b. A power-on reset (POR) is implemented at both the transmitter and the receiver. It is active below V_{POR_DEACT} . Once V_{POR_DEACT} is reached, the POR remains active for $t_{POR_DEACT_DEL}$. During power-down, the POR starts at V_{POR_ACT} . During the active POR, the output signal is low. V_{POR_DEACT} and V_{POR_ACT} apply to both Tx and Rx; $t_{POR_DEACT_DEL}$ applies only for the Rx. The delay time of the Tx is typically ~10 μ s.

- a. Provided the following characteristics of the electrical input: a) no PWD at the 1.5V input level and b) dU/dt between 1V and 2V is less than 1 V/ns.
- b. Determined from 1.5V of the rising edge of Data_In to 50% of the rising edge of Data_Out.
- c. The t_D variation between multiple devices is measured for the same input conditions and the same external signal delay.
- d. Depends on the supply voltage and the signal rate.

Block Diagram – AFBR-3950xxRZ

A low Input signal at Data_in results in a low output signal at Data_out (noninverted Tx to noninverted Rx).

The POR remains active during VCC power-up, typically until 10 μ s for Tx and 10 ms for Rx after 2.8V is reached. For both Tx and Rx, Data_out is low while the POR active.

Recommended Chemicals for Cleaning and Degreasing

- Alcohols: methyl, isopropyl, isobutyl
- Aliphatics: hexane, heptanes
- Other: soap solution, naphtha

Do not use partially halogenated hydrocarbons, such as 1,1,1 trichloroethane, or ketones, such as MEK, acetone, chloroform, ethyl acetate, methylene dichloride, phenol, methylene chloride, or N-methylpyrrolidone. Also, Broadcom does not recommend the use of cleaners that use halogenated hydrocarbons because of their potential environmental harm.
