4-TURN SERIES								
PL10118	1.60	37	1.44	1.80	1.60	55	43	37
PL10119	2.40	30	1.44	1.80	2.42	35	27	37
PL10120	3.30	17	1.44	1.80	3.60	20	18	37
PL10121	4.00	14	1.44	1.80	4.40	16	15	37
PL10122	4.90	11	1.44	1.80	5.34	13	12	37
PL10123	5.80	9	1.44	1.80	6.20	11	10	37

- NOTES:
- Parts can be ordered Non-Lead by adding "NL" to the part number (i.e. **PL10303NL**)
 - Optional Tape & Reel packaging can be ordered by adding a "T" suffix at the end of the part number (i.e. **PL10301T**)
 - The rated current as listed is either 85% of the saturation current or the heating current, depending on which value is lower.
 - The saturation current is the current which causes the inductance to drop by 15% at the stated ambient temperatures (25°C and 100°C). This current is determined by placing the component in the specified ambient environment and applying a short duration pulse current (to eliminate self-heating effects) to the component.
 - The heating current is the DC current which causes the temperature of the part to increase by approximately 45°C. This current is determined by mounting the component on a PCB with .25" wide, 2 oz. equivalent copper traces, and applying the current to the device for 30 minutes with no forced air cooling.
 - In high volt*time applications, additional heating in the component can occur due to core losses in the inductor which may necessitate derating the current in order to limit the temperature rise of the component. In order to determine the approximate total losses (or temperature rise) for a given application, the total copper and core losses should be taken into account. For approximate value of core losses, in a given application, use the core loss graph on page 24.
 - Meets solderability test per IPC/EIA J-STD-002B using flux type ORLO.

Mechanical

PL101XX

Suggested Pad Layouts and Schematics

PL101XX

PL10100 - PL10111

.405 to 1.50 μH
21 to 73 Adc

PL10112 - PL10117

1.00 to 3.40 μH
12 to 42 Adc

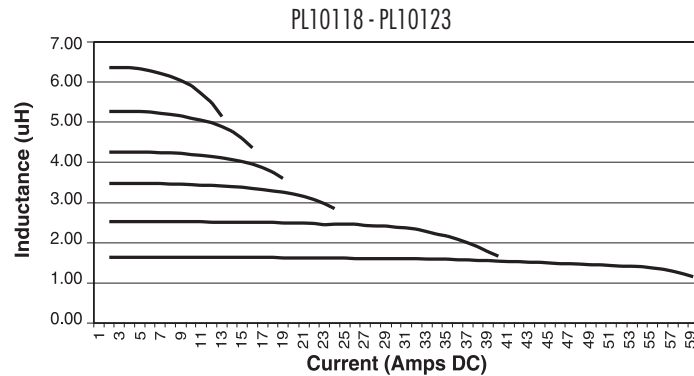

PL10118 - PL10123

1.60 to 6.20 μH
9 to 37 Adc

Inductance vs. Current Characteristics (25°C)

PL101XX

Measurements Charts

PL101XX

Core Loss vs. Flux Density

Temperature Rise vs. Power (W) Dissipation

Total Power Dissipation = Copper Loss (W) + Core Loss (W)

Copper Loss (W) = $Current(rms)^2 * DCR(m\Omega) / 1000$
Core Loss (W) = per table

Tin/Lead Recommended Reflow Profile (Based on J-STD-020D)

T_{SMIN} (°C)	T_{SMAX} (°C)	T_L (°C)	T_P (°C MAX)	t_s (s)	t_L (s)	t_p (s MAX)	Ramp-up rate (T_L to T_P)	Ramp-down rate (T_P to T_L)	Time 25°C to peak temperature (s MAX)
100	150	183	235	60-120	60-150	20	3°C/s MAX	6°C/s MAX	360

Notes:

1. All temperatures measured on the package leads.
2. Maximum times of reflow cycle: 2.
