

## Dual-, Differential, Low-Pass Filter µModule with Gain and ADC Driver

### FEATURES

- ▶ Dual-channel differential input/output
- ▶ Integrated 36 MHz, 8-pole low-pass filter
- ▶ Low power dissipation
  - ▶ 213 mW typical at 3 V supply
- ▶ 2 integrated fully differential ADC drivers
- ▶ 30 dB maximum differential gain
  - ▶ Adjustable down to 14 dB
  - ▶ Gain error:  $\pm 0.2$  dB
  - ▶ Gain drift:  $0.01$  dB/°C typical
- ▶ 2.7 V to 3.3 V supply range
- ▶ **84-ball, 6 mm × 12 mm CSP\_BGA package with 0.8 mm ball pitch**
- ▶ Operating temperature range:  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$
- ▶ Built-in supply decoupling capacitors

### APPLICATIONS

- ▶ IF broadband demodulators
- ▶ Medical imaging (CW ultrasound beam forming)
- ▶ Phased array systems
  - ▶ Radar
  - ▶ Adaptive antennas
- ▶ Communications receivers
- ▶ Radio Links
- ▶ Wireless local loop
- ▶ RF instrumentation
- ▶ Satellite modems
- ▶ Baseband data acquisition system
  - ▶ Multichannel digitizer instruments
  - ▶ Ultrasonic non-destructive test

### GENERAL DESCRIPTION

The ADAQ8088 is a dual-channel analog system in package (SIP) that integrates three common signal processing and conditioning blocks to support a variety of demodulator applications and data acquisition applications. The device integrates all active and passive components to form a complete signal chain between the output of an I/Q demodulator and the input to an analog-to-digital converter (ADC). The device also forms the complete signal chain between a transducer output and the input to an ADC in baseband data acquisition systems. No external components are required for proper functionality.

Each channel contains a preamplifier, followed by an 8-pole, low-pass filter with a 36 MHz, 3 dB frequency, and a differential ADC driver optimized to drive 12-bit to 14-bit pipeline ADCs with speeds

### FUNCTIONAL BLOCK DIAGRAM

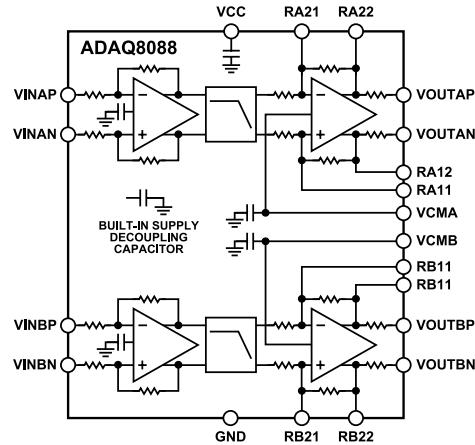

Figure 1.

up to 150 MSPS. Encapsulated in a **6 mm × 12 mm CSP\_BGA package**, the ADAQ8088 minimizes space requirements in high density multichannel systems.

The ADAQ8088 operating temperature range is from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ .

## ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Analog Inputs	3.5 V
Supply Voltage	3.5 V
Storage Temperature Range	-55°C to +125°C
Junction Temperature	150°C
Lead Temperature Soldering	260°C reflow as per JEDEC J-STD-020
Electrostatic Discharge (ESD) Ratings	500 V
Human Body Model (HBM)	2k V
Field Induced Charged Device Model	500 V

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

Table 3. Thermal Resistance

Package Type <sup>1</sup>	$\theta_{JA}$ (°C/W)	$\theta_{JC\_TOP}$ (°C/W)	$\theta_{JC\_BOTTOM}$ (°C/W)	$\theta_{JB}$ (°C/W)	$\Psi_{JT}$ (°C/W)	$\Psi_{JB}$ (°C/W)
BC-84-4	33	21.1	12.2	13.7	11	13

<sup>1</sup> Test Condition 1: Thermal impedance simulated values are based on use of a 2S2P with vias JEDEC PCB excluding the  $\theta_{JC\_TOP}$ , which uses 1S0P JEDEC PCB.

Thermal resistance values specified in Table 3 are simulated based on JEDEC specifications (unless specified otherwise) and should be used in compliance with JESD51-12.

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Type <sup>1</sup>	Description
A1	VINAP	AI	Analog Input for Channel A.
A2, A3, A5, A6, A10, A11, C2, C3, C11, D2, D3, D11, F2, F3, F5, F6, F10, F11	DNC	DNC	Do Not Connect. Do not connect to these pins.
A4, A7, A8, B1 to B14, E1 to E14, F4, F7, F8	GND	P	Analog Ground.
A9	VCMA	AI	$V_{CM}$ Input from the ADC.
A12, A13	RA21, RA22	AI	External Resistors for Channel A.
A14	VOUTAP	AO	Analog Output for Channel A.
C1	VINAN	AI	Analog Input for Channel A.
C4 to C10, D4 to D10	VCC	P	Power Supplies, 2.7 V to 3.3 V.
C12, C13	RA11, RA12	AI	External Resistors for Channel A.
C14	VOUTAN	AO	Analog Output for Channel A.
D1	VINBP	AI	Analog Input for Channel B.
D12, D13	RB11, RB12	AI	External Resistors for Channel B.
D14	VOUTBP	AO	Analog Output for Channel B.
F1	WINBN	AI	Analog Input for Channel B.
F9	VCMB	AI	$V_{CM}$ Input from the ADC.
F12, F13	RB21, RB22	AI	External Resistors for Channel B.
F14	VOUTBN	AO	Analog Output for Channel B.

<sup>1</sup> AI is analog input, DNC is do not connect, P is power, and AO is analog output.

## TYPICAL PERFORMANCE CHARACTERISTICS

V<sub>CC</sub> = 3 V; V<sub>CM</sub> is floating, typically 1.25 V; R<sub>LOAD</sub> = 1 kΩ; T = 25°C, inputs and outputs are measured differentially, unless otherwise noted.

## THEORY OF OPERATION

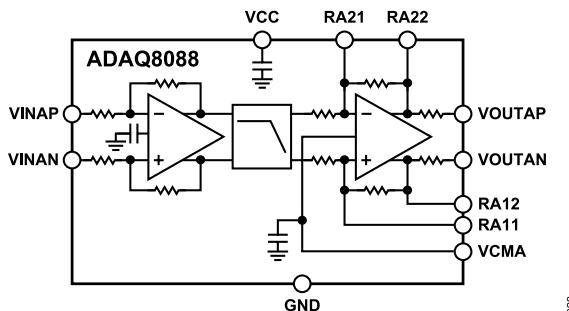

Figure 19. 1/2 ADAQ8088 Simplified Schematic

## CIRCUIT INFORMATION

The ADAQ8088 system in package (SiP) is an analog signal chain designed to interface baseband I/Q from quadrature demodulators to 12-bit to 14-bit pipeline ADCs.

### INPUT RESISTANCE

The equivalent input impedance of each input of the ADAQ8088 is a  $249\ \Omega$  resistor connected to VCC/2.

Each baseband output of the demodulator is loaded with the input impedance of the ADAQ8088. To avoid saturating the ADAQ8088 inputs, ac couple demodulators with high dc bias on the I/Q outputs to the ADAQ8088.

### LOW PASS FILTER

An 8-pole Butterworth low-pass filter provides steep roll-off beyond the filter corner frequency of 36 MHz typical.

### NOISE

Input referred broad band noise density of the ADAQ8088 is

$6\ \text{nV}/\sqrt{\text{Hz}}$

1/f corner is located at 20 kHz.

### OUTPUT STAGE

The output stage is optimized to drive 12-bit to 14-bit pipeline ADCs with speeds of 150 MSPS or lower.

The output resistance of the ADAQ8088 is set to  $10\ \Omega$ . Additional resistors in series with each output and a differential capacitor placed as close to the ADC inputs as possible provides additional filtering.

DC bias of the outputs is set by the voltage on the VCMA pin and the VCMB pin. Floating these pins self adjusts the outputs to 1.25 V (internally biased). Additionally, these pins are typically connected to the chosen ADC  $V_{CM}$  output pin.

### RESOLUTION

Two  $15\ \Omega$  resistors, each in series with an output pin of the ADAQ8088 and a  $10\ \text{pF}$  capacitor across the ADC input pins,

allows just over a 10-bit effective resolution at full-scale input for an ADC with a 4 ns acquisition time.

The  $190\ \text{nV}/\sqrt{\text{Hz}}$  RTO noise density of the ADAQ8088 at a gain value of 30 dB, integrated over the 36 MHz signal bandwidth, allows an effective signal resolution of 9 bits which is suitable for a 10-bit ADC with 2 V p-p FS analog input.

Reducing the gain to 20 dB increases the effective resolution to 10.5 bits in an ADC with 2 V p-p FS analog input.

## POWER SUPPLY DECOUPLING

The ADAQ8088 features built in,  $0.1\ \mu\text{F}$  supply decoupling capacitors on VCC.

### GAIN

With no external component, the gain of the ADAQ8088 is set to 30 dB. This gain can be reduced with external resistors ( $R_{EXT}$ ) connected between the following pins: RA11 and RA12, RA21 and RA22, RB11 and RB12, and RB21 and RB22.

The maximum gain is 30 dB with no resistors. The minimum gain is 14 dB when  $R_{EXT} = 110\ \Omega$ . Figure 20 shows the gain vs.  $R_{EXT}$  value.

Gain can be further reduced by a factor of  $249/(249 + R)$  with external resistors connected in series with each input.

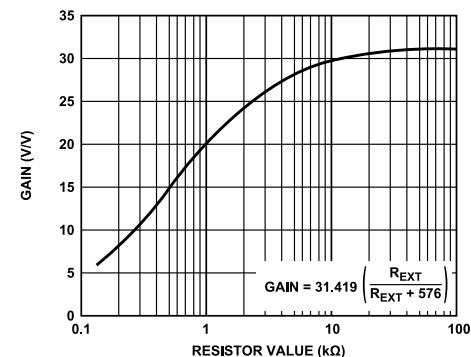

Figure 20. Gain vs. External Resistor Value

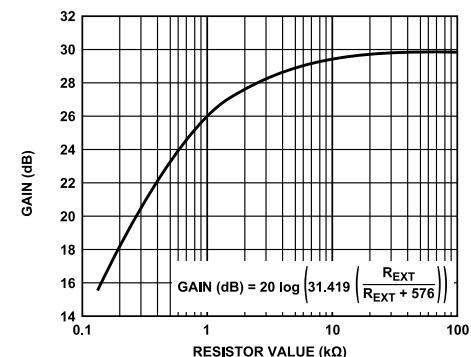

Figure 21. Gain (dB) vs. External Resistor Value

## APPLICATIONS INFORMATION

## TYPICAL APPLICATION CIRCUIT

Figure 22 shows an example of how the ADAQ8088 can be directly coupled to a demodulator. Place the  $61.9\ \Omega$  resistors close to the ADAQ8088 input pins. The parallel combination of the resistors and the  $249\ \Omega$  input impedance of the ADAQ8088 provides a  $50\ \Omega$  termination for the demodulator outputs. If the ADC is located physically some distance from the ADAQ8088 and is driven with a transmission line, place the  $40.2\ \Omega$  series resistors close to the ADAQ8088 output pins. These resistors, along with the device

internal impedance, provide a  $50\ \Omega$  series termination. The value of the shunt capacitor,  $C$ , is dependent on the input frequency and may need to be reduced or removed.

Figure 23 shows an example of how the ADAQ8088 can be used as part of an ultrasonic non-destructive test.

Figure 24 shows an example of how the ADAQ8088 works on high accuracy, wide bandwidth, multichannel digitizer instruments.
