General Description

The is a single, level translating 2-input Exclusive-OR gate . The low threshold inputs support 1.8 V input logic at $V_{CC} = 3.3\text{ V}$ and can be used in 1.8 V to 3.3 V level up translation. In addition, the 5 V tolerant input pins enable level down translation (3.3 V to 2.5 V output at $V_{CC} = 2.5\text{ V}$).

[1]t_{pd} is the same as t_{PLH} and t_{PHL}.

[2]C_{PD} is used to determine the dynamic power dissipation (PD in μW). PD = C_{PD} × V_{CC} × f_i × N + Σ(C_L × V_{CC} × f_o) where:

f_i = input frequency in MHz; f_o = output frequency in MHz;

C_L = output load capacitance in pF; V_{CC} = supply voltage in V;

N = number of inputs switching;

Σ(C_L × V_{CC} × f_o) = sum of the outputs.

TEST CIRCUIT AND WAVEFORMS

Test circuit for measuring switching times

Definitions test circuit:

R_T = Termination resistance should be equal to output impedance Z_o of the pulse generator;

C_L = Load capacitance including jig and probe capacitance;

R_L = Load resistance;

V_{EXT} = External voltage for measuring switching times.

The input A to output Y propagation delays

V_{OL} and V_{OH} are typical voltage output levels that occur with the output load.
