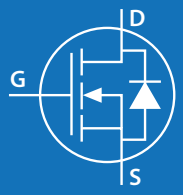
EPC2619 – Enhancement Mode Power Transistor

V_{DS}, 100 V
$R_{DS(on)}$, 4.2 mΩ max
I_D, 29 A
Pulsed I_D, 164 A



EFFICIENT POWER CONVERSION

RoHS Halogen-Free

Revised August 21, 2024

Gallium Nitride's exceptionally high electron mobility and low temperature coefficient allows very low $R_{DS(on)}$, while its lateral device structure and majority carrier diode provide exceptionally low Q_G and zero Q_{RR}. The end result is a device that can handle tasks where very high switching frequency, and low on-time are beneficial as well as those where on-state losses dominate.

Application Notes:

- Easy-to-use and reliable gate
- Gate Drive ON = 5-5.25 V typical (negative voltage not needed)
- Recommended dead time (half-bridge circuit) ≤ 30 ns for best efficiency
- Top of FET is electrically connected to source

Die Size: 2.5 x 1.5 mm

EPC2619 eGaN® FETs are supplied only in passivated die form with solder bars.

Applications

- DC-DC converters
- Isolated DC-DC converters
- Sync rectification
- Battery chargers, storage, and stabilizers
- Solar optimizers
- Motor drive
- Power tools
- eBikes and eScooters
- Robots
- DC servo
- Medical robots and DC-DC
- Class-D audio
- USB PD 3.1 chargers
- Point of load converters

Benefits

- Ultra high efficiency
- No reverse recovery
- Ultra low Q_G
- Small footprint
- Excellent thermal

LAYOUT CONSIDERATIONS

GaN transistors generally behave like power MOSFETs, but at much higher switching speeds and power densities, therefore layout considerations are very important, and care must be taken to minimize layout parasitic inductances. The recommended design utilizes the first inner layer as a power loop return path. This return path is located directly beneath the top layer's power loop allowing for the smallest physical loop size. This method is also commonly referred to as flux cancellation. Variations of this concept can be implemented by placing the bus capacitors either next to the high side device, next to the low side device, or between the low and high side devices, but in all cases the loop is closed using the first inner layer right beneath the devices.

A similar concept is also used for the gate loop, with the return gate loop located directly under the turn ON and OFF gate resistors.

Furthermore, to minimize the common source inductance between power and gate loops, the power and gate loops are laid out perpendicular to each other, and a via next to the source pad closest to the gate pad is used as Kelvin connection for the gate driver return path.

The **EPC90153 80 V Half-bridge with Gate Drive using EPC2619** implements our recommended vertical inner layout.

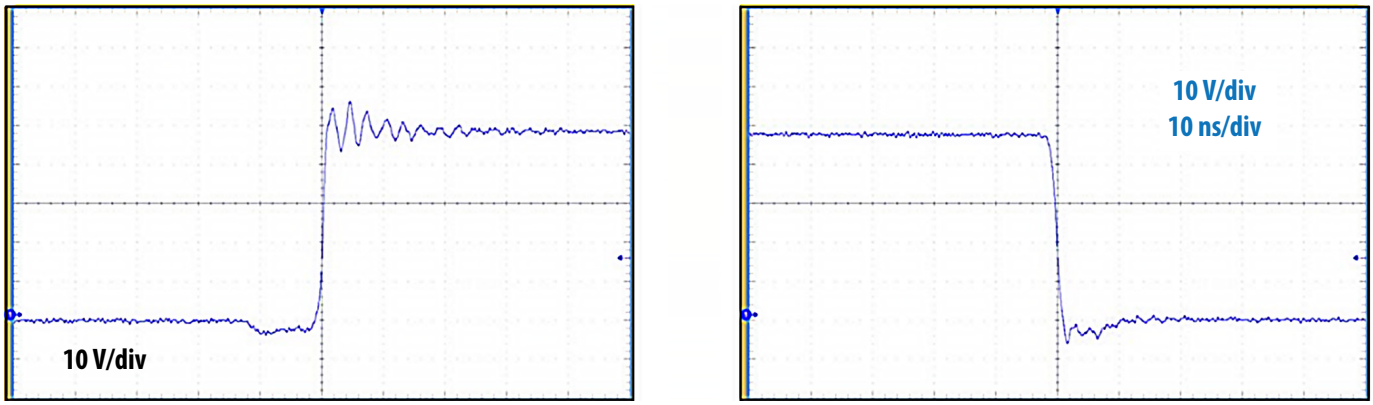
TYPICAL SWITCHING BEHAVIOR

The following typical switching waveforms are captured in these conditions:

- **EPC90153 80 V Half-bridge with Gate Drive using EPC2619**
- Gate driver: uP1966E with 0.4 Ω/0.7 Ω pull-down/pull-up resistance
- External $R_G(ON)$ = 1.8 Ω, $R_G(OFF)$ = 0.47 Ω
- V_{IN} = 48 V, I_L = 20 A



Typical turn on: 47 V/ns

Typical turn off: 22 V/ns

TYPICAL THERMAL CONCEPT

The EPC2204 can take advantage of dual sided cooling to maximize its heat dissipation capabilities in high power density designs. ***Note that the top of EPC FETs are connected to source potential, so for half-bridge topologies the Thermal Interface Material (TIM) needs to provide electrical isolation to the heatsink.***

Recommended best practice thermal solutions are covered in detail in **How2AppNote012 - How to Get More Power Out of an eGaN Converter.pdf**.

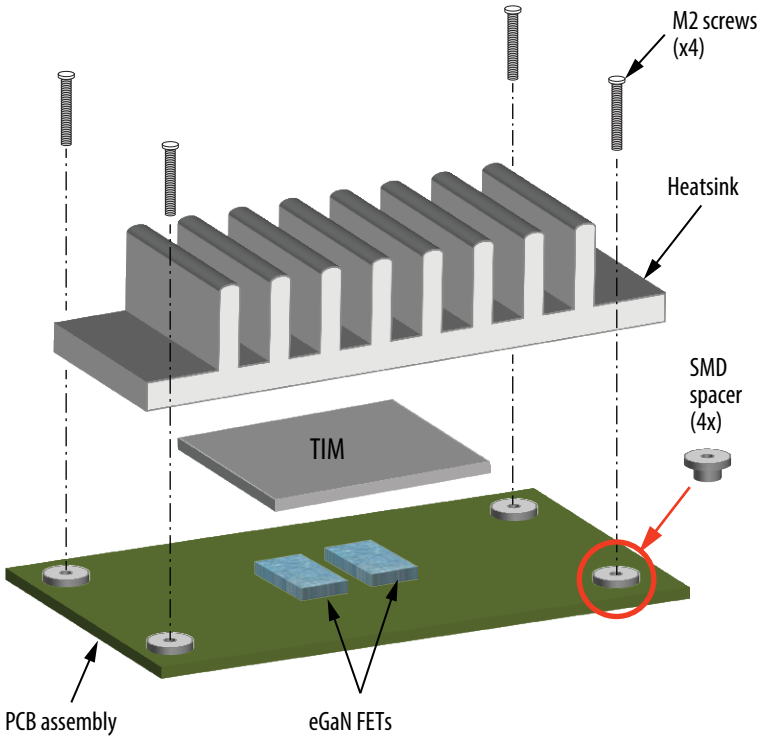

Figure 15: Exploded view of heatsink assembly using screws

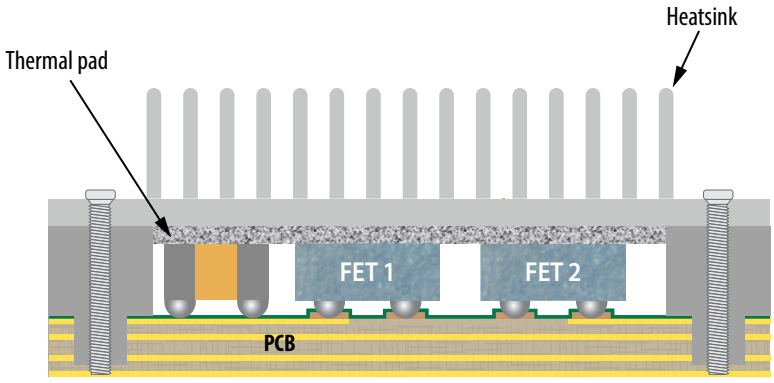

Figure 16: A cross-section image of dual sided thermal solution

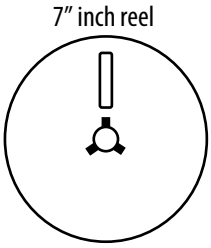
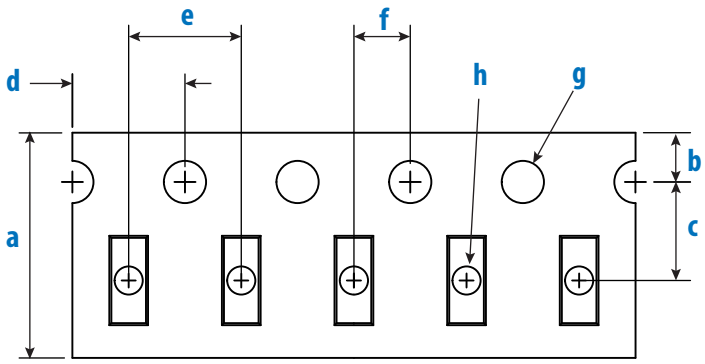
Note: Connecting the heatsink to ground is recommended and can significantly improve radiated EMI

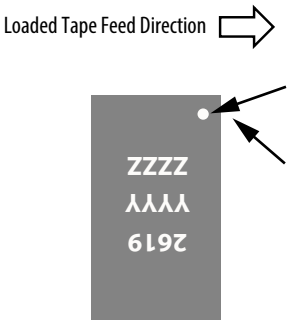
The thermal design can be optimized by using the ***GaN FET Thermal Calculator*** on EPC's website.

TAPE AND REEL CONFIGURATION

4 mm pitch, 8 mm wide tape on 7" reel







Die is placed into pocket solder bar side down (face side down)

Recommended stencil should be 4 mil (100 µm) thick, must be laser cut, openings per drawing.

The corner has a radius of R60.

Intended for use with SAC305 Type 4 solder, reference 88.5% metals content.

Split stencil design can be provided upon request, but EPC has tested this stencil design and not found any scooping issues.
