## XBLW LM2675MX

1A 300KHz 40V PWM Buck DC/DC Converter

WEB | [www.xinboleic.com](http://www.xinboleic.com)

## Descriptions

The LM2675MX regulator is monolithic integrated circuit ideally suited for easy and convenient design of a step-down switching regulator (buck converter). It is capable of driving a 1.0 A load with excellent line and load regulation. This device is available in adjustable output version. It is internally compensated to minimize the number of external components to simplify the power supply design. Since LM2675 converter is a switch-mode power supply, its efficiency is significantly higher in comparison with popular three-terminal linear regulators, especially with higher input voltages. The LM2675MX operates at a switching frequency of 300 kHz thus allowing smaller sized filter components than what would be needed with lower frequency switching regulators.

Available in a standard SOP8 Surface Mount packages. The other features include a guaranteed  $\pm 4\%$  tolerance on output voltage with in specified input voltages and output load conditions, and  $\pm 15\%$  on the oscillator frequency. External shutdown is included, featuring 50  $\mu\text{A}$  (typical) standby current. Self protection features include switch cycle-by-cycle current limit for the output switch, as well as thermal shutdown for complete protection under fault conditions.

## Features

- Adjustable Output Voltage Range 1.23V~37 V
- 3.3V, 5V, 12V, and adjustable versions
- Guaranteed 1.0 A Output Load Current
- Wide Input Voltage Range up to 40 V
- 300 kHz Fixed Frequency Internal Oscillator
- TTL Shutdown Capability
- Low Power Standby Mode, typ 50  $\mu\text{A}$
- Thermal Shutdown and Current Limit Protection
- Internal Loop Compensation
- These are Pb-Free Devices
- Moisture Sensitivity Level (MSL) Equals 1
- These are Pb-Free Devices

SOP-8

## Applications

- Simple High\_Efficiency Step\_Down (Buck) Regulator
- Efficient Pre\_Regulator for Linear Regulators
- On-Card Switching Regulators
- Positive to Negative Converter (Buck-Boost)
- Negative Step-Up Converters
- Power Supply for Battery Chargers

## Pin Configurations

Figure 1 Pin Configuration of LM2675MX

## Pin Description

Pin Number	Pin Name	Description
1/2/3	NC	Not Connected
4	FB	This pin is the direct input of the error amplifier and the resistor network R2, R1 is connected externally to allow programming of the output voltage.
5	ON/ $\overline{\text{OFF}}$	Allows the switching regulator circuit to be shut down using logic levels, thus dropping the total input supply current to approximately 50 $\mu\text{A}$ . The threshold voltage is typical. 1.6 V. Applying a voltage above this value (up to VIN) shuts the regulator on. If the voltage applied to this pin is lower than 0.6 V or if this pin is left open, the regulator will be in the "off" condition.
6	GND	Circuit ground pin. See the information about the printed circuit board layout.
7	VIN	Positive input supply for LM2675 step_down switching regulator. In order to minimize voltage transients and to supply the switching currents needed by the regulator, a suitable input bypass capacitor must be present
8	OUTPUT	Emitter of the internal switch. The saturation voltage V <sub>sat</sub> of the output switch is typically 1 V. It should be kept in mind that PCB area connected to this pin should be kept to a minimum in order to minimize coupling to sensitive circuitry

## Absolute Maximum Ratings

Note1: Stresses greater than those listed under Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability

Test Circuit and Layout guidelines

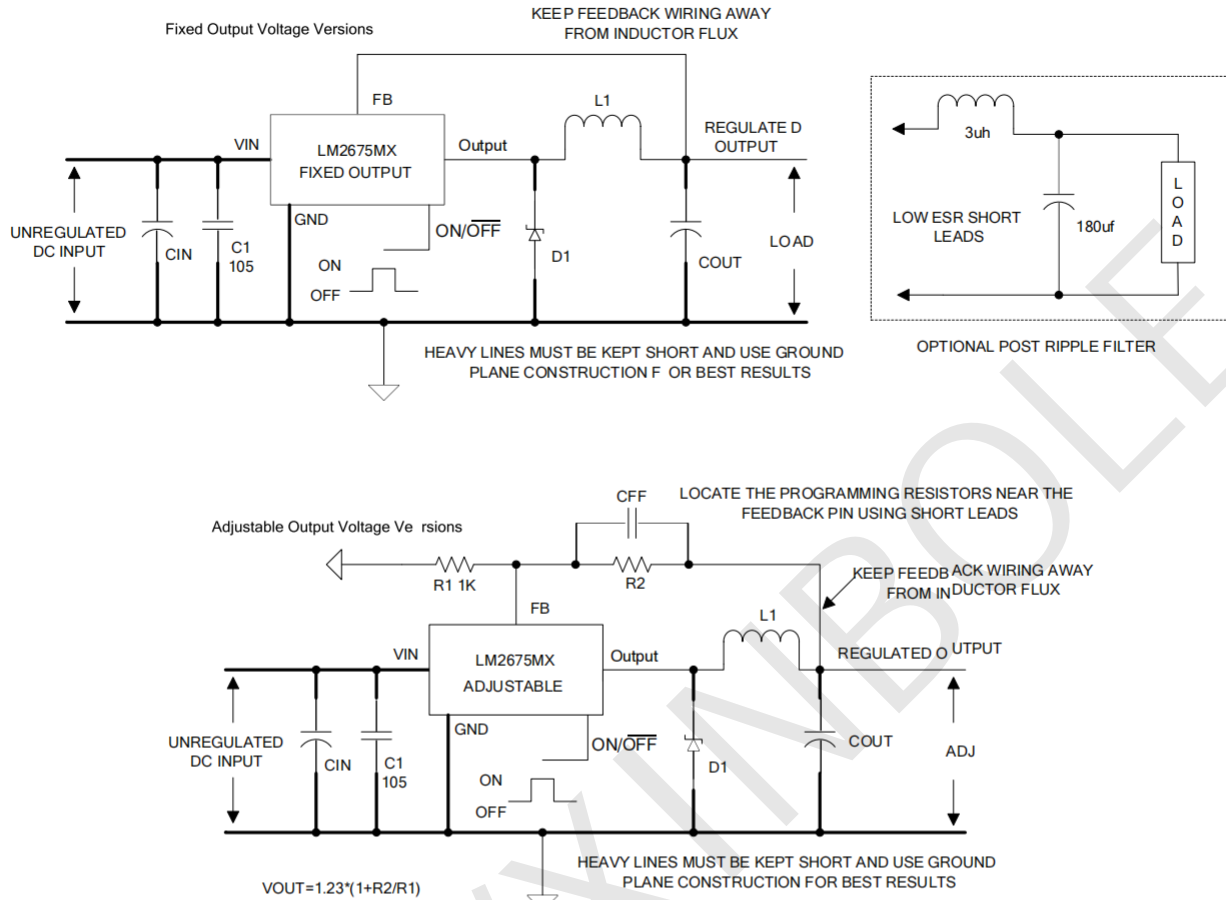

Figure 4. Standard Test Circuits and Layout Guides

Select R1 to be approximately 1K, use a 1% resistor for best stability.

C1 and CFF are optional; in order to increase stability and reduce the input power line noise, C1 must be placed near to PIN1 and PIN3;

For output voltages greater than approximately 10V, an additional capacitor CFF is required.

The compensation capacitor is typically between 100 pf and 33 nf, and is wired in parallel with the output voltage setting resistor, R2. It provides additional stability for high output voltage, low input-output voltages, and/or very low ESR output capacitors, such as solid tantalum capacitors.

$CFF = 1 / (31 * 1000 * R2)$ ; This capacitor type can be ceramic, plastic, silver mica, etc. (Because of the unstable characteristics of ceramic capacitors made with Z5U material, they are not recommended.)
