

## 1. Description

ElecSuper has developed TDS (Transient Diverting Suppressors) using “SuperSurgeControl” technology for protection against EOS (Electrical Overstress) and ESD (Electrostatic Discharge) events. It uses integrated circuit technology to provide a robust surge solution. It is no longer based on the PN junction in the traditional TVS diode for breakdown and current discharge, but transfers the surge current to the ground through the built-in surge rated field effect transistor, which has a lower on-resistance than the PN junction in the TVS diode. Therefore, the TDS device can provide an accurate, gentle and temperature-independent clamping voltage, thereby minimizing the residual voltage of the protected system.

TDS3311P.C(ES) is very suitable for protecting the power bus with operating voltage up to 33V, and its rated transient peak pulse current can reach 50A ( $t_p = 8/20 \mu s$ ). TDS uses a small DFN1616-6L package, which is 90% smaller than the industry standard SMA / SMB package, and its capacitance is lower, and the leakage current is 50% lower than the traditional TVS-based solution.

## 2. Features

- IEC 61000-4-2 Level 4 ESD Protection
  - $\pm 30kV$  Contact Discharge
  - $\pm 30kV$  Air Discharge
- High peak pulse current capability: 50A ( $t_p = 8/20 \mu s$ ) IEC 61000-4-5
- High EFT Withstand Voltage:  $\pm 4kV$  (100kHz and 5kHz, 5/50ns) IEC 61000-4-4
- High peak pulse current capability: 4A IEC 61643-321 (10/1000 $\mu s$ )
- Constant clamping voltage across the peak pulse current range and temperature range
- Working voltage: 33V
- Low leakage: 0.5nA Typ@33V
- Low capacitance: 113pF Typ@25V

## 3. Applications

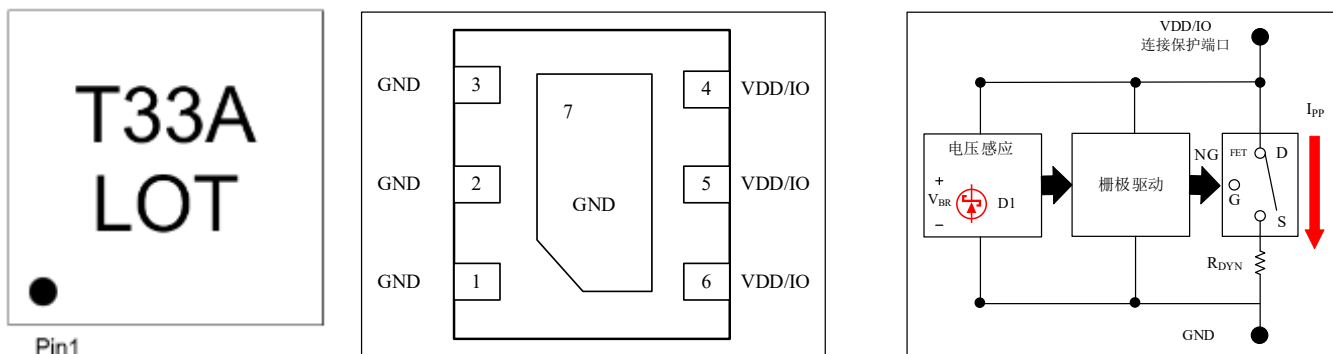

- USB PD
- USB Type-C Vbus
- Notebooks and Tablet Computers
- 4-20 mA transmitter

## 8. Application Information

### Description

The conventional TVS diode based on PN junction has a fixed dynamic resistance ( $R_{DYN}$ ) (Fig.1). The clamping voltage of the traditional TVS diode is  $V_C = V_{BR} + I_{PP} * R_{DYN}$ . Because the dynamic resistance of TVS is a fixed value, the clamping voltage increases with the increase of  $I_{PP}$ , which leads to a linear increase of the clamping voltage in the peak pulse current range. In addition, the ability of traditional TVS diodes to absorb transient current is related to junction area and junction (ambient) temperature. When it absorbs or dissipates the surge energy, its own temperature increases, the clamping voltage increases significantly, and the peak transient current  $I_{PP}$  decreases.

TDS uses a surge rated field-effect transistor as its main protective element (Fig 2). It consists of precision trigger circuit, drive circuit and surge rated field effect transistor. When the trigger circuit detects EOS events, the drive circuit is activated by the trigger circuit and turns on the field effect transistor, and the transient current is transferred to the ground. As the  $I_{PP}$  increases, the  $R_{DYN}$  of the FET is reduced to a negligible value, so that the clamping voltage is

Fig.1 Equivalent circuit of traditional TVS diode

Fig. 2 The working principle of TDS

approximately the same as the breakdown voltage of the trigger circuit. Therefore, the clamping voltage of TDS is almost constant within the rated peak pulse current range (Fig. 3). In addition, the TDS is not based on the traditional PN junction to discharge the surge current, so its clamping voltage within the normal operating temperature range also remains stable.

## Typical Applications

TDS3311P.C(ES) can be used to protect any power supply, analog or digital signal from transient overvoltage events caused by the environment or other electrical components.

The typical application of TDS3311P.C(ES) is the analog output module on the PLC in Fig.4. In this case, TDS3311P.C(ES) protects the 4-20mA transmitter of XTR115, which is a standard transmitter with a nominal voltage of 24V and a maximum input voltage of 40V. The industrial interface requires  $\pm 1\text{kV}$  surge test protection through a  $42\Omega$  coupling resistor and a  $0.5\mu\text{F}$  capacitor, which is equivalent to about 24A surge current. If there is no input protection, when lightning, coupling, ringing or other overvoltage conditions cause surge events, the input voltage will rise to hundreds of volts in a few microseconds, exceeding the absolute maximum input voltage, which will cause damage to the equipment. The ideal surge protection diode will maximize the operating voltage range and can be clamped within the safe voltage range of the system. The TDS technology introduced by Hunan Jingxin provides the best protection solution. TDS3311P.C(ES) is used to protect the device. During surge events, when the voltage rises to 38.7 V, the TDS3311P.C(ES) will be quickly triggered to instantaneously shunt the surge current to the ground. Because TDS3311P.C(ES) uses a built-in rated surge field

Fig. 4 Surge protection scheme for 4-20ma transmitters

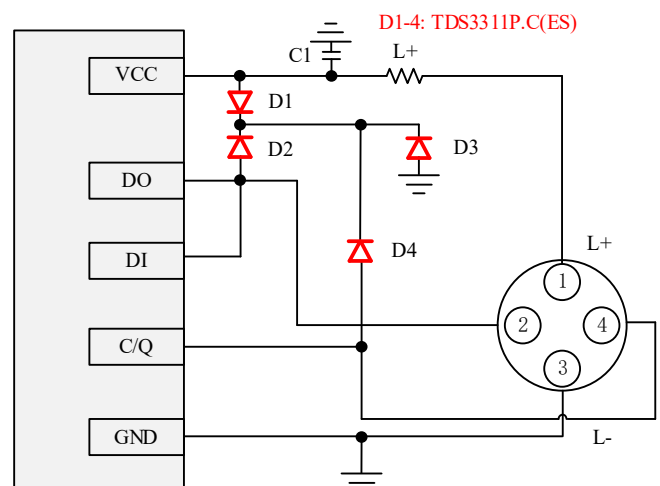

Fig. 5 ESD and surge protection of IO-Link

effect transistor to discharge current, its dynamic resistance is low, so the impact of surge current on the clamping voltage is very small. The dynamic resistance of the TDS3311P.C(ES) is about 30mΩ, and the surge current of 24A will cause the clamping voltage to increase by  $24A \times 30m\Omega = 0.72V$ . This means that during the surge pulse, the input voltage of XTR115 is  $38.7V + 0.72V = 39.42V$ , which is completely within the absolute maximum input voltage range (<40V). This ensures the strong protection of the back-end circuit by TDS3311P.C(ES), which is beneficial to increase the reliability of the system. TDS3311P.C(ES) can be used to protect the power line and I / O line of industrial sensors, and its typical applications include IO-Link interface and digital sensor input. In these applications, TDS3311P.C(ES) can be used to protect power and I / O lines, as shown in Figure 5-8.

### Pin Configuration

TDS3311P.C(ES) is in a 1.6mmx1.6mm, 6-pin DFN package. The input or connection to the protected bus is made at pins 4, 5, and 6. Ground connection is made at pins 1, 2, and 3. All pins must be connected for maximum peak pulse current handling capability (Fig. 9).
