UMW XC6206

Linear voltage regulator

1.Description

XC6206 series is a CMOS step - down voltage regulator with high ripple rejection, low power consumption, low dropout, overcurrent and short - circuit protection. These devices have a very low static bias current (6.0μA Typ.), which can provide an output current of 250mA even if the difference between the input and output voltages is very small, and still maintain a good regulation rate.

2.Product Usage

- Battery power supply system
- Cordless telephone equipment
- Wireless control system
- Portable/palm computer
- Portable consumer equipment
- Portable instrument
- Automobile electronic equipment
- Voltage reference source

3.Features

- High precision output voltage:
  Accuracy A: ±1%, Accuracy B: ±2.5%
- Output voltage: 1.5V~5.0V (step size 0.1V)
- Very low static bias current
  (Typ.=6.0 μ A)
- Low temperature adjustment
  coefficient
- The highest input voltage can reach 8V

Note:

1. $V_{OUT}(T)$: the specified output voltage.

2. $V_{OUT}(E)$: effective output voltage (that is, the output voltage when I_{OUT} keeps a certain value and V_{IN}= ($V_{OUT}(T)$+1.0V)) .

3. $I_{OUT}(max)$:V_{IN}=$V_{OUT}(T)$+1V, slowly increase the output current, and the current value when the output voltage is ≤ $V_{OUT}(E)$*95%.

4. Vdrop=$V_{IN}1$ – $V_{OUT}(e)$ s: $V_{IN}1$ = the input voltage when the output voltage drops to 98% of $V_{OUT}(E)1$. $V_{OUT}(E)s$= $V_{OUT}(E)$*98% $V_{OUT}(E)1$= the output voltage value when V_{IN}= $V_{OUT}(t)$+1V and I_{OUT}= a certain value.
