FIGURE 1

TYPICAL CHANGE OF TEMPERATURE COEFFICIENT
WITH CHANGE IN OPERATING CURRENT

The curve shown in Figure 1 is typical of the diode series and greatly simplifies the estimation of the Temperature Coefficient (TC) when the diode is operated at currents other than 7.5 mA.

EXAMPLE: A diode in this series is operated at a current of 7.5 mA and has specified Temperature Coefficient (TC) limits of $\pm 0.002\%/^{\circ}\text{C}$. To obtain the typical Temperature Coefficient limits for this same diode operated at a current of 6.0 mA, the new TC limits ($\%/^{\circ}\text{C}$) can be estimated using the graph in Figure 1.

At a test current of 6.0 mA the change in Temperature Coefficient (TC) is approximately $-0.0009\%/^{\circ}\text{C}$. The algebraic sum of $\pm 0.002\%/^{\circ}\text{C}$ and $-0.0009\%/^{\circ}\text{C}$ gives the new estimated limits of $+0.0011\%/^{\circ}\text{C}$ and $-0.0029\%/^{\circ}\text{C}$.

FIGURE 2

TYPICAL CHANGE OF ZENER VOLTAGE
WITH CHANGE IN OPERATING CURRENT

This curve in Figure 2 illustrates the change of diode voltage arising from the effect of impedance. It is in effect, an exploded view of the Zener operating region of the I-V characteristic.

In conjunction with Figure 1, this curve can be used to estimate total voltage regulation under conditions of both varying temperature and current.
