

# **MX25U1635F**

**1.8V, 16M-BIT [x 1/x 2/x 4]  
CMOS MXSMIO<sup>®</sup> (SERIAL MULTI I/O)  
FLASH MEMORY**

## ***Key Features***

- *Fast read for SPI mode and QPI mode*
- *1.65 to 2.0 volt for read, erase, and program operations*
- *12-WLCSP (Wafer-Level Chip Scale Package)*
- *Multi I/O Support - Single I/O, Dual I/O and Quad I/O*
- *Program Suspend/Resume & Erase Suspend/Resume*

**1.8V 16M-BIT [x 1/x 2/x 4] CMOS MXSMIO® (SERIAL MULTI I/O)  
FLASH MEMORY****1. FEATURES****GENERAL**

- Supports Serial Peripheral Interface -- Mode 0 and Mode 3
- 16,777,216 x 1 bit structure or 8,388,608 x 2 bits (two I/O read mode) structure or 4,194,304 x 4 bits (four I/O read mode) structure
- Equal Sectors with 4K byte each, or Equal Blocks with 32K byte each or Equal Blocks with 64K byte each
  - Any Block can be erased individually
- Single Power Supply Operation
  - 1.65 to 2.0 volt for read, erase, and program operations
- Latch-up protected to 100mA from -1V to Vcc +1V
- Low Vcc write inhibit is from 1.0V to 1.4V

**PERFORMANCE**

- High Performance
  - Fast read for SPI mode
    - 1 I/O: 104MHz with 8 dummy cycles
    - 2 I/O: 84MHz with 4 dummy cycles, equivalent to 168MHz
    - 4 I/O: 104MHz with 2+4 dummy cycles, equivalent to 416MHz
  - Fast read for QPI mode
    - 4 I/O: 84MHz with 2+2 dummy cycles, equivalent to 336MHz
    - 4 I/O: 104MHz with 2+4 dummy cycles, equivalent to 416MHz
  - Fast program time: 0.5ms(typ.) and 1.5ms(max.)/page (256-byte per page)
  - Byte program time: 12us (typical)
  - 8/16/32/64 byte Wrap-Around Burst Read Mode
  - Fast erase time: 35ms (typ.)/sector (4K-byte per sector); 200ms(typ.)/block (32K-byte per block), 350ms(typ.) / block (64K-byte per block)
- Low Power Consumption
  - Low active read current: 20mA(typ.) at 104MHz, 15mA(typ.) at 84MHz
    - Low active erase current: 18mA (typ.) at Sector Erase, Block Erase (32KB/64KB); 20mA at Chip Erase
  - Low active programming current: 20mA (typ.)
  - Standby current: 10uA (typ.)
- Deep Power Down: 1.5uA(typ.)
- Typical 100,000 erase/program cycles
- 20 years data retention

**SOFTWARE FEATURES**

- Input Data Format
  - 1-byte Command code
- Advanced Security Features
  - Block lock protection
  - The BP0-BP3 status bit defines the size of the area to be software protection against program and erase instructions
  - Additional 4k-bit secured OTP for unique identifier
- Auto Erase and Auto Program Algorithm
  - Automatically erases and verifies data at selected sector or block
  - Automatically programs and verifies data at selected page by an internal algorithm that automatically times the program pulse widths (Any page to be programmed should have page in the erased state first)
- Status Register Feature
- Command Reset
- Program/Erase Suspend
- Electronic Identification
  - JEDEC 1-byte manufacturer ID and 2-byte device ID
  - RES command for 1-byte Device ID
  - REMS command for 1-byte manufacturer ID and 1-byte device ID
- Support Serial Flash Discoverable Parameters (SFDP) mode

**HARDWARE FEATURES**

- SCLK Input
  - Serial clock input
- SI/SIO0
  - Serial Data Input or Serial Data Input/Output for 2 x I/O read mode and 4 x I/O read mode
- SO/SIO1
  - Serial Data Output or Serial Data Input/Output for 2 x I/O read mode and 4 x I/O read mode
- WP#/SIO2
  - Hardware write protection or serial data Input/Output for 4 x I/O read mode
- RESET#/SIO3
  - Hardware Reset pin or Serial input & Output for 4 x I/O read mode
- PACKAGE
  - 8-pin SOP (200mil)
  - 8-land WSON (6mm x 5mm)
  - 8-land USON (4mm x 4mm)
  - 8-land USON (4mm x 3mm)
  - 12-ball WLCSP
  - **All devices are RoHS Compliant and Halogen-free**

## 2. GENERAL DESCRIPTION

MX25U1635F is a 16,777,216 bit Serial NOR Flash memory, which is configured as 2,097,152 x 8 internally. When it is in two or four I/O read mode, the structure becomes 8,388,608 bits x 2 or 4,194,304 bits x 4. MX25U1635F feature a serial peripheral interface and software protocol allowing operation on a simple 3-wire bus while it is in single I/O mode. The three bus signals are a clock input (SCLK), a serial data input (SI), and a serial data output (SO). Serial access to the device is enabled by CS# input.

When it is in two I/O read mode, the SI pin and SO pin become SIO0 pin and SIO1 pin for address/dummy bits input and data output. When it is in four I/O read mode, the SI pin, SO pin and WP# pin become SIO0 pin, SIO1 pin, SIO2 pin and SIO3 pin for address/dummy bits input and data output.

The MX25U1635F MXSMIO<sup>®</sup> (Serial Multi I/O) provides sequential read operation on the whole chip.

After program/erase command is issued, auto program/erase algorithms which program/erase and verify the specified page or sector/block locations will be executed. Program command is executed on byte basis, or page (256 bytes) basis, or word basis for erase command is executed on 4K-byte sector, 32K-byte block, or 64K-byte block, or whole chip basis.

To provide user with ease of interface, a status register is included to indicate the status of the chip. The status read command can be issued to detect completion status of a program or erase operation via the WIP bit.

Advanced security features enhance the protection and security functions, please see security features section for more details.

The MX25U1635F utilizes Macronix's proprietary memory cell, which reliably stores memory contents even after 100,000 program and erase cycles.

**Table 1. Additional Feature**

<b>Protection and Security</b>	<b>MX25U1635F</b>
Flexible Block Protection (BP0-BP3)	V
4K-bit security OTP	V

<b>Read Performance</b>	<b>MX25U1635F</b>							
I/O mode	SPI						QPI	
I/O	1 I/O	1I /2O	2 I/O	1I/4O	4 I/O	4 I/O	4 I/O	4 I/O
Dummy Cycle	8	8	4	8	4	6	4	6
Frequency	104MHz	104MHz	84 MHz	104MHz	84 MHz	104MHz	84 MHz	104MHz

### 3. PIN CONFIGURATIONS

#### 8-PIN SOP (200mil)

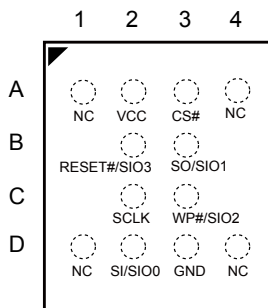

#### 8-LAND WSON (6mmx5mm)

#### 8-LAND USON(4mmx4mm), 8-LAND USON(4mmx3mm)

#### 12-BALL BGA (WLCSP) TOP View

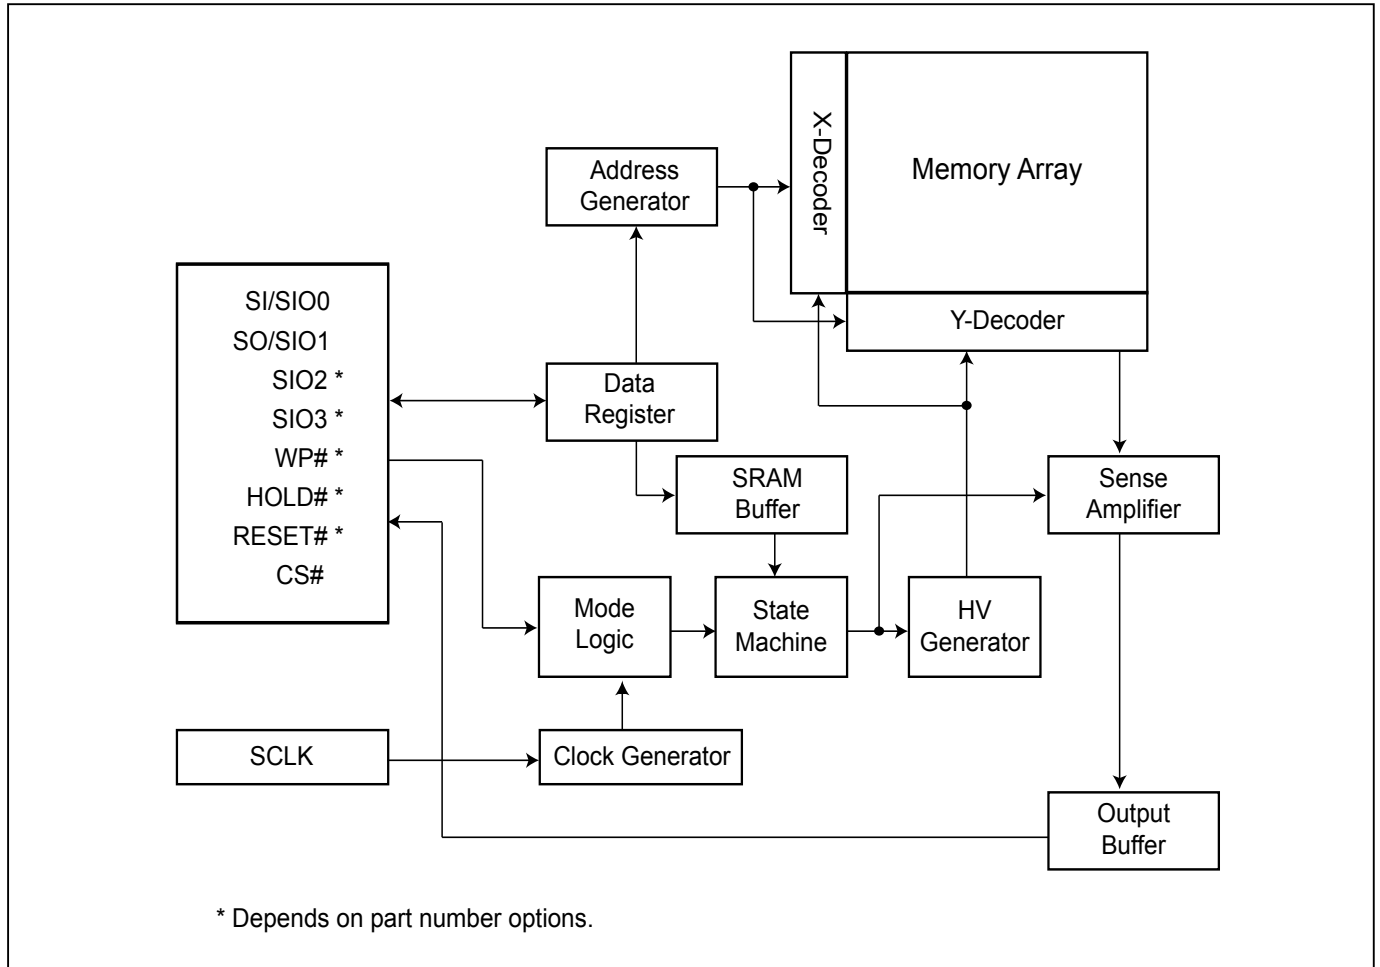

### 4. PIN DESCRIPTION

SYMBOL	DESCRIPTION
CS#	Chip Select
SI/SIO0	Serial Data Input (for 1 x I/O)/ Serial Data Input & Output (for 2xI/O or 4xI/O read mode)
SO/SIO1	Serial Data Output (for 1 x I/O)/ Serial Data Input & Output (for 2xI/O or 4xI/O read mode)
SCLK	Clock Input
WP#/SIO2	Write Protection Active Low or Serial Data Input & Output (for 4xI/O read mode)
RESET#/SIO3	Hardware Reset Pin Active low or Serial Data Input & Output (for 4xI/O read mode)
VCC	+ 1.8V Power Supply
GND	Ground

**Note:** The pin of RESET#/SIO3 or WP#/SIO2 will remain internal pull up function while this pin is not physically connected in system configuration. However, the internal pull up function will be disabled if the system has physical connection to RESET#/SIO3 or WP#/SIO2 pin.

## 5. BLOCK DIAGRAM

## 6. DATA PROTECTION

During power transition, there may be some false system level signals which result in inadvertent erasure or programming. The device is designed to protect itself from these accidental write cycles.

The state machine will be reset as standby mode automatically during power up. In addition, the control register architecture of the device constrains that the memory contents can only be changed after specific command sequences have completed successfully.

In the following, there are several features to protect the system from the accidental write cycles during VCC power-up and power-down or from system noise.

- Valid command length checking: The command length will be checked whether it is at byte base and completed on byte boundary.
- Write Enable (WREN) command: WREN command is required to set the Write Enable Latch bit (WEL) before issuing other commands to change data.
- Deep Power Down Mode: By entering deep power down mode, the flash device is under protected from writing all commands except Release from deep power down mode command (RDP) and Read Electronic Signature command (RES) and softreset command.
- Advanced Security Features: there are some protection and security features which protect content from inadvertent write and hostile access.

### I. Block lock protection

- The Software Protected Mode (SPM) use (BP3, BP2, BP1, BP0) bits to allow part of memory to be protected as read only. The protected area definition is shown as "[Table 2. Protected Area Sizes](#)", the protected areas are more flexible which may protect various area by setting value of BP0-BP3 bits.
- The Hardware Protected Mode (HPM) use WP#/SIO2 to protect the (BP3, BP2, BP1, BP0) bits and Status Register Write Protect bit.
- In four I/O and QPI mode, the feature of HPM will be disabled.

**Table 2. Protected Area Sizes**

Status bit				Protect Level
BP3	BP2	BP1	BP0	16Mb
0	0	0	0	0 (none)
0	0	0	1	1 (1block, protected block 31st)
0	0	1	0	2 (2blocks, protected block 30th~31st)
0	0	1	1	3 (4blocks, protected block 28th~31st)
0	1	0	0	4 (8blocks, protected block 24th~31st)
0	1	0	1	5 (16blocks, protected block 16th~31st)
0	1	1	0	6 (32blocks, protected all)
0	1	1	1	7 (32blocks, protected all)
1	0	0	0	8 (32blocks, protected all)
1	0	0	1	9 (32blocks, protected all)
1	0	1	0	10 (16blocks, protected block 0th~15th)
1	0	1	1	11 (24blocks, protected block 0th~23rd)
1	1	0	0	12 (28blocks, protected block 0th~27th)
1	1	0	1	13 (30blocks, protected block 0th~29th)
1	1	1	0	14 (31blocks, protected block 0th~30th)
1	1	1	1	15 (32blocks, protected all)

**II. Additional 4K-bit secured OTP** for unique identifier: to provide 4K-bit one-time program area for setting device unique serial number - Which may be set by factory or system customer.

- Security register bit 0 indicates whether the chip is locked by factory or not.
- To program the 4K-bit secured OTP by entering 4K-bit secured OTP mode (with Enter Security OTP command), and going through normal program procedure, and then exiting 4K-bit secured OTP mode by writing Exit Security OTP command.
- Customer may lock-down the customer lockable secured OTP by writing WRSCUR(write security register) command to set customer lock-down bit1 as "1". Please refer to ["Table 8. Security Register Definition"](#) for security register bit definition and ["Table 3. 4K-bit Secured OTP Definition"](#) for address range definition.
- Note: Once lock-down whatever by factory or customer, it cannot be changed any more. While in 4K-bit secured OTP mode, array access is not allowed.

**Table 3. 4K-bit Secured OTP Definition**

Address range	Size	Standard Factory Lock	Customer Lock
xxx000~xxx00F	128-bit	ESN (electrical serial number)	Determined by customer
xxx010~xxx1FF	3968-bit	N/A	

## 7. MEMORY ORGANIZATION

## 8. DEVICE OPERATION

1. Before a command is issued, status register should be checked to ensure device is ready for the intended operation.
2. When incorrect command is inputted to this device, it enters standby mode and remains in standby mode until next CS# falling edge. In standby mode, SO pin of the device is High-Z.
3. When correct command is inputted to this device, it enters active mode and remains in active mode until next CS# rising edge.
4. Input data is latched on the rising edge of Serial Clock (SCLK) and data shifts out on the falling edge of SCLK. The difference of Serial mode 0 and mode 3 is shown as *"Figure 1. Serial Modes Supported"*.
5. For the following instructions: RDID, RDSR, RDSCUR, READ, FAST\_READ, DREAD, 2READ, 4READ, QREAD, W4READ, RDSFDP, RES, REMS, QPIID, RDBLOCK, the shifted-in instruction sequence is followed by a data-out sequence. After any bit of data being shifted out, the CS# can be high. For the following instructions: WREN, WRDI, WRSR, SE, BE32K, BE, CE, PP, 4PP, DP, ENSO, EXSO, WRSCUR, WPSEL, SBLK, SBULK, GBULK, SUSPEND, RESUME, NOP, RSTEN, RST, EQIO, RSTQIO the CS# must go high exactly at the byte boundary; otherwise, the instruction will be rejected and not executed.
6. While a Write Status Register, Program or Erase operation is in progress, access to the memory array is neglected and will not affect the current operation of Write Status Register, Program, Erase.

**Figure 1. Serial Modes Supported**

**Note:**

CPOL indicates clock polarity of Serial master, CPOL=1 for SCLK high while idle, CPOL=0 for SCLK low while not transmitting. CPHA indicates clock phase. The combination of CPOL bit and CPHA bit decides which Serial mode is supported.

**Figure 2. Serial Input Timing**

**Figure 3. Output Timing**

## 8-1. Quad Peripheral Interface (QPI) Read Mode

QPI protocol enables user to take full advantage of Quad I/O Serial Flash by providing the Quad I/O interface in command cycles, address cycles and as well as data output cycles.

### Enable QPI mode

By issuing 35H command, the QPI mode is enabled.

**Figure 4. Enable QPI Sequence (Command 35H)**

### Reset QPI (RSTQIO)

To reset the QPI mode, the RSTQIO (F5H) command is required. After the RSTQIO command is issued, the device returns from QPI mode (4 I/O interface in command cycles) to SPI mode (1 I/O interface in command cycles).

#### Note:

For EQIO and RSTQIO commands, CS# high width has to follow "write spec" tSHSL (defined in ["Table 19. AC Characteristics"](#)) for next instruction.

**Figure 5. Reset QPI Mode (Command F5H)**

## 9. COMMAND DESCRIPTION

**Table 5. Command Set**

### Read/Write Array Commands

Mode	SPI	SPI/QPI	SPI	SPI	SPI/QPI	SPI
Command (byte)	READ (normal read)	FAST READ (fast read data)	DREAD (1I / 2O read command)	2READ (2 x I/O read command) <sup>Note1</sup>	4READ (4 x I/O read)	W4READ
1 <sup>st</sup> byte	03 (hex)	0B (hex)	3B (hex)	BB (hex)	EB (hex)	E7 (hex)
2 <sup>nd</sup> byte	ADD1(8)	ADD1(8)	ADD1(8)	ADD1(4)	ADD1(2)	ADD1
3 <sup>rd</sup> byte	ADD2(8)	ADD2(8)	ADD2(8)	ADD2(4)	ADD2(2)	ADD2
4 <sup>th</sup> byte	ADD3(8)	ADD3(8)	ADD3(8)	ADD3(4)	ADD3(2)	ADD3
5 <sup>th</sup> byte		Dummy(8)/(4)*	Dummy(8)	Dummy(4)	Dummy(6)	Dummy(4)
Action	n bytes read out until CS# goes high	n bytes read out until CS# goes high	n bytes read out by Dual Output until CS# goes high	n bytes read out by 2 x I/O until CS# goes high	Quad I/O read with 6 dummy cycles	Quad I/O read for with 4 dummy cycles

Mode	SPI	SPI/QPI	SPI	SPI/QPI	SPI/QPI	SPI/QPI
Command (byte)	QREAD (1I/4O read)	PP (page program)	4PP (quad page program)	SE (sector erase)	BE 32K (block erase 32KB)	BE (block erase 64KB)
1 <sup>st</sup> byte	6B (hex)	02 (hex)	38 (hex)	20 (hex)	52 (hex)	D8 (hex)
2 <sup>nd</sup> byte	ADD1(8)	ADD1	ADD1	ADD1	ADD1	ADD1
3 <sup>rd</sup> byte	ADD2(8)	ADD2	ADD2	ADD2	ADD2	ADD2
4 <sup>th</sup> byte	ADD3(8)	ADD3	ADD3	ADD3	ADD3	ADD3
5 <sup>th</sup> byte	Dummy(8)					
Action	n bytes read out by Quad output until CS# goes high	to program the selected page	quad input to program the selected page	to erase the selected sector	to erase the selected 32K block	to erase the selected block

Mode	SPI/QPI
Command (byte)	CE (chip erase)
1 <sup>st</sup> byte	60 or C7 (hex)
2 <sup>nd</sup> byte	
3 <sup>rd</sup> byte	
4 <sup>th</sup> byte	
5 <sup>th</sup> byte	
Action	to erase whole chip

\* For the Fast Read command (0Bh), when it is under QPI mode, the dummy cycle is 4 clocks.

### Register/Setting Commands

Command (byte)	WREN (write enable)	WRDI (write disable)	RDSR (read status register)	WRSR (write status register)	WPSEL (Write Protect Selection)	EQIO (Enable QPI)
Mode	SPI/QPI	SPI/QPI	SPI/QPI	SPI/QPI	SPI/QPI	SPI
1 <sup>st</sup> byte	06 (hex)	04 (hex)	05 (hex)	01 (hex)	68 (hex)	35 (hex)
2 <sup>nd</sup> byte				Values		
3 <sup>rd</sup> byte						
4 <sup>th</sup> byte						
5 <sup>th</sup> byte						
Action	sets the (WEL) write enable latch bit	resets the (WEL) write enable latch bit	to read out the values of the status register	to write new values of the status register	to enter and enable individual block protect mode	Entering the QPI mode

Command (byte)	RSTQIO (Reset QPI)	PGM/ERS Suspend (Suspends Program/Erase)	PGM/ERS Resume (Resumes Program/Erase)	DP (Deep power down)	RDP (Release from deep power down)	SBL (Set Burst Length)
Mode	QPI	SPI/QPI	SPI/QPI	SPI/QPI	SPI/QPI	SPI/QPI
1 <sup>st</sup> byte	F5 (hex)	B0 (hex)	30 (hex)	B9 (hex)	AB (hex)	C0 (hex)
2 <sup>nd</sup> byte						Value
3 <sup>rd</sup> byte						
4 <sup>th</sup> byte						
5 <sup>th</sup> byte						
Action	Exiting the QPI mode			enters deep power down mode	release from deep power down mode	to set Burst length

### ID/Security Commands

Command (byte)	RDID (read identification)	RES (read electronic ID)	REMS (read electronic manufacturer & device ID)	QPIID (QPI ID Read)	RDSFDP	ENSO (enter secured OTP)	EXSO (exit secured OTP)
Mode	SPI	SPI/QPI	SPI	QPI	SPI/QPI	SPI/QPI	SPI/QPI
1 <sup>st</sup> byte	9F (hex)	AB (hex)	90 (hex)	AF (hex)	5A (hex)	B1 (hex)	C1 (hex)
2 <sup>nd</sup> byte		x	x		ADD1(8)		
3 <sup>rd</sup> byte		x	x		ADD2(8)		
4 <sup>th</sup> byte		x	ADD <sup>(Note 2)</sup>		ADD3(8)		
5 <sup>th</sup> byte					Dummy(8)		
Action	outputs JEDEC ID: 1-byte Manufacturer ID & 2-byte Device ID	to read out 1-byte Device ID	output the Manufacturer ID & Device ID	ID in QPI interface	Read SFDP mode	to enter the 4K-bit secured OTP mode	to exit the 4K-bit secured OTP mode

COMMAND (byte)	RDSCUR (read security register)	WRSCUR (write security register)	SBLK (single block lock)	SBULK (single block unlock)	RDBLOCK (block protect read)	GBLK (gang block lock)	GBULK (gang block unlock)
Mode	SPI/QPI	SPI/QPI	SPI/QPI	SPI/QPI	SPI/QPI	SPI/QPI	SPI/QPI
1 <sup>st</sup> byte	2B (hex)	2F (hex)	36 (hex)	39 (hex)	3C (hex)	7E (hex)	98 (hex)
2 <sup>nd</sup> byte			ADD1	ADD1	ADD1		
3 <sup>rd</sup> byte			ADD2	ADD2	ADD2		
4 <sup>th</sup> byte			ADD3	ADD3	ADD3		
5 <sup>th</sup> byte							
Action	to read value of security register	to set the lock-down bit as "1" (once lock-down, cannot be update)	individual block (64K-byte) or sector (4K-byte) write protect	individual block (64K-byte) or sector (4K-byte) unprotect	read individual block or sector write protect status	whole chip write protect	whole chip unprotect

**Reset Commands**

COMMAND (byte)	NOP (No Operation)	RSTEN (Reset Enable)	RST (Reset Memory)
Mode	SPI/QPI	SPI/QPI	SPI/QPI
1 <sup>st</sup> byte	00 (hex)	66 (hex)	99 (hex)
2 <sup>nd</sup> byte			
3 <sup>rd</sup> byte			
4 <sup>th</sup> byte			
5 <sup>th</sup> byte			
Action			(Note 4)

Note 1: The count base is 4-bit for ADD(2) and Dummy(2) because of 2 x I/O. And the MSB is on SO/SIO1 which is different from 1 x I/O condition.

Note 2: ADD=00H will output the manufacturer ID first and ADD=01H will output device ID first.

Note 3: It is not recommended to adopt any other code not in the command definition table, which will potentially enter the hidden mode.

Note 4: The RSTEN command must be executed before executing the RST command. If any other command is issued in-between RSTEN and RST, the RST command will be ignored.

Note 5: The number in parentheses after "ADD" or "Data" stands for how many clock cycles it has. For example, "Data(8)" represents there are 8 clock cycles for the data in.

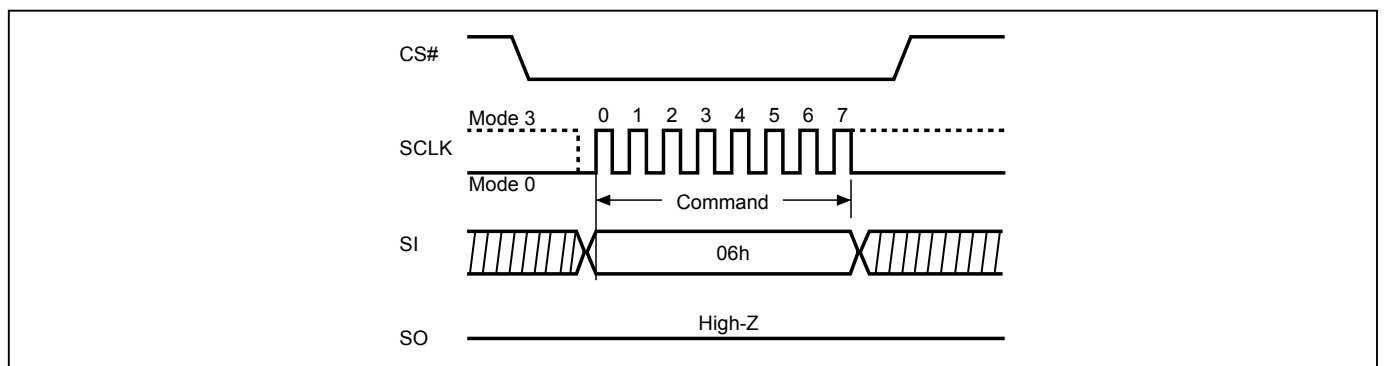

### 9-1. Write Enable (WREN)

The Write Enable (WREN) instruction is for setting Write Enable Latch (WEL) bit. For those instructions like PP, 4PP, SE, BE32K, BE, CE, and WRSR, which are intended to change the device content WEL bit should be set every time after the WREN instruction setting the WEL bit.

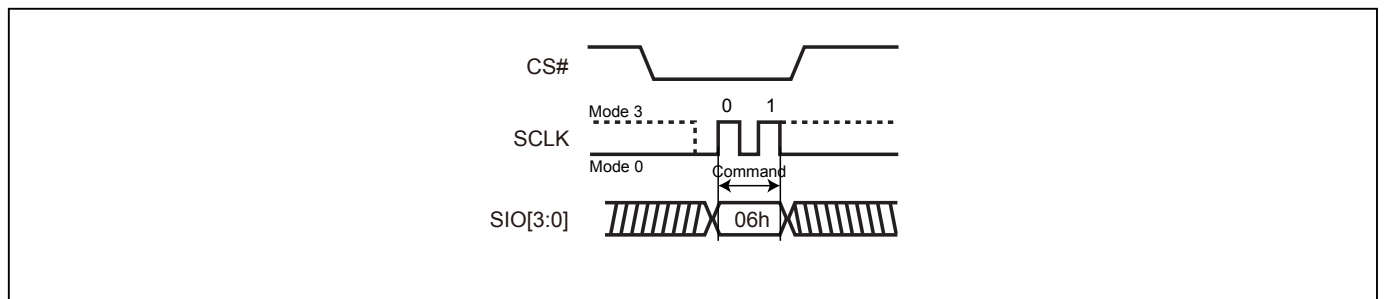

The sequence of issuing WREN instruction is: CS# goes low→sending WREN instruction code→ CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

**Figure 6. Write Enable (WREN) Sequence (SPI Mode)**

**Figure 7. Write Enable (WREN) Sequence (QPI Mode)**

## 9-2. Write Disable (WRDI)

The Write Disable (WRDI) instruction is to reset Write Enable Latch (WEL) bit.

The sequence of issuing WRDI instruction is: CS# goes low→sending WRDI instruction code→CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

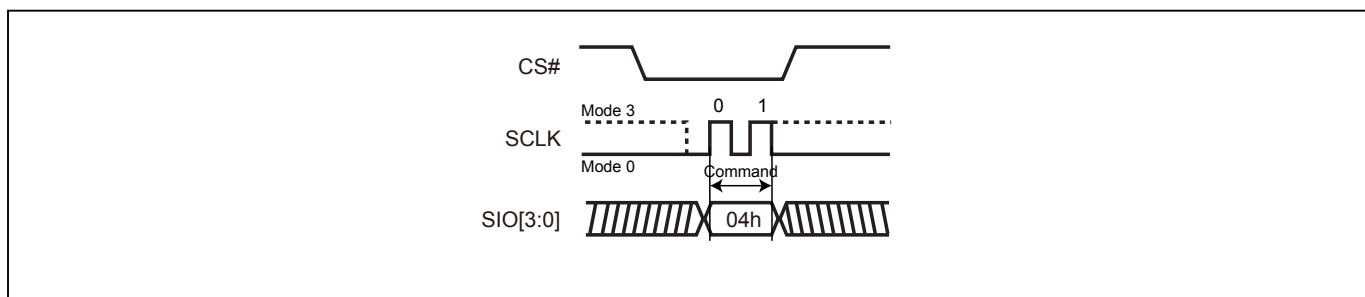

The WEL bit is reset by following situations:

- Power-up
- Reset# pin driven low
- Completion of Write Disable (WRDI) instruction
- Completion of Write Status Register (WRSR) instruction
- Completion of Page Program (PP) instruction
- Completion of Quad Page Program (4PP) instruction
- Completion of Sector Erase (SE) instruction
- Completion of Block Erase 32KB (BE32K) instruction
- Completion of Block Erase (BE) instruction
- Completion of Chip Erase (CE) instruction
- Pgm/Ers Suspend

**Figure 8. Write Disable (WRDI) Sequence (SPI Mode)**

**Figure 9. Write Disable (WRDI) Sequence (QPI Mode)**

### 9-3. Read Identification (RDID)

The RDID instruction is for reading the manufacturer ID of 1-byte and followed by Device ID of 2-byte. The Macronix Manufacturer ID and Device ID are listed as *"Table 6. ID Definitions"*.

The sequence of issuing RDID instruction is: CS# goes low→ sending RDID instruction code→24-bits ID data out on SO→ to end RDID operation can drive CS# to high at any time during data out.

While Program/Erase operation is in progress, it will not decode the RDID instruction, therefore there's no effect on the cycle of program/erase operation which is currently in progress. When CS# goes high, the device is at standby stage.

**Figure 10. Read Identification (RDID) Sequence (SPI mode only)**

#### 9-4. Release from Deep Power-down (RDP), Read Electronic Signature (RES)

The Release from Deep Power-down (RDP) instruction is terminated by driving Chip Select (CS#) High. When Chip Select (CS#) is driven High, the device is put in the Stand-by Power mode. If the device was not previously in the Deep Power-down mode, the transition to the Stand-by Power mode is immediate. If the device was previously in the Deep Power-down mode, the transition to the Stand-by Power mode is delayed by  $t_{RES2}$ , and Chip Select (CS#) must remain High for at least  $t_{RES2}(\max)$ , as specified in "Table 19. AC Characteristics". Once in the Stand-by Power mode, the device waits to be selected, so that it can receive, decode and execute instructions. The RDP instruction is only for releasing from Deep Power Down Mode. Reset# pin goes low will release the Flash from deep power down mode.

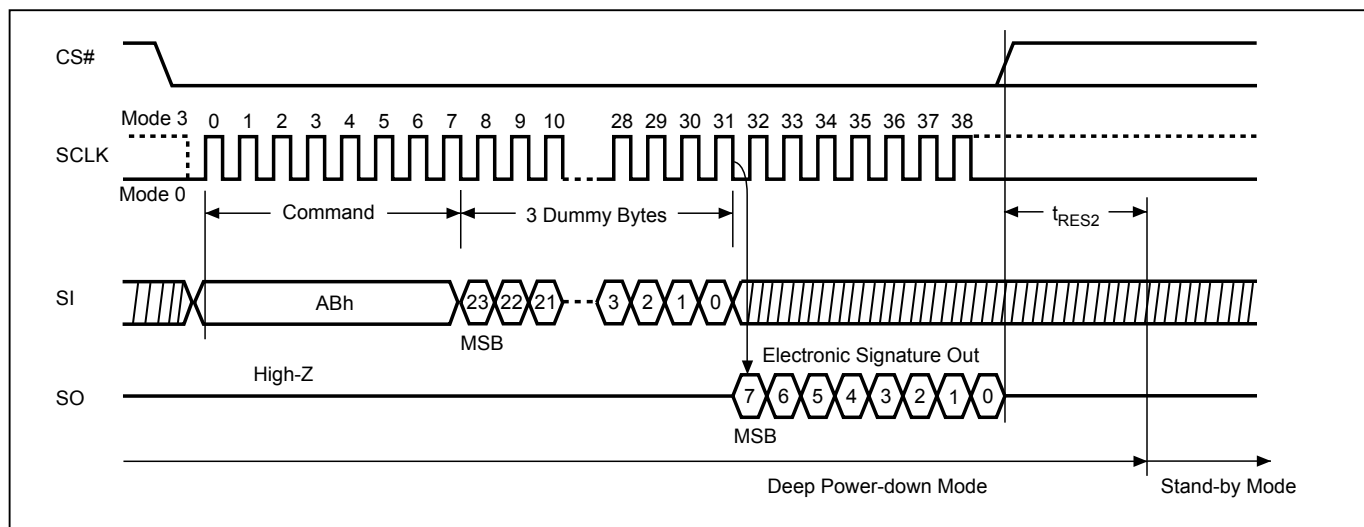

RES instruction is for reading out the old style of 8-bit Electronic Signature, whose values are shown as "Table 6. ID Definitions". This is not the same as RDID instruction. It is not recommended to use for new design. For new design, please use RDID instruction.

Even in Deep power-down mode, the RDP and RES are also allowed to be executed, only except the device is in progress of program/erase/write cycle; there's no effect on the current program/erase/write cycle in progress.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

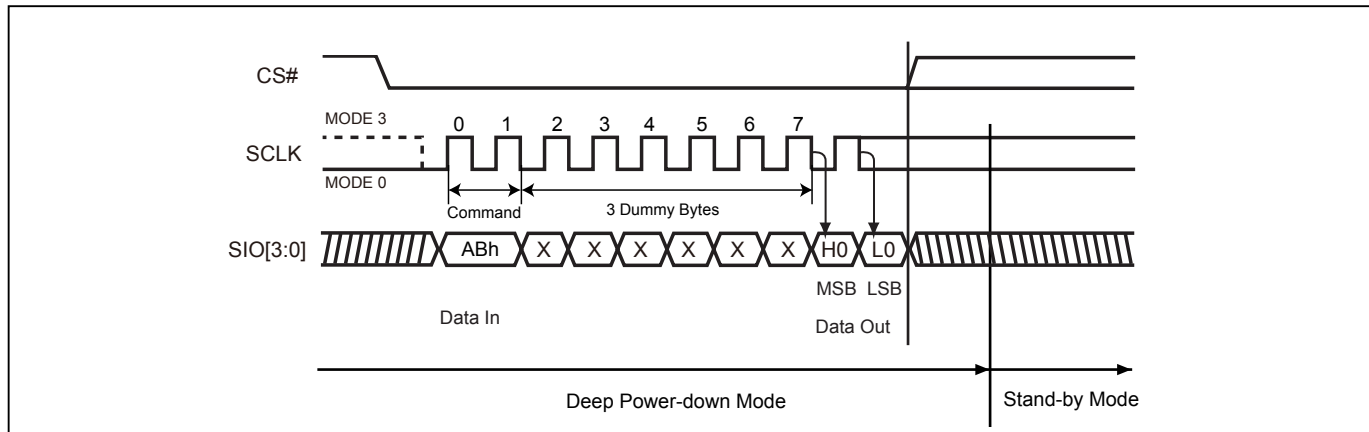

The RES instruction is ended by CS# goes high after the ID been read out at least once. The ID outputs repeatedly if continuously send the additional clock cycles on SCLK while CS# is at low. If the device was not previously in Deep Power-down mode, the device transition to standby mode is immediate. If the device was previously in Deep Power-down mode, there's a delay of  $t_{RES2}$  to transit to standby mode, and CS# must remain to high at least  $t_{RES2}(\max)$ . Once in the standby mode, the device waits to be selected, so it can be receive, decode, and execute instruction.

**Figure 11. Read Electronic Signature (RES) Sequence (SPI Mode)**

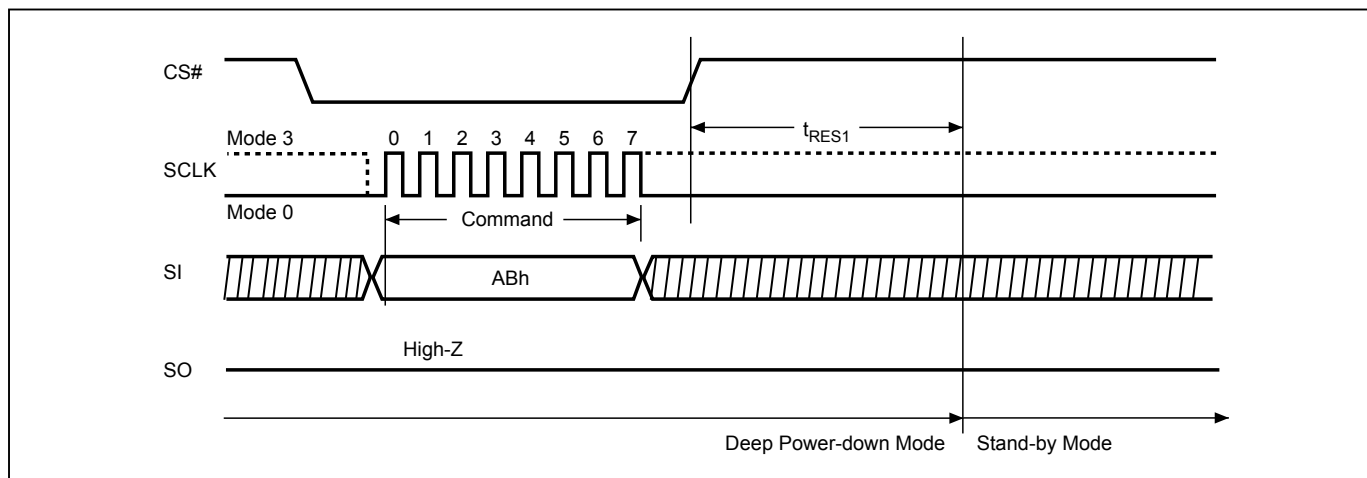

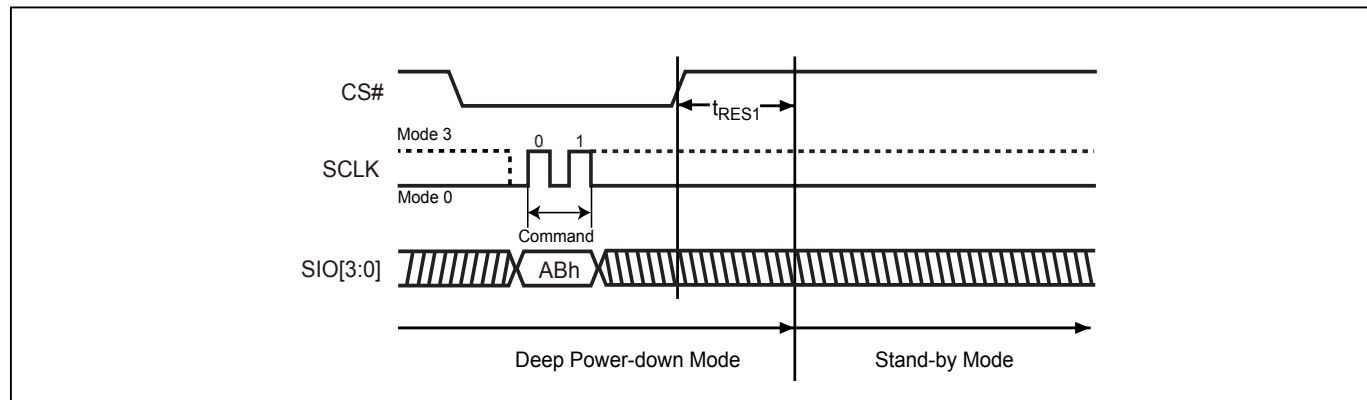

**Figure 12. Read Electronic Signature (RES) Sequence (QPI Mode)**

**Figure 13. Release from Deep Power-down (RDP) Sequence (SPI Mode)**

**Figure 14. Release from Deep Power-down (RDP) Sequence (QPI Mode)**

## 9-5. Read Electronic Manufacturer ID & Device ID (REMS)

The REMS instruction is an alternative to the Release from Power-down/Device ID instruction that provides both the JEDEC assigned manufacturer ID and the specific device ID.

The REMS instruction is very similar to the Release from Power-down/Device ID instruction. The instruction is initiated by driving the CS# pin low and shift the instruction code "90h" followed by two dummy bytes and one bytes address (A7~A0). After which, the Manufacturer ID for Macronix (C2h) and the Device ID are shifted out on the falling edge of SCLK with most significant bit (MSB) first. The Device ID values are listed in ["Table 6. ID Definitions"](#). If the one-byte address is initially set to 01h, then the device ID will be read first and then followed by the Manufacturer ID. The Manufacturer and Device IDs can be read continuously, alternating from one to the other. The instruction is completed by driving CS# high.

**Figure 15. Read Electronic Manufacturer & Device ID (REMS) Sequence (SPI Mode only)**

### Notes:

- (1) ADD=00H will output the manufacturer's ID first and ADD=01H will output device ID first.
- (2) Instruction is either 90(hex).

**9-6. QPI ID Read (QPIID)**

User can execute this QPIID Read instruction to identify the Device ID and Manufacturer ID. The sequence of issue QPIID instruction is CS# goes low→sending QPI ID instruction→→Data out on SO→CS# goes high. Most significant bit (MSB) first.

After the command cycle, the device will immediately output data on the falling edge of SCLK. The manufacturer ID, memory type, and device ID data byte will be output continuously, until the CS# goes high.

**Table 6. ID Definitions**

Command Type	Command	MX25U1635F		
		Manufactory ID	Memory type	Memory density
RDID / QPIID	9Fh / AFh	C2	25	35
RES	ABh	Electronic ID		
		35		
REMS	90h	Manufactory ID	Device ID	
		C2	35	

## 9-7. Read Status Register (RDSR)

The RDSR instruction is for reading Status Register Bits. The Read Status Register can be read at any time (even in program/erase/write status register condition). It is recommended to check the Write in Progress (WIP) bit before sending a new instruction when a program, erase, or write status register operation is in progress.

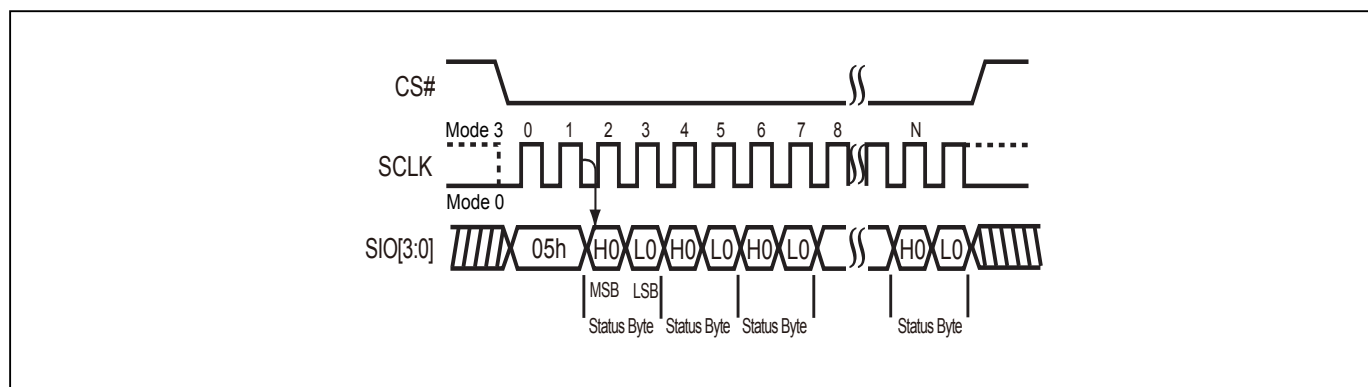

The sequence of issuing RDSR instruction is: CS# goes low→ sending RDSR instruction code→ Status Register data out on SO.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

**Figure 16. Read Status Register (RDSR) Sequence (SPI Mode)**

**Figure 17. Read Status Register (RDSR) Sequence (QPI Mode)**

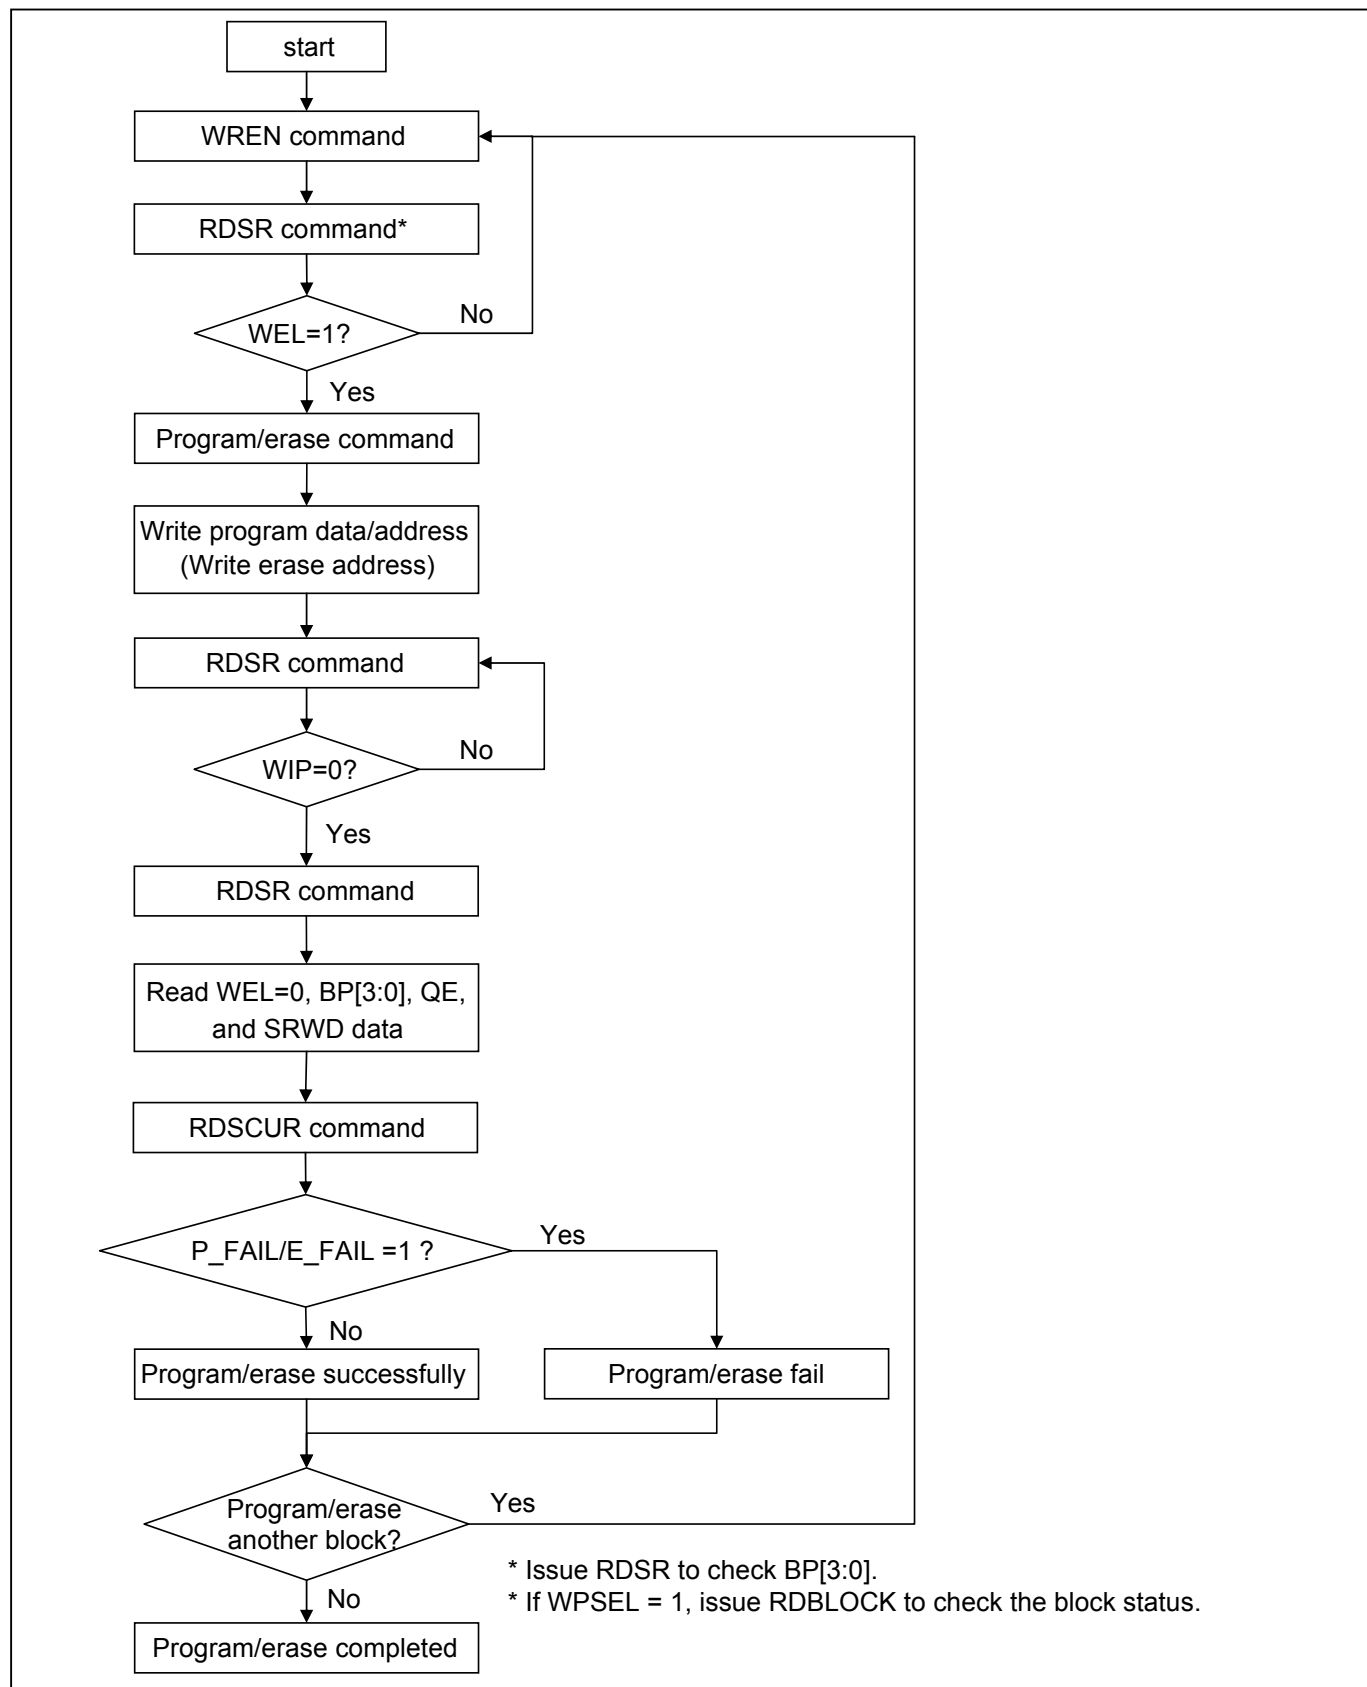

For user to check if Program/Erase operation is finished or not, RDSR instruction flow are shown as follows:

**Figure 18. Program/Erase flow with read array data**

**Figure 19. Program/Erase flow without read array data (read P\_FAIL/E\_FAIL flag)**

## Status Register

The definition of the status register bits is as below:

**WIP bit.** The Write in Progress (WIP) bit, a volatile bit, indicates whether the device is busy in program/erase/write status register progress. When WIP bit sets to 1, which means the device is busy in program/erase/write status register progress. When WIP bit sets to 0, which means the device is not in progress of program/erase/write status register cycle.

**WEL bit.** The Write Enable Latch (WEL) bit, a volatile bit, indicates whether the device is set to internal write enable latch. When WEL bit sets to 1, which means the internal write enable latch is set, the device can accept program/erase/write status register instruction. When WEL bit sets to 0, which means no internal write enable latch; the device will not accept program/erase/write status register instruction. The program/erase command will be ignored if it is applied to a protected memory area. To ensure both WIP bit & WEL bit are both set to 0 and available for next program/erase/operations, WIP bit needs to be confirm to be 0 before polling WEL bit. After WIP bit confirmed, WEL bit needs to be confirmed as 0.

**BP3, BP2, BP1, BP0 bits.** The Block Protect (BP3, BP2, BP1, BP0) bits, non-volatile bits, indicate the protected area (as defined in ["Table 2. Protected Area Sizes"](#)) of the device to against the program/erase instruction without hardware protection mode being set. To write the Block Protect (BP3, BP2, BP1, BP0) bits requires the Write Status Register (WRSR) instruction to be executed. Those bits define the protected area of the memory to against Page Program (PP), Sector Erase (SE), Block Erase 32KB (BE32K), Block Erase (BE) and Chip Erase (CE) instructions (only if Block Protect bits (BP3:BP0) set to 0, the CE instruction can be executed). The BP3, BP2, BP1, BP0 bits are "0" as default, which is unprotected.

**QE bit.** The Quad Enable (QE) bit, non-volatile bit, while it is "0" (factory default), it performs non-Quad and WP#, RESET# are enable. While QE is "1", it performs Quad I/O mode and WP#, RESET# are disabled. In the other word, if the system goes into four I/O mode (QE=1), the feature of HPM and RESET will be disabled.

**SRWD bit.** The Status Register Write Disable (SRWD) bit, non-volatile bit, is operated together with Write Protection (WP#/SIO2) pin for providing hardware protection mode. The hardware protection mode requires SRWD sets to 1 and WP#/SIO2 pin signal is low stage. In the hardware protection mode, the Write Status Register (WRSR) instruction is no longer accepted for execution and the SRWD bit and Block Protect bits (BP3, BP2, BP1, BP0) are read only. The SRWD bit defaults to be "0".

## Status Register

bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
SRWD (status register write protect)	QE (Quad Enable)	BP3 (level of protected block)	BP2 (level of protected block)	BP1 (level of protected block)	BP0 (level of protected block)	WEL (write enable latch)	WIP (write in progress bit)
1=status register write disable	1=Quad Enable 0=not Quad Enable	(note 1)	(note 1)	(note 1)	(note 1)	1=write enable 0=not write enable	1=write operation 0=not in write operation
Non-volatile bit	Non-volatile bit	Non-volatile bit	Non-volatile bit	Non-volatile bit	Non-volatile bit	volatile bit	volatile bit

Note 1: see the ["Table 2. Protected Area Sizes"](#).

## 9-8. Write Status Register (WRSR)

The WRSR instruction is for changing the values of Status Register Bits. Before sending WRSR instruction, the Write Enable (WREN) instruction must be decoded and executed to set the Write Enable Latch (WEL) bit in advance. The WRSR instruction can change the value of Block Protect (BP3, BP2, BP1, BP0) bits to define the protected area of memory (as shown in "Table 2. Protected Area Sizes"). The WRSR also can set or reset the Quad enable (QE) bit and set or reset the Status Register Write Disable (SRWD) bit in accordance with Write Protection (WP#/SIO2) pin signal, but has no effect on bit1(WEL) and bit0 (WIP) of the status register. The WRSR instruction cannot be executed once the Hardware Protected Mode (HPM) is entered.

The sequence of issuing WRSR instruction is: CS# goes low→ sending WRSR instruction code→ Status Register data on SI→CS# goes high.

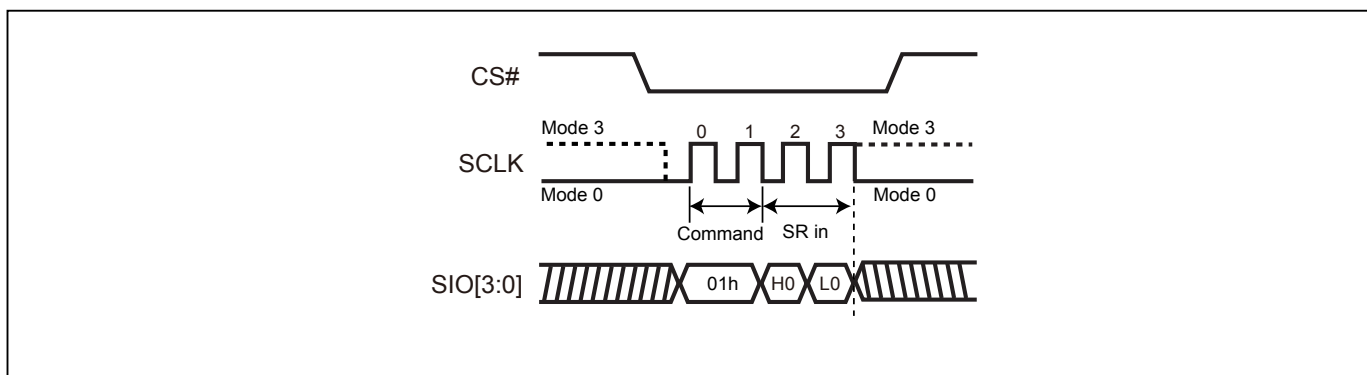

The CS# must go high exactly at the 8 bites or 16 bits data boundary; otherwise, the instruction will be rejected and not executed. The self-timed Write Status Register cycle time (tW) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Write Status Register cycle is in progress. The WIP sets 1 during the tW timing, and sets 0 when Write Status Register Cycle is completed, and the Write Enable Latch (WEL) bit is reset.

**Figure 20. Write Status Register (WRSR) Sequence (SPI Mode)**

**Note :** The CS# must go high exactly at 8 bits or 16 bits data boundary to completed the write register command.

**Figure 21. Write Status Register (WRSR) Sequence (QPI Mode)**

**Software Protected Mode (SPM):**

- When SRWD bit=0, no matter WP#/SIO2 is low or high, the WREN instruction may set the WEL bit and can change the values of SRWD, BP3, BP2, BP1, BP0. The protected area, which is defined by BP3, BP2, BP1, BP0, is at software protected mode (SPM).
- When SRWD bit=1 and WP#/SIO2 is high, the WREN instruction may set the WEL bit can change the values of SRWD, BP3, BP2, BP1, BP0. The protected area, which is defined by BP3, BP2, BP1, BP0, is at software protected mode (SPM)

**Note:**

If SRWD bit=1 but WP#/SIO2 is low, it is impossible to write the Status Register even if the WEL bit has previously been set. It is rejected to write the Status Register and not be executed.

**Hardware Protected Mode (HPM):**

- When SRWD bit=1, and then WP#/SIO2 is low (or WP#/SIO2 is low before SRWD bit=1), it enters the hardware protected mode (HPM). The data of the protected area is protected by software protected mode by BP3, BP2, BP1, BP0 and hardware protected mode by the WP#/SIO2 to against data modification.

**Note:**

To exit the hardware protected mode requires WP#/SIO2 driving high once the hardware protected mode is entered. If the WP#/SIO2 pin is permanently connected to high, the hardware protected mode can never be entered; only can use software protected mode via BP3, BP2, BP1, BP0.

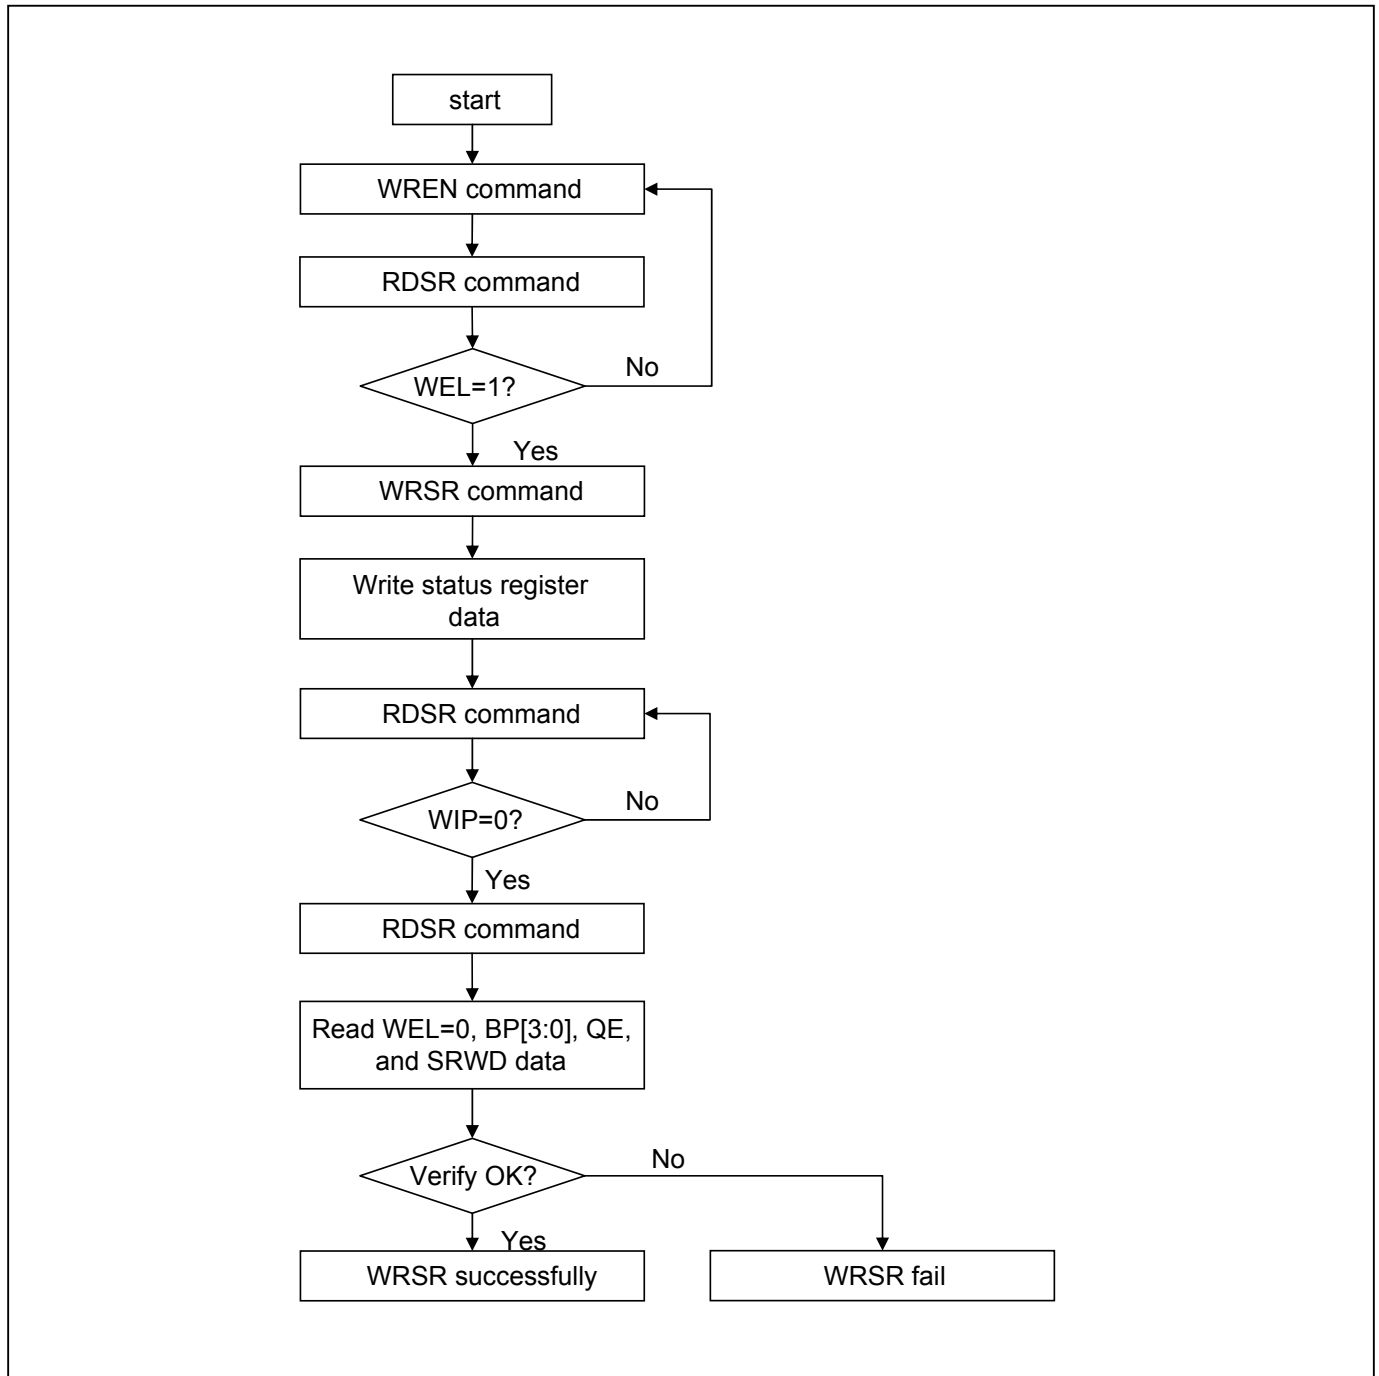

If the system enter QPI or set QE=1, the feature of HPM will be disabled.

**Table 7. Protection Modes**

Mode	Status register condition	WP# and SRWD bit status	Memory
Software protection mode (SPM)	Status register can be written in (WEL bit is set to "1") and the SRWD, BP0-BP3 bits can be changed	WP#=1 and SRWD bit=0, or WP#=0 and SRWD bit=0, or WP#=1 and SRWD=1	The protected area cannot be program or erase.
Hardware protection mode (HPM)	The SRWD, BP0-BP3 of status register bits cannot be changed	WP#=0, SRWD bit=1	The protected area cannot be program or erase.

**Note:**

1. As defined by the values in the Block Protect (BP3, BP2, BP1, BP0) bits of the Status Register, as shown in ["Table 2. Protected Area Sizes"](#).

**Figure 22. WRSR flow**

**Figure 23. WP# Setup Timing and Hold Timing during WRSR when SRWD=1**

Note: WP# must be kept high until the embedded operation finish.

### 9-9. Read Data Bytes (READ)

The read instruction is for reading data out. The address is latched on rising edge of SCLK, and data shifts out on the falling edge of SCLK at a maximum frequency  $f_R$ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single READ instruction. The address counter rolls over to 0 when the highest address has been reached.

The sequence of issuing READ instruction is: CS# goes low→sending READ instruction code→ 3-byte address on SI→ data out on SO→to end READ operation can use CS# to high at any time during data out.

**Figure 24. Read Data Bytes (READ) Sequence (SPI Mode only)**

**9-10. Read Data Bytes at Higher Speed (FAST\_READ)**

The FAST\_READ instruction is for quickly reading data out. The address is latched on rising edge of SCLK, and data of each bit shifts out on the falling edge of SCLK at a maximum frequency fC. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single FAST\_READ instruction. The address counter rolls over to 0 when the highest address has been reached.

**Read on SPI Mode** The sequence of issuing FAST\_READ instruction is: CS# goes low→ sending FAST\_READ instruction code→ 3-byte address on SI→1-dummy byte (default) address on SI→ data out on SO→ to end FAST\_READ operation can use CS# to high at any time during data out.

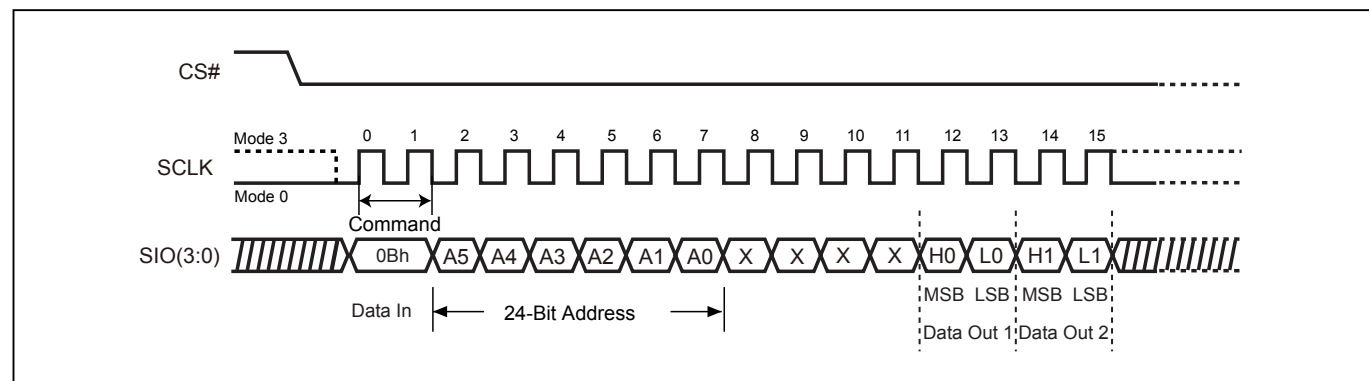

**Read on QPI Mode** The sequence of issuing FAST\_READ instruction in QPI mode is: CS# goes low→ sending FAST\_READ instruction, 2 cycles→ 24-bit address interleave on SIO3, SIO2, SIO1 & SIO0→4 dummy cycles→data out interleave on SIO3, SIO2, SIO1 & SIO0→ to end QPI FAST\_READ operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, FAST\_READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

### Figure 25. Read at Higher Speed (FAST\_READ) Sequence (SPI Mode)

### Figure 26. Read at Higher Speed (FAST\_READ) Sequence (QPI Mode)

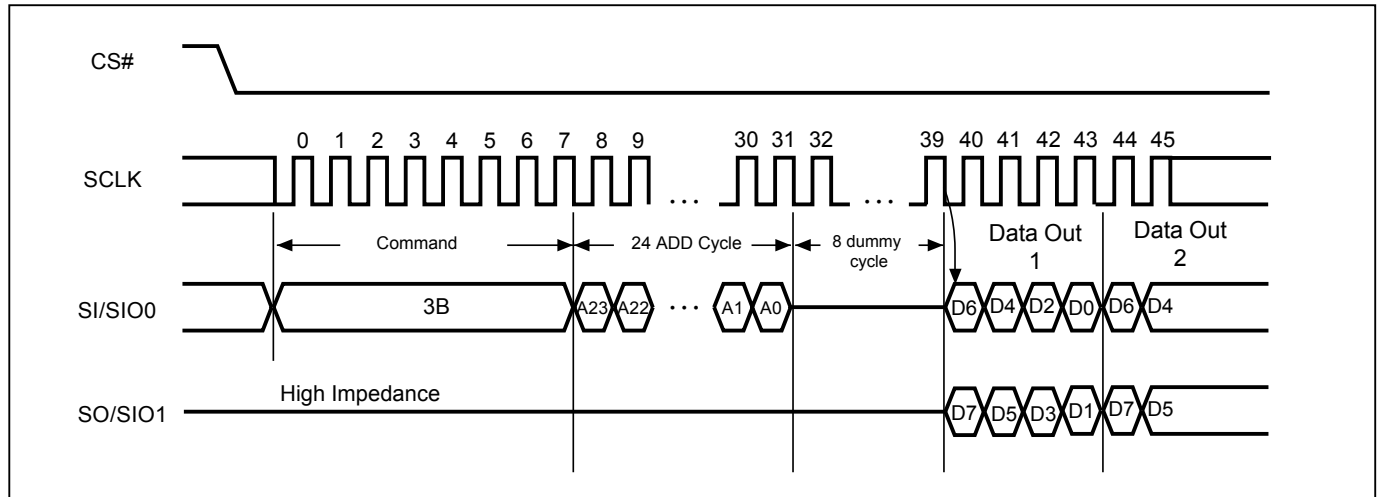

### 9-11. Dual Read Mode (DREAD)

The DREAD instruction enable double throughput of Serial Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency  $f_T$ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single DREAD instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing DREAD instruction, the following data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing DREAD instruction is: CS# goes low → sending DREAD instruction → 3-byte address on SI → 8-bit dummy cycle → data out interleave on SO1 & SO0 → to end DREAD operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, DREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

**Figure 27. Dual Read Mode Sequence (Command 3B)**

## 9-12. 2 x I/O Read Mode (2READ)

The 2READ instruction enable double throughput of Serial Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency  $f_T$ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 2READ instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing 2READ instruction, the following address/dummy/data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing 2READ instruction is: CS# goes low→ sending 2READ instruction→ 24-bit address interleave on SIO1 & SIO0→ 4 dummy cycles on SIO1 & SIO0→ data out interleave on SIO1 & SIO0→ to end 2READ operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, 2READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

**Figure 28. 2 x I/O Read Mode Sequence (SPI Mode only)**

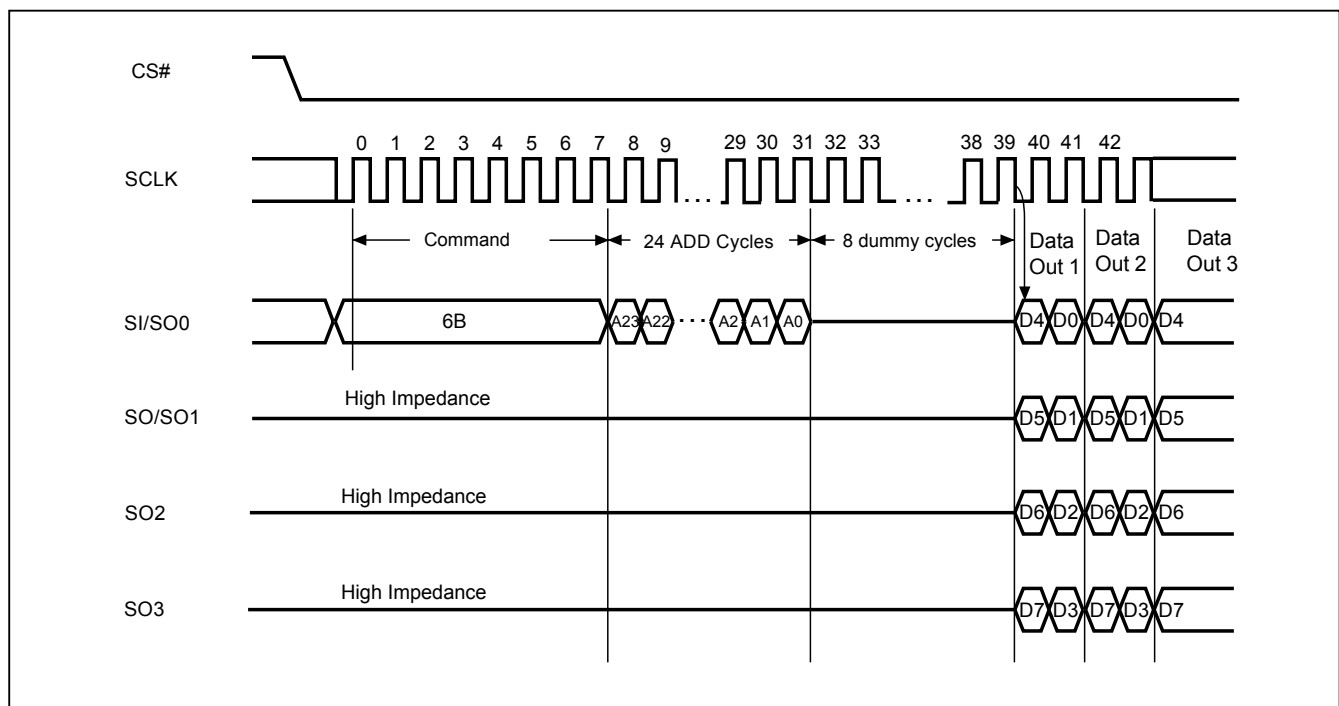

### 9-13. Quad Read Mode (QREAD)

The QREAD instruction enable quad throughput of Serial Flash in read mode. The address is latched on rising edge of SCLK, and data of every four bits (interleave on 4 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fQ. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single QREAD instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing QREAD instruction, the following data out will perform as 4-bit instead of previous 1-bit.

The sequence of issuing QREAD instruction is: CS# goes low → sending QREAD instruction → 3-byte address on SI → 8-bit dummy cycle → data out interleave on SO3, SO2, SO1 & SO0 → to end QREAD operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, QREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

**Figure 29. Quad Read Mode Sequence (Command 6B)**

**9-14. 4 x I/O Read Mode (4READ)**

The 4READ instruction enable quad throughput of Serial Flash in read mode. A Quad Enable (QE) bit of status Register must be set to "1" before sending the 4READ instruction. The address is latched on rising edge of SCLK, and data of every four bits (interleave on 4 I/O pins) shift out on the falling edge of SCLK at a maximum frequency  $f_Q$ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 4READ instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing 4READ instruction, the following address/dummy/data out will perform as 4-bit instead of previous 1-bit.

**4 x I/O Read on SPI Mode (4READ)** The sequence of issuing 4READ instruction is: CS# goes low→ sending 4READ instruction→ 24-bit address interleave on SIO3, SIO2, SIO1 & SIO0→2+4 dummy cycles→data out interleave on SIO3, SIO2, SIO1 & SIO0→ to end 4READ operation can use CS# to high at any time during data out.

**4 x I/O Read on QPI Mode (4READ)** The 4READ instruction also support on QPI command mode. The sequence of issuing 4READ instruction QPI mode is: CS# goes low→ sending 4READ instruction→ 24-bit address interleave on SIO3, SIO2, SIO1 & SIO0→2+4 dummy cycles→data out interleave on SIO3, SIO2, SIO1 & SIO0→ to end 4READ operation can use CS# to high at any time during data out.

Another sequence of issuing 4 READ instruction especially useful in random access is : CS# goes low→sending 4 READ instruction→3-bytes address interleave on SIO3, SIO2, SIO1 & SIO0 →performance enhance toggling bit P[7:0]→ 4 dummy cycles →data out still CS# goes high → CS# goes low (reduce 4 Read instruction) →24-bit random access address.

In the performance-enhancing mode, P[7:4] must be toggling with P[3:0] ; likewise P[7:0]=A5h, 5Ah, F0h or 0Fh can make this mode continue and reduce the next 4READ instruction. Once P[7:4] is no longer toggling with P[3:0]; likewise P[7:0]=FFh,00h,AAh or 55h and afterwards CS# is raised and then lowered, the system then will escape from performance enhance mode and return to normal operation.

While Program/Erase/Write Status Register cycle is in progress, 4READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

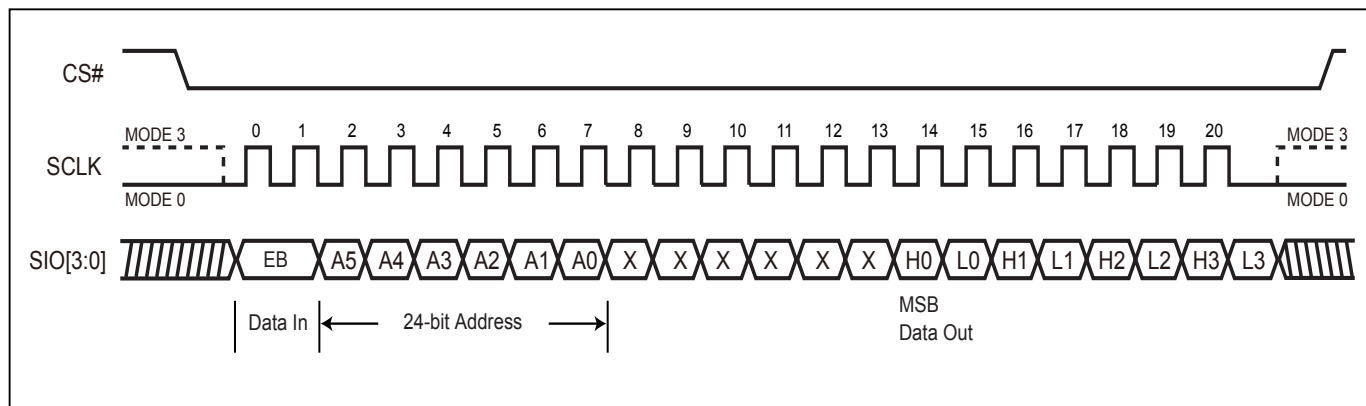

### Figure 30. 4 x I/O Read Mode Sequence (SPI Mode)

Note:

1. Hi-impedance is inhibited for the two clock cycles.
2. P7≠P3, P6≠P2, P5≠P1 & P4≠P0 (Toggling) is inhibited.

### Figure 31. 4 x I/O Read Mode Sequence (QPI Mode)

**Figure 32. W4READ (Quad Read with 4 dummy cycles) Sequence**

## 9-15. Burst Read

This device supports Burst Read in both SPI and QPI mode.

To set the Burst length, following command operation is required

Issuing command: “C0h” in the first Byte (8-clocks), following 4 clocks defining wrap around enable with “0h” and disable with “1h”.

Next 4 clocks is to define wrap around depth. Definition as following table:

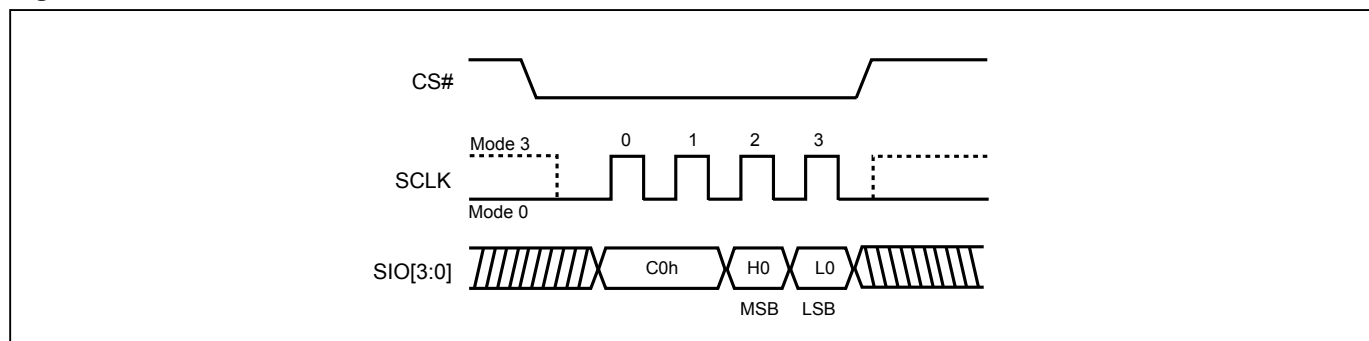

Data	Wrap Around	Wrap Depth
00h	Yes	8-byte
01h	Yes	16-byte
02h	Yes	32-byte
03h	Yes	64-byte
1xh	No	X

The wrap around unit is defined within the 256Byte page, with random initial address. It's defined as “wrap-around mode disable” for the default state of the device. To exit wrap around, it is required to issue another “C0h” command in which data=‘1xh’. Otherwise, wrap around status will be retained until power down or reset command. To change wrap around depth, it is required to issue another “C0h” command in which data=“0xh”. QPI “0Bh” “EBh” and SPI “EBh” “E7h” support wrap around feature after wrap around enable. Burst read is supported in both SPI and QPI mode. The device id default without Burst read.

**Figure 33. SPI Mode**

**Figure 34. QPI Mode**

Note: MSB=Most Significant Bit  
LSB=Least Significant Bit

#### **9-16. Performance Enhance Mode**

The device could waive the command cycle bits if the two cycle bits after address cycle toggles.

Performance enhance mode is supported in both SPI and QPI mode.

In QPI mode, “EBh” “0Bh” and SPI “EBh” “E7h” commands support enhance mode. The performance enhance mode is not supported in dual I/O mode.

After entering enhance mode, following CS# go high, the device will stay in the read mode and treat CS# go low of the first clock as address instead of command cycle.

To exit enhance mode, a new fast read command whose first two dummy cycles is not toggle then exit. Or issue “FFh” data cycle to exit enhance mode.

**Figure 35. 4 x I/O Read enhance performance Mode Sequence (SPI Mode)**

**Note:**

1. Performance enhance mode, if  $P7 \neq P3$  &  $P6 \neq P2$  &  $P5 \neq P1$  &  $P4 \neq P0$  (Toggling), ex: A5, 5A, 0F, if not using performance enhance recommend to keep 1 or 0 in performance enhance indicator.
2. Reset the performance enhance mode, if  $P7 = P3$  or  $P6 = P2$  or  $P5 = P1$  or  $P4 = P0$ , ex: AA, 00, FF

**Figure 36. 4 x I/O Read enhance performance Mode Sequence (QPI Mode)**

### 9-17. Performance Enhance Mode Reset

To conduct the Performance Enhance Mode Reset operation in SPI mode, FFh command code, 8 clocks, should be issued in 1I/O sequence. In QPI Mode, FFFFFFFFh command code, 8 clocks, in 4I/O should be issued.

If the system controller is being Reset during operation, the flash device will return to the standard SPI operation.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

**Figure 37. Performance Enhance Mode Reset for Fast Read Quad I/O (SPI Mode)**

**Figure 38. Performance Enhance Mode Reset for Fast Read Quad I/O (QPI Mode)**

## 9-18. Sector Erase (SE)

The Sector Erase (SE) instruction is for erasing the data of the chosen sector to be "1". The instruction is used for any 4K-byte sector. A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Sector Erase (SE). Any address of the sector (see ["Table 4. Memory Organization"](#)) is a valid address for Sector Erase (SE) instruction. The CS# must go high exactly at the byte boundary (the latest eighth of address byte been latched-in); otherwise, the instruction will be rejected and not executed.

Address bits [Am-A12] (Am is the most significant address) select the sector address.

The sequence of issuing SE instruction is: CS# goes low→ sending SE instruction code→ 3-byte address on SI→ CS# goes high.

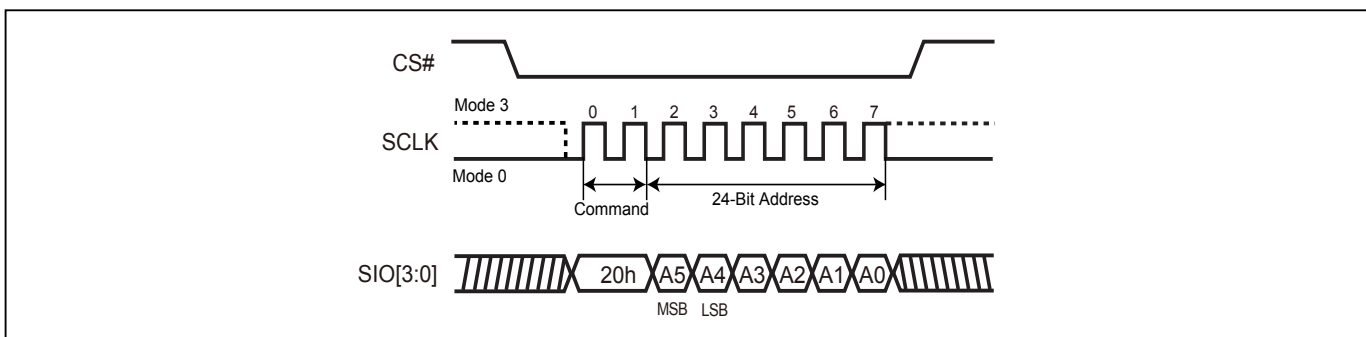

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

The self-timed Sector Erase Cycle time (tSE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Sector Erase cycle is in progress. The WIP sets 1 during the tSE timing, and sets 0 when Sector Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the sector is protected by BP3, BP2, BP1, BP0 bits, the Sector Erase (SE) instruction will not be executed on the sector.

**Figure 39. Sector Erase (SE) Sequence (SPI Mode)**

**Figure 40. Sector Erase (SE) Sequence (QPI Mode)**

## 9-19. Block Erase (BE32K)

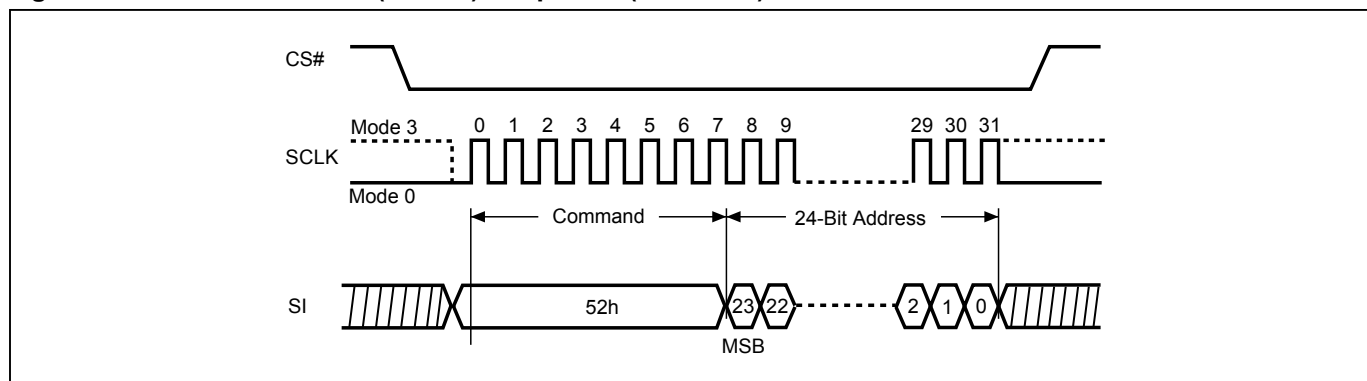

The Block Erase (BE32K) instruction is for erasing the data of the chosen block to be "1". The instruction is used for 32K-byte block erase operation. A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Block Erase (BE32K). Any address of the block (see ["Table 4. Memory Organization"](#)) is a valid address for Block Erase (BE32K) instruction. The CS# must go high exactly at the byte boundary (the latest eighth of address byte been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing BE32K instruction is: CS# goes low→ sending BE32K instruction code→ 3-byte address on SI→CS# goes high.

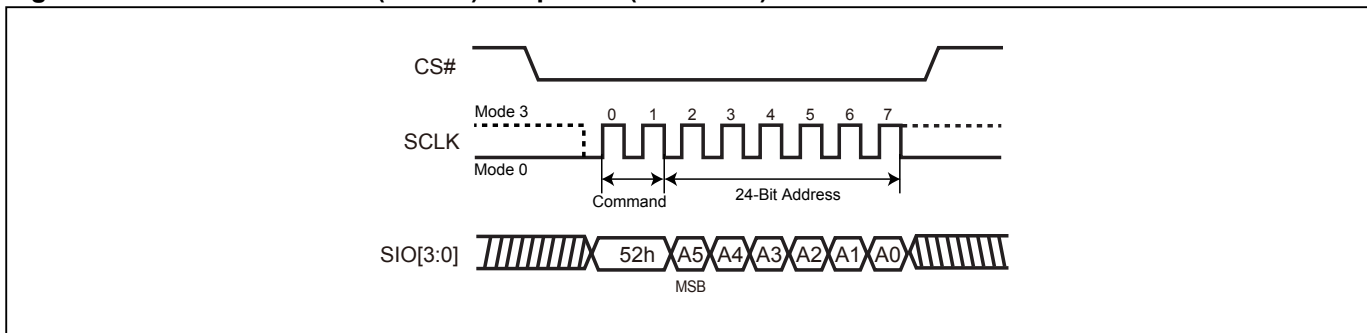

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

The self-timed Block Erase Cycle time (tBE32K) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Block Erase cycle is in progress. The WIP sets 1 during the tBE32K timing, and sets 0 when Block Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the block is protected by BP3, BP2, BP1, BP0 bits, the Block Erase (BE32K) instruction will not be executed on the block.

**Figure 41. Block Erase 32KB (BE32K) Sequence (SPI Mode)**

**Figure 42. Block Erase 32KB (BE32K) Sequence (QPI Mode)**

## 9-20. Block Erase (BE)

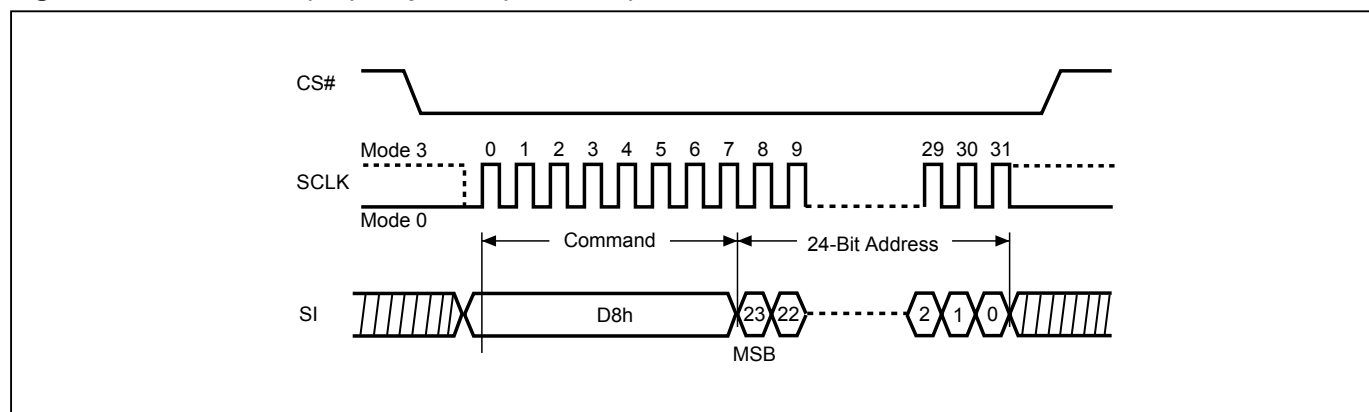

The Block Erase (BE) instruction is for erasing the data of the chosen block to be "1". The instruction is used for 64K-byte block erase operation. A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Block Erase (BE). Any address of the block (Please refer to ["Table 4. Memory Organization"](#)) is a valid address for Block Erase (BE) instruction. The CS# must go high exactly at the byte boundary (the latest eighth of address byte been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing BE instruction is: CS# goes low→ sending BE instruction code→ 3-byte address on SI→ CS# goes high.

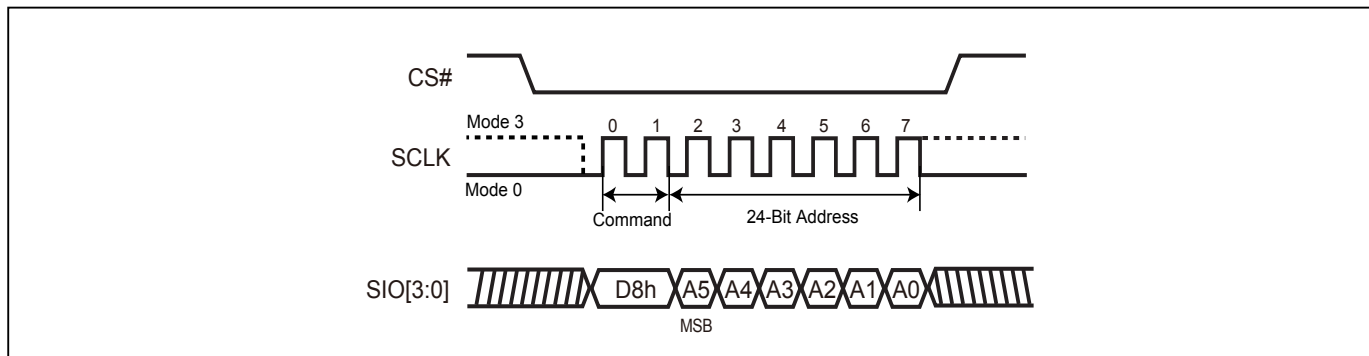

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

The self-timed Block Erase Cycle time (tBE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Block Erase cycle is in progress. The WIP sets 1 during the tBE timing, and sets 0 when Block Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the block is protected by BP3, BP2, BP1, BP0 bits, the Block Erase (BE) instruction will not be executed on the block.

**Figure 43. Block Erase (BE) Sequence (SPI Mode)**

**Figure 44. Block Erase (BE) Sequence (QPI Mode)**

## 9-21. Chip Erase (CE)

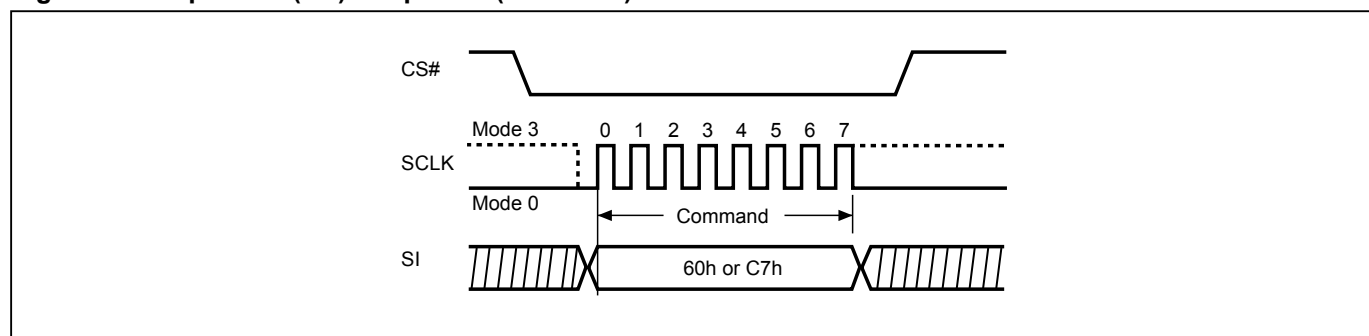

The Chip Erase (CE) instruction is for erasing the data of the whole chip to be "1". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Chip Erase (CE). The CS# must go high exactly at the byte boundary, otherwise the instruction will be rejected and not executed.

The sequence of issuing CE instruction is: CS# goes low→sending CE instruction code→CS# goes high.

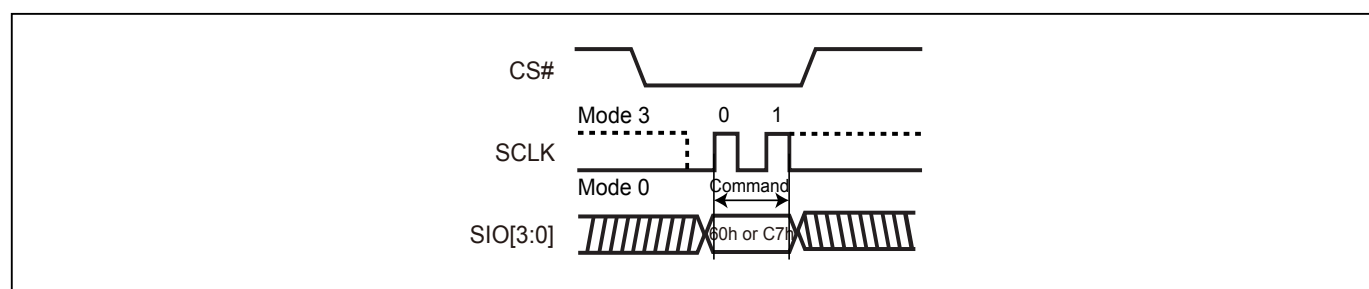

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

The self-timed Chip Erase Cycle time ( $t_{CE}$ ) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Chip Erase cycle is in progress. The WIP sets 1 during the  $t_{CE}$  timing, and sets 0 when Chip Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the chip is protected by BP3, BP2, BP1, BP0 bits, the Chip Erase (CE) instruction will not be executed. It will be only executed when BP3, BP2, BP1, BP0 all set to "0".

**Figure 45. Chip Erase (CE) Sequence (SPI Mode)**

**Figure 46. Chip Erase (CE) Sequence (QPI Mode)**

**9-22. Page Program (PP)**

The Page Program (PP) instruction is for programming memory bits to "0". One to 256 bytes can be sent to the device to be programmed. A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit before sending the Page Program (PP). If more than 256 data bytes are sent to the device, only the last 256 data bytes will be accepted and the previous data bytes will be disregarded. The Page Program instruction requires that all the data bytes fall within the same 256-byte page. The low order address byte A[7:0] specifies the starting address within the selected page. Bytes that will cross a page boundary will wrap to the beginning of the selected page. The device can accept (256 minus A[7:0]) data bytes without wrapping. If 256 data bytes are going to be programmed, A[7:0] should be set to 0.

The sequence of issuing PP instruction is: CS# goes low→ sending PP instruction code→ 3-byte address on SI→ at least 1-byte on data on SI→ CS# goes high.

The CS# must be kept low during the whole Page Program cycle; The CS# must go high exactly at the byte boundary (the latest eighth bit of data being latched in), otherwise the instruction will be rejected and will not be executed.

The self-timed Page Program Cycle time (tPP) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Page Program cycle is in progress. The WIP sets 1 during the tPP timing, and sets 0 when Page Program Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the page is protected by BP3, BP2, BP1, BP0 bits, the Page Program (PP) instruction will not be executed.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

**Figure 47. Page Program (PP) Sequence (SPI Mode)**

**Figure 48. Page Program (PP) Sequence (QPI Mode)**

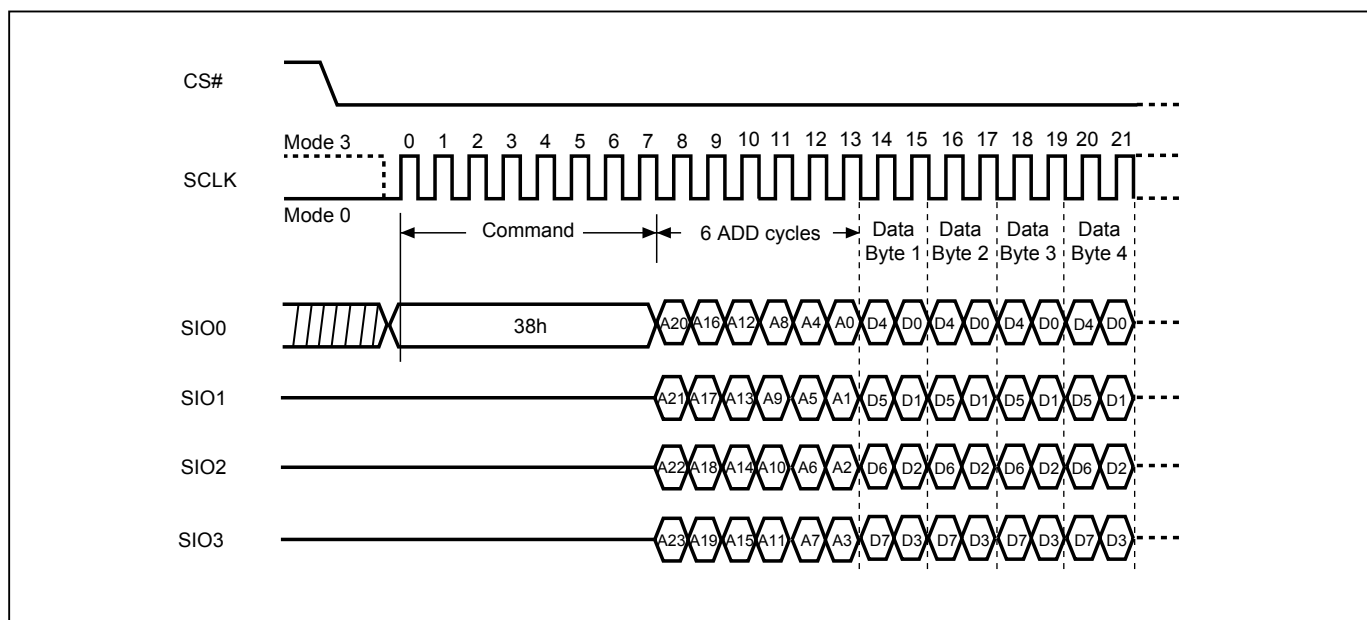

### 9-23. 4 x I/O Page Program (4PP)

The Quad Page Program (4PP) instruction is for programming the memory to be "0". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit and Quad Enable (QE) bit must be set to "1" before sending the Quad Page Program (4PP). The Quad Page Programming takes four pins: SIO0, SIO1, SIO2, and SIO3 as address and data input, which can improve programmer performance and the effectiveness of application. The 4PP operation frequency supports as fast as 104MHz. The other function descriptions are as same as standard page program.

The sequence of issuing 4PP instruction is: CS# goes low→ sending 4PP instruction code→ 3-byte address on SIO[3:0]→ at least 1-byte on data on SIO[3:0]→CS# goes high.

**Figure 49. 4 x I/O Page Program (4PP) Sequence (SPI Mode only)**

## 9-24. Deep Power-down (DP)

The Deep Power-down (DP) instruction is for setting the device on the minimizing the power consumption (to entering the Deep Power-down mode), the standby current is reduced from ISB1 to ISB2). The Deep Power-down mode requires the Deep Power-down (DP) instruction to enter, during the Deep Power-down mode, the device is not active and all Write/Program/Erase instruction are ignored. When CS# goes high, it's only in deep power-down mode not standby mode. It's different from Standby mode.

The sequence of issuing DP instruction is: CS# goes low→sending DP instruction code→CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

Once the DP instruction is set, all instructions will be ignored except the Release from Deep Power-down mode (RDP) and Read Electronic Signature (RES) instruction and softreset command. (those instructions allow the ID being reading out). When Power-down, or software reset command the deep power-down mode automatically stops, and when power-up, the device automatically is in standby mode. For DP instruction the CS# must go high exactly at the byte boundary (the latest eighth bit of instruction code been latched-in); otherwise, the instruction will not be executed. As soon as Chip Select (CS#) goes high, a delay of  $t_{DP}$  is required before entering the Deep Power-down mode.

**Figure 50. Deep Power-down (DP) Sequence (SPI Mode)**

**Figure 51. Deep Power-down (DP) Sequence (QPI Mode)**

**9-25. Enter Secured OTP (ENSO)**

The ENSO instruction is for entering the additional 4K-bit secured OTP mode. The additional 4K-bit secured OTP is independent from main array, which may use to store unique serial number for system identifier. After entering the Secured OTP mode, and then follow standard read or program procedure to read out the data or update data. The Secured OTP data cannot be updated again once it is lock-down.

The sequence of issuing ENSO instruction is: CS# goes low→ sending ENSO instruction to enter Secured OTP mode→ CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

Please note that WRSR/WRSCUR commands are not acceptable during the access of secure OTP region, once security OTP is lock down, only read related commands are valid.

**9-26. Exit Secured OTP (EXSO)**

The EXSO instruction is for exiting the additional 4K-bit secured OTP mode.

The sequence of issuing EXSO instruction is: CS# goes low→ sending EXSO instruction to exit Secured OTP mode→ CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

**9-27. Read Security Register (RDSCUR)**

The RDSCUR instruction is for reading the value of Security Register bits. The Read Security Register can be read at any time (even in program/erase/write status register/write security register condition) and continuously.

The sequence of issuing RDSCUR instruction is : CS# goes low→sending RDSCUR instruction→Security Register data out on SO→ CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

The definition of the Security Register bits is as below:

**Secured OTP Indicator bit.** The Secured OTP indicator bit shows the chip is locked by factory before ex- factory or not. When it is "0", it indicates non-factory lock; "1" indicates factory-lock.

**Lock-down Secured OTP (LDSO) bit.** By writing WRSCUR instruction, the LDSO bit may be set to "1" for customer lock-down purpose. However, once the bit is set to "1" (lock-down), the LDSO bit and the 4K-bit Secured OTP area cannot be update any more. While it is in 4K-bit secured OTP mode, main array access is not allowed.

**Erase Fail bit.** The Erase Fail bit is a status flag, which shows the status of last Erase operation. It will be set to "1", if the erase operation fails or the erase region is protected. It will be set to "0", if the last operation is successful. Please note that it will not interrupt or stop any operation in the flash memory.

**Program Fail bit.** The Program Fail bit is a status flag, which shows the status of last Program operation. It will be set to "1", if the program operation fails or the program region is protected. It will be set to "0", if the last operation is successful. Please note that it will not interrupt or stop any operation in the flash memory.

**Erase Suspend bit.** Erase Suspend Bit (ESB) indicates the status of Erase Suspend operation. Users may use ESB to identify the state of flash memory. After the flash memory is suspended by Erase Suspend command, ESB is set to "1". ESB is cleared to "0" after erase operation resumes.

**Program Suspend bit.** Program Suspend Bit (PSB) indicates the status of Program Suspend operation. Users may use PSB to identify the state of flash memory. After the flash memory is suspended by Program Suspend command, PSB is set to "1". PSB is cleared to "0" after program operation resumes.

**Table 8. Security Register Definition**

bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
WPSEL	E_FAIL	P_FAIL	Reserved	ESB (Erase Suspend bit)	PSB (Program Suspend bit)	LDSO (indicate if lock-down)	Secured OTP indicator bit
0=normal WP mode 1=individual mode (default=0)	0=normal Erase succeed 1=indicate Erase failed (default=0)	0=normal Program succeed 1=indicate Program failed (default=0)	-	0=Erase is not suspended 1= Erase suspended (default=0)	0=Program is not suspended 1= Program suspended (default=0)	0 = not lock- down 1 = lock-down (cannot program/ erase OTP)	0 = non- factory lock 1 = factory lock
Non-volatile bit (OTP)	Volatile bit	Volatile bit	Volatile bit	Volatile bit	Volatile bit	Non-volatile bit (OTP)	Non-volatile bit (OTP)

## 9-28. Write Security Register (WRSCUR)

The WRSCUR instruction is for changing the values of Security Register Bits. The WREN (Write Enable) instruction is required before issuing WRSCUR instruction. The WRSCUR instruction may change the values of bit1 (LDSO bit) for customer to lock-down the 4K-bit Secured OTP area. Once the LDSO bit is set to "1", the Secured OTP area cannot be updated any more.

The sequence of issuing WRSCUR instruction is :CS# goes low→ sending WRSCUR instruction → CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

The CS# must go high exactly at the boundary; otherwise, the instruction will be rejected and not executed.

## 9-29. Write Protection Selection (WPSEL)

There are two write protection methods provided on this device, (1) Block Protection (BP) mode or (2) individual block protection mode. The protection modes are mutually exclusive. The WPSEL bit selects which protection mode is enabled. If WPSEL=0 (factory default), BP mode is enabled and individual block protection mode is disabled. If WPSEL=1, individual block protection mode is enabled and BP mode is disabled. The WPSEL command is used to set WPSEL=1. A WREN command must be executed to set the WEL bit before sending the WPSEL command. **Please note that the WPSEL bit is an OTP bit. Once WPSEL is set to "1", it cannot be programmed back to "0".**

**Every time after the system is powered-on, and the Security Register bit 7(WPSEL) is checked if WPSEL=1. When WPSEL=1, it is in individual block protection mode, all the blocks or sectors will be write protected by default.** User may only unlock the blocks or sectors via SBULK and GBULK instruction. Program or erase functions can only be operated after the Unlock instruction is conducted.

When WPSEL = 0: Block Protection (BP) mode.

The memory array is write protected by the BP3~BP0 bits.

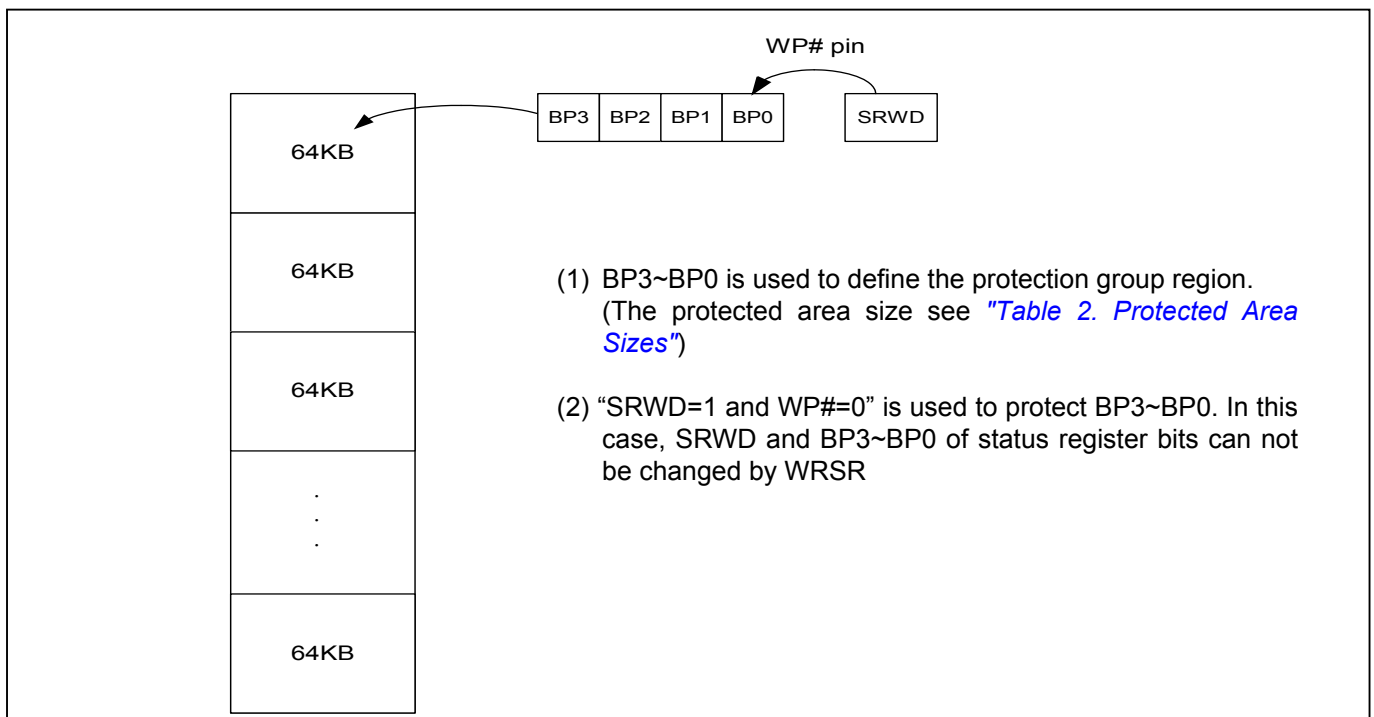

When WPSEL = 1: Individual block protection mode.

Blocks are individually protected by their own SRAM lock bits which are set to "1" after power up. SBULK and SBLK command can set SRAM lock bit to "0" and "1". The Individual block protection instructions SBLK, SBULK, RD-BLOCK, GBLK, GBULK...etc are activated to conduct block lock protection. The BP3~BP0 bits of the Status Register are disabled and have no effect. Hardware protection is performed by driving WP#=0. Once WP#=0 all blocks and sectors are write protected regardless of the state of each SRAM lock bit.

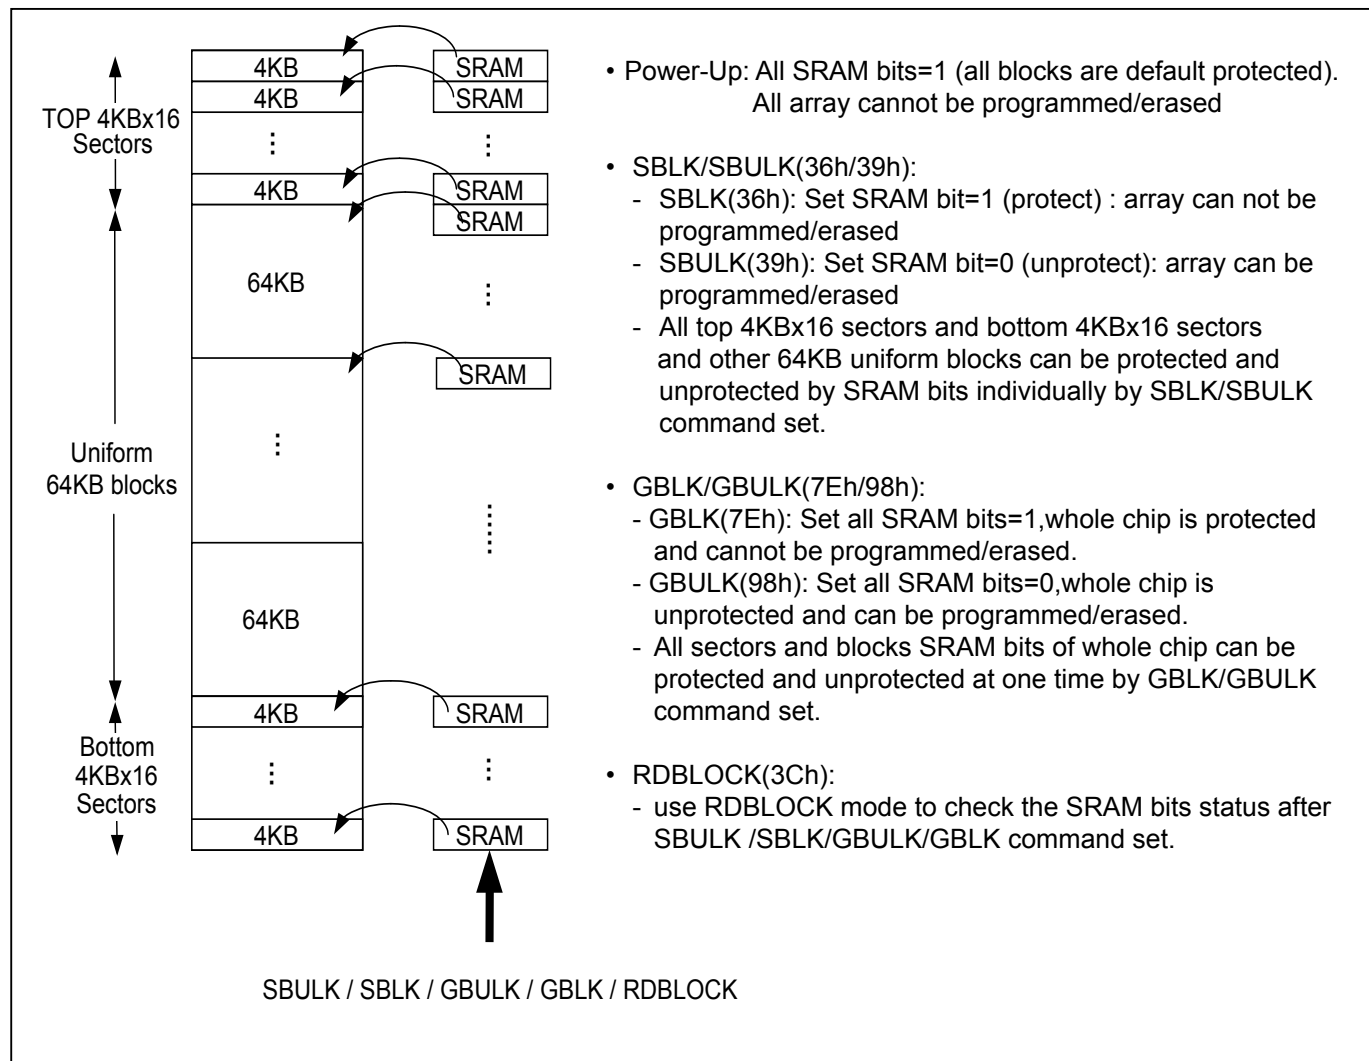

The sequence of issuing WPSEL instruction is: CS# goes low → send WPSEL instruction to enable the individual block protect mode → CS# goes high.

WPSEL instruction function flow is as follows:

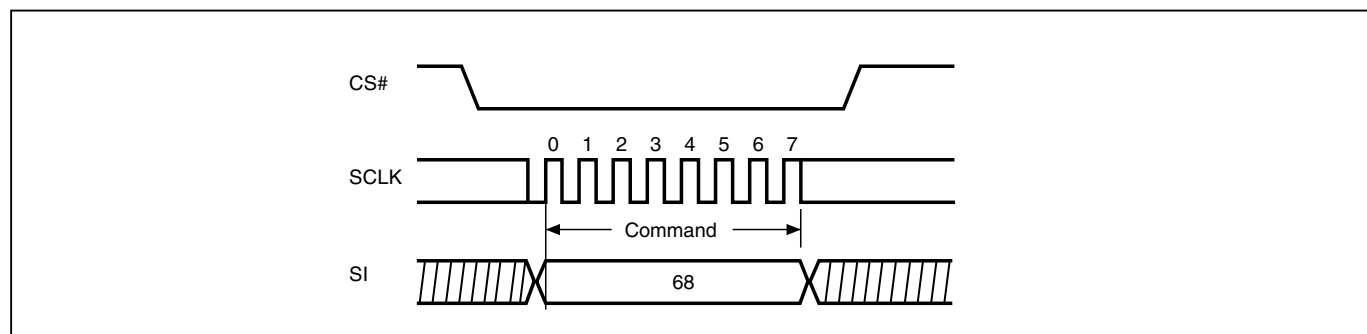

### BP and SRWD if WPSEL=0

**The individual block lock mode is effective after setting WPSEL=1**

**Figure 52. Write Protection Selection (WPSEL) Sequence (Command 68)**

**Figure 53. WPSEL Flow**

### 9-30. Single Block Lock/Unlock Protection (SBLK/SBULK)

These instructions are only effective after WPSEL was executed. The SBLK instruction is for write protection a specified block (or sector) of memory, using  $A_{MAX}-A16$  or ( $A_{MAX}-A12$ ) address bits to assign a 64Kbyte block (or 4K bytes sector) to be protected as read only. The SBULK instruction will cancel the block (or sector) write protection state. This feature allows user to stop protecting the entire block (or sector) through the chip unprotect command (GBULK).

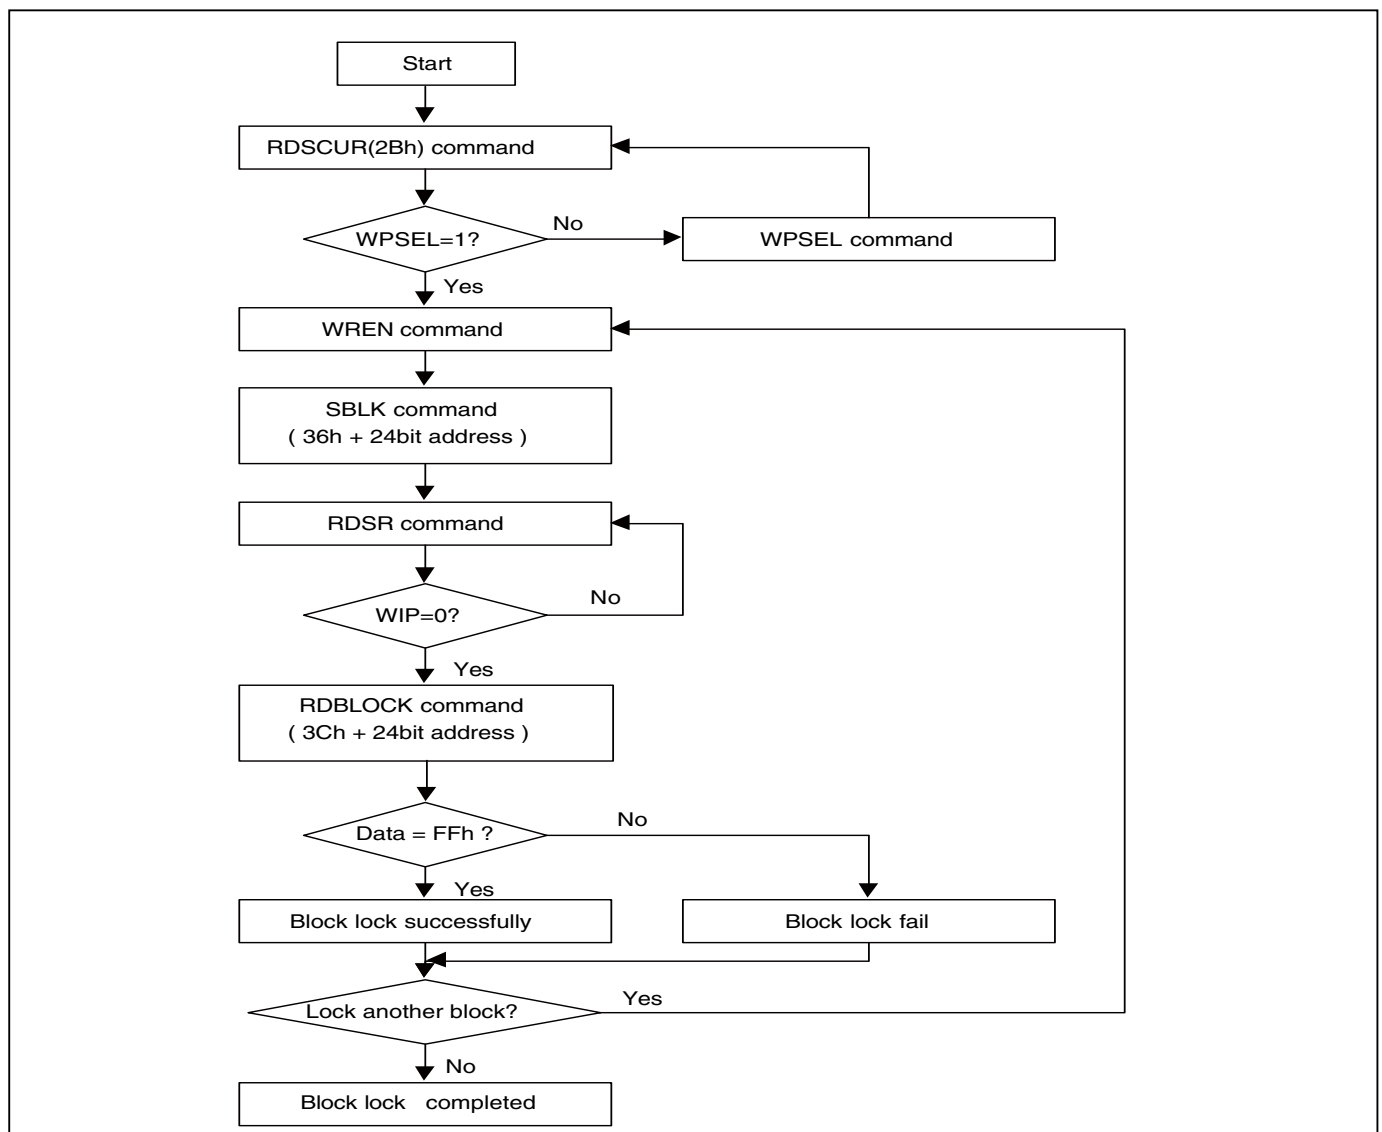

The WREN (Write Enable) instruction is required before issuing SBLK/SBULK instruction.

The sequence of issuing SBLK/SBULK instruction is: CS# goes low → send SBLK/SBULK (36h/39h) instruction → send 3-byte address assign one block (or sector) to be protected on SI pin → CS# goes high. The CS# must go high exactly at the byte boundary, otherwise the instruction will be rejected and not be executed.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

SBLK/SBULK instruction function flow is as follows:

**Figure 54. Block Lock Flow**

**Figure 55. Block Unlock Flow**

**9-31. Read Block Lock Status (RDBLOCK)**

This instruction is only effective after WPSEL was executed. The RDBLOCK instruction is for reading the status of protection lock of a specified block (or sector), using  $A_{MAX}-A16$  (or  $A_{MAX}-A12$ ) address bits to assign a 64K bytes block (4K bytes sector) and read protection lock status bit which the first byte of Read-out cycle. The status bit is "1" to indicate that this block has been protected, that user can read only but cannot write/program/erase this block. The status bit is "0" to indicate that this block hasn't been protected, and user can read and write this block.

The sequence of issuing RDBLOCK instruction is: CS# goes low → send RDBLOCK (3Ch) instruction → send 3-byte address to assign one block on SI pin → read block's protection lock status bit on SO pin → CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

**9-32. Gang Block Lock/Unlock (GBLK/GBULK)**

These instructions are only effective after WPSEL was executed. The GBLK/GBULK instruction is for enable/disable the lock protection block of the whole chip.

The WREN (Write Enable) instruction is required before issuing GBLK/GBULK instruction.

The sequence of issuing GBLK/GBULK instruction is: CS# goes low → send GBLK/GBULK (7Eh/98h) instruction → CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

The CS# must go high exactly at the byte boundary, otherwise, the instruction will be rejected and not be executed.

### 9-33. Program Suspend and Erase Suspend

The Suspend instruction interrupts a Page Program, Sector Erase, or Block Erase operation to allow access to the memory array. After the program or erase operation has entered the suspended state, the memory array can be read except for the page being programmed or the sector or block being erased (*"Table 9. Readable Area of Memory While a Program or Erase Operation is Suspended"*).

**Table 9. Readable Area of Memory While a Program or Erase Operation is Suspended**

Suspended Operation	Readable Region of Memory Array
Page Program	All but the Page being programmed
Sector Erase (4KB)	All but the 4KB Sector being erased
Block Erase (32KB)	All but the 32KB Block being erased
Block Erase (64KB)	All but the 64KB Block being erased

When the serial flash receives the Suspend instruction, there is a latency of tPSL or tESL (*"Figure 56. Suspend to Read Latency"*) before the Write Enable Latch (WEL) bit clears to "0" and the PSB or ESB sets to "1", after which the device is ready to accept one of the commands listed in *"Table 10. Acceptable Commands During Program/Erase Suspend after tPSL/tESL"* (e.g. FAST READ).

Refer to *"Table 19. AC Characteristics"* for tPSL and tESL timings.

*"Table 11. Acceptable Commands During Suspend (tPSL/tESL not required)"* lists the commands for which the tPSL and tESL latencies do not apply. For example, RDSR, RDSCUR, RSTEN, and RST can be issued at any time after the Suspend instruction.

Security Register bit 2 (PSB) and bit 3 (ESB) can be read to check the suspend status (please refer to *"Table 8. Security Register Definition"*). The PSB (Program Suspend Bit) sets to "1" when a program operation is suspended. The ESB (Erase Suspend Bit) sets to "1" when an erase operation is suspended. The PSB or ESB clears to "0" when the program or erase operation is resumed.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

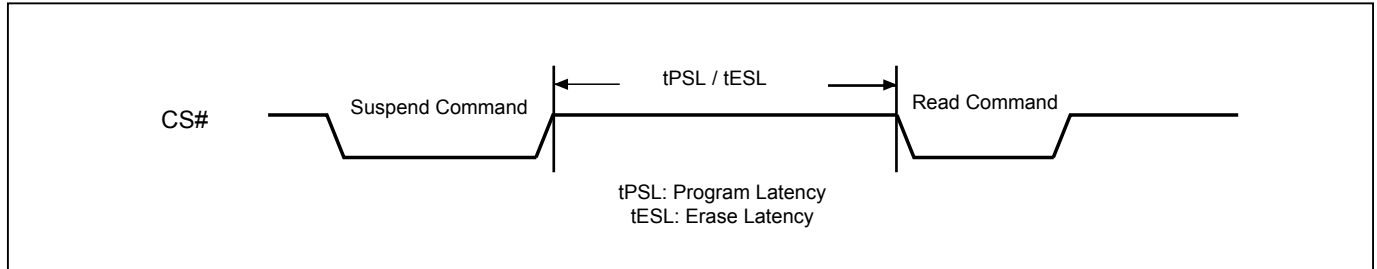

**Table 10. Acceptable Commands During Program/Erase Suspend after tPSL/tESL**

Command Name	Command Code	Suspend Type	
		Program Suspend	Erase Suspend
READ	03h	•	•
FAST READ	0Bh	•	•
DREAD	3Bh	•	•
QREAD	6Bh	•	•

**Figure 56. Suspend to Read Latency**

**Figure 57. Resume to Suspend Latency**

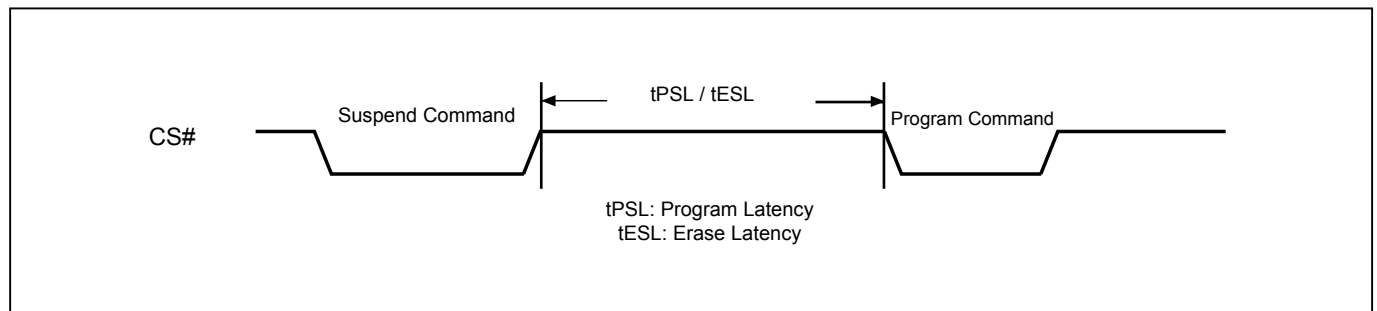

### 9-33-1. Erase Suspend to Program

The “Erase Suspend to Program” feature allows Page Programming while an erase operation is suspended. Page Programming is permitted in any unprotected memory except within the sector of a suspended Sector Erase operation or within the block of a suspended Block Erase operation. The Write Enable (WREN) instruction must be issued before any Page Program instruction.

A Page Program operation initiated within a suspended erase cannot itself be suspended and must be allowed to finish before the suspended erase can be resumed. The Status Register can be polled to determine the status of the Page Program operation. The WEL and WIP bits of the Status Register will remain “1” while the Page Program operation is in progress and will both clear to “0” when the Page Program operation completes.

**Figure 58. Suspend to Program Latency**

### 9-34. Program Resume and Erase Resume

The Resume instruction resumes a suspended Page Program, Sector Erase, or Block Erase operation. Before issuing the Resume instruction to restart a suspended erase operation, make sure that there is no Page Program operation in progress.

Immediately after the serial flash receives the Resume instruction, the WEL and WIP bits are set to “1” and the PSB or ESB is cleared to “0”. The program or erase operation will continue until finished (*“Figure 59. Resume to Read Latency”*) or until another Suspend instruction is received. A resume-to-suspend latency of  $t_{PRS}$  or  $t_{ERS}$  must be observed before issuing another Suspend instruction (*“Figure 57. Resume to Suspend Latency”*).

Please note that the Resume instruction will be ignored if the serial flash is in “Performance Enhance Mode”. Make sure the serial flash is not in “Performance Enhance Mode” before issuing the Resume instruction.

**Figure 59. Resume to Read Latency**

### 9-35. No Operation (NOP)

The "No Operation" command is only able to terminate the Reset Enable (RSTEN) command and will not affect any other command.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are don't care when during SPI mode.

### 9-36. Software Reset (Reset-Enable (RSTEN) and Reset (RST))

The Software Reset operation combines two instructions: Reset-Enable (RSTEN) command and Reset (RST) command. It returns the device to a standby mode. All the volatile bits and settings will be cleared then, which makes the device return to the default status as power on.

To execute Reset command (RST), the Reset-Enable (RSTEN) command must be executed first to perform the Reset operation. If there is any other command to interrupt after the Reset-Enable command, the Reset-Enable will be invalid.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode.

If the Reset command is executed during program or erase operation, the operation will be disabled, the data under processing could be damaged or lost.

The reset time is different depending on the last operation. Longer latency time is required to recover from a program operation than from other operations.

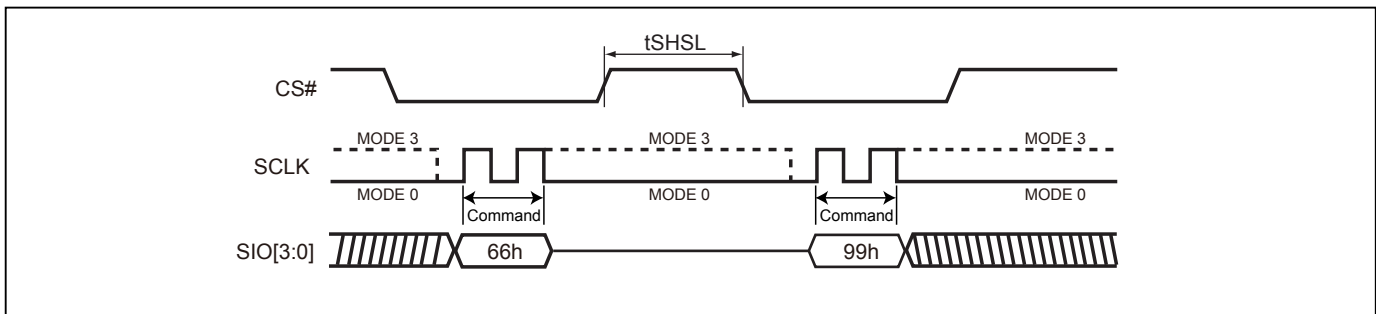

**Figure 60. Software Reset Recovery**

**Figure 61. Reset Sequence (SPI mode)**

**Figure 62. Reset Sequence (QPI mode)**

### 9-37. Read SFDP Mode (RDSFDP)

The Serial Flash Discoverable Parameter (SFDP) standard provides a consistent method of describing the functional and feature capabilities of serial flash devices in a standard set of internal parameter tables. These parameter tables can be interrogated by host system software to enable adjustments needed to accommodate divergent features from multiple vendors. The concept is similar to the one found in the Introduction of JEDEC Standard, JESD68 on CFI.

The sequence of issuing RDSFDP instruction is same as FAST\_READ: CS# goes low→send RDSFDP instruction (5Ah)→send 3 address bytes on SI pin→send 1 dummy byte on SI pin→read SFDP code on SO→to end RDSFDP operation can use CS# to high at any time during data out.

SFDP is a JEDEC Standard, JESD216.

**Figure 63. Read Serial Flash Discoverable Parameter (RDSFDP) Sequence**

**Table 12. Signature and Parameter Identification Data Values**

SFDP Table below is for MX25U1635FBAI-10G, MX25U1635FM2I-10G, MX25U1635FZBI-10G, MX25U1635FZNI-10G and MX25U1635FZUI-10G

Note 1: h/b is hexadecimal or binary.

Note 2: **(x-y-z)** means I/O mode nomenclature used to indicate the number of active pins used for the opcode (x), address (y), and data (z). At the present time, the only valid Read SFDP instruction modes are: (1-1-1), (2-2-2), and (4-4-4)

Note 3: **Wait States** is required dummy clock cycles after the address bits or optional mode bits.

Note 4: **Mode Bits** is optional control bits that follow the address bits. These bits are driven by the system controller if they are specified. (eg, read performance enhance toggling bits)

Note 5: 4KB=2<sup>0Ch</sup>, 32KB=2<sup>0Fh</sup>, 64KB=2<sup>10h</sup>

Note 6: All unused and undefined area data is blank FFh for SFDP Tables that are defined in Parameter Identification Header. All other areas beyond defined SFDP Table are reserved by Macronix.

## 10. RESET

Driving the RESET# pin low for a period of tRLRH or longer will reset the device. After reset cycle, the device is at the following states:

- Standby mode
- All the volatile bits such as WEL/WIP/SRAM lock bit will return to the default status as power on.

If the device is under programming or erasing, driving the RESET# pin low will also terminate the operation and data could be lost. During the resetting cycle, the SO data becomes high impedance and the current will be reduced to minimum.

**Figure 64. RESET Timing**

**Table 15. Reset Timing**

Symbol	Alt.	Parameter	Min.	Typ.	Max.	Unit
tRLRH		Reset Pulse Width	1			us
tRS		Reset Setup Time	15			ns
tRH		Reset Hold Time	15			ns
tRHRL		Reset Recovery Time (During instruction decoding)			20	us
	tRCR	Read			20	us
	tRCE	Erase			12	ms
	tRCP	Program			20	us
		Reset Recovery Time (for WRSR operation)			20	us

## 11. POWER-ON STATE

The device is at the following states after power-up:

- Standby mode (please note it is not deep power-down mode)
- Write Enable Latch (WEL) bit is reset

The device must not be selected during power-up and power-down stage until the VCC reaches the following levels:

- VCC minimum at power-up stage and then after a delay of tVSL
- GND at power-down

Please note that a pull-up resistor on CS# may ensure a safe and proper power-up/down level.

An internal power-on reset (POR) circuit may protect the device from data corruption and inadvertent data change during power up state. When VCC is lower than VWI (POR threshold voltage value), the internal logic is reset and the flash device has no response to any command.

For further protection on the device, if the VCC does not reach the VCC minimum level, the correct operation is not guaranteed. The write, erase, and program command should be sent after the below time delay:

- tVSL after VCC reached VCC minimum level

The device can accept read command after VCC reached VCC minimum and a time delay of tVSL.

Please refer to the *"Figure 71. Power-up Timing"*.

### Note:

- To stabilize the VCC level, the VCC rail decoupled by a suitable capacitor close to package pins is recommended. (generally around 0.1uF)
- At power-down stage, the VCC drops below VWI level, all operations are disabled and device has no response to any command. The data corruption might occur during this stage if a write, program, erase cycle is in progress.

## 12. ELECTRICAL SPECIFICATIONS

**Table 16. Absolute Maximum Ratings**

Rating		Value
Ambient Operating Temperature	Industrial grade	-40°C to 85°C
Storage Temperature		-65°C to 150°C
Applied Input Voltage		-0.5V to VCC+0.5V
Applied Output Voltage		-0.5V to VCC+0.5V
VCC to Ground Potential		-0.5V to 2.5V

**NOTICE:**

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only and functional operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended period may affect reliability.
2. Specifications contained within the following tables are subject to change.
3. During voltage transitions, all pins may overshoot to VCC+1.0V or -1.0V for period up to 20ns.

tW		Write Status Register Cycle Time			40	ms
tBP		Byte-Program		12	30	us
tPP		Page Program Cycle Time		0.5	1.5	ms
tPP <sup>(7)</sup>		Page Program Cycle Time (n bytes)		0.008+ (nx0.004) <sup>(8)</sup>	1.5	ms
tSE		Sector Erase Cycle Time		35	200	ms
tBE32		Block Erase (32KB) Cycle Time		0.2	1	s
tBE		Block Erase (64KB) Cycle Time		0.35	2	s
tCE		Chip Erase Cycle Time		10	20	s
tESL <sup>(9)</sup>		Erase Suspend Latency			20	us
tPSL <sup>(9)</sup>		Program Suspend Latency			20	us
tPRS <sup>(10)</sup>		Latency between Program Resume and next Suspend	0.3	100		us
tERS <sup>(11)</sup>		Latency between Erase Resume and next Suspend	0.3	400		us

**Notes:**

1.  $t_{CH} + t_{CL}$  must be greater than or equal to  $1/\text{Frequency}$ .
2. Typical values given for  $T_A=25^{\circ}\text{C}$ . Not 100% tested.
3. Only applicable as a constraint for a WRSR instruction when SRWD is set at 1.
4. Test condition is shown as *"Figure 67. Input Test Waveforms and Measurement Level"*, *"Figure 68. Output Loading"*.
5. When dummy cycle=4 (In both QPI & SPI mode), maximum clock rate=84MHz; when dummy cycle=6 (In both QPI & SPI mode), maximum clock rate=104MHz.
6. The maximum clock rate=33MHz when reading secured OTP area.
7. While programming consecutive bytes, Page Program instruction provides optimized timings by selecting to program the whole 256 bytes or only a few bytes between 1~256 bytes.
8. "n"=how many bytes to program. In the formula, while  $n=1$ , byte program time=12us.
9. Latency time is required for Erase/Program Suspend until WIP bit is "0".
10. For  $t_{PRS}$ , minimum timing must be observed before issuing the next program suspend command. However, a period equal to or longer than the typical timing is required in order for the program operation to make progress.
11. For  $t_{ERS}$ , minimum timing must be observed before issuing the next erase suspend command. However, a period equal to or longer than the typical timing is required in order for the erase operation to make progress.
12. The value guaranteed by characterization, not 100% tested in production.

### 13. OPERATING CONDITIONS

#### At Device Power-Up and Power-Down

AC timing illustrated in *"Figure 69. AC Timing at Device Power-Up"* and *"Figure 70. Power-Down Sequence"* are for the supply voltages and the control signals at device power-up and power-down. If the timing in the figures is ignored, the device will not operate correctly.

During power-up and power-down, CS# needs to follow the voltage applied on VCC to keep the device not to be selected. The CS# can be driven low when VCC reach Vcc(min.) and wait a period of tVSL.

**Figure 69. AC Timing at Device Power-Up**

Symbol	Parameter	Notes	Min.	Max.	Unit
tVR	VCC Rise Time	1		500000	us/V

Notes :

1. Sampled, not 100% tested.
2. For AC spec tCHSL, tSLCH, tDVCH, tCHDX, tSHSL, tCHSH, tSHCH, tCHCL, tCLCH in the figure, please refer to *"Table 19. AC Characteristics"*.

**Figure 70. Power-Down Sequence**

During power-down, CS# needs to follow the voltage drop on VCC to avoid mis-operation.

**Figure 71. Power-up Timing**

Note: VCC (max.) is 2.0V and VCC (min.) is 1.65V.

**Table 20. Power-Up Timing and VWI Threshold**

Symbol	Parameter	Min.	Max.	Unit
tVSL <sup>(1)</sup>	VCC(min) to CS# low (VCC Rise Time)	800		us
VWI <sup>(1)</sup>	Write Inhibit Voltage	1.0	1.4	V

**Note: 1.** These parameters are characterized only.

### 13-1. Initial Delivery State

The device is delivered with the memory array erased: all bits are set to 1 (each byte contains FFh). The Status Register contains 00h (all Status Register bits are 0).

**14. ERASE AND PROGRAMMING PERFORMANCE**

PARAMETER	Min.	Typ. <sup>(1)</sup>	Max. <sup>(2)</sup>	Unit
Write Status Register Cycle Time			40	ms
Sector Erase Cycle Time (4KB)		35	200	ms
Block Erase Cycle Time (32KB)		0.2	1	s
Block Erase Cycle Time (64KB)		0.35	2	s
Chip Erase Cycle Time		10	20	s
Byte Program Time (via page program command)		12 <sup>(5)</sup>	30	us
Page Program Time		0.5 <sup>(5)</sup>	1.5	ms
Erase/Program Cycle		100,000		cycles

**Note:**

1. Typical erase assumes the following conditions: 25°C, 1.8V, and all zero pattern.
2. Under worst conditions of 85°C and 1.65V.
3. System-level overhead is the time required to execute the first-bus-cycle sequence for the programming command.
4. The maximum chip programming time is evaluated under the worst conditions of 0°C, VCC=1.8V, and 100K cycle with 90% confidence level.
5. Typical program assumes the following conditions: 25°C, 1.8V, and checkerboard pattern.

**15. LATCH-UP CHARACTERISTICS**

	Min.	Max.
Input Voltage with respect to GND on all power pins, SI, CS#	-1.0V	2 VCCmax
Input Voltage with respect to GND on SO	-1.0V	VCC + 1.0V
Current	-100mA	+100mA
Includes all pins except VCC. Test conditions: VCC = 1.8V, one pin at a time.		

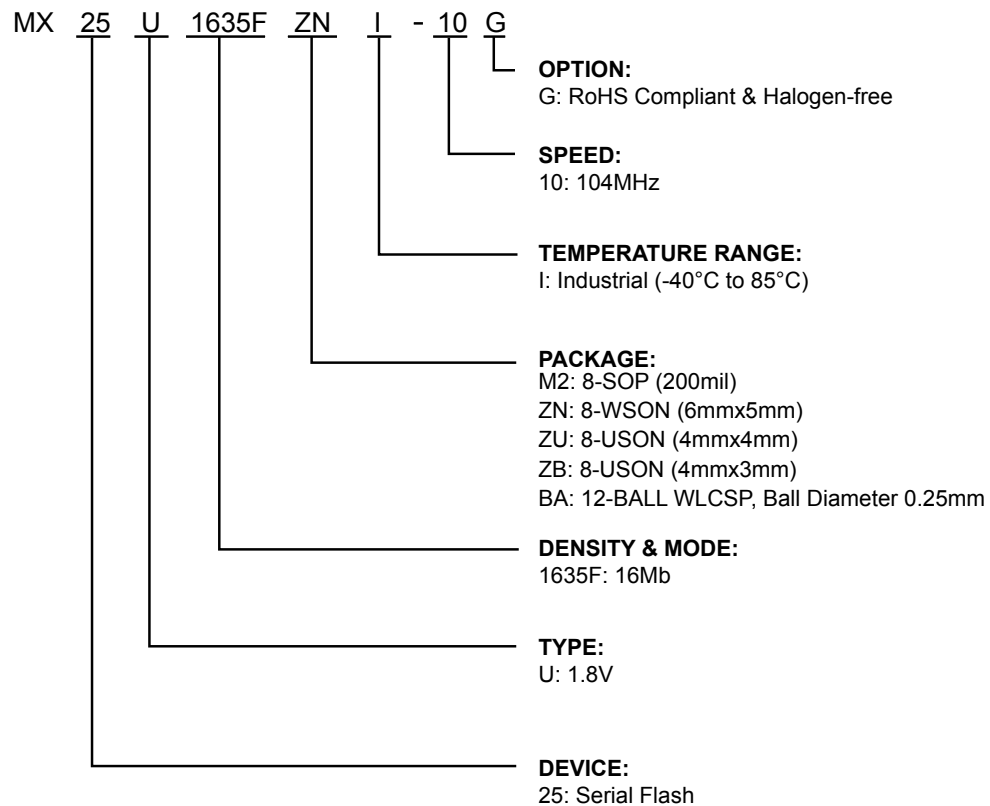

## 16. ORDERING INFORMATION

Please contact Macronix regional sales for the latest product selection and available form factors.

PART NO.	CLOCK (MHz)	TEMPERATURE	PACKAGE	Remark
MX25U1635FM2I-10G	104	-40°C to 85°C	8-SOP (200mil)	
MX25U1635FZNI-10G	104	-40°C to 85°C	8-WSON (6mmx5mm)	
MX25U1635FZUI-10G	104	-40°C to 85°C	8-USON (4mmx4mm)	
MX25U1635FZBI-10G	104	-40°C to 85°C	8-USON (4mmx3mm)	
MX25U1635FBAI-10G	104	-40°C to 85°C	12-BALL WLCSP	Ball Diameter 0.25mm

**18-2. 8-land WSON (6mm x 5mm)**

Doc. Title: Package Outline for WSON 8L (6x5x0.8MM, LEAD PITCH 1.27MM)

**TOP VIEW**

**SIDE VIEW**

**BOTTOM VIEW**

**Note:**

This package has an exposed metal pad underneath the package. It is recommended to leave the metal pad floating or to connect it to the same ground as the GND pin of the package. Do not connect the metal pad to any other voltage or signal line on the PCB. Avoid placing vias or traces underneath the metal pad. Connection of this metal pad to any other voltage or signal line can result in shorts and/or electrical malfunction of the device.

## 19. REVISION HISTORY

Revision No.	Description	Page	Date
1.0	1. Removed "Advanced Information" 2. Added 8-USON (4mmx3mm) package information	P4 P5,8,85,86,90	FEB/22/2013
1.1	1. Modified Package Information	P88~90	APR/25/2013
1.2	1. Added DREAD function 2. Added QREAD function 3. Updated DREAD(1-1-2) / QREAD(1-1-4) in SFDP Table 4. Modified Data Retention value 5. Modified Erase Suspend & <a href="#">Figure 55</a> 6. Added note on WP# setup 7. Modified VCC to Ground Potential 8. Updated Erase time, Consumption current and Page Program 9. Updated ISB1, ISB2, ICC1, ICC3 and ICC4 in DC Table 10. Updated tBP, tSE, tBE32, tBE and tCE in AC Table 11. Updated Erase time and Byte Program time	P7,14,17,39 P7,14,17,41 P72,73 P4 P66,67 P35 P78 P4 P80 P81 P86	OCT/23/2013
1.3	1. Added WLCSP package and Part No.	P5,8,87,88,93	APR/07/2014
1.4	1. Removed Advanced Information of MX25U1635FZNI-10G and MX25U1635FZUI-10G	P87	JUN/25/2014
1.5	1. Updated Block Diagram 2. Updated Note 6 of SFDP Tables 3. Added program/erase suspend/resume parameters 4. Updated program/erase suspend/resume descriptions 5. Updated notes of Table 19. AC Characteristics 6. Added Write Protection Selection (WPSEL) Sequence figure 7. Added descriptions of Security Register E_FAIL/P_FAIL, ESB/PSB 8. Updated Write Protection Selection (WPSEL) descriptions	P9 P76 P82-83 P66-69 P82-83 P61 P59 P60	MAR/17/2015
1.6	1. Updated tVR values 2. Added a statement for product ordering information 3. Modified <a href="#">"9-22. Page Program (PP)"</a> descriptions 4. Content modification. 5. Added the note for the internal pull up status of RESET#/SIO3 and WP#/SIO2 6. Updated <a href="#">"18-2. 8-land WSON (6mm x 5mm)"</a>	P84 P88 P54 P20,46 P8 P91	JAN/17/2017

Except for customized products which have been expressly identified in the applicable agreement, Macronix's products are designed, developed, and/or manufactured for ordinary business, industrial, personal, and/or household applications only, and not for use in any applications which may, directly or indirectly, cause death, personal injury, or severe property damages. In the event Macronix products are used in contradicted to their target usage above, the buyer shall take any and all actions to ensure said Macronix's product qualified for its actual use in accordance with the applicable laws and regulations; and Macronix as well as it's suppliers and/or distributors shall be released from any and all liability arisen therefrom.
