

LM158DT-HX/LM258DT-HX/LM358DT-HX Low Power Dual Operational Amplifier

Description

The LM158DT-HX/LM258DT-HX/LM358DT-HX integrates two independent, high-gain operational amplifiers, each featuring internal frequency compensation. These op-amps operate over a wide supply voltage range and are fully compatible with both single-supply and split-supply configurations. The device exhibits low quiescent supply current—largely independent of supply voltage—making it especially well-suited for battery-powered applications.

When your design requires conventional op-amp functionality, the LM158DT-HX/LM258DT-HX/LM358DT-HX enables simplified implementation using only a single power supply. A standard +5 VDC rail—commonly available in virtually any digital system or personal computer application—is sufficient; there is no need for an additional ± 15 V supply solely to support interface circuitry.

The LM158DT-HX/LM258DT-HX/LM358DT-HX is a versatile, robust, and widely applicable operational amplifier—ideal for countless applications, including signal conditioning from diverse transducers, DC gain stages, and general-purpose analog signal processing. The accompanying pages provide practical application examples to help you rapidly implement and validate your design.

Features

- ★ Internally frequency compensated for unity gain
- ★ Large DC voltage gain: 100dB
- ★ Wide power supply range:
3V ~ 32V (or ± 1.5 V ~ ± 16 V)
- ★ Input common-mode voltage range includes ground
- ★ Large output voltage swing: 0V DC to $V_{CC}-1.5$ V DC
- ★ Power drain suitable for battery operation
- ★ Low input offset voltage and offset current
- ★ Differential input voltage range equal to the power supply voltage

* Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

Functional operation should be restricted to the Recommended Operating Conditions.

Notes:

1. Split Power Supplies.
2. $V_{IN} < -0.3V$. This input current will only exist when voltage at any of the input leads is driven negative.

Recommended operating conditions

Symbol	Parameter	Min	Max	Unit
V_{CC}	DC Supply Voltage	± 2.5 or 5.0	± 15 or 30	V
T_A	Operating Temperature, All Package Types	-40	+105	°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{IN} and V_{OUT} should be constrained to the range $GND \leq (V_{IN} \text{ or } V_{OUT}) \leq V_{CC}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.
