

MFRC522 Standard performance MIFARE and NTAG frontend

Description

The MFRC522 is a highly integrated reader/writer IC designed for contactless communication at a frequency of 13.56 MHz. This reader supports ISO/IEC 14443 A/MIFARE and NTAG standards.

The internal transmitter of the MFRC522 is capable of driving a reader/writer antenna specifically engineered to communicate with ISO/IEC 14443 A/MIFARE cards and transponders, eliminating the need for additional active circuitry. The receiver module offers a robust and efficient solution for demodulating and decoding signals from ISO/IEC 14443 A/MIFARE compatible cards and transponders. Furthermore, the digital module oversees comprehensive management of ISO/IEC 14443 A framing as well as error detection functionalities, including parity checks and CRC.

The MFRC522 is compatible with MF1xxS20, MF1xxS70, and MF1xxS50 products. It facilitates contactless communication while utilizing MIFARE's higher transfer speeds of up to 848 kBd in both directions.

[1] Supply voltages below 3 V reduce the performance in, for example, the achievable operating distance.

[2] V_{DDA}, V_{DDD} and V_{DD(TVDD)} must always be the same voltage.

[3] V_{DD(PVDD)} must always be the same or lower voltage than V_{DDD}.

[4] I_{pd} is the total current for all supplies.

[5] I_{DD(PVDD)} depends on the overall load at the digital pins.

[6] I_{DD(TVDD)} depends on V_{DD(TVDD)} and the external circuit connected to pins TX1 and TX2.

[7] During typical circuit operation, the overall current is below 100 mA.

[8] Typical value using a complementary driver configuration and an antenna matched to 40 Ω between pins TX1 and TX2 at 13.56 MHz.

The MFRC522's contactless UART and dedicated external host must manage the complete ISO/IEC14443 A/MIFARE protocol. [Figure 6](#) shows the data coding and framing according to ISO/IEC 14443A/MIFARE.

Fig 6. Data coding and framing according to ISO/IEC 14443 A

The internal CRC coprocessor calculates the CRC value based on ISO/IEC 14443 A part 3 and handles parity generation internally according to the transfer speed. Automatic parity generation can be switched off using the MfRxReg register's ParityDisable bit.

Digital interfaces

Automatic microcontroller interface detection

The MFRC522 supports direct interfacing of hosts using SPI, I2C-bus or serial UART interfaces. The MFRC522 resets its interface and checks the current host interface type automatically after performing a power-on or hard reset. The MFRC522 identifies the host interface by sensing the logic levels on the control pins after the reset phase. This is done using a combination of fixed pin connections. [Table 5](#) shows the different connection configurations.
