Features

- ESD Protection for RS-485 I/O Pins
 - ±15kV—Human Body Model
 - ±15kV—IEC61000-4-2, Air-Gap Discharge
 - ±8kV—IEC61000-4-2, Contact Discharge
- 3V to 5.5V Supply Voltage Range
- Enhanced Slew-Rate Limiting Facilitates Error-Free Data Transmission
- 1µA Low-Current Shutdown Mode
- -7V to +12V Common-Mode Input Voltage Range
- Allows up to 256 Transceivers on the Bus
- Thermal Shutdown
- Current-Limiting for Driver Overload Protection

Figure 1. Pin Diagram

Description

The UM3486E is a 3V to 5.5V powered, ±1kV ESD protected limited-slope differential transceiver, offering full RS485 compatibility. Each section contains a driver and a receiver, designed for data transmission in a common mode range of (-7V to 12V). The UM3486E features a limited-slope driver that minimizes EMI and reduces reflections due to improper cabling. UM3486E allows for data transmission rates up to 2.5Mbps.

The UM3486E features enhanced electrostatic discharge (ES) protection. All driver outputs and receiver inputs are protected by IEC61000-4-2 air gap discharge (±15kV), human body (±1kV), and IEC61000-4-2 contact discharge (±8kV). The driver features short-circuit current. When the driver is placed in a high-impedance state by the thermal shutdown circuit, it is protected against excessive power dissipation. The receiver input's fault-safe guarantees a logic high output if both inputs are open, shorted, or idle.

The UM3486E has a power-on/power-off mode, the absence of transient driver outputs allows the transceiver to be hot-plugged on the data bus. The CMOS design provides significant power savings without sacrificing robustness against overloads ESD damage. The typical static current is only 300µA during operation and 1µA in power-off mode.

The UM3486E designed for half-duplex communication and is available in SOP8 and DIP8 packages.

Applications

- Telecommunications
- Low-Power RS-485 Transceivers
- Integrated Services Digital Networks
- Industrial-Control Local Area Networks
- Transceivers for EMI-Sensitive Applications
- Packet Switching
- Level Translators

Pin description

Pin Number	Pin Name	FUNCTION
1	RO	Receiver Output. When enabled, if $A-B \geq -10\text{mV}$, then $RO = \text{high}$. If $A-B \leq -200\text{mV}$, then $RO = \text{low}$
2	/RE	Receiver Output Enable. A low level enables the RO; a high level places it in a high impedance state.
3	DE	Driver Output Enable. A high level enables the driver differential outputs, Pin A and Pin B; a low level places the driver in a high impedance state.
4	DI	Driver Input. When the driver is enabled, a logic low on DI forces Pin A low and Pin B high; a logic high on DI forces Pin A high and Pin B low.
5	GND	Ground Connection (0V).
6	A	No inverting Receiver Input A/Driver Output A
7	B	Inverting Receiver Input B/Driver Output B.
8	VCC	Power Supply

Parameter limit

PARAMETER	Symbol	Value	Unit
CTR Port	/RE, DE, DI	-0.3~VCC+0.3	V
Driver Output Voltage	A, B	-7~13	V
Receiver Output Voltage	RO	-0.3~VCC+0.3	V
Supply Voltage	VCC	+7	V
Continuous Power Dissipation	MSOP8.SOP8.DIP8	830	mW
Soldering Temperature (reflow)		300	°C
Storage Temperature Range		-60~150	°C
Temperature Range		-40~85	°C

Stresses beyond those listed under “Parameter limit” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability

Receiver Switching Characteristics

Parameter	symbol	Test condition	Minimum	Typical case	Maximum	Unit
Propagation delay from receiver input to output, from low to high	tRPLH	CL=15pF See Figures 7 and 8		80	150	ns
The propagation delay from receiver input to output is from high to low	tRPHL			80	150	ns
tRPLH-tRPHL	tRPDS			7	10	ns
Enable low time out	tRPZL	CL=15pF See Figures 7 and 8		20	50	ns
Enable to output high time	tRPZH	CL=15pF See Figures 7 and 8		20	50	ns
Time from output low to disable	tpRLZ	CL=15pF See Figures 7 and 8		20	45	ns
Time from out-put high to disable	tpRHZ	CL=15pF See Figures 7 and 8		20	45	ns
Off stateEnable to output high time	tRPSH	CL=15pF See Figures 7 and 8		200	1400	ns
Off stateEnable low time out	tRPSL	CL=15pF See Figures 7 and 8		200	1400	ns
Time to turn off	tsHDN	NOTE	80		300	ns

NOTE: When /RE=1 and DE=0, the device will not enter shutdown mode if the duration is less than 80ns;however, it will definitely enter shutdown mode if the duration exceeds 300ns

supply current						
Parameter	symbol	Test condition	Minimum	Typical case	Maximum	Unit
Supply current	I _{CC1}	/RE=0V,DE=0V		520	800	uA
	I _{CC2}	/RE=VCC,DE=VCC		540	700	uA
Turn-off current	I _{sHDN}	/RE=VCC,DE=0V		0.5	10	uA
Drive Switch Characteristics

Additional description

Description

3486, including a driver and a receiver, is a half-duplex high-speed transceivers for RS-485 / RS-422 communications. 3486 features fail-safe, overvoltage protection, overcurrent protection, thermal protection, and allows / RE, DE hot-swappable. The 3486 allows an error-free data transmission up to 2.5Mbps.

Typical Application

Backbone cable type: 3486 transceiver is designed for multi-point bi-directional data communication bus transmission lines. Figure 11 shows a typical network application circuit. These devices can also be used as a cable longer than 4,000 feet of line repeater, to reduce the reflection, the transmission line should be in its ends terminated in its characteristic impedance, and stub lengths off the main line should be as short as possible. Hand in hand type: Also known as daisy chain topology, is the prior RS485 bus topology recommended by the TIA organization. The routing method is the master device and a number of slave devices connected in hand-handle configuration, as shown in Figure 12. It should be noted that hand in handle means no branch line. This kind of topology has the advantages of small reflection and high rate of success communication. The bus port protection: In harsh environments, RS485 communication ports are usually done with static protection, lightning surge protection, and other additional protection, even prepared to prevent 380V electricity access by mistake. To avoid the destruction of intelligent instruments and industrial control host, figure 13 demonstrates three general kinds of RS485 bus port protection configuration.

Connecting 256 Transceivers on one Bus

The standard 3486 receiver input impedance is guaranteed $>12k\ \Omega$, the standard driver can drive up to 256 unit loads. These devices can be any combination, or in combination with other RS-485 transceiver combination, as long as the total load does not load more than 256 units, can be connected on the same bus.

Drive Output Protection

Through two mechanisms to avoid failure or a bus contention causes power consumption is too high. First, in the entire common Mode voltage range, overcurrent protection circuit provides a fast short protection. Second, when the die temperature exceeds 150°C , driver output is forced into a high impedance state by the thermal shutdown circuit.

Fail Safe

When the receiver inputs are shorted or open, or when they are connected to a terminated transmission line with all drivers disabled, 3486 guarantees a logic-high receiver output. This is done by the receiver input thresholds are set between -10mV and -200mV . If the differential receiver input voltage (A-B) $\geq -10\text{mV}$, RO is logic high; if the voltage (A-B) $\leq -200\text{mV}$, RO is logic low. When attached to the terminal all transmitters on the bus are disabled, the receiver differential input voltage is pulled to 0V by the termination resistor. With the receiver threshold of the 3486, this results in a logic-high with a 10mV minimum noise margin. The -10mV to -200mV threshold complies with the $\pm 200\text{mV}$ EIA/TIA-485 standard.
