1. DESCRIPTION

The XLP2518FD device is a cost-effective and small-footprint CAN FD controller that can be easily added to a MCU/DSP/FPGA/SOC with an available SPI interface. A CAN FD channel can be easily added to a MCU/DSP/FPGA/SOC that is either lacking a CAN FD peripheral or does not have enough CAN FD channels. XLP2518FD supports both CAN frames in the Classical format (CAN2.0B) and CAN Flexible Data Rate (CAN FD) format, as specified in ISO 11898-1:2015.

2. FEATURES

2.1. General

- External CAN FD Controller with Serial Peripheral Interface (SPI) up to 20MHz
- Arbitration Bit Rate up to 1 Mbps
- Data Bit Rate up to 8 Mbps
- CAN FD Controller modes: Mixed CAN 2.0B and CAN FD Mode or CAN 2.0B Mode
- VDD: +2.7V to +5.5V
- Active Current: maximum 20 mA at 5.5 V, 40 MHz CAN clock
- Sleep Current: 15µA, typical
- Low Power Mode current: maximum 10uA
- Temperature Ranges: -40°C to +125°C or +150°C
- Package available: SOP14 and VDFN14
- AEC-Q100 Pre-Qualified

2.2. Message FIFOs

- 31 FIFOs, configurable as Transmit or Receive FIFOs
- One Transmit Queue (TXQ)
- Transmit Event FIFO (TEF) with 32-bit time stamp

2.3. Message Transmission

- Message transmission prioritization:
  - Based on priority bit field
  - Message with lowest ID gets transmitted first using the Transmit Queue (TXQ)
- Programmable automatic retransmission attempts: unlimited, 3 attempts or disabled

2.4. Message Reception

- 32 Flexible Filter and Mask Objects
- Each object can be configured to filter either: Standard ID + first 18 data bits, or Extended ID
- 32-bit Time Stamp

2.5. Safety Critical Systems

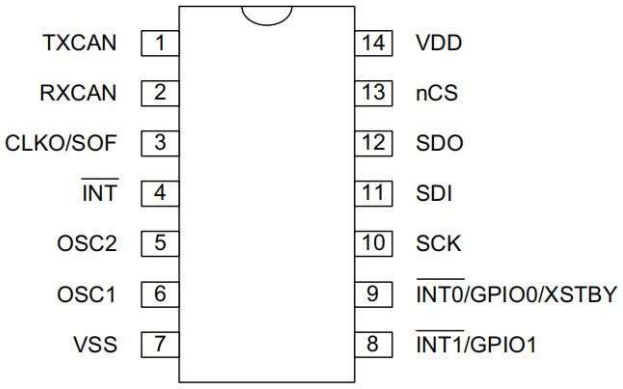
- SPI commands with CRC to detect noise on SPI interface
- Error Correction Code (ECC) protected RAM

2.6. Special Features

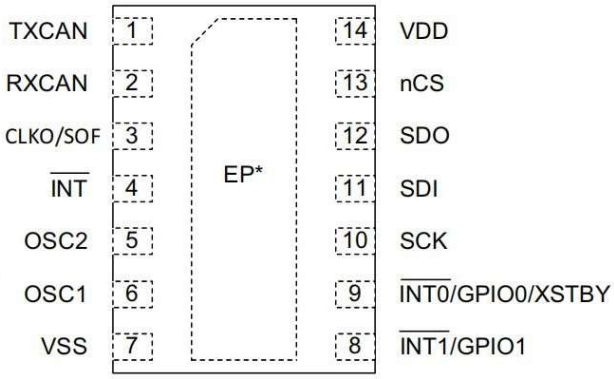
- Message Objects are located in RAM: 2 KB
- Up to 3 Configurable Interrupt Pins (/INT ,/INT0, and /INT1)
- Bus Health Diagnostics and Error Counters
- Transceiver Standby Control
- Start of frame pin for indicating the beginning of messages on the bus
- Oscillator Support 40, 20 or 4 MHz Crystal or Ceramic Resonator; External Clock Input
- Clock Output with Pre-scaler (divided by 1/1 or 1/2 or 1/4 or 1/10)
- Supports SPI Modes 0,0 and 1,1
- Registers and bit fields are arranged in a way to enable efficient access through SPI
- Open drain outputs: TXCAN, /INT, /INT0, and /INT1 pins can be configured as push/pull or open drain outputs

3. PACKAGE AND PINOUT

SOP14



VDFN14



(Comments: Top view ,EP is a Exposed Thermal Pad and connect to VSS, package are not scaler 1:1)

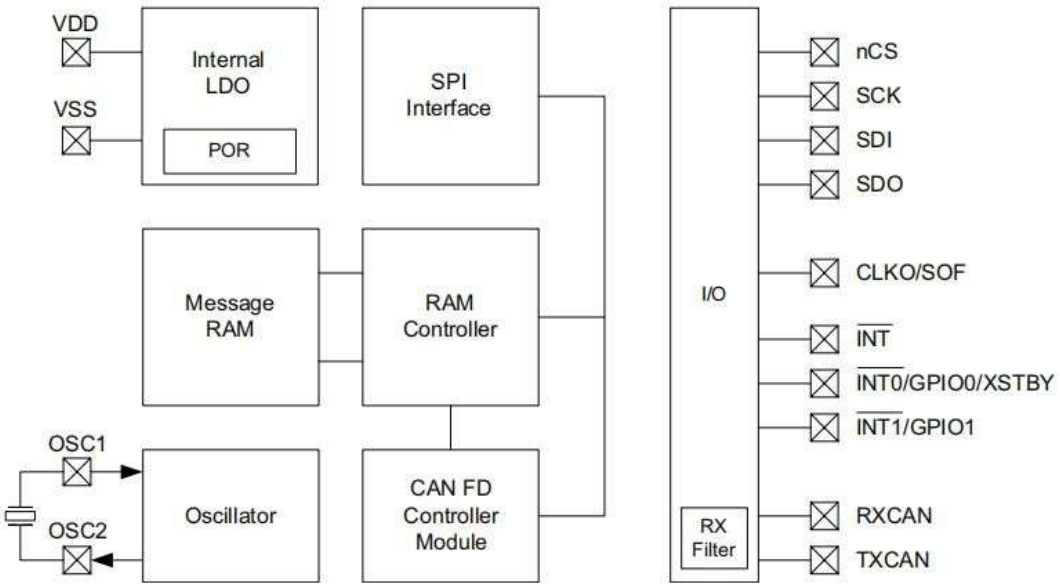
TABLE 1-1: PIN DESCRIPTIONS

Pin Name	SOP14	VDFN14	Pin Type	Pin Function Descriptions
TXCAN	1	1	O	Transmit output to CAN FD transceiver
RXCAN	2	2	I	Receive input from CAN FD transceiver
CLKO/SFOF	3	3	O	Clock output/Start of Frame output
/INT	4	4	O	Interrupt output (active low)
OSC2	5	5	O	External oscillator output
OSC1	6	6	I	External oscillator input
VSS	7	7	P	Ground
/INT1/GPIO1	8	8	I/O	RX Interrupt output (active low)/GPIO
/INT0/GPIO0/ XSTBY	9	9	I/O	TX Interrupt output (active low)/GPIO/ Transceiver Standby output
SCK	10	10	I	SPI clock input
SDI	11	11	I	SPI data input
SDO	12	12	O	SPI data output
nCS	13	13	I	SPI chip select input, Active low level
VDD	14	14	P	Positive Supply (+2.7V ~ +5.5V)
EP	-	15	P	Exposed Thermal Pad; connect to VSS

(Comments: P = Power, I = Input, O = Output)

4. DEVICE OVERVIEW

4.1. Block Diagram



(**FIGURE 1-1**: XLP2518FD BLOCK DIAGRAM)

Figure 1.1 shows the block diagram of the XLP2518FD device. It contains the following main blocks:

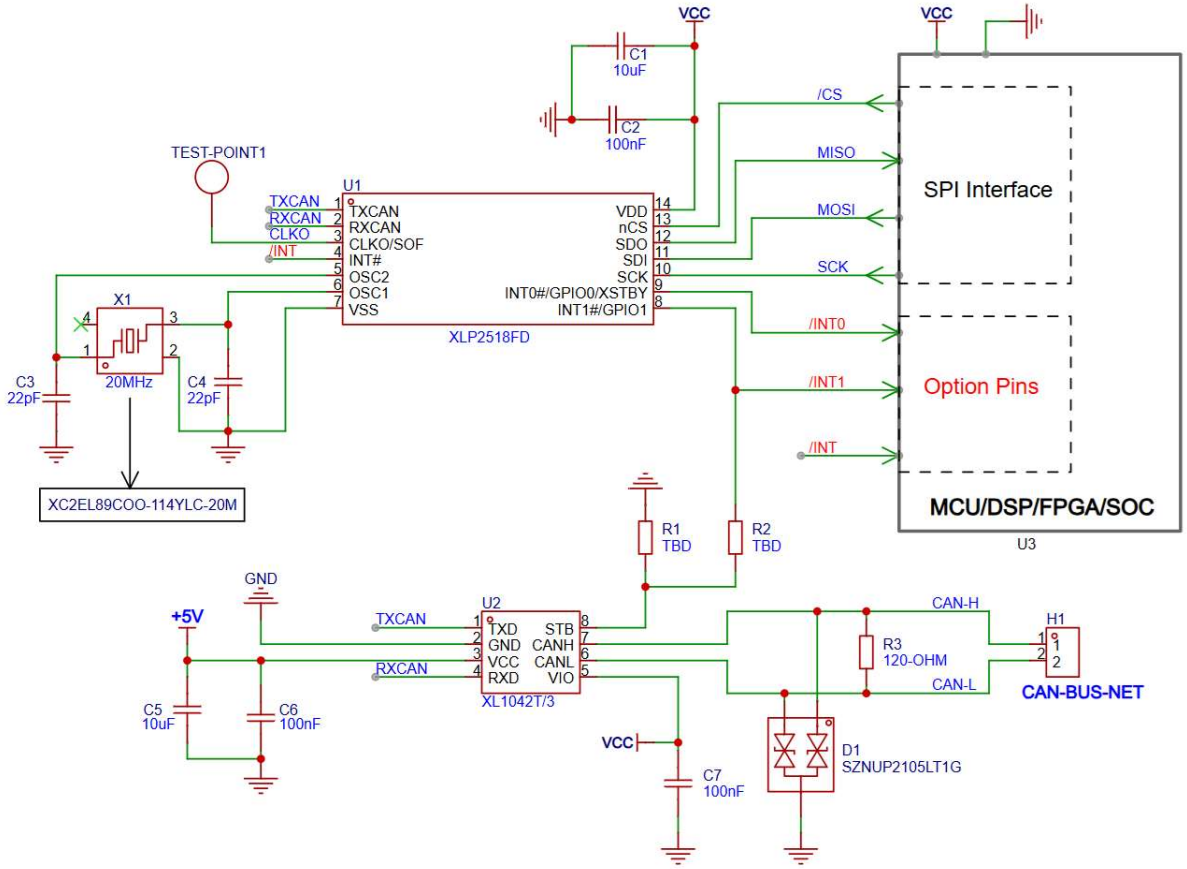
- The CAN FD Controller module implements the CAN FD protocol, and contains the FIFOs and Filters.
- The SPI interface is used to control the device by accessing Special Function Registers (SFR) and RAM.
- The RAM controller arbitrates the RAM accesses between the SPI and CAN FD Controller module.
- The Message RAM is used to store the data of the Message Objects.
- The oscillator generates the CAN clock.
- The Internal LDO and POR circuit.
- The I/O control.

4.2. Application Circuit Example

Figure 1-2 shows an example of a typical application of the XLP2518FD device. In this example, the CAN FD transceiver is power by +5V, but the XLP2518FD device can connect directly to high-speed CAN FD transceivers. There are no external level shifters required when connecting VCC of the XLP2518FD and the MCU/DSP/FPGA/SOC to VIO of the transceiver. The range of VCC is +2.7V to +5.5V.

The SPI interface is used to configure and control the CAN FD controller to communicate with CAN BUS devices. The XLP2518FD device signals interrupts to the MCU/DSP/FPGA/SOC by using INT, INT0 and INT1. Interrupts need to be cleared by the MCU/DSP/FPGA/SOC through SPI, so these Interrupt's pins is option .

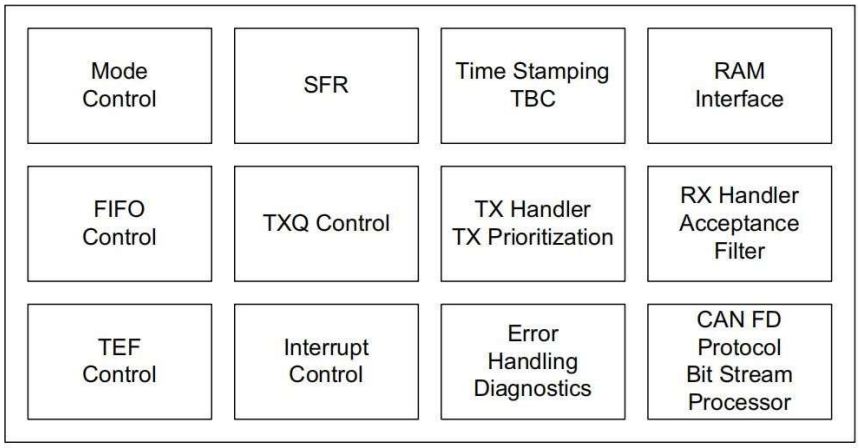
The CLKO pin is a test-point and default output as the frequency divider(1/1 or 1/2 or 1/4 or 1/10) of the crystal oscillator X1. So it can be using as a clock source to the MCU/DSP/FPGA/SOC.



(**FIGURE 1-2**: XLP2518FD INTERFACING WITH MCU/DSP/FPGA/SOC)

5. CAN FD CONTROLLER MODULE

Figure 1-3 shows the main blocks of the CAN FD Controller module:



(**FIGURE 1-3**: CAN FD CORE BLOCK)

- The CAN FD Controller module has multiple modes:
  --- Configuration
  --- Normal CAN FD
  --- Normal CAN 2.0
  --- Sleep (normal Sleep mode and Low Power Mode)
  --- Listen Only
  --- Restricted Operation
  --- Internal and External Loop back modes

- The CAN FD Bit Stream Processor (BSP) implements the Medium Access Control of the CAN FD protocol described in ISO 11898-1:2015. It serializes and de-serializes the bit stream, encodes and decodes the CAN FD frames, manages the medium access, acknowledges frames and detects and signals errors.

- The TX Handler prioritizes the messages that are requested for transmission by the Transmit FIFOs. It uses the RAM Interface to fetch the transmit data from RAM and provides it to the BSP for transmission.
- The BSP provides received messages to the RX Handler. The RX Handler uses the Acceptance Filter to filtern out messages that shall be stored into Receive FIFOs. It uses the RAM Interface to store received data into RAM.

- Each FIFO can be configured either as a Transmit or Receive FIFO. The FIFO Control keeps track of the FIFO Head and Tail, and calculates the User Address. For a TX FIFO, the User Address points to the address in RAM where the data for the next transmit message shall be stored. For a RX FIFO, the User Address points to the address in RAM where the data of the next receive message shall be read. The User notifies the FIFO that a message was written to or read from RAM by incrementing the Head/Tail of the FIFO.

- The Transmit Queue (TXQ) is a special transmit FIFO that transmits the messages based on the ID of the messages stored in the queue.
- The Transmit Event FIFO (TEF) stores the message IDs of the transmitted messages.

- A free-running Time Base Counter is used to time stamp received messages. Messages in the TEF can also be time stamped.
- The CAN FD Controller module generates interrupts when new messages are received or when messages were transmitted successfully.

- The SFR are used to control and to read the status of the CAN FD Controller module.

6. MEMORY ORGANIZATION

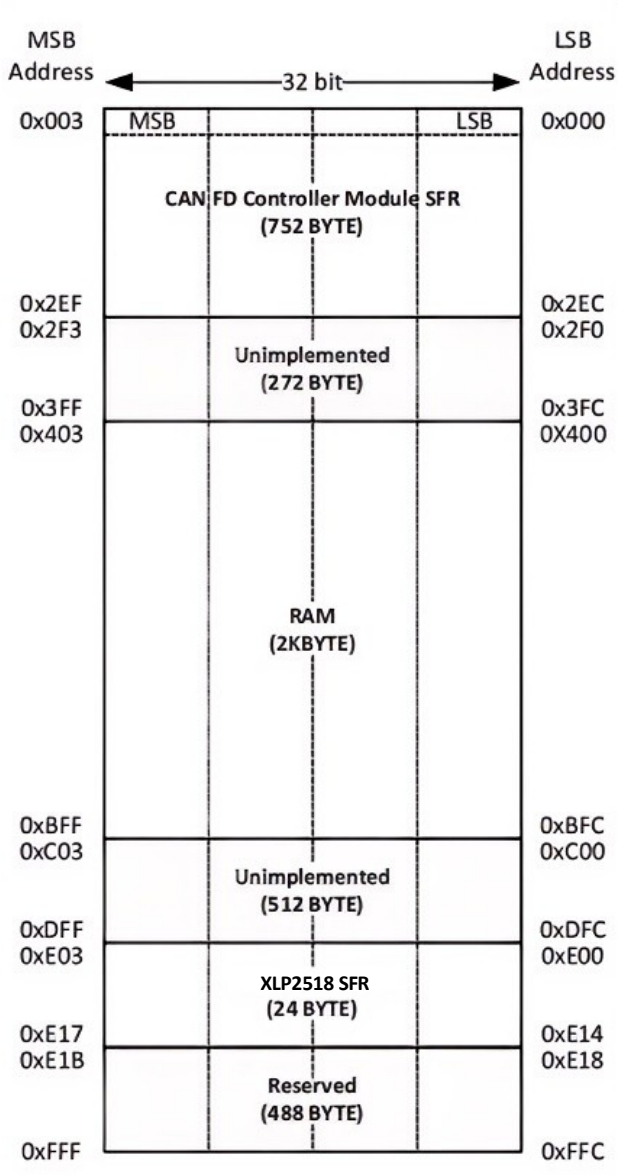
Figure 3-1 illustrates the main sections of the memory and its address ranges:

- XLP2518FD Special Function Registers
- CAN FD Controller module SFR
- Message Memory (RAM)

The SFR are 32-bit wide. The LSB is located at the lower address, for example, the LSB of C1CON is located at address 0x000, while its MSB is located at address 0x003.

Table 3-1 lists the XLP2518FD specific registers. The first column contains the address of the SFR.

Table 3-2 lists the registers of the CAN FD Controller module. The first column contains the address of the SFR.



(FIGURE 3-1: MEMORY MAP)

2: Reserved register reads 0.

6.1. XLP2518FD Specific Registers

- Register 3-1: OSC
- Register 3-2: IOCON
- Register 3-3: CRC
- Register 3-4: ECCCON
- Register 3-5: ECCSTAT
- Register 3-6: DEVID

TABLE 3-3: REGISTER LEGEND

Symbol	Description	Symbol	Description
R	Readable bit	HC	Cleared by Hardware only
W	Writable bit	HS	Set by Hardware only
U	Unimplemented bit, read as '0'	1	Bit is set at Reset
S	Settable bit	0	Bit is cleared at Reset
C	Clearable bit	X	Bit is unknown at Reset

EXAMPLE 3-1:

R/W - 0 indicates the bit is both readable and writable, and reads '0' after a Reset.

REGISTER 3-1: OSC – XLP2518FD OSCILLATOR CONTROL REGISTER

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
—	—	—	—	—	—	—	—
bit 31							bit 24

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
—	—	—	—	—	—	—	—
bit 23							bit 16

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
—	—	—	SCLKRDY	—	OSCRDY	—	PLLRDY
bit 15							bit 24

U-0	R/W-1	R/W-1	R/W-0	R/W-0	HS/C-	U-0	R/W-0
—	CLKODIV[1:0]		SCLKDIV(1)	LPMEN(3)	OSCDIS(2)	—	PLLEN(1)
bit 37							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-13 **Unimplemented:** Read as '0'

bit 12 **SCLKRDY:** Synchronized SCLKDIV bit
1 = SCLKDIV 1
0 = SCLKDIV 0

bit 11 **Unimplemented:** Read as '0'

bit 10 **OSCRDY:** Clock Ready
1 = Clock is running and stable
0 = Clock not ready or off

bit 9 **Unimplemented:** Read as '0'

bit 8 **PLLRDY:** PLL Ready
1 = PLL Locked
0 = PLL not ready

bit 7 **Unimplemented:** Read as '0'

bit 6-5 **CLKODIV[1:0]:** Clock Output Divisor
11 =CLKO is divided by 10
10 =CLKO is divided by 4
01 =CLKO is divided by 2
00 =CLKO is divided by 1

bit 4 **SCLKDIV:** System Clock Divisor(1)
1 = SCLK is divided by 2
0 = SCLK is divided by 1

Note
1: This bit can only be modified in Configuration mode.
2: Clearing OSCDIS while in Sleep mode will wake-up the device and put it back in Configuration mode.
3: Setting LPMEN does not actually put the device in LPM. It selects which Sleep mode will be entered after requesting Sleep mode using CiCON.REQOP. In order to wake up on RXCAN activity, CiINT.WAKIE must be set.

bit 3 **LPMEN:** Low Power Mode (LPM) Enable[3]
1 = When in LPM, the device will stop the clock and power down the majority of the chip. Register and RAM values will be lost. The device will wake-up due to asserting nCS, or due to RXCAN activity. 0 = When in Sleep mode, the device will stop the clock, and retain it's register and RAM values. It will wake-up due to clearing the OSCDIS bit, or due to RXCAN activity.

bit 2 **OSCDIS:** Clock (Oscillator) Disable[2]
1 = Clock disabled, the device is in Sleep mode.
0 = Enable Clock

bit 1 **Unimplemented:** Read as '0'

bit 0 **PLLEN:** PLL Enable[1]
1 = System Clock from 10x PLL
0 = System Clock comes directly from XTAL oscillator

Note
1: This bit can only be modified in Configuration mode.
2: Clearing OSCDIS while in Sleep mode will wake-up the device and put it back in Configuration mode.
3: Setting LPMEN does not actually put the device in LPM. It selects which Sleep mode will be entered after requesting Sleep mode using CiCON.REQOP. In order to wake up on RXCAN activity, CiINT.WAKIE must be set.

REGISTER 3-2: IOCON – INPUT/OUTPUT CONTROL REGISTER

U-0	R/W-0	R/W-0	R/W-0	U-0	U-0	R/W-1	R/W-1
—	INTOD	SOF	TXCANOD	—	—	PM1	PM0
bit 31							bit 24

U-0	U-0	U-0	U-0	U-0	U-0	R/W-x	R/W-x
—	—	—	—	—	—	GPIO1	GPIO0
bit 23							bit 16

U-0	U-0	U-0	U-0	U-0	U-0	R/W-x	R/W-x
—	—	—	—	—	—	LAT1	LAT0

—	XSTBYEN	—	—	—	—	TRIS1(1)	TRIS0(1)
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **Unimplemented:** Read as '0'

bit 30 **INTOD:** Interrupt pins Open Drain Mode
1 = Open Drain Output
0 = Push/Pull Output

bit 29 **SOF:** Start-Of-Frame signal
1 = SOF signal on CLKO pin
0 = Clock on CLKO pin

bit 28 **TXCANOD:** TXCAN Open Drain Mode
1 = Open Drain Output
0 = Push/Pull Output

bit 27-26 **Unimplemented:** Read as '0'

bit 25 **PM1:** GPIO Pin Mode
1 = Pin is used as GPIO1
0 = Interrupt Pin $\overline{INT1}$, asserted when CiINT.RXIF and RXIE are set

bit 24 **PM0:** GPIO Pin Mode
1 = Pin is used as GPIO0
0 = Interrupt Pin $\overline{INT0}$, asserted when CiINT.TXIF and TXIE are set

bit 23-18 **Unimplemented:** Read as '0'

bit 17 **GPIO1:** GPIO1 Status
1 = $V_{GPIO1} > V_{IH}$
0 = $V_{GPIO1} < V_{IL}$

bit 16 **GPIO0:** GPIO0 Status
1 = $V_{GPIO0} > V_{IH}$
0 = $V_{GPIO0} < V_{IL}$

Note
1: If PMx = 0, TRISx will be ignored and the pin will be an output.
2: The bit fields in the IOCON register must be written using single data byte SFR WRITE instructions.

bit 15-10	**Unimplemented:** Read as '0
bit 9	**LAT1:** GPIO1 Latch 1 = Drive Pin High 0 = Drive Pin Low
bit 8	**LAT0:** GPIO0 Latch 1 = Drive Pin High 0 = Drive Pin Low
bit 7	**Unimplemented:** Read as '0'
bit 6	**XSTBYEN:** Enable Transceiver Standby Pin Control 1 = XSTBY control enabled 0 = XSTBY control disabled
bit 5-2	**Unimplemented:** Read as '0'
bit 1	**TRIS1:** GPIO1 Data Direction(1) 1 = Input Pin 0 = Output Pin
bit 0	**TRIS0:** GPIO0 Data Direction(1) 1 = Input Pin 0 = Output Pin

Note
1: If PMx = 0, TRISx will be ignored and the pin will be an output.
2: The bit fields in the IOCON register must be written using single data byte SFR WRITE instructions.

REGISTER 3-3: CRC – CRC REGISTER

- Register 3-21: CiBDIAG0
- Register 3-22: CiBDIAG1

Fifo Control and Status Registers

- Register 3-23: CiTEFCON
- Register 3-24: CiTEFSTA
- Register 3-25: CiTEFUA
- Register 3-26: CiTXQCON
- Register 3-27: CiTXQSTA
- Register 3-28: CiTXQUA
- Register 3-29: CiFIFOCONm – m = 1 to 31
- Register 3-30: CiFIFOSTAm – m = 1 to 31
- Register 3-31: CiFIFOUAm – m = 1 to 31

Filter Configuration and Control Registers

- Register 3-32: CiFLTCONm – m = 0 to 7
- Register 3-33: CiFLTOBJm – m = 0 to 31

Note: The 'i' shown in the register identifier denotes CANi, for example, C1CON. The XLP2518FD device contains one CANFD Controller Module.

TABLE 3-4: REGISTER LEGEND

Sym	Description	Sym	Description
R	Readable bit	HC	Cleared by Hardware only
W	Writable bit	HS	Set by Hardware only
U	Unimplemented bit, read as '0'	1	Bit is set at Reset
S	Settable bit	0	Bit is cleared at Reset
C	Clearable bit	X	Bit is unknown at Reset

EXAMPLE 3-2:

R/W - 0 indicates the bit is both readable and writable, and reads '0' after a Reset.

REGISTER 3-7: CiCON – CAN CONTROL REGISTER

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-1	R/W-0	R/W-0

—	PXEDIS(1)	ISOCRCEN(1)	DNCNT[4:0]				
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-28 **TXBWS[3:0]**: Transmit Bandwidth Sharing bits
Delay between two consecutive transmissions (in arbitration bit times)
0000 = No delay
0001 = 2
0010 = 4
0011 = 8
0100 = 16
0101 = 32
0110 = 64
0111 = 128
1000 = 256
1001 = 512
1010 = 1024
1011 = 2048
1111-1100 = 4096

bit 27 **ABAT**: Abort All Pending Transmissions bit
1 = Signal all transmit FIFOs to abort transmission
0 = Module will clear this bit when all transmissions were aborted

Note
1: These bits can only be modified in Configuration mode.
2: In Sleep mode, the OPMOD bits indicate Configuration mode (OPMOD = 100) and OSC. OSCDIS will read as '1'. The application software should use these bit fields as a handshake indication for the Sleep mode request.

REGISTER 3-7: CiCON – CAN CONTROL REGISTER (CONTINUED)

bit 26-24 **REQOP[2:0]**: Request Operation Mode bits
000 = Set Normal CAN FD mode; supports mixing of CAN FD and Classic CAN 2.0 frames
001 = Set Sleep mode
010 = Set Internal Loopback mode
011 = Set Listen Only mode
100 = Set Configuration mode
101 = Set External Loopback mode
110 = Set Normal CAN 2.0 mode; possible error frames on CAN FD frames
111 = Set Restricted Operation mode

bit 23-21 **OPMOD[2:0]**: Operation Mode Status bits(2)
000 = Module is in Normal CAN FD mode; supports mixing of CAN FD and Classic CAN 2.0 frames
001 = Module is in Sleep mode
010 = Module is in Internal Loopback mode
011 = Module is in Listen Only mode
100 = Module is in Configuration mode
101 = Module is in External Loopback mode
110 = Module is Normal CAN 2.0 mode; possible error frames on CAN FD frames
111 = Module is Restricted Operation mode

bit 20 **TXQEN**: Enable Transmit Queue bit(1)
1 = Enables TXQ and reserves space in RAM
0 = Do not reserve space in RAM for TXQ

bit 19 **STEF**: Store in Transmit Event FIFO bit(1)
1 = Saves transmitted messages in TEF and reserves space in RAM
0 = Do not save transmitted messages in TEF

bit 18 **SERR2LOM**: Transition to Listen Only Mode on System Error bit(1)
1 = Transition to Listen Only Mode
0 = Transition to Restricted Operation Mode

bit 17 **ESIGM**: Transmit ESI in Gateway Mode bit(1)
1 = ESI is transmitted recessive when ESI of message is high or CAN controller error passive
0 = ESI reflects error status of CAN controller

bit 16 **RTXAT**: Restrict Retransmission Attempts bit(1)
1 = Restricted retransmission attempts, CiFIFOCONm.TXAT is used
0 = Unlimited number of retransmission attempts, CiFIFOCONm.TXAT will be ignored

bit 15-13 **Unimplemented**: Read as '0'

bit 12 **BRSDIS**: Bit Rate Switching Disable bit
1 = Bit Rate Switching is Disabled, regardless of BRS in the Transmit Message Object
0 = Bit Rate Switching depends on BRS in the Transmit Message Object

bit 11 **BUSY**: CAN Module is Busy bit
1 = The CAN module is transmitting or receiving a message
0 = The CAN module is inactive

bit 10-9 **WFT[1:0]**: Selectable Wake-up Filter Time bits
00 = T00FILTER
01 = T01FILTER
10 = T10FILTER
11 = T11FILTER

Note: Please refer to Table 7-5.

REGISTER 3-7: CiCON – CAN CONTROL REGISTER (CONTINUED)

bit 8 **WAKFIL**: Enable CAN Bus Line Wake-up Filter bit(1)
1 = Use CAN bus line filter for wake-up
0 = CAN bus line filter is not used for wake-up

bit 7 **Unimplemented**: Read as '0'

bit 6 **PXEDIS**: Protocol Exception Event Detection Disabled bit(1)
A recessive "res bit" following a recessive FDF bit is called a Protocol Exception.
1 = Protocol Exception is treated as a Form Error.
0 = If a Protocol Exception is detected, the CAN FD Controller Module will enter Bus Integrating state.

bit 5 **ISOCRCEN**: Enable ISO CRC in CAN FD Frames bit(1)
1 = Include Stuff Bit Count in CRC Field and use Non-Zero CRC Initialization Vector according to ISO 11898-1:2015
0 = Do NOT include Stuff Bit Count in CRC Field and use CRC Initialization Vector with all zeros

bit 4-0 **DNCNT[4:0]**: Device Net Filter Bit Number bits
10011-11111 = Invalid Selection (compare up to 18-bits of data with EID)
10010 = Compare up to data byte 2 bit 6 with EID17
...
00001 = Compare up to data byte 0 bit 7 with EID0
00000 = Do not compare data bytes

Note
1: These bits can only be modified in Configuration mode.
2: In Sleep mode, the OPMOD bits indicate Configuration mode (OPMOD = 100) and OSC. OSCDIS will read as '1'. The application software should use these bit fields as a handshake indication for the Sleep mode request.

bit 31-26 **Unimplemented**: Read as '0'

bit 25 **EDGFLTEN**: Enable Edge Filtering during Bus Integration state bit
1 = Edge Filtering enabled, according to ISO 11898-1:2015
0 = Edge Filtering disabled

bit 24 **SID11EN**: Enable 12-Bit SID in CAN FD Base Format Messages bit
1 = RRS is used as SID11 in CAN FD base format messages: SID[11:0] = {SID[10:0], SID11}
0 = Do not use RRS; SID[10:0] according to ISO 11898-1:2015

bit 23-18 **Unimplemented**: Read as '0'

bit 17-16 **TDCMOD[1:0]**: Transmitter Delay Compensation Mode bits; Secondary Sample Point (SSP)
10-11 = Auto; measure delay and add TDCO.
01 = Manual; Do not measure, use TDCV + TDCO from register
00 = TDC Disabled

bit 15 **Unimplemented**: Read as '0'

bit 14-8 **TDCO[6:0]**: Transmitter Delay Compensation Offset bits; Secondary Sample Point (SSP)
Two's complement; offset can be positive, zero, or negative.
011 1111 = 63 x TSYSCLK
...
000 0000 = 0 x TSYSCLK
...
111 1111 = –64 x TSYSCLK

bit 7-6 **Unimplemented**: Read as '0'

bit 5-0 **TDCV[5:0]**: Transmitter Delay Compensation Value bits; Secondary Sample Point (SSP)
11 1111 = 63 x TSYSCLK
...
00 0000 = 0 x TSYSCLK

Note 1: This register can only be modified in Configuration mode.

REGISTER 3-11: CiTBC – TIME BASE COUNTER REGISTER

bit 31-19 **Unimplemented**: Read as '0'

bit 18 **TSRES**: Time Stamp res bit (FD Frames only)
1 = at sample point of the bit following the FDF bit.
0 = at sample point of SOF

bit 17 **TSEOF**: Time Stamp EOF bit
1 = Time Stamp when frame is taken valid:
- RX no error until last but one bit of EOF
- TX no error until the end of EOF
0 = Time Stamp at "beginning" of Frame:
- Classical Frame: at sample point of SOF
- FD Frame: see TSRES bit.

bit 16 **TBCEN**: Time Base Counter Enable bit
1 = Enable TBC
0 = Stop and reset TBC

bit 15-10 **Unimplemented**: Read as '0'

bit 9-0 **TBCPRE[9:0]**: Time Base Counter Prescaler bits
1023 = TBC increments every 1024 clocks
...
0 = TBC increments every 1 clock

000 = 8 data bytes
001 = 12 data bytes
010 = 16 data bytes
011 = 20 data bytes
100 = 24 data bytes
101 = 32 data bytes
110 = 48 data bytes
111 = 64 data bytes

bit 28-24 **FSIZE[4:0]:** FIFO Size bits(1)
0_0000 = FIFO is 1 Message deep
0_0001 = FIFO is 2 Messages deep
0_0010 = FIFO is 3 Messages deep
...
1_1111 = FIFO is 32 Messages deep

bit 23 **Unimplemented:** Read as '0'

bit 22-21 **TXAT[1:0]:** Retransmission Attempts bits
This feature is enabled when CiCON.RTXAT is set.
00 = Disable retransmission attempts
01 = Three retransmission attempts
10 = Unlimited number of retransmission attempts
11 = Unlimited number of retransmission attempts

bit 20-16 **TXPRI[4:0]:** Message Transmit Priority bits
00000 = Lowest Message Priority
...
11111 = Highest Message Priority

Note
1: These bits can only be modified in Configuration mode.
2: This bit is updated when a message completes (or aborts) or when the FIFO is reset.
3: FRESET is set while in Configuration mode and is automatically cleared in Normal mode.

REGISTER 3-29: CiFIFOCONm – FIFO CONTROL REGISTER m, (m = 1 TO 31) (CONTINUED)

bit 15-11 **Unimplemented:** Read as '0'

bit 10 **FRESET:** FIFO Reset bit(3)
1 = FIFO will be reset when bit is set; cleared by hardware when FIFO was reset. User should wait until this bit is clear before taking any action.
0 = No effect

bit 9 **TXREQ:** Message Send Request bit(2)
TXEN = 1 (FIFO configured as a Transmit FIFO)
1 = Requests sending a message; the bit will automatically clear when all the messages queued in the FIFO are successfully sent.
0 = Clearing the bit to '0' while set ('1') will request a message abort.
TXEN = 0 (FIFO configured as a Receive FIFO)
This bit has no effect.

bit 8 **UINC:** Increment Head/Tail bit
TXEN = 1 (FIFO configured as a Transmit FIFO)
When this bit is set, the FIFO head will increment by a single message.
TXEN = 0 (FIFO configured as a Receive FIFO)
When this bit is set, the FIFO tail will increment by a single message.

bit 7 **TXEN:** TX/RX FIFO Selection bit(1)
1 = Transmit FIFO
0 = Receive FIFO

bit 6 **RTREN**: Auto RTR Enable bit
1 = When a remote transmit is received, TXREQ will be set.
0 = When a remote transmit is received, TXREQ will be unaffected.

bit 5 **RXTSEN**: Received Message Time Stamp Enable bit(1)
1 = Capture time stamp in received message object in RAM.
0 = Do not capture time stamp.

bit 4 **TXATIE**: Transmit Attempts Exhausted Interrupt Enable bit
1 = Enable interrupt
0 = Disable interrupt

bit 3 **RXOVIE**: Overflow Interrupt Enable bit
1 = Interrupt enabled for overflow event
0 = Interrupt disabled for overflow event

bit 2 **TFERFFIE**: Transmit/Receive FIFO Empty/Full Interrupt Enable bit
TXEN = 1 (FIFO configured as a Transmit FIFO)
Transmit FIFO Empty Interrupt Enable
1 = Interrupt enabled for FIFO empty
0 = Interrupt disabled for FIFO empty
TXEN = 0 (FIFO configured as a Receive FIFO)
Receive FIFO Full Interrupt Enable
1 = Interrupt enabled for FIFO full
0 = Interrupt disabled for FIFO full

Note
1: These bits can only be modified in Configuration mode.
2: This bit is updated when a message completes (or aborts) or when the FIFO is reset.
3: FRESET is set while in Configuration mode and is automatically cleared in Normal mode.

REGISTER 3-29: CiFIFOCONm – FIFO CONTROL REGISTER m, (m = 1 TO 31) (CONTINUED)

6.3. Message Memory

The XLP2518FD device contains a 2 KB RAM that is used to store message objects. There are three different kinds of message objects:

- Table 3-5: Transmit Message Objects used by the TXQ and by TX FIFOs.
- Table 3-6: Receive Message Objects used by RX FIFOs.
- Table 3-7: TEF objects.

Figure 3-2 illustrates how message objects are mapped into RAM. The number of message objects for the TEF, the TXQ, and for each FIFO is configurable. Only the message objects for FIFO2 are shown in detail. The number of data bytes per message object (payload) is individually configurable for the TXQ and each FIFO.

FIFOs and message objects can only be configured in Configuration mode.

The TEF objects are allocated first. Space in RAM will only be reserved if CiCON.STEF = 1. Next the TXQ objects are allocated. Space in RAM will only be reserved if CiCON.TXQEN = 1. Next the message objects for FIFO1 through FIFO31 are allocated.

This highly flexible configuration results in an efficient usage of the RAM.

The addresses of the message objects depend on the selected configuration. The application does not have to calculate the addresses. The User Address field provides the address of the next message object to read from or write to.

6.3.1. RAM ECC

The RAM is protected with an Error Correction Code (ECC). The ECC logic supports Single Error Detection (SEC) and Double Error Detection (DED). SEC/DED requires seven parity bits in addition to the 32 data bits. Figure 3-3 shows the block diagram of the ECC logic.

6.3.1.1. ECC Enable and Disable

The ECC logic can be enabled by setting ECCCON.ECCEN. When ECC is enabled, the data written to the RAM is encoded, and the data read from RAM is decoded.

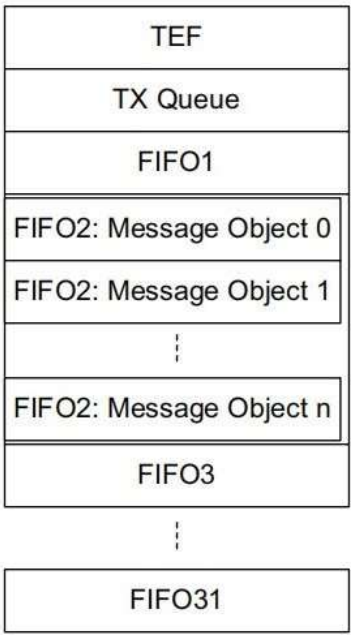
When the ECC logic is disabled, the data is written to RAM, the parity bits are taken from ECCCON.PARITY. This enables the testing of the ECC logic by the user. During a read the parity bits are stripped out and the data is read back unchanged.

6.3.1.2. RAM Write

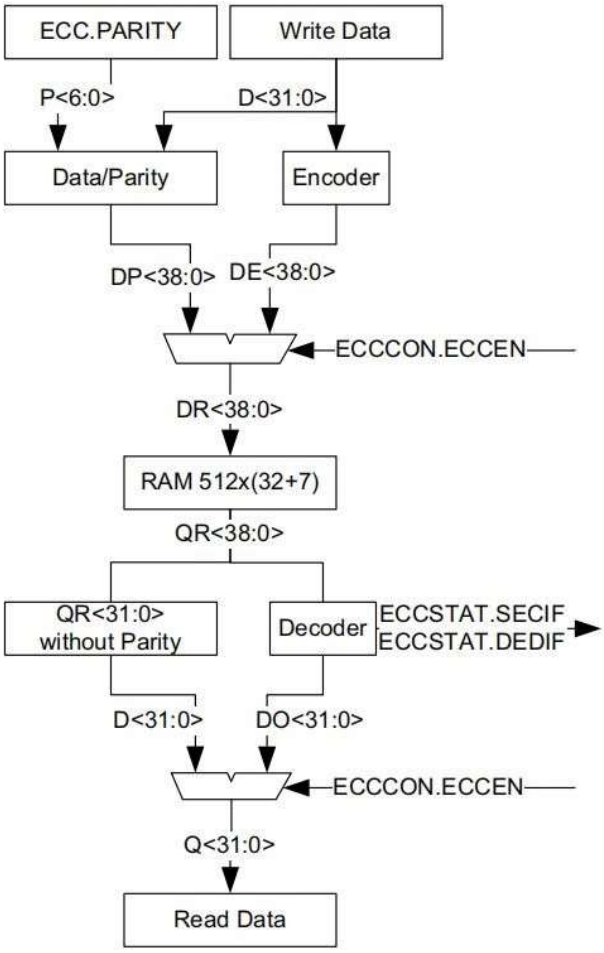
During a RAM write, the Encoder calculates the parity bits and adds the parity bits to the input data.

6.3.1.3. RAM READ

During a RAM read, the Decoder checks the output data from RAM for consistency and removes the parity bits. It corrects single bit errors and detects double bit errors.



(FIGURE 3-2: MESSAGE MEMORY ORGANIZATION)



(FIGURE 3-3: ECC LOGIC)

	15:8	TXMSGTS[15:8]							
	7:0	TXMSGTS[7:0]							

bit TE0.31-30 **Unimplemented:** Read as 'x'

bit TE0.29 **SID11:** In FD mode the standard ID can be extended to 12 bit using r1

bit TE0.28-11 **EID[17:0]:** Extended Identifier

bit TE0.10-0 **SID[10:0]:** Standard Identifier

bit TE1.31-9 **SEQ[22:0]:** Sequence to keep track of transmitted messages

bit TE1.8 **ESI:** Error Status Indicator
1 = Transmitting node is error passive
0 = Transmitting node is error active

bit TE1.7 **FDF:** FD Frame; distinguishes between CAN and CAN FD formats

bit TE1.6 **BRS:** Bit Rate Switch; selects if data bit rate is switched

bit TE1.5 **RTR:** Remote Transmission Request; not used in CAN FD

bit TE1.4 **IDE:** Identifier Extension Flag; distinguishes between base and extended format

bit TE1.3-0 **DLC[3:0]:** Data Length Code

bit TE2.31-0 **TXMSGTS[31:0]:** Transmit Message Time Stamp [(1)]

Note
1: TE2 (TXMSGTS) only exits in objects where CiTEFCON.TEFTSEN is set.

7. SPI INTERFACE

The XLP2518FD device is designed to interface directly with a Serial Peripheral Interface port available on most microcontrollers. The SPI in the microcontroller must be configured in mode 0,0 or 1,1 in 8-bit operating mode.

SFR and Message Memory (RAM) are accessed using SPI instructions. Figure 4-1 illustrates the generic format of the SPI instructions (SPI mode 0,0). Each instruction starts with driving nCS low (falling edge on nCS). The 4-bit command and the 12-bit address are shifted into SDI on the rising edge of SCK. During a write instruction, data bits are shifted into SDI on the rising edge of SCK. During a read instruction, data bits are shifted out of SDO on the falling edge of SCK. One or more data bytes are transfered with one instruction. Data bits are updated on the falling edge of SCK and must be valid on the rising edge of SCK. Each instruction ends with driving nCS high (rising edge on nCS).

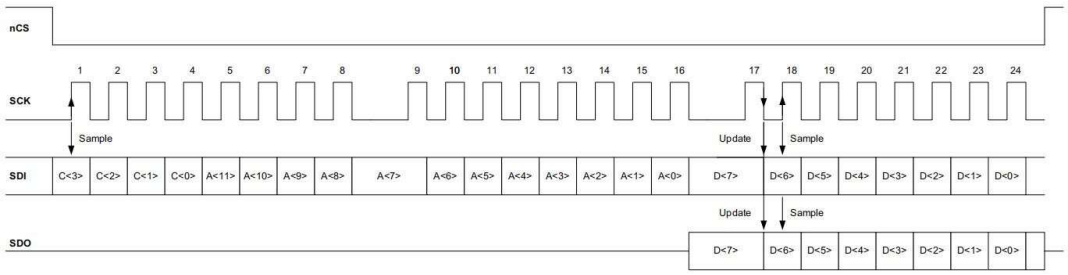
Refer to Figure 7-1 for detailed input and output timing for both mode 0,0 and mode 1,1.

Table 4-1 lists the SPI instructions and their format.

Note

1: The frequency of SCK has to be less than or equal to 0.85 * half the frequency of SYSCLK. This ensures that the synchronization between SCK and SYSCLK works correctly.

2: In order to minimize the Sleep current, the SDO pin of the XLP2518FD device must not be left floating while the device is in Sleep mode. This can be achieved by enabling a pull-up or pull-down resistor inside the MCU on the pin that is connected to the SDO pin, while the XLP2518FD device is in Sleep mode.



(FIGURE 4-1: SPI INSTRUCTION FORMAT)

TABLE 4-1: SPI INSTRUCTIONS

Name	Format	Description
RESET	C = 0b0000; A = 0x000	Resets internal registers to default state; selects Configuration mode
READ	C = 0b0011; A; D = SDO	Read SFR/RAM from address A.
WRITE	C = 0b0010; A; D = SDI	Write SFR/RAM to address A.
READ_CRC	C = 0b1011; A; N; D = SDO; CRC = SDO	Read SFR/RAM from address A. N data bytes. Two bytes CRC. CRC is calculated on C, A, N and D.
WRITE_CRC	C = 0b1010; A; N; D = SDI; CRC = SDI	Write SFR/RAM to address A. N data bytes. Two bytes CRC. CRC is calculated on C, A, N and D.
WRITE_SAFE	C = 0b1100; A; D = SDI; CRC = SDI	Write SFR/RAM to address A. Check CRC before write. CRC is calculated on C, A and D.

Legend: C = Command (4 bit), A = Address (12 bit), D = Data (1 to n bytes), N = Number of Bytes (1 byte), CRC (2 bytes)

7.1. SFR Access

The SFR access is byte-oriented. Any number of data bytes can be read or written with one instruction. The address is incremented by one automatically after every data byte. The address rolls over from 0xFFF to 0x000.

The following SPI instructions only show the different fields and their values. Every instruction follows the generic format illustrated in Figure 4-1.

7.1.1. RESET

Figure 4-2 illustrates the RESET instruction. The instruction starts with nCS going low. The Command (C[3:0] = 0b0000) is followed by the Address (A[11:0] = 0x000). The instruction ends when nCS goes high.

The RESET instruction should only be issued after the device enters Configuration mode. All SFR and State Machines are reset just like during a Power-on Reset (POR), and the device transitions immediately to Configuration mode.

The Message Memory is not changed.

The actual reset happens at the end of the instruction when nCS goes high.

7.1.2. SFR READ – READ

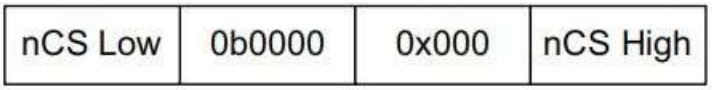
Figure 4-3 illustrates the READ instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b0011), is followed by the Address (A[11:0]). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by data byte from address A+1 (DB[A+1]). Any number of data bytes can be read. The instruction ends when nCS goes high.

7.1.3. SFR WRITE – WRITE

Figure 4-4 illustrates the WRITE instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b0010), is followed by the Address (A[11:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). Any number of data bytes can be written. The instruction ends when nCS goes high.

Note:
The bit fields in the IOCON register must be written using the single data byte SFR WRITE instructions.

Data bytes are written to the register with the falling edge on SCK following the 8th data bit.



(FIGURE 4-2: RESET INSTRUCTION)

(FIGURE 4-3: SFR READ INSTRUCTION)

(FIGURE 4-4: SFR WRITE INSTRUCTION)

7.2. Message Memory Access

The Message Memory (RAM) access is word-oriented (4 bytes at a time). Any multiple of 4 data bytes can be read or written with one instruction. The address is incremented by one automatically after every data byte. The address rolls over from 0xBFF to 0x400.

Writes and Reads must be word-aligned. The lower two bits of the address are always assumed to be 0. It is not possible to do unaligned reads/writes.

The following SPI instructions only show the different fields and their values. Every instruction follows the generic format illustrated in Figure 4-1.

7.2.1. MESSAGE MEMORY READ – READ

Figure 4-5 illustrates the READ instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b0011), is followed by the Address (A[11:0]). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by data byte from address A+1 (DB[A+1]). The instruction ends when nCS goes high.

Read commands from RAM must always read a multiple of 4 data bytes. A word is internally read from RAM after the address field, and after every fourth data byte read on the SPI. In case nCS goes high before a multiple of 4 data bytes is read on SDO, the incomplete read should be discarded by the microcontroller.

7.2.2. MESSAGE MEMORY WRITE – WRITE

Figure 4-6 illustrates the WRITE instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b0010), is followed by the Address (A[11:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). The instruction ends when nCS goes high.

Write commands must always write a multiple of 4 data bytes. After every fourth data byte, with the falling edge on SCK, the RAM Word gets written. In case nCS goes high before a multiple of 4 data bytes is received on SDI, the data of the incomplete Word will not be written to RAM.

nCS Low	0b0011	A<11:0>	DW[A]				nCS High
			DB[A]	DB[A+1]	DB[A+2]	DB[A+3]	

(FIGURE 4-5: MESSAGE MEMORY READ INSTRUCTION)

nCS Low	0b0010	A<11:0>	DW[A]				nCS High
			DB[A]	DB[A+1]	DB[A+2]	DB[A+3]	

(FIGURE 4-6: MESSAGE MEMORY WRITE INSTRUCTION)

7.3. SPI Commands with CRC

In order to detect or avoid bit errors during SPI communication, SPI commands with CRC are available.

7.3.1. CRC CALCULATION

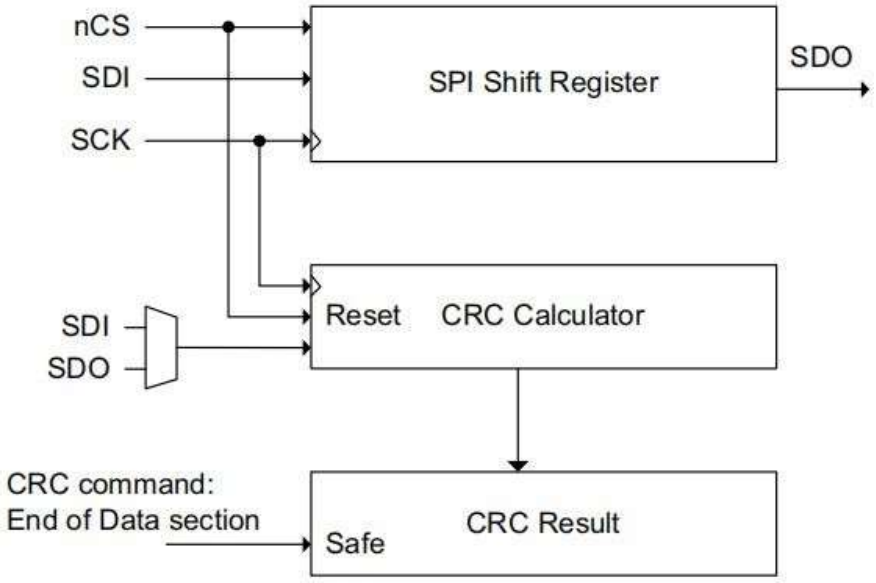
The CRC is calculated in parallel with the SPI shift register (see Figure 4-7).

When nCS is asserted, the CRC calculator is reset to 0xFFFF.

The result of the CRC calculation is available after the Data section of a CRC command. The result of the CRC calculation is written to the CRC register in case a CRC mismatch is detected. In case of a CRC mismatch, CRC.CRCERRIF is set.

The XLP2518FD device uses the following generator polynomial: CRC-16/USB (0x8005). CRC-16 detects all single and double-bit errors, all errors with an odd number of bits, all burst errors of length 16 or less, and most errors for longer bursts. This allows an excellent detection of SPI communication errors that can happen in the system, and heavily reduces the risk of miscommunication, even under noisy environments.

The maximum number of data bits is used while reading and writing TX or RX Message Objects. A RX Message Object with 64 Bytes of data + 12 Bytes ID and Time Stamp contains 76 Bytes or 608 bits. In comparison, USB data packets contain up to 1024 bits. CRC-16 has a Hamming Distance of 4 up to 1024 bits.



(FIGURE 4-7: CRC CALCULATION)

7.3.2. SFR READ WITH CRC – READ_CRC

Figure 4-8 illustrates the READ_CRC instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b1011), is followed by the Address (A[11:0]), and the number of data bytes (N[7:0]). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by the data byte from address A+1 (DB[A+1]). Any number of data bytes can be read. Next the CRC is shifted out (CRC[15:0]). The instruction ends when nCS goes high.

The CRC is provided to the microcontroller. The microcontroller checks the CRC. No interrupt is generated on CRC mismatch during a READ_CRC command inside the XLP2518FD device.

If nCS goes high before the last byte of the CRC is shifted out, a CRC Form Error interrupt is generated: CRC.FERRIF.

7.3.3. SFR WRITE WITH CRC – WRITE_CRC

Figure 4-9 illustrates the WRITE_CRC instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b1010), is followed by the Address (A[11:0]), and the number of data bytes (N[7:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). Any number of data bytes can be written. Next the CRC is shifted in (CRC[15:0]). The instruction ends when nCS goes high.

The SFR is written to the register after the data byte was shifted in on SDI, with the falling edge on SCK. Data bytes are written to the register before the CRC is checked.

The CRC is checked at the end of the write access. In case of a CRC mismatch, a CRC Error interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC Form Error interrupt is generated: CRC.FERRIF.

(FIGURE 4-8: SFR READ WITH CRC INSTRUCTION)

(FIGURE 4-9: SFR WRITE WITH CRC INSTRUCTION)

7.3.4. SFR WRITE SAFE WITH CRC – WRITE_SAFE

This instruction ensures that only correct data is written to the SFR.

Figure 4-10 illustrates the WRITE_SAFE instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b1100), is followed by the Address (A[11:0]). Afterwards, one data byte is shifted into address A (DB[A]). Next the CRC (CRC[15:0]) is shifted in. The instruction ends when nCS goes high.

The data byte is only written to the SFR after the CRC is checked and if it matches.

If the CRC mismatches, the data byte is not written to the SFR and a CRC Error interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC Form Error interrupt is generated: CRC.FERRIF.

(FIGURE 4-10: SFR WRITE SAFE WITH CRC INSTRUCTION)

7.3.5. MESSAGE MEMORY READ WITH CRC – READ_CRC

Figure 4-11 illustrates the READ_CRC instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b1011), is followed by the Address (A[11:0]), and the number of data Words (N[7:0]). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by data byte from address A+1 (DB[A+1]). Next the CRC (CRC[15:0]) is shifted out. The instruction ends when nCS goes high.

Writes and Reads must be word-aligned. The lower two bits of the address are always assumed to be 0. It is not possible to do unaligned reads/writes.

Read commands should always read a multiple of 4 data bytes. A word is internally read from RAM after the "N" field, and after every fourth data byte read on the SPI. In case nCS goes high before a multiple of 4 data bytes are read on SDO, the incomplete read should be discarded by the microcontroller.

The CRC is provided to the microcontroller. The microcontroller checks the CRC. No interrupt is generated on CRC mismatch during a READ_CRC command inside the XLP2518FD device.

If nCS goes high before the last byte of the CRC is shifted out, a CRC Form Error interrupt is generated: CRC.FERRIF.

7.3.6. MESSAGE MEMORY WRITE WITH CRC – WRITE_CRC

Figure 4-12 illustrates the WRITE instruction accessing the RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b1010), is followed by the Address (A[11:0]), and the number of data Words (N[7:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). Next the CRC (CRC[15:0]) is shifted in. The instruction ends when nCS goes high.

Write commands must always write a multiple of 4 data bytes. After every fourth data byte, with the fallingedge on SCK, the RAM gets written. In case nCS goes high before a multiple of 4 data bytes is received on SDI, the data of the incomplete Word will not be written to RAM.

The CRC is checked at the end of the write access. In case of a CRC mismatch, a CRC interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC interrupt is generated: CRC.FERRIF.

nCS Low	0b1011	A<11:0>	N<7:0>	DW[A]				CRC<15:8>	CRC<7:0>	nCS High
				DB[A]	DB[A+1]	DB[A+2]	DB[A+3]			

(FIGURE 4-11: MESSAGE MEMORY READ WITH CRC INSTRUCTION)

nCS Low	0b1010	A<11:0>	N<7:0>	DW[A]				CRC<15:8>	CRC<7:0>	nCS High
				DB[A]	DB[A+1]	DB[A+2]	DB[A+3]			

(FIGURE 4-12: MESSAGE MEMORY WRITE WITH CRC INSTRUCTION)

7.3.7. MESSAGE MEMORY WRITE SAFE WITH CRC – WRITE_SAFE

This instruction ensures that only correct data is written to RAM.

Figure 4-10 illustrates the WRITE_SAFE instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b1100), is followed by the Address (A[11:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]), A+2 (DB[A+2]), and A+3 (DB[A+3]). Next the CRC (CRC[15:0]) is shifted in. The instruction ends when nCS goes high.

The data word is only written to RAM after the CRC is checked and if it matches.

If the CRC mismatches, the data word is not written to RAM and a CRC Error interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC interrupt is generated: CRC.FERRIF.

nCS Low	0b1100	A<11:0>	DW[A]				CRC<15:8>	CRC<7:0>	nCS High
			DB[A]	DB[A+1]	DB[A+2]	DB[A+3]			

(FIGURE 4-13: MESSAGE MEMORY WRITE SAFE WITH CRC INSTRUCTION)

8. OSCILLATOR

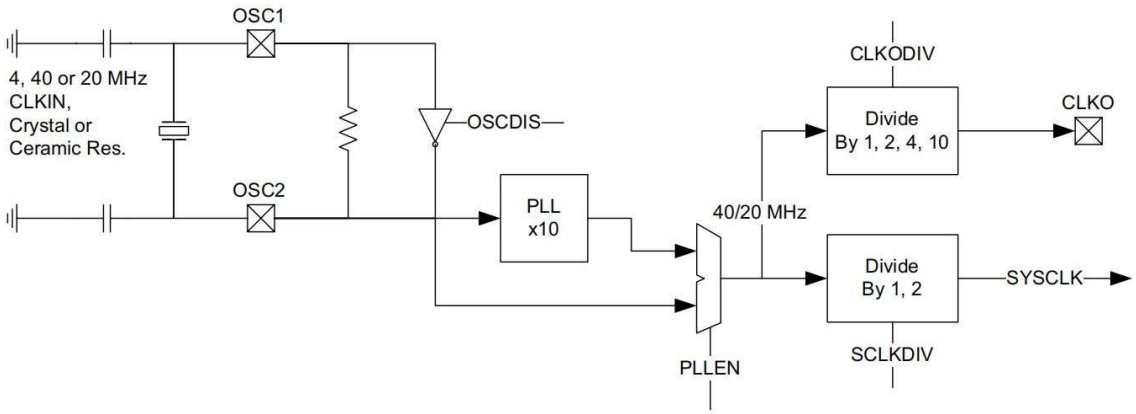
Figure 5-1 shows the block diagram of the oscillator in the XLP2518FD device. The oscillator system generates the SYSCLK, which is used in the CAN FD Controller module and for RAM accesses. It is recommended by the CAN FD community to use either a 40 or 20 MHz SYSCLK.

The time reference for clock generation can be an external 40, 20 or 4 MHz crystal, ceramic resonator or external clock.

The OSC register controls the oscillator. The PLL can be enabled to multiply the 4 MHz clock by 10.

The internal 40/20 MHz can be divided by two.

The internally generated clock can be divided and provided on the CLKO pin.



(FIGURE 5-1: XLP2518FD OSCILLATOR BLOCK DIAGRAM)

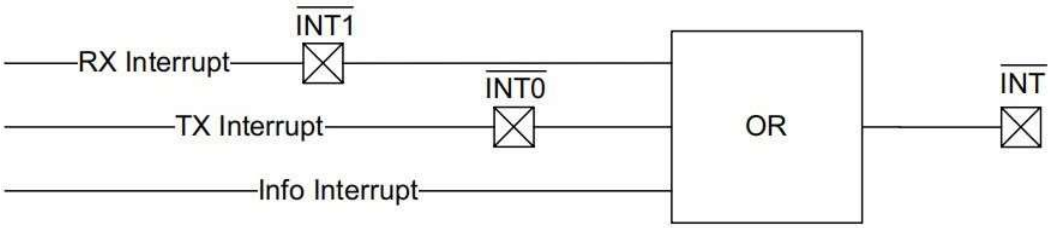
9. I/O CONFIGURATION

- The IOCON register is used to configure the I/O pins:
- CLKO/SOF: select Clock Output or Start of Frame.
- TXCANOD: TXCAN can be configured as Push-Pull or as Open Drain output. Open Drain outputs allows the user to connect multiple controllers together to build a CAN network without using a transceiver.
- INT0 and INT1 can be configured as GPIO with similar registers as in the PIC microcontrollers or as Transmit and Receive interrupts.
- INT0/GPIO0/XSTBY can also be used to automatically control the standby pin of the transceiver
- INTOD: The interrupt pins can be configured as open-drain or push/pull outputs.

9.1. INTERRUPT PINS

The XLP2518FD device contains three different interrupt pins, see Figure 6-1:

- INT is asserted on any interrupt in the CiINT register (xIF & xIE), including the RX and TX interrupts.
- INT1/GPIO1 can be configured as GPIO or RX interrupt pin (CiINT.RXIF & RXIE).
- INT0/GPIO0 can be configured as GPIO or TX interrupt pin (CiINT.TXIF & TXIE). All interrupt pins are active low.



(FIGURE 6-1: INTERRUPT PINS)

10. ELECTRICAL SPECIFICATIONS

10.1. Absolute Maximum Ratings*

V_{DD} ..... V to 6.0V
DC Voltage at all I/O w.r.t GND ..... V to VDD + 0.3V
Virtual Junction Temperature, TVJ (IEC607471) ..... Soldering
temperature of leads (10 seconds)..... +300°C
ESD protection on all pins (IEC 801; Human Body Model) ..... ±8 kV
ESD protection on all pins (IEC 801; Machine Model) ..... ±400V
ESD protection on all pins (IEC 801; Charge Device Model) ..... ±750V

NOTE*:Stresses above those listed under "Maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TABLE 7-1: DC CHARACTERISTICS

DC Specifications		Electrical Characteristics: Extended (E): TAMB = -40°C to +125°C; High (Q): TAMB = -40°C to +150°C; V_{DD} = 2.7V to 5.5V				
Sym	**Characteristic**	**Min**	**Typ**	**max**	**Units**	**Conditions/Comments**
V_{DD} Pin						
V_{DD}	Voltage Range	2.7	—	5.5	V	RAM data retention guaranteed
V_{PORH}	Power-on Reset Voltage	—	—	—	V	Highest voltage on VDD before device releases POR
V_{PORL}	Power-on Reset Voltage	2.2	—	—	V	Lowest voltage on VDD before device asserts POR
S_{VDD}	VDD Rise Rate to ensure POR	0.05	—	—	V/ms	**Note 1**
I_{DD}	Supply Current	—	15	20	mA	40 MHz SYSCLK, 20 MHz SPI activity
I_{DDS}	Sleep Current	—	15	60	µA	Clock is stopped T_{AMB} ≤ +85°C (**Note 1**)

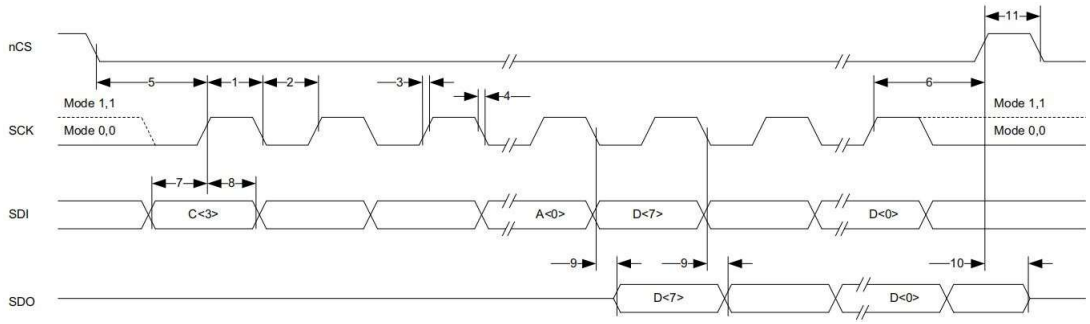
1	T_{SCKH}	SCK High Time	20	—	—	ns	
2	T_{SCKL}	SCK Low Time	20	—	—	ns	
3	T_{SCKR}	SCK Rise Time	—	—	100	ns	**Note 2**
4	T_{SCKF}	SCK Fall Time	—	—	100	ns	**Note 2**
5	T_{CS2SCK}	nCS ↓ to SCK ↑	T_{SCK}/2	—	—	ns	
6	T_{SCK2CS}	SCK ↑ to nCS ↑	T_{SCK}	—	—	ns	
7	$T_{SDI2SCK}$	SDI Setup: SDI ↕ to SCK ↑	5	—	—	ns	
8	$T_{SCK2SDI}$	SDI Hold: SCK ↑ to SDI ↕	—	—	—	ns	
9	$T_{SCK2SDO}$	SDO Valid: SCK ↓ to SDO ↕	—	—	20	ns	C_{LOAD} = 50 pF
10	$T_{CS2SDOZ}$	SDO High Z: nCS ↑ to SDO Z	—	—	2 T_{SCK}	ns	C_{LOAD} = 50 pF
11	T_{CSD}	nCS ↑ to nCS ↓	T_{SCK}	—	—	ns	

Note
1: Characterized; not 100% tested.
2: Design guidance only.
3: FSCK must be less than or equal to 0.85*(FSYSCLK/2).



(FIGURE 7-1: SPI I/O TIMING)

TABLE 7-7: TEMPERATURE SPECIFICATIONS

Parameters	Sym	Min	Typ	max	Units	Conditions
Temperature Ranges						
Operating Temperature Range	T_A	-40	—	+125	°C	
Storage Temperature Range	T_A	-55	—	+150	°C	
Thermal Package Resistance						
Thermal Resistance for SOIC-14	θ_{JA}	—	+110	—	°C/W	
Thermal Resistance for DFN-14	θ_{JA}	—	+45	—	°C/W
