 <sup>th</sup> byte	A[7:0]	A[7:0]	A[7:0]	A[7:0]	A[7:0]	A[7:0]
5 <sup>th</sup> byte		Dummy(8)	Dummy*	Dummy(8)	Dummy*	Dummy(8)
Action	n bytes read out until CS# goes high	n bytes read out until CS# goes high	n bytes read out by 2 x I/O until CS# goes high	n bytes read out by Dual Output until CS# goes high	n bytes read out by 4 x I/O until CS# goes high	n bytes read out by Quad output until CS# goes high

**Note:** \*Dummy cycle number will be different, depending on the bit6 (DC) setting of Configuration Register. Please refer to "[Configuration Register](#)" Table.

## Other Commands

Command	WREN (write enable)	WRDI (write disable)	RDSR (read status register)	RDCR (read configuration register)	WRSR (write status/ configuration register)	4PP (quad page program)	SE (sector erase)
1 <sup>st</sup> byte	06 (hex)	04 (hex)	05 (hex)	15 (hex)	01 (hex)	38 (hex)	20 (hex)
2 <sup>nd</sup> byte					Values	A[23:16]	A[23:16]
3 <sup>rd</sup> byte					Values	A[15:8]	A[15:8]
4 <sup>th</sup> byte						A[7:0]	A[7:0]
Action	sets the (WEL) write enable latch bit	resets the (WEL) write enable latch bit	to read out the values of the status register	to read out the values of the configuration register	to write new values of the configuration/ status register	quad input to program the selected page	to erase the selected sector

Command	BE 32K (block erase 32KB)	BE (block erase 64KB)	CE (chip erase)	PP (page program)	DP (Deep power down)	RDP (Release from deep power down)	PGM/ERS Suspend (Suspends Program/ Erase)
1 <sup>st</sup> byte	52 (hex)	D8 (hex)	60 or C7 (hex)	02 (hex)	B9 (hex)	AB (hex)	75/B0 (hex)
2 <sup>nd</sup> byte	A[23:16]	A[23:16]		A[23:16]			
3 <sup>rd</sup> byte	A[15:8]	A[15:8]		A[15:8]			
4 <sup>th</sup> byte	A[7:0]	A[7:0]		A[7:0]			
Action	to erase the selected 32KB block	to erase the selected 64KB block	to erase whole chip	to program the selected page	enters deep power down mode	release from deep power down mode	program/erase operation is interrupted by suspend command

Command	PGM/ERS Resume (Resumes Program/ Erase)	RDID (read identific- ation)	RES (read electronic ID)	REMS (read electronic manufacturer & device ID)	ENSO (enter secured OTP)	EXSO (exit secured OTP)	WRSCUR (write security register)
1 <sup>st</sup> byte	7A/30 (hex)	9F (hex)	AB (hex)	90 (hex)	B1 (hex)	C1 (hex)	2F (hex)
2 <sup>nd</sup> byte			x	x			
3 <sup>rd</sup> byte			x	x			
4 <sup>th</sup> byte			x	ADD			
Action	to continue performing the suspended program/erase sequence	outputs JEDEC ID: 1-byte Manufacturer ID & 2-byte Device ID	to read out 1-byte Device ID	output the Manufacturer ID & Device ID	to enter the 8K-bit secured OTP mode	to exit the 8K-bit secured OTP mode	to set the lockdown bit as "1" (once lockdown, cannot be update)

Command (byte)	RDSCUR (read security register)	RSTEN (Reset Enable)	RST (Reset Memory)	RDSFDP	SBL (Set Burst Length)	NOP (No Operation)
1 <sup>st</sup> byte	2B (hex)	66 (hex)	99 (hex)	5A (hex)	C0/77 (hex)	00 (hex)
2 <sup>nd</sup> byte				A[23:16]		
3 <sup>rd</sup> byte				A[15:8]		
4 <sup>th</sup> byte				A[7:0]		
5 <sup>th</sup> byte				Dummy(8)		
Action	to read value of security register		(Note 2)	Read SFDP mode	to set Burst length	

Note 1: It is not recommended to adopt any other code not in the command definition table, which will potentially enter the hidden mode.

Note 2: The RSTEN command must be executed before executing the RST command. If any other command is issued in-between RSTEN and RST, the RST command will be ignored.

**10-1. Write Enable (WREN)**

The Write Enable (WREN) instruction sets the Write Enable Latch (WEL) bit. Instructions like PP, 4PP, SE, BE, BE32K, CE, WRSR and WRSCUR that are intended to change the device content, should be preceded by the WREN instruction.

The sequence of issuing WREN instruction is: CS# goes low → send WREN instruction code → CS# goes high.

The SIO[3:1] are don't care.

**Figure 3. Write Enable (WREN) Sequence (Command 06h)**

**10-2. Write Disable (WRDI)**

The Write Disable (WRDI) instruction resets the Write Enable Latch (WEL) bit.

The sequence of issuing WRDI instruction is: CS# goes low→ send WRDI instruction code→ CS# goes high.

The WEL bit is reset in the following situations:

- Power-up
- WRDI command completion
- WRSR command completion
- PP command completion
- 4PP command completion
- SE command completion
- BE32K command completion
- BE command completion
- CE command completion
- PGM/ERS Suspend command completion
- Soft Reset command completion
- WRSCUR command completion

**Figure 4. Write Disable (WRDI) Sequence (Command 04h)**

### 10-3. Read Identification (RDID)

The RDID instruction is for reading the 1-byte manufacturer ID and the 2-byte Device ID that follows. The Macronix Manufacturer ID and Device ID are listed as table of ["Table 9. ID Definitions"](#).

The sequence of issuing RDID instruction is: CS# goes low → send RDID instruction code → 24-bits ID data out on SO → to end RDID operation, raise CS# to high at any time during data out.

While Program/Erase operation is in progress, it will not decode the RDID instruction, so there's no effect on the cycle of program/erase operation which is currently in progress. When CS# goes high, the device is at standby stage.

**Figure 5. Read Identification (RDID) Sequence (Command 9Fh)**

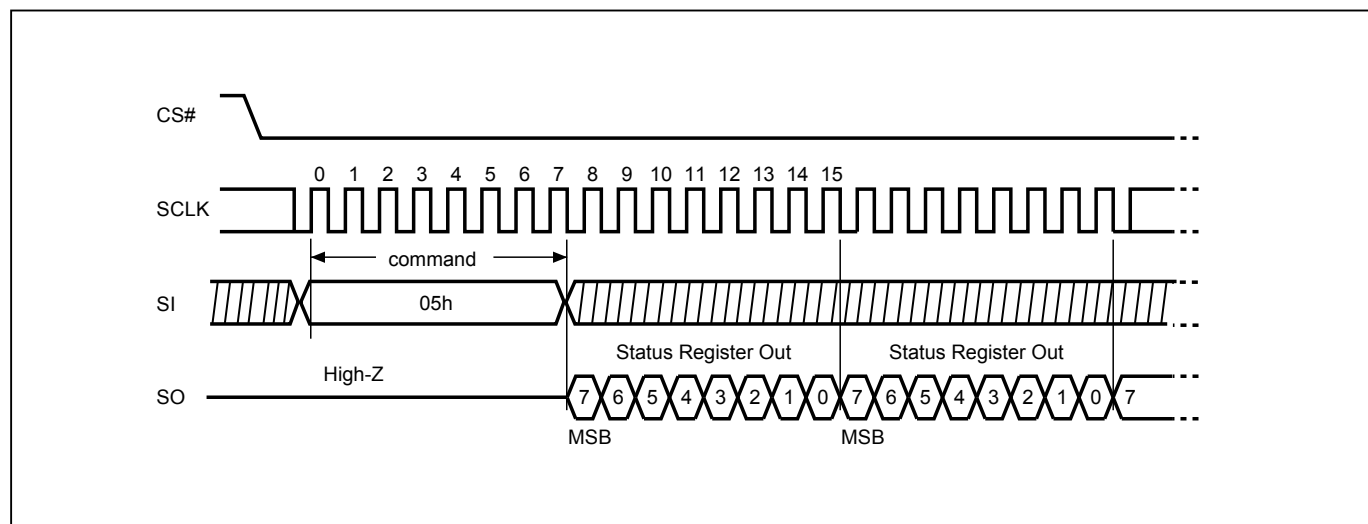

#### 10-4. Read Status Register (RDSR)

The RDSR instruction is for reading Status Register. The Read Status Register can be read at any time (even in program/erase/write status register condition) and continuously. It is recommended to check the Write in Progress (WIP) bit before sending a new instruction when a program, erase, or write status register operation is in progress.

The sequence of issuing RDSR instruction is: CS# goes low→ send RDSR instruction code→ Status Register data out on SO.

The SIO[3:1] are don't care.

**Figure 6. Read Status Register (RDSR) Sequence (Command 05h)**

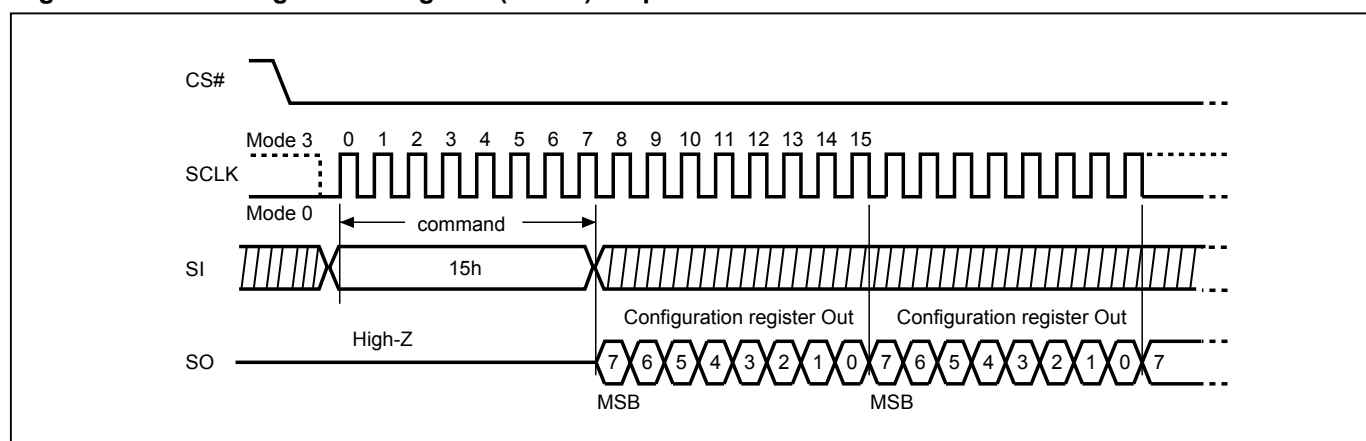

### 10-5. Read Configuration Register (RDCR)

The RDCR instruction is for reading Configuration Register Bits. The Read Configuration Register can be read at any time (even in program/erase/write configuration register condition). It is recommended to check the Write in Progress (WIP) bit before sending a new instruction when a program, erase, or write configuration register operation is in progress.

The sequence of issuing RDCR instruction is: CS# goes low→ send RDCR instruction code→ Configuration Register data out on SO.

The SIO[3:1] are don't care.

**Figure 7. Read Configuration Register (RDCR) Sequence**

## Status Register

The definition of the status register bits is as below:

**WIP bit.** The Write in Progress (WIP) bit, a volatile bit, indicates whether the device is busy in program/erase/write status register progress. When WIP bit sets to 1, which means the device is busy in program/erase/write status register progress. When WIP bit sets to 0, which means the device is not in progress of program/erase/write status register cycle.

**WEL bit.** The Write Enable Latch (WEL) bit is a volatile bit that is set to “1” by the WREN instruction. WEL needs to be set to “1” before the device can accept program and erase instructions, otherwise the program and erase instructions are ignored. WEL automatically clears to “0” when a program or erase operation completes. To ensure that both WIP and WEL are “0” and the device is ready for the next program or erase operation, it is recommended that WIP be confirmed to be “0” before checking that WEL is also “0”. If a program or erase instruction is applied to a protected memory area, the instruction will be ignored and WEL will clear to “0”.

**BP3, BP2, BP1, BP0 bits.** The Block Protect (BP3, BP2, BP1, BP0) bits, non-volatile bits, indicate the protected area (as defined in ["Table 1. Protected Area Sizes"](#)) of the device to against the program/erase instruction without hardware protection mode being set. To write the Block Protect (BP3, BP2, BP1, BP0) bits requires the Write Status Register (WRSR) instruction to be executed. Those bits define the protected area of the memory to against Page Program (PP), Sector Erase (SE), Block Erase (BE) and Chip Erase (CE) instructions (only if all Block Protect bits set to 0, the CE instruction can be executed). The BP3, BP2, BP1, BP0 bits are "0" as default. Which is un-protected.

**QE bit.** The Quad Enable (QE) bit is a non-volatile bit with a factory default of “0”. When QE is “0”, Quad mode commands are ignored; pins WP#/SIO2 and HOLD#/SIO3 function as WP# and HOLD#, respectively. When QE is “1”, Quad mode is enabled and Quad mode commands are supported along with Single and Dual mode commands. Pins WP#/SIO2 and HOLD#/SIO3 function as SIO2 and SIO3, respectively, and their alternate pin functions are disabled. Enabling Quad mode also disables the HPM and HOLD features.

**SRWD bit.** The Status Register Write Disable (SRWD) bit, non-volatile bit, default value is "0". SRWD bit is operated together with Write Protection (WP#/SIO2) pin for providing hardware protection mode. The hardware protection mode requires SRWD sets to 1 and WP#/SIO2 pin signal is low stage. In the hardware protection mode, the Write Status Register (WRSR) instruction is no longer accepted for execution and the SRWD bit and Block Protect bits (BP3, BP2, BP1, BP0) are read only. The SRWD bit defaults to be "0".

**Table 5. Status Register**

bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
SRWD (Status Register Write Disable)	QE (Quad Enable)	BP3 (level of protected block)	BP2 (level of protected block)	BP1 (level of protected block)	BP0 (level of protected block)	WEL (write enable latch)	WIP (write in progress bit)
1=status register write disabled 0=status register write enabled	1= Quad Enabled 0=not Quad Enabled	(note 1)	(note 1)	(note 1)	(note 1)	1=write enabled 0=not write enabled	1=write operation 0=not in write operation
Non-volatile bit	Non-volatile bit	Non-volatile bit	Non-volatile bit	Non-volatile bit	Non-volatile bit	volatile bit	volatile bit

**Note 1:** Please refer to ["Table 1. Protected Area Sizes"](#).

## Configuration Register

The Configuration Register is able to change the default status of Flash memory. Flash memory will be configured after the CR bit is set.

### ODS bit

The output driver strength ODS bit are volatile bits, which indicate the output driver level of the device. The Output Driver Strength is defaulted=1 when delivered from factory. To write the ODS bit requires the Write Status Register (WRSR) instruction to be executed.

### TB bit

The Top/Bottom (TB) bit is a OTP bit. The Top/Bottom (TB) bit is used to configure the Block Protect area by BP bit (BP3, BP2, BP1, BP0), starting from TOP or Bottom of the memory array. The TB bit is defaulted as "0", which means Top area protect. When it is set as "1", the protect area will change to Bottom area of the memory device. To write the TB bit requires the Write Status Register (WRSR) instruction to be executed.

**Table 6. Configuration Register**

bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
Reserved	DC (Dummy Cycle)	Reserved	Reserved	TB (top/bottom selected)	Reserved	Reserved	ODS
x	2READ/ 4READ Dummy Cycle	x	x	0=Top area protect 1=Bottom area protect (Default=0)	x	x	0,Output driver strength=1 1,Output driver strength=1/4 (Default=0)
x	volatile	x	x	OTP	x	x	volatile

**Note:** Please refer to "[Table 7. Dummy Cycle and Frequency Table](#)", with "Don't Care" on other Reserved Configuration Registers.

**Table 7. Dummy Cycle and Frequency Table**

	DC	Numbers of Dummy Cycles	Freq. (MHz)
2READ	0 (default)	4	80 @ $2.65V \leq VCC < 3V$
			104 @ $VCC \geq 3V$
	1	8	133
4READ	0 (default)	6	80 @ $2.65V \leq VCC < 3V$
			104 @ $VCC \geq 3V$
	1	10	133

## 10-6. Write Status Register (WRSR)

The WRSR instruction is for changing the values of Status Register Bits and Configuration Register Bits. Before sending WRSR instruction, the Write Enable (WREN) instruction must be decoded and executed to set the Write Enable Latch (WEL) bit in advance. The WRSR instruction can change the value of Block Protect (BP3, BP2, BP1, BP0) bits to define the protected area of memory (as shown in "Table 1. Protected Area Sizes"). The WRSR also can set or reset the Quad enable (QE) bit and set or reset the Status Register Write Disable (SRWD) bit in accordance with Write Protection (WP#/SIO2) pin signal, but has no effect on bit1(WEL) and bit0 (WIP) of the status register. The WRSR instruction cannot be executed once the Hardware Protected Mode (HPM) is entered.

The sequence of issuing WRSR instruction is: CS# goes low→ send WRSR instruction code→ Status Register data on SI→ Configuration Register data on SI→ CS# goes high.

The CS# must go high exactly at the 8 bits or 16 bits data boundary; otherwise, the instruction will be rejected and not executed. The self-timed Write Status Register cycle time (tW) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Write Status Register cycle is in progress. The WIP sets 1 during the tW timing, and sets 0 when Write Status Register Cycle is completed, and the Write Enable Latch (WEL) bit is reset.

**Figure 8. Write Status Register (WRSR) Sequence (Command 01h)**

**Note:** The CS# must go high exactly at 8 bits or 16 bits data boundary to completed the write register command.

The CS# must go high exactly at the byte boundary; otherwise, the instruction will be rejected and not executed. The self-timed Write Status Register cycle time (tW) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked out during the Write Status Register cycle is in progress. The WIP sets 1 during the tW timing, and sets 0 when Write Status Register Cycle is completed, and the Write Enable Latch (WEL) bit is reset.

**Table 8. Protection Modes**

Mode	Status register condition	WP# and SRWD bit status	Memory
Software protection mode (SPM)	Status register can be written in (WEL bit is set to "1") and the SRWD, BP0-BP3 bits can be changed	WP#=1 and SRWD bit=0, or WP#=0 and SRWD bit=0, or WP#=1 and SRWD=1	The protected area cannot be programmed or erased.
Hardware protection mode (HPM)	The SRWD, BP0-BP3, TB of status register bits cannot be changed	WP#=0, SRWD bit=1	The protected area cannot be programmed or erased.

**Note:** As defined by the values in the Block Protect (BP3, BP2, BP1, BP0, TB) bits of the Status Register, as shown in ["Table 1. Protected Area Sizes"](#).

As the table above showing, the summary of the Software Protected Mode (SPM) and Hardware Protected Mode (HPM):

Software Protected Mode (SPM):

- When SRWD bit=0, no matter WP#/SIO2 is low or high, the WREN instruction may set the WEL bit and can change the values of SRWD, BP3, BP2, BP1, BP0. The protected area, which is defined by BP3, BP2, BP1, BP0, is at software protected mode (SPM).
- When SRWD bit=1 and WP#/SIO2 is high, the WREN instruction may set the WEL bit can change the values of SRWD, BP3, BP2, BP1, BP0. The protected area, which is defined by BP3, BP2, BP1, BP0, is at software protected mode (SPM)

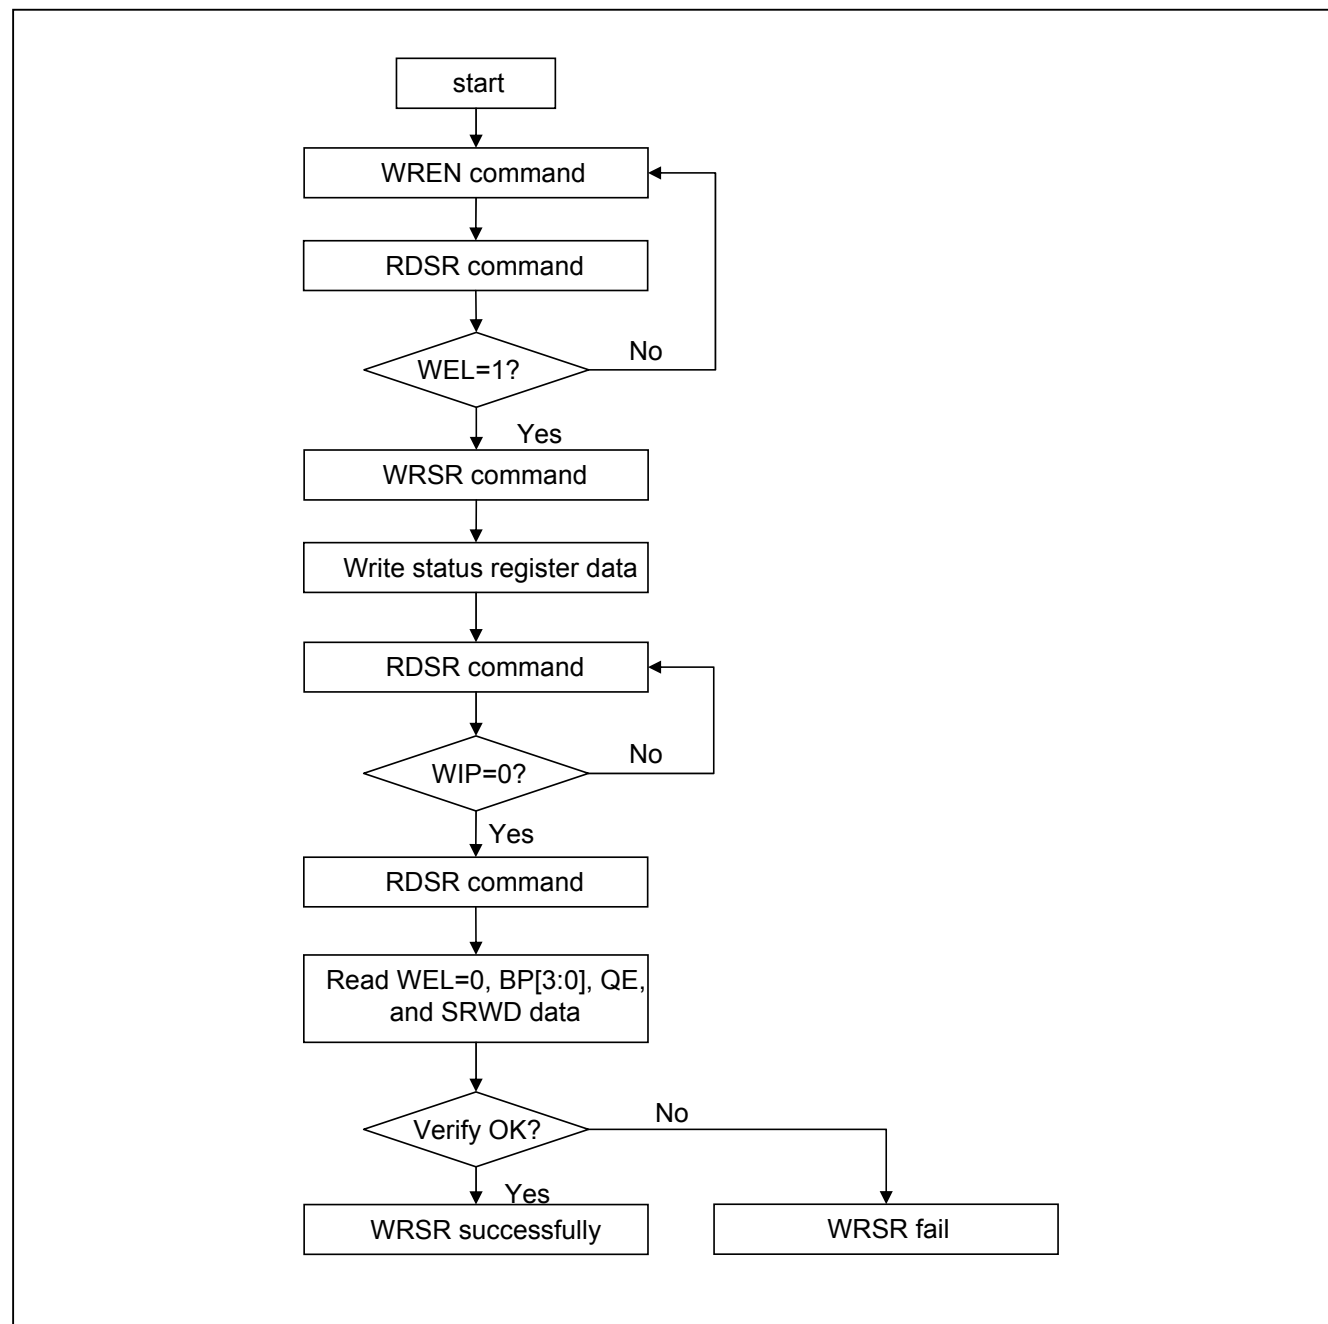

Hardware Protected Mode (HPM):

- When SRWD bit=1, and then WP#/SIO2 is low (or WP#/SIO2 is low before SRWD bit=1), it enters the hardware protected mode (HPM). The data of the protected area is protected by software protected mode by BP3, BP2, BP1, BP0, TB and hardware protected mode by the WP#/SIO2 to against data modification.

**Note:**

To exit the hardware protected mode requires WP#/SIO2 driving high once the hardware protected mode is entered. If the WP#/SIO2 pin is permanently connected to high, the hardware protected mode can never be entered; only can use software protected mode via BP3, BP2, BP1, BP0, TB.

If the system goes into four I/O mode, the feature of HPM will be disabled.

**Figure 9. WRSR flow**

### 10-7. Read Data Bytes (READ)

The read instruction is for reading data out. The address is latched on rising edge of SCLK, and data shifts out on the falling edge of SCLK at a maximum frequency  $f_R$ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single READ instruction. The address counter rolls over to 0 when the highest address has been reached.

The sequence of issuing READ instruction is: CS# goes low → sending READ instruction code → 3-byte address on SI → data out on SO → to end READ operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

**Figure 10. Read Data Bytes (READ) Sequence (Command 03h)**

### 10-8. Read Data Bytes at Higher Speed (FAST\_READ)

The FAST\_READ instruction is for quickly reading data out. The address is latched on rising edge of SCLK, and data of each bit shifts out on the falling edge of SCLK at a maximum frequency  $f_C$ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single FAST\_READ instruction. The address counter rolls over to 0 when the highest address has been reached.

The sequence of issuing FAST\_READ instruction is: CS# goes low→ send FAST\_READ instruction code→ 3-byte address on SI→1-dummy byte (default) address on SI→ data out on SO→ to end FAST\_READ operation, raise CS# high at any time during data out. (Please refer to "Figure 11. Read at Higher Speed (FAST\_READ) Sequence (Command 0Bh)")

While Program/Erase/Write Status Register cycle is in progress, FAST\_READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

**Figure 11. Read at Higher Speed (FAST\_READ) Sequence (Command 0Bh)**

### 10-9. Dual Read Mode (DREAD)

The DREAD instruction enables double throughput of the Serial NOR Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency  $f_T$ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single DREAD instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing DREAD instruction, the following data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing DREAD instruction is: CS# goes low → send DREAD instruction → 3-byte address on SI → 8-bit dummy cycle → data out interleave on SIO1 & SIO0 → to end DREAD operation, raise CS# high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, DREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

**Figure 12. Dual Read Mode Sequence (Command 3Bh)**

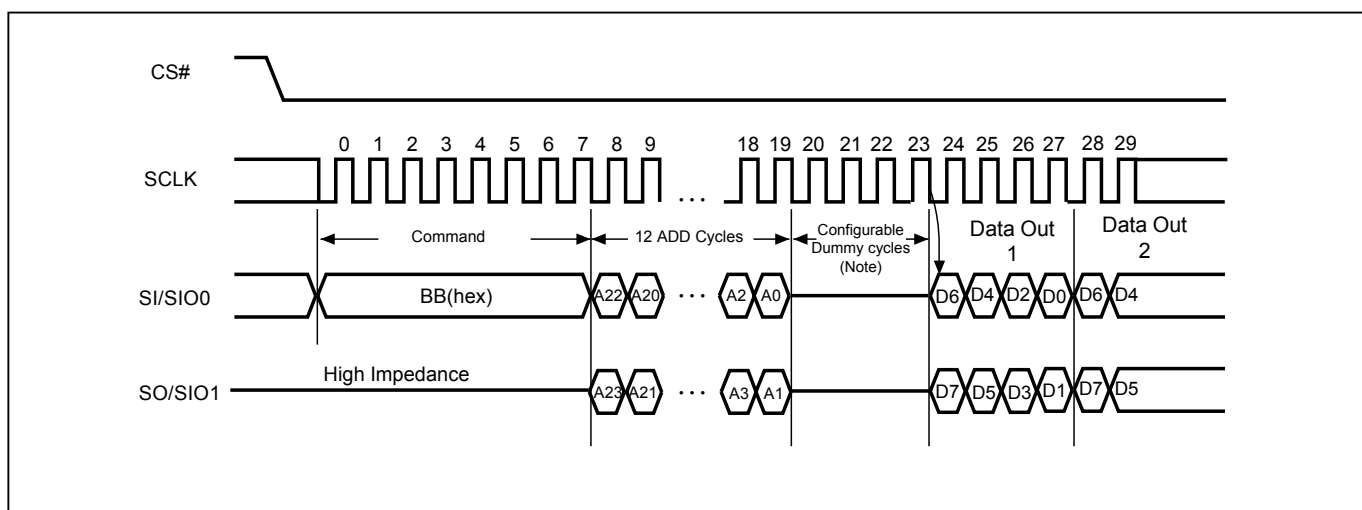

## 10-10. 2 x I/O Read Mode (2READ)

The 2READ instruction enables Double Transfer Rate of the Serial NOR Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency  $f_T$ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 2READ instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing 2READ instruction, the following address/dummy/data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing 2READ instruction is: CS# goes low → send 2READ instruction → 24-bit address interleave on SIO1 & SIO0 → 4 dummy cycles(default) on SIO1 & SIO0 → data out interleave on SIO1 & SIO0 → to end 2READ operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, 2READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

**Figure 13. 2 x I/O Read Mode Sequence (Command BBh)**

**Note:** The Configurable Dummy Cycle is set by Configuration Register Bit. Please refer to ["Table 7. Dummy Cycle and Frequency Table"](#).

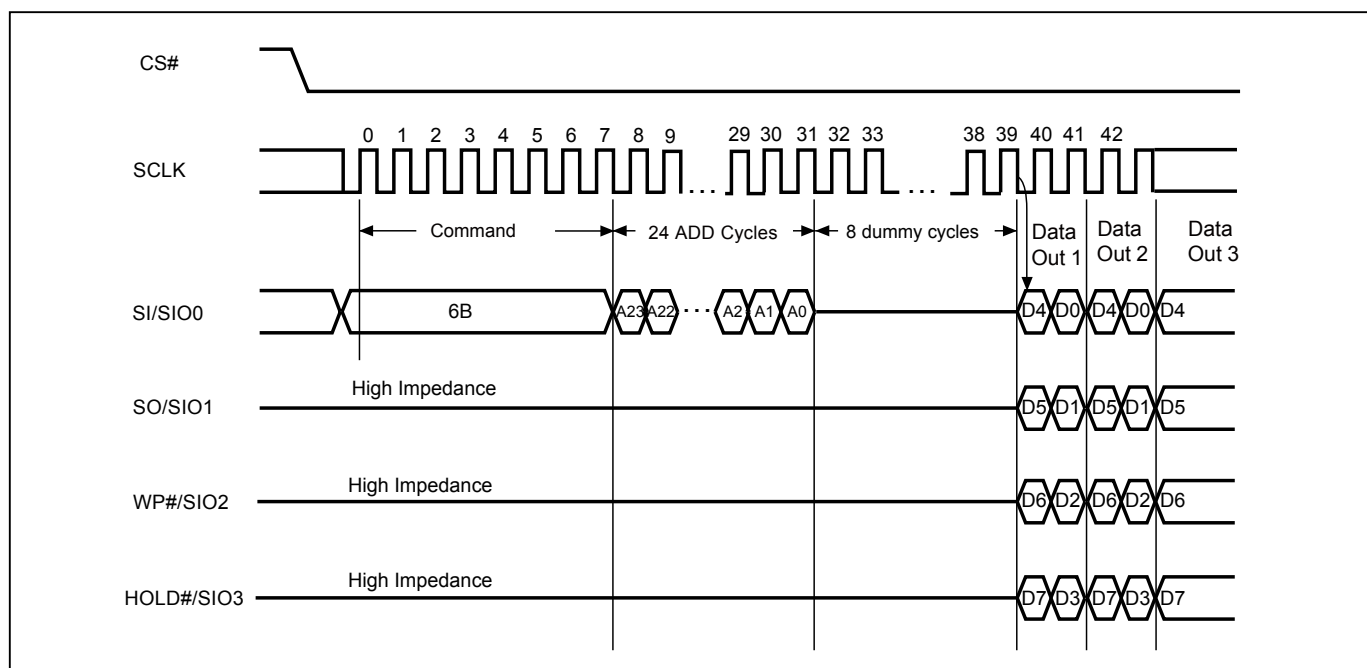

## 10-11. Quad Read Mode (QREAD)

The QREAD instruction enables quad throughput of the Serial NOR Flash in read mode. A Quad Enable (QE) bit of status Register must be set to "1" before sending the QREAD instruction. The address is latched on rising edge of SCLK, and data of every four bits (interleave on 4 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fQ. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single QREAD instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing QREAD instruction, the following data out will perform as 4-bit instead of previous 1-bit.

The sequence of issuing QREAD instruction is: CS# goes low → send QREAD instruction → 3-byte address on SI → 8-bit dummy cycle → data out interleave on SIO3, SIO2, SIO1 & SIO0 → to end QREAD operation, raise CS# high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, QREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

**Figure 14. Quad Read Mode Sequence (Command 6Bh)**

## 10-12. 4 x I/O Read Mode (4READ)

The 4READ instruction enables quad throughput of Serial NOR Flash in read mode. A Quad Enable (QE) bit of status Register must be set to "1" before sending the 4READ instruction. The address is latched on rising edge of SCLK, and data of every four bits (interleave on 4 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fQ. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 4READ instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing 4READ instruction, the following address/dummy/data out will perform as 4-bit instead of previous 1-bit.

The sequence of issuing 4READ instruction is: CS# goes low→ send 4READ instruction→ 24-bit address interleave on SIO3, SIO2, SIO1 & SIO0→2+4 dummy cycles (default) →data out interleave on SIO3, SIO2, SIO1 & SIO0→ to end 4READ operation, raise CS# high at any time during data out. (Please refer to the figure below)

**Figure 15. 4 x I/O Read Mode Sequence (Command EBh)**

### Notes:

1. Hi-impedance is inhibited for the two clock cycles.
2. P7≠P3, P6≠P2, P5≠P1 & P4≠P0 (Toggling) will result in entering the performance enhance mode.
3. The Configurable Dummy Cycle is set by Configuration Register Bit. Please refer to ["Table 7. Dummy Cycle and Frequency Table"](#).

Another sequence of issuing 4READ instruction especially useful in random access is: CS# goes low→send 4READ instruction→3-bytes address interleave on SIO3, SIO2, SIO1 & SIO0→performance enhance toggling bit P[7:0]→4 dummy cycles →data out until CS# goes high → CS# goes low (The following 4READ instruction is not allowed, hence 8 cycles of 4READ can be saved comparing to normal 4READ mode) → 24-bit random access address (Please refer to *"Figure 16. 4 x I/O Read Performance Enhance Mode Sequence (Command EBh)"* ).

In the performance-enhancing mode (Notes of *"Figure 16. 4 x I/O Read Performance Enhance Mode Sequence (Command EBh)"*), P[7:4] must be toggling with P[3:0]; likewise P[7:0]=A5h, 5Ah, F0h or 0Fh can make this mode continue and reduce the next 4READ instruction. Once P[7:4] is no longer toggling with P[3:0]; likewise P[7:0]=FFh, 00h, AAh or 55h. These commands will reset the performance enhance mode. And afterwards CS# is raised and then lowered, the system then will return to normal operation.

While Program/Erase/Write Status Register cycle is in progress, 4READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

### 10-13. Performance Enhance Mode - XIP (execute-in-place)

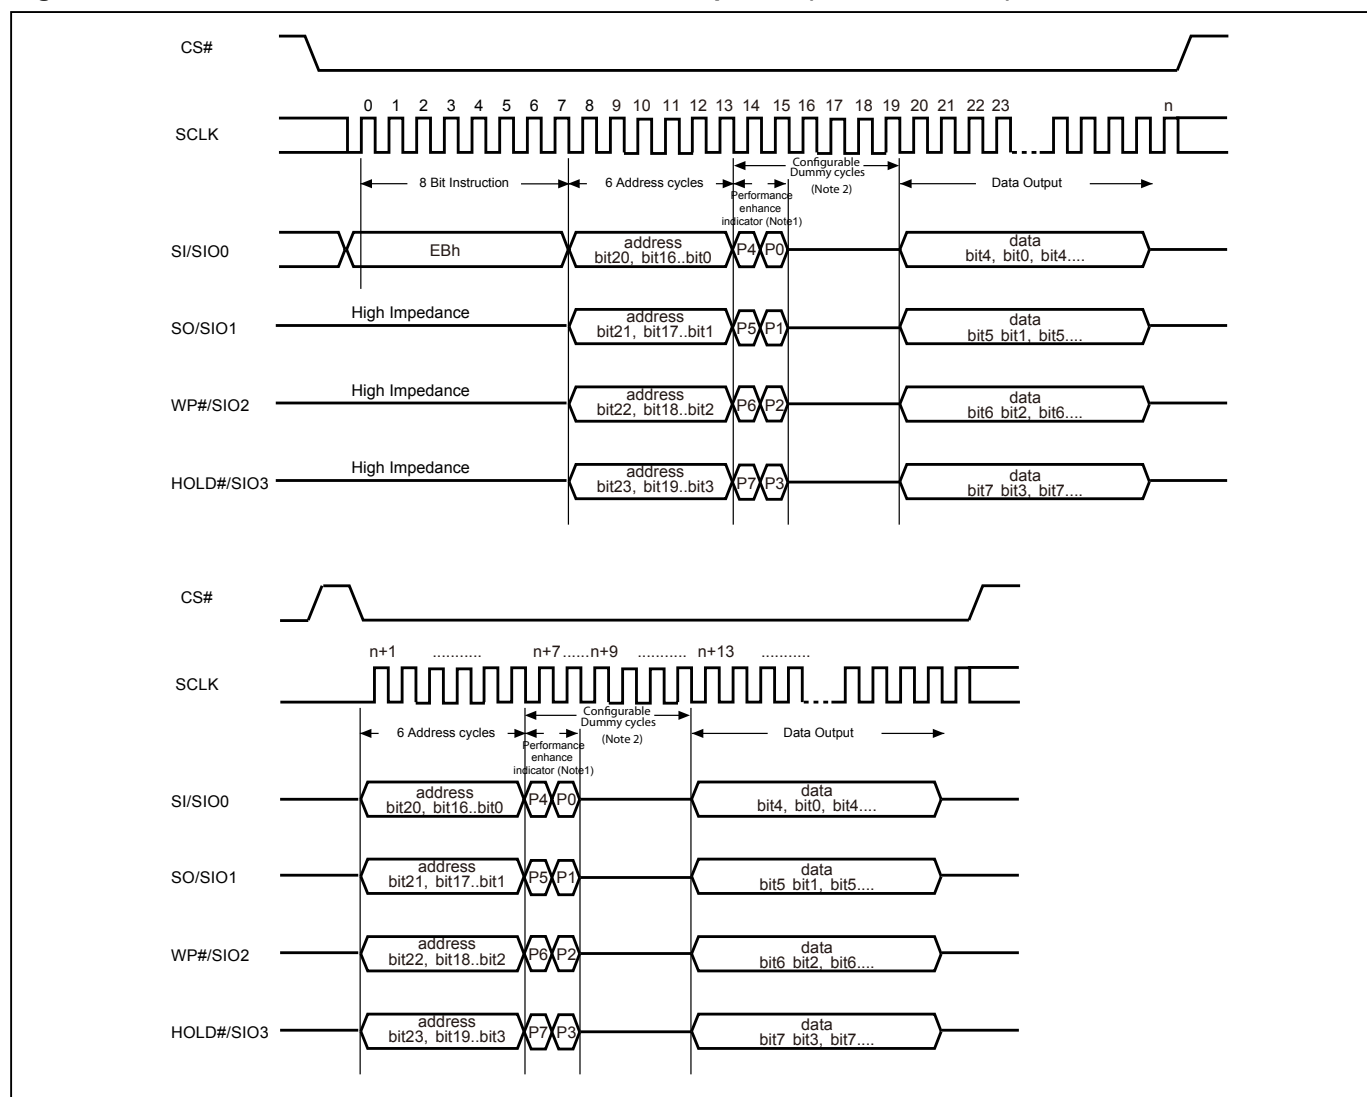

The device could waive the command cycle bits if the two cycle bits after address cycle toggles. (Please note ["Figure 16. 4 x I/O Read Performance Enhance Mode Sequence \(Command EBh\)"](#))

Performance enhance mode is supported for 4READ mode.  
"EBh" commands support enhance mode.

After entering enhance mode, following CS# go high, the device will stay in the read mode and treat CS# go low of the first clock as address instead of command cycle.

To exit enhance mode, a new fast read command whose first two dummy cycles is not toggle then exit. Or issue "FFh" data cycles to exit enhance mode.

**Figure 16. 4 x I/O Read Performance Enhance Mode Sequence (Command EBh)**

#### Notes:

- Performance enhance mode, if  $P7 \neq P3$  &  $P6 \neq P2$  &  $P5 \neq P1$  &  $P4 \neq P0$  (Toggling), ex: A5, 5A, 0F, if not using performance enhance recommend to keep 1 or 0 in performance enhance indicator.  
Reset the performance enhance mode, if  $P7 = P3$  or  $P6 = P2$  or  $P5 = P1$  or  $P4 = P0$ , ex: AA, 00, FF.
- The Configurable Dummy Cycle is set by Configuration Register Bit. Please refer to ["Dummy Cycle and Frequency Table"](#)

## 10-14. Burst Read

The Burst Read feature allows applications to fill a cache line with a fixed length of data without using multiple read commands. Burst Read is disabled by default at power-up or reset. Burst Read is enabled by setting the Burst Length. When the Burst Length is set, reads will wrap on the selected boundary (8/16/32/64-bytes) containing the initial target address. For example if an 8-byte Wrap Depth is selected, reads will wrap on the 8-byte-page-aligned boundary containing the initial read address.

To set the Burst Length, drive CS# low → send SET BURST LENGTH instruction code (C0h or 77h) → send WRAP CODE →drive CS# high. Refer to the table below for valid 8-bit Wrap Codes and their corresponding Wrap Depth.

Data	Wrap Around	Wrap Depth
00h	Yes	8-byte
01h	Yes	16-byte
02h	Yes	32-byte
03h	Yes	64-byte
1xh	No	X

Once Burst Read is enabled, it will remain enabled until the device is power-cycled or reset. The 4READ read command supports the wrap around feature after Burst Read is enabled. To change the wrap depth, resend the Burst Read instruction with the appropriate Wrap Code. To disable Burst Read, send the Burst Read instruction with Wrap Code 1xh. "EBh" supports wrap around feature after wrap around is enabled.

**Figure 17. Burst Read**

## 10-15. Sector Erase (SE)

The Sector Erase (SE) instruction is for erasing the data of the chosen sector to be "1". The instruction is used for any 4K-byte sector. A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit before sending the Sector Erase (SE). Any address of the sector (Please refer to ["Table 3. Memory Organization"](#)) is a valid address for Sector Erase (SE) instruction. The CS# must go high exactly at the byte boundary (the least significant bit of the address has been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing SE instruction is: CS# goes low → send SE instruction code → 3-byte address on SI → CS# goes high.

The SIO[3:1] are don't care.

The self-timed Sector Erase Cycle time (tSE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked while the Sector Erase cycle is in progress. The WIP sets during the tSE timing, and clears when Sector Erase Cycle is completed, and the Write Enable Latch (WEL) bit is cleared. If the sector is protected by BP3-0, the array data will be protected (no change) and the WEL bit still be reset.

**Figure 18. Sector Erase (SE) Sequence (Command 20h)**

## 10-16. Block Erase (BE)

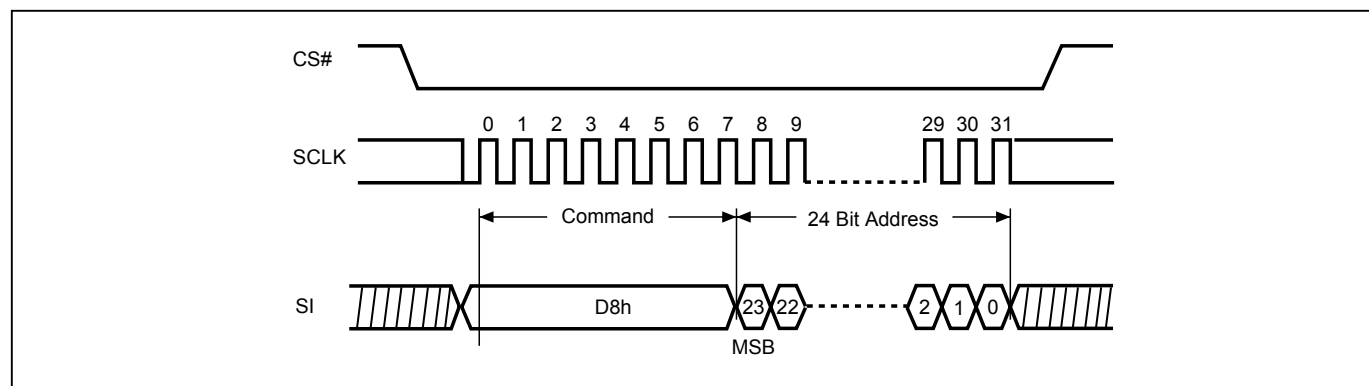

The Block Erase (BE) instruction is for erasing the data of the chosen block to be "1". The instruction is used for 64K-byte block erase operation. A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit before sending the Block Erase (BE). Any address of the block (Please refer to ["Table 3. Memory Organization"](#)) is a valid address for Block Erase (BE) instruction. The CS# must go high exactly at the byte boundary (the least significant bit of address byte has been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing BE instruction is: CS# goes low → send BE instruction code → 3-byte address on SI → CS# goes high.

The SIO[3:1] are don't care.

The self-timed Block Erase Cycle time (tBE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked while the Block Erase cycle is in progress. The WIP sets during the tBE timing, and clears when Block Erase Cycle is completed, and the Write Enable Latch (WEL) bit is cleared. If the block is protected by BP3-0, the array data will be protected (no change) and the WEL bit still be reset.

**Figure 19. Block Erase (BE) Sequence (Command D8h)**

## 10-17. Block Erase (BE32K)

The Block Erase (BE32K) instruction is for erasing the data of the chosen block to be "1". The instruction is used for 32K-byte block erase operation. A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit before sending the Block Erase (BE32K). Any address of the block (Please refer to ["Table 3. Memory Organization"](#)) is a valid address for Block Erase (BE32K) instruction. The CS# must go high exactly at the byte boundary (the least significant bit of address byte has been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing BE32K instruction is: CS# goes low → send BE32K instruction code → 3-byte address on SI → CS# goes high.

The SIO[3:1] are don't care.

The self-timed Block Erase Cycle time (tBE32K) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked while the Block Erase cycle is in progress. The WIP sets during the tBE32K timing, and clears when Block Erase Cycle is completed, and the Write Enable Latch (WEL) bit is cleared. If the block is protected by BP3-0, the array data will be protected (no change) and the WEL bit still be reset.

**Figure 20. Block Erase 32KB (BE32K) Sequence (Command 52h)**

**10-18. Chip Erase (CE)**

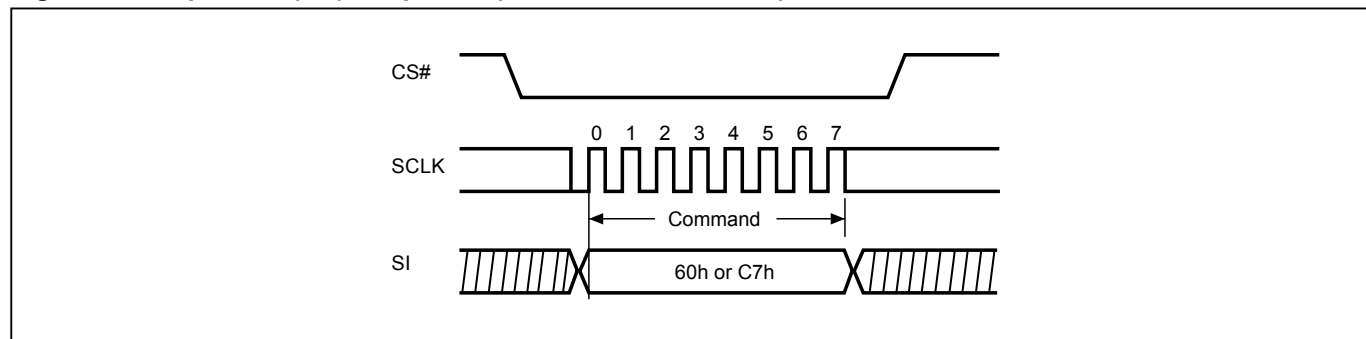

The Chip Erase (CE) instruction is for erasing the data of the whole chip to be "1". A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit before sending the Chip Erase (CE). The CS# must go high exactly at the byte boundary; otherwise, the instruction will be rejected and not executed.

The sequence of issuing CE instruction is: CS# goes low → send CE instruction code → CS# goes high.

The SIO[3:1] are don't care.

The self-timed Chip Erase Cycle time (tCE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked while the Chip Erase cycle is in progress. The WIP sets during the tCE timing, and clears when Chip Erase Cycle is completed, and the Write Enable Latch (WEL) bit is cleared. If the chip is protected the Chip Erase (CE) instruction will not be executed, but WEL will be reset.

**Figure 21. Chip Erase (CE) Sequence (Command 60h or C7h)**

## 10-19. Page Program (PP)

The Page Program (PP) instruction is for programming memory bits to "0". One to 256 bytes can be sent to the device to be programmed. A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit before sending the Page Program (PP). If more than 256 data bytes are sent to the device, only the last 256 data bytes will be accepted and the previous data bytes will be disregarded. The Page Program instruction requires that all the data bytes fall within the same 256-byte page. The low order address byte A[7:0] specifies the starting address within the selected page. Bytes that will cross a page boundary will wrap to the beginning of the selected page. The device can accept (256 minus A[7:0]) data bytes without wrapping. If 256 data bytes are going to be programmed, A[7:0] should be set to 0.

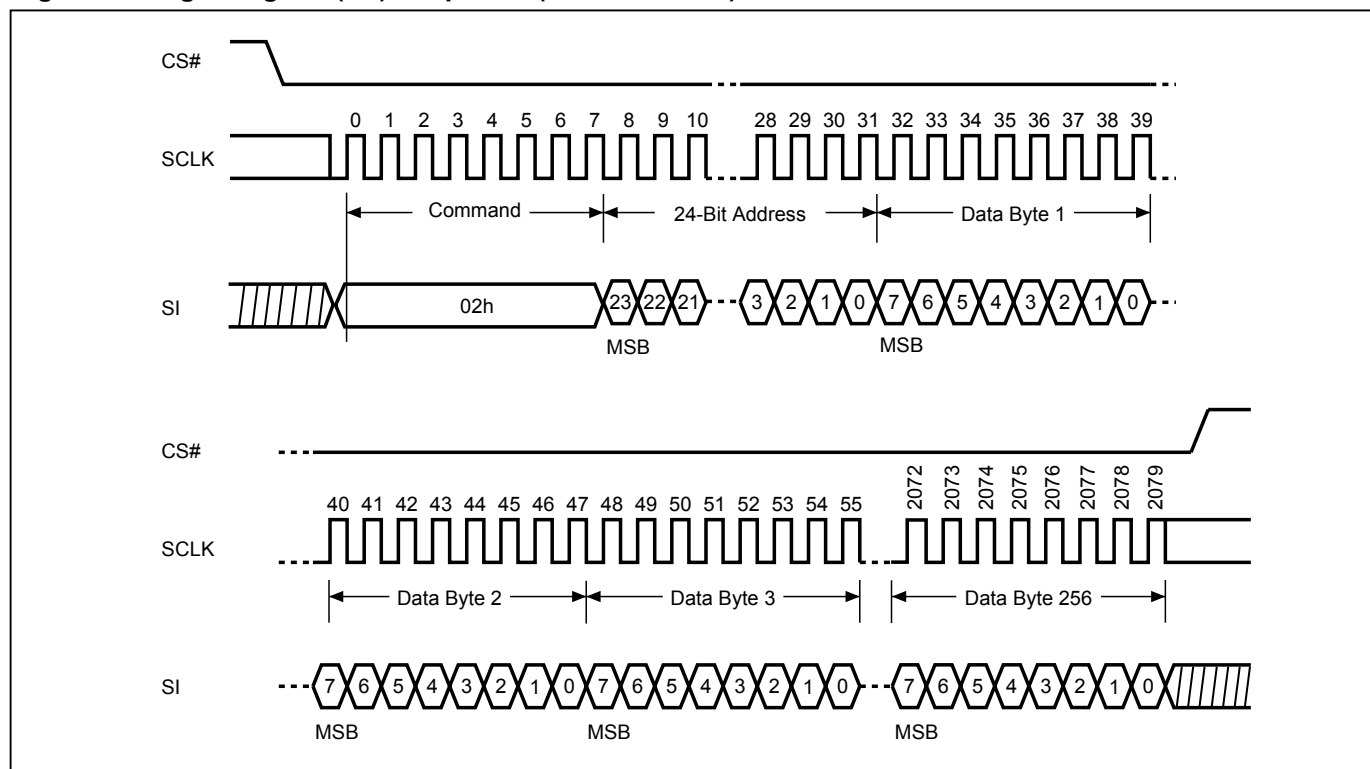

The sequence of issuing PP instruction is: CS# goes low → send PP instruction code → 3-byte address on SI → at least 1-byte on data on SI → CS# goes high.

The CS# must be kept to low during the whole Page Program cycle; The CS# must go high exactly at the byte boundary (the latest eighth bit of data being latched in), otherwise, the instruction will be rejected and will not be executed.

The self-timed Page Program Cycle time (t<sub>PP</sub>) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked while the Page Program cycle is in progress. The WIP sets during the t<sub>PP</sub> timing, and clears when Page Program Cycle is completed, and the Write Enable Latch (WEL) bit is cleared. If the page is protected by BP3-0, the array data will be protected (no change) and the WEL bit will still be reset.

The SIO[3:1] are don't care.

**Figure 22. Page Program (PP) Sequence (Command 02h)**

## 10-20. 4 x I/O Page Program (4PP)

The Quad Page Program (4PP) instruction is for programming the memory to be "0". A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit and Quad Enable (QE) bit must be set to "1" before sending the Quad Page Program (4PP). The Quad Page Programming takes four pins: SIO0, SIO1, SIO2, and SIO3, which can raise programmer performance and the effectiveness of application of lower clock less than f4PP. For system with faster clock, the Quad page program cannot provide more performance, because the required internal page program time is far more than the time data flows in. Therefore, we suggest that while executing this command (especially during sending data), user can slow the clock speed down to f4PP below. The other function descriptions are as same as standard page program.

The sequence of issuing 4PP instruction is: CS# goes low→ send 4PP instruction code→ 3-byte address on SIO[3:0]→ at least 1-byte on data on SIO[3:0]→ CS# goes high.

If the page is protected by BP3-0, the array data will be protected (no change) and the WEL bit will still be reset.

**Figure 23. 4 x I/O Page Program (4PP) Sequence (Command 38h)**

The Program/Erase function instruction function flow is as follows:

**Figure 24. Program/Erase Flow(1) with read array data**

**Figure 25. Program/Erase Flow(2) without read array data**

## 10-21. Deep Power-down (DP)

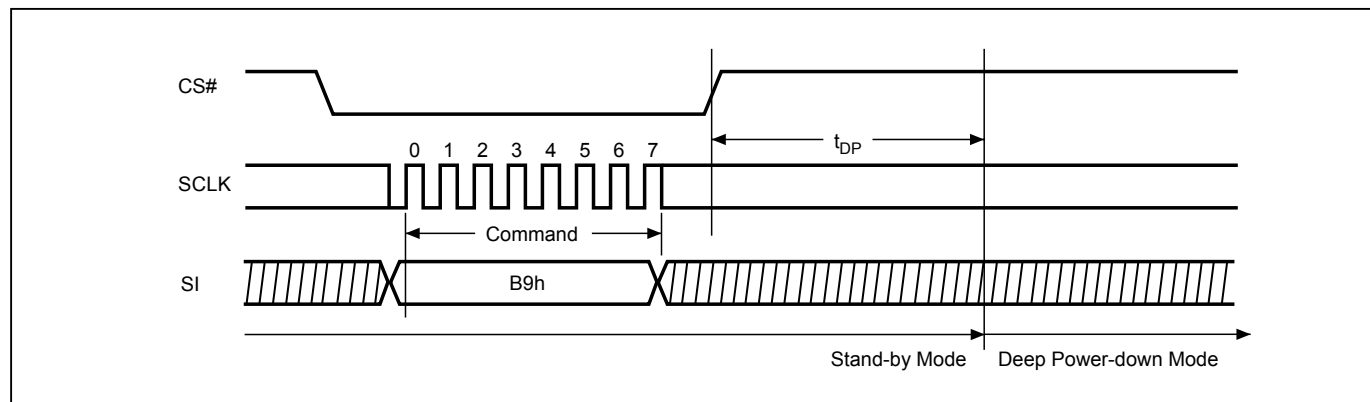

The Deep Power-down (DP) instruction places the device into a minimum power consumption state, Deep Power-down mode, in which the quiescent current is reduced from ISB1 to ISB2.

The sequence of issuing DP instruction: CS# goes low→ send DP instruction code→ CS# goes high. The CS# must go high at the byte boundary (after exactly eighth bits of the instruction code have been latched-in); otherwise the instruction will not be executed. SIO[3:1] are "don't care".

After CS# goes high there is a delay of  $t_{DP}$  before the device transitions from Stand-by mode to Deep Power-down mode and before the current reduces from ISB1 to ISB2. Once in Deep Power-down mode, all instructions will be ignored except Release from Deep Power-down (RDP).

The device exits Deep Power-down mode and returns to Stand-by mode if it receives a Release from Deep Power-down (RDP) instruction, power-cycle, or reset. Please refer to ["Figure 28. Release from Deep Power-down \(RDP\) Sequence"](#).

**Figure 26. Deep Power-down (DP) Sequence (Command B9h)**

## 10-22. Release from Deep Power-down (RDP), Read Electronic Signature (RES)

The Release from Deep Power-down (RDP) instruction is completed by driving Chip Select (CS#) High. When Chip Select (CS#) is driven High, the device is put in the standby Power mode. If the device was not previously in the Deep Power-down mode, the transition to the standby Power mode is immediate. If the device was previously in the Deep Power-down mode, though, the transition to the standby Power mode is delayed by  $t_{RES1}$ , and Chip Select (CS#) must remain High for at least  $t_{RES1(max)}$ , as specified in "Table 18. AC Characteristics". Once in the standby mode, the device waits to be selected, so that it can receive, decode and execute instructions.

RES instruction is for reading out the old style of 8-bit Electronic Signature ID, whose values are shown as "Table 9. ID Definitions". This is not the same as RDID instruction. It is not recommended to use for new design. For new design, please use RDID instruction. The RDP and RES are allowed to execute in Deep power-down mode, except if the device is in progress of program/erase/write cycle; In this case, there is no effect on the current program/erase/write cycle that is in progress.

The SIO[3:1] are don't care during this mode.

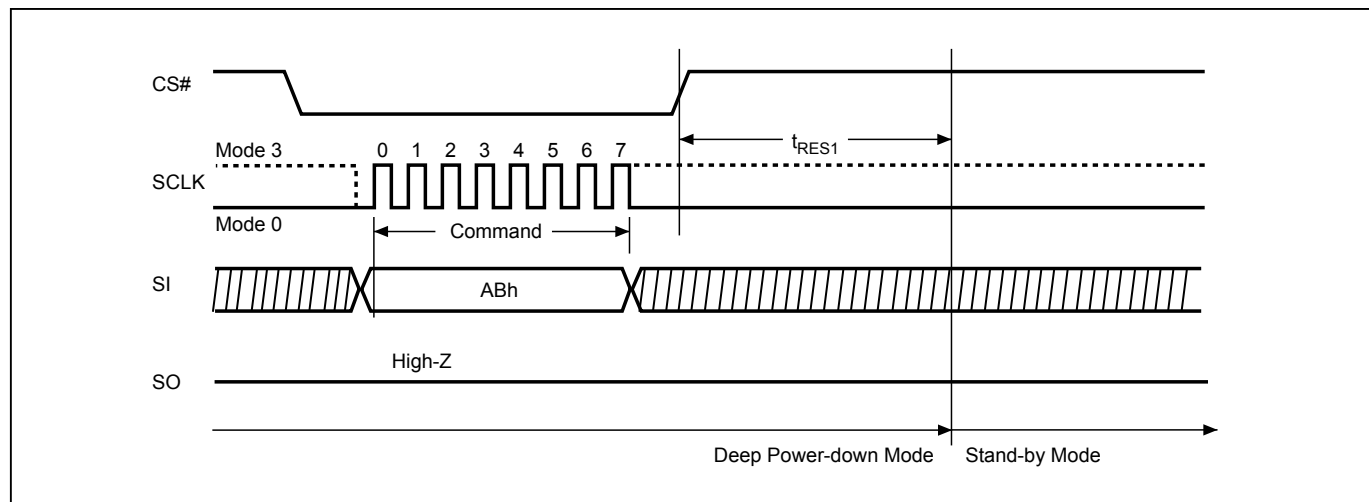

The RES instruction ends when CS# goes high, after the ID been read out at least once. The ID outputs repeatedly if continuously send the additional clock cycles on SCLK while CS# is at low. If the device was not previously in Deep Power-down mode, the device transition to standby mode is immediate. If the device was previously in Deep Power-down mode, there's a delay of  $t_{RES2}$  to transit to standby mode, and CS# must remain to high at least  $t_{RES2(max)}$ . Once in the standby mode, the device waits to be selected, so it can receive, decode, and execute instruction.

The RDP instruction is for releasing from Deep Power-down Mode.

**Figure 27. Read Electronic Signature (RES) Sequence (Command ABh)**

**Figure 28. Release from Deep Power-down (RDP) Sequence**

### 10-23. Read Electronic Manufacturer ID & Device ID (REMS)

The REMS instruction returns both the JEDEC assigned manufacturer ID and the device ID. The Device ID values are listed in ["Table 9. ID Definitions"](#).

The REMS instruction is initiated by driving the CS# pin low and sending the instruction code "90h" followed by two dummy bytes and one address byte (A7-A0). After which the manufacturer ID for Macronix (C2h) and the device ID are shifted out on the falling edge of SCLK with the most significant bit (MSB) first. If the address byte is 00h, the manufacturer ID will be output first, followed by the device ID. If the address byte is 01h, then the device ID will be output first, followed by the manufacturer ID. While CS# is low, the manufacturer and device IDs can be read continuously, alternating from one to the other. The instruction is completed by driving CS# high.

**Figure 29. Read Electronic Manufacturer & Device ID (REMS) Sequence**

**Notes:**

(1) ADD=00H will output the manufacturer's ID first and ADD=01H will output device ID first.

**Table 9. ID Definitions**

Command Type	MX25L6433F		
	Manufacturer ID	Memory Type	Memory Density
RDID	C2	20	17
RES	Electronic Signature ID		
	16		
REMS	Manufacturer ID	Device ID	
	C2	16	

**10-24. Enter Secured OTP (ENSO)**

The ENSO instruction is for entering the additional 8K-bit Secured OTP mode. While the device is in 8K-bit Secured OTP mode, array access is not available. The additional 8K-bit Secured OTP is independent from main array, which may use to store unique serial number for system identifier. After entering the Secured OTP mode, and then follow standard read or program procedure to read out the data or update data.

The Secured OTP data cannot be updated again once it is lock-down.

The sequence of issuing ENSO instruction is: CS# goes low→ send ENSO instruction to enter Secured OTP mode→ CS# goes high.

The SIO[3:1] are don't care.

Please note that WRSR/WRSCUR/CE/BE/SE/BE32K commands are not acceptable during the access of secure OTP region, once Security OTP is locked down, only read related commands are valid.

**10-25. Exit Secured OTP (EXSO)**

The EXSO instruction is for exiting the additional 8K-bit Secured OTP mode.

The sequence of issuing EXSO instruction is: CS# goes low→ send EXSO instruction to exit Secured OTP mode→ CS# goes high.

The SIO[3:1] are don't care.

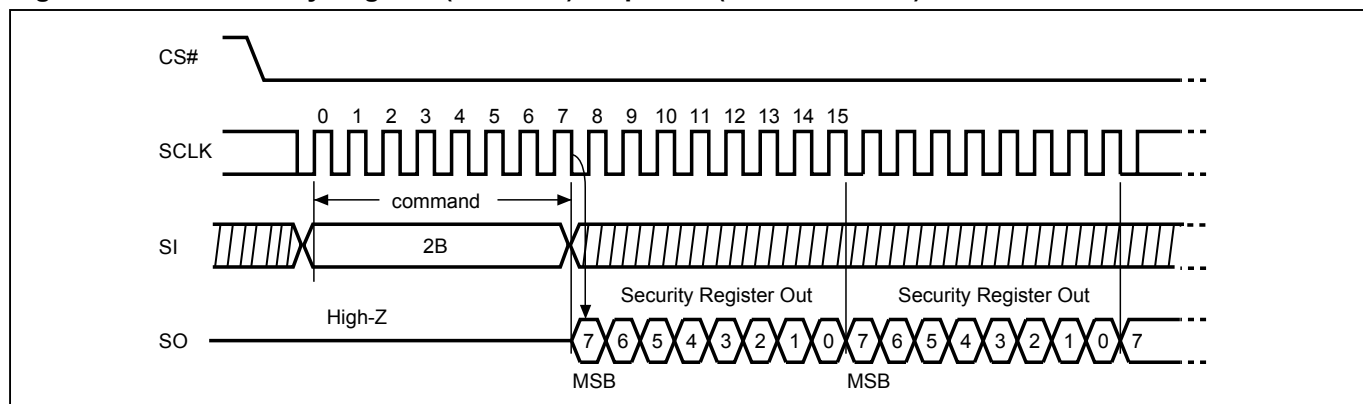

## 10-26. Read Security Register (RDSCUR)

The RDSCUR instruction is for reading the value of Security Register. The Read Security Register can be read at any time (even in program/erase/write status register/write security register condition) and continuously.

The sequence of issuing RDSCUR instruction is : CS# goes low→ send RDSCUR instruction → Security Register data out on SO→ CS# goes high.

The SIO[3:1] are don't care.

**Figure 30. Read Security Register (RDSCUR) Sequence (Command 2Bh)**

The definition of the Security Register is as below:

**Secured OTP Indicator bit.** The Secured OTP indicator bit indicates the chip is locked by factory before ex- factory or not. When it is "0", it indicates non-factory lock; "1" indicates factory- lock.

**Lock-down Secured OTP (LDSO) bit.** By writing WRSCUR instruction, the LDSO bit may be set to "1" for customer lock-down purpose. However, once the bit is set to "1" (lock-down), the LDSO bit and the 1<sup>st</sup> 4K-bit Secured OTP area cannot be updated any more.

**Program Suspend Status bit.** Program Suspend Bit (PSB) indicates the status of Program Suspend operation. Users may use PSB to identify the state of flash memory. After the flash memory is suspended by Program Suspend command, PSB is set to "1". PSB is cleared to "0" after program operation resumes.

**Erase Suspend Status bit.** Erase Suspend Bit (ESB) indicates the status of Erase Suspend operation. Users may use ESB to identify the state of flash memory. After the flash memory is suspended by Erase Suspend command, ESB is set to "1". ESB is cleared to "0" after erase operation resumes.

**Program Fail Flag bit.** While a program failure happened, the Program Fail Flag bit would be set. If the program operation fails on a protected memory region, this bit will also be set. This bit can be the failure indication of one or more program operations. This fail flag bit will be cleared automatically after the next successful program operation.

**Erase Fail Flag bit.** While an erase failure happened, the Erase Fail Flag bit would be set. If the erase operation fails on a protected memory region, this bit will also be set. This bit can be the failure indication of one or more erase operations. This fail flag bit will be cleared automatically after the next successful erase operation.

**Table 10. Security Register Definition**

bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
Reserved	E_FAIL	P_FAIL	Reserved	ESB (Erase Suspend status)	PSB (Program Suspend status)	LDSO (lock-down 1 <sup>st</sup> 4K-bit Secured OTP)	Secured OTP Indicator bit (2 <sup>nd</sup> 4K-bit Secured OTP)
Reserved	0=normal Erase succeed 1=indicate Erase failed (default=0)	0=normal Program succeed 1=indicate Program failed (default=0)	Reserved	0=Erase is not suspended 1=Erase is suspended (default=0)	0=Program is not suspended 1=Program is suspended (default=0)	0 = not lockdown 1 = lock-down (Secured OTP can no longer be programmed)	0 = nonfactory lock 1 = factory lock
non-volatile bit	volatile bit	volatile bit	volatile bit	volatile bit	volatile bit	non-volatile bit	non-volatile bit
Reserved	Read Only	Read Only		Read Only	Read Only	OTP	Read Only

### 10-27. Write Security Register (WRSCUR)

The WRSCUR instruction is for changing the values of Security Register Bits. Unlike write status register, the WREN instruction is required before sending WRSCUR instruction. The WRSCUR instruction may change the values of bit1 (LDSO bit) for customer to lock-down the 1<sup>st</sup> 4K-bit Secured OTP area. Once the LDSO bit is set to "1", the 1<sup>st</sup> 4K-bit Secured OTP area cannot be updated any more.

The sequence of issuing WRSCUR instruction is : CS# goes low → send WRSCUR instruction → CS# goes high.

The SIO[3:1] are don't care.

The CS# must go high exactly at the boundary; otherwise, the instruction will be rejected and not executed.

**Figure 31. Write Security Register (WRSCUR) Sequence (Command 2Fh)**

## 10-28. Program Suspend and Erase Suspend

The Suspend instruction interrupts a Page Program, Sector Erase, or Block Erase operation to allow access to the memory array. After the program or erase operation has entered the suspended state, the memory array can be read except for the page being programmed or the sector or block being erased (["Table 11. Readable Area of Memory While a Program or Erase Operation is Suspended"](#)).

**Table 11. Readable Area of Memory While a Program or Erase Operation is Suspended**

Suspended Operation	Readable Region of Memory Array
Page Program	All but the Page being programmed
Sector Erase (4KB)	All but the 4KB Sector being erased
Block Erase (32KB)	All but the 32KB Block being erased
Block Erase (64KB)	All but the 64KB Block being erased

When the Serial NOR Flash receives the Suspend instruction, there is a latency of tPSL or tESL (["Figure 32. Suspend to Read Latency"](#)) before the Write Enable Latch (WEL) bit clears to "0" and the PSB or ESB sets to "1", after which the device is ready to accept one of the commands listed in ["Table 12. Acceptable Commands During Program/Erase Suspend after tPSL/tESL"](#) (e.g. FAST READ). Refer to ["Table 18. AC Characteristics"](#) for tPSL and tESL timings. ["Table 13. Acceptable Commands During Suspend \(tPSL/tESL not required\)"](#) lists the commands for which the tPSL and tESL latencies do not apply. For example, RDSR, RDSCUR, RSTEN, and RST can be issued at any time after the Suspend instruction.

Security Register bit 2 (PSB) and bit 3 (ESB) can be read to check the suspend status. The PSB (Program Suspend Bit) sets to "1" when a program operation is suspended. The ESB (Erase Suspend Bit) sets to "1" when an erase operation is suspended. The PSB or ESB clears to "0" when the program or erase operation is resumed.

**Figure 32. Suspend to Read Latency**

**Figure 33. Resume to Suspend Latency**

### 10-28-1. Erase Suspend to Program

The “Erase Suspend to Program” feature allows Page Programming while an erase operation is suspended. Page Programming is permitted in any unprotected memory except within the sector of a suspended Sector Erase operation or within the block of a suspended Block Erase operation. The Write Enable (WREN) instruction must be issued before any Page Program instruction.

A Page Program operation initiated within a suspended erase cannot itself be suspended and must be allowed to finish before the suspended erase can be resumed. The Status Register can be polled to determine the status of the Page Program operation. The WEL and WIP bits of the Status Register will remain “1” while the Page Program operation is in progress and will both clear to “0” when the Page Program operation completes.

**Figure 34. Suspend to Program Latency**

### 10-29. Program Resume and Erase Resume

The Resume instruction resumes a suspended Page Program, Sector Erase, or Block Erase operation. Before issuing the Resume instruction to restart a suspended erase operation, make sure that there is no Page Program operation in progress.

Immediately after the Serial NOR Flash receives the Resume instruction, the WEL and WIP bits are set to “1” and the PSB or ESB is cleared to “0”. The program or erase operation will continue until finished ([“Figure 35. Resume to Read Latency”](#)) or until another Suspend instruction is received. A resume-to-suspend latency of  $t_{PRS}$  or  $t_{ERS}$  must be observed before issuing another Suspend instruction ([“Figure 33. Resume to Suspend Latency”](#)).

Please note that the Resume instruction will be ignored if the Serial NOR Flash is in “Performance Enhance Mode”. Make sure the Serial NOR Flash is not in “Performance Enhance Mode” before issuing the Resume instruction.

**Figure 35. Resume to Read Latency**

### 10-30. No Operation (NOP)

The "No Operation" command is only able to terminate the Reset Enable (RSTEN) command and will not affect any other command.

### 10-31. Software Reset (Reset-Enable (RSTEN) and Reset (RST))

The Software Reset operation combines two instructions: Reset-Enable (RSTEN) command and Reset (RST) command. It returns the device to a standby mode. All the volatile bits and settings will be cleared then, which makes the device return to the default status as power on.

To execute Reset command (RST), the Reset-Enable (RSTEN) command must be executed first to perform the Reset operation. If there is any other command to interrupt after the Reset-Enable command, the Reset-Enable will be invalid.

If the Reset command is executed during program or erase operation, the operation will be disabled, the data under processing could be damaged or lost.

The reset time is different depending on the last operation. Longer latency time is required to recover from a program operation than from other operations.

**Figure 36. Software Reset Recovery**

### 10-32. Read SFDP Mode (RDSFDP)

The Serial Flash Discoverable Parameter (SFDP) standard provides a consistent method of describing the functional and feature capabilities of serial flash devices in a standard set of internal parameter tables. These parameter tables can be interrogated by host system software to enable adjustments needed to accommodate divergent features from multiple vendors. The concept is similar to the one found in the Introduction of JEDEC Standard, JESD68 on CFI.

The sequence of issuing RDSFDP instruction is CS# goes low→send RDSFDP instruction (5Ah)→send 3 address bytes on SI pin→send 1 dummy byte on SI pin→read SFDP code on SO→to end RDSFDP operation can use CS# to high at any time during data out.

SFDP is a JEDEC Standard, JESD216.

**Figure 37. Read Serial Flash Discoverable Parameter (RDSFDP) Sequence**

**Table 14. Signature and Parameter Identification Data Values**

SFDP Table (JESD216) below is for MX25L6433FM2I-08G, MX25L6433FMI-08G, MX25L6433FZNI-08G, MX25L6433FXCI-08G, MX25L6433FZ2I-08G, MX25L6433FM2I-08Q, MX25L6433FMI-08Q, MX25L6433FZNI-08Q and MX25L6433FZCI-08Q

Note 1: h/b is hexadecimal or binary.

Note 2: **(x-y-z)** means I/O mode nomenclature used to indicate the number of active pins used for the opcode (x), address (y), and data (z). At the present time, the only valid Read SFDP instruction modes are: (1-1-1), (2-2-2), and (4-4-4)

Note 3: **Wait States** is required dummy clock cycles after the address bits or optional mode bits.

Note 4: **Mode Bits** is optional control bits that follow the address bits. These bits are driven by the system controller if they are specified. (eg, read performance enhance toggling bits)

Note 5: 4KB=2<sup>0Ch</sup>, 32KB=2<sup>0Fh</sup>, 64KB=2<sup>10h</sup>

Note 6: All unused and undefined area data is blank FFh for SFDP Tables that are defined in Parameter Identification Header. All other areas beyond defined SFDP Table are reserved by Macronix.

## 11. POWER-ON STATE

The device is in the states below when power-up:

- Standby mode
- Write Enable Latch (WEL) bit is reset

The device must not be selected during power-up and power-down stage until the VCC reaches the following levels:

- VCC minimum at power-up stage and then after a delay of  $t_{VSL}$
- GND at power-down

Please note that a pull-up resistor on CS# may ensure a safe and proper power-up/down level.

An internal Power-on Reset (POR) circuit may protect the device from data corruption and inadvertent data change during power up state.

For further protection on the device, if the VCC does not reach the VCC minimum level, the correct operation is not guaranteed. The read, write, erase, and program command should be sent after the time delay:

- $t_{VSL}$  after VCC reached VCC minimum level

The device can accept read command after VCC reached VCC minimum and a time delay of  $t_{VSL}$ .

### Note:

- To stabilize the VCC level, the VCC rail decoupled by a suitable capacitor close to package pins is recommended. (generally around 0.1 $\mu$ F)

## 12. Electrical Specifications

### 12-1. Absolute Maximum Ratings

RATING		VALUE
Ambient Operating Temperature	Industrial grade	-40°C to 85°C
Storage Temperature		-65°C to 150°C
Applied Input Voltage		-0.5V to 4.6V
Applied Output Voltage		-0.5V to 4.6V
VCC to Ground Potential		-0.5V to 4.6V

#### NOTICE:

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only and functional operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended period may affect reliability.
- Specifications contained within the following tables are subject to change.
- During voltage transitions, all pins may overshoot Vss to -2.0V and Vcc to +2.0V for periods up to 20ns, see the figures below.

**Figure 38. Maximum Negative Overshoot Waveform**

**Figure 39. Maximum Positive Overshoot Waveform**

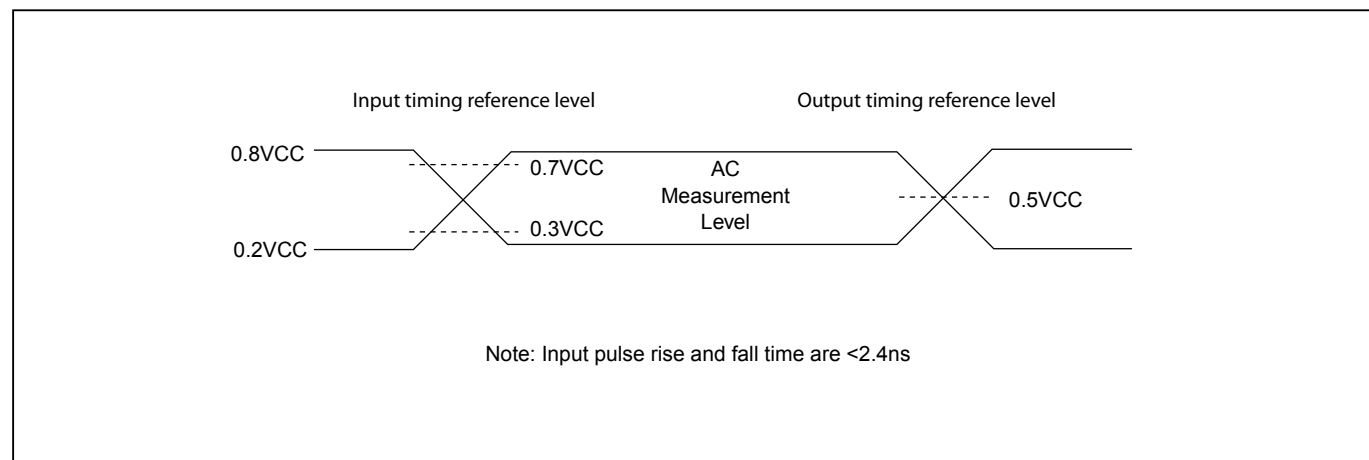

### 12-2. Capacitance TA = 25°C, f = 1.0 MHz

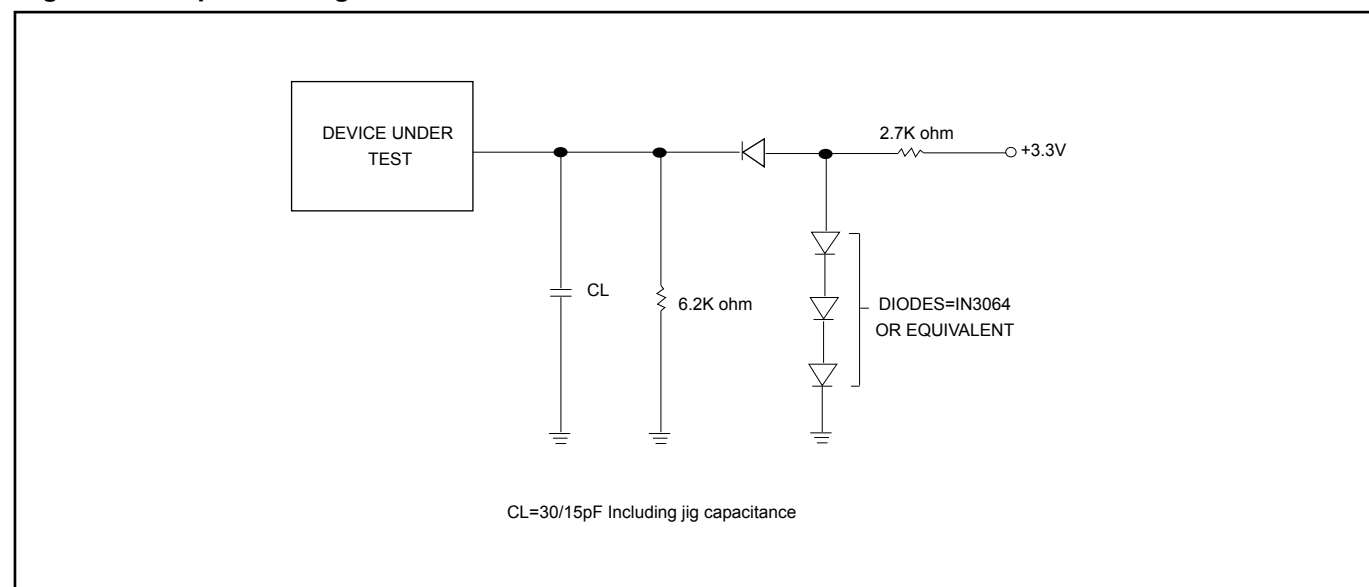

Symbol	Parameter	Min.	Typ.	Max.	Unit	Conditions
CIN	Input Capacitance			6	pF	VIN = 0V
COUT	Output Capacitance			8	pF	VOOUT = 0V

**Figure 40. Data Input Test Waveforms and Measurement Level**

**Figure 41. Output Loading**

**Figure 42. SCLK TIMING DEFINITION**

**Table 17. DC Characteristics**

Temperature = -40°C to 85°C for Industrial grade, VCC = 2.65V - 3.6V

Symbol	Parameter	Notes	Min.	Typ.	Max.	Units	Test Conditions
ILI	Input Load Current	1			± 2	uA	VCC = VCC Max, VIN = VCC or GND
ILO	Output Leakage Current	1			± 2	uA	VCC = VCC Max, VOUT = VCC or GND
ISB1	VCC Standby Current	1		10	50	uA	VIN = VCC or GND, CS# = VCC
ISB2	Deep Power-down Current			3	20	uA	VIN = VCC or GND, CS# = VCC
ICC1	VCC Read	1		10	17	mA	fQ=133MHz (4 x I/O read) SCLK=0.1VCC/0.9VCC, SO=Open
				2.5	5	mA	f=50MHz, SCLK=0.1VCC/0.9VCC, SO=Open
ICC2	VCC Program Current (PP)	1		10	15	mA	Program in Progress, CS# = VCC
ICC3	VCC Write Status Register (WRSR) Current			10	15	mA	Program status register in progress, CS#=VCC
ICC4	VCC Sector Erase Current (SE)	1		10	15	mA	Erase in Progress, CS#=VCC
ICC5	VCC Chip Erase Current (CE)	1		10	15	mA	Erase in Progress, CS#=VCC
VIL	Input Low Voltage		-0.5		0.8	V	
VIH	Input High Voltage		0.7VCC		VCC+0.4	V	
VOL	Output Low Voltage				0.4	V	IOL = 1.6mA
VOH	Output High Voltage		VCC-0.2			V	IOH = -100uA

**Notes :**

1. Typical values at VCC = 3.3V, T = 25°C. These currents are valid for all product versions (package and speeds).
2. Typical value is calculated by simulation.
3. The value guaranteed by characterization, not 100% tested in production.

**Table 18. AC Characteristics**

Temperature = -40°C to 85°C for Industrial grade, VCC = 2.65V - 3.6V

tSE		Sector Erase Cycle Time (4KB)		25	200	ms
tBE32K		Block Erase Cycle Time (32KB)		0.14	0.6	s
tBE		Block Erase Cycle Time (64KB)		0.25	1	s
tCE		Chip Erase Cycle Time		20	60	s
tWSR		Write Security Register Time			1	ms

## Notes:

1. tCH + tCL must be greater than or equal to 1/ fC.
2. The value guaranteed by characterization, not 100% tested in production.
3. Only applicable as a constraint for a WRSR instruction when SRWD is set at 1.
4. Latency time is required to complete Erase/Program Suspend operation until WIP bit is "0".
5. For tPRS, minimum timing must be observed before issuing the next program suspend command. However, a period equal to or longer than the typical timing is required in order for the program operation to make progress.
6. For tERS, minimum timing must be observed before issuing the next erase suspend command. However, a period equal to or longer than the typical timing is required in order for the erase operation to make progress.
7. The value guaranteed by characterization, not 100% tested in production.

### 13. TIMING ANALYSIS

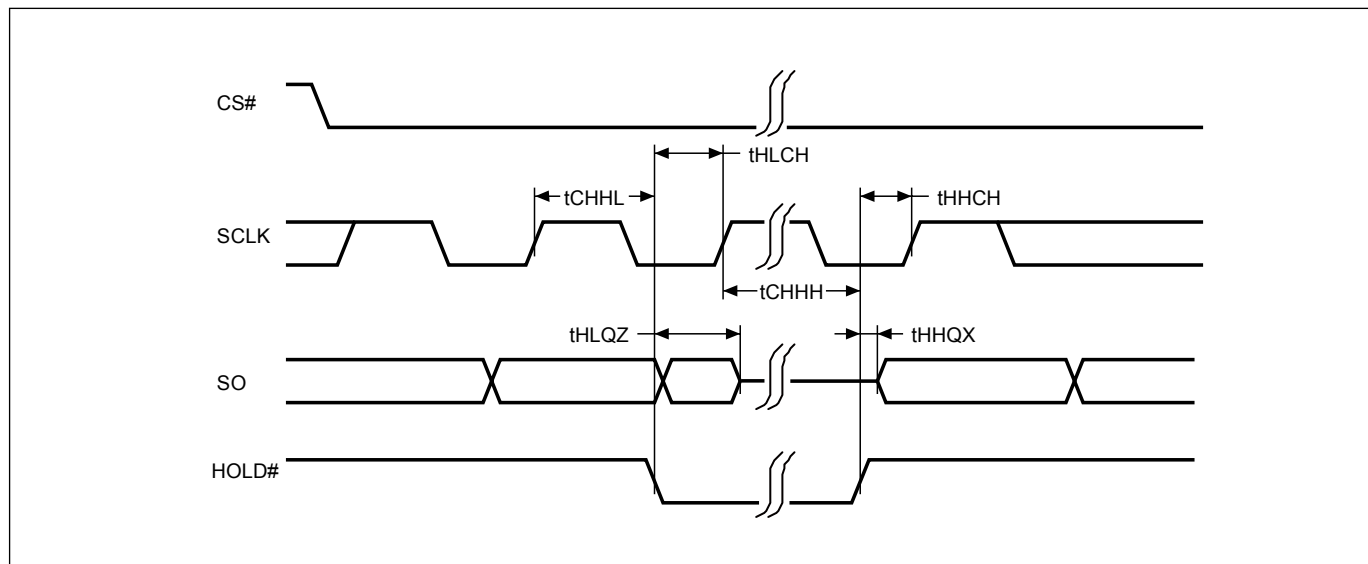

### Figure 43. Serial Input Timing

### Figure 44. Output Timing

**Figure 45. Hold Timing**

**Figure 46. WP# Setup Timing and Hold Timing during WRSR when SRWD=1**

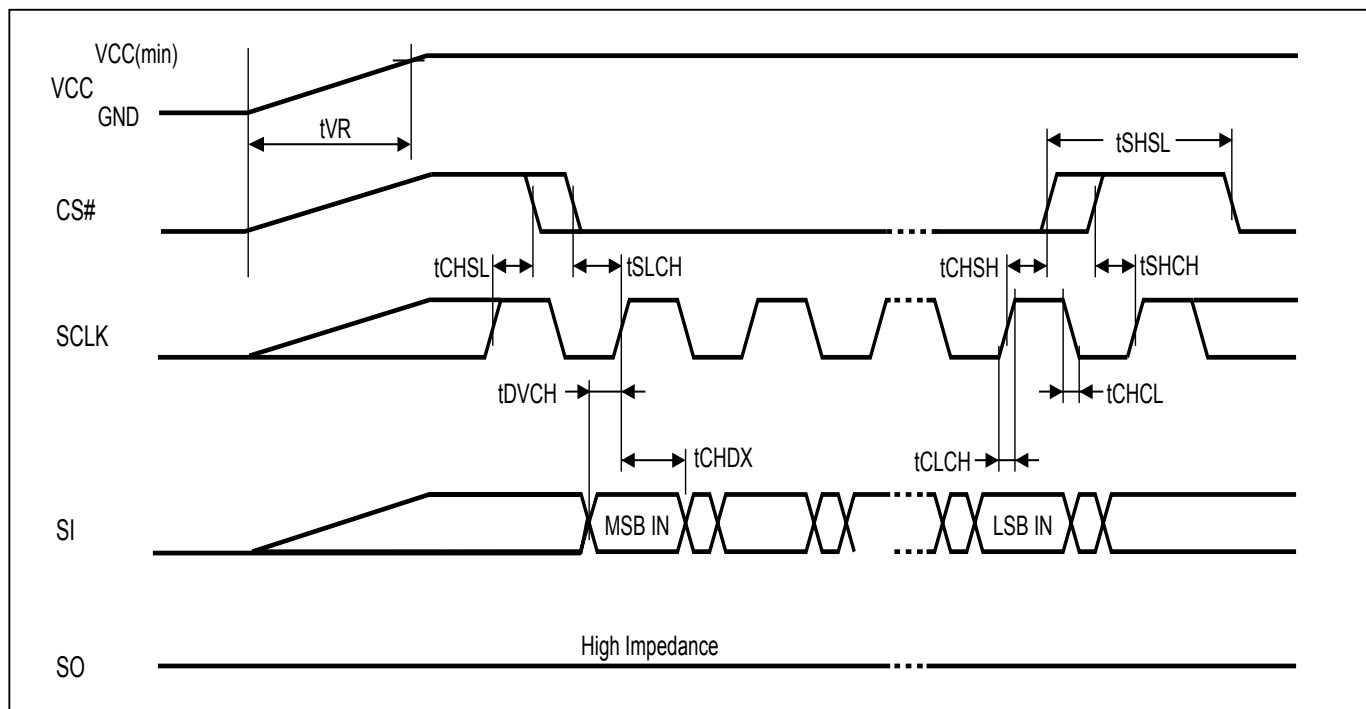

## 14. OPERATING CONDITIONS

### At Device Power-Up and Power-Down

AC timing illustrated in "[Figure 47. AC Timing at Device Power-Up](#)" and "[Figure 48. Power-Down Sequence](#)" are for the supply voltages and the control signals at device power-up and power-down. If the timing in the figures is ignored, the device will not operate correctly.

During power-up and power-down, CS# needs to follow the voltage applied on VCC to keep the device not to be selected. The CS# can be driven low when VCC reach Vcc(min.) and wait a period of tVSL.

**Figure 47. AC Timing at Device Power-Up**

Symbol	Parameter	Notes	Min.	Max.	Unit
tVR	VCC Rise Time	1		500000	us/V

**Notes :**

1. Sampled, not 100% tested.
2. For AC spec tCHSL, tSLCH, tDVCH, tCHDX, tSHSL, tCHSH, tSHCH, tCHCL, tCLCH in the figure, please refer to "[Table 18. AC Characteristics](#)".

**Figure 48. Power-Down Sequence**

During power-down, CS# needs to follow the voltage drop on VCC to avoid mis-operation.

**Figure 49. Power-up Timing**

**Figure 50. Power Up/Down and Voltage Drop**

When powering down the device, VCC must drop below  $V_{PVD}$  for at least  $t_{PVD}$  to ensure the device will initialize correctly during power up. Please refer to "Figure 50. Power Up/Down and Voltage Drop" and "Table 19. Power-Up/Down Voltage and Timing" below for more details.

**Table 19. Power-Up/Down Voltage and Timing**

Symbol	Parameter	Min.	Max.	Unit
tVSL	VCC(min.) to device operation	800		us
VWI	Write Inhibit Voltage	1.5	2.5	V
$V_{PVD}$	VCC voltage needed to below $V_{PVD}$ for ensuring initialization will occur		0.9	V
tPVD	The minimum duration for ensuring initialization will occur	300		us
VCC	VCC Power Supply	2.65	3.6	V

**Note:** These parameters are characterized only.

#### 14-1. Initial Delivery State

The device is delivered with the memory array erased: all bits are set to 1 (each byte contains FFh). The Status Register contains 00h (all Status Register bits are 0).

**15. ERASE AND PROGRAMMING PERFORMANCE**

Parameter	Typ. <sup>(1)</sup>	Max. <sup>(2)</sup>	Unit
Write Status Register Cycle Time		40	ms
Sector Erase Time (4KB)	25	200	ms
Block Erase Time (64KB)	0.25	1	s
Block Erase Time (32KB)	0.14	0.6	s
Chip Erase Time	20	60	s
Byte Program Time (via page program command)	10	50	us
Page Program Time	0.33	1.2	ms
Erase/Program Cycle	100,000		cycles

**Notes:**

1. Typical program and erase time assumes the following conditions: 25°C, 3.3V, and checkerboard pattern.
2. Under worst conditions of 2.65V, highest operation temperature, post program/erase cycling.
3. System-level overhead is the time required to execute the first-bus-cycle sequence for the programming command.

**16. DATA RETENTION**

Parameter	Condition	Min.	Max.	Unit
Data retention	55°C	20		years

**17. LATCH-UP CHARACTERISTICS**

	Min.	Max.
Input Voltage with respect to GND on all power pins		1.5 VCCmax
Input Current on all non-power pins	-100mA	+100mA
Test conditions: VCC = VCCmax, one pin at a time (compliant to JEDEC JESD78 standard).		

## 18. ORDERING INFORMATION

**SIDE VIEW**

Note:

This package has an exposed metal pad underneath the package. It is recommended to leave the metal pad floating or to connect it to the same ground as the GND pin of the package. Do not connect the metal pad to any other voltage or signal line on the PCB. Avoid placing vias or traces underneath the metal pad. Connection of this metal pad to any other voltage or signal line can result in shorts and/or electrical malfunction of the device.

## 21. REVISION HISTORY

Revision No.	Description	Page	Date
1.0	1. Removed document status "ADVANCED INFORMATION"	All	OCT/27/2014
	2. Revised AC value: tRCR (min) = 20us.	P65	
	3. Modified ordering information descriptions.	P5,7,72-73,79	
1.1	1. Added command ENSO, EXSO, and WRSCUR.	P13,16,19, 50-51	NOV/21/2014
	2. Added content of Additional 8K-bit bit security OTP.	P4,11,52,59-62	
	3. Updated suspend/resume descriptions.	P54-56,69	
	4. Modified tCH/tCL formula.	P68	
	5. Removed 8-WSON (8x6mm) package.	P5,7,76,77	
	6. Updated the ordering information of MX25L6433FZNI-08G.	P76	
1.2	1. Updated the ordering information of MX25L6433FMI-08G.	P76	DEC/31/2014
	2. Modified BLOCK DIAGRAM.	P8	
	3. Modified <i>"Table 12. Acceptable Commands During Program/Erase Suspend after tPSL/tESL"</i> .	P54	
1.3	1. Updated the ordering information of MX25L6433FXCI-08G	P76	MAR/17/2015
	2. Added VCC range on the DC and AC characteristics table titles.	P67-68	
1.4	1. Modified SRWD bit and QE bit descriptions.	P23	MAR/10/2016
	2. Added MX25L6433FZ2I-08G.	P5,7,75-76,79	
	3. Added a statement for product ordering information.	P75	
	4. Modified Performance Enhance Mode Reset descriptions.	P35	
	5. Modified Deep Power-down (DP) descriptions.	P45	
	6. Modified REMS descriptions.	P48	
1.5	1. Added 08Q part names of 8-SOP,16-SOP,6x5mm 8-WSON	P75,76	OCT/11/2016
	2. Updated tVR values.	P71,73	
	3. Updated 8-WSON (8x6mm) package outline	P79	
	4. Description modifications.	P36,41	
1.6	1. Updated <i>"19. PART NAME DESCRIPTION"</i> .	P76	OCT/21/2016
1.7	1. Updated the note for the internal pull up status of HOLD#/SIO3 and WP#/SIO2 and Modified 24-Ball TFBGA (6x8 mm) TOP View.	P7	MAY/27/2021
	2. Added "Support Performance Enhance Mode - XIP (execute-in-place)".	P5,35	
	3. Description modifications.	P5,11,13,15,18, 25,28,46,49,51, 58-61,65,67,69, 73,75-76	
	4. Revised <i>"Figure 13. 2 x I/O Read Mode Sequence (Command BBh)"</i> .	P31	
	5. Modified the notes of Performance enhance indicator.	P33	
	6. Modified Burst Read descriptions.	P36	
	7. RDP instruction description and "Read Electronic Signature (RES) Sequence" figure correction.	P46	
	8. Added <i>"Figure 42. SCLK TIMING DEFINITION"</i> .	P65	
	9. Corrected tCH / tCL descriptions.	P67	
	10. Modified the Note descriptions of AC Tables.	P67-68	
	11. Modified the note description of Max. Erase/Program.	P74	
	12. Revised LATCH-UP testing descriptions	P74	
	13. Updated 8-WSON in Min./Max. D1, E1 and L values.	P79,80	
	14. Format modification.	P15-17,78-81	
	15. Added "Macronix Proprietary" footnote.	All	
	16. Revised Doc. Title of package outline.	P77
