■ 焊接温度及注意事项 Solder temperature and notes

● 无铅波峰焊 Wave soldering(lead-free)

注意事项 notes:

- ①PCB主面预热温度最高升温斜率:2~3°C / sec , 预热时长:120s左右;
- ②PCB主面预热温度范围:90~130°C;
- ③PCB背面最高预热温度不超过130°C;
- ④波峰温度与预热区温度落差不能大于150°C.
- ⑤波峰焊锡炉温度应控制在250~260°C 之间;
- ⑥波谷温度最好不能低于217°C, 也就是说如果是双波峰, 两个波峰之间落差不能大于60度, 以防造成二次焊接;
- ⑦焊接时间:双波峰" I " 控制在0.5-2s 之间, 波峰" II " 的时间控制在1.5-4s之间, 合计时间:2-6s. 单波时间控制在2-6s.
- ⑧冷却区斜率一般指从最高温降到90°C时间平均负斜率-4~-2°C/s

● 烙铁焊接 Iron soldering

烙铁作业:最高温度: 350 ± 5°C, 焊接时间: 3±0.5 秒.

■ 概述 Scope

本规范规定了所有系列径向引线引出铝电解电容器的技术规范。

This specification covers "ALL series" miniature single-ended aluminium electrolytic capacitors.

■ 参考标准 Standard

本承认书参考 JIS-C-5101-1 和 JIS-C-5101-4 制定

This approval sheet consulted the institute of JIS-C-5101-1 and JIS-C-5101-4.

■ 工作温度范围 Operating temperature range

工作温度范围是电容器在施加额定工作电压条件下,可以长期可靠工作的环境温度范围。

Operating temperature range is the range of ambient temperature at which the capacitor can be operated continuously at rated

■ 测试环境 Condition of test

如果没有其他规定,标准的测试、检验环境条件如下所示:

环境温度: $10^{\circ}\text{C}\sim 35^{\circ}\text{C}$

相对湿度: $\leq 80\% \text{ RH}$

大气压力: $860\text{mbar}\sim 1060\text{mbar}$

如果对测试结果有异议,可以在以下条件测试:

环境温度: $20\pm 2^{\circ}\text{C}$

相对湿度: $45\% \text{RH}\sim 60\% \text{RH}$

大气压力: $860\text{mbar}\sim 1060\text{mbar}$

Unless otherwise specified, the standard range of atmospheric conditions for making measurements and tests are as follows:

Ambient temperature : 10°C to 35°C

Relative humidity : $\leq 80\% \text{ RH}$

ir pressure: $860\text{mbar}\sim 1060\text{mbar}$

If there may be doubt on the results, measurements shall be made within the following limits:

Ambient temperature : $20\pm 2^{\circ}\text{C}$

Relative humidity: $45\% \text{RH}\sim 60\% \text{RH}$

Air pressure : $860\text{mbar}\sim 1060\text{mbar}$

■ 试验方法及要求 Tests

压力释放 Pressure relief	<p>直流试验 D.C. test 施加同额定电压相等的反电压。 Reversed polarity D.C. rated voltage shall be applied to the capacitor.</p> <p>注: 1. 试验开始 30 Min 后,防爆装置不动作时,停止试验。 2. 该规定适用于铝壳直径6.3mm 以上的电容器。 Note: 1. When the pressure relief device does not open even 30 min after commencement of this test, the test may be ended. 2. This requirement applies to capacitors with a diameter of 6.3mm or more</p>	<p>防爆装置释放时, 无燃烧、无爆炸或铝壳和封口材料的分离。 The pressure relief device shall open in such a way as to avoid any danger of fire or explosion of Capacitor elements .</p>																								

提示: Notes:

*温度系数不应用在寿命计算公式中,只能作为参考

Temperature coefficient is not used in life formula but for reference.

*每升高5℃,纹波电流产生的温升使电容器的使用寿命减半,从而降低电容器的使用寿命.当实际使用中需延长寿命性能时,必须降低rms纹波电流。

The endurance of capacitors is reduced with internal heating produced by ripple current at the rate of halving the lifetime with every 5°C rise.

When long life performance is required in actual use, the rms ripple current has to be reduced.

■铝电解电容器的使用注意事项 Guidelines For Using Aluminum Electrolytic Capacitor

为使您获得电解电容器的最佳性能和延长电解电容器的使用寿命，在使用电解电容器前，请务必阅读本注意事项。

Upon using Aluminum Electrolytic Capacitors, please proper handing and observing to following important points will insure optimum capacitor performance and long life.

①直流电解电容器是有极性的。DC electrolytic capacitors are polarized.

确定极性，极性标志在电容器的基体上。以免因极性反可能引起电路短路或电容器损坏，当极性不固定或不确定的，使用双极性电容器。

注意直流电解电容器不能使用于交流。

Make sure of the polarity .The polarity is marked on the body of the capacitor .Application of the reversed voltage cause a short circuit or damage to the capacitor .

Use bipolar capacitors when the polarity is not determined or unknown . Note that DC electrolytic capacitors can not be used for AC application .

②使用电压不要大于额定电压。Do not apply voltage greater than rated voltage .

使用电压大于额定电压，漏电流会增大，可能损坏电容器。建议工作电压为额定电压的70~80%，电容器在建议的工作电压下使用可延长电容器的寿命。

IF a voltage exceeding the rated voltage is applied ,the leakage current will increase , which damage the capacitor . Recommended working voltage is 70 to 80 percent of tatted voltage . Using capacitors at recommended working voltage prolongs capacitor life .

③不要使过大的纹波电流通过电容器。Do not allow excessive ripple current through the capacitor .

流过电容器的纹波电流超过许可值，将会引起电容器发热，电容量减少，损害电容器。通过电容器的纹波电流不要大于允许值。

The flow of ripple current over permissible ripple current will cause heat of the capacitor ,which may decrease the capacitance and damage the capacitor .

ripple current on the capacitor must be at or bellow allowable level .

④快速的充放电电路中,使用专门设计的电容器。Use specially designed capacitors for the circuits where charge and discharge are frequency repeated .

在经受快速的周期性充放电电路中，电容器可能受损害，它的寿命因容量下降、温升等原因而缩短，在这种电路中，一定要使用专门设计的电容器。

In the circuit subjected to rapid charge cycles ,capacitors may be damaged ,its life may be shortened by capacitance decrease ,heat rise , ect .

Be sure and use special capacitors in these applications .

⑤工作温度范围。Operating temperature range .

电容器的特性随工作温度而变化，在温度较高的情况下，容量、漏电流增大， $tg\delta$ 减少；在低温情况下，容量和漏电流下降， $tg\delta$ 增大。

电容器在较低的温度下使用会确保延长寿命。

The characteristics of capacitors change with the operating temperature .The capacitance and leakage current increase and decrease at higher temperatures .

The capacitance and leakage current decrease and $tg\delta$ increase lower temperature .Usage at lower temperature will ensure longer life .

⑥核对工作频率。Check operating frequency .

电解电容器的容量通常是在100Hz或120Hz下测得的。然而要记住容量随频率的升高而下降， $tg\delta$ 随频率的升高而增大，并使周围温度升高。

The capacitance of electrolytic capacitors is usually measured at 100Hz or 120Hz . However , remember that capacitance decrease and $tg\delta$ increase as the applied frequency becomes higher whereas the ambient temperature becomes higher .

⑦长时间存放的电容器，在使用前加额定直流电压处理。Apply rated DC voltage treatment to the capacitors which have been stored for a long time

长时间的存放，实际对电容器的容量和 $tg\delta$ 没有多大的影响，然而往往会使漏电流增大，耐压降低。长时间存放后的电容器处理，首先逐渐施加直流电压至额定电压，然后再使用。

Long periods of storage have virtually no effect no a capacitor's capacitance and $tg\delta$.Such periods tend however ,to increase leakage current and decrease

withstand voltage .After removing capacitors from long-duration storage ,first apply a gradually increasing DC voltage to rated voltage and then use them.

⑧电容器外壳与阴极端是不绝缘的。The capacitor case is not insulated from the cathode terminal .

电容器外壳与阴极端是通过电解液连接的，如果电容器的外壳必须与线路绝缘，则电容器的安装位置处，一定要采取绝缘措施。

The capacitor's case and cathode terminal connect through the electrolyte.If the case is to be completely insulated,that insulation must be at the capacitor's mounting point.

⑨电容器的端子或引线上不要施加过大的力。Do not apply excessive force to the terminals and leads.

过大的力施加到端子和引线上，可能引起引线的断裂或端子分裂，转而引起内部连接的破坏。

The excessive strong force applied to the terminals and lead wires may cause leads to break or terminals to separate and ,in turn ,cause the internal contact to fail.

⑩关于焊接以后的清洗。Cleaning after soldering

① 电容器不能用卤化有机物系列的清洗剂进行清洗。如果必须进行清洗，请使用能够保证电容器质量的清洗剂。

The aluminum electrolytic capacitors should be free of halogenated solvents during board cleaning after soldering. Use solvent proof capacitors when halogenated solvents are used.

② 请不要让固定剂及镀层（涂层剂）将电容器封口部位（端子一侧）全部封住。

Do not cover up all the sealing area of capacitors with adhesives、fixative or coating materials (coating agent), make coverage only partial.

■ 包装Packing
